This two-volume document contains the proceedings of the 2000 conference of the Academy of Human Resource Development (AHRD). Volume 1 contains the following materials: conference overview; text of a town forum on social responsibility and human resource development (HRD); papers from symposia 1-24; and papers from innovative sessions 1-4. The topics of the symposia and innovative sessions covered in Volume 1 are as follows: using technology for learning; linking HRD theory and practice; motivation for learning and performance; images of HRD; workplace issues; new perspectives in evaluation; meeting the informal learning challenges of free-agent learners; identity, influence, and politics; charting the future of HRD; assessing university programs; assessing the learning organization; organizational change; leadership development; training companies on HRD industry changes; knowledge and intellectual capital; workforce diversity; management development; improving HRD practice through research; transformative learning; instructional technology; Internet courses in HRD programs; increasing participation in learning; emotion and behavior in the
workplace; action learning; increasing job satisfaction; designing effective HRD programs; organizational culture and climate; and confronting professional values and ethical issues. Volume 2 contains the following materials: materials from the poster sessions; papers from symposia 25-45; and papers from innovative sessions 5-7. The topics of the symposia and innovative sessions covered in Volume 2 are as follows: developing employee competence; self-directed and incidental learning; ethics and integrity; feedback systems; cross-cultural issues in HRD; organizational structure and strategy; HRD and metaphor; evaluation in HRD; core directions in HRD; work motivation; career development; HRD in Asia; knowledge management; workforce development; advances in distance learning; integrating learning with working; research methods in HRD; inquiring into dilemmas of implementing action learning; organizations in transition; HRD and employee outcomes; change and consultants; individual learning issues; theory building research in HRD; and emotional intelligence and sales success. A CD-ROM containing the proceedings and an AHRD membership directory is also included. (MN)
The copyright for the papers in these proceedings is retained by the individual authors. Unauthorized use is not permitted. Content, editing, and proofreading were the responsibilities of each author.

From the Editor
Call for Papers 2001
Conference Overview

Conference Papers

Town Forum

Symposium 1: Using Technology for Learning
Openness to Technology in Virtual Teams: Implications for International Human Resource Development, Mary R. Watson, Leigh Anne Liu
Towards A Framework For Teaching And Learning In An Online Environment: A Review of the Literature, Saundra Wall Williams
Learning Human Resource Development Through Electronic Discussion, Barbara J. Daley

Symposium 2: Linking HRD Theory and Practice
Development Towards What End? An Analysis of the Notion of Development for the Field of Human Resource Development, K. Peter Kuchinke
A Study of the Influence of the Theoretical Foundations of Human Resource Development (HRD) on Research and Practice, Tim Hatcher
Clarifying and Defining the Performance Paradigm of Human Resource Development, Elwood F. Holton III

Symposium 3: Motivation for Learning and Performance
A Holistic Approach Towards Motivation to Learn, Constantine Kontoghiorghes
Employee Perceptions of the Meaning of Empowerment, Mark S. Rulle, Neal E. Chalofsky

Symposium 4: Images of HRD
Analyzing HRD through metaphor: Why, how, and some likely findings, Darren C. Short
Scientific Paradigms and Their Implications for a Vision of HR/HRD, Alice E. McAndrew
The Meaning of the Meaning of Work: A Literature Review Analysis, Neal E. Chalofsky

Symposium 5: Workplace Issues
Maximizing Opportunities for the Aging Workforce Through Workplace Design, Virginia W. Kupritz
Age and the University Workplace: A Case Study of Remaining, Retiring, or Returning Older Workers, Tonette S. Rocco, David Stein
Access to Work for College Students with Disabilities in the Twin Cities Metropolitan Area, Oscar A. Aliaga

Symposium 6: New Perspectives in Evaluation
A Systems Model for Evaluating Learning and Performance, Hallie Preskill, Darlene Russ-Eft
Economic Analysis of Human Resource Development: Update on the Theory and Practice, Richard A. Swanson
Evaluating HRD Research Using a Feminist Research Framework, Laura L. Bierema, Maria Cesh
Innovative Session 1
Meeting The Informal Learning Challenges Of The “Free-Agent Learner: Drawing Insights From Research-Based Lessons Learned, Victoria J. Marsick, Marie Volpe, Ann Brooks, Maria Cseh, Barbara Keelor Lovin, Sally Vernon, Karen Watkins, Mary Zeigler .................................................. I-1

Symposium 7: Identity, Influence, and Politics
Identification of Power and Influence Styles in Program Planning Practice, Baiyin Yang .................................................. 7-1
Gender Consciuosness Development: A Critical Literature Review, Laura L. Bierema, Jessica T. Kovan ........................................ 7-2
White Male Backlash: Practitioner Perspectives on the Phenomenon, Martin B. Kormanik .................................................. 7-3

Symposium 8: Charting the Future of HRD
Should We Define the Profession of HRD? Views of Leading Scholars, Wendy E. A. Ruona .................................................. 8-1
Strategic Roles of Human Resource Development in the New Millennia, Richard A. Swanson .................................................. 8-2

Symposium 9: Assessing University Programs
Where Have All the Young Ones Gone? An Analysis of the Graduates of a Human Resource Development Program, Douglas H. Smith, Jo D. Gallagher .................................................. 9-1
Effective Strategies for Recruiting College Students, Fredrick M. Nafukho, Michael Burnett .................................................. 9-2
Innovative Techniques in the Training of Health Professionals: The Case of MOI University, Faculty of Health Sciences, Kenya, Simon Kangethe, Fredrick M. Nafukho, Alfred M. Mutema .................................................. 9-3

Symposium 10: Assessing the Learning Organization
Relationship Between Learning Organization Strategies and Performance Driver Outcomes, Elwood F. Holton III, Sandra M. Kaiser .................................................. 10-1
Translation, Validation, and Adaptation of an Instrument to Assess Learning Activities in the Organization: The Spanish Version of the Modified "Dimensions of the Learning Organization Questionnaire", Miguel Hernandez .................................................. 10-3

Symposium 11: Organizational Change
KaiZen Blitz: Rapid Learning to Facilitate Immediate Organizational Improvement, Robert B. Gudgel, Fred C. Feitler .................................................. 11-1
Organization Identity: Exploring "New" Avenue For Intervention and Performance Improvement, Chris van Tonder .................................................. 11-2
Identification of Critical Work Environment Variables for Quality Performance in a Service Organization, Constantine Kontoghiorghes, Deborah Dembeck .................................................. 11-3

Symposium 12: Leadership Development
Leadership Development: A Review of the Theory and Literature, Susan A. Lynham .................................................. 12-1
Developing Workplace Leaders through Their Emotional Reactions: Creating Committed Change Agents to Build a Learning Organization, Darren C. Short, Peter Jarvis .................................................. 12-2
Investigation of a Leadership Development Program, Brad D. Lafferty, Christina L. Lafferty .................................................. 12-3

Innovative Session 2
Training Companies Speak Out on HRD Industry Changes: Symposium Introduction, Wayne Pace .................................................. I2-1
The Working Knowledge Paradigm, Judyth S. Peterson .................................................. 12-2

Symposium 13: Knowledge and Intellectual Capital
Human Capital Measurement, Joanne Provo .................................................. 13-1
Measures And Indicators Of Intangible Assets For Research Institutes And Colleges: A Literature Review, Eunsang Cho, Gary N. McLean .................................................. 13-2
The Corporate Curriculum: A Working-Learning Environment, Jaap van Lakerveld, Joukje van den Berg, Kees de Brabander, Joseph Kessels .................................................. 13-3
Symposium 14: Workforce Diversity
Cross-Organizational vs. Localized Participation: A Case Study on Workplace Diversity Dialogues
Implementation, Martin B. Kormanik, Daniel A. Krieger, Timothy E. Tilghman .......................................................... 14-1
Evaluation of Diversity Initiatives in Multinational Corporations, Rose Mary Wentling .................................................. 14-2
Change: The Japanese Workplace and the Aging Workforce, Mary E. Repass, Leititia A. Combs ........................................ 14-3

Symposium 15: Management Development
Conceptualizing Global Leadership From Multiple Perspectives: An Analysis of Behavioral Ratings, Allan H. Church ................................................................. 15-1
Comparing Managerial Careers, Management Development and Management Education in the
UK with the US: Some Theoretical and Practical Implications, Graeme Martin, Mark Butler .................. 15-2
The Impact of Facilitative Leadership: Multi-Rater Measurement of Behavioral Outcomes
of Managerial-leaders, Valerie L. Weisman .......................................................... 15-3

Symposium 16: Improving HRD Practice through Research
Why HRD Practitioners Can Lack Respect: Sizing the Credibility Gap Between What Top Managers
Want and HRD Professionals Deliver, Robert L. Dilworth, Timothy McClernon .................................................. 16-1
Issues in Human Resource Development in Central and Eastern Europe, Geoff Chivers ........................................ 16-2
Human Resource Professional Support for Work-Based Management Development, Jean Woodall ........ 16-3

Symposium 17: Transformative Learning
Leadership Development as Transformative Pedagogy, Olga V. Kritskaya, John M. Dirkx ........................................ 17-1
The Added Dimension: Using the Learning and Change Model As A Means for Understanding
Professionals’ Performance, Brenda Edgerton Conley, Sharon J. Confessore .................................................. 17-2
A Methodology for Narrative Inquiry: Examining the Role of Narrative in Framing for Action,
Nancy Lloyd Pfahl .......................................................... 17-3

Symposium 18: Instructional Technology
Strategies for Facilitating Interaction When Using Technology-Mediated Training Methods,
Jeffrey S. Lewis, Gary D Geroy, Orlando Griego .......................................................... 18-1
The Determination of Factors Affecting User Acceptance of a Computer-Based Training
Support Tool in the Workplace, G. Dale Wagner, Daniele D. Flannery .................................................. 18-2
Distance Education at the University of the West Indies - Positioning the Institution as a Catalyst for
Human Resource Development in the Caribbean region: A Case Study, Carmeta Tate-Blake ........ 18-3

Innovative Session 3
The Use of Internet Courses in HRD Programs, Robert Schwindt, Ping-Lun Tsai .................................................. 13

Symposium 19: Increasing Participation in Learning
Factors influencing employee participation in training: An empirical investigation, Reid A. Bates .................................................. 19-1
‘Personal development-I’m not really interested!’: Perceptions on Barriers to Learning for Mid-Career,
Middle Level Managers in the Scottish Life Assurance Industry, Martin McCracken, Sandra Watson .................................................. 19-2
Lifelong Learning and Knowledge Transfer to the Workplace: A Longitudinal Case Study,
Graeme Martin, Judy Pate, Philip Beaumont, Jim McGoldrick .................................................. 19-3

Symposium 20: Emotion and Behavior in the Workplace
Emotion Work and Perceptions of Affective Culture in a Military Nonprofit Organization,
Jamie L. Callahan, David R. Schwandt .......................................................... 20-1
Mature Behavior in Organizations: Indications of Growth and Learning in the Workplace,
Dorothy Marcic, John Maslyn, Debbie L. Waddell .................................................. 20-2
Sensation-Seeking Behaviors: Predictors of Job Performance?, Thomas G. Reio, Jr, Chris R. Hardy .................................................. 20-3
Symposium 21: Action Learning
Employee Strategies in Organizing Action Learning Programs, Rob F. Poell, Ferd J. Van der Krogt
Comparing Action Learning Programs at Six Universities on Three Continents: Similarities and Differences, Robert L. Dilworth

Symposium 22: Increasing Job Satisfaction
A Systematic Model of Job Design by examining the Organizational Factors Affecting Satisfaction, Zhichao Cheng, Danyang Yang, Fenglou Liu
Are Managerial Women Getting What They Need to Succeed? A Look At Job Satisfaction, Julia Morrison Chambers
An Assement of the Validity of the Natural Work Goals Profile, C. Layden Colby, R. Wayne Pace

Symposium 23: Designing Effective HRD Programs
Leveraging System Factors for Increased Training Effectiveness, David Ripley
Establishing Internal Quality Benchmarks for the South Carolina Fire Academy, John H. Abraham, Jr., Melissa H. Marcus, Dennis G. Tesolowski, Clinton H. Isbell
Implementing a New Model For On-the-Job Training: Critical Success Factors, Simone J. van Zolingen, Jan N. Streumer, Marcel R. van der Klink, Rolinda de Jong

Symposium 24: Organizational Culture and Climate
A Comparative Profile of Workgroup Climate in Different Organizational Settings, Allan H. Church
The Relationship between Organizational Commitment and Organizational Climate, Adela J. McMurray, Don Scott, R. Wayne Pace
Action Learning as a Vehicle for Organizational Culture Change, Susan R. Meyer

Innovative Session 4
Confronting professional values and ethical issues, Janet Z. Burns, Peter Dean, Tim Hatcher

## Table of Contents

### Conference Overview

**Poster Sessions**

- Human Resource and Organizational Development Program Brochures: What Prospective Students Want, *Rose Opengart, Mary Wilson Callahan* P1-1
- Creating The Global Learning Organization (GLO), *Gary N. McLean, Amy S. Tolbert, Ray C. Meyers* P1-3
- Organizational Alignment Theory Updated: Poster Presentation, *Steve W. Semler* P1-4

### Symposium 25: Developing Employee Competence

- Coaching In Organizations: Self-Assessment of Competence, *Gary N. McLean, Min-Hsun Kuo* 25-1
- An Examination of the Role of Failure in the Development of Workplace Expertise, *Richard W. Herling* 25-2
- When Caring Is Not Enough: Competencies Needed by Service Providers, *Darlene Russ-Eft, Caryl Berrey, Tim Boone* 25-3

### Symposium 26: Self-directed and Incidental Learning

- Self-Directed Learning for Supervisory Development, *Judy O'Neil, Maria Lamattina* 26-1
- Case Study of an Advanced Technology Business Incubator as a Learning Environment, *Mary Wilson Callahan* 26-2

### Symposium 27: Ethics and Integrity

- Factors Influencing Ethical Resolution Efficacy: A Model for HRD Practitioners, *Kimberly S. McDonald* 27-1

### Symposium 28: Feedback Systems

- The Role of Feedback in Management Development Training, *K. Peter Kuchinke* 28-1

### Symposium 29: Cross-Cultural Issues in HRD

- The Perceptions of Physical Therapy Students regarding the Provision of Transcultural Care, *Theresa J. Kraemer* 29-1
- Theory of intercultural adaptation and implication for HRD, *Soo Mi Ha* 29-3

### Symposium 30: Organizational Structure and Strategy

- Exploring Alignment: A Comparative Case Study of Alignment in Two Organizations, *Steve W. Semler* 30-1
- Vertical Integration of HRD Policy within Companies, *A.A.M. (Ida) Wognum* 30-2
- Speculating About the Connection of Management Development and Organizational Goals: A Post-Data Collection Interpretation, *Max U. Montesino* 30-3
- Strategic HRD and Stakeholder-Based Evaluation: A Conceptual Framework of In-Service Training Programs in the Evinset Project, *Sari Heinonen, John A. Niemi* 30-4

### Innovative Session 6

- HRD and Metaphor, *Darren C. Short* (see 4-2)
Symposium 31: Evaluation in HRD
Profile of Management Training Evaluation Studies with Control Group: 1983-1997,
Jiping Zhang, Martin Burlingame ......................................................... 31-3
An Evaluation of a Competency Based Training Program, Dale E. Thompson ................................................................. 31-4

Symposium 32: Core Directions in HRD
Exploring the Convergence of Political and Managerial Cultures in the Dominican Republic:
Implications for Management Development and Training, Max U. Montesino ................................................................. 32-1
The Types of Verbal Interactions and Impact of Gender in Corporate Training Sessions,
Frances L. Good, Gary N. McLean ................................................................. 32-2
Developing Human Potential Through Anthropocentric Work Organization, Jonathan Winterton ......................................................... 32-3

Symposium 33: Work Motivation
An Attitudinal Examination of the Role of HRD in Voluntary Turnover in Public Service Organizations,
Kenneth R. Bartlett, William R. McKinney ......................................................... 33-1
A Passion for Work: Developing and Maintaining Motivation, Patricia Boverie, Michael Korth ......................................................... 33-2
The Influence of Multiple Performance Interventions on Employee Turnover: A Case Study, Tim Hatcher ......................................................... 33-3

Symposium 34: Career Development
Emerging Career Development Needs as Reported by Adult Students at Four Ohio Institutions of
Higher Education: A Qualitative Study, Kathryn S. Hoff ......................................................... 34-1
Mid-Life Mid-Career Renewal - An Outcome Of Involuntary Career Transition As Experienced By
Federal Employees, Sara Erwin Walser, Neal E. Chalofsky ......................................................... 34-2
The Role Of Acculturation In Career Advancement Among Hispanic Corporate Managers,
Lizette Zuniga, Cindy Skaruppa, Toni Powell ......................................................... 34-3

Symposium 35: HRD in Asia
The Impact of Action Learning on the Conflict-Handling Styles of Managers in a Malaysian Firm,
Antony Hii, Michael J. Marquardt ......................................................... 35-1
What is it Like to be an HRD Practitioner in Taiwan?, Bella Ya-Hui Lien ......................................................... 35-2
Role of Public Sector Agencies in National Human Resource Development: A Study of the Expectations of
Singapore-Based Companies, A. Ahad M. Osman-Gani ......................................................... 35-3

Symposium 36: Knowledge Management
Corporate Knowledge Management and New Challenges for HRD, Hunseok Oh ......................................................... 36-1
The Impact of the Corporate University - Case Study Analysis Developments in the UK,
John S. Walton, Michele C. Martin ......................................................... 36-2
Integrating Knowledge Management into HRD to Improve the Expatriation Process,
Teresa M. Palmer, Iris L. Varner ......................................................... 36-3

Symposium 37: Workforce Development
Unemployment and Low-Literacy Among Welfare Recipients: Continuum of Literacy Program Models,
Larry G. Martin ......................................................... 37-1
The Relationship Between Learning Transfer System Perceptions and Basic Workplace Skills,
Reid A. Bates, Elwood F. Holton III ......................................................... 37-2
Survey Evidence from College-Bound High School Graduates: Implications for School-to-Work
and Human Resource Development, Richard L. Hannah ......................................................... 37-3
Symposium 38: Advances in Distance Learning
Teaching Strategies in a Synchronous Distance Learning Environment for Adult Students, 
Luis A. C. Lima, Kathryn S. Hoff ................................................................. 38-1
The influence of Learning Style Preferences on Student Success in online vs. Face-to-Face Environments, Steven R. Aragon, Scott D. Johnson, Najmuddin Shaik ................................................................. 38-2
The Impact of a Distance-Training System with Two Delivery Processes On Trainee Satisfaction and Individual Job Performance: A Case Study, Maria Hruby Moore ................................................................. 38-3

Symposium 39: Integrating Learning with Working
Constructing Knowledge in Continuing Professional Education, Barbara J. Daley, Merrill Carlsson ................................................................. 39-1
How Important is Education for Learning to Work?, Richard J. Torraco ................................................................. 39-2
Critically Reflection on the Shop-Floor, Marianne van Woerkom, Wim J. Nijhof, Loek F. M. Nieuwenhuis ................................................................. 39-3

Symposium 40: Research Methods in HRD
Utilizing Electronic Mail to Survey HRD Practitioners. A Comparison Between Electronic Mail and the U.S. Postal Service for the Purpose of Data Collection, Harold Shoemaker, James Kirk ................................................................. 40-1

Innovative Session 6
Inquiring into the Dilemmas of Implementing Action Learning, Lyle Yorks, Robert L. Dilworth, Michael J. Marquardt, Victoria Marsick ................................................................. 16

Symposium 41: Organizations in Transition
Human Resource Development In An Industry In Transition: The Case Of The Russian Banking Sector, Alexander Ardichvili, Alexander Gasparishvili ................................................................. 41-1
HR Involvement Decisions and Strategies in Mergers and Acquisitions: Four Organizational Portraits, C. Carol Anthony, Laurel Jeris, James R. Johnson ................................................................. 41-3

Symposium 42: HRD and Employee Outcomes
The Impact of Participating in Human Resource Development activities on Individuals' Job Level and Income, Tim de Jong, Bob Witziers, Martin Mulder ................................................................. 42-1
The Relationship Between Training and Organizational Commitment in the Health Care Field, Kenneth R. Bartlett ................................................................. 42-2
The Role of HRD in Promoting Job Satisfaction In Malaysian SMEs, Robert W. Rowden, Shamsuddin Ahmad ................................................................. 42-3

Symposium 43: Change and the Consultant
A Theory of Consultancy, Daniel Boroto, Douglas A. Zahn, Darren C. Short ................................................................. 43-1
The Method of Narrative Change Accounting, Matti Laitinen, Ville Nurmi, Kari E. Nurmi ................................................................. 43-2
Colleges of Education and Internal Consultants, Gene L. Roth ................................................................. 43-3

Symposium 44: Individual Learning Issues
Communication in the Workplace: Using Myers-Briggs to Build Communication Effectiveness, Patrice M. Scanlon, Judy K. Schmitz, Tracey Murray ................................................................. 44-1
An Analysis Using Houle's Typology of Learner Orientation and Selected Variables in Predicting Student Persistence in a Two-year Proprietary Technical College, Francis C. Pengitore ................................................................. 44-2
Examining the Differences in Preferred Learning Environments between Members of the "X" and the Baby Boomer Generations, Blue Wooldridge, Stacey Bellamy ................................................................. 44-3
Innovative Session 7
Theory Building Research in HRD--Pushing the Envelope!
Richard A. Swanson, Wendy E. A. Ruona, Richard J. Torraco ................................................................. I7-1
The Role of Theory Building in Maturing the Human Resource Development Profession,
Susan A. Lynham ............................................................................................................................................. I7-2

From the Editor

Welcome to Raleigh-Durham and the 2000 Academy of Human Resource Conference! Our profession and the Academy are continuing to grow and the quality and quantity of the papers and presentations at this conference attest to this fact.

These proceedings contain over 140 papers written by 266 authors, among them 54 from outside the U.S. The Netherlands and the U.K. lead the group of international authors with 20 and 18 authors, respectively. Other countries represented at the conference include Russia, Ireland, Finland, Kenya, Australia, China, Korea, Singapore, Malaysia, and Taiwan, as well as contributions from international HRD students currently living in the U.S.

Also notable are the contributions by authors from outside the university sector. These include the World Bank, branches of the U.S. military, U.S. Fortune 500 organizations, as well as government, education, and consulting organizations.

Using the Proceedings

1. This year, again, the proceedings have been printed in two volumes. The papers in each volume follow the conference program.

2. The Table of Contents at the beginning of each volume covers both volumes. So do the author and keyword indices at the end of each volume.

3. A short program overview is included in both volumes, the full program is printed as a separate document.

4. As in previous years, papers are identified by symposium number, and this number is used for the Table of Contents and the indices.

5. The CD contains the entire proceedings document as well as the current Membership Directory.

6. The CD contains ‘hotlinks’ from the Table to Contents to individual papers. Just double-click on the paper number in the right hand margin to open an individual paper.

I hope that you will enjoy the conference and find value in the many presentations and other events at this conference.

Proceedings Editor
Call for Papers
AHRD Research Conference 2001

Tulsa, Oklahoma, USA
February 28, 2001 - March 3, 2001
Hosted by Oklahoma State University

The Academy of HRD, an international organization having the mission of encouraging the systematic study of human resource development theories, processes, and practices, encourages you to submit Manuscripts for the 2001 International Research Conference.

- All scholars interested in HRD are invited to submit manuscripts for consideration. The conference is attended by researchers and students from the areas of HRD, business, psychology, education, economics, sociology, technology, and communication. In addition, HRD researchers and reflective practitioners from business, industry, and government participate fully in the conference.
- Manuscripts may be submitted in three categories: Research and Theory Symposium, Innovative Session, and Poster. All Manuscripts will be blind reviewed and should be of new unpublished research. Papers accepted for the conference program will be published in the conference proceedings and may be published elsewhere following the conference.
- Authors must submit full manuscripts. Authors need to be aware that computers and projectors are not provided by the conference. Authors wishing to use computers and projectors must plan on providing them themselves.

Manuscript Requirements

**Research and Theory**

- **Full manuscripts (up to 20 pages) are required.** Submissions should be new and unpublished. Research papers, as appropriate to the methodology used, should minimally contain the following elements:
  1. Title
  2. Problem statement
  3. Theoretical framework
  4. Research questions or propositions
  5. Methodology and/or research design with limitations
  6. Results and findings
  7. Conclusions and recommendations
  8. How this research contributes to new knowledge in HRD

AHRD also welcomes manuscripts presenting new scholarly theory, models, conceptual analyses, literature reviews, and case studies. While these papers may not yet offer results (#5 above) and conclusions (#6 above), they must otherwise follow the above requirements as closely as possible.

**Innovative Session**

- An innovative session is designed to present new and innovative HRD work through creative, interactive presentation formats that do not fit within the regular research and theory symposium process. Multiple papers will be considered, but one complete manuscript must be submitted for inclusion in the proceedings. **Full manuscripts (up to 20 pages) are required.** The following criteria MUST be addressed and met in the Manuscript:
  1. Title
  2. Content of session with evidence that it is new, is innovative addresses research or scholarship, and makes a substantive contribution to HRD knowledge.
  3. Description of format and style of presentation that is to be innovative, intellectually stimulating, generative of a high level of scholarly dialogue, and participative by both presenters and audience.
  4. A timetable for how the 90-minute sessions will be filled.

**Posters**

- Posters are useful in presenting a theory or a model, though effective. Manuscripts have also been presented to use a variety of sessions to view the field of HRD in different ways. Posters are not a substitute for a scholarly paper. Posters will remain up throughout the conference, and a session will be scheduled to allow interaction between the author(s) and conference participants. The following criteria MUST be addressed and met in the Manuscript:
  1. Title
  2. No more than two, professional appearing, 2' x 3' poster boards that must be readable from a distance of six feet. Reduced copies of the poster boards should be included with the Manuscript.
  3. An accompanying description of the poster, including the reduced copies of the posters. **Full manuscripts (up to 14 pages including the poster miniatures) are required.**
  4. Must be research-based.
Submission Requirements

Full Manuscripts are required for consideration and manuscripts must meet the following criteria:

1. Double-spaced in 12-point font.
2. Should not exceed the page limits specified, including figures and references. Manuscripts that exceed the page limits will be returned. Shorter Manuscripts will be accepted.
3. Blind review ready
   a. Cover sheet with author(s) identification
   b. No author identification in body, header or footer of manuscript
4. Cover sheet should contain full identification and contact information for ALL authors
5. All communication with authors will be via Email. Manuscript/manuscript submissions MUST INCLUDE AN E-MAIL ADDRESS FOR ALL AUTHORS, if possible, but at least one author who will then receive all communications.
6. All deadlines are firm. Exceptions will be made only for true emergencies or extraordinary circumstances.
7. All final manuscripts not forwarded by Email must include a disk copy in MS Word 6.0 (or later) format.

Submission Deadlines

1. Manuscripts/Manuscripts:  
   October 1, 2000
2. Decision Notification:  
   November 20, 2000
3. Final Papers Due to proceedings editor:  
   January 8, 2001

Final papers are limited to 8 single-spaced pages except for posters, which is limited to four, in addition to the reduced copy or photograph of the posters.

Submission Addresses

Email Address

Submission by email attachment is strongly preferred. office@ahrd.org

Do not send duplicate manuscripts. If an email submission does not go through, you will be given time to submit a faxed or mailed copy of the manuscript. Manuscripts sent as email attachments should specify the word processing format.

Social Responsibility of Human Resource Development: How Our Definitions and Worldviews Impact Our Leadership Role

Timothy G. Hatcher
University of Louisville

Ann K. Brooks
University of Texas at Austin

Whether or not HRD should assume a leadership role in social responsibility has not been seriously or rigorously addressed in related literature or in professional dialogue. Examining the issue of social responsibility and HRD as a profession and occupation demands that we examine the assumptions underlying our fields' particular use of the disciplines of economics and psychology and to explore more socially responsible alternatives. In addition, this dialogue includes a critical and unorthodox look at how we define our field, how we define social responsibility, and how we view the world.

Keywords: Social Responsibility, Professional Responsibility, Professional Ethics

A profession is differentiated from a collection of skills or an occupation by certain shared characteristics. These characteristics include extensive intellectual knowledge and the provision of products and/or “services which are important to the organized functioning of society” (Callahan, 1988, p. 26). Human resource development has recognized, albeit unendorsed, collections of competencies that identify extensive intellectual knowledge. What the discipline of HRD has yet to acknowledge and resolve is its fundamental responsibility to society.

The way we view reality colors the way we see and understand the field of HRD and the breadth and depth of our leadership in social responsibility. Discussions are needed to critically assess certain taken-for-granted worldviews in which HRD is embedded, and thereby enhance the likelihood that as a profession we will act consciously on issues of social responsibility. Although as a multidisciplinary field, HRD draws on many disciplines, economics and psychology have been particularly influential. Thus, the purpose of this paper is to critically examine the assumptions underlying our field’s particular use of the disciplines of economics and psychology and to explore more socially responsible alternatives.

Defining Social Responsibility

Being socially responsible as HRD professionals has two possible meanings. The first, a rational economic one, says that we have no moral responsibility beyond helping our own organization increase profits. Because rational economics is presumed to be morally neutral and human beings to be either amoral or immoral without outside control, morality is enforced through laws, contracts, and rules. The second meaning says that we do have a moral responsibility to address the needs and problems of the larger communities as well as those of our own organization. Morality issues from an understanding of the interconnectedness of all entities in the world and beyond. The first meaning, a rational economic one, implies that organizations are bounded entities dedicated to increasing profits through interactions with other bounded entities in society. The second is more fluid and suggests that the realities we construct and the boundaries we set are artificial, and we cannot profit if others do not profit, as well.

To be socially responsible within the rational economic worldview requires that we either justify what appears to be a moral action taken beyond the bounds of our own organization as “good for business,” or take the radical step of going beyond the walls of our organizations to include stakeholders with no direct link to what we do. The first is reflected in the tax deductions allowed both organizations and individuals for philanthropic contributions and the current appearance of philanthropic foundations sponsored by high technology companies such as Microsoft and Dell in order to improve their corporate image. Similarly, we regularly see advertisements by oil and tobacco companies showing us how the “care” for either the environment or our children. One way HRD professionals have acted with concern for the bottom line and in a socially responsible manner has been to contribute to education improvement and recruitment of diverse groups. However, many of the community issues that require attention are
not directly linked to a company’s bottom line. Devoting time and resources to them as HRD professionals within an organization cannot be justified in terms of rational economics. For example, companies have been little concerned with the Earth’s atmosphere, and little rational justification related to the bottom line exists for HRD professionals to address that issue. We have little wonder that social responsibility for organizations and HRD professionals currently seems to be either calculated or cynical or a fringe preoccupation.

The second meaning of social responsibility suggests that a profession such as HRD does have a responsibility to communities beyond its employing organization’s boundaries. It implies that organizations and professional groups are social institutions and have a social contract with society. Social responsibility under this precept suggests that HRD has “a moral obligation to use their resources for the common good as well as obligations to particular groups such as stakeholders, consumers, employers, clients, and creditors” (Tomer, 1994, p. 128). In this worldview, we construct reality with each action we take, all living and non-living entities are interconnected and interdependent, rationality is holistic and nonlinear, and each of us (like organizations and communities) are defined by our relationships. Morality issues from recognition of our fundamental interdependence.

Defining HRD in economic and psychological terms

As a multidisciplinary field, HRD is influenced not only by societal needs, but also by several underlying disciplines; namely, economics, psychology, general systems, ethics, and sociology, among others. Arguably, most of the organizations in which HRD professionals work are economically-driven, meaning that HRD itself is infused with the economic/capitalist ethos of what Peter Drucker calls a post-capitalist society (Drucker, 1993). Historically, the discipline of psychology has been capitalism’s handmaiden in developing ever-better ways to adapt employees to this economic/capitalist worldview.

Economics

Even with the ubiquitous nature of economics, HRD researchers and practitioners have not embraced it as a basis for research and practice in ways that would benefit organizations and the HRD field (Passmore, 1997). Few scholars or practitioners, if any, have made any attempt to study the relationship between economic theory and HRD research and practice or to apply economic theory to research and practice. The taken-for-granted economic belief system of HRD professionals is that the purpose of HRD interventions is to provide financial benefit to the organization, people are economic capital, and organizations are economic entities (Swanson, 1999). This economic ideology is consistent with neoclassical economics or free-market capitalism.

Neoclassical economics explains the free-market capitalist system and suggests that “starting from zero consumption, people will strive to consume goods and services without limit (Burk, 1994, p. 315). However, in a finite system there are always limits. Scarcie resource economic theory implies that “decision makers choose between options based on their forecasted return on investment (Swanson, 1999, p. 13). The problem is that most decision makers in organizations today do not understand or acknowledge that organizations are “not only engines of economic growth but also pivotal agents of social and political integration” (Tichy, McGill & St. Clair, 1997, p. 28). Thus, decisions are made using myopic economic models that wreak havoc on the environment and have been linked to violence in the workplace. The brilliant economist E.F. Schumacher said that the modern economic system was a “path to resource depletion, environmental degradation, worker alienation, and violence (Schumacher, 1979).

The current discontent with privileging economics over human and social issues is exposing the weaknesses of neoclassical economic theory as well as limitations of a rational scientific worldview. Both the ideology of capitalism and the culture of consumerism need to be fundamentally reassessed (Welford, 1995; Hatcher, 1999). Based on exploitation of valuable and non-renewable resources and characterized by individualism rather than collectivism orthodox, short-term and linear economic models fall short when addressing systemic societal and global environmental dilemmas. “Long-term results cannot be achieved by piling short-term results on short-term results (Drucker, 1993, p.80).

Traditional capitalist economies are mechanistic, static, and atomistic and view technical growth as the way to make our resources endlessly sustainable. The ability of the environment to continue to support life is increasingly undermined by the same neoclassical economic approaches subscribed to (consciously or unconsciously) by most HRD professionals. The obstacles preventing sustainability, i.e., depletion of natural resources, increasing population, workplace violence, and environmental degradation, show little sign of diminishing. The awareness of the planetary life support system’s deterioration is forcing the realization that decisions made on the basis of short-term economic criteria can have far-reaching and disastrous results. The
The challenge is to strengthen the interdependence between economic development and environmental and social sustainability by creating a profession that actively addresses the obstacles preventing sustainability. HRD has the opportunity to become such a profession.

Psychology

The field of psychology has provided the basis for much of the HRD field. Behavioral psychology spawned competency-based training and behavioral and performance objectives, psychologist Kurt Lewin's input/output model of organizational change and psychoanalytic and Gestalt theories dominated organizational development, and developmental psychology provided a foundation for career development.

However, psychology itself does not provide a sparkling model of social responsibility. It has a history of strong commitment to the tenets of scientific rationalism and is only now reassessing the serious limitations of its historical alliances, alliances that were themselves established in order to gain legitimacy as a scientific field and secure prestige and funding for research. The result of selling itself to the highest bidder has meant that the field has used its skills to further the interests of society's dominant groups and often failed to act on behalf of those who are oppressed. Clinical psychology pathologized those who fail to conform. Organizational psychology medicalized dysfunctional organizations and learning psychology problematized recalcitrant learners. Developmental psychology took male Harvard undergraduates as the norm and categorized those who were different as less developed.

Much of this history has been blindly incorporated into HRD practice in the name of increased efficiency, management development, job skill inventories, competency-based training, career ladders, motivational tools, performance appraisals, organizational diagnosis, and even team-building and some kinds of action research. In fact, even when we step outside our organizations and look back, we still focus on our own well-being and ask questions such as "Is revenue up or down, how are products/services being improved, and how do customers feel about the company" (Weisbord, 1987, p. 7).

Emerging psychological theory begins to erase the boundaries between the social science disciplines. It emphasizes the inseparable nature of individual and society (Bruner, 1996; Gergen, 1994), the ways in which we use narrative to construct our realities (Bruner, 1985), the ways in which we define ourselves by our relationships (Mitchell, 1988), the co-construction of ourselves and our understandings of reality (Gergen, 1994; Brooks & Edwards, 1997), and the increasingly complex cognitive demands our environment places on us (Kegan, 1994). All of these theories support an increasingly systemic view of our world and us. They ask that we take responsibility for the world beyond our organization, and recognize that with each interaction we have and each action we take, we are co-constructing a new organization. They require us to take a perspective and develop the ability to enact our professional skills in a way that is non-linear and non-reductionistic. Does competency-based training develop people who can understand their interdependence with others? Does diagnosing organizations encourage us to focus on our interrelatedness with our environment or the project of self-perfection? Does a career ladder allow us to think about employment as a social issue or as job posting and succession planning within our organization? With a new understanding of interrelatedness and existential choice, psychology has engaged the possibility of diminishing the isolation of individuals within Western society and establishing a basis for responsible social action.

With psychology's leap forward, HRD can interact with a discipline that provides theoretical clarity for carrying out an everyday practice that is socially responsible. HRD not only can, but also should lead organizations to an ever-deeper understanding that social responsibility is no longer a financial burden, but a necessity for survival.

Impact of Worldviews on HRD

Taking for granted the rational scientific assumptions of rational economics and a traditional psychology has made the lens through which HRD sees both reductionistic and predictable in a variable and limitless world. The importance of viewing HRD diverse worldviews including logical positivism, critical theory, hermeneutics, and systems thinking or deep ecology, for example (Capra, 1996), requires further discussion. The discussion of at least two of these worldviews, logical positivism and systems theory, should help justify HRD's role as a leader in social responsibility.

20 Town Forum
Logical Positivism

Logical positivism is a philosophy with an "extremely positive evaluation of scientific methodologies (Lincoln & Guba, 1985). As a worldview for a profession such as HRD, it limits our approach to individuals, organizations, and even societies to one of control, efficiency, rule-based predictability, two-dimensional thinking, anthropocentric-orientation, and cause-effect relationships. Capra (1996) writes that logical positivism is an "outdated worldview, a perception of reality inadequate for dealing with our overpopulated, globally connected world" (p. 4). Although positivism is arguably the dominant worldview of business and industry today, Lincoln & Guba (1985) describe it as a worldview that is "passe...and is the product of small, confused minds who retreat to it because they lack any other viable alternatives" (p. 24).

Positivism has two consequences: determinism and reductionism. Both are negative to professions like HRD and unfounded as a viable way of seeing today's world. Determinism negates human free will to change social mores and networks or establish new social interconnections. Reductionism makes all phenomena, including social responsibility, subject to a single set of laws (Lincoln & Guba, 1985).

Logical positivism has an important impact on HRD's role in social responsibility. First, when we choose to view our reality as deterministic, we negate our ability to regenerate and legitimate our profession and our society. When we believe that there is a single tangible reality that can be reduced to a series of parts to be studied independently, and that the whole is simply the sum of those parts, we are unable to grasp the utter simplicity that our profession is part of society. Similarly, when we are unable or unwilling to accept our part in the web of life, we are sentencing our profession to second-class status as the slave of a paternalistic and contemptuous economic/management system. A system that is dedicated to profit at any cost is blind to the disastrous affects that uncontrolled capitalism is having on our social and ecosystems and ultimately, the capitalist organization itself (Fox, 1994; Capra, 1996; Hatcher, 1999).

Systems Theories

Unlike logical positivism, a worldviews that HRD professionals may not be as familiar with, but that allow us to change our frame of reference (Kuhn, 1962) are systems theories. General systems theory, for example, is defined as "an important means of controlling and investigating the transfer of principles from one field to another" (Bertalanffy, 1968, p. 84). Many systems theorists suggested that organizations and societies are complex, three dimensional, cosmological, open systems with interdependent subsystems working together to achieve the goal of the whole system (Capra, 1996; Wimbiscus, 1995). Yet, compared to rational economics, general systems theory is a relatively modest body of knowledge (Swanson, 1999).

Recent concerns with the relationship between organizations and environmental degradation have illuminated the relevance of related and contemporary systems theories such as autopoiesis or self-regulating systems (Maturana & Varela, 1980), deep ecology (Capra, 1996), and the Gaia hypothesis (Lovelock, 1979, 1988). We will discuss each systems theory briefly.

Autopoiesis, also known as self-regulating or self-producing systems, is concerned with two hypothesis: first, all living systems are organized in a closed circular process, and second, all living systems are cognitive systems, and living is a cognitive process (Maturana & Varela, 1980). Behavior in the physical domain is governed by physical laws while behavior in a social system is governed by norms and rules which can be broken (Capra, 1996). Luhmann (1990) developed the concept of social autopoiesis as a process or network of communication. Since social systems are language-bound, i.e., symbolic, they are self-produced by non-physical boundaries of expectations, loyalty, confidentiality, and so on (Capra, 1996). This system's worldview implies that organizations and societies are living systems and as part of the physical world are self-regulating and thus capable of continual change while preserving a pattern of organization.

Capra's concept of deep ecology is a broad-based, holistic worldview: a way of seeing the world as an integrated whole rather than a detached collection of parts. "Deep ecological awareness recognizes the fundamental interdependence of all phenomena and the fact that, as individuals and societies, we are all embedded in (and ultimately dependent on) the cyclical processes of nature" (Capra, 1996, p. 6). Thus, humans, communities, organizations, and societies are simply strands in a "web of life" (Capra, 1996, p. 7).

Perhaps the most comprehensive and enchanted example of systems theory is Gaia, the notion that the planet Earth is a living system. Gaia is an ancient and organic, Mother-Earth metaphor, "drawn from the process of life"; mechanistic thinking depends on metaphors drawn from man-made machines (Sheldrake, 1991, p. 13). Gaia as a mother earth metaphor is evidenced in cultures worldwide. Mother Earth was accepted as a sacred belief until the Protestant Reformation in the sixteenth century when humanity's fear of wild, untamed nature reinforced its desire to
subdue Mother Nature. A world view where nature was no longer acknowledged as Mother or sacred, and no longer considered alive, finally evolved out of the desacralized scientific and industrial revolutions. Shifting focus from ecosystems to the planet as a whole, Gaia is a system of three layers (metaphorically): (a) Earth's biosphere, a thin layer of living things; (b) the inanimate Earth itself, and (c) a protective layer of atmosphere surrounding the biosphere. Gaia is considered autopoietic, i.e., it is self-bounded, self-generating, and self-perpetuating (Capra, 1996).

Systems theories have evolved from a mechanistic general systems theory to the organismic philosophy of Gaia. Mechanistic science rejects the idea that Gaia is alive, yet "morphogenesis, instinctive behavior, learning, and memory are still among the unsolved problems of biology, and the nature of life itself remains an open question" (Sheldrake, 1991, p.157). Unlike scientific systems thinking, Gaia reflects the fact that humankind's actions cannot be separated from the Earth, and like the Great Mother of ancient mythology, that Earth has a reciprocal aspect that cannot be ignored.

Our worldviews must begin to reflect contemporary needs for explanations that are applied, holistic, social, and ecologically benevolent. Wheatley (1994) suggested that "if nature uses certain principles to create her infinite diversity, it is highly probable that those principles apply to human organizations" (p. 143). Modifying theories and our worldviews without concurrent shifts in practice seals the fate of HRD as a second-rate discipline and most certainly obscures its role in enhancing corporate social responsibility. Continuously reviewing, revising, and utilizing economic and psychological theories and diverse worldviews that affect the ability of HRD to play a decisive role in building a sustainable future is both judicious and moral. Human resource development as a field of study and a profession should always reflect only those theories and worldviews that can truly enhance its ability to create a better world for individuals, organizations, and society.

Summary and Conclusions

Organizations significantly and continually influence humanity and acquire dominance over ecosystems. The way organizations view their contributions to society and the planet must be fundamentally changed to cultivate a chance for a sustainable future. "Organizations have to take social responsibility. There is no one else around in the society of organizations to take care of society itself. Yet they must do so responsibly, within the limits of their competence, and without endangering their performance capacity" (Drucker, 1993, p.97).

Human resource development as an organizational function and as a stand-alone profession plays a principle role in enhancing the long-term sustainability of organizations and has the potential to help cultivate organizations and people that positively influence communities, society, and the environment. The influence that economic and psychological theory have had on HRD and the worldviews that have influenced HRD require review and re-definition so that we might clarify and better understand our potential contributions and responsibility to society.

Today, society must be served through organizations. As organizations become more influential they become either instruments of destruction of the environment and society or tools for sustainability of communities, the ecology, and humanity. As an integral part of today's organizations, human resource development has an economic responsibility to the organizations who employ its professionals and methods and the HRD profession has a moral responsibility to individuals, organizations, and societies it influences. But, as discussed herein, HRD also has a responsibility to create a profession that is responsible beyond shortsighted economic gain. Rational economic and traditional psychological theory and obsolete worldviews are faithful to short-term returns and disjointed approaches to sustained change. Such theories hamper socially responsive organizational and societal changes. "There could be no greater folly than to manage the economy as though its sole relationship to earth is that of exploiter – as though the earth could be viewed as a fund of resources and a dumping ground for that which no longer serves us" (Harman & Porter, 1997, p133).

Shifts in the way we view our world (reality) are catalysts for progress toward sustainable development of the environment and humanity. Applied disciplines such as HRD must systematically review its assumptions about the world to ensure their validity and worth.

Human resource development professionals and academics who respond to the challenge of social responsibility will prove in the long run most successful not because it is simply the right thing to do but because "..... if we take care of the societal bottom line, the conventional bottom line will probably take care of itself. When an organization adds value to external clients and society, it will also likely add value to itself and its shareholders" (Kaufman, 1997, p. 3). Finally and ultimately, not to do so guarantees the eventual destruction of the Earth.
One final thought on the HRD profession assuming a leadership role in social responsibility. As implied earlier in this paper, some HRD professionals believe that just because we ought to do something does not mean we can do it. We must logically be able to perform an action. We all want to rid our society of poverty and crime and heal the environment, but given limited resources and abilities, we are not obligated to perform actions beyond our physical or mental abilities. Thus, we choose to delegate our responsibility to a “third party” such as the government or social institutions. This is a logical positivistic argument that results in limited and obviously questionable outcomes. It also assumes that we have no social responsibility because we are not morally culpable and social problems are not moral problems. There are several inconsistencies with this approach to social responsibility.

First, in the case of moral responsibility, “no delegation occurs because no person is excluded from the relationship” (French, 1988, p. 266). Using systems thinking previously discussed we are morally responsible because we are moral entities and are interconnected. The next inconsistency is that the act of delegation implies intention to be responsible. As collections of individuals with particular physical and mental properties, professions can be morally and thus socially responsible. This ascribes a certain level of singular intent that many would not ascribe to collective entities. However, we believe that, as a profession we have a collective conscience that manifests itself within the skills, knowledge, abilities, attitudes, culture, experiences, and spirit of the individuals who collectively make up the profession of human resource development. This conscience provides the catalyst for leadership in social responsibility.

Openness to Technology in Virtual Teams: Implications for International Human Resource Development

Mary R. Watson
Leigh Anne Liu
Vanderbilt University

This study examines three levels of analysis--national culture, group identity, and individual—in the prediction of attitudes about and use of technology in global virtual teams. Using data from 520 subjects in six countries, we present validation results of an openness to technology scale, and examine a multi-level model of attitudes about technology. We find different predictors for individualist versus collectivist cultures, and we discuss implications for managing global virtual teams.

Keywords: Virtual Teams, International HRD, Technology

Fueled by a simultaneous explosion in new media technology to support cross-national communication and human resource development interventions, global corporate internet and intranet communications are commonplace (ACM, 1996; Hoffman, Kalsabeek, and Novak, 1996). Geographically dispersed virtual teams operate in most major multi-national corporate settings. Yet little is known about the cross-cultural communication differences among team members with different national culture backgrounds (Watson, Miguel, Aycan, and Jaeger, 1998; Gomez-Mejia and Palich, 1997). The purpose of our research is to validate an instrument designed to examine cultural differences in communication norms when virtual team members communicate via internet technology.

We begin by presenting a conceptual framework that links cross-cultural differences with communication theory. We then present the validation results of confirmatory factor analysis on an openness to technology scale developed earlier (Watson et. al, 1998). Next we turn to discussion of findings about attitudes about technology of more than 500 subjects in six nations. Then we explore the cultural generalizability of predictors related to our instrument. Finally, we discuss the implications of our results for human resource development in corporations using internet technology for global employee communication.

Theoretical Framework

Classic communication theory has a long history of examining how the communication medium impacts the way signals are sent, transmitted, and received. In recent years, a large body of empirical studies housed in the information systems literature has examined how communicating via electronic media impacts communication behavior (e.g., Jackson, Chow, and Leitch, 1997; Ferguson and Nevell, 1996). The channels studied range from the relatively simple and widely available electronic mail, through more complex and expensive media like simultaneous satellite live videoconferencing. In general, the array of contemporary electronic technology available is referred to as new media.

The process by which adoption of technology occurs has been studied at the industry, firm, group, and individual levels. We blend an institutional theory perspective (DiMaggio and Powell, 1983) with a social psychological attitudinal change perspective (Fishbein and Ajzen, 1975) and suggest that isomorphic effects occur that lead to the diffusion of perceived acceptability of technology across levels. Further, positive individual experiences with technology will lead to increased acceptance of technology. Thus, increased diffusion across both the macro and micro levels occur simultaneously.

The conceptual framework we examine is depicted in Figure 1. This model brings together concepts from multiple levels of analysis – the national culture level, the organization level, and the individual level.

Cultural Dimensions. In high uncertainty avoidance cultures, things that are unknown or different are perceived as dangerous, and innovation is resisted (Hofstede, 1991). In these cultures, uncertainty leads to stress and anxiety, and ambiguous situations are to be avoided. Conversely, those in low uncertainty avoidance cultures perceive new and different things as curious, and uncertainty is accepted.

Copyright © 2000, Mary R. Watson & Leigh Anne Liu
Hofstede (1980) and Gudykunst (1995) suggest that effective interpersonal and inter-group communication is a function of the amount of anxiety and uncertainty individuals experience when communicating with others. Gudykunst (1995) found that the ways individuals gather information to manage and reduce uncertainty differs in individualist and collectivist cultures. Members of individualist cultures seek out person-based information to reduce uncertainty about strangers, while people from collectivist cultures look for group-based information. When communicating with strangers, members of individualist cultures search for personal similarities while members of collectivist cultures are more likely to search for group similarities.

Figure 1: Multi-level Model of Predictors of Attitudes about Technology

According to Hall (1976), members of collectivist cultures emphasize the importance of context to explain others' behavior. Under uncertain situations, adapting and accommodating to the context is more important for members of collectivist cultures than to those of individualist cultures to manage the uncertainty. Using new media technology to communicate with people around the world brings more uncertainty to members of collectivist cultures since it is difficult to build groups and to access the physical communication context of others. With respect to the use of new technology, this leads us to the following hypotheses:

Hypothesis 1a: Those in low uncertainty avoidance cultures will be more open to the use of technology than those in high uncertainty avoidance cultures.

Hypothesis 1b: Those in individualist cultures will be more open to the use of technology than those in collectivist cultures.

Group/Organization Level Characteristics. Cultural identity groups are based on a wide variety of group-level characteristics: organization identity, cultural identification, professional norms, etc. Research on organizational culture (Schein, 1975), for example, finds that organizations vary from strong to weak cultures, and individuals within organizations tend to identify with organizational norms and with one another.
Yet there is debate about the homogeneity of organization members’ attitudes. Joanne Martin’s (1992) work divides culture into three perspectives: integration, differentiation, and fragmentation. Depending on the perspective taken, individuals in organizations are both similar in attitudes as well as different. The integration perspective, embraced implicitly by the person-organization fit literature (O’Reilly, Chatman, and Caldwell, 1991), suggests that consistency holds together organization members. The differentiation perspective allows for inconsistency across organizations, with subculture similarities (e.g., VanMaanen and Barley, 1985). Finally, the fragmentation perspective embraces a loosely coupled web of fluid and multiple meanings, with fluid identities adapting continuously as needs change (a perspective embraced by Weick, 1976).

Nonetheless, there is evidence that group identity differences do exist, and that across formal organizations attitudes are likely to be different. These cross organization differences are likely to be moderated by norms of subgroups, like professional norms. This leads to the following hypothesis about groups and new media technology:

Hypothesis 2: Across organizations, attitudes about technology will differ, and the extent to which they differ will vary depending on the strength of professionalism moderating the organizational differences.

Individual Differences. Individuals differ in both surface-level and deep-level dimensions (Harrison, Price, and Bell, 1998). Research on relational demography has investigated how surface level characteristics, like race and ethnicity, impact individual behavior (e.g., O’Reilly et. al, 1991). Deep level differences, like attitudes and values, have also been widely investigated. Attitudes and values have been linked to prior experiences with phenomena.

One key demography characteristic extensively investigated in the technology adoption literature is gender. Numerous empirical studies have examined the relationship between gender and attitudes about technology. In general, men have been found to be less anxious about technology and more likely to use it (e.g., Gefen and Straub, 1997; Gattiker and Hlavka, 1992). This leads to the following hypothesis about gender and new media:

Hypothesis 3: Men, as compared to women, will hold more positive attitudes about technology.

As with all multi-level phenomena, cross level interactions will exist across levels. We posit that all predictors may not be uniformly relevant across cultural settings. This leads to the following hypothesis:

Hypothesis 4: There will be an interaction effect between national cultural and group and individual dimensions, reflected by differing predictors of attitudes about technology depending on cultural type.

Methodology

Research Participants. The findings presented here are based on two sets of data collected from an internet-based discussion forum that linked more than 500 undergraduate and graduate students at seven universities in six countries (Canada, Israel, Turkey, Thailand, United States, The Netherlands). Participants took part in the internet based project as part of their course requirements.

First, the research team developed an instrument to measure attitudes about using computer technology (Watson et. al, 1998). Next, we collected data from 520 participants working in geographically dispersed virtual teams. We measured their attitudes about technology before and after a seven-week project (change in attitude data not shown here) in which they were required to participate in global teams. The results from our analyses support the validity of our technology attitudes instrument. Furthermore, they provide insight into how the cross-cultural differences of geographically dispersed team members impact their attitudes and satisfaction with internet technology.

Openness to Technology Scale. We validated a 40-item scale developed by Watson and colleagues (1998), designed to capture cognitive (e.g., I know what a LAN is), affective (e.g., Getting error messages makes me anxious), and behavioral components (e.g., I word process regularly). Cronbach’s alpha for the 40-item scale was a very acceptable .86 overall.

As part of a prior research project, exploratory factor analysis was conducted using principal components extraction. Three factors emerged in our analyses: comfort with computers, technical knowledge about computers, and perceived value of computers (variance explained = 41.35%). All the sub-scales demonstrated high internal validity (Cronbach’s alpha ranged from .65 to .93). Sample items from each factor appear in Table 1.
We validated this scale through confirmatory factor analysis on a separate data collection of 320 virtual team participants. Both sets of analyses support the validity of the openness to technology scale, specifically the replication of the three factors (comfort/experience, knowledge, and perceived value).

Results and Findings

Hypothesis 1a suggested that those in low uncertainty avoidance cultures would hold more positive attitudes about computers than those in high uncertainty avoidance cultures. In the first study, we grouped our respondents based on uncertainty avoidance scores reported by Hofstede (1991). Consistent with our hypothesis, respondents from the low uncertainty avoidance (Canada/US) group reported more openness to technology in both the pre- (p<.001) and post-tests (p<.002) than respondents from the high uncertainty avoidance (Turkey/Israel) group.

Hypothesis 1b suggested that those from individualist cultures would be more open to technology use than those from collectivist cultures. In the second study, we grouped respondents based on individualism and collectivism scores reported by Hofstede (1991). Consistent with our hypothesis, those from individualist cultures (US/Canada/Netherlands) reported more openness to technology than did those from collectivist cultures (Thailand/Turkey).

Hypothesis 2 posited that across organizations, attitudes about computers would likely differ, but that those differences would be greater or lesser depending on the strength of professionalism. We ran analyses comparing the six universities on all technology subscales and detected no significant differences. We concluded that professional norms among universities were stronger than university identity differences, leading to a non-significant effect.

Hypothesis 3 suggested that men would have more positive attitudes about technology than women. Consistent with this proposition, we found that men reported more comfort with computers (p<.01) and more technical knowledge (p<.002) than women. Overall technology scale scores were also significantly higher for men than for women.

Hypothesis 4 posited that there would be different predictors across cultures for the successful use of technology. A Chow test on the differences between individualist and collectivist cultures resulted in significant scores (F=2.3 and p<.05). Figure 2 and Figure 3 depict the different predictors for individualist and collectivist cultures respectively.

Discussion

In the present study, we sought conceptual understanding and empirical testing of the multi-level model of predictors of attitudes about technology across cultures. We used our data in the aggregate to validate our attitudes about technology scale. Our results support all our hypotheses at the culture level (significant findings for uncertainty avoidance and individualism), group level (non-significant findings for university), and individual level (significant findings for age and gender).

We also posited that predictors for our model of attitudes and behavior would differ based on meta-culture type (e.g., Hofstede's individualism dimension), following existing theory in cross-cultural communication style differences (Hall, 1976; Hofstede, 1991). Consistent with our predictions, the results indicated that there are different predictors for attitudes about technology between individualist and collectivist cultures (see Figures 2 and 3). Because of space limitations, we highlight here only a few variables we explored.

Socioeconomic elements may explain some difference in the predictors of using technology because of the relatively higher level of industrialization and modernization of individualist cultures, versus the relatively lower levels in collectivist cultures. Although our data comes from only six countries, there is evidence that these relationships hold across the individualism/collectivism dimension. For example, Low (1996) argued that socioeconomic issues create a dilemma in balancing the need to be competitive and efficient through applications of information technology in Asia. Goonasekera (1990) suggested that the introduction of modern communication technology to Third World societies has resulted in the sudden and rapid increase of "social density" or social relationships by bringing to the consciousness of individuals issues and personalities outside their immediate experiences. She reported "...(some societies) have resulted in the emergence of a heightened individual self-identity in order to understand and give meaning to new and unfamiliar situations created by the new media" (p.34).

In our current study, in collectivist cultures (Turkey and Thailand) coming from an urban home is a significant determinant of successful use of computer technology. This is likely because urban areas in these collectivist cultures are more exposed to modern technologies and related information, thus holding more similar socioeconomic access to technology as the individualist cultures. In our data, urban home was not a significant predictor of successful use of technology in individualist cultures (United States, Canada, the Netherlands). We suggest that within country dispersion of advanced technology is greater in these individualist cultures.

Other factors that influence successful use of computer technology may include time pressure, infrequent terminal access, unfamiliarity of the communication protocol, and lack of command of English in non-English speaking countries. One of the most exciting findings of this study is that in collectivist cultures, familiarity with foreign languages significantly predicts the successful use of computer technology, while in individualist cultures this variable is not a predictor. Besides socioeconomic elements that lead to exposure to international culture and languages in collectivist cultures, English has been dominating the world of the Internet and computer programs. However, it is not the official or working language for most collectivist cultures around the world. Thus we find that in collectivist cultures the ability to speak multiple languages (especially English) predicts successful technology use. In individualist cultures, where English is widely spoken, multiple language facility is not a significant predictor of successful technology use.

Some seemingly simple variables created even more complex outcomes. For example, we found cultural differences in the way in which subjects expressed their comfort or discomfort with technology. Although there was a significant relationship between age and comfort in both culture types, subjects in individualist cultures expressed their comfort with technology in positive terms (e.g., I enjoy working with machines), while subjects in collectivist cultures expressed these feelings in terms of discomfort (e.g., Computers make me uncomfortable). The explanation for this difference may lie in different styles of managing uncertainty across cultures. Members of collectivist cultures depend more on group and context to reduce uncertainty, which is difficult or impossible while using computers to communicate with distant strangers. Therefore, they would likely express discomfort with the uncertainty created by the technology. Members of individualist cultures, on the other hand, communicate more personal and individual information to manage uncertainty. Since this type of information is more readily available via technology, and since members of individualist cultures have a lower need to avoid uncertainty (Hofstede, 1990), they are less likely to express their comfort in negative terms that reflect some of the uncertainty they feel unable to manage.

What is particularly striking about our overall findings is that the number of predictors for individualist cultures is greater than the number of predictors for the collectivist cultures (as indicated visually by the greater number of significant relationships indicated in Figure 2, versus Figure 3). One puzzling result of this study is that for collectivist cultures, none of the factors on attitudes about technology are significant predictors of successful use of technology, and there are fewer predictors for the factors than in individualist cultures. The reason may be
because most of the cross-cultural communication and technology management theories and research designs are the result of works by social scientists from western and individualist cultures. Future research could explore the perspectives and relevant predictors from a collectivist cultural perspective.

Implications and Contribution to HRD

This study gives us new insight into cross-cultural communication as it occurs in global virtual teams. This insight makes a unique contribution to the field of human resource development because it empirically examines an issue critical to the success of the human resource development profession in the new millennium -- application of technology in a global context. Our data sample, representing over 500 participants in six countries, is unique in its size and scope. We present data from individuals actually working in global virtual teams, and thus the findings can be readily interpreted for use in organization settings.

Human resource development professionals interested in facilitating successful global virtual teams need to be particularly sensitive to cultural communication differences as they will impact the ways in which team members communicate. Further, they need to be aware that there are different predictors of successful use of technology based on cultural background. Training may be needed to address culturally bound attitudes about technology in order to facilitate positive technology use. Further, the design and delivery of such training needs to be done in a culturally appropriate way, one that is sensitive to feelings of self-efficacy about using technology (Christoph, Schoenfeld, and Tansky, 1998). We recommend a cross-national training team, like our own research team, in order to best address the differences through a variety of cultural lenses, and to promote global understanding and tolerance.

This study is simply a starting point for research on global virtual teams and the cultural differences that underlie their efficacy. We encourage further research in this area, particularly by practitioners who have access to global virtual teams operating in current business practice.

Towards a Framework for Teaching and Learning in an Online Environment:  
A Review of the Literature

Saundra Wall Williams  
North Carolina State University

The problem addressed in this paper is the lack of theory specifically related to teaching and learning in an online environment. Through a literature review and analysis, two significant teaching and learning theoretical paradigms are presented. It was concluded that the integration of these two approaches will allow for the emergence of new theories that focus on teaching and learning in an online environment.

Keywords: Online Teaching, Behaviorism, Constructivism

Human Resource Development (HRD) curriculums in academic institutions are currently being impacted by two major factors: the Internet and the growing demand for courses via the Internet. These factors have come about due to the societal move from an industrial age to an information age. This shift has caused adults to use the Internet at a continuous pace for professional, personal, and educational purposes (Eastmond, 1998). With the advances of the technology and software surrounding the Internet, the conversion of courses from traditional face-to-face into Web-based courses has become easier and is occurring more systematically in education (Jiang & Ting, 1998). HRD faculty in higher education have also moved toward the use of the Internet to deliver training and development, organizational development, and career development courses online.

Although teaching via the Internet is growing at a steady pace, the current literature on Web-based courses focuses primarily on the technical processes of design or the differences in outcomes for learners who participated in face-to-face instruction versus those who participated in a course via the Internet. With the expansion of Web-based technology in all areas of HRD, it is evident that it is time for research in Web-based teaching and learning to expand farther than the popular comparison studies of learning outputs (Russell, 1997; Johnson, Aragon, Palma-Rivas, Shaik, & Bilsbury, 1999).

Although research in the aforementioned area is necessary, there should also be research dealing with the learning theories that conceptualize teaching and learning in an online environment. There must be attempts at theoretical explanations for Web-based or online teaching and learning in order for professionals that teach via the Internet to make teaching and learning decisions with confidence. Until recently these theoretical considerations were not addressed. Research in these areas will give HRD faculty their purpose for teaching in an online environment, help to categorize learners who take online courses; define the role of the teacher in an online environment, and define appropriate methods that can be used in an online teaching and learning environment.

The purpose of this literature review was to determine the theoretical framework for teaching and learning in an online environment. Because theory suggests why events occur in the manner that they do, it is important to begin to link teaching and learning online with current teaching and learning theory. These theories provide a direction to research and practice; hence, it is important for HRD faculty to have a link that will allow them to predict aspects of teaching and learning online. Therefore, the following questions should be asked about online research as educators move into the new century. This review of the literature attempts to seek answer these questions.

- Currently, what are the theories and principles that provide HRD faculty with the most effective methods and strategies of teaching and learning in an online environment?
- Do current theories of teaching and learning supply HRD faculty with a framework of which to develop online teaching and learning activities?

This paper will review the literature surrounding the theory of teaching and learning in an online environment. The purpose of this exploration is to determine the basis of this construct and how it can implicate the instructional design, teaching, and learning process in online educational programs. In order to analyze this application of teaching and learning, bodies of literature from distance learning, teaching and learning theory, educational
technology, and instructional technology were reviewed within the fields of HRD, adult education, and industrial/organizational psychology.

Review of the Literature

Before any research in any area can take place, a review of the literature must be completed. The review of the literature can summarize previous work on the topic and offer suggestions for future research (Merriam & Simpson, 1995). The original purpose of this literature review was not to present results or findings on teaching and learning in an online environment. The original purpose was the same as any literature review as described by Merriam and Simpson (1995). It was completed as a conceptual foundation to a study focusing on instructional design and online teaching and learning. This literature review was to: (1) provide a foundation for building knowledge in online teaching and learning theory; (2) show how the researchers current study on instructional design advances what is already known about online teaching and learning; (3) help conceptualize the study; (4) help provide and define a framework for the methodology for the study; and (5) offer a collect point of reference for interpreting the data that will be collected from the researchers study on instructional design and online teaching and learning. However, as this researcher reviewed the literature on theories of teaching and learning in an online environment, it became apparent, that there were several different views on what current learning theories best fit teaching and learning online.

These differences reiterated the need for theoretical approaches as a basis for instructional practice in an online environment. Numerous decisions concerning policy, finances, and education are being made based on online teaching and learning. Some of these decisions are being made based on experience with traditional face-to-face courses. These decisions are atheoretical, yet they affect thousands of potential students each year. It is this researcher's belief that just as in converting a traditional face-to-face course to a Web-based course requires time and effort, the theories and principles that guide practice in traditional face-to-face instruction can not be directly converted to online instruction.

A discussion of the theory surrounding teaching and learning in an online environment is important because it directly affects the practice of the field. What follows is a synthesis of the major issues and differences found in the literature on teaching and learning in an online environment.

Theory Wars in Online Teaching and Learning: Behaviorism versus Constructivism

A major debate has surfaced about the basis of teaching and learning in an online environment. Of the current theories that support online teaching and learning, behaviorism has historically had the greatest impact. However, more courses are being designed online with the cognitive view in mind. Hence, there are two ends of a spectrum relative to teaching and learning online. That is, some researchers view the behaviorist principles as the most suitable for online learning, while others view the constructivist principles, which has its basis in cognition, as the most appropriate.

Historically, behaviorism methods have been used where students are presented information which they repeat back to the teacher. These methods have been predominant in training and development (Peterson & Cooper, 1999). Behaviorists view psychology in terms of resulting behaviors which can be modified by consequences such as rewards or punishments. Behaviorism was used as the basis for designing early audio-visual materials and was the impetus for many related teaching strategies such as teaching machines and programmed texts. Thorndike’s connectionism, Pavlov’s classical conditioning, and Skinner’s operant conditioning were ideas used to give direction to the early researchers who examined the impact of technology on teaching and learning (Thompson, Simonson, & Hargrave, 1992). Although some researchers believe that there is much about behaviorism that is unattractive to learning, a great deal is owed to those theorists who advocated behaviorist principles in teaching using technology.

The current trend in teaching and learning, tends to be constructivism which is based in cognitive psychology. With this model, students are viewed as active participants and processors of information. Constructivism, which has as its synonyms active learning, adult learning, and self-directed learning, is changing the way educators think about the teaching and learning. Constructivists believe that learners approach a learning task with a set of personal beliefs, motivations, and conceptions about the subject area and the knowledge to be taught (Holmes & Leitzel, 1993). Kember & Murphy (1990) site that when learners are taught, they construct meanings from the material by relating it to their existing conceptions, frameworks, and knowledge. The implications of constructivism on teaching and
learning in an online environment require that teaching methods be selected and implemented that draw on the participant's experience and fosters participation from the participants.

Behaviorism and constructivism have common grounds such as the use of feedback and the importance of assessment. However in teaching and learning situations, the behaviorist wants to take the learner and produce desired behaviors by controlling the environment, whereas the constructivist wants to see how learning occurs. Both these views are important for online teaching and learning. Hence, both these methods are critical to provide a rich teaching and learning climate. The nature of the Internet provides a perfect vehicle to integrate behaviorist and constructivist theories in order to understand the totality of teaching and learning in an online environment.

Behaviorism and Constructivism: A Teaching/Learning Match Made Online

Some researchers would consider it improper to integrate behaviorism and constructivism into a single approach for teaching and learning in an online environment. However, after reviewing the literature on this subject, this researcher takes the risk to conclude that new theories and principles of teaching and learning should be developed for use in an online environment. What are these new theories and how will they affect current practice? Based on the “wars” from the literature, it is evident that new theories and principles may begin to emerge which focus on teaching and learning in an online environment. The figure below shows an equation that should be solved for online teaching and learning.

A New Equation in Online Teaching and Learning

The use of technology as a delivery medium has fostered the integration of current teaching and learning theories; therefore, as researchers it is important to examine the current theoretical literature as it relates to online instruction and learning. In addition, this researcher believes that the philosophies which undergird the teaching and training of adults should be examined as technology may force educators who deliver online courses to merge toward one consistent philosophy of “teaching” online.

Implications for HRD Theory and Practice

“A literature review functions as a means of conceptualizing, justifying, implementing, and interpreting a research investigation” (Merriam & Simpson, 1995 p. 33). Therefore, this literature review shows that it is necessary that additional research be undertaken in determining theoretical bases for online teaching and learning. HRD scholars and practitioners who teach in an online environment must be aware of the possible issues that surround teaching and learning in this medium. Therefore, the conclusions of this literature review lie in the possible questions that can prompt future research in online teaching and learning.

Research Implications.

The major implication for research on this theoretical match is the development of new research areas and the emergence of theories, principles, and applications that are directly related to teaching and learning in an online environment. These implications for research in the area of online teaching and learning are endless. The most
promising areas of research surrounding online learning are the design and development of online learning courses, the evaluation of the instructional design and development process, technological impacts on teaching and learning, online "teaching" competencies, theoretical bases for teaching and learning in an online environment, the impact of online educational programs, and organizational and institutional issues concerning online educational programming. These are just a few areas that will require investigation from researchers as the field begins the new century. Examination of these areas will advance the academic field of HRD by providing new insights about teaching and learning, filling practical and theoretical voids, defining relationships to existing theory, and contribute to the improvement of online teaching and learning.

Practical Implications

The implications for HRD practice lie predominately with instructional design and teaching. Examining a theoretical base for online learning will give those professionals in HRD a sound basis for assessing, designing, developing, implementing, and evaluating online learning materials, courses, and programs. Online teaching and learning strategies and methodologies can be applied to practice when theories and principles are developed for this environment. HRD organizations and practitioners will be able to apply these principles to the development of online programs which can improve practice in all areas of HRD and adult education.

Summary

The Internet has changed the way educators view teaching and learning. The purpose of this literature review was to determine a theoretical framework for teaching and learning in an online environment. What the literature suggests is that an integration of behaviorist principles and constructivist principles may be best suited for online teaching and learning. Although historically the theory which undergirds these principles have not been combined, it is this researchers view that a combination of these principles will create new principles for teaching and learning and will mold online methods and strategies. Hence, a key question for future research has become: will technology force new teaching and learning theories, principles, and models to emerge?

Learning Human Resource Development through Electronic Discussion

Barbara J. Daley
University of Wisconsin – Milwaukee

The purpose of this study was to explore the use of electronic discussion as a teaching and learning strategy for graduate students within a human resource development graduate program. Over 450 student contributions to electronic discussions were analyzed to extrapolate learning processes, group processes and faculty role. Results indicate that learning progressed to a high analytical level during electronic discussion and that group process development facilitated learning as well.

Keywords: Computer Mediated Instruction, Technology, Learning Processes

The delivery of training through on-line courses, web-based instruction, reflector groups, and web-based conferencing is exploding. Yet, research is only beginning to examine the impact this technology has on learning. Previous research has examined instructional design of web-based courses (Braden, 1996), differences between face-to-face teaching and on-line teaching (Russell, 1997), and learning style change in a technology-rich environment (Cohen, 1997). A major question yet to be explored in-depth by the field of human resource development (HRD) is: “What impact do new technological teaching strategies have on the learning of HRD practitioners?”

Often the terms teaching and learning are used interchangeably in every day conversations of faculty and students. When it comes to understanding computer-mediated environments, most often the concept of teaching is explored and the unstated assumption is that good teaching will produce high quality learning. However, following a study of 127 courses housed on the world wide web, Boshier, et. al. (1997) indicate that, “While the web holds considerable potential for learner interaction, few courses use much of its interactive capability. Most courses surveyed offer no possibility of collaborative learning. The chief difficulty was conceptual, not technological. It appears that many, if not most courses, were designed by ‘instructional designers’ obsessed with objectives, assessment of students and arranging things in a hierarchical order . . . the author has uncritically and, in many cases, unwittingly and naively endorsed a transmission model of learning” (p. 340). Thus, as indicated in this study the major focus of faculty using computer-mediated environments has often been on teaching and course design.

Very recently, however, the concept of learning in computer mediated environments has begun to be investigated. For example, Milton, Davis & Watkins (1999) looked at the interactions that occurred within small groups in an asynchronous web-based distance learning environment and found that virtual learning communities developed when there was a fusion of the learning processes and group dynamics. Rheingold (1994) indicated that the potential anonymity of virtual communities contributes to learners feeling that “virtual communities treat them as they always wanted to be treated – as thinkers and transmitters of ideas and feeling beings” (p. 26). Chester and Gwynne (1998) found that two-thirds of the students in an on-line course rated their participation in the subject matter as greater than in a face-to-face course. Holt (1998) analyzed student participation in a national issues forum conducted on the internet for the purpose of studying its effectiveness and analyzing facilitation methods. Holt (1998) described how a multi-stage deliberation process developed that was “largely consistent with the theoretical literature about critical and reflective thinking” (pg. 46). Additionally, this study identified that the discourse developed differently in discussions conducted on the internet versus those conducted by electronic mail. Finally, Milton and Wilson (1999) indicated that “the analysis of these small groups (in a computer-mediated environment) has taught us that the additional dimensions of time and space supported through collaborative technology increase the complexity of the learning and the interdependence of the processes and people involved” (pg. 7). These previous studies indicate a great need for additional information describing the impact of technology on learning processes, learning effectiveness and learning outcomes. The intent of this study was to begin to fill this gap by analyzing learning processes, group processes and teaching processes in courses using electronic discussion.
Conceptual Framework

Constructivist learning theory provided the overall conceptual framework for this study. This framework was selected because, as Merriam and Caffarella (1999) indicate, "two adult education practice arenas in particular where constructivist and situated cognition concepts are having an impact are in continuing professional education and human resource development" (p. 263).

Constructivist learning theory holds that "learners actively construct and reconstruct knowledge out of their experiences in the world" (Kafai and Resnik, 1996, p. 3). Knowledge construction takes place when learners actively construct knowledge through intellectual engagement and investment in personally meaningful tasks. Constructivists believe that individuals learn through their experience and that meaning is rooted in that experience. The key to learning, in a constructivist framework, is for the learner to find multiple ways to link new information to previous experience. Lambert et al. (1995) refer to constructivism as the epistemological processes of knowing and coming to know (p. 17). Within a constructivist framework learners create their own knowledge by how they put their worlds together. In other words, constructivists focus on the connections that the learner is making between ideas. Novak (1998) believes that learning occurs through a process of assimilating concepts into the cognitive structures by either subsuming concepts under each other, by progressively differentiating concepts from each other or by reconciling the similarities between concepts. The crucial element is that the learner actively creates a knowledge base through the linkages and the experiences. "The design task, therefore, is one of providing a rich context within which meaning can be negotiated and ways of understanding can emerge and evolve" (Hannafin, et. al, 1997, p. 109). For this study, graduate courses were designed and implemented from a constructivist framework. Electronic discussion was viewed as a teaching strategy to facilitate constructivist learning.

Research Questions

The purpose of this study was to analyze one component of technological teaching strategies, electronic discussion groups, with an adult student population. The following research questions were advanced to guide this inquiry:

1. In an electronic discussion, what learning processes do adult learners utilize?
2. In an electronic discussion, how do group processes develop?
3. How does the faculty role change when using electronic discussion?

Methodology

Electronic discussion was used as a teaching methodology in four HRD graduate courses offered within a master's degree program in adult education and HRD at a major Midwestern university. Course activities were designed to offer the learner an opportunity to develop knowledge and beliefs related to course content, integrate experiences, and ultimately reflect on and assess their own level of learning. Electronic discussions were used in each course to analyze case studies, discuss course readings, and reflect on learning achieved during the course. Learners were expected to participate in assigned course activities, as well as, in conversations with other course participants. Since the intent of this study was to explore the impact of electronic discussion on learning, a convenience sample of courses using electronic discussion was included in this study. All courses were taught by the same instructor. Two courses employed electronic discussion using electronic mail and two courses employed electronic discussion over the internet.

A total of 52 individuals participated in the electronic discussions analyzed for the purpose of this study; 76% were female and 24% were male. The majority of students enrolled in the courses reviewed in this study had used some form of electronic discussion previously. Participants ranged in age from 25-55 years old. Following the completion of the four courses, over 450 adult student discussion contributions were analyzed using a constant comparative method of analysis (Glaser & Strauss, 1973). Each individual learner contribution was treated as a separate unique piece of data. All learner contributions were reviewed, compared and analyzed until category themes could be extracted. Data from all the contributions were then coded into a qualitative data analysis software program using the coding scheme developed. In addition to data coding, a system of matrices was designed to analyze each research question under study. One matrix depicted data descriptive of learning processes, one matrix depicted data descriptive of group processes, and one matrix depicted data demonstrating faculty role. From these
matrices the researcher was able to see patterns, themes, and processes that developed during the electronic discussions. Quality control was maintained by a second qualitative researcher reviewing the dependability and confirmability (Lincoln & Guba, 1985) of study data, methods and findings.

Findings

The findings from this study will be presented in three areas:

1. learning processes
2. group process
3. faculty role in electronic discussions. (see Figure 1).

Learning Processes Data indicate that adult students, in these courses, used four different learning processes during an electronic discussion. These processes were labeled engaging, developing conceptual relationships, drawing conclusions, and reflecting and self-evaluating.

First, an engagement process developed where the adult learner used multiple and varied strategies to gain comfort with the technology. During this engagement process it was common to receive messages that stated, “I have never done this before but here goes.” Adult learners not only engaged with the technology in this phase, but they needed to “get over the technology hump.” They would send messages multiple times to make sure that they were received, they would switch Internet providers and change services as they discovered how the technology worked. They would initially engage with the technology to chat, plan snacks and meals for class, and clarify course assignments. Second, the adult learners began developing conceptual relationships with the course content under study by:

a. linking and differentiating concepts; b. engaging in dialogue linked to their own and their colleagues experiences, and, c. evaluating colleague comments. Each of these three processes were seen within each course, in the same sequence, irrespective of the course being conducted on the Internet or by electronic mail.

Linking. Learners initially used the electronic discussion to link and differentiate concepts. This process was most often initiated by a learner who linked concepts from two-three course readings. Once this linking happened a different learner responded and further clarified or expanded on the connected ideas. For example, a student enrolled in a continuing professional education course stated:

Schon’s work on reflecting in action, Mezirow’s work on transformation theory and Brookfield’s work involving critical thinking combine into an interesting look at how we might get outside our own minds and see our thoughts and feelings as magnificent contrivances of the world rather than as the only way that things can be. Each work deals with bewilderment and intellectual vertigo but differ in where they place emphasis of work within the topsy-turvy world of our brains.

Following this a second learner stated:

I feel compelled to reply to J. She did such a splendid job of discussion of Schon/Mezirow/Brookfield. Now for a little perspective from my view of the reading.

Dialogue. Next the learner’s ability to create a dialogue that linked to their own experience developed. In this phase the learners seemed to move away from the focus on their readings and move to a discussion of their own experiences as related to their colleagues’ experiences. For example in this phase learners stated:

So rather than questioning the role of CPE in fostering these concepts, I question the role of the organizations sending their employees to the CPE programs. Do some of your corporations have a defined policy or process whereby employees can propose changes based on new learning from CPE? In my experience of a hospital setting, it seems to me that most changes come from the top and only the free and easy suggestions from the lower ranks are easy to implement.

During this dialogue phase, learners attempted to understand and create meaning. As such, learners often made the following type of comment.
I've just printed and re-read everyone's comment in the last week. Besides helping me better understand what I've read, I've really thought about everyone's examples.

This learner then went on to link colleague comments together, provide a summary of the discussion to date and add her own new comments that moved the dialogue even further.

Evaluating. It was interesting to note that in each group analyzed for this study, there was a point where one learner took the risk to disagree or challenge the thinking of a student colleague. Sometimes these challenges were subtle such as, “in thinking about Hs comments I am not sure I agree with her full assessment, my ideas take me in a different direction.” At other times the challenge was more direct. For example, in a leadership course the students were discussing the movie Norma Rae. One student characterized the movie’s main character as a transactional leader. Another student took exception with this and wrote a detailed analysis of transactional versus transformational leadership and challenged the first interpretation as not linked to the course materials or content. This challenge spurred the rest of the group to analyze leadership theories in much more depth. Once that challenge happened, the group moved to yet another level of learning; drawing conclusions.

In the third level of learning, adult students used knowledge to draw conclusions and make decisions. For example, students were discussing the importance training within a business environment. They had discussed both the role of management and the role of training. One learner used this discussion to frame a work-related decision as follows:

More and more I believe HRD people must be very business focused, not only in their approach to training but how they manage themselves and their departments. . . . The decision to use CBLs as the training tool for new employees may not be the best solution but there are so many aspects to consider. Our company has over 100 employees. Their orientation, training, etc. is solely in the hands of managers. I would score huge brownie points if I delivered a CD ROM with an overview of the company and executive welcome, but I won’t because I do not believe that training is the root cause for 50% turnover.

Finally, some groups reached a fourth level of learning that included a reflection and self-evaluation process. In these groups, learners would share changes in their own thinking, changes in their world views and meta-cognitive processes they used in learning. For example consider the student who indicated:

Why is it important to be situated in an authentic activity? I will give you an example via a problem I solved while I read the articles on situated cognition. I believe that I have finally figured out - "Why do the professors always want us to include in our papers the implications of what it is we are studying or alleging through our analysis?" Well, obvious as the answer may seem to you - I have always been bothered by it. First of all, since I am currently not an educator I often could not think of any implications for the field of education. . . . Now, I realize that because I am not situated in an education field I have completely backward perception of these exercises. Also the word implication got in the way for me. My business background led me to want to think about situations as having to have a cause and effect. When I could not say this could cause that I did not have an implications worth writing down. Well, I have been transformed. I don’t believe the task of compiling implications is a cause/effect assignment anymore . . . I consider the thinking exercise of realizing implications as a way to hone my tools as a student. Therefore I can let my thinking lead me to the implications and then let the implications lead me to future study. So not I just don’t study about situated cognition I try to live in the idea of it.

Group Processes Data indicated that the group processes seemed to be similar to group processes that develop in face-to-face instruction. Group atmospheres were cordial, communication patterns seemed to be linked and nested, participation patterns included all learners, and group norms seemed to develop. In one group, for example, the discussion norm seemed to be that before entering the discussion on a particular topic, the learner first needed to develop their own written statement of understanding before it was acceptable to comment on a colleague’s view. Additionally, level of participation in an electronic discussion was a group norm that developed. In some groups the level of participation was extremely high and the group seemed to push each other for more and more contact. In other groups a moderate level of participation developed and the group norm was not as demanding. Groups also developed ways to tease, have fun and "joke around" on line. These findings are similar to that of Milton, Davis and Watkins (1999) who in their study of virtual learning communities, noted that “each group engaged in their own set of behaviors and established a unique identity that was largely the result of the group
The two issues that seemed to be critical but that detracted from the performance of the groups were agreement of an acceptable level of participation and engagement with the group" (p. 5).

**Faculty Role** Electronic discussion fostered a change in the faculty role. The faculty role tended to be one of electronically summarizing and linking comments made by learners rather than presenting or sharing information. This summarization and linking process appeared to be most helpful to the groups once they had engaged in dialogue about their own experiences. This study supports Holt's (1998) findings that indicated "facilitating on-line learning involved many responsibilities: creating the environment, guiding the process, providing points of departure, moderating the process, managing the content and creating the community" (p. 48). These changes place faculty members in a guiding and facilitation role, rather than a knowledge transmission role.

One interesting finding of this study was that if the faculty member entered the discussion too early, then the learners talked to the faculty member as the authority figure. However, if the faculty member waited and entered the discussion after colleague relationships had been established between learners, then the faculty member could enter the discussion and the group would treat them as a group member rather than as the authority figure.

**Implications for Practice and Research**

This study has implications for the practice of HRD, as well as, further research in the field. First, HRD practitioners will benefit from a greater understanding of how technology facilitates not only the teaching process, but the learning process as well. This deeper understanding of the impact of technology on learning, can lead to more effective use of technology in teaching.

It was evident in this study that the learners moved through learning processes of engagement, developing conceptual relationships, drawing conclusions, and reflection and self-evaluation. The electronic discussion format fostered the learners taking a more analytical and reflective approach to their own learning. A number of factors could have contributed to this high level of analysis and synthesis in learning. First, a constructivist approach was used in designing the discussion format and group activities. Learners were asked to focus on connections with content and analysis of experiences. Second, the technology provided the learner the ability to read colleagues' comments, print those comments, go back to course materials and integrate these materials with their colleagues comments, think about what it meant and then, ultimately frame their response. Learners who participated in electronic discussions felt that they used a "more thoughtful" process in framing responses. They also indicated, "You know, there is a record of the things we say, so I think we are accountable in a different way for our ideas than we are in a classroom discussion." A major teaching/learning issue raised by this study, is what course content/activities are best suited for electronic discussion and which are best suited for classroom discussion. It appears that trainers and adult educators will need to address this issue in their consideration of the use of discussion formats within courses. As Boshier et. al. indicate, "From an adult education perspective, it is not acceptable to use the web to emulate the worst of face-to-face courses where power relations are unproblematised and learners constructed as passive recipients of information" (p. 347).

Second, this study has implications for further research. The author considers this to be an initial, preliminary exploration, and the field would benefit from its replication and expansion. Additionally, future research is needed to understand learning processes that develop in computer-mediated environments. For example, the field would benefit from understanding more about the connections between specific technologies, instructional design, learning process, context, and facilitators. What impact do each of these have on the learner in a technology enhanced environment? Holt (1998) concurs and indicated that "further research is needed to investigate the structuring and sequencing of electronic forums, strategies for combining face-to-face and electronic experiences, techniques for effective moderation of on-line conferences, and methods for modeling critical thinking" (p. 48).

**Conclusions**

In conclusion, this study has begun to identify the impact that electronic discussion has on the learning processes, teaching processes, and group processes within an HRD graduate program. It is apparent that these processes are intricately connected and that each needs to be fully analyzed and understood in order to be employed effectively. As adult educators, we need to move beyond using technology because it is available, exciting, new and unique. We need to ask ourselves, "If I use this technology will it have an impact on learning and how will that impact occur?"
As Chester and Gwynne (1998) indicate, “We can not assume that the skills and pedagogy of face-to-face teaching will be appropriate in cyberspace. We have to be open to change and open to the lessons, both in their delights and their dangers, that teaching on-line can offer” (pg. 9).

Development Towards What End? An Analysis of the Notion of Development for the Field of Human Resource Development

K. Peter Kuchinke
University of Illinois at Urbana-Champaign

The research, theory, and practice of the field of Human Resource Development are based on often unspoken assumptions about the concept of adult development. Examining these assumptions is useful to researchers and practitioners because of the possibility of more deliberate choices and improved scholarship and professional practice. Three alternative views of adult development can serve to distinguish competing schools of thought, each rooted in different philosophical traditions and political thought. The person-centered view aims at self-realization of the individual and is grounded in humanistic psychology and liberalism; the production-centered view focuses on organizational goals and is based on behaviorism and libertarianism; and the definition of development as principled problem-solving in cognitive psychology, progressivism, and pragmatism. Each view serves as a root construct for a specific orientation toward the role and function of the profession. By highlighting the differences between these views and their relative strengths and shortcomings, the author seeks to advance the theoretical foundation of the field and to contribute to more reasoned theory and practice in the field.

Keywords: Philosophy of HRD, Human Development, HRD Theory

Paradigmatic debates are still rare in the field of Human Resource Development (HRD) that is relatively young and concerned with gaining and expanding its academic legitimacy relative to the established fields of adult education, vocational education, and the array of management and organizational sciences. The practice of HRD is firmly established, with US organizations expending over $200 billion per year on HRD interventions (Training, 1997) and an exceedingly vibrant training and consulting industry operating in this country and abroad. Still, there are continued calls for more and better research and recommendations for practice to keep up with the pace of technical, political, economic, and social changes that organizations face in this global economy.

As an academic matter, HRD programs are now firmly established in US graduate schools. HRD enrollments are among the fastest growing in Schools of Education, where the “training of ...HRD professionals is now the ‘bread and butter’ activity” (Gray, 1997, p. 80). Here, paradigm debates can deepen theory and provide the foundation for new research.

What philosophical debates exist in HRD have centered on whether professional HRD activities should promote ‘performance’ or ‘learning’. Swanson and Watkins argued this issue during the profession’s annual conference in 1995, (Holton, 1995), Dirkx juxtaposed earning and learning in discussing the meaning of work, and Barrie and Pace (1998) argued passionately for the adoption of a liberal education framework for the HRD profession. The learning focus is most prominently advanced by those adult education scholars, who claim HRD as an area of practice (Dirkx, 1997). More recently, Kuchinke (1998) has attempted to reconcile these perspectives by using a progressive learning philosophy. Other attempts to comprehend and classify different directions in the field include Russ-Eft’s (1996) work identifying three different views of HRD held by consultants and organizations: development-focused, issue-linked, and strategic. Lewis (1996) described a “model for thinking about training evaluation” (p. 3) that differentiated training along several context, process, and outcome factor dimensions and classified it as either proactive or reactive. Watkins (1989) described five alternative metaphors for the HRD professional: organizational problem solver, change agent, designer, empowerer, and developer of human capital.

No attempt, however, has been made to analyze the field in terms of its understanding of ‘development’, a concept so centrally positioned in the name of the profession. What HRD professionals view—implicitly or explicitly—as the purpose and end of developmental activities that persons in organizations engage in, gives rise to very different models of HRD. Since HRD is an applied field and, therefore concerned with practical problems—deciding what to do and what action to take (Copa, 1985)—HRD professionals address not only what is, but predominantly what should be. Reasoned practice depends on reflective choice of the ends or purposes of action, and it is at this normative level that the distinction between different views of HRD become most salient and
revealing. Should HRD practice aim at the well-being of the individual worker, as Bjorquist and Lewis (1992) argued, or should the interests of the shareholders predominate, as Friedman (1970) advocated? Should HRD aim solely at responding to business needs and corporate goals as identified by senior management, as Rummler and Brache (1990) proposed, or is a stakeholder model of the organization more appropriate, whereby HRD functions as the advocate of valid and legitimate interests of an inclusive set of groups and shapes corporate strategy (Evan and Freeman, 1988)?

The purpose of this paper is to answer the following questions: How can differing definitions of human development in organizations be used to distinguish alternative HRD philosophies? How do these frameworks differ in terms of their philosophical and political assumptions and contributing schools of thought? How have these frameworks informed HRD theory, and how has HRD practice been conceived from each perspective? And, finally, what new directions are emerging from theory and practice that might overcome the shortcomings of existing philosophies and more adequately answer to the challenges of the rapidly changing world of work?

Human Development and the Field of HRD

HRD theory and practice appear to be driven by three different theoretical approaches related to the purpose of developing persons in organizations. These frameworks can be classified following the classic work of Lawrence Kohlberg and Rochelle Mayer (1972) who distinguished among three streams of educational ideologies, romantic, cultural transmission, and progressive. A similar triarchy was described by Malcolm Knowles (1984) who described three models of adult education: mechanistic/behaviorist, cognitive, and organismic/humanistic, each associated with a unique strategies for learning and based on "three different models of man" (p. 6.6).

The system developed in this article classifies schools of thought according to the central focus of the developmental activity: person-centered, production-centered, and principled problem-solving. Each encompasses a range of models, theories, authors, and schools of thought, is rooted in different philosophical traditions, and makes specific assumptions about the nature of human beings and the nature of organizations and society.

Frameworks of Human Development

Table 1 presents the frameworks of human development in greater detail. Each is described in terms of its roots in philosophy and the social sciences, the proposed aims or end goals, the assumptions about human nature, and about the nature of organizations and the larger economic and societal context. Examples of specific theories, concepts, and strengths and limitations of each theory are also given.

**Person-Centered Development**

The concept of person-centered development in HRD is rooted in the philosophical traditions of idealism, humanism, and romanticism. Romanticism was an intellectual movement that was at its height in Europe toward the end of the 18th and early 19th century (Flew, 1979). In more recent times, the romantic notion of development was expressed by A. S. Neill, whose Summerhill represented an example of a school based on these principles, and proponents of the California growth movement, who emphasized inner growth and the connection to one's inner reality. Personality theorists of humanistic psychology—the "third force" in psychology— included scholars such as Henry Murray, Gordon Allport, Abraham Maslow, and Carl Rogers. Strongly influenced by Existentialism, they carried on the romantic tradition in contemporary times. Many concepts and theories in organizational development and HRD in general have their origins in this philosophy.

The person-centered notion of development is the discovery and unfolding of innate qualities, of the inner good and inborn health of the human being, the search for personal fulfillment and meaning. Successful development means being all one can be. Individuals are by nature proactive, rational, self-aware, and complex; they possess freedom and dignity, and carry the responsibility to find meaning for their lives. There is the assumption of an inner spontaneous tendency toward positive values and a strong emphasis on inner states and feelings. Performance, skills, achievements, tasks, and responsibilities and duties are not satisfying in themselves, but important as means to inner growth, awareness, happiness, and health.

**Strengths of the person-centered approach** The strength of this philosophy of HRD lies in the compelling idea of the perfectibility of the human being, the importance of individuals and their responsibility to the self, and the role of the untapped potentialities inside every one. It places the locus of control over and responsibility for the individual's life and actions squarely at his or her feet. This position adheres to the Kantian imperative that persons should always be treated as ends in themselves, never as means to an end. It proposes that employees are stakeholders in their organizations whose rights are on par with the shareholders, i.e. owners of the firm. The perspective paves the conceptual way for employee participation and employee wellness approaches that have been central to organizational development since the 1950s.

**Critique** The person-centered view of HRD, however, is also vulnerable as a reasoned basis for HRD because it is largely silent about the economic dimension of work in organizations. While self-development might well be seen as a primary individual goal and perhaps a public good that deserves public support in the form of educational opportunities for everybody, it is not the primary charter of organizations operating in a competitive environment. Organizations incur direct, indirect, and opportunity costs when conducting HRD activities. These costs will put them at an economic disadvantage over organizations who provide fewer HRD activities, unless the pay-off of HRD interventions exceeds their costs and provides a higher return than investing the training budget to, say, upgrading machines or purchasing new equipment. The person-centered notion of human development is insufficient as the sole foundation for HRD, despite its appeal and popularity. The next section will describe the production-centered philosophy of development and evaluate its merits within the context of today's rapidly changing economic and social world.

**Production-Centered Development**

While the person-centered view of development emphasizes individual needs and goals, the concept of production-centered development stresses the enhancement of the productive capacity of a person as the goal of development. The role of HRD is to transmit knowledge, skills, and social and moral rules of the organization. The process of transmission is conducted through educational technology and a behavioristic approach (Skinner, 1971). Successful development means the acquisition of prerequisite skills, knowledge, abilities, attitudes, and values in order to be able to respond favorably to external demands. This framework depends heavily on role theory (Stryker and Statham, 1985); development is evaluated in terms of the degree of fit between measurable and observable behaviors and role expectations, and not, as in the case of the person-centered view, in terms of feelings, thoughts, or other internal states. In the 1940s this position was expressed well by Dooley in The Training Within Industry Report (cited in Swanson and Torraco, 1995, p. 2): "Training is for the good of plant production—it is a way to solve production problems through people; it is specific and helps people to acquire skills through the use of what they learned."

**Strengths of the production-centered approach.** The strength of this framework lies in its ability to find quick responses to well-defined problems. Within an immediate time horizon, HRD can help provide the knowledge, skills, and attitudes required to meet clear objectives. In situations where clear goals exist, where these goals are agreed upon and supported, where the ways to meet these goals are proven and known, and the required resources are available, issue-focused HRD can provide the necessary support to meet these important objectives. This view is predominant in the management sciences, including organizational behavior, organizational theory, industrial/organizational psychology, and industrial relations. It posits the rational aspect of an organization, makes planning and strategy possible, and enables planning, forecasting, and goal setting.

Rooted in a libertarian philosophy (Maitland, 1994), the relationship between employee and the organization is characterized by rational and free choice and a clear contractual understanding of the rights (pay, benefits, etc.) and duties (task, working hours, etc) by each party.

**Critique of the production-centered approach.** The two primary lines of criticism against this view center on the underlying view of the nature of organizations and the value statement inherent in this model. The major criticism of the production-centered view is that it portrays organizations as static, closed, mechanistic systems rather than open systems in dynamic, continuous interchange with the external environment. Requirements change constantly, and employees and managers alike satisﬁce rather than maximize the demands of multiple constituents.

In a similar vein, Weick (1990) asserted that there is a growing consensus that management is "more like cartography than like the board game 'Mastermind' in which people try to discover a pre-set pattern" (p. 317). Without a pre-set pattern of correct answers, goal setting becomes a response to a continuously shifting set of preferences that require active and intelligent interpretation by all participants. Where organizational goals are ambiguous and means to achieving those goals uncertain, narrowly defined job skills are of limited effectiveness. Swanson and Torraco (1995) spoke about this complexity when introducing a taxonomy of performance with two tiers—managing the system and changing the system. As they and other observers of the changing nature of work (for example Reich, 1991) noted, the specific definable and trainable tasks that formed the vast majority of work in the early part of this century are giving way to more amorphous, ambiguous task requirements. This calls for a broader range of skills, attitudes, behaviors, and abilities for which the cultural transmission model with its mechanistic notion of skill transfer may no longer be adequate.

**Principled problem-solving as the goal of development**

When the person-centered view of development was the unfolding of innate, latent patterns and potentialities, and the production-centered model stressed the adjustment of the individual to the demands of the external environment, the principled problem-solving view seeks to overcome the shortcomings of both. It is the most complex stance and perhaps the most difficult to implement. Based on the progressive educational ideology (a term first introduced by John Dewey) it defines development as "an active change in patterns of thinking brought about by experiential problem-solving situations" (Kohlberg & Mayer, 1972, p. 455). This orientation, with its emphasis on cognitive development, principled and interactive problem-solving, and pragmatic orientation is well suited to serve as a guiding philosophy for HRD in today's rapidly changing social and economic environment.

In contrast to the two previous views, progressivism stresses the interactive, dynamic aspect of problem-solving in a given social situation. It focuses on the primacy of experience and experiential learning, on the active involvement of individuals in emergent problematic social situations. The emphasis is neither on the internalization of established goals or values, nor the unfolding of spontaneous impulses and emotions, but the "active change in patterns of response to problematic social situations" (Kohlberg & Mayer, 1972, p. 455). The aim is the achievement of a solution that satisfies all participants given the specific situational constraints.

A second foundation of this philosophy is cognitive psychology and its central assumption of cognition as mental structures, internally organized wholes or systems used to structure our experience of the external world. Cognition filters the information about the environment we perceive, the experiences that we have, the meaning that we attribute to our experiences, and our thinking about our world in general. Cognitive structures, however, are not fixed but able to change. Cognitive development results from a dialogue between the individual's cognitive structure and the structure of the environment. In a given situation thinking that can envision solutions that are more encompassing and better able to integrate the demands of the various participants is preferred.

The aims of human development in this philosophy are to foster the ability for optimal functioning through critical thinking and problem-solving, for an integration and synthesis of internal and external demands, and of balancing competing claims with the goal of functional (in the broad, pragmatic sense) optimization of the situation. This includes an examination of the underlying assumptions of a given situation, an awareness of the historical conditions that have led to the current situation, the ability to take others' roles and perceive accurately the
perspectives of all parties involved, and the personal maturity and integrity to find creative solutions in situations where scarce resources demand tough decisions. Rather than advocating the exclusive development of the self, or blindly adhering to an external goal, this approach suggests the continuous re-definition of a given situation in light of its requirements, the courage to challenge past solutions and examine current assumptions, and the consideration of dynamically changing configurations of the needs and wants of all stakeholders.

Strengths of the principled problem-solving approach. The major strength of this orientation to HRD is its inclusiveness and systematic nature. In a fast-changing world, the resources, concerns, and needs of all must be considered, and an inclusive approach is superior to win-lose or lose-lose propositions. Secondly, this approach is capable to address issues of global scope, social justice and democratic values, and attempts to find solutions to the complex problems of a democratic market economy. It provides for full participation of all employees and has the potential of creating situations where everybody wins.

Critique A major shortcomings of this approach to human development are its requirement for long-term commitment and development in an competitive market place that oftentimes rewards short-term success. Maitland (1994) addressed this problem and argued that political changes must precipitate changes in organizational policies, in order to avoid punishment of organizations that forego short-term profits for the sake of long-term development. As long as organizations are evaluated on quarterly fiscal results alone, long-term strategies that sacrifice short-run results for long-term gain may not become wide-spread. However, as even Aktouf, writing from a radical humanistic perspective, observes: "this movement toward a more human firm is neither a romantic ideal nor a philanthropic gesture, nor a utopia, but a necessity .... [Organizations] need to step out of the Taylorian rut...[T]he time has come for the employee who knows how (and is allowed) to think, to react, to modify" (pp. 417-418).

Secondly, many companies, especially start-up and small firms, are unable to invest in the long-term development of their employees, and there are some job categories that do not require extensive use of higher-level cognitive skills and problem-solving abilities. Lastly, not all employees may be willing to become involved and take on greater shares of responsibility and participation, so that the developmental approach may only be applied selectively.

Conclusion

In this paper, the author proposed that the principal foundations and assumptions of the various theories, concepts, and practices of Human Resource Development might be understood as three distinct approaches: person-centered, production-centered, and principled problem-solving. These approaches are based on different philosophies of development, which is so centrally placed in the name of the profession. This attempt at a classification and explication of the roots and strengths and potential shortcomings of each approach can be useful for furthering theory and practice of this emerging field.

A HRD professional who is, for example, faced with lagging work performance in an organization might approach this issue from any one of the three proposed approaches: From the person-centered perspective, she might propose to post the names of top performers on the lunchroom bulletin board and hold monthly award ceremonies for these employees to instill pride the good performers. From a performance-centered philosophy, she might propose switching from an hourly pay system to a piece rate or pay-for-performance system to provide incentives to work harder. From a principled problem-solving perspective, she might propose an open-book management strategy where employees are given full information about the implications of poor performance for the stakeholders, and charter cross-functional teams to investigate the root causes of the problem and develop solutions. A HRD professional who can select from a number of different approaches will be likely to have a wider range of choices than one who is tied to only one perspective.

A second implication for practice is related to the newly evolving strategic role of HRD. Over the past 10 years, HRD has changed from a narrow function limited to designing and delivering training to a much broader organization-wide role (Gilley & Maycunich, 1998). Recognizing the competitive advantage of a committed and well-qualified workforce, HRD professional are becoming increasingly charged with developing organization-level HRD strategies. Strategic decisions, however, are choices over competing values and principles, and many organizations develop HRD philosophies to guide them. Similarly to the individual examples given above, being aware of the range of options for the HRD strategy will enlarge a firm’s range of options. Where HRD professional can enter into a dialogue with other corporate decision-makers over the underlying values and philosophies of the workforce development, more appropriate solutions become possible. Oftentimes, senior managers come from functional backgrounds such as engineering or operations and have little insight into educational issues. If HRD
professionals are able to explain the differences between and relative strengths of the developmental approaches based on the person-centered, production-centered, and principled problem-solving approach views, more deliberate and informed decision-making becomes possible.

A third implication of this explication of different HRD philosophies is for educators and trainers of HRD professionals and other educators working in and with organizations. Training and education in HRD should include information and reflection of the paradigmatic and philosophical foundations of the field. While adult and education university curricula often include at least one course addressing the history and philosophy of the respective field (for instance the heated debates over the direction of vocational education between John Dewey and Charles Prosser in the early part of this century), many HRD introductory courses and textbooks that I am aware of give only short shrift to such matters, instead focusing on functional topics such as instructional design and technology. Debates over the philosophical directions of HRD need to be included in HRD education and training, an area of practice so important to the well-being of society and impacting so many employees.

Finally, the issues raised in this paper also impact research and scholarship. Researchers need to be aware of their own philosophies and value positions regarding the aims of developing persons working in organizations. They ought to state their value preference in the written research reports so as to allow the audience to situate the report and understand its merits and limitations. Secondly, empirical work and further theory development are urgently necessary to learn more about the results of HRD activities conducted within each of the three approaches. If one agrees with a contingency approach, and much of the empirical organization behavior research points to the validity of situation and context specific solutions to problems rather than approaches that stipulate “one best way”, then we need clarification to questions such as: Under what conditions (related to a firm, its product or service, its workforce, its market etc.) is one approach more effective than the other? How do personal-level variables (age, gender, education, socio-economical background, profession, etc.) interact with each developmental approach? What are the trade-offs of each approach related to the benefits to the employee and the organization and how should they be reconciled? Such contingency theories are beginning to appear in the management sciences [for example, Lepak & Snell, 1999] discussion of the conditions under which organizations should develop expertise from the inside versus hiring it from the outside) and is need in our field as well.

There is also a need to further address the philosophical and moral/ethical dimensions of HRD, areas not easily suited for empirical work. Here, questions include: What are the ethical/moral responsibilities of an organization towards its employees and vice versa? What are the boundaries of development that an organization can demand that an employee undergo? How to resolve value conflicts between an organization’s HRD philosophy and the values/beliefs of its employees?

HRD is a field that is growing in importance and size. Because of its pragmatic orientation, much of the theorizing and research has held a functional flavor with largely unstated assumptions about its values. As the field develops, a clearer and more open debate over its core values and philosophies is needed. I hope that this paper can begin a dialogue over one key aspect of the field: the aims and desired outcomes of development of persons in organizations through the field of HRD.

A Study of the Influence of the Theoretical Foundations of Human Resource Development on Research and Practice

Tim Hatcher
University of Louisville

There is a deficiency of empirically based literature on the relationship between theory and practice in HRD and little attention has been given to the relationship between the theoretical foundations of HRD and HRD research and practice. This study surveyed researchers and practitioners in the HRD academic community as to which theoretical foundations are and will be influencing the field and which foundations are of most importance in research and practice now and in the future. Preliminary results are discussed.

Keywords: Theoretical Foundations, Theory to Practice

There is a deficiency of empirically based literature on the relationship between theory and practice in HRD. Not since the late 1980s have the theoretical foundations of human resource development been discussed or critiqued with any constancy or depth in the research literature and no publications were located during a literature review that discussed the relationship between theory and practice. Yet, the theoretical foundations are "the intellectual underpinnings of the profession (Chalofsky, 1992, p.181), and "research efforts must continually be guided by underlying theory" (Jacobs, 1990, p.70).

While the relationship between theory and practice has generated moderate conceptual discussion in the related literature, inadequate attention has been given to the relationship between the theoretical foundations of HRD and the practice and outcomes of HRD. No research was located that identified the theoretical foundations of HRD by surveying researchers and practitioners in the academic community as to which theoretical foundations are and will be influencing the field and which foundations are of most importance in research and practice now and in the future.

Although there seems to be general agreement that we work from an interdisciplinary body of knowledge, there is no agreement as to what part of this body of knowledge should be considered as essential for HRD professionals (Jacobs, 1990). "Existing knowledge derived from the various contributing areas should be reviewed and analyzed to reveal gaps in knowledge and direct HRD research efforts in a more systematic manner, using theories unique to HRD as the organizing principles"(Jacobs, 1990, p70).

Theoretical Framework

Although the foundations of HRD are evident in several notable HRD publications, no published research identified how scholars and practitioners use the theoretical foundations, or the extent of their influence on research and practice, or even how they were defined. Thus, an obvious conclusion is that the foundations are conceptual in nature and are based primarily on evident opinion and rational perception "whether they are explicitly acknowledged or not" (Passmore, 1996, p. 200) when engaged in HRD research or practice.

The theoretical framework for the study was based on a synthesis of the conceptual propositions of Swanson (1996; 1999), Jacobs (1990), and Hatcher (1999). This synthesis implies that the theoretical foundations derived from several disciplines such as general systems theory, economics, psychology, sociology, and ethics, prescribe a conceptual and ideological framework for the field of human resource development research and practice.

Swanson (1996, 1999), Jacobs (1989; 1990), Watkins (1989, 1990), Hatcher (1999), and others have periodically discussed and modified their interpretations of the theoretical foundations of HRD. However, the foundations of HRD/PI have not been reviewed in light of their currency within the discipline of HRD/PI since their inclusion as theoretical disciplines in the late 1980s (Hatcher, 1999). The current hypothesis is that many of these same disciplines contribute to research and practice of HRD. Thus, it is important to examine the currency and
The efficaciousness of each discipline (Hatcher, 1999) and "contributing bodies of knowledge made explicit" (Jacobs, 1990, p.66).

The disciplines identified in the related literature included economics, education, ethics, general systems theory, learning, sociology, organizational behavior, field and intervention theory, design theory, and psychology (Dean, 1993; Hatcher, 1999; Jacobs, 1989, 1990; Rothwell & Sredl, 1992; Ruona & Swanson, 1997; Swanson, 1996, 1999; Watkins, 1989, 1990). Furthermore, the validity of the theoretical foundations of HRD and the roles that they may play in enhancing or hindering HRD research and practice have been intuitive at best and all but ignored in the related literature (Hatcher, 1999).

Research Questions

The following research questions guided the study:
1. How do respondent's rate theoretical foundations of HRD in terms of current and future influences on and importance to HRD research and practice?
2. Which theoretical foundations of HRD have substantially changed and how have such changes influenced HRD research and practice?
3. To what extent do respondents feel alignment with, understand, and teach the theoretical foundations of HRD?
4. To what extent do respondents perceive that the theoretical foundations currently, should be, or will influence HRD research and practice?

Methodology

The research design was ex post facto survey research based on a review of related literature. Empirical and conceptual studies and practitioner-based literature published between the early 1970's and the present were reviewed. The review included human resource development related topics such as training and performance improvement and theoretical framework, theoretical disciplines, and related topics. This review was used to develop survey items for the 81 item Theoretical Foundations of Human Resource Development Inventory, which was used to collect data from the research sample.

Sample population

The study population for the present study was the human resource development (HRD) academic/scholarly community. The sample used in this study is organized under the Academy of Human Resource Development (AHRD), an international organization composed of over 600 recognized scholars, researchers, and practitioners performing HRD-related research throughout the world. The 605 members of the Academy were used as the sample population for the study.

Instrumentation

The instrument was a new survey designed by the researcher from a review of related literature to answer the research questions. A total of 81 instrument items as independent variables were developed from a review of literature and interviews with HRD practitioners and scholars. A total of 6 demographic items as dependent variables were developed from the literature and interviews. The instrument was pilot tested with a group of 7 scholar/practitioners to insure face validity and usability. Pilot participants were also asked to establish content validity. Changes suggested by the pilot-test group were implemented prior to final submittal to the study sample. In order to differentiate between research questions variables across time such as "To what extent do respondents perceive that the theoretical foundations currently, should be, or will influence HRD research and practice?" multiple survey items were included in the final instrument.

Data Collection

Procedures included mail-outs of instruments to the entire population of 605 HRD scholars as a subset of the HRD scholar/practitioner community. Follow-up procedures included a second mail out and two follow-up electronic mail reminders.
Data Analysis
Preliminary data analysis included basic descriptive statistics, factor analysis, analysis of variance, and paired samples analyses. Descriptive statistics were used to identify variance in survey items. Multivariate analysis of variance was used to determine the differences in mean scores between variables. Note that the analysis is incomplete.

Results and Findings

Few references were found on theoretical foundations of HRD and no references were located on how changes in theoretical disciplines have influenced HRD, especially HRD outcomes.

Several disciplines were identified as contributing to the knowledge base of HRD, namely education, systems theory, economics, psychology, sociology, and organizational behavior. Other disciplines such as anthropology and management science have also been mentioned (Chalofsky & Lincoln, 1983). Jacobs (1990) indicated five major bodies of knowledge: education, systems theory, economics, psychology, and organizational behavior. Passmore (1996), reflecting on the earlier work of Swanson, said there were three disciplinary bases suggested as the foundation of HRD: economics, general systems theory, and psychology. Swanson recently added ethics as a theoretical foundation to general systems theory, economics, and psychology (1999). Jacobs (1990), Swanson (1999), and Passmore (1996) concluded that although various bodies of knowledge had influenced HRD, HRD should focus on the economic, psychological, systems theory, social benefits, and ethics of HRD and the contributing areas should be reviewed and analyzed.

The survey was mailed to 605 Academy of Human Resource Development members. At the time of this preliminary report 210 surveys had been returned for a 34.7% response rate. A total of 205 surveys were usable. Non-respondents were not significantly different from respondents in terms of demographics. Reasons for non-response were primarily (a) I do not work with theoretical foundations, and (b) I didn't have time to complete the survey and get it back in time.

Demographics resulted in a profile of respondents. The general profile is a male (53.4%) or female (46.7%), between 41 and 60 years of age (63.6%) with a doctorate (Ph.D. 50.5% and EdD 19.4%) in HRD (12.1%) or Adult Education (7.3%). Respondents' current position was practitioner (31.6%) or faculty member (Assistant Professor 13.1%, Associate Professor 13.1%, Instructor or other faculty 15.5%) and spent varied amounts of time as a practitioner (15% indicated they spent 100% as practitioner and 11.2% spent 30% of their time).

The survey was initially divided into 6 logical sections by the researcher. Each section was designed to answer one or more of the research questions. Preliminary results of the principle components factor analysis with varimax rotation revealed 5 comprehensive factors with eigenvalues over .40 and one undeveloped factor. Thus, the factor analysis essentially supported the preliminary conceptual divisions.

Items 1 – 30 asked for opinions on whether a theoretical foundation is currently, should be, or will influence HRD research or practice. Multivariate analysis of variance (MANOVA) revealed a significant difference (p = .000) between sociology is, should be, or will influence HRD research (F=39.683). Paired samples t-tests revealed that sociology should be influencing HRD research was significant (t = 8.916 and mean of 4.82) followed by will influence (t = 5.717, mean of 4.51), and is currently influencing research (t = 8.916, mean 4.04). Sociology’s influence on practice indicated similar results of MANOVA (F = 65.911) and paired samples t-tests which revealed that sociology should be influencing HRD practice as significant (t = 11.260 and mean of 4.72), followed by will influence (t = 7.390, mean of 4.27), and is currently influencing research (t = 6.186, mean 3.72). See Table 1 for similar results of economics, psychology, ethics, and general systems theory (GST). Note that all paired samples t-tests were significant at the p <.05 level.

Items 31–40 asked for opinions on the extent that a theoretical foundation was currently influencing individual respondents’ research and practice. Results revealed a significant p < .000 difference among all foundations with a MANOVA of 1677.841 for research and 1893.332 for practice. Paired samples t-tests revealed significant difference between all pairs of theoretical foundations with the exception of pairs referenced in Table 2. Means for each theoretical foundation indicated that psychology (4.83, 4.96), GST (4.66, 4.88), ethics (4.33, 4.82), sociology (4.19, 4.29), and economics (3.82, 4.08) influenced research and practice respectively.

Items 41 and 42 requested respondents to rank order the theoretical foundations in order of importance to HRD research and practice. Results revealed that respondents rated economics (3.67) first followed by ethics (3.40), sociology (3.21), psychology (2.43), and GST (2.28) as most important to HRD research. Respondents rated sociology (3.48) first followed by economics (3.12), ethics (3.10), psychology (2.82), and GST (2.57) as most important to HRD practice.

Items 43 through 47 asked respondents to rate the extent they felt theoretical foundations had changed since the inception of HRD as a field of study. Means indicated that ethics (4.06), followed by economics (4.04), psychology (3.95), sociology (3.77), and GST (3.69) had changed. MANOVA revealed a significant difference between theoretical foundations (F = 1044.445, p = .000). Additional significant results are illustrated in Table 3.

Items 48 and 49 sought to identify the extent respondents felt the impact of theoretical foundations was clear on research and practice. Mean results indicated that the impact of theoretical foundations was not clear on research (3.53) and practice (3.03). Items 50-54 asked respondents to rate the extent that each of the theoretical foundations influenced their personal philosophy. Results indicated that their personal philosophies were influenced by psychology (5.04), followed by ethics (4.96), GST (4.95), sociology (4.38), and economics (4.05).

Items 55-59 asked respondents to rate their knowledge and skills of each of the theoretical foundations. Results indicated that respondents had knowledge and skills in GST (5.12), psychology (4.94), ethics (4.64), sociology (4.34), and economics (4.07). Items 60-69 asked for feedback on the extent respondents learned the theoretical foundations through formal education or informally and/or on the job. See Table 4 for results.

Items 70-75 asked respondents to rate their teaching and understanding of the theoretical foundations of HRD. Results indicated that teaching of theoretical foundations as part of one or more courses was rated higher (4.75) than teaching theoretical foundations as a separate course (2.63). Item 72 asked respondents to rate the extent
they felt theoretical foundations were difficult to teach with a mean of 3.16. Results of questions about student's knowledge of theoretical foundations and whether respondents felt their colleagues had knowledge of or taught theoretical foundations revealed means of 3.8, 4.3, and 4.1 respectively.

Items 76 through 81 asked respondents to rate whether they felt theory or practice was, should be, or will be having the most influence on HRD. Results indicated that theory should be (3.91), will (3.59), and is (3.17) having an influence on HRD and that practice will (4.70), is (4.44), and should (4.24) be influencing HRD. Additional statistical analyses such as MANOVAs on demographics as dependent variables with various iterations of items 1 – 81 as independent variables and additional within group analysis are planned.

Conclusions and Recommendations

Several conclusions may be drawn from the preliminary results of the study. It appears that respondents felt that each of the theoretical foundations should, will, and is influencing both HRD theory and practice and that psychology followed by General Systems Theory and ethics had overall most influence on HRD theory and practice. Psychology was having the most influence on individual’s research and practice followed by GST and ethics. Respondents rank ordered the theoretical foundations by importance to research as economics, ethics, sociology, psychology, and GST and by importance to practice as sociology, economics, ethics, psychology, and GST. Theoretical foundations that have changed since the inception of HRD as a field of study included ethics, economics, psychology, sociology, and GST. Respondent’s personal philosophies were influenced by, in order of influence, psychology, ethics, GST, sociology, and economics. Respondents indicated knowledge and skills in GST, psychology, ethics, sociology, and economics. There was only one difference between rankings of learning the theoretical foundations formally or informally. Formal learning included psychology, GST, sociology, economics, and ethics while informal learning included ethics, psychology, economics, sociology, and GST.

It should be noted that self-reports used in this study are limited to participant’s perceptions of theoretical foundations. These perceptions may be limited to the depth of knowledge and understanding that participants have of the five theoretical foundations listed and the extent that participants recognize and comprehend the influence of these foundations on their research and practice.

Theoretical foundations are taught as part of one or more courses and colleagues have knowledge of and teach theoretical foundations. Students do not appear to have knowledge of the theoretical foundations. Theory should be having the greatest impact on HRD and practice will have most influence in the future.

It is interesting that psychology, GST and ethics are having the most influence on both the theory and practice of HRD as a field of study and as influences on individual respondent’s research and practice and personal philosophies. Of greater interest is the finding that psychology was ranked fourth in terms of importance to both research and practice while economics ranked first for research and sociology ranked first for practice. Psychology was also rated low in terms of change as a theoretical foundation while ethics rated highest. Finally, theory should be influencing HRD and it appears that practice may have more influence on HRD in the near future.

There are several limitations inherent this preliminary study. One possible limitation is that an over reliance on self-reporting surveys leads to invalid conclusions, especially with content as complex and philosophic as the theoretical foundations of HRD. A case could be made against self reporting due to the inherent bias that scholars and practitioners in HRD may have for or against a particular foundation as well as the influence that deep or superficial knowledge of a particular foundation may have on reporting. For example, a respondent may have a cursory understanding of general systems theory, thus have little or no deep comprehension as to how systems theory impacts their research or practice, yet rate general system’s theory high on the survey.
Further research should attempt to identify additional theoretical foundations or foundations mentioned in the literature review herein but not considered prevalent and their influence on research and practice as well as seeking to discover how practitioners and scholars actually use the theoretical foundations in their research and practice. Future research should also identify cultural differences between the influences of theoretical foundations and research and practice. Additionally, in order to gain more depth of understanding, more qualitative methods should be employed in future research to identify whether existing foundations that are being used are in fact the “right” ones. It is also important to identify whether or not there is an over reliance on any one or two foundations and explore the influence this is having on HRD research and practice. Finally, questions concerning how theoretical foundations are considered “essential” by HRD scholars and practitioners and whether or not the field needs to consciously shift the focus from a currently predominant foundation to another less predominant one to enhance the disconnect between theory and practice.

Significance of the Study to New Knowledge in HRD

Although human resource development (HRD) as a field of study has been analyzed from its theoretical perspectives to a degree, there has been no distinct attempt to further explore the theoretical foundations. No research is available that seeks input on the importance and influences of the theoretical foundations of HRD from scholars and practitioners. The present study provides a baseline of data to further our awareness of the importance of the theoretical foundations and provides insights into how researchers and practitioners view theoretical foundations as influences on their own and the HRD field’s research and practice.

As an interdisciplinary field of study HRD’s theoretical disciplines must be rigorously studied and better understood by scholars and practitioners. Without such a focus on the theoretical foundations of research and practice HRD is destined to remain atheoretical and in nature and poor practice will continue to undermine its credibility (Swanson, 1997).

Clarifying and Defining the Performance Paradigm of Human Resource Development

Elwood F. Holton III
Louisiana State University

The performance paradigm of HRD has been sharply criticized recently. However, many of the criticisms reflect rather gross misunderstandings that stem in part from the lack of definition and explication of the core assumptions of the performance paradigm. This article proposes a definition and eleven core assumptions. Some of the criticisms of the performance paradigm are refuted and specific myths addressed.

Keywords: HRD Theory, Performance

The field of human resource development has been characterized by a variety of definitions (Weinberger, 1998) and perspectives. Since 1995 there has been an intense debate in the literature around the "learning" versus the "performance" paradigms of HRD (Watkins & Marsick, 1995; Swanson, 1995a, 1995b). This has occurred in spite of the fact that human resource development practice has been found to be increasingly focusing on performance outcomes and developing systems to support high performance (Bassi & Van Buren, 1999).

In this debate the performance paradigm of HRD has come under increasing criticism, some of which reflects misconceptions about the basic tenets of performance-based HRD. For example, Barrie and Pace (1998) argue for a more educational approach to HRD manifested through an organizational learning approach. They were also particularly critical of the performance paradigm:

Performance consists of the demonstration of specific behaviors designed to accomplish specific tasks and produce specific outcomes (Swanson & Gradous, 1986). Improvements in performance are usually achieved through behavioral control and conditioning. Indeed, performance may be changed or improved through methods that allow for very little if any willingness and voluntariness on the part of the performers. In fact, behavioral performance may be enhanced decidedly by processes that allow for minimal or no rational improvement on the part of performers in the change process. Their willingness of consciousness as rational agents is neither encouraged nor required. Such persons function in a change process purely as "means" and not "ends" (Holding, 1981).

Recently, their criticisms became even harsher (Barrie & Pace, 1999):

It is the performance perspective that denies a person's fundamental and inherent agency and self-determination, not the learning perspective. All of the negative effects of training come from a performance perspective (p. 295).

Bierema (1997) calls for a return to a focus on individual development and appears to equate the performance perspective to the mechanistic model of work. She says, "The machine mentality in the workplace, coupled with obsessive focus on performance, has created a crisis in individual development (p. 23)." She goes on to say that "valuing development only if it contributes to productivity is a viewpoint that has perpetuated the mechanistic model of the past three hundred years (p. 24)." Peterson and Provo (1999) also equate the performance paradigm with behaviorism.

Dirkx (1997) offers a somewhat similar view when he says that "HRD continues to be influenced by an ideology of scientific management and reflects a view of education where the power and control over what is learned, how, and why is located in the leadership, corporate structure, and HRD staff (p. 42)." He goes on to say that the traditional view in which learning is intended to contribute to bottom-line performance leads "practitioners to focus on designing and implementing programs that transmit to passive workers the knowledge and skills needed to improve the company's overall performance and, ultimately, society's economic competitiveness. In this market-driven view of education, learning itself is defined in particular ways, largely by the perceived needs of the sponsoring corporation and the work individuals are required to perform (p. 43)."

What is striking about these comments and others offered by critics of the performance paradigm of HRD is that they all contain rather gross errors and misunderstandings. A core premise of this paper is that many criticisms...
reflect a poor understanding of what the performance paradigm really means. However, the key reason for the misunderstanding is that the performance paradigm of HRD has not been clearly defined and presented in such a way that its core assumptions and theoretical premises are evident and easily accessible to other researchers. Performance is not a unitary or consensually defined construct, within or outside HRD (Holton, 1999; Swanson, 1999). The result is that performance advocates must blame themselves for the misunderstandings. The first purpose of this paper then is to clearly define the performance paradigm. After years of debate and theory building, it seems that it is time to reexamine “where we stand” with the performance paradigm of HRD and, in the process, clarify misunderstandings in the literature.

A second purpose of this paper is to demonstrate that there is less of a gap between the performance and learning paradigms than is represented by learning paradigm advocates. Simply, when properly and clearly framed, the performance paradigm is not what the learning paradigm advocates present it to be. While there can be no denying that there will always be some tension between the learning systems and work systems in an organization (Van der Krogt, 1998), there is actually more common ground than has been portrayed by performance critics.

In sum, the overall goal of this paper is not to argue for a unifying definition or perspective of HRD. Rather, it is hoped that the debate can become clearer and more accurate as a result of a better articulation of the performance paradigm. As Kuchinke (1998) has articulated, it is probably not possible or even desirable to resolve paradigmatic debates, but that the sharp dualism that has characterized this debate is also not appropriate or necessary.

Definition of the Performance Paradigm of HRD

The performance paradigm of HRD has not been formally defined in the literature, although there are definitions of HRD that are performance-based (Weinberger, 1998). The performance paradigm of HRD may be defined as:

The performance paradigm of HRD holds that the purpose of HRD is to advance the mission of the organizational system which sponsors the HRD efforts by improving the capabilities of individuals working in the organization and improving the organizational systems in which they perform their work.

Core Assumptions of the Performance Paradigm of HRD

1-Organizations must perform to survive and prosper, and individuals who work within organizations must perform if they wish to advance their careers and maintain employment. The performance paradigm views performance as a fact of organizational life that is not optional. If organizations do not perform, they decline and eventually disappear. Performance is not defined as only profit, but rather by whatever means the organization uses to define its core outcomes (e.g., citizen services for a government organization). Every organization has core outcomes and constituents or customers who expect them to be achieved. Even non-profit and government organizations face restructuring or extinction if they do not achieve their core outcomes.

By extension then, if individual employees do not perform in a manner that supports the organization's long-term interests, they are unlikely to advance in the organization and may ultimately lose their jobs. This is not to suggest that employees must blindly follow the organization's mandates. In the short-term they are expected to challenge the organization when necessary but over the long-term every employee must make contributions to core outcomes. Thus, the greatest service HRD can provide to the individual and to the organization is to help improve performance by enhancing expertise and building effective performance systems.

2-The ultimate purpose of HRD is to improve performance of the system in which it is embedded and which provides the resources to support it. The purpose of HRD is to improve performance of the system in which it is embedded (or within which it is working in the case of consultants) and which provides the resources to support it (Swanson & Arnold, 1997). All interventions and activities undertaken by HRD must ultimately enhance that system's mission-related performance by improving performance at the mission, critical performance sub-system, process and individual levels (Holton, 1999). Aside from general ethical responsibilities (Dean, 1993), HRD's primary accountability is to the system within which it resides.
The system’s mission, and the goals derived from it, specify the expected outcomes of that system. Every purposefully organized system operates with a mission, either explicitly or implicitly, and the role of the mission is to reflect the system’s relationship with its external environment. For a business organization, the mission may reflect its relationship with its industry, society and competitors. For a non-profit organization, its mission may reflect its relationship with the community and society. It is important to note that the concept of “performance system” is used instead of “organization.” A mission may be defined for any system organized to accomplish some purpose. If the system has a purpose, then it also has desired outcomes, so performance theory is applicable.

The particular system’s definition of its performance relationship with the external environment is fully captured by the mission and goals of the organization. In that sense, this model differs from that of Kaufman and his associates (cf. Kaufman, Watkins, Triner & Smith, 1998; Kaufman, 1987) who have argued that societal benefits should be included as a level of performance. This difference should not be interpreted to mean that societal benefits are unimportant. Rather, I argue that the relationship between the performance system and society is most appropriately captured by the mission of that system.

3-The primary outcome of HRD is not just learning, but also performance. The argument about “learning” versus “performance” has positioned the two as equal and competing outcomes. In reality, this is an inappropriate theoretical argument. Performance and learning really represent two different levels of outcomes that are complementary, not competing. Multi-level theory building has become increasingly popular as a means to integrate competing perspectives (Klein, Tosi, & Cannella, 1999). In management, this divide has been characterized as the “micro” domain where the focus is on the individual, and the “macro” domain where the focus is on the organization. Multi-level theory integrates the two by acknowledging the influence of the organization on the individual, and vice-versa:

Multi-level theories illuminate the context surrounding individual-level processes, clarifying precisely when and where such processes are likely to occur within organization. Similarly, multilevel theories identify the individual-level characteristics, behaviors, attitudes and perceptions that underlie and shape organization-level characteristics and outcomes (Klein, Tosi, & Cannella, 1999, p. 243).

From the multilevel perspective then, neither level is more or less important. Furthermore, individual learning would be seen as an integral part of achieving organizational and individual goals.

4-Human potential in organizations must be nurtured, respected and developed. Performance advocates believe in the power of learning and the power of people in organizations to accomplish great things. It is important to distinguish between the performance paradigm of HRD and simple performance management. The later does not necessarily honor human potential in organizations like performance oriented HRD does. Performance oriented HRD advocates remain HRD and human advocates at the core. Performance advocates do not believe that emphasizing performance outcomes invalidates their belief in and respect for human potential.

The performance paradigm of HRD recognizes that it is the unleashing of human potential that creates great organizations. While performance advocates emphasize outcomes, they do not demand that outcomes be achieved through control of human potential. Performance advocates fully embrace notions of empowerment and human development because they will also lead to better performance when properly executed (Huselid, 1995; Lam & White, 1998). Furthermore, they see no instances where denying the power of human potential in organizations would lead to better performance. Thus, they see it as completely consistent to emphasize both human potential and performance.

5-HRD must enhance current performance and build capacity for future performance effectiveness. Kaplan and Norton (1996) suggest two categories of performance measures: outcomes and drivers. Unfortunately, they do not offer concise definitions of either. For our purposes, outcomes are measures of effectiveness or efficiency relative to core outputs of the system, sub-system, process or individual. The most typical are financial indicators (profit, ROI, etc.) and productivity measures (units of goods or services produced) and are often generic across similar performance systems. According to Kaplan and Norton, these measures tend to be lag indicators in that they reflect what has occurred or has been accomplished in relation to core outcomes.

Drivers measure elements of performance that are expected to sustain or increase system, sub-system, process, or individual ability and capacity to be more effective or efficient in the future. Thus, they are leading indicators of future outcomes and tend to be unique for particular performance systems. Together with outcome measures, they describe the hypothesized cause and effect relationships in the organization’s strategy (Kaplan &
Norton, 1996). Thus, drivers should predict future outcomes. For example, for a particular company return on investment might be the appropriate outcome measure which might be driven by customer loyalty and on-time delivery, which in turn might be driven by employee learning so internal processes are optimized.

From this perspective, performance improvement experts who focus solely on actual outcomes, such as profit or units of work produced, are flawed in that they are likely to create short term improvement but neglect aspects of the organization that will drive future performance outcomes. Experts who focus solely on performance drivers such as learning or growth are equally flawed in that they fail to consider the actual outcomes. Only when outcomes and drivers are jointly considered will long-term sustained performance improvement occur. Neither is more or less important, but work in an integrated fashion to enhance mission, process, sub-system and individual performance.

6-HRD professionals have an ethical and moral obligation to insure that attaining organizational performance goals is not abusive to individual employees. Performance advocates agree that the drive for organizational performance can become abusive and unethical. In no way should performance oriented HRD support organizational practices that exceed the boundaries of ethical and moral treatment of employees. Clearly, there is ample room for disagreement as to the specifics of what is ethical and moral, but the basic philosophical position is that performance improvement efforts must be ethical. This is not viewed as hard to accomplish because of the assumption described above that effective performance is good for individuals and organizations.

7-Training/learning activities can not be separated from other parts of the performance system and are best bundled with other performance improvement interventions. Table 3 shows five different perspectives of HRD practice, grouped into three categories (Holton, 1999). Category 1, the learning perspective, used to be predominant in HRD practice. Most HRD practice has advanced to category 2, the learning systems perspective. The key change when moving from the learning to the learning systems perspective is that the outcomes focus changes to performance. The primary intervention continues to be learning, but interventions are also focused on building organizational systems to maximize the likelihood that learning will improve performance. One approach within this category, the performance-based learning approach (column 2a) remains focused on individual learning and associated systems, while the whole systems learning approach (column 2b) focuses on multiple levels of learning and associated systems.

The third category, the performance systems perspective, is the one of primary interest in this article. It is quite familiar to those who have embraced performance improvement or human performance technology (HPT) as their disciplinary base (Brethower, 1995). From these perspectives, the outcome focus is on performance like the

learning systems perspective, but the intervention focus is on non-learning as well as learning interventions. Within the performance systems perspective, the individual performance improvement approach (column 3a) focuses mostly on individual level performance systems.
The broadest approach, and the one advocated by performance-based HRD, is the whole systems performance improvement approach (column 3b). This approach focuses on improving performance outcomes at multiple levels with non-learning and learning interventions. In most organizations there is no profession or discipline charged with responsibility for assessing, improving and monitoring performance as a whole system. This void is directly responsible for the proliferation of "quick fixes" and faddish improvement programs, most of which focus on only a single element or a subset of performance variables. Because HRD is grounded in systems theory and the whole systems perspective of organizations, it is the logical disciplines to take responsibility for whole system performance improvements in organizations.

8-Effective performance and performance systems are rewarding to the individual and to the organization. Performance clearly benefits the organization. However, lost in the literature is the recognition that effective performance benefits the individual equally. In many instances, performance is presented as almost antithetical to individual benefits, implying one must choose between them. In fact, a variety of research tells us that people like to perform effectively:

- The goal-setting literature tells us that individuals build self-esteem by accomplishing challenging goals (Katzell & Thompson, 1990).
- Hackman and Oldham's (1980) job characteristics model and the research supporting it have shown that experienced meaningfulness of work and responsibility for work outcomes are two critical psychological states that individuals seek.
- Self-efficacy is built when individuals experience success at task performance which is referred to as enactive mastery (Wood & Bandura, 1989).
- Individuals may receive valued intrinsic and extrinsic rewards as a result of performance.
- Performance may lead to more career advancement and career opportunities in organizations.

People do not want to fail to perform in their jobs. Therefore, to the extent that HRD helps them be more successful in their jobs, performance-oriented HRD is just as valuable to the individual as the organization. Effective performance can make a significant contribution to individuals as well as their organizations.

9-Whole systems performance improvement seeks to enhance the value of learning in an organization. Contrary to conventional thinking, performance-based HRD actually seeks to increase the value of the individual employee and individual learning in the organization system, not diminish it. Performance-based HRD fully agrees that enhancing the expertise of individual employees is fundamentally important. However, performance-based HRD suggests that individually oriented HRD violates the fundamental principles of systems theory (Bertalanffy, 1968), which tell us that no one element of the system can be viewed separately from other elements. Intervening in only one element of the system without creating congruence in other parts of the system will not lead to systemic change. Furthermore, intervening in the whole system to improve outcomes or drivers alone is also flawed. For example, a company that downsizes drastically may increase profits (outcomes) in the short run, but it will leave itself without any intellectual capital (driver) for future growth. Human performance technologists (Stolovich & Keeps, 1992) and needs assessors (Moore & Dutton, 1978) have understood the need to view the individual domain within the larger organizational system in order to make individual domain performance improvement efforts more effective. Whole systems performance improvement goes a step further to analyze and improve performance of the whole system through a balanced emphasis on outcomes and drivers in the four performance domains.

10-HRD must partner with functional departments to achieve performance goals. One common lament from HRD practitioners is that the performance approach forces them to deal with organizational variables over which they have no control (e.g., rewards, job design, etc.). Performance oriented HRD acknowledges this and stresses that HRD must become a partner with functional units in the organization to achieve performance improvement, even through learning. Opponents often suggest that HRD should focus on learning because they can influence learning. Yet, classroom learning is the only variable in the performance system over which HRD professionals have the primary influence. Learning organization advocates stress the fact that much of the really valuable learning that takes place in organizations occurs in the workplace, not the classroom (Watkins & Marsick, 1993). Performance oriented HRD advocates suggest that if HRD is not willing to be a performance partner then it is doomed to play only small roles in organizations with minimal impact and with great risk for downsizing and outsourcing.
11- The transfer of learning into job performance is of primary importance. Because the dependent variable in performance oriented HRD is not just learning, but individual and organizational performance, considerable emphasis is placed on the transfer of learning to job performance. As Holton, Bates and Ruona (in press) point out, researchers are still working to operationalize the organizational dimensions important to enhancing transfer. Nonetheless, there is widespread recognition that the transfer process is not something that occurs by chance or is assured by achieving learning outcomes, but rather is the result of a complex system of influences (Baldwin & Ford, 1988). Learning is a necessary, but not sufficient, condition for improving job performance through increased expertise.

Performance advocates are known for emphasizing measurement of HRD outcomes to see if outcomes are achieved. Measuring performance is a common activity in organizations, so it is logical that performance oriented HRD would also emphasize measurement. This emphasis stems from two key observations. First, it seems that important performance outcomes in organizations are almost always measured in some manner. Thus, if HRD is to improve performance, then it must measure its outcomes. Second, components of organizational systems that are viewed as contributing to the organization's strategic mission are usually able to demonstrate their contribution through some measurement. Thus, if HRD is to be a strategic partner, it must measure results.

**Myths About The Performance Paradigm of HRD**

1- **Performance is behavioristic.** The performance paradigm is not the same as behaviorism. The performance paradigm is most concerned that performance outcomes occur, but in no way should it be interpreted to restrict the strategies and interventions employed to behavioristic ones. Barrie and Pace's (1998) contention that "improvements in performance are usually achieved through behavioral control and conditioning" is simply wrong. Similarly, Bierema's (1997) view that the performance approach is "mechanistic" and Dirkx's (1997) view that it leads organizations to "transmit to passive workers the knowledge and skills needed" are also wrong. The performance paradigm advocates none of these things, nor must it lead organizations in that direction. This myth probably arose because of the early work in performance technology which indeed grew out of behaviorism (Gilbert, 1978). It may persist for two reasons: a) the performance paradigm places considerable emphasis on building effective systems, in addition to individual development and b) performance-based HRD sanctions interventions which change the system in which the individual works, but do not involve the individual.

It is perfectly possible for a performance-oriented person to take a humanistic approach to HRD, as long as that approach will lead to performance outcomes. For example, interventions that attempt to spark more creativity and innovation in an organization can rarely be done using a behavioristic strategy. Or, a more spiritual approach to adding meaning to employees lives may be quite appropriate, if it leads to performance outcomes. Furthermore, the performance paradigm would not restrict learning solely to the objectivist paradigm (Mezirow, 1996), but would also embrace critical and transformational learning if needed to improve performance. In fact, many organizational change interventions to improve performance encourage employees to think more critically about their work and the organization. The performance paradigm can and does adopt any type of HRD strategy, as long as outcomes occur which further the mission of the system.

2- **Performance is deterministic.** Another mistaken belief is that the performance paradigm demands that outcomes of HRD interventions be pre-determined before the interventions. If that were true, then the only interventions that would be acceptable would be those for which outcomes could be determined in advance, thereby leaving out strategies such as the learning organization. In fact, the performance paradigm advocates no such thing. Performance advocates are just as comfortable as learning advocates with less certain outcomes, provided that outcomes do occur at some point. For example, in a learning organization example, an organization does not need to know exactly where the performance improvement will occur, but a performance advocate would say that they should expect to see that performance improvements do occur at some point and be able to assess outcomes when they do occur.

3- **Performance ignores individual learning and growth.** The performance paradigm honors and promotes individual learning and growth just as much as a learning paradigm does. The key difference is that the performance paradigm expects that learning and growth to benefit the performance system in which it is embedded. That is, learning and growth for the sole benefit of the individual and which will never benefit the organization is not acceptable for organization-sponsored HRD. Note that many performance HRD advocates (including this author) would honor learning and growth of the individual as a core outcome for other circumstances, but not for organization-sponsored HRD.
**4-Performance is abusive to employees.** There is little doubt that a performance approach to HRD can be abusive to employees, particularly when organizations use cost-cutting through downsizing as a substitute for sound performance improvement. However, this is a problem of implementation, not one that is inherent in the theoretical framework. Recent research (e.g., Huselid, 1995; Lau & May, 1998) clearly shows that creating an environment that is supportive and respectful of employees is not only the right thing to do, but also results in improved performance. When properly implemented, performance-based HRD is not abusive to employees.

**5-Performance is short-term focused.** Once again, this is a problem of implementation, not theory. It is true that many organizations place too much emphasis on short-term results. However, most organizations have learned that focusing on short term performance and not building capacity for long-term success does not work. There is nothing inherent in performance theory that says it must be short-term. Many long-term interventions have been abused by companies and inappropriately conducted with a short-term perspective (e.g., TQM). Performance oriented HRD is no different—some will do it right, and others will not.

**An Unresolved Issue: Control of Learning and Individual Growth**

There are some unresolved issues that divide the performance advocates from individual learning and development advocates. These seem to be deeply held values and philosophical assumptions (Ruona, 1999). The issue of organizational control over the learning process and outcomes is a difficult one for those who believe that only the individual should control his or her learning process (Bierema, 1997). It may be the one issue about which there can be no agreement because it is a philosophical issue about which people have passionate feelings.

The performance paradigm accepts the premise that the organization and the individual should share control of the individual’s learning if the organization is the sponsor of the intervention. However, performance advocates would argue that ignoring performance in favor of individual control may ultimately be bad for the individual if the organization is not able to survive or prosper. The individual employee presumably needs the benefits of employment (e.g., economic, psychological, instrumental) which will only exist if the organization thrives. Thus, sharing control in order to advance organization performance is viewed as appropriate and beneficial to both parties.

The other argument for shared control is an economic one. Simply, if the organization is paying for the HRD efforts, it has a right to derive benefits from it and share control over it. This is one area of criticism that performance advocates truly struggle to understand. It is difficult to understand how organizations can be expected to pay for HRD efforts, but yet have those efforts focus primarily on what is good for the individual. To performance advocates, this sounds perfectly appropriate for schools and universities in a democratic society, but not for organization-sponsored HRD. In fact, most would wholeheartedly support the individually oriented philosophy for learning activities outside of organizations. Yet, most performance advocates also understand there are deeply held fears about institutional control over individual learning. Nonetheless, they view the situation as different once HRD crosses the organizational boundary and employers fund HRD efforts.

**Why the Performance Paradigm is Important**

Perhaps the best way of thinking about the importance of the performance paradigm is to ask this question: Could organizationally sponsored HRD survive if it did not result in improved performance for the organization? Most would agree that the answer is no. Like all components of an organization, HRD must enhance the organization’s effectiveness. The performance paradigm is most likely approach to lead to a strategic role for HRD in organizations. HRD will only be perceived as having strategic value to the organization if it has the capability to connect the unique value of employee expertise with the strategic goals of the organization (Torraco & Swanson, 1995). While it would be naïve to think that the performance and learning paradigms would ever converge, it is important to realize that there may be much more common ground than has been stated by learning advocates. Further scholarly research and debate is needed to more clearly articulate the common ground as well as the differences.

**References**

The purpose of this study was to identify key variables within and outside the learning context that could affect motivation to learn during training. Task autonomy, extrinsic rewards, organizational orientation toward quality improvement, and a work environment within which people live up to high ethical standards were found to be the most important predictors for motivation to learn during training.

Keywords: Learning, Motivation, Work Environment

According to DeSimone and Harris (1998), learning can be defined as "a relatively permanent change in behavior, cognition, or affect that occurs as a result of one's interaction with the environment" (p. 56). DeSimone and Harris further state that "learning is an important part of all HRD efforts. Whether you are training a carpenter's apprentice to use a power saw, conducting a workshop to teach managers to use discipline more effectively, or trying to get meatpackers to understand and follow new safety procedures, your goal is to change behavior, knowledge, or attitudes through learning" (p. 56). DeSimone and Harris (1998) make the point that HRD professionals and supervisors who understand the learning process and how to create environments that facilitate learning can design and implement more effective HRD programs.

When it comes to maximizing learning outcomes, researchers have identified three factors that are perceived to affect learning: (1) trainee personal characteristics; (2) training design; and (3) training transfer climate (Baldwin & Ford, 1988; Baldwin & Magjuka, 1991; DeSimone & Harris, 1998).

Briefly, training design "involves adapting the learning environment to maximize learning. Training design issues include (a) the conditions of practice that affect learning, and (b) the factors that affect retention of what is learned" (DeSimone & Harris, 1998; p. 64). In terms of the training transfer climate factor, researchers have shown that the degree to which learning is transferred back to the job greatly depends on how conducive the work environment is towards learning. In particular, supervisory and coworker support for new learning, task cues - the degree to which characteristics of trainee's job prompt or remind him or her to use new skills and knowledge acquired in training, and a continuous-learning culture have been found to be significantly associated with training transfer (Baldwin & Ford, 1988; Clark, Dobbins, & Ladd; 1993; Rouillier & Goldstein, 1993; Tracey, Tannenbaum, & Kavanagh, 1995).

In terms of trainee personal characteristics, the personal attributes of trainability, personality, and attitudes have been found by researchers to affect learning. Some of the personality traits that have been identified as influential factors during learning are locus of control, need for achievement, independence, extraversion, openness to experience, and cognitive playfulness (DeSimone & Harris, 1998). As far as attitudes toward learning are concerned, research by Noe (1986) has shown that "an employee's attitudes toward career exploration and job involvement have an effect on both learning and its applications to the job" (DeSimone & Harris; p. 64). Trainability, finally, refers to the degree to which a learner has the motivation and ability to learn as well as perceives the work environment to be supportive of learning.

According to DeSimone and Harris (1998), "trainability is an important factor in HRD. Placing employees in programs they are not motivated to attend or are not prepared to do well in can waste time and resources" (p. 61). The importance of identifying the factors that affect motivation to learn during training, therefore, cannot be overemphasized. With regard to the importance of understanding the motivation to learn construct, Clark et al. (1993) stated the following:

Recently, several individuals (e.g., Noe, 1986) have recognized that motivation to learn is critical for training effectiveness and that researchers need to identify factors that foster such motivation. Without motivation to learn, the most sophisticated training program cannot be effective. A common complaint of trainers is that trainees enter the training environment with little motivation to learn and thus training is doomed to fail from the beginning. Hence it is important that the training literature develop a better understanding of the motivation-to-learn construct and the factors that affect it. (p. 293)
Clark et al. (1993) further stated that despite its importance, the construct of motivation to learn has been largely neglected in training research. The authors attempted to address this research gap by conducting a structural equations modeling study. The purpose of the study was to explore the effects of several contextual factors on training motivation. Their survey instrument was designed to measure training motivation, expected job and career utility of training, peer and supervisor training transfer climate, involvement in decision to be trained, and decision-maker credibility.

The structural equations model for Clark's et al. (1993) study was built upon expectancy theory. The underlying premise for the model was that training motivation is a direct function of the extent to which the trainee believes that training will result in either job utility or career utility. Clark et al. (1993) defined career utility as "the perceived usefulness of training for attainment of career goals, such as getting a raise or promotion, or taking a more fulfilling job" (p. 294). Job utility at the same time was defined as "the perceived usefulness of the training course to facilitate goals associated with the current job, such as increased productivity, reduced errors, or better problem-solving skills" (Clark et al., 1993; p. 294).

In summary, the structural equations modeling study by Clark et al. (1993) revealed the following important findings: (a) perceived job and career utility of training significantly predicts training motivation, (b) involvement in the decision to be trained results in higher perceptions of job and career utility, (c) the credibility of the individual recommending or requesting training affects job and career utility, and (d) perceived supervisory support for training transfer affects anticipated job utility and thus motivation to learn during training. However, Clark et al. (1993) pointed out that a limitation of their study was that not all variables affecting training motivation were included in it. In particular the excluded variables of job involvement, organizational commitment, and achievement motivation were cited as being important to motivation to learn but not included in their study.

The construct of pretraining motivation was researched further by Facteau, Dobbins, Russell, Ladd, and Kudisch (1995). Through structural equations analysis with LISREL VII the authors of this study attempted to determine whether trainees' general perceptions of the training environment had an influence on pretraining motivation as well as training transfer. Moreover, the authors attempted to determine the degree to which pretraining motivation and training transfer were influenced by social support for training and task constraints in the work environment. Social support for training was defined in terms four organizational constituents - top management, supervisors, peers, and subordinates, while task constraints as lack of resources.

Training incentives was also used as a predictor in this study. Training incentives was defined in terms intrinsic incentives - the degree to which trainees believed a variety of intrinsic benefits were likely to result from successful completion of training, extrinsic incentives - the degree to which training would result in such tangible external rewards as pay raise and promotions, and compliance - the degree to which training was taken because it was mandated by the organization. Other predictors that were used in this study were: (a) career exploration and planning; (b) organizational commitment; (c) support for training transfer; and (d) training reputation.

In short, the Facteau et al. (1995) study found training reputation, intrinsic and compliance incentives, organization commitment, perceived training transfer and three social support variables (subordinates, supervisor, and top management) to be predictors of pretraining motivation. However, unlike previous studies, extrinsic incentives as well as career exploration and career planning were not found to be significantly related to pretraining motivation.

Facteau et al. (1995) concluded their study by once again stressing the importance of examining the organizational context within which training exists when investigating training motivation. Some organizational factors that were cited as relevant to the study of pretraining motivation were the organizations' strategic plans, layoff policies, emphasis on employee development and continual learning, creation of self-managed work teams, and climate.

Purpose of the Study

Given the scarcity and limitations of research on the important area of motivation to learn, the main purpose of this study was to bridge some of the above stated research gaps by identifying the key variables within and outside the learning context that could affect motivation to learn during training. What distinguishes this study from previous ones is that it takes a more holistic approach towards training motivation by incorporating in its design organizational variables that are also perceived to affect motivation to perform. Given that the ultimate goal of training is to enhance performance, the underlined premise of this study is that motivation to learn will not only be affected by the immediate learning environment, but the organizational variables that affect performance as well. Therefore, this study assumes that a trainee will be more motivated to learn during training if he/she is a member of a high performance system which in turn expects and rewards exemplary performance.
Theoretical Framework

Aside from the previously cited research pertaining to the motivation to learn construct, the theoretical framework of this study was also based on the sociotechnical systems (STS), total quality management (TQM), and training transfer theories and research which in turn furnished the training and organizational variables projected to have an influence on employee and organizational performance. Briefly, this study incorporated in its design the following learning and organizational dimensions: training transfer climate; learning climate; management practices; employee involvement; organizational structure; communication systems; reward systems; job design; innovation practices; technology management; teamwork climate; ethical work culture; and process improvement climate. Organizational performance was defined in terms of the following dimensions: quality, productivity, job satisfaction, and rate of new technology adaptation.

Research Questions

In short, this study attempted to answer the following research questions:

1. What is the degree of association between each of the identified training transfer climate, learning, and organizational dimensions with motivation to learn during training?
2. To what extent is a high performance system, as defined by the STS and TQM theories, associated with motivation to learn during training?

Methodology

Instrument

The instrument for this study consisted of a 99 Likert item questionnaire which was designed to assess the organization in terms of the earlier described dimensions. Many of the dimensions were assessed with scales that were used or described in previous instruments or research, while several were designed specifically for this study. The questionnaire was pilot-tested on a group of 15 participants before the main study for clarity. Moreover, a group of seven experts reviewed the instrument for content validity.

Subjects

The sampling frame of this study consisted of 35 employees of a small distribution and light manufacturing firm, 30 employees of an engineering firm, 10 employees of a small manufacturing firm that attended total quality management training, and 54 salaried employees of a large Midwestern Bank who were asked to complete the questionnaire after attending technical training. Given that all but 35 of the participants have returned their questionnaire (94/129), the response rate of this study so far is calculated at 72.9%. In all, 63.6% of the respondents were males and 36.4% females. In terms of education, 31.7% of all respondents were high school graduates, 13.4% obtained an associates degree, 35.4% had a bachelors, 15.9% a masters, and 3.7% a PhD. Lastly, 31.1% of the participants were hourly employees, 4.4% were administrative personnel, 36.7% were salaried employees, 11.1% held a supervisor’s job, while 12.2% and 4.4% were middle and senior managers respectively.

Data Analysis

Once all the data from all participants was collected, both descriptive and inferential statistics were used to analyze it. With regard to research question 1, correlational and regression analyses were used to describe the extent to which the identified training transfer climate, learning, and organizational dimensions are associated with motivation to learn during training. Correlational and regression analyses were also used to answer research question 2 and thus determine the extent to which a high performance system, as defined by the STS and TQM theories, is associated with training motivation. Coefficient alpha of the instrument was calculated at 0.97 which indicates that the instrument is highly reliable.
Results

As shown in Table 1, the motivation to learn variable was found to be significantly correlated with 30 of the 99 variables of the questionnaire. The correlations ranged from 0.215 to 0.399 and covered variables from a variety of dimensions. With regard to the learning and training transfer dimensions, motivation to learn during training was found to exhibit the highest association with the variables that dealt with rewards for learning, especially extrinsic rewards, as well as with the degree to which the trainee is held accountable for training received. Interestingly enough, task cues and supervisory support for new skills and knowledge, two of the strongest predictors of training transfer, were not found to be significantly correlated with motivation to learn. Other learning and training transfer variables that were not found to be significantly associated with motivation to learn during training were: reduced workload upon return from training, having input into the type of training the employee attends, and clearly stated training program goals and objectives.

In terms of the other organizational dimensions, motivation to learn during training was found to be significantly correlated with variables from the job design, teamwork, and innovative/competitive organization dimensions. Moreover, motivation to learn was found to be associated with a work environment that is characterized by a high degree of employee involvement, high ethical standards, and flexible policies and structures. Within such an environment coworkers produce at the expected level, employees are praised by their supervisor for outstanding performance and the system regards people as more important than technology. It is important to note that the variable that was found to exhibit the highest correlation (r = 0.399, p < 001) with motivation to learn was the task autonomy variable of having influence over the things that determine how one's work gets done.

In all, motivation to learn during training was found to be more highly associated with the following variables: the degree to which one has influence over the things that determine how his/her work gets done (r = 0.399, p < 001); the degree to which learning is well rewarded (r = 0.364, p < 001); the degree to which one receives such extrinsic rewards as pay and promotion when applying new skills and knowledge acquired in training (r = 0.360, p < 001); the degree to which the organization regards people as more important than technology (r = 0.353, p < 001); the degree to which one has independence and freedom in how he/she does the work (r = 0.346, p < 001); the degree to which coworkers produce at the expected level (r = 0.327, p < 001); and the degree to which one's job requires skill variety (r = 0.305, p < 001).

The results of the stepwise regression analysis of the motivation to learn during training variable is shown in Tables 2 and 3. As it is shown in Table 2, the produced regression model accounted for almost 33% of the total variance of the dependent variable and it incorporated in its design four independent variables. Task autonomy, or having influence over the things that determine how one's job gets done, accounted for 14.8% of the total variance and it can thus be considered as the most important predictor (b = 0.364; p = 0.001) of this regression model. Receiving such extrinsic rewards as pay and promotion when applying the skills and knowledge acquired in training (b = 0.282; p = 0.011) was the second variable selected by the regression model and accounted for 7% of the total variance. The extent to which quality improvement has higher strategic priority than short-term financial gains (b = 0.351; p = 0.002) and people live up to high ethical standards (b = 0.288; p = 0.011) were the last two variables selected by the regression model and accounted for 5.4% and 5.7% of the total variance respectively. Given the high tolerance values depicted in Table 3, one may conclude that multicollinearity was not a problem for this regression model.

Summary and Conclusions

In terms of previous research, this study agrees with Clark's et al. (1993) conclusion that career utility, or the perceived usefulness of training for attainment of such career goals as raise or promotion, is a significant predictor of training motivation. This in turn contradicts Facteau's et al. finding according to which extrinsic incentives is not a significant predictor of pretraining motivation. However, unlike Clark's et al. study, this study failed to show an association between supervisory support for training transfer and motivation to learn during training. Motivation to learn during training was instead found to exhibit a low to moderate correlation (r = 0.250, p < 0.05) with supervisory praise and recognition for outstanding performance.

In summary, what the regression model of this study suggests is that motivation to learn during training will be predominantly dependent on the extent to which the trainee holds a job that assures him or her task autonomy, he or she expects to receive such extrinsic rewards as pay and promotion when applying newly acquired skills and knowledge, and functions in a quality driven organization within which people live up to high ethical standards. essence, this finding confirms the earlier stated underlying assumption of this study and proves that training motivation is indeed also related to organizational variables that directly or indirectly affect employee or organizational performance. The fact that 24 out of the 30 significant correlations depicted in Table 1 pertained to the association between motivation to learn and the identified TQM and STS job and work environment variables, attests to the validity of this conclusion.

Another significant finding of this study is the identification of task autonomy as a more important predictor for training motivation than all 15 learning and training transfer variables incorporated in the study. Given that task autonomy has often been cited by scholars (French & Bell, 1995; Hackman & Oldham, 1980; Pasmore, 1988) as a
predictor for job motivation as well, this finding exemplifies the point that training motivation and training effectiveness in general cannot be studied in isolation. Rather, researchers should view training as another performance improvement intervention which is directly or indirectly affected by all other systemic factors perceived to affect employee or organizational performance.

How does this Research Contributes to New Knowledge in HRD?

As stated in the introduction, several scholars have recognized that motivation to learn is critical for training effectiveness and that researchers need to identify the factors that foster such motivation. By taking a holistic approach to learning motivation, and thus identifying new variables in the broader work environment that can facilitate the learning process, this empirical study was be able to assist the HRD field in three ways: a) bridge some the research gaps with regard motivation to learn; b) significantly contribute new knowledge in an area which often directly affects the success of many HRD efforts; and c) assist learning organization theorists operationalize the work environment in terms of dimensions that are conducive to a learning environment. In terms of future research, this study has identified at least one new important predictor (task autonomy) for the motivation to learn construct. Given the small sample size associated with this study, however, the conduction of future research with regard to the examination of the relationship between task autonomy and motivation to learn will help determine the extent to which such an association is indeed an important one.

Nonprofit Learning Organizations: Issues for Human Resource Development

Susan Kay McHargue
University of Georgia

Nonprofit organizations (NPOs) play a significant social and economic role in our society, yet they are facing ever-increasing changes that impact their performance and survival. To cope with the changes and challenges they face and to achieve a high level of competence, NPOs, as well as for-profit organizations, must be learning organizations. A study of this issue revealed that there is a direct relationship between learning organization dimensions and resources and performance in NPOs. Findings support the need for HRD in NPOs, and point to the unique and specific concerns that might impact learning in the nonprofit sector.

Keywords: Nonprofit Learning Organization, Nonprofit Performance, Nonprofit human resources

The growing economic and social significance of nonprofit organizations (NPOs) in our country is widely discussed in literature (Hodgkinson, Weitzman, Abrahams, Crutchfield, & Stevenson, 1996; Drucker, 1990; Dees, 1998; Pappas, 1996). NPOs assume a vital share of the responsibility for meeting public needs that neither government nor business can meet. Statistics show that these organizations have expenses roughly equivalent to 6% of the nation's total economy (Wilbur, Finn, & Freeland, 1994), and are America's largest employer when you consider the total number of their workers and volunteers (Drucker, 1990).

While the role of NPOs is significant, so too are the challenges these organizations face. As discussed in the current literature (Dees, 1998; Hammack and Young 1993; Hodgkinson et al., 1996), these challenges include growing controversies and scrutiny, an increasing complexity of social issues, ever-increasing costs and diminished funding, particularly public funding, and competition from for-profit businesses and other nonprofits. These trends are creating more business-like NPOs. Funders, as well as the general public, expect efficiency of administration and effectiveness in service outcomes.

Nonprofit Learning Organizations

To achieve a high level of competence and cope with the changes and challenges they face, NPOs, as well as for-profit organizations, must be learning organizations (Garratt, 1987; Garvin, 1993; Marquardt, 1996, Senge, 1990; Watkins & Marsick, 1993, 1996). Learning organizations subscribe to an ongoing learning process that continually increases their capacity, both for change and performance. The learning is systemic and improves and empowers the organization, leading to a higher intent of service and education to a larger world. Yet time for learning and the formalization of human resource development (HRD) in these agencies is probably last on their agenda, due to heavy work loads (NPOs are labor-intensive), lack of funding, and weak internal systems and structures for doing so. One dilemma is that donors no longer simply give to an organization, but earmark dollars for a specific program. Money is intended to provide client services, with minimal amounts spent for operations or training. This can restrict the organization's initiative and ability for learning by their workers, let alone the funding for staff, even minimal, whose concerns focus on the development of their personnel. This problem is put in perspective when one considers that most NPOs are young and small, with limited internal structure to make HRD possible. Nearly seventy-five percent of all charitable 501(c)(3) organizations have been founded since 1970, and seventy-two percent of those organizations that filed IRS forms in 1993 had expenses of less than $500,000 (Hodgkinson et al., 1996).

Learning and Performance. Research with action plans must be developed to guide donors and constituents of NPOs toward new ways of thinking about funding and the importance of HRD in these organizations. NPOs cannot afford that funding for personnel development and training be seen as an unwarranted or unaffordable expense. One such way to do this is to relate learning to performance. Donors and the public in general want to know that the NPO is engaging their monies in ways that will increase performance. For NPOs, the performance bottom line is service and service outcomes, which may be reflected in financial performance, learning performance, and mission.
performance. A recent study (McHargue, 1999) shows that there is a direct relationship between learning organization dimensions and performance in NPOs.

The major objective of this study was to examine the relationships between learning organization dimensions and resources in performance in nonprofit 501(c)(3) human service organizations in the nation. To do this, the mission performance measures for nonprofit human service organizations were identified and made operational, and the financial and knowledge performance measures which have been developed and successfully studied in the for-profit sector (Watkins & Marsick, 1997a, Dimensions of the Learning Organization Questionnaire) were adapted for use in the nonprofit setting.

The conceptual model guiding the study is shown in Figure 1.

The resource segment of the model is adapted from Lawler, Nadler, & Cammann's (1980) model of an organizational behavior system. Another model (Herman & Renz, 1997) from a study on health and welfare charities also identified some of the sample organization characteristics relating to organizational effectiveness. The learning organization behaviors in the conceptual model were taken from the theoretical framework for the study, Watkins and Marsick's Sculpting the Learning Organization (1993), and their edited book In Action: Creating the learning organization (1996).
We wanted to answer the following four questions: To what extent do learning organization dimensions independently explain observed variances in nonprofit performance? To what extent do select nonprofit organization characteristics independently explain observed variances in learning organization dimensions? To what extent do select nonprofit organization characteristics independently explain observed variances in nonprofit performance? To what extent can learning organization dimensions and select nonprofit organization characteristics jointly explain the observed variances in nonprofit performance?

The significance of the findings of this study for human resource developers is that they will be able to more effectively approach nonprofit learning and development. Even though the nonprofit sector is naïve about what it takes to invest in their paid staff or their volunteers (Pappas, 1996), there is an increasing need for ongoing education and training (Dees, 1998). The present study supports the theory that learning organization dimensions can be applied successfully in the nonprofit sector.

For-Profit to Nonprofit Issues

To better develop learning and to improve performance in NPOs, one must first understand the distinct differences and the similarities between this sector and for-profit organizations. Although Kerka (1995) stated that any type of organization can be a learning organization, there are differences as well as similarities between NPOs and for-profit organizations that should be noted and may impact the strategies for becoming a learning organization. Table 1 presents a compilation of some of the unique features of the NPO. While these characteristics are not true in every case, they are true enough to be considered a common distinction.

</tr>
</tbody>
</table>
The difficulty some NPOs currently face is to work effectively within two distinct organizational frameworks: to think and act nonprofit and for-profit at the same time. In other words, NPOs compete in a volatile for-profit world to keep their services funded, and yet they must remain true to their nonprofit mission and constituents. They must market their services differently because they are selling something intangible to donor/customers who will not benefit directly from the product (Hammack and Young (1993)).

Another distinct feature of the NPO is the wide diversity of its constituents. NPOs work with paid staff as well as volunteers, clients, boards, and donors. Hodgkinson and Weitzman (1992) report that volunteers provide the equivalent of nine million full-time employees to the nonprofit work force. Boards also provide unique governing functions in the NPO (Axelrod, 1994). The board of directors is usually made up of volunteers whose members come from differing backgrounds, rather than stockholders, professional managers, or government officials, as in business. Kanter and Summers (1987) suggest that the varying standards of clients, donors, and others in a NPO create organizational rigidities that make innovation and change difficult. Learning and personnel development may also be more challenging.

Method

Participants. The population of interest for this study was human service 501(c)(3) NPOs in the nation. Names and addresses for the study were generated from the Urban Institute’s NCCS Core File, 1997 data base, the sampling frame for the study. This data is produced annually and is based on the 1997 IRS Form 990 Return Transaction File. A total of slightly over 6,000 organizations fit the sample characteristics: be in existence five years or more, and have a budget of $1 million or more. A survey was mailed to the leaders of 617 randomly selected organizations. A total of 264 NPOs who met the study criteria responded. The adjusted response rate was 44%, and is above the response range of 25% to 40% reported in other studies of NPOs. Of the participants, 73% held an executive position, 22% held an administrative position, 3% held a professional position, and 1% were hourly employees.

Analyses. Bivariate and exploratory multiple regression analyses were used to answer the four research questions.

Results

Question 1. To what extent do learning organization dimensions independently explain observed variances in nonprofit performance? Of the learning organization variables, systems to capture learning showed the strongest relationship with both financial performance ($\beta=.49$, $r^2=.24$) and knowledge performance ($\beta=.47$, $r^2=.22$), while continuous learning ($\beta=.33$, $r^2=.11$) showed the strongest relationship with mission performance.

Question 2. To what extent do select nonprofit organization characteristics independently explain observed variances in learning organization dimensions? One organization characteristic, debt ratio, predicted more of the learning organization variables than either human resources or the other capital resources of net assets (fund balance) or savings ratio. The debt ratio was calculated to show the relationship of liabilities to assets. A negative showing is actually a positive outcome. Debt ratio showed a negative relationship with continuous learning ($\beta=-.13$, $r^2=.02$), systems to capture learning ($\beta=-.12$, $r^2=.02$), connect to the environment ($\beta=-.18$, $r^2=.03$), and leadership for learning ($\beta=-.15$, $r^2=.02$). The strongest relationship overall was between connection to the environment and debt ratio ($\beta=.18$, $r^2=.03$). Systems to capture learning and number of volunteers ($\beta=.17$, $r^2=.03$) showed the second strongest relationship.

Question 3. To what extent do select nonprofit organization characteristics independently explain observed variances in nonprofit performance? Of the twenty-four possible relationships, only three were significant. Two of these, debt ratio to knowledge performance ($\beta=-.13$, $r^2=.02$) and savings ratio to mission performance ($\beta=-.15$, $r^2=.02$) were significant at the $p<.05$ level. One relationship, debt ratio to financial performance ($\beta=.17$, $r^2=.03$) was significant at the $p<.01$ level. Note that the debt ratio and savings ratio show a negative relationship. These calculations show the relationship of liabilities to assets (debt ratio) and surplus (the revenue less expenses) to expenses (savings ratio). As discussed above, a negative showing is actually a positive outcome. Human resources (number of employees and number of volunteers), as well as the age of the organization and net assets (fund balances) were not significantly related with any of the performance measures. In summary, of the organizational characteristics, debt ratio related most frequently and at the highest level with both learning organization dimensions and performance measures, specifically financial performance and knowledge performance. Four of the
six resource variables (employees, volunteers, age of organization, and net assets) were not significantly related to performance.

**Question 4.** To what extent can learning organization dimensions and select nonprofit organization characteristics jointly explain the observed variances in nonprofit performance? The findings resulted in three best performance models, as shown in Tables 2, 3, and 4 and Figures 2, 3, and 4. The best financial performance model showed that when taken together, number of volunteers and systems to capture learning along with debt ratio and leadership for learning explained 26% of the variance in financial performance. The best knowledge performance model showed that when taken together, number of volunteers and systems to capture learning, along with number of volunteers, net assets and continuous learning explained 26% of the variance in knowledge performance. The best mission performance model showed that team learning along with number of volunteers and net assets when taken together with continuous learning, and savings ratio explained 16% of the variance in mission performance.

Note: Learning takes place at every level: individual, team, organization, and global

Discussion

The following principle conclusions are drawn from this study.

- *Embedded systems to capture and share learning* strongly predict the financial and knowledge performance in a NPO. This important learning dimension incorporates the use of two-way communication, easy and quick access to information, maintenance of an up-to-date profile of employee/volunteer skills, the creation and use of effective evaluation methods, sharing with employees and volunteers of lessons learned, and a monitoring of the results of the investments in learning. In other words, learning must not be left to chance or overlooked, but valued and integrated into the organization and the worklife of the employee. Openness in communication, enabling, and development for all is implied. The need for investment in technology and its significance to NPO performance is also shown in these findings. NPOs and their donors and stakeholders must not see this as “fluff” for their organization, but rather as vital to their existence. As mentioned earlier, donors earmark their monetary gifts for specific services and programs leaving little resources, if any, for equipment to administer the services. Challenges facing NPOs include securing outside funding for the development of both low and high tech systems for learning, and the creation of systems where there is no funding.

- As we move from the information era to the knowledge era, NPOs will need to focus more on human resource development. The NPO’s mission of impacting and changing lives is best performed when the staff, on an individual basis, has time and resources to learn and is able to see day-to-day challenges as opportunities to
learn. It is doubtful that NPOs can justify to their donors, above service to their clients, the need for HRD unless they can also show that it is profitable. This study confirms that financially efficient NPOs support individual learning in their organizations. To insure effective NPOs, it is important that consideration and encouragement be given by government and donors for these organizations to invest monies in their staff and not solely in their clients at the expense of significant organizational and staff needs.

- Learning and performance are higher in a NPO when the organization is financially stable and has sufficient and skilled human resources, including employees and volunteers. NPOs exist in an environment of uncertainty that is difficult for them to control – Will funding allotments be cut? Will volunteers continue to help? Will employees leave for better paying jobs? Who or what will dictate our next services and programs? Can we determine our performance when so much of it depends upon outside stakeholders? If NPOs want to be learning organizations it will be important to strategically plan for a conducive environment for learning, i.e., where human and capital resources are adequate so that energies are not directed solely toward fundraising and services, but the NPO has time and resources to learn and continuously improve.

- Leadership for learning is critical to becoming a learning organization. Findings from this study show that this dimension, along with systems to capture learning, are most predictive of financial performance. Organizations can only become effective if the people who run them are capable of learning continuously and of giving direction and support for learning. While the learning process does not need to be expensive and can be performed with little cost, the leader’s time is vital. This may be crucial because most NPOs are small with meager resources (Hodgkinson Weitzman, Abrahams, Crutchfield, & Stevenson, 1996).

- The use of volunteers is significant in the learning and the performance of a NPO. In terms of value, there are estimates that voluntary action in the nonprofit sector is at least on par with personal gifts of money and financial assets that these organizations receive (Brown, 1999). According to the findings from this study, volunteers keep a NPO close to their mission. However, the use of volunteers presents a unique management challenge to NPOs, who may work extensively with volunteers in achieving their mission. Many volunteers are with the organization short term, making it difficult for learning to be captured and shared and for any significant human resource development to take place.

Nearly three-fourths of all NPOs have been founded since 1970 (Hodgkinson et al., 1996). Many of these organizations have a short life span because they can not cope with the challenges they face. The possibility of market share is also shrinking with this proliferation. NPO leaders must prepare for increasing competition from other nonprofits. Learning organization dimensions provide the materials to do this. The successful organizations in this study identified skills they needed for future tasks, learned from past mistakes, brought the client into the decision-making process, considered employee morale in their decisions, and empowered others to achieve the organization’s vision. They were also innovative in their new services. These NPOs and their leaders will be sought after to meet the needs of society. Leaders of nonprofits must aggressively develop these specific learning organization elements in their organizations, and be prepared to sacrifice to do so. NPOs that can learn and thereby improve their performance will not only impact their clients and their communities, but ultimately all of society.

Implications. HRD can profit from these findings as this field incorporates into their learning and development theory elements that are unique to NPOs. It is important to remember that while NPOs are like for-profit organizations in many ways, they are also unique. HRD can profit by playing to this uniqueness rather than trying to conform the NPOs to the practices of the business world. As we move from the information era to the knowledge era, NPOs will focus more on HRD and additional research will be needed. More HRD departments will be created in NPOs, and the demonstrated benefits in this study for adult learning on an individual, team, organizational, and societal level in NPOs will better inform development in the field.

Future Research. Future studies will need to focus on how to best design learning organizations in human service NPOs. It will also be important to learn how to do this where funding and time for learning is limited or non-existent.

Employee Perceptions of the Meaning of Empowerment

Mark S. Rulle
Washington County Health System, Inc.

Neal Chalofsky
The George Washington University

This study explored the perceptions that non-supervisory employees have of the meaning of empowerment. Analysis of employee interviews resulted in the identification of five major themes: Impact, Competence, Autonomy, Meaning of Work, and Relationship with Supervisor, which work interdependently as aspects of empowerment. Employees identified everyday type activities as providing empowerment opportunities. Most experiences involved relationships with patients although the employee's relationship with their supervisor was a key aspect to the subject's experience.

Keywords: Empowerment, Employees, Healthcare

Empowerment has become increasingly important to American businesses as it has been linked to employee creativeness (Walton, 1985), commitment (Yankelovitch, 1981), and independence (Berlew, 1986). There is a perception that empowerment of employees may provide a competitive advantage for those who do it well as it is seen as a mechanism to managing change and an approach toward improving the bottom line (Kizilos, 1990).

An emerging definition of empowerment is, “to enable.” This implies that activities which enable an individual to act within a particular situation are empowering activities. The purpose of this study was to explore the perceptions that non-supervisory, medical professional employees have of the meaning of empowerment. Whereas much of the current literature focuses on management interventions to empower employees, very little research has been conducted to determine how employees perceive their own empowerment. Therefore, the major research question is, “What are non-supervisory, medical professional employees perceptions of the meaning of empowerment?” In seeking answers to this question the study will examine the empowered individual’s perception of their own empowerment experience. The answer to the research question is significant as it can guide workers, managers and human resource professionals toward the creation of an empowered work force.

Recent work has proposed that empowerment is a multi-dimensional construct (Spreitzer, 1995; Thomas & Velthouse, 1990) having suggested that individuals may identify and interpret empowerment in various ways. Therefore, references to the empowerment construct are found in the psychological, social action and management literature.

According to Spreitzer (1995), psychological empowerment consists of four distinct dimensions; self-determination, competence, meaning and impact. Each dimension interacts with the other dimensions and contributes to the overall construct of an individual’s psychological empowerment (Spreitzer, 1995; Kraimer & Seibert, 1997).

Self-determination has been equated to an individual’s sense of choice and is used by Thomas & Velthouse (1990) who proposed a cognitive model of empowerment that focuses primarily on the choice individuals believe they have as well as the influence they experience. This creates a sense of “being enabled” which includes feeling able to perform competently, a sense of self efficacy (Bandura, 1977) and a perception of meaningfulness (Spreitzer, 1995; Fulford & Enz, 1995). In the general business literature autonomy is defined in terms of self-determination and individual choice (Deci & Ryan, 1985; Thomas & Velthouse 1990; Spreitzer, 1995). The basis for this arises from DeCharms’ (1968) concept of locus of causality where the individual believes he or she is the origin of his or her own behavior. In health care, particularly nursing, autonomy references how nurses practice their craft. To be autonomous means to be able to make independent decisions and, to be accountable for those decisions. According to Collins & Henderson (1991) and Sabiston & Laschinger (1995) the pathway to autonomous nursing practice is built on the expert knowledge of the practitioner. Therefore, if the nurse has the appropriate knowledge and skill to initiate action, carry out action and, to be responsible for the result, then she is practicing autonomously (Collins & Henderson, 1991). Defining autonomy in this way suggests self-determination and competence are components of
autonomy. Dwyer, Schwartz & Fox (1992) discovered in their study of 151 nurses that they differed in their need for autonomy. As that difference emerged, the type of support needed from management changed. Those who needed more autonomy tended to desire less direction from management while those who had a lower need for autonomy needed more management direction.

Chandler (1992) conducted a study in which she interviewed 56 nurses asking them to describe both a situation in which they felt empowered and one in which they felt powerless. After the interviews were recorded and transcribed a content analysis was performed that identified themes. Of the fifty-six nurses interviewed, fifty-seven percent reported being empowered by their interactions with patients and families. The interactions included their professional duties of assessment, intervention, changing, and responding. These duties included activities such as teaching, supporting, comforting and advocating. In addition, twenty-three percent of the respondents reported empowerment when interacting with the physician in a collaborative manner. Therefore, eighty percent of the subjects found being involved in a significant relationship as an experience where they felt empowered. Other empowerment experiences were working as a team, being complemented by the nurse manager and feeling good about being a nurse. The largest source of powerlessness was from a negative interaction with the physician.

DeCharms (1968) has indicated that individuals need to feel as though they are personally competent in their environment. Competence, as defined by Gist (1987), is the belief that one has the skills and abilities needed to perform the job. They gain this competence through the acquisition of knowledge and, by mastering skills. According to Kieffer (1984), competence is a product of experience and subsequent reflection. Kieffer referred to this relationship between experience and reflection as praxis and stated that it brings forth new understandings which results in more effective actions. Although individuals may become more competent through various experiences, Rappaport (1984) posited that empowerment implies an individual is already competent and will use that competence given the opportunity. In this sense competence may be viewed as a precursor to empowerment.

Meaning is another of Spreitzer's (1995) dimensions of empowerment. Brief & Nord (1990) have stated that "meaning is defined as a fit between the requirements of the job tasks and one's own values, beliefs, and behaviors." Therefore, a worker's motivation is most likely to occur when the value of the work activity is seen as positive and when the expectation exists that the behaviors implemented will result in the desired outcome (Kleiber & Maehr, 1985). Shamir (1991) has stated that a task could motivate an individual, even in the absence of any rewards, because it has meaning for them while Thomas & Velthouse (1990) have related meaning to the intrinsic caring about a given task and have indicated that a person whose work is meaningful is likely to be empowered by the work.

According to Ashforth (1989) and Spreitzer (1996), impact is a belief that an individual has about their own ability to have significant influence over outcomes at work. It is also a key to psychological empowerment. Important to the understanding of impact is the notion that the individual is aware of the influence their actions have had on work activities (Kraimer & Seibert, 1997). However, the ability to have impact is related to having access to the sources of empowerment (Sabiston & Laschinger, 1995). According to Sabiston & Laschinger those sources are support, information, resources and opportunities. Therefore, impact is identified as only one aspect of empowerment which must be integrated with others to be fully meaningful.

The social action and community psychology literature has explored many of the same elements identified in psychological empowerment but does so in the context of community groups and social needs. This research serves as a bridge between psychological empowerment and managerial empowerment emphasizing peer support and empowerment in a group setting. In the community setting empowerment has been viewed as the "mechanism by which people, organizations and communities gain mastery over their lives," (Rappaport, 1984) implying that individuals possess and can develop the skills necessary to become empowered. Kieffer’s (1984) study supported this having illustrated the development of 15 individuals from powerless to being empowered. Rappaport suggested that empowerment is different for different people in different settings and though it may be the result of some purposeful program it is more likely to be found when true collaboration occurs among professionals and the beneficiaries of their interventions. His assertions were supported by Corsun & Enz (1997) as they studied empowerment within an organizational context. They saw the relationship between the dimensions of empowerment (meaning, self-efficacy and competence) and peer helping behaviors and, also asserted that formal empowerment attempts by an organization might fail because the organization has not created a "relationship-based", supportive and caring work environment" for the employee.

Corsun & Enz’s work is illustrative of the research that comprises the work on leadership, management and organizations. Within this body of literature are the actions and structures of the work place that either nurture or limit the individual’s ability to be empowered. Burns (1978) viewed empowering managers as those who activate and mobilize subordinates. Kouzes & Posner (1995) identified this as “enabling others to act,” and Sashkin (1982) labeled it as participative management. According to Sashkin, this participation can take various forms including:
participation in goal setting, decision making, problem solving and change. All forms involve some sharing of power that creates conditions for empowerment (Burke, 1986). As a part of sharing power Burke stated that empowerment should come from a person's involvement in significant and relevant tasks.

Likewise, Kouzes and Posner (1995) wrote that "feeling powerful - literally feeling “able” -comes from a deep sense of being in control of our own lives. Any leadership practice that increases another’s sense of self-confidence, self-determination, and personal effectiveness makes that person more powerful and greatly enhances the possibility of success."

Empowering leaders may also provide information to individuals. One illustration of this is provided in a quote from a manager interviewed by Kouzes and Posner (1995) who said, “If I had to tell you in one sentence why I am motivated by my job, it is because when I know what is going on, and how I fit into the overall picture, it makes me feel important.” According to Kouzes and Posner (1995), “without information, people won’t extend themselves to take responsibility; armed with information, people’s creative energies can be harnessed to achieve extraordinary results. Information empowers people, strengthening their resolve and providing them with the resources they need to be successful.”

Kouzes and Posner (1995) also indicated that leaders influence individual workers negatively by exerting too much control. They stated that “the most insidious thing about external control is that it actually erodes the intrinsic motivation that a person might have for a task,” (p. 181). According to Mainiero (1986), “individuals in highly dependent or powerless jobs are more likely to give up than individuals in powerful jobs.” Lorsch (1970) stated that jobs should be divided to give the individual meaningful work over which he or she can have some feeling of control and influence. Kanter’s (1993) theory suggested that work behaviors and attitudes are partially the result of the individual’s position within the organization as well as the situations that the individual faces. She stressed the importance of these workplace factors and de-emphasized the importance of the individual’s personality and upbringing. Kanter further indicated that power is the result of the individual being able to access and mobilize certain empowerment structures including support, information, resources and opportunities. This theory was supported when Sabiston & Laschinger (1995) found that nurses perceived that they had a moderate degree of job-related empowerment and a moderate degree of access to those four empowerment structures indicating a correlation between the two.

The purpose of this study was to explore non-supervisory, medical professional employee perceptions of the meaning of empowerment. Therefore the research method was an exploratory, phenomenological design. Data was collected through in-depth individual interviews. Three sites, all not-for-profit hospitals, were chosen in which to conduct the study. Since the researcher is an insider at one site, that site was chosen for a pilot study as well as one of the three main study sites. Two other sites that are in close proximity and, similar in size to the first site were also chosen for the study. The similarity in regard to type of business and location was important in order to reduce variations in tasks and geographical differences. Additionally, the researcher had greater opportunities for entry into those sites and therefore the cost of the study was kept within budgetary constraints.

Permission to conduct the study was first obtained from the sites. Each site preferred a different method of introducing the study to its employees. One site designated an internal person to coordinate the effort with the researcher. A second site announced the study through its organization's newsletter and communication to its managers and a third site solicited a manager's help directly. Since the research purpose was to explore the perceptions that non-supervisory, medical professions have of the meaning of empowerment it was important to identify potential interviewees who had some experience, by their own definition, with empowerment. Having the potential interviewees self-select into the study ensured an experience of empowerment and a willingness to discuss that experience. Therefore, all of the potential interviewees who indentified an interest in the study were selected to participate in an interview regardless of how they personally defined empowerment. The objective of this study was to explore their own individual perceptions of empowerment not necessarily to explore similar perceptions. The potential interviewees responded directly to the researcher. Letters introducing the study, the researcher and the requirements of the study and the confidentiality with which the interview would be conducted were then sent to them. Each interview was audiotaped and later transcribed. Each interview was held privately and each interviewee was asked to describe in detail a work situation where she felt empowered.

For the purpose of this study a non-management medical professional was defined as an individual who had no direct responsibility for the performance appraisal of another worker and, is employed in a position that requires a professional license or certification. A pilot study was conducted with three individuals from one of the three sites. Four employees from each of the three sites were then interviewed as part of the main study for a total of fifteen individuals interviewed. Although the study was open to all non-supervisory medical professionals, eleven of the twelve main study interviewees were nurses.
The written transcripts of the interviews were analyzed using Giorgi's (1985) model. This included an initial reading of the transcript to gain an overall sense of the entire interview and, a second reading to note major themes or main ideas. Once recurrent themes had been identified, the interview tapes were listened to again to determine if the language used, voice inflections, pauses, etc., held significance for the meaning extracted from the text. The transcript was read a third time to place meanings gained from the tape into the text. An essay reflecting the interviewee’s perspective was then constructed. A copy of the actual transcript and essay were given to the interviewee for review and, the final essays were reviewed by an independent third party reviewer who had experience in the health care field for the purpose of reducing bias, confirming results and validating the themes.

In examining the transcripts and essays of all of the interviewees, five major themes emerged. Those themes were: Impact, Competence, Autonomy, Meaning of Work and, Supervisory Relationship. Impact concerns the notion that the individual is aware of the influence their actions have on work activities. In this study the interviewees indicated that having an impact was important to their empowerment experience. They talked about “making a difference” in the lives of patients and families. A key aspect of this theme was that the impact that was made did not have to be one of great overall significance. The interviewees related stories of keeping the patient from feeling pain, making the patient’s day a little bit better or, teaching the patient about their disease process. One interviewee, Kristine, described her impact like this: “...the next day when I gave her the big bath and I did her fingernails there was the biggest smile and the tear out of her eye that made me feel like ‘yes,’ I did something for this person that made a difference. Even though it’s something little, it made a difference to them. And the family, they were just like “Oh!’...all crying, and it’s going to make me cry!” For the organization these situations appear to be of minor importance when compared with major budgetary or medical decisions. For the caregiver, instances like these were successful interventions that contributed to their feelings of empowerment.

A second theme, competence, was also identified. In this study competence consisted of the knowledge, skills, abilities and confidence needed to perform required work. Interviewees in this study indicated that they already possessed the knowledge needed to perform the job prior to their experience of empowerment although some did indicate that they also gained knowledge from the empowerment experience itself. This knowledge and overall competence was obtained primarily from their professional training and their prior experiences on the job. Prior experiences were identified as being very important by interviewees who worked on shifts in which there was no supervisor present. These experiences allowed them to make informed decisions when there was no supervisor available with which to confer. The interviewees indicated that conversations with supervisors reinforced their confidence in their skills and knowledge, which prompted them to continue with their experience.

The process of self-reflection was identified by half of the interviewees as having occurred during or after the noted experience and accounted for an increase in knowledge, skill or confidence. According to the literature, the process of reflection is central to adult learning (Jarvis, 1987; Kieffer, 1984). One nurse, in reflecting on a devastating moment during her empowerment experience, stated, “I have failed! But then you reevaluate the situation and, OK, what’s really going on here? And then, what do I need to do? What’s my plan? And then set some goals. It’s just a never ending circle of reevaluation.”

Autonomy was identified as a third theme of this study. Autonomy is related to having the permission to act, in most cases, on the behalf of the patient. Each interviewee in this study believed that they had a certain amount of freedom to act while in the situation they described as their experience of empowerment. For some, the autonomy they experienced was a condition which was granted to them by their supervisor, their position in the organization and, by their professional license. Likewise, feeling responsible for the patient and certain activities related to the care of the patient were embedded in the job itself and the professional license. One nurse indicated how a sense of responsibility flows from her license and position as a registered nurse; “I think that is the job of a registered nurse. Different people have different feelings about where their responsibility ends and that kind of thing but I think that you know, as his nurse, it was my responsibility. It was just mine because he was my patient for the evening. Just the ethical code that I took on when I became a nurse.” A license or an otherwise clearly defined role in which authority is granted may provide what is needed for a person to operate autonomously.

As with responsibility, willingness to initiate action also appeared as a sub-set to this theme of autonomy. Half of the interviewees indicated they initiated action in their empowerment experience while the remaining half indicated that their supervisors had initiated the first contact with them which allowed them to initiate other actions to continue with the experience.

A fourth theme identified in this study was that of Meaning of Work. This is best explained by one of the interviewees who stated, “This is going to be my life time work. It’s rewarding for me that I know that during that eight hour shift I made a difference. Nothing major. I don’t think in terms of big rewards or major life changing events…. But I know, for that night and maybe he was just more comfortable the next day. I know for myself that...
I've made a difference with my patients and I think that's what helps me enjoy my job.” For the majority of the interviewees, achieving results that related to making someone else’s life better is what made their work meaningful and indicates why they had such a high level of commitment. It was evident within the study that the interviewees personal values played a role in how they attributed meaning to their empowerment experience as the activities they were engaged in; teaching, supporting, comforting and advocating had personal importance to them. For some, those activities were expressly related to issues they had dealt with earlier in their lives. One nurse specifically indicated how empowered she became when she taught others, relating that situation to her own difficulties as a learning disabled child.

The terms “accountable” and “responsible” were used by the interviewees when talking about meaning. Each felt as though they were personally accountable and responsible for the task they were performing at that time and, to not accomplish it was not acceptable. This meant working through obstacles and taking risks that they might not have otherwise taken. The nurses in the study referred to their nursing license and their own definition of what it means to be a nurse as indications of their commitment to, what they perceived, as their responsibility.

The final theme identified in this study was that of Supervisor Relationship. Supervisors were involved in the interviewee’s empowerment experiences at different levels. For some, their supervisor initiated the action that involved the interviewee in the experience. For others, their supervisor was used as a confidant and advisor; a person they went to when they engaged an obstacle or were less certain of the appropriate approach to take. However, for most of the interviewees the supervisor was not directly involved in the experience of empowerment at all. Regardless, the relationship that existed between the interviewees and their supervisor was important to them. The interviewees attributed some of their ability to proceed through their empowerment activity to the “trusting” relationship they believed existed between them and their supervisor. Their ability to move forward was due in part to the belief they had that their supervisor would support their efforts. This belief had been formed from previous situations in which the individuals felt they had received some sort of support. The relationship with their supervisor was also important for the individuals who had actually communicated with their supervisor at a point within the activity. One of the interviewees indicated that had she not received support from her supervisor than she most likely would have not pursued the issue that led to her experience of empowerment. She stated that her supervisor allowed her to blow “off a little steam,” listened to her account of the situation and then indicated her agreement with the interviewee’s assessment of the situation.

Empowerment is often conceived as a delegation of power or a program initiated by management which allows employees the opportunity to participate in problem solving not usually recognized as a part of the employee’s regular job duties. For the majority of individuals in this study empowerment was not the result of any specific management action. Instead, it was comprised of a number of themes, which worked in unison to provide the feeling of empowerment. Any of the themes may have been the focus of the empowerment discussion for any one of the individual interviewees but each described a situation that was multidimensional in regard to empowerment themes. Additionally, these themes came together, not during an extraordinary event but, during typical daily events that could conceivably occur a number of times within a normal work day. As such, they were centered on relationships between the care givers and their patients. These relationships, and the responsibility that was felt for the well-being of the patient, provided much of the meaning for the interviewees in this study. This was a finding of Chandler’s (1992) study as well. Sometimes the relationship was an interactive one where the care givers communication with, and treatment of, the patient was the major activity and sometimes it was the care givers concern over the patient’s well-being that lead to an intervention on the patient’s behalf. In addition, the role of the supervisor in the empowerment process was described in this study as a relationship of trust. This relationship, for all interviewees, had been built over time prior to the empowerment experience and, had assisted the individual in proceeding with the activities of the experience regardless of the supervisors absence or presence during the actual empowerment experience.

These different aspects of empowerment and the relationship between them further support previous theories of empowerment being a multidimensional construct. Additionally, this study furthers the theory by including the importance of the supervisory aspect as part of an overall construct of empowerment.

The results of this study have implications for the health care industry, business leaders and HRD professionals. H.R.D. professionals are often contracted with to help build teams within organizations. Traditionally, team building includes the creation of trusting relationships. The results of this study support the importance of trust between employee and supervisor as a key aspect of empowerment. The building of trust appears to allow for both employee and supervisor initiated experiences, which lead to empowerment. Trust also appears to allow empowering situations to emerge from everyday work activities as individuals will proceed with empowering activities in the absence of permission from their supervisor when they perceive the relationship between them and their supervisor is...
a trusting one. In helping supervisors develop empowerment activities, HRD professionals should first look at the level of trust that exists between the supervisor and those employees reporting to him or her. Teaching supervisors to develop trusting relationships is a key step toward empowerment. Absence of a trusting relationship may be enough to keep individuals from engaging in activities that are empowering.

In addition to building trust, supervisors need to learn about and develop their skill at providing support to employees. This may be providing the employee with permission to pursue an activity that is a part of their responsibility but one where the employee is not taking initiative because of perceived constraints. Being able to encourage and, knowing how to give permission to act are examples of support that relate to acts of empowerment.

Operations managers also will call upon HRD professionals to assist with job evaluation, productivity improvements and change initiatives. Professionals should be aware that, in accordance with the results of this study, changes in job tasks that take the employee away from their core work may also result in missed opportunities for empowerment as this study concluded employees were likely to find empowerment in everyday work situations. Additionally, managers should exercise caution in pulling employees away from daily work duties if those duties are the core of the job and, if the employee has pursued that profession because of the meaning those duties provide. Even different tasks that may seem empowering to the manager may be construed by the employee as an interruption or inconvenience to them as it takes them away from a task that is meaningful. Jobs and job duties that an employee currently perceives as empowering must be replaced with other empowering work if changes need to be made. HRD professionals should be able to alert supervisors to these needs and offer suggestions on suitable options.

Similarly, HRD professionals are often asked to participate in or lead the organization in empowerment efforts with the expectation that a program will be constructed which empowers employees through the use of methods such as committee involvement and increased departmental responsibilities. However, attempts to empower employees by taking them away from their source of meaning with the lure of greater responsibility may actually be disempowering. Therefore, an organization may consider replacing empowerment programs with organizational wide empowerment initiatives.

In regard to the training needs of employees, the results of this study indicate that autonomy in work is partially a function of expert knowledge. This suggests that employees may need certain training and education prior to being able to utilize the experiences in the job that are naturally empowering. It also suggests that any training or education that adds to a base of expert knowledge may have a benefit in future experiences of empowerment. Whereas specific job training may have an immediate use, training and education that increases expert knowledge may eventually produce benefits in regard to increased confidence and a willingness to act which in turn may lead to empowering actions.

This study also has implications for the Health Care Industry and supervisors in general. One major implication is the importance of the relationship between the professional caregiver and the patient. The empowerment of patient care staff is more likely to occur when the relationship between the employee and the patient is allowed to develop. Any activity that pulls the employee away from the patient potentially lessens the opportunities to be empowered. Understanding what is meaningful to workers and allowing them to participate in meaningful work is important. For many medical professionals, meaning is found within the core work of their chosen profession. The interviewees of this study defined that meaning most often as "helping others."

By illustrating the importance and relationship of supervisor contributions to employee empowerment this study furthers the knowledge of the empowerment construct. Aspects of trust and support provided by the supervisor prior to the empowerment experience become an integral part of whether or not an individual will experience empowerment in the work setting. While the concept of trust is not new, the results of this study suggest that it is vital to the empowerment of the individual if they are to be able to engage in the kinds of activities that bring about the empowerment experience. This also supports the notion that empowerment is dependent on other, well performed, leadership practices and cannot be implemented as a separate organizational activity.

Whereas empowerment has often been viewed as the result of specific organizational programming or the provision of an extraordinary opportunity afforded an employee who rose to the occasion creating an often-dramatic result, this study shows that empowerment is readily available to the typical employee while engaged in the more ordinary tasks of the job. This moves our understanding of empowerment from the concept of a specialized effort to one of an opportunity that is constantly available.

Analyzing HRD Through Metaphor: Why, how, and Some Likely Findings

Darren C. Short
Office for National Statistics, UK

Metaphors can be viewed as central to the task of accounting for how we think about things, make sense of reality, and set the problems we try to solve. What then does the uses of metaphor in HRD say about how those in the field view the world, and how might that view be limiting? This article contains an argument for completing an analysis of HRD metaphor, a framework for that analysis, and examples of what might be discovered.

Keyword: Metaphors

Justifying a metaphor analysis of HRD

HRD as a three-legged stool, an octopus, a centipede, a clover leaf? Organizations with memory, identity, culture, and an ability to learn? Researchers using narrative portraits, path analysis, grand tour questions, and pilot studies? Practitioners with career anchors and psychological contracts who run canned training, environment scans, and brainstorming sessions? There is little doubting that when it comes to the language of HRD, metaphors abound. But, what do these metaphors tell us about HRD, how can we use them to our advantage, and in what ways might they be dangerous for the field?

One tradition in metaphor treats it as being central to the task of accounting for our perspectives on the world: how we think about things, make sense of reality, and set the problems we later try to solve (Schön, 1993); and also helping to constitute that reality and prescribing how it ought to be viewed and evaluated (Tsoukas, 1991). In HRD, it is likely that we operate totally unaware of the influence of metaphors, for often they are so deeply embedded in our daily language that we are blinded to their effect on our thinking and behavior (Kendall & Kendall, 1993). However, once identified and made explicit, the appropriateness of metaphors can be questioned, and new metaphors can be explored to create a new reality, a new understanding of experience, and a new meaning to pasts, daily activities, and what is known and believed (Lakoff & Johnson, 1980).

Inns (1996) argued that metaphor analyses could be applied to fields of study and such analyses have already been completed for psychology (Leary, 1990) and organizations (Morgan, 1997). What then if a metaphor analysis was completed on HRD; what might it find? It could conceivably identify how certain metaphors influence how we view reality, how we conceive of issues, how we design our approaches, and how we behave in certain situations. Making those metaphors explicit would allow for a dialogue on their appropriateness and how they help or hinder the field. It would also allow for an exploration of alternative metaphors; the potential outcome being greater awareness of what underpins our actions, of the alternatives available to us, and of new metaphors to orient future behavior.

In this article, I outline the arguments for completing a metaphor analysis for HRD, offer a framework for that analysis, and offer examples of what might be discovered. I also explore the potential benefits to the field of those findings. The paper is structured so that readers are first introduced to metaphor theory and then metaphors from other disciplines, before I describe three approaches to exploring metaphor in HRD.

Metaphors: definitions and impact

Metaphors can be traced back centuries, at least as far as Aristotle circa 330 BC (Leary, 1990). They work by forging an equivalence of identity between separate elements of experience in a way that encourages us to understand what is common. Through assertions that subject A is, or is like, B, the processes of comparison, substitution, and interaction between the images of A and B act as generators of new meaning (Morgan, 1980), as well as organizers of perception (Barrett & Cooperrider, 1990). Social sciences metaphors typically work by structuring inherently
vaguer concepts in terms of more concrete concepts (Tsoukas, 1991), and are most powerful when the differences between the subjects or concepts are significant but with some areas of overlap (Morgan, 1980).

Despite the long history of metaphor, there remains considerable disagreement about their significance: something reflected by the over 125 definitions of metaphor discovered by Soskice in 1985 (Leary, 1990). There exists a long-running debate on whether metaphors are anything other than a literary tool. On one side, metaphor is regarded as a figure of speech of primarily aesthetic value, and therefore as no more than a literary and descriptive device for embellishment. However, another tradition (and the one I focus on in this article) treats metaphors as being central to the task of accounting for our perspectives on the world (Schön, 1993), and as the cognitive lenses used to make sense of and shape our reality (Kendall & Kendall, 1993). The full nature of the debate between the two views of metaphor is beyond the scope of this article, however it is important when interpreting the remainder of the article to note that these differing views exist.

Where metaphors are viewed as being more than linguistic tools, they are considered as describing an external reality, and helping to constitute that reality and prescribe how it ought to be viewed and evaluated (Tsoukas, 1991, p. 570). As Lakoff and Johnson (1980) argued, we do not just use metaphorical language, but we also use metaphors to structure, understand, talk about, and perform. That view was supported by the results of a study by Sapienza (Sackmann, 1989), which found that metaphorical language influences not only perceptions, but also subsequent actions.

The potential impact metaphors have on our behavior brings to the fore the importance of exploring those we use and highlights the potentials for influencing behavior by changing metaphors. The issue-at-hand is what subjects are used in the metaphors, what relationship is asserted, how do the subjects and asserted relationship influence behavior, and what alternative subjects and asserted relationships could lead to more beneficial behaviors? Schön (1993) described this a “process by which new perspectives on the world come into existence” (p. 137). As Lakoff and Johnson (1980) described, “new metaphors have the power to create a new reality... If a new metaphor enters the conceptual system that we base our actions on, it will alter that conceptual system and the perceptions and actions that the system gives rise to” (Lakoff & Johnson, 1980, p. 145).

Lakoff and Johnson placed particular emphasis on the potential for achieving changes to conceptual systems by introducing new imaginative and creative metaphors. Such metaphors, they argued, “are capable of giving us a new understanding of our experience. Thus, they can give new meaning to our pasts, to our daily activities, and to what we know and believe” (Lakoff & Johnson, 1980, p.130).

Metaphors from other disciplines

Given the significance of metaphor in framing realities and in creating new meaning perspectives, metaphors offer a potential route to explore the realities of groups. Inns (1996) argued that metaphorical analyses could be applied to a field of study, and used to reveal core values and assumptions, trace a field’s progression and emerging philosophies, and explore more appropriate alternative frameworks. Such an approach has already been taken by Kendall and Kendall (1993) with information systems, by Dunn (1990) with Human Resource Management, and by Leary (1990) with psychology. However, the analysis of metaphors for organizations has come closest to studying metaphors in HRD, albeit by studying those applicable to Organization Development rather than training.

Using metaphors to describe organizations has a long history. For example, when Brigham Young led the Mormons to Utah, he described their organization as a beehive: everyone working hard in an orderly fashion and not questioning the authority of the church hierarchy (Brink, 1993). This is but one of many metaphors applicable to modern organizations, each constituting and capturing the nature of organizational life in different ways and offering powerful, distinctive, but essentially partial insights (Morgan, 1980). Some include: organizations as machines, organisms, psychic prisons, ecological systems, theaters, instruments of domination, garbage cans, icebergs, and soap bubbles.

As well as exploring metaphors for whole organizations, metaphorical terms are also commonly found to describe organizational issues or are common in language about organizations. Examples include: organizational culture; drivers of change; vision and mission; organizational memory; re-engineering organizations; and learning organizations. Some of these are good examples of ‘dead metaphors,’ that is statements that were once obviously metaphorical but which have since, through regular usage, become accepted in their own non-metaphorical ‘right.’

There is also evidence of metaphors being used in organizational change to diagnose and transform organizations. Morgan (1980), for example, described the use of metaphor both as a supplementary and
contradictory approach to organizational analysis; and Armenakis and Bedeian (1992) described the advantage of change agents using metaphor to arrive at problem diagnoses and solutions rapidly. Other examples include: understanding organizations by listening to the metaphors given by customers, employees, and other stakeholders (Brink, 1993), and analyzing metaphors to shed light on underlying assumptions that affect surface organizational behavior (Conrad, cited in Cleary & Packard, 1992). Perhaps the most famous example of metaphor in organizational change is that of Lewin's 'unfreezing-change-refreezing.'

On transformation, Sackmann (1989) hypothesized that metaphors can influence employees' thinking, feelings, and their construction of reality in ways that facilitate organizational transformation. Specifically, Keizer and Post (1996) described using metaphoric gaps as catalysts of change; Morgan (1986) offered eight metaphors, suggesting different interventions as being appropriate for each; and Palmer and Dunford (1996) described fifteen common organizational metaphors and referred to their use in strategic planning, structural change, organization development, organizational culture, and organizational change.

A framework for exploring metaphor in HRD

Given Inns' (1996) assertion that metaphorical analyses could be applied to a field of study, what then if we applied that to the field of HRD? Brink (1993) identified three applications of metaphor to better understand organizations: explore metaphors used by employees, customers, and other stakeholders; explore how metaphor is, and can be, used to describe the organization to outsiders; and encourage the formulation of new metaphors that might facilitate change. These could be usefully re-phrased to structure the three-way exploration of metaphors in HRD in the following sections:

- identifying what current metaphor usage (from its many sources) tells us about the field of HRD;
- identifying how metaphor is used, or can be used, to describe the field of HRD; and
- identifying how new perspectives for the HRD field can be generated using metaphor.

Data collection

Several data collection methods have been suggested to explore metaphors which could be used in addressing these three bullets, including: interviews and focus groups (Kendall & Kendall, 1993); reviewing documents and records of employee discussions (Kock & Deetz, in Cleary & Packard, 1992); observing symbols, objects, facilities, and language with an eye toward metaphorical content (Cleary & Packard, 1992); and participant observation (Brink, 1993). In each case, the methods are qualitative and each author used multiple collection methods. Various analysis methods have also been used, including: Q-methodology (Kendall & Kendall, 1993), and theme-identification (Cleary & Packard, 1992).

Applying those methods to identifying metaphors in HRD suggests such approaches as:

- interviews or focus groups with various stakeholder groupings (HRD practitioners, educators, researchers, students, clients);
- reviewing printed materials (e.g. books and magazines for practitioners, academic texts and journals, research conference papers, and organization HRD strategy documents);
- observation (e.g. at training and consultancy sessions run by practitioners, HRD education classes, meetings of academic and practitioner groups); and
- case studies of educational, research, and practitioner-based settings.

Identifying current metaphor usage in HRD research, practice, and education

There are three primary areas of focus for the identification of metaphors used in HRD: research, practice, and education.

Metaphor in HRD research

Regardless of the discipline, there are many metaphors contained in the language of research methods and analysis. Examples taken from recent HRD literature include: stream of research, narrative portraits, path analysis, hybrid designs, key questions and themes, grand tour questions, triangulation of data sources, and pilot studies.
However, of potentially greater interest to those in HRD is the use of metaphors in research, with recent examples including:

- to introduce an area of research - Frantz (1998) used the image of a football team quarterback when introducing research into the decision-making process leaders go through in ‘calling audibles’;
- for data collection - Scanlon (1999), in researching the voluntary sector, asked focus group participants to describe metaphors for the volunteer climate;
- as data given by research participants - Bierema (1999), after studying women executives, reported a particular recurring metaphor offered by those interviewed; and
- in data validation - Ardishvili (1999), after interviewing independent HRD consultants, validated the preliminary results by sharing a summary of emerging themes and metaphors with interviewees.

**Metaphor in HRD practice**

As already noted, several authors have explored the use of metaphors by practitioners to diagnose and transform organizations, and described the role of metaphors as a communication tool in organizational changes. However, little has been published about the specific usage of metaphors by HRD practitioners or to describe practice. Such an analysis could identify: what metaphors-in-use say about the core values and assumptions of people in HRD; where those in the field may have become blinkered by operating under unquestioned metaphors; and what alternative metaphors exist and their impact on behavior.

The purpose of this article is to argue the case for a research agenda on metaphors rather than to present research findings, however let me list just a sample of metaphors from recently published HRD articles:

- Metaphors for how HRD works: as a strategically important partner; through strategic interventions; by harnessing workplace learning;
- Metaphors for what HRD seeks: alignment in organizations; unleashing of human expertise; root causes of problems;
- Metaphors for HRD concerns: fad driven HRD and blind application of interventions; canned training; mechanical adherence to good practice;
- Metaphors for learning: learning as a compass for navigating; triggers of learning; virtual learning communities;
- Metaphors for the topics HRD deals with: whole person development; organizational culture, memory and scripts; global markets;
- Metaphors for HRD methods: mentoring as a tool; evaluation through smile sheets; brainstorming.

**Metaphor in HRD education**

Although little has been written specifically about metaphor in HRD education, much is in print about the use of metaphor more generally in education that has a potential read-across to HRD. Ortony (1975) described metaphors as being “used as teaching devices since the earliest writings of civilized man” (p. 45). The potential benefits of using metaphor in education include: permitting teachers to provide or transmit meaning for unfamiliar or abstract concepts and providing the most memorable ways of learning; providing a way of passing from a ‘familiar system’ to a ‘to-be-learned’ system, directing the learner’s attention to key information, and encouraging learners to connect events into a coherent structure; and providing an efficient means of transmitting large chunks of information in a memorable manner through the mnemonic powers of vivid images.

Writings on metaphor usage in education therefore suggest that metaphors offer the potential to be used in describing the HRD field to students, or in teaching aspects of the field. A potential advance for the field could come from studying which metaphors are being used, and which metaphors and methods are most successful in educating students of HRD.

**Using metaphor to describe HRD**

Metaphors for the field of HRD have three potential uses:

- to better describe the field to those outside of it;
- to better communicate complex aspects of the field to HRD students and clients; and
to highlight differences of opinion on the nature of the field, and differences between HRD and other disciplines.

The metaphors used in HRD, as illustrated earlier in the article, provide an insight to the various aspects of the field (the people, the environment they operate in, the problems they address, the approaches they take, etc), but without describing the whole field. That stated, one does gain an insight to the whole field by looking for themes in those metaphors and identifying what Averill (1990) described as ‘abstract metaphors:’ subordinate categories of metaphor for the most part not found in ordinary speech. For example, one emerging abstract metaphor for HRD identified from the metaphors listed earlier is that ‘problems are divides to be crossed or closed.’ That leads to such language in recent HRD literature as: skills gap; theory-to-practice gap; a bridge to link individual and organizational development; bridging the producers and consumers of HRD research; research-practice gap; and linking HRD to strategy. Another apparent abstract metaphor for the field is that of ‘organizations can be treated as human entities.’ That leads to such language as: organizational health; organizational identity; organizational memory; and organizational role shock.

If we agree with Schon (1993) that metaphors frame realities, then such metaphors as ‘problems are divides to be crossed or closed’ and ‘organizations can be treated as human entities’ may well influence how those in HRD conceptualize, and design solutions for, certain problems. If we also agree with Lakoff and Johnson (1980) that metaphors can help to create new realities, then the question arises as to what alternative metaphors could replace these two and produce different ways of conceptualizing problems and organizations.

Such meta-analysis of metaphors provides only a limited picture of HRD without providing one metaphor for the whole field. Several authors though have written metaphorically about HRD, for example, Lee (1998) described the metaphorical links between HRD and clover, with the three parts of a clover leaf representing HRD theory, practice, and being. However, arguably the most widely recognized metaphor for HRD is Swanson’s three-legged stool, which Swanson (1999) described as “a visual portrayal of the components of the theoretical foundation of HRD” (p. 2). Although not a definition of HRD processes, the stool stressed what Swanson described as the unique integration of psychological, economic, and systems theories in the HRD context, which have since been supplemented with ethics. McLean (1998) also offered the metaphor of the HRD centipede to stress limitless sources of input into the complexity of HRD, and the HRD octopus (whose eight tentacles were viewed as more manageable than the hundred legs on a centipede).

Whereas metaphors to describe the HRD field have focused on objects (stool, centipede, clover leaf), those describing the development of the field appear to have had a strong link to the ‘journey’ metaphor that Lakoff and Johnson (1980) argued was one of the central metaphors of Western culture. The journey metaphor embodies notions of progress, direction, and purpose, and specific examples from recent HRD articles include: HRD on a theory-building journey; journey management of HRD institutions, body of knowledge, and direction; reorienting the theoretical foundations of HRD; HRD as a boundary-flexing, evolutionary system; HRD at a crossroads, with a dominant path, signposts, and a road map; HRD as having taken a detour; and the HRD stream.

All of the metaphors so far cited in this section have originated from within HRD, and a study of those metaphors, although potentially illuminating and useful for the field, would omit an important source of HRD metaphors: those used about the field by those from outside of HRD. Exploring the HRD-related metaphors used by current and potential clients and partners of those in HRD, and those in related disciplines such HRM and organizational psychology, would assist in understanding how they view HRD and identify sources of common ground and potential differences.

Using metaphor to generate new perspectives on HRD

So far, I have focused on identifying and exploring metaphors already in use by those in HRD (in research, practice, and education), and those used to describe HRD. Yet, Lakoff and Johnson (1980) asserted that metaphors could create new realities as well as define existing ones. For HRD, that could imply exploring alternatives to such HRD metaphors as: the stool; the centipede; the clover leaf; problems are divides to be crossed or closed; organizations can be treated as human entities; and HRD is on a journey.

There are two approaches to generating new perspectives: considering existing metaphors from other fields and their potential use in HRD; and generating new metaphors. I shall explore each in turn.

Using existing metaphors from other fields
‘Importing’ metaphors from other fields offers those in HRD the opportunity to reflect on how they could be adapted for use in this field. One area of potentially useful ‘imports’ is that of consultancy, where the role of the consultant has been likened metaphorically to: helper, colleague, oracle, shoe clerk, entrepreneur, detective, advocate, friendly co-pilot, navigator, and many more. Each metaphor emphasizes particular aspects of consultant behavior, allowing the discussion to focus on whether such behavior adds value to the consultancy or hinders the consultant’s effectiveness. The shoe clerk, for example, illustrates where a consultant approaches problems with a fixed number of possible processes or ‘solutions’ and has to mold problems to fit them.

Identifying and exploring metaphors for consultancy raises such questions as: how relevant are they to HRD consultants, how often do we use them and what are the consequences of such an approach, what would be the benefits in HRD education of using these metaphors to highlight various approaches and ‘bear-traps,’ and what other metaphors might be appropriate for the various roles we play in HRD? On that latter point, what about such possible metaphors for HRD consultants as: missionaries; historians; librarians; interpreters; mouthpieces; fall guys; flag-bearers; and doctors?

The field of organizational studies offers another example of the potential of applying metaphors from other fields to HRD. For example, what if HRD was viewed within the broader ‘organization as an organism’ metaphor as being the eyes and ears of management? How might that result in different perceptions of HRD roles from the view of HRD within the broader ‘organization as a machine’ metaphor, where HRD could be seen as the lathe operator who grinds the machine parts to the correct size? Alternatively, what if we view HRD as a torch shining light into the unexplored corners within the metaphor of ‘organizations as psychic prisons’?

Generating new metaphors

Although there are no set instructions for devising metaphor (Davidson, 1978), most authors agree that the process makes significant use of past experience, perceptions, and a triggering by unusual comparisons. Schott (1993) described one three-stage process for generating new metaphors: noticing or feeling that A and B are similar, without being able to say similar with respect to what; describing relations of elements present in a restructured perception of both A and B, that is formulating an analogy; and constructing a general model for which a redescribed A and B can be identified as instances. That process starts by posing a kind of riddle - how is one object like another? Once entertained, those seeking answers to the riddle notice new features of both objects, leading to a transformation of phenomena.

Exploring how the HRD field can be seen as other unrelated things offers the potential of transforming how we perceive HRD, which can in turn change our behavior. Using Schon’s (1993) three-stage process, we would begin by exploring our experiences to identify how HRD is similar to other concepts or objects. That would lead to analogies, and eventually to general models. A poster submission to the 1999 annual conference of the Academy of HRD (Short, 1999) illustrated the first two stages of Schon’s process: noticing a similarity and exploring analogies. By asking in what ways the training process was similar to the effects of heat in transforming an ice-cube into steam, Short drew analogies between ice and pre-trained employees, and between the realizing of steam as a higher state and the transformation potential of training.

One area in particular need of new ‘generating’ metaphors is in the description of the whole HRD field and its relations to other disciplines. How satisfied are we that the stool, centipede, clover leaf, and others like them, sufficiently capture the nature of HRD in its many forms? What alternatives exist that capture aspects of HRD missed by those metaphors? What alternatives exist that capture the same aspects in better ways? In what ways do the existing metaphors limit our perceptions of reality and our behaviors, and how can we shift away from that position?

Obviously, because of the nature of this paper, I have raised far more questions than answers. However the purpose has been to illustrate the potential benefits from generating new metaphors and, as such, I trust that the questions offer a suitable illustration of the avenues available to explore.

Conclusions

Despite there being well over 125 documented definitions of metaphor, there is a clear tradition that views them as central to the task of accounting for our perspectives on the world. Often though, they are so deeply embedded that people are blinded to their influence. Within that tradition, metaphors are viewed as framing our realities, and so not only influencing our language but also our behavior. As such, the metaphors used in HRD influence how reality is
framed by those in the field, how problems are conceptualized, how solutions are designed, and how efforts are evaluated. That influence could benefit or hinder the field and gives rise to discussions on how perspectives, language, and behavior of those in HRD can be influenced by changing the metaphors-in-use.

Metaphor is so prevalent in our language that it is easy to find examples from any field or discipline, and academics in several disciplines related to HRD have completed formal analyses of metaphor usage. Two such areas are psychology and organizations. In the former case, metaphors have been traced back centuries providing illustrations of how metaphors have influenced psychological thinking. As for organizations, there are many published accounts of metaphors to describe whole organizations and organizational issues, as well as accounts of metaphors used to diagnose and transform organizations.

Knowing that metathorical analyses have been applied to other fields raises the question of how to approach such a study for HRD. In this paper, I have offered a structured framework for that study under the three headings of:

- exploring current metaphor usage in HRD - by using qualitative methods to explore metaphor usage in HRD research (including for data collection and validation), in HRD practice (including the language used to describe the aims of HRD, and its processes, concerns, and methods), and in HRD education (including describing the field to students and in teaching complex, substantial, or abstract aspects of the field);
- exploring metaphors for the field of HRD - both by using metaphors designed to describe the field (such as the stool, centipede, and clover leaf), and by identifying themes in HRD language (such as the tendency for HRD to view certain problems as gaps or divides to be bridged or closed); and
- generating new perspectives on HRD - both by applying metaphors from other fields (such as metaphors for consultancy), and by generating new metaphors to describes aspects of the field, the field itself, and the relationship between HRD and other disciplines.

To summarize, I have set out how research could explore the use of metaphor in HRD and reasons for wanting to undertake such a task, and have provided a metaphorical ‘taster’ of what that research might discover. As described, it is the ‘first step’ in a research ‘journey’ and ‘a process for bridging the divide between where HRD is and where it needs to be’ in its understanding of metaphors and their impact. As such, perhaps the way I conceive of the research provides a perfect illustration of the impact of HRD metaphors on my own thinking and actions.

Scientific Paradigms and Their Implications for a Vision of HR/HRD

Alice E. McAndrew
Virginia Tech at Northern Virginia

Scientific paradigms can provide "new lenses" from which to view the field of HR/HRD. Paradigms from physics, biology and chemistry echo themes of an increasing role for consciousness, holism and interconnectedness in our universe. These same themes have implications that point the way for a new vision for HR/HRD as organizational architects of human development. Holistic approaches require, not only developing the intellectual capital of individuals, but the whole person with emotion, spirituality and ethics.

Keywords: Paradigms, Human Resources, Vision

In his book The Structure of Scientific Revolutions, Thomas Kuhn introduced the concept of the scientific paradigm which he defined as "a constellation of achievements - concepts, values, techniques, etc. - shared by a scientific community and used by that community to define legitimate problems and solutions" (Kuhn, 1962). At any specific point in history the scientific community shares a prevailing paradigm that informs and shapes the direction of work in the field. Perhaps John Casti (1990) stated it best when he said, "for most scientists major paradigms are like a pair of spectacles that they put on in order to solve puzzles". Following his metaphor he further indicates that when a paradigm shift occurs, the glasses get smashed and a new pair is put on; once again, transforming the shape of everything and providing a new vision of "truth". The new glasses will provide scientists with new puzzles to be solved while advancing what Kuhn referred to as "normal science." As Einstein so succinctly stated, "The theory tells you what you can observe."

The purpose of this paper is to review some of the scientific research creating paradigms that shape our world. The science contributing to these paradigms is largely taken from the field of physics, biology and chemistry. First a history of scientific paradigms will be presented that illustrates the likelihood that we are currently experiencing a major paradigm shift, from the well-ordered universe of classical physics, to a more chaotic but ultimately self-organizing universe. The paradigms are pointing to a vast interconnectedness of all things, in which our role is not as a separate observer, but more that of an active creator and participant.

For the purpose of this paper we will define paradigms as scientific research taken from the hard sciences that provide examples or models which can be used to help construct understanding in many different fields. This incorporates aspects of Kuhn's definition; however, his definition varies at different points in his book (1962) and involves far more detail than needed for our discussion. The selection of paradigms for this paper is idiosyncratic and meant only to provide a representation from each of the different sciences of physics, chemistry and biology. After an examination of these paradigms we will look at implications for business in general, and then, specifically, HR/HRD. What are some of the dominant themes arising from the paradigms that have particular implications for forming a vision for the future of Human Resources (HR) and Human Resource Development (HRD)? What should be the central focus of our efforts? This paper is not meant to offer a definitive vision for HR/HRD; rather, it's to suggest areas for focus, thought and future dialogue.

In The Beginning . . . There Were Paradigms

While Thomas Kuhn was the first to use the term "paradigm" as an organizing construct giving shape and direction to scientific endeavor, mankind has always found ways to structure experience into organized wholes. Prior to Aristotle myth (mythos) was the traditional means for structuring experience, presenting sometimes a strange but authoritative account of facts not to be questioned (Capra, 1975;Casti, 1989). According to Joseph Campbell (1968), myths helped explain, harmonize and balance human experience by serving functions of a metaphysical, cosmological, social and psychological nature. Aristotle introduced the opposite side of the coin with "logos", the Greek term for presenting accounts of experience from which truth can be either demonstrated and/or debated. Thus "logos" was developed into "logic" beginning the process of deduction, replacing myth, and ultimately culminating with science (Casti, 1975).

The Paradigm That Shook the World

Arguably one of the most dramatic paradigm shifts of all times was the move from Ptolemaic astronomy to the ideas of Copernicus (Casti, 1990). Ptolemaic astronomy is an example of a long-lived paradigm that placed the earth at the center of the universe with the sun and stars revolving around it. However, by the beginning of the sixteenth century, Europe's best astronomers realized that the paradigm was failing to explain newly discovered phenomena. Copernicus' sun centered universe eventually replaced Ptolemy's ideas although, this was not easily done since the Church supported the views of Ptolemy. Galileo who supported and wrote about Ptolemy's ideas was forced to recant these positions and spent the rest of his life under house arrest by the Church. The weight of scientific evidence eventually forced the Church to accept the fact that no longer was man at the center of the universe. Kuhn asserts that paradigm shifts rarely occur immediately after a new paradigm is presented; but rather, they occur when the old system is found to be inadequate. So it was for the views of Copernicus. Initially his theory was no better than Ptolemy's for orbital predictions. However, eventually the unsolved anomalies of the Ptolemaic system gave way to explanation by the Copernican system (Barnes, 1982; Cohen, 1985).

The Newtonian Paradigm

In the seventeenth century Newton used his calculus, specifically a set of differential equations to describe all motions of solid bodies (e.g., the motion of the planets). Einstein described Newton's equations of motion as "the greatest advance in thought that an individual was ever privileged to make" (Capra, 1996). Newton's stunning successes led nineteenth century scientists to believe that the world was a completely causal and deterministic mechanical machine running according to Newtonian laws. (Capra, 1996). The world of Newton can be described as a collection of independently existing objects that exist whether we observe them or not. The Newtonian world was mechanistic, predictable and controllable. If one knew the mass, position in space and velocity of a particle, its subsequent movements could be predicted. In this Newtonian world man and all living organisms were compared to machines (Capra, 1975, 1996). That which couldn't be quantified lost value; hard sciences came to dominate, soft sciences were devalued. This attitude can be seen in organizations today, hard skills dominate, soft skills are often given considerable lip service, but ultimately considered secondary.

The Quantum Paradigm - The Way the World Is?

Two major developments in the first three decades of the twentieth century - relativity theory and atomic physics - completely shattered the central ideas of the Newtonian worldview: Einstein destroyed the idea of absolute space and time and Quantum theory further destroyed the Newtonian concept of elementary solid particles and the causal nature of physical phenomena. In the Special Theory of Relativity, Einstein showed that space is not three-dimensional and time is not a separate dimension but one indivisible unit spacetime, a four-dimensional continuum. Two observers at different locations in space viewing an event could see two different "realities" and even disagree on the basic question of which event preceded the other. With this idea it became clear that there is no Newtonian, objective, observer-independent reality with respect to describing its location in space and time (Casti, 1990).

It's important to realize that Quantum theory is a brilliantly successful practical branch of physics that has given us computer technology, lasers, electron microscopes, superconductors, transistors and nuclear power. (Capra, 1975; Casti, 1989). Quantum theory arose from efforts to describe the behavior of atoms and other constituents of the microworld. Newtonian science would have predicted that subatomic particles, such as atoms, electrons or photons, would have both a finite location and a definite motion; however, quantum theory says something quite different: you can have either one or the other but not both (Capra, 1976; Casti, 1990; Zohar, 1990). Which one results (wave or particle) depends on what the experimenter is looking for or how s/he sets up the experiment.

The philosophical implications of this theory are staggering and have rocked the world of science and can best be summed up by Niels Bohr's own words, "Anyone who is not shocked by quantum theory has not understood it." Einstein echoed a similar sentiment when he wrote in his autobiography, "All my attempts to adapt the theoretical foundation of physics to this (new type of) knowledge failed completely. It was as if the ground had been pulled out from under one, with no firm foundation to be seen anywhere, upon which one could have built (Capra, 1976).

Paradigms from Biology, Chemistry and Other Fields

During the twentieth century there has been a change in paradigms from mechanistic to holistic or systemic thinking in various scientific fields. It is not, however, progressive change but rather one characterized by backlashes and pendulum swings. The basic argument can be described as a conflict between the parts and the whole. Emphasis on
the parts is regarded as mechanistic, atomistic, deterministic and reductionist; emphasis on the whole is viewed as holistic, organismic and ecological. Holistic approaches are embodied in "systems thinking" that simultaneously emerged in several fields in the early part of this century (Bertalanffy 1968; Capra, 1996).

Systems concepts were brought to the life sciences by Paul Weiss who derived them from his earlier studies of engineering (Harraway, 1976) and spent the rest of his life promoting an organismic conception of biology. The idea behind systems thinking is that the whole is always greater than the sum of its parts, and its essential nature cannot be understood by dissection of either a theoretical or physical basis. This was a profound revolution in Western scientific thought and in diametrical opposition to the Cartesian paradigm that a whole can be understood in its entirety by careful examination of the properties of the individual parts. Systems' thinking of the 1920's was quickly enhanced by Gestalt psychology, ecology and as we have already seen, quantum physics.

**Theory of Dissipative Structures or Chaos in Living Systems**

Nobel laureate Russian born chemist and physicist, Ilya Prigogine, proposed the first detailed theory of self-organizing structures (Prigogine & Stengers, 1984). While a professor of physical chemistry at the Free University of Brussels, he constructed his theory based on physical and chemical systems, but freely admitted that his inspiration came from contemplating the problem of life. A major breakthrough for him occurred in the 1960s when he realized that open systems (living systems as opposed to physical systems) far from equilibrium must be described by nonlinear equations (Capra, 1996; Prigogine & Stengers, 1984).

In his theory of dissipative structures, he proposed that dissipation of energy or entropy is not associated with waste as in classical thermodynamics (Second Law of Thermodynamics) but leads to increased order. Prigogine has described linear systems or physical systems, as opposed to dissipative systems (living organizations), as tending to "forget their initial conditions as they move toward equilibrium" (Prigogine & Stengers, 1984). When equilibrium is approached universal laws apply and repetitive phenomena can be observed. Moving away from equilibrium, well-known characteristics of life appear that reflects uniqueness and variety (Wheatley; 1992).

The conceptual shift that evolves from Prigogine's work points to an idea that nature, instead of being like a machine, predictable, deterministic, in fact more like human nature, unpredictable, evolving, and creative. Instead of chaos or disorder leading to death, in living systems it actually leads to new forms of creativity and order. In their book *Order Out of Chaos*, Prigogine and Stengers suggest a new approach to nature not out of domination and control but rather cooperation, respect and dialogue. It is fitting they subtitled their book "Man's New dialogue With Nature".

**Santiago Theory of Cognition and Autopoiesis - “Self Making”**

The Santiago theory was introduced by two Chilean neuroscientists who postulated that mind is not a thing, but rather a process, a process that forms the very essence of life (Maturana & Varela, 1980). They identified mental activity as the essential organizing activity of life. Plants, animals and humans, all cognitively interact with their environments. According to this theory a brain and nervous system are not required for mind to exist. An ameba or a plant has no brain but is capable of perception and cognition and thus possess a mind. Cognition and mind cannot be narrowly defined as thinking, but involve emotions, perceptions and actions – the entire process of life. This theory of cognition may be the first scientific theory that resolves the Cartesian split between mind and matter; no longer are these two categories viewed as separate, but rather different aspects of the process of life (Maturana & Varela, 1980; Capra, 1996).

The theory of cognition is based on Maturana's concept of autopoiesis, a term he coined to describe the circular organization of the nervous system, which is the basic organization of all living systems. This is a process by which a living system allows environmental elements to trigger its own structural changes constituting an act of cognition. Maturana and Varela term this "bringing forth a world." Cognition does not represent an independent existing world, but rather through the process of living continually brings forth a world. From this each living system builds its own distinctive world based on its own unique structure. In the words of Varela, "Mind and world arise together" (Varela et. al., 1991).

**Applications of Paradigms to the World of Business**

Scientific paradigms find their way into all aspects of our society, including our social, political and business worlds (Capra, 1996; Overman 1996; Wheatley 1992). Frederick Taylor's now obsolete Scientific Management theories were also based on the linear thinking of Newton and relied on such concepts as fixed time and space, simple causal relationships and the importance of physical reality and what can be observed (Overman, 1996). Employees were basically viewed as lazy and irresponsible; in order to utilize them fully they should be paid only on a piecemeal basis so that they perform tasks with the minimum number of actions within prescribed time limits (Overman,
1996). While the Newtonian paradigm still has useful applications in many domains, it can be viewed as under siege since its mention is always of a pejorative nature in most current business literature (Wheatley 1992; Overman 1996; Murphy 1996).

In Newtonian organizations boundaries and compartments shape the way we view the world; there are highly structured roles and accountabilities. All experience is analytically chunked. Pie charts are regarded as Holy Scripture, pointing the way to greater market share, customer service or employee satisfaction. This “thing” world is a world of scientific objectivity, a mechanical clocklike world that can feel distinctly anti-human (Wheatley, 1992).

Quantum mechanics broke the clock. Quantum organizations offer the potential for us to construct new realities. As with wave packets (wave/particle), we as individuals represent pure potential. We do not exist independently of our relationship with others. Certain people and settings stimulate unique aspects of our personalities, as we move from one environment to another, each with a new cast of characters, we become slightly different in a new way (Wheatley, 1992).

Presently there is a great deal of information being written in an effort to apply chaos theory and self-organization in living systems to business organizations (Stumph, 1995; Wheatley, 1992). Many management experts are rapidly becoming disillusioned with efforts to measure, predict and control business outcomes. Many are beginning to believe that business organizations, as living systems, have tremendous capabilities to self-organize. They are advocating that leaders need to embrace the biological model to find new ways to give up control, empowering workers to act as independent agents interacting with one another in the creation of new business processes.

Paradigm Themes: The Role of Consciousness, Holism and Interconnectedness

From our review of the paradigms several themes emerge: consciousness, holism and interconnectedness. The Quantum paradigm brought with it startling implications for the role of consciousness in the universe. Arguably the most spectacular aspect of Quantum theory is whether a particle or wave state manifests depends on the observer or scientist who sets the conditions for the experiment. Somehow “we” seemed to enter the arena of objective science. This amazing revelation reflects a new epistemology that eliminates the idea that there is a reality separate from the observer. From the world of physics, Wheeler stated, “in some strange sense this is a participate universe.” Prigogine, from the world of chemistry indicated, “Whatever we call reality is revealed to us through an active construction in which we participate.” To distill this to its essence: Our human consciousness gives us a participatory and creative role in shaping our world (Zukav, 1989; Skolimowski, 1994).

Scientific work from the field of physics, biology and chemistry point to a holistic and interconnected world, a web of relations connecting the various parts of a unified whole (Capra, 1976; 1996). It is not surprising that our organizations are now described and interpreted in the same manner (Burke, 1992; Morgan, 1998; Wheatley, 1992). Meier (1985) asserts that our age is frequently symbolized by the geodesic sphere, which represents integration, interrelationship and a connection to the whole. This idea has influenced not only our scientific endeavors, but our educational philosophies, organization development activities and notions about human personality (Meier, 1985). Systems approaches are commonplace in our literature on organizations. But organizations still mostly have a mechanistic approach to the development of employees. There is a great deal of discussion about knowledge workers and their training needs, all in an effort to build "intellectual capital". But there is much to do in creating organizations that develop the whole person - intelligence, emotions, spirituality and ethics. In order to examine possibilities for a future vision for HR/HRD based on the themes of consciousness, holism and interconnectedness, we need to review where we have been.

The Old HR/HRD

In order to envision a new role for HR/HRD, it is important to review exactly what that role has been. It traditionally has not been one of real authority, being accorded a middle-level position in the organization, an unenviable position ensuring tongue-lashings from above as well as endless complaints from below or adjacent levels in the organization. Generally the role has not been a strategic one; HR people are not paid to think, they are paid to react and execute. They are expected to be the ones that stick their fingers in the dike to plug a leak, but they are not asked why the dike is leaking in the first place. It is not without good reason that HR has been called the "handmaiden of management" or more pejoratively, "lapdogs of management". Vision, major decision-making and control have not been the norm. Everyone knows that HR is there to serve its master: management.

Employee surveys run by companies, irrespective of industry, often reveal that the HR department is regarded as the most irrelevant department (Weiss, 1997). Is it any wonder that there is much talk today suggesting various ways to dismantle HR? While many are discussing new strategic roles for HR, there are those who suggest elimination of the HR department and that all HR functions should be outsourced (Ulrich, 1998).
An Emerging New Role - Developing the Whole Person?
Cognitive development, as an important part of consciousness has definitely expanded in the 20th Century. Behaviorism dominated psychology for over half this century and clearly denied there was a mind to be studied. Arguably, the most important development in psychology over the last half of this century is the ascendancy of cognitive science and that individuals can choose the way they think (Seligman, 1994). A recent Bureau of Labor Statistics report (Galagan & Wulf, 1996) indicates that the fastest growth industry is the adult learning industry because of the rapid changes in every field and occupation. We all know that there is a tremendous need for training and education for the new knowledge jobs. Even under the Newtonian paradigm, limited cognitive development has been acceptable goal for organizations (i.e., cognitive development related to doing one’s immediate job). But the workplace today also demands the ability to form connections, to build relationships as exemplified by: the new emphasis on teamwork, the need for employees to assume temporary or permanent leadership roles and the need for diverse groups to work together, not only locally, but globally.

As we saw from Maturana and Varela’s research, cognition not only encompasses thinking but emotions and the entire process of life. Morris (1993) indicates that most organizations have not taken into account research on adult development that emphasizes adult transitions and transformations, including feelings, thoughts and morals. Organizations will have to realize the importance of a holistic approach to organizational design and the development of its human resources. All of this necessitates training, organizational design and organizational development to not only help people develop cognitively, but emotionally and ethically as well. It could be argued that because the work of knowledge workers requires a high level of functioning, the organization could become the biggest purveyor of and strongest force for human development in our society.

The concept of the learning organization certainly exemplifies the importance of organizational design to create a continuous learning environment for development. Peter Senge (1990) promotes a systems approach to the learning organization in which organizational learning includes teamwork, collaboration, creativity and all knowledge processes as part of the collective norms and values with a common meaning for all. Senge (1990) viewed the organization holistically and described five disciplines essential to the learning organization: 1) systems thinking, 2) personal mastery 3) mental models 4) shared vision and 5) team acquisition of knowledge. All of the disciplines are to be used by the individual to augment organizational knowledge, thus, ensuring organizational success. Even though Senge’s work defines the learning organization, all of his disciplines are largely cognitive in nature, only one, personal mastery touches on issues of emotions and spirituality.

Role of Emotional Intelligence
It has been stated that “learning organizations assume the competence of all members” Confessore and Kops (1998). But we need to acknowledge that even your most competent members have periods in their lives when personal problems render them functionally incompetent. Also, sometimes people who otherwise function quite well have emotional "blindspots" that can be destructive. In today’s environment, the mere mention of introducing training concerning anything to do with emotions is guaranteed to be greeted with disbelief and raised eyebrows. You could actually be viewed as a subversive. Yet, Daniel Goleman (1995) is pioneering the promotion of emotional intelligence and his work is beginning to open a discussion of the legitimacy of introducing such learning into business environments.

Goleman tells the story of a manager who had glaring blindspots regarding his own conduct resulting in disaster for the workplace. This manager was the epitome of abusiveness, which resulted in his employees being so intimidated that they would never give him honest feedback. While in many workplaces this may have had no outward consequences, in this workplace it was fatal: the plane he was piloting crashed because no one on the flight deck dared speak up to question his decisions (Koonce, 1996).

Goleman’s (1995) research shows that emotional intelligence is emerging as a critical piece of our human development. He indicates that IQ may help a person get a job but it’s emotional intelligence that helps him/her keep it. His research has demonstrated that the emotionally adept, those who understand and cope with their own feelings well, who can read and effectively handle the feelings of others, have a great advantage in both personal and work relationships. The ability to bounce back with optimism, after experiencing hardship and adversity, or respond...
with equanimity to hostile attack is a great advantage in any arena. Goleman (1994) views emotional intelligence as a meta-ability: It determines our ability to use effectively the other skills we possess as well as our intellect.

**Spirituality and Ethics**

The paradigms show us that the world is interconnected at its most basic level and that consciousness is a part of all lifeforms, the planet and universe as well. This connectedness of all things has profound implications for spirituality and ethical behavior (Capra 1996; Zukav, 1989). Ecology is showing us that we can't abuse certain areas of the planet and not expect repercussions elsewhere. The world community is now looking in on the treatment of all the citizens of the world. Unethical treatment of people in organizations is now being exposed more than ever. People who have not found spiritual reasons to treat others equally, or haven't even discovered that treating people well or fairly makes good common sense, should at least be tempered by exposure for such behavior in the future. Once again, the boundaries are disappearing. Unethical behavior in business has been easily achieved in the past, but as boundaries weaken, it is, at least, getting somewhat harder to do.

It's reassuring to know that even in the field of economics, they are also wrestling with paradigm changes. John Tomer (1998) critiques the mechanistic economic models that reduce businesses to vehicles for achieving outputs and ignore intangible or "soft" assets such as leadership, principle, character, spirit and vision. He postulates a holistic model of economics that accounts for the "soft" assets being as critical for success as the usual hard assets (organizational structure, financial structure, etc).

As part of a vision for the future, HR/HRD should take a firm stand and plant itself firmly on ethical ground. Currently, employees, when they run afoul of managers, can expect little support from their own HR department even when they have been wronged. HR/HRD too often works to cover-up the wrongdoing of managers, rather than taking an independent fair-minded approach. Weiss (1997) describes corporate downsizing as an example of a "morally bereft" effort based on a short-term mentality by top executives to pump up the organizations bottom-line and their own compensation packages. He asks an excellent question, where is the moral outrage on the part of HR? He sadly concludes there is none because "HR is often an accessory to the slaughter".

Now some will say it's not our place to take an ethical stance against upper management. However, if HR/HRD wants to craft itself as consultants, coaches of people development and as architects of organizational environments, then it must take on this role or risk having very little credibility with the human resources it's there to develop. Serving as a "check and balance" on upper management's ethics should ultimately be welcomed by upper management; it could save them a lot of lawsuits.

We can compare this "check and balance" system to the organization of our government with its three branches of government serving to balance the actions of one another. The organization with its hierarchical structure has been an anomaly in a democratically constructed country for some time. We are already seeing this structure change with the emergence of matrix organizations. The higher cognitive development of people will call for more democratically designed organizations, as well as systems approaches for maintaining ethical integrity.

**A New Strategic Direction?**

Some will say that it's a Herculean task for HR/HRD to lead the charge in promoting the full development of employees. Being an architect of human development, perhaps, is a clarion call only to the brave. But is there a more ethically responsible stance to maximize the productivity of employees? Should we envision anything less when we consider that human resources were originally used to serve production, but production is now being designed to serve human resources (Meier, 1985). It seems HR managers should be a step ahead of the human resources they are there to manage. This requires adopting a strategic orientation to the organization. Recent articles based on surveys of HR executives and professionals are echoing a theme that HR/HRD should prepare to move into strategic positions in organizations (Caudron, 1994; Stuart, 1992; Walker, 1990). The middle-management position is no longer appropriate for those who have inherited the role of developing, cultivating, training and supporting the central asset of organizations.

In order to pave the way and even have the time to reorient to a strategic role, HR/HRD will have to make decisions about which activities will be considered core activities and which can be spun-off. We are seeing that some CEOs consider less important such HR functions as compensation, benefits and labor (Stuart, 1992). Today it is not unusual to see many of these functions, including training, outsourced. Increasingly, CEOs want HR/HRD to provide them with fundamental business decisions and make suggestions for future developments. A call is going out for HR/HRD to become a strategic business partner and to address bottom-line business needs (Stuart, 1992).

Unfortunately, most HR/HRD departments don't have the clout to command CEO attention. Too often CEOs call in consultants to provide them with the same information their HR/HRD department has been trying to tell them for years (Weiss, 1997). Some experts believe that HR is frequently not even out front on issues that
should be its natural domain, such as workplace diversity, sexual harassment, work/family balance issues and goal alignment (Weiss, 1997). If we defined ourselves as organization architects and facilitators for human development, would there be any doubt that we should be on the leading edge of these issues that define even the current corporate landscape?

Interim Steps for Budding Corporate Architects . . .

In order to work toward a vision of becoming architects and facilitators of human development, we need to consider some pragmatic guidelines for getting there:

1. We need to start with building our credibility as organization problem solvers. The good news here is that more and more CEOs are asking for this from HR/HRD (Stuart, 1992; Caudron, 1994). To achieve this goal will entail more learning about what contributes to bottom-line business results, including understanding the nature of the product, business direction of the company, who the customers are and how the business is positioned in the marketplace. This means developing a HR business plan with specific details regarding HR implications for each one of the company's business goals (Caudron, 1994).

2. To augment goals of becoming strategic-minded regarding bottom-line business results, we, in this field, should assess our college and university HR/HRD programs to ensure that there is some "hard" business knowledge as part of the core curricula. It's not unusual to hear organization experts stating that MBAs are more useful than a Ph.D. in organization development (Weiss, 1997). Perhaps we should take this as a cue that we should incorporate some hard business courses. We must be careful not to over focus on business courses which could take us away from developing our human resources. It's important to consider what courses are essential to help HR/HRD become the central resource for performance development in an organization.

3. Perhaps the best place for HR/HRD to start building credibility is to work to build and augment the relationship with our natural partners, the line-managers. Caudron (1994) asserts that HR/HRD has traditionally offered prepackaged HR services to the company, but is now shifting to provide service that helps line managers develop and manage their own HR policies. More companies today are utilizing HR as partners for their operating managers. Basically what is taking place is an exchange of functions: HR works with managers to handle some of the traditional HR functions, thereby, providing more time for HR managers to understand and help solve the bottom-line business problems of operating managers. Both work in concert to develop and provide an environment that enables employees to work in an optimum fashion (Caudron, 1994). Similarly, Confessore and Kops (1998) promote the concept that HRD professionals need to move beyond their role as trainers and "become coaches, consultants and counselors of learners."

4. As we saw in item number (3), forming connections in the organization will be critical for our success. Additionally, HR, HRD and OD have, in many ways, like couples in a bad marriage, split up and gone their separate ways. Sadly, sometimes they don't even speak. The potency of our profession is dependent on working across these mechanistic barriers (Remember the paradigms!) and forging a comprehensive and integrated vision. The roles can still be separate in many ways, but we need to consider more cross-functionality of training and knowledge. Allison Rossett (1996) describes that HRD people often don't understand what organizational development is all about; thus, they fail to recognize when that is the solution, rather than training. She tells how AMOCO, following on the quality movement's emphasis on cross-functionality, asked her to help integrate their OD and HRD department. Also serving the theme of collaboration and connections, HR executives are frequently forming partnerships with other companies in an effort to leverage their collective technologies and other competencies (McMorrow, 1999).

Onward to the Challenge!
The end of this century brings us to an interesting crossroads. It's as if HR/HRD has been an understudy waiting in the wings backstage; suddenly we find ourselves thrust into the limelight, are we ready? A strategic role has been proffered -- can we handle it? It's not without good reason that HR has been called the "handmaiden of management". Vision, major decision-making and control have not been the norm. We know that with the new limelight on human resources in the knowledge age, a ball has definitely been tossed to us, whether we run with it or fumble depends on what we do now.

The paradigms we have reviewed have themes that could have profound implications for the future of HR/HRD. Even coming from divergent fields, they speak to us of a holistic unity of our world, permeated and interconnected through consciousness. Today we hear much about and are dazzled by the technological and scientific achievements of our world. So much so, that we almost have failed to notice our own development. It's certainly paradoxical that paradigms from the world of science are teaching us about the importance of developing the whole person and the creative role of consciousness in creating or "bringing forth" our world.
As we begin to consider our future in the next millennium, never have conditions been more favorable for a dynamic, new and strategic role for HR/HRD. Emerging into the era of the knowledge worker, we, as the traditional caretaker of human resources, find ourselves on center stage. By looking carefully at the prevailing scientific paradigms, we can see the outline of possible future developments that put us in our rightful place: at the heart of an organization.

The Meaning of the Meaning of Work: A Literature Review Analysis

Neal Chalofsky
The George Washington University

This literature review addressed the state of research concerning the concept of the meaning of work. This analysis is an update of a preliminary review conducted four years ago. This inquiry built on the theoretical foundation of the content motivation theorists, but focused on what the research informs us about meaning of work as a motivational construct. Several elements were identified that could form the basis for such a construct.

Keywords: Meaning of Work, Spirituality, Self-Actualization

Four years ago, a small group of doctoral students studying with a faculty member of their HRD program conducted a preliminary literature search to see what research had been conducted in the area of meaning and spirituality of work. While they discovered there was relatively little research reported in the literature, there was enough to begin to formulate a set of conclusions around a dichotomy between values and meaning. Since then a number of other studies have been conducted that now allow us to perceive several consistencies among the findings about what is the meaning of the meaning of work.

"The managerial and popular literature is [still] increasingly referring to individuals questioning the meaning and purpose in their work" (Chalofsky et al, 1997. A significant number of the books published by the major management publishers certainly reflect this theme, as well as the popular and professional magazines. There are at least ten conferences a year on spirituality and work in this country and this same topic is beginning to be echoed internationally. The baby boomers are going through mid-life questioning the meaning and purpose of the work and their lives. The twenty somethings are questioning whether they even want to start down the path their parents took, career-wise, and are making different choices about the role of work in their lives.

Theoretical Framework

Gayle (1997) reported that the classic motivation theorists and humanistic psychologists clearly supported the notion that individuals have an inherent need for a professional life that they believe is meaningful (Alderfer, 1972; Herzberg, et al., 1959; Maslow, 1943, 1971; McGregor, 1960; Rogers, 1959, 1961). Maslow (1971) wrote that individuals who do not perceive the workplace as meaningful and purposeful will not work up to their professional capacity. Yet, with rapidly changing economic conditions, organizational structures, and job requirements, what once may have provided a measure of meaning and purpose for individuals in the workplace is eroding (Csikszentmihalyi, 1990; Shamir, 1991).

There is a long history of research and discourse about what motivates employees and the relationship between job satisfaction, morale and performance/productivity. As organizations became more complex, assumptions about the power of rewards such as pay, security, and working conditions were questioned. In addition, the correlation between morale and productivity was challenged. In response, the human relations movement produced theories focused on human needs. This classic motivation literature referred to work itself as the primary motivator.

Maslow (1943, 1954, 1970, 1971), Herzberg (1959), McClelland (1965), and Alderfer (1972), theorized that individuals are motivated to take certain actions based on fulfilling needs believed to be inherent in all humans. These content theorists all proposed that as these needs move from basic survival needs to higher order needs, they become more intrinsic and reflective in nature. The higher order needs are translated to values, working toward a higher cause; meaningfulness and life purpose. (Given the brevity of this paper, the individual theories of the authors mentioned above will not be discussed in detail.). A few theorists moved beyond the notion of the value of performing a set of tasks as a primary motivator, most notably Maslow (1971). After establishing his hierarchy of needs, he began to explore the meaning of work. This exploration was expressed in his description of being values,
referred to as B-values. B-values included truth, transcendence, goodness, uniqueness, aliveness, justice, richness, and meaningfulness. A self-actualized person would feel that work equates with play and both become an integral part of a person's being. Maslow equated B-values with spiritual values which he believed is a part of the human essence (Gayle, 1997).

Also noteworthy is the thoughtful discourse from Rogers (1961), Locke (1975), and Ackoff (1981. Rogers (1961) believed that people find purpose when they experience freedom to be exactly who they are in a fluid and changing manner. Locke (1975) wrote that people strive to attain goals in order to satisfy their emotions and desires. Ackoff (1981) described purpose and meaning as progress toward an ideal that converts mere existence into significant living by making choice meaningful. And lastly, further exploring the meaning of work would provide an opportunity to learn from where Maslow and others have left off.

Purpose

The purpose of this paper is to determine what the research and theory-building literature can inform us about the meaning of work. At the time we did our initial review, there was little or no research on the meaning of the meaning of work, even though the popular and professional literature has addressed the issue for years. We wanted to know not only what the more recent research is about, but also how it may change our initial perceptions of the scant research we found four years ago.

A review of this nature is important to: (1) develop a framework for understanding the construct, (2)how HRD practitioners may impact workplace productivity and satisfaction, and; (3) determine what gaps exist that warrant further research and theory-building.

Methodology

A literature review of researched-based articles, both quantitative and qualitative, was conducted in 1996. Business, psychology, sociology, and education literature was reviewed. The following databases were searched: ABI/Inform, Educational Resources Information Center, Psychological INFO (journal and articles), and Dissertation Abstracts. Keywords used in the literature search include: work values and beliefs, work and meaning, work and spirituality, motivation and meaning, motivation and high performance, purpose of work, work and personal growth. The same review was again conducted in 1999 to see what had been added to the literature. The resulting literature were reviewed and analyzed.

Findings

Two major areas within meaning of work were identified in the original literature review, values and meaning. This update has concentrated on the meaning of the meaning of work. But first a synopsis of the original review will be presented.

Values

A preliminary keyword search identified a limited number of literature reviews, articles from scholarly journals and abstracts of doctoral dissertations on "values" as they relate to "work" and "spirituality." The initially daunting variety of concepts that appeared in these articles was sorted into four clusters: cognition, emotion, action, and outcomes. The cluster titles also suggest a process of value formation.

The cognition cluster includes key words like valuing, comparing, recognition and assessment. The cognitive dimension of valuing involves the determination of whether an option is worthy, either intrinsically or in relationship to some extrinsic outcome. Broenen described cognition in valuing as "making subjective rankings or judgments about variables in one's environment that may relate to how satisfying one considers one's job" (1990, p.2).

The emotion cluster includes concepts like, needs, desire, and affect. George (1996) found that research in subjective well being suggested that values, attitudes and moods form a powerful triple interaction that can affect job satisfaction and turnover. Emotions also help energize or motivate action. Action/Result keywords include performance, behavior, and goal achievement as outcomes of value motivated activity.
Much of the research on organizational behavior and human resource management involves the interaction of individual values with the workplace (Coomey, 1988; Carlson, 1995). Coomey reported that her search of the literature uncovered widely diverse definitions of values which she eventually consolidated into one. According to Coomey’s definition, values are the transformations that take place between actual or perceived outcomes (rewards, losses, etc.) and affective states (satisfaction, dissatisfaction, etc.) which lead to action (behavior, performance, etc.). She further explained that values derive from a vast number of contextual variables like: childhood, education, occupation, personal goals, stage in the life cycle, perceived equity, organizational climate, outcomes, and values themselves. It was suggested, therefore, that values, instead of being isolated entities, more closely resemble a system.

Four themes that elaborate the cognitive, emotive, and action/result dimensions of value and work also emerged from the literature: (1) intrinsic vs. extrinsic factors; (2) work values and quality of work life; (3) subjective well-being and happiness; and (4) working hard vs. working smart.

**Meaning**

Csikszentmihalyi (1990) in his attempt to define meaning, readily acknowledged the difficulty the task presents by suggesting that any definition of the term would undoubtedly be circular. However, he points to three ways in which the word may be defined: (1) having a purpose or the significance of something, (2) the intentions one holds, and (3) identifying or clarifying the term in context. Similarly, one may attempt to define work. Dirkx (1995) subscribed to the theory that work is one of the ways that a mature adult cares for oneself and others. This was expressed by respondents in the Schaefer and Darling (1996) study who defined work as an opportunity for service to others and not distinct from the rest of life. The term may also be definitive of one’s uniqueness and a way of expressing one’s self in the world.

Adding the word “work” to meaning presents an even greater challenge at definition. Meaning of work suggests an inclusive state of being. It probably is that which seeks to define who we are, the purpose of our being, and the spirit with which we approach what we do. Put in a spiritual context, it is that which gives essence to what we do and what brings a sense of fulfillment to our lives. The literature indicates that meaning of work is a significant contributor to meeting one’s purpose in life. Supporting conditions for its fulfillment are work spirit and the sense of being as founded in one’s spirituality. These are regarded as cogent factors for finding meaning in one’s work.

The conclusions we reached in the initial review revolved around a dichotomy between values and meaning in relation to work. The literature seemed to refer to values as intrinsic motivators to performing a job and deriving satisfaction from a job. The emphasis is on what the job means to us in terms of the congruence of the tasks with our beliefs, objectives, and anticipated rewards. Values are relatively easy to identify through instrumentation; and understanding the fit between values and job responsibilities significantly influences job satisfaction.

The meaning of work, on the other hand, “comes from the inside out; work is the expression of our soul, our inner being” (Fox, 1994, p.5). The meaning of work is in and of itself much subtler; as is the distinction between meaning related to work and values related to a job. The distinction seems to lie in the notion that a job is what we do; work is who we are. We get paid to do our job; we are successful if we achieve some goal or target. Yet, as Fox points out, much work in our society is not paid at all; for example, raising children, tending a garden, singing in a choir, or organizing youth activities. So what then is the nature, the meaning, of the meaning of work?

**Meaning of Work Research**

Wishner’s (1991) study on the influence of the meaning of work, among other constructs on job satisfaction of school psychologists, yielded interesting results. Though the prediction that the meaning of work was prominent and intrinsically important was not confirmed, the construct itself proved the single best prediction of job satisfaction. This indication propelled the researcher to conclude that the meaning of work has a more pervasive role in the lives of individuals. Shamir (1991) reported that a task can be motivating due solely to its meaning to the individual, rather than for the intrinsic rewards it may bring. Jaeger (1994), in investigating the self-employed, concluded that among aspects of the Protestant work ethic, a need for meaningful work was the single most important descriptor which defined the individuals’ sense of purpose in their contribution to the spirit of community living. Further, the researcher concluded that work was an accepted part of the participants’ personal identity. It was that which brought meaning, enjoyment and satisfaction to their lives.
It seems that one's ability to achieve meaning from one's work depends on what one brings to the work itself. Loscoscco (1985) identified two elements - work commitment and work orientation and suggested that these are designators through which people come to and assign particular meanings to the work they do. In one aspect, work commitment represents the relative contribution of work to the sense of self, while work orientation reflects the importance people attach to the various types of rewards available from the work they do.

Together, these ideas are reflective of Connelly's (1985) concept of work spirit, the set of qualities exhibited by people who enjoy their work enormously. Among these qualities are a positive state of mind, a sense of purpose and vision, and a full sense of self. One group of participants in Connelly's study describes work spirit as a "ground of being," a continuing state of mind from which everything else emerges. Connelly concluded from this study that people who love their work and find meaning in it realize that their work experience, to some extent, is dependent on what they themselves bring to the experience.

Shamir (1991) argued that current work-motivation theories should be augmented by the concept of self. He built a theory of self-concept-motivations on the following assumptions: that people are not only goal-oriented, but also self-expressive; that they are motivated to maintain and enhance their self-esteem, self-worth, and self-consistency. Shamir also postulated that self-concepts are composed, in part, of identities. He further suggests that self-concept-based behavior is not necessarily related to clear expectations or specific outcomes. These assumptions imply that work motivation will be increased when job related identities are prominent in the self-concept, and when the engagement offers opportunities for enhancing self-esteem and self-worth through actions that are consistent with the person's self-concept.

Pitts (1995) indicated that the ability to find meaning in one's work is an expression of one's sense of self. It seems then, that if people derive meaning from their work to the degree of how work spirit is described, then work becomes one means of how people are grounded in who they are as spiritual beings. Neck and Millman (1994) suggest that a central aspect of spirituality involve the meaning of one's work. The concept itself (spirituality) is multi-dimensional and may be expressed as a transforming power or an expressed desire to find meaning and purpose in life. It also suggests a desire to make a difference and create a meaningful world, or an inner wisdom and compassion. Sveinunggaard (1992) similarly describes one's spirituality as a transformational life experience that gives rise to a reaffirmation of self-characterized by a contextual awareness of oneself as one journeys inward to discover the self.

The theory of self, as expressed through spirituality, is defined by Hartman (1996) as inclusive of all human experiences including work and one's experience of reality. Further, the researcher indicated that the meaning one encounters from this reality gives rise to the quest for significance. This theory is substantiated by McEnroe (1995) who claimed that the most significant factor contributing to outstanding leadership is the executives' strong inner core of spirituality which, among other competencies, include finding meaning in everyday life, what they do, and what happens to the organization.

Csikszentmihalyi (1990) found in his research on high performance that people in what he refers to as a "flow state" actually feel a sense of disappointment when they achieve the objective of their performance, because the act of performing is the motivator; not the accomplishment of the task. People in the flow state derive meaning from their work because they both believe/know they will succeed and accept "failure" because it is worth the risk. So success is secondary to the work itself and risk (and possibly failure) increases the challenge and learning, two factors Gayle (1997) found that contribute to meaningfulness among high technology professionals. The people she researched were "gold collar" employees, technical experts in great demand in the workplace who know they can go anywhere and get as much salary as they desire. So the end-goal of money or status was not what was of importance to them, it was their ability to have an impact on the organization's effectiveness through the work, and the self-directed "space" to be continually challenged, creative, and learning. Similarly, Deems (1997) found that people in two organizations she studied perceived self-authority, participatory work practices, and continuous growth and development, as integral to the meaning of work.

Several studies have dealt specifically with women and meaning of work. Svendsen's (1997) study looked at how women experience the attempt to achieve integrated wholeness, the merging of their professional and personal selves. She found that the co-researchers brought their whole selves (mind, body, emotion, spirit) to their work and their "play", that relationships played a critical role in achieving integrated whole ness, and, again, the theme of continuous learning and growth. Ostendorf (1998) also found that the relationships women formed at work were integral to the meaning these women derived from their work. Personal growth and emotional well being were also themes that emerged in the study. Rulle's (1999) study of empowerment among nurses (all women) revealed the relationship between meaning, autonomy, and giving to others.

Jaeger (1994) also found the same relationship among self-employed persons. And giving to others was
also a theme that emerged from Allan's (1996) study of CEO's and volunteerism and Mukri's (1998) study of Navy nurses and Schein's lifestyle career anchor. An additional theme that was the purpose of Svendson's study but also mentioned, though not clearly identified, in most of the above-cited studies was work/life balance. In Mukri's study, she found that the structure of the military actually provided the ability to commit to a balance between work and family, which was valued by the nurses and supported by the leadership.

The most recent study looked at spirituality in the workplace. Mitroff and Denton (1999) asked their respondents to define spirituality and the one word that captured their descriptions was interconnectedness. Yet their research question was about what gave the respondents the most meaning and purpose in their jobs. The findings of their survey were that people ranked the ability to realize their full potential as a person as their first choice, being associated with a good (ethical) company as their second choice, and interesting work as their third. Interestingly, the results of their follow-up interviews were that most people do not feel that they bring their whole selves to the workplace, thus they do not feel that the ability to reach their potential exists. There were other disconnects between what people believed in and what was practiced in their organizations.

There was one conclusion to their study that has significant implications for how we use the terms spirituality and meaning almost interchangeably. The popular literature tends to use the term spirituality and work; as in how can we help organizations to realize the power of spirituality at work. Yet the respondents talked about spirituality as being very personal and relating to all of their lives, not just in relationship to their jobs. Meaning of work, on the other hand, while also being very personal, resides in the interaction of the self and the work, and can be exclusive of the organization.

Conclusions

Based on a review of the literature, the following components of meaningful work were identified:

1. People need to bring their whole selves (mind, body, emotion, and spirit) to their work. The sense of self is critical to finding meaning in work. This includes both a very positive self-belief system and a total integration of the work self and the personal self. The positive belief system is what allows people to achieve the flow state and to thrill to the challenges and the learnings. It brings out the creative energy that results in highly productive efforts. The integration of the total self means that there is an alignment between the person's beliefs, values, and competencies, and the purpose for the work (and hopefully the mission of the organization). This alignment translates into an inner feeling that this is the work I was meant to do and this is how I was meant to live my life. Svendson (1997) used the term integrated wholeness to reflect this state of being.

2. Giving to others. Giving to the clients/customers of the work, to colleagues, to family and friends, and to community and society is a key component. It relates to the sense of spirituality and to the sense of mastery. The spirituality of the work is about contributing to others individually and collectively. To some it may refer to the notion of a calling, something a higher power or higher consciousness would expect. To others it relates more to social responsibility, what we should give back to society. The person who masters the skills and knowledge of the work shares that experience with apprentices, and this act provides additional learning and growth, as well as a sense of giving.

Recommendations for Further Research

It seems obvious that more research needs to be done to determine the impact of values and meaning on work, performance, and organizational effectiveness. We also need to learn more about the interrelationship between values and meaning, and between meaning and spirituality. We need to investigate the components of meaningful work in more depth, especially in the area of self-concept. Finally, we need to identify actual examples of meaningful workplaces and share best practices.

Implications for the Field of HRD

In this age of the “new employee contract” we need to pay attention to:

1. our whole selves at work, to admit that some work has no meaning to us and offers no
possibility of joy, to examine what work will have meaning to us and seek such work, to meet our
coworkers self-to-self, center-to-center, and to stop pretending that our interior lives don’t matter.
(Only then) will our work become more joyful (and) our organizations will flourish with
commitment, passion, imagination, spirit, and soul (Richards, 1995, p.94).
When the emphasis on performance is paramount over all else, employees gradually lose the meaning of their work.
Such loss of meaning affects attitudes, behavior, and overall mental health. Our profession needs to search for and
implement new workplace models that address work as both a vehicle for production and individual and social
development and satisfaction. (Svendsen, 1997).

Maximizing Opportunities for the Aging Workforce through Workplace Design

Virginia W. Kupritz
The University of Tennessee

This study further investigates the Kupritz findings (1999) that older and younger workers perceive similar types of design features as impacting work. The study utilizes the second phase of the Heuristic Elicitation Methodology (HEM), building upon the first phase of the HEM used in the earlier study. The first phase of the HEM is qualitative and the second phase is quantitative. Results from the present study indicate that even though older and younger workers generally associate similar design features with facilitating work activities, cohorts do not perceive similar weightings of importance for certain design features, especially those related to privacy. This suggests that design changes to the office may be necessary to provide older workers with the same opportunity as their younger counterparts to perform efficiently.

Keywords: Aging Workforce Perceptions, Workplace Design, Privacy

This study examines physical attributes of the office environment that accommodate older and younger American workers. The increasing age diversity in the workplace is a striking change in the American labor force. 76 million baby boomers, expected to live 30 or more years longer than their predecessors in 1900, face a social phenomenon unparalleled in history (Dychtwald & Flower, 1990). Demographic studies project that this aging population will play a significant role in the diversity of the American workforce (AARP, 1996; Brill, 1993; Hopkins, Nestleroth, & Bolick, 1991). Health professionals caution that design changes may need to be made to the workplace to support the physiological decline occurring in aging workers (Ashcraft, 1992; see also Robinson, Coberly & Paul, 1985). If design renovations and retrofits are deemed necessary to support the work practices of an older working population, corporations will need empirical data to guide them in allocating their finite resources to the design changes that produce the highest productivity. This study helps corporations target the most critical design areas that older and younger workers perceive as facilitating their performance. With the exception of Kupritz (1999), research examining the impact of a broad range of design features on older workers is especially uncommon; also research examining cohort perceptions is rare. The present study builds upon the research findings of Kupritz. Kupritz discovered a system of cultural meanings that older and younger workers use to describe office features that facilitate and impede their work. The findings revealed that older and younger workers perceive similar types of design features to impact work. Aging workers do not appear to require different physical features or special design adaptions to facilitate job performance. This suggests that structural changes to the workplace may not be necessary to accommodate aging workers. As an inductive approach, these findings provide a beginning knowledge base about what cohorts think about physical features of the office and privacy, which surfaced as a major concern. The qualitative nature of this earlier study, however, did not allow Kupritz to measure the strength of relationships between physical features and work activities nor the relative importance given to office features by cohorts. This investigator believes that design differences may surface in other ways through quantitative measurement. The objectives of this study are to determine the strength of association that cohorts perceive between office design features and work activities performed and the relative importance given to office design and privacy features by cohorts.

Older and younger learners need a supportive work environment to help bridge the application gap between the training environment and the practical work environment. Trainees returning to a supportive work environment appear to demonstrate greater utilization of training skills (Baumgartel, Reynolds, & Pathan, 1984; Broad & Newstrom, 1992; Foxon, 1995; Richey, 1990, 1992; Rouiller, 1989). Research indicates that organizational climate, as part of organizational context, may be at least as important as learning in facilitating transfer (Richey, 1992; Rouiller, 1989; Russell, Terborg, & Powers, 1985). The physical setting is an integral part of that organizational context (Sundstrom, De Meuse, & Futrell, 1990). Human resource development (HRD) is in the business of improving performance. Training and development, therefore, should not take place in a vacuum for training sake; the dimensions of the larger system–the organizational context–must be taken into account when training is planned, developed and evaluated (Richey, 1992; Tannenbaum & Yuki, 1992). This means that prior to
setting up the training program, emphasis should be placed on the organization itself, taking into account organizational issues that can impact the ultimate success or failure of the training intervention (Foxon, 1995). This includes the physical surroundings of the workplace because it can impact worker performance. Environmental design research examining individual, group and organizational performance documents that office design can enhance or inhibit overall organizational effectiveness (Brill, Margulis, Konar, & BOSTI, 1984, 1985; Davis, Becker, Duffy, & Sims, 1985; DeMarco & Lister, 1985; Springer, 1982; Vischer, 1996). Based upon experiences since his 1984, 1985 research, Brill (1993) proposes that providing a supportive physical environment can yield a productivity benefit equal to 2 to 5 percent annual salary in all job categories. HRD has paid minimal attention to the role that physical surroundings play in mitigating performance in organizations.

The aging population is a megatrend creating a diversified workforce not only in age and physiological makeup but also in work and life experiences. The American Association of Retired Persons (AARP) projects that the most rapid increase in population growth will occur between the years 2010 and 2030, when the "baby boom" generation reaches age 65 (1996). The median age of the workforce was approximately 35 years in 1980, 37 years in 1990, and is projected to be approximately 41 years in 2005 (Brill, 1993; see also Hopkins, Nestleroth, & Bolick, 1991). A large percentage of older workers will experience physiological changes sooner than their younger counterparts. Organizations have raised concerns about the physiological decline of the aging workforce for some time (Ashcraft, 1992; Fox, 1951; Robinson, 1983; Welford, 1976). Robinson, Coberly, and Paul (1985) reviewed a number of studies on occupational performance with age, concluding that "environmental conditions are important in mitigating the effects of decline in aging workers" (p. 519). Environmental conditions provide the physical context of workplace design. While the review's conclusion seems intuitively valid, Kupritz (1999) determined that older workers do not seem to need different physical features or special design adoptions to perform their job, even with the physiological changes occurring. The present study further investigates this phenomenon.

Research Methodology

120 administrators participated in the present study, 59 older workers (60+ years old) and 61 middle age workers (35-50 years old). All 120 office workers are paid and hold lead positions, with at least some supervisory responsibilities. Replicating the Kupritz (1999) study, general work responsibilities entail supervising and evaluating staff, using information technology, conducting meetings, working with clients, promoting the organizational mission, compiling reports, collaborating with coworkers, and reporting to higher management. The administrators work for service organizations in the same geographic area. They occupy a cubicle, an office with floor-to-ceiling solid walls, or a desk in an open area as their personal work space. Neither the Kupritz study nor the present study included ages 51-59 in the sample of older persons as the investigator believed that the sample cohort comparison of office features probably would be more pronounced by sampling a higher age group due to the physiological changes that occur with increasing age.

The present study utilized the second phase of the Heuristic Elicitation Methodology (HEM), building upon the first phase of the HEM used in the Kupritz (1999) study. The first phase of the HEM is qualitative and is designed to analyze complex issues by exhausting the range of respondent perceptions concerning the variables being examined.1 The second phase of the HEM is quantitative and is designed to determine beliefs associated with the issues and to identify interrelationships among the issues. As a cognitive ethnographic method, the basic assumption of the HEM is that it is possible to match particular items and attributes with particular cultural values (Harding & Livesay, 1984). HEM stimulus materials are respondent-generated and data respondent-categorized rather than investigator-generated and investigator-categorized. This preserves the language and conceptualizations of respondents and decreases the likelihood of overlooking significant attributes of a domain being examined (Spradley, 1979; 1980). The methodology is predicated upon the idea that "language provides a powerful entry to cultural meaning structures" (Harding & Livesay, 1984, p. 75). The second phase of the HEM utilizes a structured questionnaire, consisting of a Beliefs Matrix and Preference Ranking. The questionnaire for the present study was designed based upon responses elicited during interviews conducted during the Kupritz study. Questionnaire categories reflected the language of the respondents, salient variables mentioned most frequently, and items of special interest to the investigator. Privacy regulating activities, described by the administrators during their interviews in the Kupritz study, were included in the work activities listed in the matrix as privacy surfaced as a major concern in the earlier study. It should be noted, also, that during the Kupritz interviews, the administrators discussed many of the design items listed in the matrix in relation to privacy activities. This is not surprising as most analyses consider privacy to be a relational characteristic, or attribute of a selected class of interpersonal situations (see Archea, 1977).
**Beliefs Matrix.** Each cohort compared 19 design features to 15 work activities arranged in a binary matrix. The respondents answered yes or no to the question, "Is X [design feature] important for/when Y [work activity]?") Past experience with the matrix indicates that data tend to stabilize with a sample size of about fifty (Kupritz, 1998; Nardi & Harding, 1978). Respondents took about 20 minutes to complete the matrix. Design items and work activities deemed less critical to the success of the study were placed toward the beginning and the end of the matrix in order to avoid possible problems with 'orientation' and 'fatigue' in respondent answers. It is unlikely, however, that 'fatigue' at least would be of much consequence in such a short time. Each respondent, upon completing the matrix, in effect answered 285 questions concerning his/her perceptions of what work activities are associated with each design feature. Table 1 displays a graphic summary of the measured association between design features and work activities for computed matrix cells, per cohort. The probability of association between design features and activities was calculated using the binomial distribution at the .01 level of significance. Z-scores were computed for matrix cells whose p value (sample proportion) was greater than the hypothesized P value (population proportion). Z-scores reached significance for particular design features and activities. Some are associated with privacy and others are not. Uses of the term “privacy” in work environments generally reflect the regulation of interaction, which encompasses retreat from incoming stimulation (generated by people and environmental stimuli) and information management, that is, outgoing information (Sundstrom, 1986).

Categories 3-8 and 12 listed in Table 1 are common meanings found in the privacy literature on work environments. (See Justa & Golan, 1977; Kupritz, 1998, 1999; Oldham, 1988; O'Neill, 1994; Sundstrom, Herbert, & Brown, 1982; Zalesny & Farace, 1987.) Categories being able to concentrate, minimizing interruptions, and minimizing noise and visual distractions are examples of attempts to regulate outgoing information; and evaluating people, written and verbal, encompasses both retreat and information management.

**Preference ranking.** 24 hours of interviewing older and middle age workers in the Kupritz (1999) study did not elicit office design or privacy differences between cohorts, even with the physiological changes occurring in older workers. In order to investigate this finding further, the relative importance of individual design features was measured through preference ranking. Each cohort ranked the 19 design features, listed in the Beliefs Matrix, in order of their importance to conduct work. This part of the questionnaire asked the question, "What are the most important design features for you to have at work in order to perform your job?" Respondents took about 10 minutes to complete the preference ranking. Table 2 positions the mean rank of each design item listed in the Beliefs Matrix, per cohort. Rankings per design item were summed across all respondents and divided by the number of respondents per subgroup. The lower the mean rank the closer the design item is to being ranked first, or most important. The rank order reflects not only each subgroup’s most important design items but also those deemed least important to facilitate performance. The Levene’s Test for the Equality of Equal Variances did not produce significant F scores. As sample data supported the assumption of homogeneous variances, T tests were computed, however, computations did not reach significance for any design items.

**Findings**

The Beliefs Matrix and Preference Ranking analyses taken together determined the strength of association between design features and general work activities, the relative importance given to design and privacy features for performing work and where privacy fits into what is important to older and younger workers in their office environments. **Theoretical consideration #1**-Older and younger workers, in general, appear to perceive similar strengths of association between design features and work activities. Z scores reached significance for similar design features and work activities overall for both older and younger workers. (See Table 1.) Relationships were

particularly strong for cohorts and clustered together regarding the design features 'having a work space with floor-to-ceiling solid walls, a door, minimal traffic routed through my area, my work space located away from the main traffic flow' and the general work activities, having little meetings, concentrating, talking privately on the phone and in person, minimizing interruptions, and minimizing noise and visual distractions, and performing individual work. At another level of analysis, many of these activities relate to privacy issues as described earlier. **Theoretical consideration #2:** Older and younger workers perceive similar weightings of importance for some design features needed to perform work, but not for others. Cohorts ranked 10 out of 19 design features the same or within one or two positions of each other. (See Table 2.) For example, 'having a larger personal office' was ranked 1st in importance by both older and younger workers to perform their work, 'having adequate storage' was ranked 4th in importance by both subgroups, and 'having adequate lighting' was ranked 6th in importance by older workers and 7th by younger workers. Particularly strong relationships for cohorts clustered together regarding certain work activities and design features when compared individually in the Beliefs Matrix. However, cohorts do not consider these design features necessarily as the most important workplace design characteristics when

Prioritized with other design items. On the other hand, cohorts did consider some design features that reached significance for certain work activities as some of the most important features needed to perform work. For example, 'having a work space with floor-to-ceiling solid walls' was ranked 3\textsuperscript{rd} in importance by older workers and 8\textsuperscript{th} by younger workers and 'having an adequate work surface to spread out my work' was ranked 5\textsuperscript{th} in importance by older workers and 2\textsuperscript{nd} by younger workers. Theoretical consideration \#3- First, older and younger workers generally appear to perceive design features needed to perform basic job functions as most important to have at work, followed by certain design features associated with privacy activities. For example, 'having a larger personal office' was ranked by both subgroups as 1\textsuperscript{st} in importance and 'having up-to-date information technology' was ranked 2\textsuperscript{nd} in importance by older workers and 5\textsuperscript{th} by younger workers. Cohorts connect some privacy activities with these design features. Younger workers associate 'having a larger personal office' with talking privately in
person and 'having up-to-date information technology' with talking privately on the phone. Older workers rank 'having a work space with floor-to-ceiling solid walls' as 3rd in importance and associate this design feature with many privacy activities described earlier. 'Having a flexible work space where my furniture and equipment can be rearranged to fit my work needs' is ranked 7th in importance by older workers and 6th by younger workers who associate this feature with the privacy activities, concentrating and minimizing interruptions and visual distractions. 'Having adequate lighting' is ranked 6th in importance by older workers and 7th by younger workers. Both subgroups associate this feature with concentrating. Younger workers also associate this item with minimizing visual distractions. Second, older and younger workers appear to prefer different architectural privacy features to facilitate work. Architectural privacy refers to the visual and acoustical isolation supplied by the physical surroundings of an environment (Sundstrom, Burt, & Kamp, 1980). Cohorts generally perceived different types of design features associated with privacy as important for performing work. 'Having a larger personal office' was ranked 1st as most important by both cohorts to perform their work, however, only younger workers associated this design item with the privacy activity, talking privately in person. Even though relationships were particularly strong and clustered together for certain design features and privacy activities listed in the Beliefs Matrix, cohorts typically did not give similar weightings of importance. For example, cohorts strongly associated 'having a work space with floor-to-ceiling solid walls' with concentrating, talking privately on the phone and in person, minimizing interruptions, and minimizing noise and visual distractions yet this design feature was ranked 3rd in importance by older workers and 8th by younger workers. For the most part, even design features ranked less important by cohorts but related to privacy were not given similar weightings. Three exceptions were noted where cohorts gave similar weightings of importance (within one position of each other) for design features associated with privacy: 'having adequate lighting', 'having a flexible work space where my furniture and equipment can be rearranged to fit my work needs', and 'having my work space located away from the main traffic flow.'

Summary

The present findings indicate that cohorts prioritize certain design and architectural privacy features differently, even though older and younger workers generally associate similar design features with facilitating work activities. Older workers appear to need different physical features depending upon the design item (especially architectural privacy features). The findings suggest that design changes to the office may be necessary to provide older workers with the same opportunity as their younger counterparts to perform efficiently. This does not warrant heavy expenditures so long as Corporations initiate careful planning and foresight to provide compatible design needs. On the downside, if these needs are not met productivity may suffer. Many of the design needs of older workers can be accommodated by replacing certain rigid design features with more flexible features that allow workers themselves to manipulate physical elements of their workspaces when needed (e.g., providing a workspace where furniture and equipment can be rearranged to fit the worker's needs). Organizations should provide flexible environments that allow worker flexibility and control over their work environments. Flexible environments charge a low adaptive cost because workers can manipulate the physical setting to suit their own behaviors and particular work processes at that time. O'Neal and Carayon (1993) determined that individual and group control over the work environment can enhance employees' satisfaction with the environment and reduce stress. HRD professionals—who best understand how older and younger workers learn and practice new ways of working—can be teamed with design professionals to create work environments most conducive to work practices. Companies such as Hewlett-Packard and Owens Corning have teamed human resource professionals with design professionals to create work environments conducive to work practices. Jakabuwoski, a workplace strategist at Hewlett-Packard, explains the company's strategy: "When most organizations are designing office spaces, they need to consider their employees—their human resources—and the way those individuals do their jobs; and that means HR professionals are, or should be, included in the office redesign teams from the outset as a matter of successful business strategy" (Bencivenga, 1998, p. 69).

Providing a mix of work settings that are available to older and younger workers when needed further creates diverse environments that accommodate design differences as well as similarities. HRD professionals can work in concert with organizations to schedule space-time use of offices that support work practices of older and younger workers. This structuring of activities in space and time results in a mix of settings that individuals and groups experience each day: places for individual or group privacy; communication; team interaction; research and computer work; teleconferencing, etc. (Haworth, 1995; see also Brill, 1993). HRD professionals also can provide training tools on office protocols that support privacy needs for acceptable conversation levels in work areas and acceptable conversation and density levels in incidental meeting areas where colleagues are concentrating, cubicle
etiquette (e.g., how loudly a person should talk on the phone), how to deal with interruptions, etc. Bencivenga (1998) urges human resource professionals to train employees on appropriate ways to work in today’s work environments and to help employees establish rules or protocols for the workplace. This kind of training program empowers individuals and work groups by enabling them to modify their own social norms to manage privacy better in today’s work environments. Corporations face complex decision-making as they attempt to accommodate workers with diverse design needs. The present study enhances their ability to target the most critical design areas that facilitate performance for older and younger workers. Recognizing cohort design similarities and differences alerts and directs HRD professionals and organizations to where they should channel their finite resources to facilitate work practices when training is planned, developed and evaluated. As stressed in the introduction, the physical surroundings of the workplace--as an integral part of organizational context--can impact the ultimate success or failure of a training intervention. Organizations can use this information to assess cost benefits and to evaluate alternative design solutions to support new ways of working back on-the-job. This potentially can prove cost effective to organizations as they strive to support workforce diversity.

Footnotes
1. The Kupritz (1999) study did not examine the symbolic value that workers attach to workplace design for status recognition, etc. as this was not the purpose of the study. The study specifically targeted physical attributes that impact worker efficiency; 24 hours of interviewing never elicited symbolic values of design as impacting work.

Age and the University Workplace: A Case Study of Remaining, Retiring, or Returning Older Workers

Tonette S. Rocco
David Stein
The Ohio State University

Trends toward longer working lifespans, include patterns of remaining, retiring, and returning. HRD practitioners need to include age in diversity discussions and re-examine career development and training and development opportunities. A framework was developed for considering aging issues from an HRD perspective using case study.

Keywords: Older Workers, Life Long Working, HRD Policy

Incentives for early retirement, increasing demands for workforce productivity, and a projected shortage of skilled and experienced workers are powerful societal forces shaping human resource management and development practices in the workplace. Demographics are creating a workplace in which the traditional notions of retirement may be replaced with another concept--life long working--working in various positions for varying amounts of time throughout adult life. In the next decade, workers over the age of 55 may exceed the number of new entrants into the workplace. Hale (1990) predicts that by the year 2000 the average age of the worker will be 40 years old as compared to 34 years old in 1980. A declining birthrate might result in a shortage of skilled and knowledgeable employees (Dychtwald, 1990) making the notion of retirement for older workers a serious drain on organizational resources. While early retirement incentives have contributed to the decline of expertise in the workplace, inflation, increasing health care costs, and inadequate pensions are propelling older adults to remain or re-enter the workforce past the traditional retirement age (Doering, 1990; Herz, 1995).

While some human resource development literature investigates the effects of workplace programs on new employees (Holton, 1996) and women (Wentling, 1996; Taylor-Carter, 1996), little attention is focused on the older adult in the work setting. Two decades ago, Sheppard and Rix (1977) forecast the changing nature of the workplace and suggested that keeping older persons in the workforce would make sound economic and social policy sense. As the workforce ages, the future imagined by Sheppard and Rix is becoming a matter of importance to HRD practitioners and scholars. In what ways can HRD create working environments supportive of the needs and capabilities of older workers? What are the needs and concerns expressed by older workers? In this paper we will present an HRD policy framework suggesting ways to create a workplace supportive of older workers.

While continued employment of older workers is socially and economically beneficial, the workplace is age sizing: a readjustment in the median age of the workplace to permit the flow of new ideas, promotion opportunities, and innovation (Lavelle, 1997). Aging myths persist that continued employment of older workers blocks career growth, lowers productivity, and stifles innovation. While human resource professionals value older workers for experience, stability, judgment, and work ethic, executive officers believe that older workers are not flexible, are critical of non-traditional work arrangements, and are not technologically competent (Hochstein, 1995). According to Lewis (1996) early retirement incentives are tools for hiring employees who may be more current and whose energy level may be higher than that of aging workers. This is based on two assumptions that older workers: (a) do not keep up with knowledge in their fields, and (b) do not have the physical or mental stamina to remain productive. H. Deets, Executive Director of the AARP, addressing human resource professionals, pointed out a bias toward hiring and retaining older workers, “You don’t hire too many people after 45; you don’t train too many people after 50; and if you have a downsizing, anyone over 55 is on the way out” (Deets, 1995). The California Supreme Court offered a ruling permitting companies to age size for economic reasons. The California Court of Appeals also ruled that age discrimination laws were not intended to harm organizations financially (San Gabriel Valley Tribune, 1997).

Age is notably absent from the discourse on diversity issues in the workplace for example a chapter entitled, "Diversity Issues in the Workplace," omits age from the discussion of organizational diversity issues.

No longer are comments, jokes, or negative behaviors based on someone’s race or ethnicity, gender, religion, sexual orientation, or physical ability acceptable in the workplace. Smart organizations are not
only making it clear but they are also providing opportunities to gain new skills in dealing with employees' diversity. (Kendall, 1995, p. 79)

Research Design

The embedded single-case design was used to explore the proposition that changing demographics means that workforce policy may have to change to encourage older workers to remain or return to the workforce. According to Yin, "the method of generalization is 'analytic generalization,' in which a previously developed theory is used as a template with which to compare the empirical results of the case study" (1994, p. 31). A large university provides a critical case illustrating the "contemporary phenomenon" of employment patterns of older workers in its "real-life context," (Yin, 1994, p. 13). The research question was: How is the university adjusting to the changes in the labor force? Two subsidiary questions were (a) Are there indicators that employees over age 55 are remaining or returning to the university labor force? and (b) What is the subjective experience of being an older worker in a university environment?

Data Collection and Data Analysis

Descriptive statistics were collected from the university to provide information on the numbers of older workers in each job classification past the age of 55. Documents were collected on all policies and procedures. Structured interviews were conducted at the respondents' work sites either in an office or a conference room and lasted between 45 and 120 minutes to provide insights into the effects of the policies on older workers' lives. Interview questions covered: current work situation, career patterns, career development opportunities, and perceptions of career patterns. The questions asked were: How do you define career? How many careers have you had? Why are you working? What is your attitude about retirement?

Snowball sampling (Patton, 1990) was used to find respondents who were currently employed and at least 55 because retirement eligibility begins then for most Midwestern University employees (OHR, 1999). We asked acquaintances who were longtime employees for suggestions. The case illustrates the experience of being an older worker in a specific context from different job classifications. Twelve respondents, six men and six women between the ages of 55 and 68, participated. The embedded units (Yin, 1994) of analysis were faculty, administrative, and civil service classifications (CCS). One of the five faculty members was a woman, one of the three administrators was a woman, and all four of the CCS employees were women. One CCS employee was Filipino, all other participants were European American. Within the categories of faculty and administration, four were full-time employees, while the others were retirees who had accepted anywhere from a 10% to 50% appointment. One faculty member from this group also held another part-time position outside the university.

Interview transcripts were read and checked against the tapes, read again with preliminary themes recorded and grouped by job classification. The themes of remaining, retiring, and returning appeared as patterns from a comparison of the chart and relationship outline, the discussions, and additional readings. Doering (1990) suggested these themes in his analysis of employment trends among older workers.

Emergent Themes

Our focus is not on the status of the respondents but on the comments they made relevant to each concept. The data suggest that older workers are in the workplace past the traditional age of retirement choosing to remain, retire, or return creating different patterns than retirement as the traditional permanent separation from work. A remaining worker meets the retirement qualifications of age and years of service but has chosen to continue working in a full or part-time capacity without a break in service. A returning worker has ended active paid work, experienced a period of retirement, and returned to a paid position. A retiring worker meets the age and service requirements electing to leave current work with no intention of returning.
There was a marked difference between the responses given by classified civil service workers and those from faculty and administrators, especially regarding the financial considerations of retirement, the perceived value their work, and the university's response to a work force that is aging.

None of the respondents felt discriminated against with respect to their age. Three respondents (faculty) noted the uniqueness of the setting. Brad stated that “in a university setting, I suspect that in many cases the work of older workers is viewed in a very positive light” because in higher education “their expertise continues to be valued.”

Maggie felt that the institution’s priorities were different from her own,

I love working with students - I really enjoy that. I'm angry about the fact that doesn't seem to be 
rewarded here as much as doing research, which I also enjoy. But I don't think anymore, I enjoy it as 
much as my interactions with students. And whether that's a side effect of the aging process which of 
course I don't like to think is true or a side effect of having had my surgery and its taken a lot of my self 
confidence away. I'm not sure. I don't know whether that's a common pattern among us old farts or 

Jodi, (administrator, and faculty) agreed that what others think of older workers “depends on where you’re 
an older worker.” She continued, saying “we have lost through retirement; we have lost people who still had a great 
deal to contribute.” Jodi, who was engaged in a casual job search, mentioned one consideration would be the number 
of productive years remaining. Eddie, a professor, learned that his wife, a high school teacher felt that “older 
teachers are not given the same status as younger teachers. Older teachers are looked at in terms of people who are 
going to leave the system and, therefore, don’t get as much recognition or support as and regard from their 
colleagues as the younger people do.” While, “I don’t see that in terms of the university.”

Classified Civil Service workers remained in the workforce “So I can eat and live. Does that make sense to 
you?” (Karen). Civil service workers did not make enough money to be comfortable with the idea of retirement. Karen explained,

[Retire] Not yet, I could but it wouldn’t be a very good retirement pay. So I’ll work another one or two, 
anyhow it’ll help out. Plus I have credit I’ll buy back when I worked downtown for the state and I can 
buy some time back. That’ll give me a better retirement.

May admitted to not planning wisely, and Muffy complained pay increases did not cover the increase in necessary 
deductions such as parking and medical. From a different perspective, administrator Bobby said that his financial 
planning was done leaving the details of the “career shift” of retirement. Bobby hadn’t decided how to spend the 
majority of his time in productive “work,”

If somebody paid me the same salary to do nothing and don’t go to work just stay at home just don’t do 
anything, I would create work...something that was progressively satisfying, it would be a value added, 
return something, you know, to the society.

Amanda (CCS) said “people are living longer, and they’re working longer...a few years ago an older person 
retired practically at 60, and that’s it, or mothers always stayed at home” and if they did choose to go to work “some 
was necessary and some, they went to work to go to work to be doing something.” The idea of no longer being 
productive was unacceptable to many of our participants. Civil service participants saw retirement as allowing more 
time for personal interests such as family, travel, reading, or other hobbies. Faculty perceived retirement as a 
“continuation” of professional endeavors and contributions to the field.

The gratification individuals received from their work, the appreciation of colleagues, their health, and their 
financial situation influenced remaining in the workforce, or a simple work ethic as Jodi said, “Why am I working? I 
couldn’t not work”. Remaining workers want financial planning assistance in preparation for reduced income, 
respect for their contributions, and to have meaningful work.

Eddie (faculty) admitted, “retirement to me does not mean leaving my profession. [It means] freedom—
release from systematic and routine obligations.” Ryan echoed that sentiment, “I don’t like to use the word 
retirement; I like to say career change.” He elaborated, “I believe we should be continually doing something whether 
it’s paid work, volunteer work, just keeping active doing things...” When interviewed he was an instructor (third 
career) having received his doctorate months before. He pursued his doctorate after retiring from twenty years in the 
Air Force (first career), and another twenty years teaching high school (second career). Maggy admitted that upon 
retirement she would miss the social and intellectual interaction with students. For Jake, “retirement isn’t a clear
Returning productive work, living healthier and longer lives. Respondents perceived inequities in retirement plans based on job and a contributing member of society. Fred echoed the sentiments of other faculty and administrative respondents by some capacity after retirement to supplement income, for greater health insurance coverage, or to be a productive become a trend as baby boomers enter the retirement eligible age. Many older workers want to continue working in between periods of retirement (Doering, 1990). Older adults as new hires is an extremely low percentage, this may classifications, wanted realistic previews of retirement, and skill enhancement in preparation for new opportunities. Society needs to recognize all of the costs of supporting a non-working population capable of corporations will need to assess the consequences to profits and productivity of encouraging talented elders to exit the workforce. This is in direct contrast to the policy for faculty and administration, who can be rehired. Jake returning to work, [Thought] that some of the policies--the reemployment of people who retired--are punitive. You know the college has policies whereby they'll set a salary, but it's based on a reduction from what your retirement salary was. They start with 80% of what your retirement salary was and that's the new base they figure from, and then employ [you at] some percent of that. I work now for 40% of 80% of what my salary was last year. Which isn't very much, but, you know, I'm not doing it for the money and when and you add the retirement benefit it's almost as much money as it was in terms of salary. But that's still a negative kind of message that comes from those sort of calculations.

Early retirement incentives draw older workers from the workforce at ages younger than the traditional retirement age. If the trend continues, by the year 2000, the average retirement age will be approximately fifty-nine, an age at which most adults could enjoy another fifteen to twenty five years of productive employment (Hale, 1990). Rix (1990) concluded that many adults continue to work at peak efficiency, with more variation within age groups than between age groups. Shea (1991) indicated that "age-related changes in physical ability, cognitive performance, and personality have little effect on workers' output except in the most physically demanding tasks" (p. 153). Among faculty in the sciences, age had a slight negative relationship to publishing productivity (Levin & Stephan, 1989). Some studies have shown a stronger negative relationship between age and work performance for non-professional and lower-level clerical jobs than for higher level craft, service, and professional jobs (Avolio, Waldman, & McDaniel, 1990; Waldman & Avolio, 1993).

With an anticipated shortage of new entrants to the workforce by the year 2020 (Sheppard & Rix, 1977), corporations will need to assess the consequences to profits and productivity of encouraging talented elders to exit the workforce. Society needs to recognize all of the costs of supporting a non-working population capable of productive work, living healthier and longer lives. Respondents perceived inequities in retirement plans based on job classifications, wanted realistic previews of retirement, and skill enhancement in preparation for new opportunities.

Returning

Older adults are finding employment at the university as a second career or as a bridge job, a position between periods of retirement (Doering, 1990). Older adults as new hires is an extremely low percentage, this may become a trend as baby boomers enter the retirement eligible age. Many older workers want to continue working in some capacity after retirement to supplement income, for greater health insurance coverage, or to be a productive and a contributing member of society. Fred echoed the sentiments of other faculty and administrative respondents by
observing, "in the education profession often you move from one challenge to a more demanding one that's the way you move up in the career" is ending one career through retirement. Staff respondents could not afford to retire or live on their salaries. Muffy complained, "when I'm working overtime here, it's costing me money, because I work a part-time job." None of the staff we spoke to had retired from one job or career to embark on another one.

Faculty and administrative contributions were perceived by the participants as more highly valued than those of civil service employees who were not offered early retirement buy-outs. Civil Service workers lacked the opportunity to retire and return in a complimentary capacity.

The university's response to older workers returning or remaining has been haphazard at best. Policies clarified the status of the "returning from retirement" worker and have provided additional benefits for older workers who remain as a by-product of meeting the needs of other groups redefining policies to accommodate a changing workforce (Fisher, 1993; Dellman-Jenkins, Bennett & Brahe, 1994). Faculty retiring under early retirement programs may 1) teach a course until a replacement is available or where there is a lack of competent instructors, 2) complete an externally funded program, or 3) continue research on a part time basis. The maximum level of re-employment is .50 FTE with limited benefits, and a negotiated salary that need not be based on prior earnings (Stoffel, March 18,1992, Recent Changes in Retiree Re-Employment Policy and Definition of Immediate Family for Sick Leave Policy). A 1996 change increased the number of work scheduling options to include: reduced appointments permitting flexibility during non-peak work periods, reduced time, providing a temporary reduction in hours in conjunction with a corresponding reduction in salary (Office of Human Resources Policy and Procedure Manual, Feb. 1,1996, #6.10).

Overall, university policies do not seem to be age biased. In fact, several respondents explained that certain policies changed over the years to be more accommodating such as the procedures for procuring disability parking stickers and regular parking stickers. One respondent was unhappy her raises did not cover her increasing health care costs because her doctors were not on the new list of providers. Eligible faculty appreciated the flexibility that came with early buy-outs and rehiring of faculty. The inability to rehire civil service employees when faculty could be rehired was a state policy not a University policy. Jake (faculty) found salary calculations for rehires punitive because it was based on 80% of previous salary.

The university might need to rethink allocating opportunities as well as changing the attitudes and expectations of managers and younger employees toward older workers (Paul & Townsend, 1993; Hassell & Perrewe, 1995). We found no evidence that inservice programs on aging issues were provided. An indicator of the value an organization places on investing in older workers is its allocation of training resources to older employees. Investments can be made in people or environmental adaptations to compensate for physiological changes due to aging. Work environments are being re-engineered to account for seasonal or contingent labor pools composed of older workers (Lastowka, 1995; Canter, 1995). Gooderham and Hines (1995) found a gradual increase in the number of older employees receiving training and development opportunities while the bulk of opportunities are offered to younger employees. While older workers' job performance compares favorably with younger workers (Sheppard & Rix, 1977), chronological age rather than functional age is the determinant of training opportunities (Greller & Stroh, 1995). Eyres (1996) cautions that "Age discrimination is prevalent in training cases. Although a lack of training is a legitimate basis for selection for layoffs, when the lack of training is age-related an indirect violation of the ADEA [Age Discrimination in Employment Act] can be found" (p. 196).

Few positions in our information society remain static. Education and job redesign are the means by which the older workers can enter, reenter, and advance at work. Respondents wanted more family friendly policies and training programs to assist with re-entry into the workplace.

Reflections

We began the study with a naive assumption that the university environment might be more supportive and respectful of older employees. This assumption seemed reasonable considering the tenure system and the guarantee of lifelong employment. We attempted to illustrate the meaning of growing older by those employees who have reached the age of fifty-five or older in a university environment. Aging is experienced differently depending on gender, position, and ethnicity. Our respondents described an environment in which aging is rewarded among the faculty but devalued among the administrative and civil service classifications. Conflict within the university ranged from policies designed to attract older professors to retirement and reduce personnel costs to a university coping with ways to retain expertise developed through experience. In some cases, seniority is rewarded through ease of accessing university services. Our respondents indicated the continuing importance of work as a means of staying engaged and
continuing to contribute to the community. However, work as contribution was more often found among the faculty than among civil service staff. Civil service staff equated the necessity to work with lack of funds to retire. Our interviews hint at culturally determined meanings of work and retirement.

Human Resource Development Implications

Older workers exhibit different work patterns at different stages of life-long working. The workplace becomes a dynamic space for older workers. Rather than a unidirectional journey leading to retirement HRD practices for older workers should be situated in the dynamic pattern of periods of active employment, disengagement, and re-entry into the same or a new career. An HRD perspective for the third stage, the working life beyond the traditional retirement age, will view the older worker as an active agent negotiating various roles within the workspace. The roles, depending on life circumstances, might include the decision to remain in, retire from, or return to periods of part time, full time, or part season work challenging HRD practitioners and scholars to develop training, career development, and organizational development strategies appropriate to a third stage of working life.

Older workers are a differentiated employee group with different workplace issues suggesting an HRD framework that combines functions with employment patterns. Table 1 combines the components of HRD: training and development, career development, and organizational development with the working patterns of remaining, returning, and retiring. The framework is useful for evaluating issues of age during policy development in each intersection of HRD component with work pattern.

A workplace, which blends training opportunities, flexible employment patterns, and policies supportive of the life needs of an aging workforce, may become a workplace that embraces older workers as capable, productive, and knowledgeable lifelong workers. The quality and sensitivity of a workplace's human resource development program might be measured by the extent older workers receive the support necessary to maintain challenging, responsible, and meaningful work. An aging workforce might influence workplace cultures and values in ways that change our notions of the meaning and necessity of work.

An investigation of the meaning of work in the lives of older workers is fertile ground for future research studies. HRD practitioners might explore strategies that are more effective and delivery systems for providing career guidance to older adults making transitions to part time work, returning from periods of retirement, or contemplating leaving the workforce. Flexible schedules, job sharing, reduced loads and seasonal employment (e.g. teaching summer sessions) may be redefined in the context of a changing and aging workforce. Notions of full-time, part-time and career work usually applied to the 18-65-age workforce may need to be reexamined in light of employees working beyond the eighth decade of life. Building intergenerational work teams would enhance organizational development. The effect on productivity of intergenerational work teams is an area of future research and will
require creative ways of blending training opportunities, flexible employment patterns, and policies supportive of the life needs of an aging workforce.

References

Changes in the organizational behavior and the role of HRD are examined in facilitating access to work for college graduates. The organization's readiness to hire and retain graduates with disabilities is studied. The implementation of accommodations as mandated by the Americans With Disabilities Act is also described.

Keywords: Access to Work for Persons with Disabilities; Organizational Behavior; Training and Disability

Persons with one or more disabilities totaled about 43,000,000 in the United States at the beginning of the 1990's, which represented about 17 percent of the total population (Americans With Disabilities Act, 1990; Pfeiffer, 1993). They face more barriers in accessing a job, or advancing in their career path, than persons without disabilities. In the workplace, persons with disabilities may require reasonable accommodations to perform the essential functions of their jobs. Accommodations, however, are not always provided, resulting in an increasing number of persons with disabilities who are less likely to advance (Bruyère, Brown, & Mank, 1997; McAfee & McNaughton, 1997), or cannot retain their job.

Students with disabilities are attending post-secondary and higher education at increasing rates. According to Gilson (1996), 8.8% of freshmen in 1991 reported having some type of disability; in 1993 4.8% of students attending public 4-year colleges had disabilities, and the rate was 4.4% of those attending independent 4-year colleges. In 1994, 9.2% of all freshmen reported some disability. “Of all graduate and first-professional students in 1993, 4% reported having a disability, with 16% of these students having multiple disabilities” (Gilson, 1996, p. 264). Different studies also report increasing number of college students by specific disability, like deaf or hard of hearing (Petty & Kolvitz, 1996), or through non-traditional means like the internet (Amtmann & Johnson, 1998).

A survey of Americans with disabilities indicates that two-thirds of Americans with disabilities between the ages of 16 and 64 were not working, although 79 percent of them reported that they want to work. (Szymanski, Ryan, Merz, Treviño, & Johnston-Rodríguez, 1996). Labor market participation for people with disabilities appears to be a complex phenomenon. It influences of trends in the labor market as well as the work structure, and the organization behavior and culture.

The policy goal of the Americans With Disabilities Act (ADA) was to reduce those barriers, therefore allowing more persons with disabilities to have access to work. Has this situation changed with the implementation of the ADA, with the advancement in technology, and with the expansion of the economy resulting in more employment opportunities? Have organizations changed their organization structure and culture so as to make work accessible for persons with disabilities? Is there a significant shift in the organizations practices to accommodate persons with disabilities?

Is the situation for college graduates with disabilities any different? Specifically, what are the chances today for a college graduate with disabilities to obtain a permanent job? Has increased access to college education for persons with disabilities resulted in increased opportunities for employment?

Problem Statement and Theoretical Framework

With the increasing number of persons with disabilities graduating from college, there is an expectation about those persons getting jobs in the market at increasing rates. There are several indications, however, that students or persons with disabilities in general still face several disability-related obstacles when seeking employment. To increase access to work for college graduates with disabilities, accommodations need to be made at the workplace. But as essential as accommodations, changes are also required in the organizational behavior (in the form of employment policies), and in the organization structure and culture.
The problem is thus defined as the lack of organization readiness to incorporate, retain, and promote college graduates with disabilities into the workplace and the potential role human resource development can play.

This problem is crucial from the perspective of protecting persons with disabilities from social and economic discrimination. One of the most important basis of the ADA is that it acknowledges the existence of systematic barriers to a group, rejecting the idea that organizations are neutral work environments ruled by economic and technological forces (Harlan & Robert, 1998). The core definition of Human Resource Development (HRD) as being "a process for developing and unleashing human expertise for the purpose of improving performance" (University of Minnesota, quoted in Swanson, 1998) demands that HRD be engaged.

Access to work draws on three different theoretical frameworks. The first is the values approach, which analyzes the different stages the US society has gone through concerning disability--from the functional limitation, to the medical impairment, to the independent living movement (Wilkinson & Dresden, 1996), and self-determination (Miller, 1997). The second is the understanding of disability as a type of civil rights (Pfeiffer, 1993; Conley, 1995; Johnson, 1999). Accordingly, disability, as defined by the social theory of disability, is an outcome of social attitudes, institutions, and social structures (Harlan & Robert, 1998), and it has followed the path of other civil rights in terms of recognition.

The third approach analyzes access to work from the economics perspective. It has been said that the passing of the ADA, the promotion of access to work, is an intervention on the free interaction of forces in the labor market. Burkhauser, Butler, & Kim (1995) have noted that at the basis for the policy set-for by the ADA there is a recognition of the failure in the employers' side to incorporate and expand the performance of persons with disabilities. There are also those that perceive disability, the ADA and the required accommodations as paternalistic. Weaver (quoted by Conley, 1995) proposed an economic, incentive-based approach, which would translate in deregulation of employment opportunities for persons with disabilities, therefore reinstating the free interaction of forces in the labor market.

Yet, another approach is based on the organizational behavior theories. It looks at access to work from the perspective of the organizational readiness for change and the individual in the organization. This translates into the extent to which organizations are willing to use and develop the human capital of persons with disabilities.

Research Questions

To address issues regarding the readiness of organizations to accommodate college graduates with disabilities, research was conducted at Disability Services at the University of Minnesota. The main purpose was to explore how, and if, organizations have introduced changes at the organizational level to accommodate and work with college graduates with disabilities. The stated assumptions were that, even though nine years have elapsed since the implementation of the ADA, organizations still do not have the necessary information about persons with disabilities, that they do not have information and/or experience implementing accommodations, and they have not changed the organizational behavior and structure necessary to transform the organizational culture so as to incorporate persons with disabilities.

The research then aimed at examining the current conditions of college graduates gaining access to a job for which the research focused in two broad areas--what the organization's level of knowledge is about college graduates with disabilities, and what the organization's practices are with respect to working with college graduates with disabilities. Specifically, the research questions were: a) have organizations introduced changes regarding persons with disabilities after the passage of the ADA?, b) have those changes resulted in a meaningful impact at the organizational behavior level, or are those changes related to a basic compliance with the ADA?, and c) have those organizations experienced a significant shift in their practices to accommodate persons with disabilities?

Although the research focused on college graduates, the primary interest for a higher-education institution, it was inevitable to include all persons with disabilities when gathering and analyzing the data. Graduates are not necessarily recognized as such when entering the job market, and graduates may have not disclosed their disabilities when hired, which leaves reporting data open for all persons with disabilities that do disclose their disabilities.

Research Method

This descriptive research was conducted in the context of the Access to Work Model Demonstration Project (Project #H078C70029) carried out at Disability Services, University of Minnesota. The Model Demonstration Project included interaction with faculty, organizations, and students to examine major issues concerning access to work for
college graduates with disabilities—e.g., experiential learning, barriers, disclosure, information level, and training. The project's goals were to increase knowledge about those issues, and also increase knowledge and comfort level of employers through developmental training. Therefore, the research that is reported here is complementary to those other activities. Other research methods were used in the project as well, including interviews and focus group techniques. Analysis of that information was used to the design and collection of data contained in this paper.

This research used data collected through two surveys that had been created by Disability Services at the University of Minnesota: "Access to Work" (Disability Services. University of Minnesota, 1998a), and "Organization Needs Assessment" (Disability Services. University of Minnesota, 1998b).

Both surveys were created based on the knowledge of the professionals working on the program, as well as their experience working with college students with disabilities. The surveys cover a representative set of items related with disability and access to work. Before being sent to respondents, both surveys were analyzed by consultants working with Disability Services. The surveys were also piloted with different organizations prior to and during the implementation of the project. Responses in these latter cases were studied to provide organizations with technical consultation regarding disability issues, and to reflect upon information gathered through interviews. Successive responses were used to adjust their content. Whenever sent to organizations, they were responded in the context of training sessions or any other technical consultancy provided by Disability Services through this project. Those responses, however, are not included in this research. Only the final versions that were sent to the sample for the purpose of this research are reported here. The surveys state the questions we try to address in this research—what and how have organizations changed after the adoption of the ADA so as to facilitate access to work for college graduates with disabilities.

The first survey (hereinafter, the "Staffing and Training" survey), gathered basic descriptive data regarding the organization's policy development in disability issues (α reliability coefficient .62), training on disability-related topics (α reliability coefficient .89), and accommodation implementation. This survey was sent to a total of 237 Human Resource managers or staff in organizations in the Twin Cities Metropolitan Area (the Twin Cities Metropolitan Area is comprised of Minneapolis and Saint Paul, and cities in the seven-county surrounding area). The mailing list was acquired from their professional association with a one-time permission to use it, so no follow-up could be used. Thus, this survey was the first contact between Disability Services and those organizations. The response rate was 27% (N=64). For-profit, not-for-profit, and public organizations were included in this group. The type of organization was identified by respondents—there was not prior identification.

The second survey (hereinafter, the "Organization Needs Assessment" survey) had a different purpose. It asked specifically about whether the organization sought information about ADA after the law was passed. It also measured the experience the organization had with different disabilities students disclosed or that were visible (α reliability coefficient .91). Finally, it measured the experience of the organization implementing accommodations for persons with disabilities (α reliability coefficient .84). This survey was sent to a list of managers, professionals, and other personnel of 394 organizations also located in the Twin Cities Metropolitan Area. The mailing list was acquired from the University of Minnesota's Office for Special Learning Opportunities, which has a close cooperation with Disability Services. This office maintains a mailing list of several organizations in the Twin Cities with which they interact for learning activities. Therefore, most of these organizations had previously collaborated with Disability Services in disability-related issues in this project and others. The response rate was 35% (N=138). As in the first survey, for-profit, nonprofit, and public organizations were included in this survey.

Both surveys were sent at the same time—May 1999. Each copy of the survey had no space for identifying the respondent, but a coded-number was used to process data. The envelope containing the survey included an invitation letter to participate in the research, which also ensured confidentiality of the responses. To facilitate the response, organizations in the mailing lists were given a self-addressed envelope to use to return answered surveys. After 20 days of the initial mailing, non-respondents were sent a follow-up card with another self-addressed envelope to increase response rate.

Research Results

The Staffing and Training Survey

The first area this survey explored about the organization's knowledge on disability-related issues was policy development. Three major types of policies were addressed—the implementation of written
nondiscriminatory policies, the adoption of written guidelines about availability of disability accommodations, and the adoption of procedures for implementing accommodations requests.

Table 1. Organizations and Disability-Related Policy Development (Percentages)

<table>
<thead>
<tr>
<th>Policy Type</th>
<th>All Organizations</th>
<th>For Profit</th>
<th>Nonprofit</th>
<th>Public</th>
</tr>
</thead>
<tbody>
<tr>
<td>Written Nondiscriminatory Policy(N=61)</td>
<td>91.8</td>
<td>91.3</td>
<td>87.5</td>
<td>100.0</td>
</tr>
<tr>
<td>Written Guidelines About Availability of Disability Accommodations (N=58)</td>
<td>51.7</td>

<tr>
<td>Established Procedure for Implementing Accommodations Requests (N=61)</td>
<td>57.4</td>
<td>56.5</td>
<td>37.5</td>
<td>85.7</td>
</tr>
</tbody>
</table>

Table 1 summarizes the information about the organizations that have established policies in those areas. In general, a great majority of the organizations surveyed (91.8%) indicated they have adopted written nondiscriminatory policies in the workplace. That number drops substantially to about half of the organizations about adopting policies regarding availability of accommodations (51.7%) and how to proceed whenever a request for accommodations is made (57.4%). In both cases, public organizations appear to have more implementation of these policies.

<td>28.3</td>
<td>20.0</td>
<td>8.3</td>
</tr>
</tbody>
</table>

This survey also examined training on disability issues. For this purpose, questions focused on three groups of people within the organizations—human resource staff, supervisors/managers, and training for employees. The majority of the organizations appeared to have training programs for their human resource staff for either implementing ADA (90.0%) or interviewing candidates with disabilities (86.7%). Conversely, those organizations that did not have any training at all on these issues are around 10% (Table 2).
Less training is reported when it comes to training of supervisors. The number of organizations training supervisors, from a small extent to a great extent, on implementing the ADA represented 71.2%, and 72.4% in the case of training for making reasonable accommodations for persons with disabilities. Conversely, those organizations that did not provide training at all in these matters showed a higher number (28.8% and 27.6%, respectively).

However, it is the supervisors training on conducting performance appraisals for employees with disabilities that seems to be less frequent—only 53.6% of the organizations reported some sort of training in this area, versus 46.4% of organizations that reported not training at all. Similarly, less training is reported about training employees to interact with co-workers with disabilities. About 57% of all organizations responded as having had some type of training for their workers on this issue—and only 8.3% did that type of training to a great extent. But 43.3% of the organizations surveyed responded in the complete negative sense—they have not had this training at all.

Finally, the third major area those organizations were surveyed on was the implementation of accommodations for college graduates/employees with disabilities. The intent here was to gather initial information about the organizations’ experience in dealing with employees with disabilities and implementing accommodations. A short list of accommodations was provided to organizations. With this respect, those organizations showed less experience implementing accommodations. By far, making work schedule flexible is the type of accommodation organizations experienced the most (42.6%).

</tbody>
</table>

### The Organization Needs Assessment Survey

This survey had a somehow different purpose, and contained fewer questions that targeted three major areas. The first one was a rather simple and direct topic—if the organization sought information on ADA after this law was passed. In general, the response is high (73.1%), although some variations can be seen within each category of organizations (Table 4).

### Table 4. Organization and Information on the Americans With Disabilities Act (Percentages)

<td>73.1</td>
</tr>
</tbody>
</table>

The second area deals with the organization's or program's experience working with students with disabilities, for which respondents were given the opportunity of responding to selected types of disabilities. It
appears to be that organizations had more experience working with students with learning disabilities. In a 4-point scale, with 1 being "never" and 4 being "have worked with those students many times", they responded as having had experience "once or twice" (choice number 2 in the scale) with this particular type of disability. Table 5 provides a summary of the information about the experience with the disabilities listed in the survey and the respective means.

Table 5. Organization’s Working Experience with Students/Employees with Disabilities (Mean)

</tr>
</tbody>
</table>

The other major issue was the organization or program experience implementing accommodations, for which the respondents were also given a list of 17 different types of accommodations. In this case, means are high for different accommodations listed in Table 6. In a 4-point scale with 1 being the organization “having little information or knowledge about the accommodation”, 2 being “unsure how to implement this accommodation”, 3 “have had difficulty implementing the accommodation”, and 4 being the organization “made the accommodation successfully”, the most notorious accommodation implemented is accessible parking (mean 3.7). Other accommodations that relate to physical mobility ranked also high--ramps, accessible doorways, grab bars, and power doors. Nonphysical accommodations like flexibility in schedule and deadlines ranked also high.

Discussion and Conclusions

Two major conclusions can be drawn from these two surveys: knowledge and training about disability issues seem to be concentrated, still, in the realms of human resource staff, and there seems to be a disconnect between the type
of disability with which the organization has had experience, and the accommodations implemented in the workplace.

Data collected suggest organizations are dealing with disability-related issues still at a basic level. Policy development information, as well as data on training corroborate that organizations are restricting the issue of disabilities to some levels within the organization. This may suggest that to the degree of experience these organizations have with persons with disabilities, they are having a compliance approach to disabilities.

On the other hand, data on experience working with students with disabilities show that organizations appear to have had relevant experience with disabilities that are not visible and would require a disclosure on the part of the student/employee—i.e., learning disability, psychiatric disability and to some extent chronic illness. On the other hand, that experience would relate to some extent only to the type of accommodations they implemented—e.g., flexible work schedule and deadlines, and responsibilities restructuring. However, there is a strong emphasis on physical-related accommodations, which may suggest again the organization’s culture with respect to disabilities as well as a compliance issue.

These conclusions suggest that although some efforts have been undertaken in those organizations, little changes have been made at the organizational behavior and culture level that could mean’s significant shift in practices. On the one hand, changes seem to be not rooted yet in the structure of those organizations, and that the issue of accommodation implementation would require more significant efforts. On the other hand, at the organization culture level, more changes are needed so as to trickle down the awareness about disabilities. Leaving disabilities as an almost exclusive topic of HR staff is an example of an area where the culture of the organization needs a change.

Research Contribution to Knowledge in HRD

This research’s contribution to knowledge and practice of HRD can be approached from different perspectives (see Freeburg, 1994). It requires a systemic analysis of the organization. One of the assumptions frequently made is that all workers are equal. A systemic analysis does not only mean that all functions and jobs are properly related in the organization, and that jobs and tasks need to respond to the organization’s goals—a systems approach requires a thorough understanding of differences and disabilities. This topic is crucial when aligning human capital with the overall strategy of the organization. As with any other employees, investing and retaining the human capital of employees with disabilities avoid turnover and related costs. Persons with disabilities constitute the most educated minority group, and yet it goes mostly untapped in the labor market.

Organizational behavior and culture, through policies implemented at the organization level, needs to move to a more comprehensive approach. Changes in the organizational culture are needed in order to transform not only attitudes towards disabilities, but to be competent in disability related issues—as with other expressions of diversity in organizations. An example that comes from the data collected is the need to make training materials available for persons with disabilities. From the perspective of a person with disabilities, if the organization is competent with disability issues, that would add his or her chances to increase performance as any other worker. Implementing accommodation also becomes a key subject for increasing performance through changes in the organization’s culture and structure. There are several examples regarding accommodation and organizational culture change: through total quality management (Bruyère, Brown, & Mank, 1997); through changes in the workplace environment (Westmorland, Zeytinoglu, Pringle, Denton, & Chouinard, 1998); by dealing with specific accommodations like visual impairment (Scadden, 1997), traumatic brain injury (Hirsh, Duckworth, Hendricks, & Dowler, 1996), or spinal cord injury (Dowler, Batiste, & Whidden, 1998); and through the use of assistive technology (Brown, 1992; Galvin, 1997; Senge, 1997).

Part of the need for change in the organization’s culture is the required change in awareness towards disabilities. This research has presented the evidence of training being mostly concentrated in a specific sector of the organization—the HR staff. However, if the organization is to be inclusive and systemic to improve performance, training in disability-related topics needs to be expanded beyond the realms of the HR staff. That might also avoid employees with disabilities to lose their jobs or to work sporadically only, because all supervisors and co-workers—not only HR staff—will work more effectively with employees with disabilities.

This issue is critical for HRD, and efforts towards organizations culture change, and strategic planning should consciously involve persons with disabilities. However, more research is needed in most of the areas in HRD—e.g., team building, leadership, conflict management. Other research may be approached from the need for changes in practices at different levels—e.g., task bundle, performance appraisals. Whatever the area is, it remains clear that the central area for change is the organizations’ culture.

A Systems Model for Evaluating Learning and Performance

Hallie Preskill
University of New Mexico

Darlene Russ-Eft
AchieveGlobal

In this paper we describe a model for evaluating learning and performance that takes into account not only the processes of evaluation, but also the internal and external variables that affect the design and implementation of an evaluation, as well as the use of its findings. The proposed model is grounded in the belief that evaluation can facilitate and support individual, team and organizational learning, and that HRD professionals should assume the role of internal evaluators.

Keywords: Evaluation, Performance Measurement, Assessment of Learning

With increasing frequency, learning and performance professionals are being asked to evaluate the effectiveness and impact of their efforts (Bassi, Benson, & Cheney, 1996; Bassi & Lewis, 1999; Brown & Seidner, 1998). As Phillips (1998) notes, “Although organizations have focused much attention on evaluation in the past 40 years, only recently have organizations taken a systematic and comprehensive approach to evaluating training and development, human resource development, and performance improvement initiatives” (p. 1). The urgency to evaluate has emerged from both internal and external customers who are asking for evidence of programs’ effectiveness and contributions. The demand for, and interest in, systematic and useful evaluation results are occurring not only in for-profit organizations, but in non-profit and local, state, and federal agencies as well.

While we believe this increased attention to evaluation represents an extremely important development, it has presented HRD professionals with a significant challenge. First, few trainers or other learning and performance practitioners have any formal education or training in the philosophies, theories or technical skills of evaluation. Most HRD professionals know what they know about evaluation from either taking brief workshops on the topic, or through their experiences with evaluation on the job. Few are aware that evaluation constitutes a profession with its own history, theories, and standards. Nor do they know that professional evaluation organizations exist all across the world (e.g., American Evaluation Association, Canadian Evaluation Society, Australasian Evaluation Association, European Evaluation Society). The second dilemma trainers face is that the models on which they’ve relied to conduct evaluation are far too simplistic and vague to guide them in the kinds of evaluation work now being required (Hilbert, Preskill & Russ-Eft, 1997).

For example, Donald Kirkpatrick’s four-level evaluation model (1959 a, b; 1960 a, b; 1994), developed over 40 years ago continues to offer HRD practitioners and researchers little more than a taxonomy of evaluation categories. Ask almost any trainer and they know that Level 1 means measuring a participant’s reactions to the learning event; Level 2 is associated with measuring how much participants’ learned; Level 3 relates to determining the extent to which participants’ on-the-job behavior has changed as a result of the training; and Level 4, the holy grail of all training evaluation, concerns measuring the results of the learning intervention on the organization, otherwise referred to as cost-benefit analysis or measuring the return-on-investment.

While others have attempted to expand on Kirkpatrick’s model over the last four decades (Brinkerhoff, 1989; Hamblin, 1974; Holton, 1996; Phillips, 1995), none has provided a comprehensive, systems-approach, practitioner-oriented evaluation model. If HRD professionals are to demonstrate the effects of their efforts, then they must be provided with the necessary knowledge and tools to competently evaluate their programs, products, processes, services, and systems. In essence, they must become internal evaluators.

What follows is an evaluation model that we hope will take HRD professionals to the next level of conceptualizing and practicing evaluation within their organizations. In the following pages we outline the questions that guided the model’s development, describe its theoretical underpinnings, and explain each of the model’s components. We conclude with our ideas on how the evaluation model may contribute to new evaluation practice and research.
Theoretical and Research Questions:

The model's development grew out of the following questions:
1. What are the necessary components of a comprehensive systems-approach to evaluating learning and performance within organizations?
2. What system-wide variables affect the evaluation of learning and performance efforts within an organization?
3. How should evaluation be practiced within an organizational context?

Theoretical Framework

The evaluation model we propose is based on the philosophies, theories and practices in the fields of: 1) evaluation, 2) organizational learning, and 3) systems theory. While several definitions of evaluation have been offered in the evaluation literature (see Patton, 1997; Rossi & Freeman, 1985; Scriven, 1967, 1991), the model presented in this paper is based on the following understanding of evaluation:

Evaluative inquiry is an ongoing process for investigating and understanding critical organization issues. It is an approach to learning that is fully integrated with an organization's work practices, and as such, it engenders (a) organization members' interest and ability in exploring critical issues using evaluation logic, (b) organization members' involvement in evaluative processes, and (c) the personal and professional growth of individuals within the organization. (Preskill & Torres, 1999, p. 1-2)

Implied in this definition is the notion that evaluation is a systematic process. It should not be conducted as an afterthought; rather, it is a planned and purposeful activity. Second, evaluation involves collecting data regarding questions or issues about society in general and organizations and programs in particular. Third, evaluation is seen as a process for enhancing knowledge and decision-making, whether the decisions are related to improving or refining a program, process, product, system, or organization, or for determining whether or not to continue or expand a program. In addition, evaluation involves some aspect of judgment about the evaluand's merit, worth or value. Finally, the notion of evaluation use is embedded in all evaluation activity.

In the last decade, many organizations have embraced the concept and practices of organizational learning in an effort to respond to constantly changing global economic, technological, and social conditions. Fiol and Lyles (1985) define organizational learning as changes in the organization's cognition or behavior. This learning represents itself in "the development of insights, knowledge, associations between past actions, the effectiveness of those actions, and future action" (p. 811). Thus, we believe that evaluation can be the mechanism for inquiring into a problematic situation on the organization's behalf (Argyris & Schon, 1996), and for helping organization members grow and learn as a result of such inquiry.

Our model has also been strongly influenced by the concepts of systems theory and systems thinking (Senge, 1990; Wheatley 1992). Adopting a systems perspective means that we look at an organization as a set of interrelated parts and interconnected systems, which are dependent on one another and influenced by each other. As Senge (1990) explains, "It is a framework for seeing interrelationships rather than things, for seeing patterns of change rather than static 'snapshots'...it is a discipline for seeing the 'structures' that underlie complex situations, and for discerning high from low leverage change" (p. 68-69). A systems approach to organizational learning and change acknowledges that an organization is,

Interacting with its environment and has to adapt to it and permanently change in order to survive...The organization is conceptualized as an information processing system, a systems which performs certain necessary functions such as the generation of information, as well as the diffusion, the storage and the utilization of this information...This systemic approach aims at describing the way an organization can learn as a system" (Finger & Brand, 1999, p. 138).

Therefore, information is a core element of organizations that learn. Emphasizing the role of information in organizations, Wheatley (1992) passionately writes, "The fuel of life is new information-novelty ordered into new structures. We need to have information coursing through our systems, disturbing the peace, imbuing everything it touches with new life" (p. 105). Since evaluation provides information for decision-making and learning, we believe that evaluation can serve a critical role in organizations.
A Systems Model of Evaluation

As depicted in Figure 1, the evaluation model's general conception denotes a non-linear understanding of evaluation practice, though the evaluation process itself occurs in a somewhat linear manner. Starting with the center circle, we outline five critical evaluation phases or processes. Every evaluation starts with the Focusing phase. This is where primary stakeholders of the program come together to discuss the background and history of the evaluand (that which is being evaluated), to identify other stakeholders who might be interested in using the evaluation results, and key questions the evaluation will address. This process is fundamental to ensuring that the evaluation attends to issues of concern to a variety of individuals and groups. Throughout our teaching, training and consulting experiences, we have found that all too often trainers use the term "evaluation" synonymously with "survey." Without first knowing what questions we wish to answer from an evaluation, it is difficult to know which methods should be used to collect valid data. The second phase of the evaluation process is determining the evaluation's design, methods of data collection, and means for implementation. There should be discussions about which methods (e.g., surveys, tests, interviews, observation, document reviews) would be best suited to answering the key evaluation questions. In addition, the team should talk about how to ensure the validity of data, how to obtain a high response rate, the timing of data collection, and how to choose a sample population if the entire population cannot be involved. The next phase in the evaluation involves analyzing the data, as well as interpreting and assigning meaning to the data. This process typically involves statistical analysis of quantitative data and/or content analysis of the qualitative data. The fourth phase of the evaluation process is communicating and reporting the evaluation findings. Though it appears as a final phase in the process, it should be noted that it is often important to communicate the evaluation's progress and sometimes, preliminary findings, to various stakeholders or audiences during the evaluation. HRD professionals who do evaluation should also seek ways to disseminate the findings via various communication devices such as memos, posters, and newsletters, in addition to the usual report (Torres, Preskill, & Piontek, 1996). The fifth part of the process is making sure to have one or more management plans that describe in detail, the logistics of the evaluation. There may be several different plans including a timeline, a roles and responsibilities plan, a communicating and reporting plan, a budget, and/or a plan of options in case obstacles are encountered during the evaluation's implementation.

What we have just described is standard practice for most evaluators, and by itself, does not constitute the uniqueness of this model. It is the remaining components that have gone unexplained in the HRD evaluation literature. As can be seen in Figure 1, the Evaluation Process sits within an internal organizational context that includes three components: 1) Evaluator Characteristics, 2) Political Context, and 3) Intended Use of Findings. We provide these additional components because of their potential affect on the evaluation's commissioning, design, implementation, and reporting of findings. Evaluation does not occur in isolation; it is affected by several different personal and organizational factors. One of these factors is the evaluator's characteristics. These characteristics include the evaluator's:

- credibility
- experience with the program
- previous experience in conducting evaluation
- knowledge of evaluation theory and methods
- position within the organization relative to the program being evaluated
- commitment to evaluation and use of findings
- understanding of the organization's culture and politics
- commitment to ethical behavior - integrity
- group facilitation skills
- verbal and written communication skills
- understanding of program content
- data analysis skills

In order to minimize evaluator bias as much as possible in designing, implementing and reporting the results of the evaluation, we recommend establishing a task force, or workgroup that agrees to

Evaluator Characteristics

Technology
collaborate on the evaluation. This approach creates a kind of checks and balances throughout the evaluation process. Plus, it increases the team and organization’s learning potential by their very involvement in the evaluation. Assessing these evaluator characteristics before the evaluation begins, can not only help build a better evaluation team, but it can help avoid some serious obstacles once the evaluation is underway.

Evaluation is inherently a political act. Therefore, it is important that HRD professionals clearly understand that regardless of the evaluation’s depth and scope, it deals with issues of power, position and resources. In 1973, Carol Weiss was one of the first evaluation researchers to publicly recognize the importance of politics and values within the evaluation and policy-making process. She identified three ways in which evaluation and politics are related: 1) The policies and programs with which evaluation deals are creatures of political decisions; 2) Because evaluation is undertaken in order to feed into decision-making, its reports enter the political arena; and 3) Evaluation itself has a political stance. By its very nature it makes implicit political statements about such issues as the problematic nature of some programs and the unchallengeability of others, the legitimacy of program goals and program strategies, the utility of strategies of incremental reform, and even the appropriate role of the social scientist in policy and program formation (1987, p. 47-48). Thus, the proposition, “evaluation is always disruptive of the prevailing political balance,” reminds us that even in programs that seem “nonpolitical,” there are political implications from the mere act of evaluation, not to mention the findings (Guba & Lincoln, 1981). As a group begins to engage in the evaluation process, they should consider the ways in which the evaluation could be political and identify ways in which the politics can be managed.

The second type of use is called “conceptual” or “knowledge” use. This type of use cannot be seen directly, as the information from the evaluation becomes integrated with what the ‘user’ already knows or believes about the evaluand. The evaluation information serves to inform the individual, and contributes to a higher level of understanding or cognition about the program being evaluated. The individual might make a decision later on that in part was based on the evaluation findings, but she might be hard pressed to say it was based solely on the evaluation’s results.

Finally, evaluation findings might be used in a “symbolic,” “political,” or “persuasive” way. For example, many programs are required to participate in an accreditation evaluation, which includes a self-evaluation component. Members of the organization might not be particularly interested in the evaluation and thus do it, symbolically. They may not use the findings to improve their programs, but they can show that “they did it.” Another common example is when we use the findings of an evaluation to lobby for additional program resources. This political act is a justifiable use of evaluation results. Weiss (1998) suggests that,

Rather than yearning to free evaluation from the pressures of politics, a more fruitful course would be to undertake and report evaluation with full awareness of the political environment. A study will be more useful and more likely to be used if it addresses the issues that are in contention and produces evidence directly relevant to political disputes (p. 316).

In many evaluations the results may be used in all three ways: 1) instrumentally for improving the program, 2) conceptually to inform others about the program’s effects, or 3) symbolically, to increase the credibility of the HRD function. It is important for the evaluation team to discuss these potential uses and to identify anywhere the process or findings might be misused before the evaluation is implemented.

Even if the evaluation process is well defined and articulated, and even if the evaluation team has considered the evaluator’s characteristics, the political context, and the intended uses of the evaluation’s findings, evaluation still must be implemented within an even larger organizational context. The outer circle (Figure 1) describes the necessary organizational infrastructure for supporting evaluation practice (Preskill & Torres, 1999). Though rarely discussed in other HRD evaluation models, we believe that for evaluation to contribute to learning and decision-making in organizations, there must be at least some presence of these four elements. The first is the organization’s leadership. The more leaders support a learning environment, the more likely organization members
will support systematic and ongoing evaluation. If organizational leaders suggest that they know it all, or that learning from our experiences is unnecessary, then evaluation will be more difficult to implement. On the other hand, if leaders model learning, create a spirit of inquiry, and use data to act, then evaluation practice may be more successful.

The second element, the organization's culture, is fundamental to creating learning from evaluation practice. If the culture is one which supports asking questions, open and honest communication, teamwork, risk-taking, valuing mistakes, and employees trust each other, evaluation may be welcomed and successful. However, if organization members are afraid to give their opinions, don't believe managers will act on the results, or the results will be used to punish individuals or groups, then the evaluation's results will be less useful in helping the organization make effective decisions.

The third element, organization communications is closely related to the intended use of evaluation findings. The more systems and channels an organization has to communicate and report the progress and findings of an evaluation, the more likely the evaluation will have an impact on individuals, teams, and the organization overall. However, if there are few means to share what is learned from the evaluation, or organization members are restricted from sharing their learning, then evaluation will lose an important opportunity for enhancing the organization's performance.

The fourth element is the organization's systems and structures. How employees' jobs are designed, how they are rewarded and recognized for their work, and how learning is expected to occur, are all important factors in how often and how well evaluation may be conducted by organization members. The more cross-trained they are, the more they are encouraged to learn from each another, the more their jobs allow for teamwork, and the more employees understand the interrelatedness of their jobs, the more likely evaluation will serve its learning function.

Finally, the model we propose takes into account the fact that organizations, more than ever, are being influenced by a myriad of external forces (Drucker, 1997; Judy & D'Amico, 1997; Marquardt, 1999) (see Figure 1.). These include increasing competition for personnel and other resources, evolving customer or client expectations, an increasingly diverse workforce, new requirements for working in a global environment, technological advances which are literally altering the way we work and communicate, and ever-changing legal rules and regulations. While HRD professionals do not need to conduct a complete scan of these variables when designing and implementing an evaluation, they should at least be aware of where and how the organization is responding to these factors at any point in time. It is entirely possible that an evaluation could be seriously affected by any one of these variables.

The Contribution of the Evaluation Model to HRD Practice and Research

Many writers on management today believe that the future success of organizations will be dependent on their ability to build core competencies within a context of collaboration. Technology, and quick and easy access to information will help create web-like structures of work relationships which will facilitate their working on complex organizational issues (Hargrove, 1998; Helgeson, 1993; Limerick & Cunnington, 1993; Stewart, 1997). We believe evaluation can be a means for a) collectively identifying information needs, b) gathering data on critical questions, and c) providing information that when used, becomes part of the organization's knowledge base for decision-making, learning, and action. As organizations have been forced to respond to an increasingly competitive environment that is volatile and unpredictable, and as they are likely to continue being pressured to do things better, faster, and cheaper, they are looking at evaluation as a means to help them determine how best to proceed. For the HRD practitioner, the proposed model offers a kind of roadmap for undertaking an evaluation. Instead of deciding to gather only participant reactions, the practitioner can use the model to determine the political context and intended uses of findings in order to determine what questions must be answered by the evaluation. By doing so, the practitioner will be following a more comprehensive and systematic evaluation process. Such a process should increase the probability that the evaluation findings are valid and can be used for decision-making.

For the HRD researcher, the proposed model offers new research opportunities. For example, HRD scholars could examine the specific effects of evaluator characteristics, the political context, and the intended use on decisions regarding the evaluation design of a learning and performance initiative. Furthermore, researchers need to determine the effects of these factors on actual use of evaluation findings. Other questions might revolve around the effects of the evaluation process on organizational decision-making. For example, do certain evaluation designs and methods tend to emerge from certain evaluator characteristics, political contexts, or intended uses? What is the impact of certain evaluation processes on organizational decision-making? Do organizations or functions within
organizations that routinely evaluate programs and processes yield higher levels of learning and performance than those organizations or functions that do not evaluate?

In the knowledge era, where we now find ourselves, it is critical that organizations learn from their experiences, that they see themselves as part of a larger system, and that they use quality information for making timely decisions. We hope that the proposed evaluation model will provide HRD practitioners and researchers with a tool that can help them collect and use valid information that contributes to individual, group, and organizational growth and success.

Economic Analysis of Human Resource Development: Update on the Theory and Practice

Richard A. Swanson
University of Minnesota

A serious problem facing the HRD profession is the perception among executives that workforce competence and expertise are essential while HRD is optional. Studies of HRD practices report that almost no HRD functions are assessed in terms of their overall economic contribution to the organization. This paper reports economic research related to the contribution HRD makes to the success of organizations and proposes new areas of economic research.

Key words: economic analysis, benefit analysis, financial benefit analysis

Does business education provide value for the money? This is one of the pressing questions posed in the recent business book titled Gravy Training (Crainer & Dearlove, 1999). Couple this message with headlines like “Training falls down on the job.” (Daily Telegraph, October 27, 1997, p. 31) and the popular perception that HRD costs organizations more than it returns in benefits continues.

Any organization that remains alive will ultimately judge each of its components from a return-on-investment (ROI) framework and they will do it with or without valid data. Not only will the judgement be made; actions will be taken based on the economic assessment (real or perceived economic data). These hard decisions are not restricted to private sector business and industry. Every organization is ultimately an economic entity. Organizations do not have an inherent right to continue to exist. Two examples that quickly come to my are the closing of my childhood church over 20 years ago and a more recent closing of a non-profit ballet performance company.

To face this challenge, four views of HRD have been presented to the HRD profession. They are: (1) a major business process, something an organization must do to succeed, (2) a value-added activity, something that is potentially worth doing, (3) an optional activity, something that is nice to do, and (4) a waste of business resources, something that has costs exceeding the benefits (Swanson, 1995).

The dominant view of HRD is within the last two options above-- HRD as being an optional activity or having costs greater than its benefits. The simple idea that HRD is not a good investment is popular and entrenched. At the same time HRD professionals most often believe that what they do is a good investment. The popular belief within the profession has very little evidence to back it up with only three percent are evaluated for financial impact (Bassi, Benson, & Cheney, 1996).

Problem Statement, Historical Framework, and Research Questions

Top decision-makers in organizations create scenarios and strategies that provide essential and fundamental organizational direction. These decisions are ideally based on estimates of future states and what is required to attain them. While HRD theorists and leaders may think of HRD as essential, strategic, and a sound investment, it is the perspectives that top decision makers have on knowledge, competence, and expertise that fundamentally limits the role of HRD in an organization (Herling & Provo, 2000).

HRD leaders propose strategies, projects, and programs to top management. Unlike other managers, HRD people tend to resist these strategic tasks, especially when they are tied to economic issues. While much claim economic theory to be fundamental to the profession (Ruona & Swanson, 1998), HRD people are not inclined toward the financial side of the organization.

Historical Framework

Economic thinking related to human capacity, human expertise, and human effort and the effects of each is disjointed. History provides a fairly consistent notion that there is much to be gained by being purposeful in managing these domains. Throughout history, the ideological responses to capturing the spoils of human expertise have ranged from communes, to slavery, to meritocracies.
The importance of increasing one's expertise is confirmed in society's comparisons of educational levels and economic success. Even so, investments in the development of its personnel are still not a clear option for most firms. Organizations can access expertise in ways other than offering development programs. For example, they can hire expertise and/or establish the expectation that employees will manage the development of their own expertise. Neither of these two options requires an organization to make direct financial outlays for HRD.

For the HRD profession, the "Training Within Industry" project (Dooley, 1945) was a watershed. This 1940-45 massive national performance improvement effort clearly and consistently demonstrated the economic impact of HRD and the required conditions for achieving financial benefits. The role of this national effort in shaping the contemporary HRD profession (see Ruona & Swanson, 1998) and for directly connecting the profession to economic results cannot be underestimated. Unfortunately, the informed and best practices in HRD during WWI slowly eroded during the postwar affluence in a manner similar to the quality of USA produced goods.

In the 1970s a renaissance in the profession provided incentive to think more about HRD as an investment. The literature increasingly reported financial analysis methods (FAM) and studies of programs' costs and benefits (Cullen, Sawzin, Sisson, & Swanson, 1976, 1978; Gilbert, 1978; Meissner, 1964; Swanson & Sawzin, 1975). In the 1980s this financial analysis trend continued with a greater focus on costs and the human resource management perspective versus performance improvement (Cascio, 1987; Flamboltz, 1985; Head, 1985; Kearsley, 1982; Spencer, 1986). These company-wide FAMs took an accounting perspective rather than a performance improvement perspective.

To the 1980s, FAM efforts in HRD did not address the decision-making dilemmas faced by organizations at the investment decision stage of their organizational planning. Difficult as it may seem, any organization can conduct an after-the-fact cost-benefit analysis. What was needed was a method for forecasting those costs and benefits, at the point of making investment decisions. The forecasting financial benefits (FFB) of HRD method was designed to fill this gap (Swanson, Lewis, & Boyer, 1982; Swanson & Geroy, 1983; Swanson & Gradous, 1988). The FFB is a practical step-by-step method for making accurate investment decisions based of forecasting (1) the financial value of improved performance projections for a program, (2) the cost of implementing a program, and (3) the return on the program investment (Swanson & Gradous, 1988). The FFB method is best suited to short term HRD interventions purposefully connected to performance deficiencies.

**Problem Statement and Research Questions**

The problem facing the established FAMs are not easily applied to large-scale change, long-term change and to interventions loosely connected to performance requirements. The following two questions serve as the basic of this inquiry:

1. What are the general findings relevant to the financial analysis of HRD have appeared in the literature?
2. What economic theories and tools reported in the literature should HRD pursue to assess the HRD function and large-scale, organization-wide change efforts?

**General Findings Related to HRD Financial Analysis Methods**

The basic financial analysis method (FAM) method, based upon several years of research, has proven to be a helpful tool to overcome the difficult and often resisted problem of talking about human resource development in dollar and cents terms (Swanson & Gradous, 1988). The model and method for analyzing actual and forecasted financial benefits are relatively simple and straightforward. They both have three main components: (1) the performance value resulting from the program, (2) the cost of the program, and (3) the benefit resulting from the program. The basic financial analysis model is:

\[
\text{Performance Value} - \text{Cost} = \text{Benefit}
\]

The FAM method is an expansion of the three components into three separate worksheets. Readers wishing to receive detailed instruction on these should obtain the author's full text (Swanson & Gradous, 1988). For a broad overview of FAMs in context of HRD, see Mosier (1990). In addition, the extensive bibliography serves to capture important literature related to the economic analysis of HRD beyond just those studies cited directly in this paper.
Early HRD Financial Analysis Classics

There is a substantial base of HRD economic research. Unfortunately, it spread throughout the refereed, non-refereed, HRD, and non-HRD literature and generally is not in the hands of HRD decision-makers. Five early classics provide excellent examples. The research results from these varied studies were quite consistent. They demonstrated that HRD imbedded in a purposeful performance improvement framework yielded very high returns on investments, an ROI of 8:1 or more in a year or less (see Swanson, 1998).

From Financial Analysis of Methods (FAM) to Forecasting Financial Benefits (FFB)

There are a substantial number of studies in the realm of forecasting the financial benefits of HRD. This FFB literature is also dispersed in the HRD literature. These studies in this domain clearly demonstrate that HRD can be a very sound financial investment (see Swanson, 1998). Research further provides evidence that HRD interventions focused on appropriate dependent performance variables and systematically executed will financially forecast and return 8:1 or more. In contrast, there is no evidence that unfocused and unsystematic HRD interventions yield positive returns, let alone returns that exceed the costs.

Recent Financial Analysis Research in HRD

There is a substantial array of new HRD related economic research studies. Each of these studies provides a challenge and opportunity in the financial analysis of HRD benefits. The most interesting are the Critical Outcome Technique (Mattson, 2000) and the efforts at industry-wide impact (Lyau & Pucel, 1995).

Economic Assessment of the HRD Function and Organization-wide Efforts

Companies tend to use a limited number of economic analysis techniques. They include: payback time, average rate of return, present value (or present worth), and internal rate of return (Moore & Reichart, 1983). Payback time is the time period in which the amount invested is recovered by financial returns. This technique typically avoids long-range issues and also doesn’t capture any long-range benefits. Average rate of return allows for a comparison of alternatives as to their relative return per dollar invested. Alternatives can be ranked or compared to a standard. Present value recognizes that money has value over time and could be making money in other investments. Thus, cash flows are discounted to the present using a standard interest rate. Internal rate of return is a method that determines the interest rate needed to make the present value of the cash investment. It represents the rate of interest it would take if all efforts were paid from borrowed funds.

The economic techniques in the previous discussion force the decision-maker— and HRD decision makers in particular-- to realize that money to make an organization function is not sitting idly in a safe. If there is money available, there are alternative means of increasing its worth. If it is not available, and must be obtained through loans or from selling shares to stockholders, the bank and the shareholders expect a return for allowing the use of their money.

Three economic assessment strategies are highlighted here to explore the challenge of getting beyond the perspective of individual program assessment. They each deserve attention and application in HRD. They are: Measuring Intellectual Capital, Measuring Human Capital, Strategic Training Investment Decision Model

Measuring Intellectual Capital (Edvinsson & Malone, 1997)

Premise: In a knowledge-based company, the accounting system doesn’t capture anything important. Value lies in assets and when the assets are intangible, accounting has great difficulty.

Method: A measurement system for company-wide intellectual capital (IC); 31 possible IC metrics (e.g., information technology investment in dollars, rate of repeat customers in percentage) that can be customized, pursued, and tracked in terms of gains in the metrics and the overall economic performance of the company.
Measuring Human Capital (Provo, 2000)

**Premise:** Like other assets, there is a return on human assets. Human capital is a source of strategic advantage and requires investment. Build on the value chain, searches for constraints, and uses data models even if the data are imperfect.

**Method:** A “return on people approach” (Boudreau & Ramstad, 1997). The formula is: Effectiveness (increase in capabilities) x Impact (value of capabilities) = Benefit (value created).

Strategic Training Investment Decision Model (Krone, 2000).

Premise: There is strategic economic risk associated with investing in a training initiative. There is (1) general training that raises the productivity the same for the firm providing the training as in other firms and (2) specific training provided by a firm has value to that firm and no utility to competitive firms (Becker, 1993).

Method: The training investment decision is based on the expected return on specific training, plus the expected return from general training, minus the performance improvement value of the training to the competing organizations.

Conclusion

Economics has been purported to be one of the foundational theories of the HRD discipline. Yet, the HRD profession is woefully behind in reporting its economic contribution. This paper dichotomizes economic analysis into: (1) the individual program level and (2) the larger function or multi-dimensional organization-wide intervention level. The financial analysis methods available to the HRD profession are more than adequate to do the economic analysis of individual programs. In contrast, the methods and reported research economic analysis of the total HRD function or multi-dimensional organization-wide interventions is inadequate. Economic research into the underlying economic theory and application to HRD is needed to fill this void.

Evaluating HRD Research Using a Feminist Research Framework

Laura L. Bierema
Michigan State University

Maria Cseh
Oakland University

Over 400 AHRD Proceedings papers from 1997-1999 were analyzed according to a feminist research framework to understand how HRD creates knowledge through research. Although knowledge is being produced through both traditional and non-traditional methodologies, few studies recognize gender as a category of analysis. Nearly absent from the literature are studies concerned with: women/diverse people's experience; asymmetrical power arrangements; problems of racism and sexism; or advocacy of social justice and change. Research implications research are discussed.

Keywords: Research, Feminism, Document Analysis

Human Resource Development is an emerging discipline that is in the process of creating and validating knowledge. Little has been written about HRD research itself (Hixon and McClernon, 1999; Jacobs, 1990; Sleezer and Sleezer, 1997, 1998). Existing studies of HRD research have investigated journals publishing HRD research (Hixon and McClernon, 1999; Sleezer and Sleezer, 1997, 1998), and analyzed study context and methods (Hixon and McClernon, 1999). Arnold (1996) examined the 1994 and 1995 proceedings of AHRD according to the type of research and tools used to discuss findings, and van Hoof and Mulder (1997) described the contents and characteristics of research appearing in the 1996 AHRD proceedings. van Hoof and Mulder found that most researchers conduct studies of individual development and on the development of HRD as a field. Key research issues include: integrity, globalization, teams, employee development, learning on-the-job, new technologies, transfer, evaluation, organizational change, training effectiveness, partnership research, and roles in HRD. HRD has an impressive and diverse body of research. As the field emerges it is important to not only continue existing research, but also critically assess what is and is not being studied.

HRD as a discipline, has not exceedingly concerned itself with issues of diversity, equality, power, discrimination, sexism, racism, or other similar issues in organizations. Yet, these challenges pervade in both the workplace and society. Governmental policies, business practices, and research agendas lag behind the pace of workplace diversification. Fernandez observes, “corporate America as a whole, has failed to effectively address the challenges posed by diversity, particularly with regard to racism and sexism” (1999, p. 3). Meyerson and Fletcher (2000) suggest that discrimination in organizations is so deeply embedded culturally that it is practically indiscernible. Whether you consider race or gender, the figures are grim. Beck reports that 99 percent of all American women will work for pay at some point in their lives (1998). Although women’s workforce participation has steadily increased and shows no sign of diminishing in the new millennium, women trail men in pay, promotion, benefits, and other economic rewards (Knoke & Ishio, 1998). Despite the progress over the last fifty years, about half of the world’s workers are in sex-stereotyped occupations, and women work in a narrower range of occupations than do men. Rowney and Cahoon (1990) suggest that women find it easier to obtain leadership positions at lower levels in the hierarchy. According to their figures women hold only 23 percent of managerial positions in Canada, which is similar to the United States (24 percent) and the United Kingdom (19 percent). They found, in a sample of 423 organizations, that 30 percent of first line supervisors were female, whereas only 17 percent of middle managers and 8 percent of executives were women (1990). Despite more equal opportunity, women are still segregated into typically “female” careers, and the wage gap persists. Women earn 76 cents for every dollar men earn (Bureau of Labor Statistics, 1998), with the average managerial level differential at 74 cents. The data worsen based on race. African-American women earn 58 cents; Hispanic women earn 48 cents, Asian/other women earn 67 cents (Catalyst, 1997).

Women at the top levels are still a rarity comprising only 10 percent of senior managers in Fortune 500 companies. Fewer than 4 percent of women hold positions of CEO, president, executive vice president and COO, and less than 3 percent of top corporate earners are women (Meyerson and Fletcher, 2000). Carly Fiorina became
the first woman CEO of a Fortune 100 company when she was named CEO of Hewlett-Packard during 1999. She is one of only three women CEO’s in the Fortune 500. Dobosz notes, “Fiornia, briefly forgetting her math, cavalierly told the press that her appointment proved that there was no glass ceiling” (2000, p. 21). The glass ceiling is alive and well although Meyerson and Fletcher suggest it has gone “underground.” They explain, “Today discrimination against women lingers in a plethora of work practices and cultural norms that only appear unbiased. They are common and mundane—and woven into the fabric of an organization’s status quo—which is why most people don’t notice them, let alone question them. But they create a subtle pattern of disadvantage, which blocks all but a few women from career advancement” (200, p. 128). Hultin and Szulkin studied Swedish workers to investigate gender wage inequality, specifically whether earnings were affected by the gender composition of the establishments’ managerial and supervisory staff. They found that “gender-differentiated access to organizational power structures is essential in explaining women’s relatively low wages” (1999, p. 453). They emphasize that gender composition in hierarchical power structures should be considered an important part of research to increase our understanding of gender wage inequity. They conclude that, “Power relations in work organizations are of crucial importance for understanding how gender inequalities in financial rewards are generated and sustained in the labor market” (1990, p. 465).

Workplace HRD is not exempt from this type of systemic discrimination. Knoke and Ishio (1998) conducted longitudinal data analysis on a cohort of young workers to document that women’s participation in company training programs was at a significantly lower rate than men’s. Their study was done to evaluate whether reports of a demise of the gender gap in company training based on incident levels observed in cross sectional surveys were accurate. Knoke and Ishio indicated that, “Our principle conclusion is that the gender gap in company job training remains far more robust, tenacious, and resistant to explanation that previous researchers had indicated. This discovery admonishes both firms and social researchers to pay more attention to the ways that employees’ genders interact with private-sector policies and practices” (1998, p. 153). This study was undertaken heeding pleas for more gender sensitive research (Hultin & Szulkin, 1999; Knoke & Ishio, 1998) and recognizing Meyerson and Fletcher’s (2000) argument that discrimination is embedded so deeply that we do not often see it.

Problem Statement

HRD is an emerging discipline. Now is the time to question the theoretical frameworks and practices defining the field before they become embedded and simply serve to reinforce the status quo. Today’s HRD research and practice pays significant attention to the US corporate context, skews loyalties toward management, and lauds performance improvement above other results. HRD researchers must explore the assumptions underlying their research, consider the beneficiaries of research, reflect on areas yet unexplored, and question the value of HRD research according to its impact on theory, practice, organizations, communities, and employees.

Research questions in the social sciences have traditionally been conceptualized without consideration of women (Fine, 1985; Lykes & Stewart, 1986; Unger, 1983) and HRD is no exception. A quick reading of HRD research reveals an agenda driven by management interests focused primarily on learning and performance. Leimbach and Baldwin (1997) identify the characteristics of effective HRD research as being customer driven, linked to value creation, short in duration, and rigorous. These characteristics are important in HRD research, however, they overlook issues related to women and other diverse individuals, power relationships, social context, or social and political change. Employees are not even mentioned in the characteristics.

The purpose of this inquiry is to understand how the HRD field is creating knowledge through research. We are intrigued by what is valued knowledge in HRD and how the research trends over time shape the emerging field of HRD. The questions guiding this research are, “To what degree is HRD research using feminist inquiry? What are some under-addressed dimensions for the emerging field of HRD?”

Theoretical Framework

This study is grounded in a feminist research framework. Describing the many types of feminism is beyond the scope of this paper. A feminist—at the most simplistic level—is a person who seeks economic, social and political equality between the sexes. Feminists participate in and/or support organized activity to advance women’s rights and interests. Acker, Barry, and Esseveld (1983) define feminists as engaged in: acknowledging the exploitation, devaluation and often oppression of women; making a commitment to changing the condition of women; and adopting a critical perspective toward dominant intellectual traditions that have ignored and/or justified women's
oppression. Pritchard (1994) suggests that "Feminist critique starts with ‘women’ or ‘women’s issues’ but goes beyond to the impact of gender relations and gendered conditions of human development in all spheres of thought and action" (p. 42). Conduit and Hutchinson (1997) summarize five strategies viewed by feminist researchers as needed to create change and measure progress. These include: (1) providing women access and encouragement to enter the world of work, politics, and knowledge production; (2) reclaiming the works of previously absent women (or absent treatments of women) to what is considered the fundamental canon of knowledge in a given discipline; (3) adding women into the pot of “the human subject” in all types of research where they have been previously represented only through their absence; (4) turning feminist eyes, of diverse types, to a reexamination of the fundamental theories, mechanisms of analysis, and primary values that have given shape to our epistemological techniques and our ontological assumptions; and (5) ascertaining how adding women and feminism to the mix at so many levels has changed the kinds of questions asked, the types of policies attended to, and the categories of research done.

Feminist critique examines power in social and political institutions and the values and communication patterns that manifest themselves in both abstract and concrete patterns. Feminist critique has revolutionized workplace analysis and the ways knowledge is constructed (Pritchard, 1994). See Bierema (1998a; 1998b) for further explanation about feminist research in HRD.

Methodology

We conducted document analysis of AHRD conference proceedings from 1997-1999 using a feminist research framework. We selected a feminist framework because we felt it provided the most critical lens for assessing HRD research. Feminist research is concerned with eliminating all forms of oppression, thus it was suitable for considering research on diverse populations. Worell (1996) credits feminist psychologists with introducing a dialogue that challenged prevailing structures of knowledge creation. Feminist research is grounded in assumptions that, like most other social institutions, the process of knowledge creation and dissemination has historically been the province of white men. Women’s experience and knowledge has been traditionally excluded or overlooked in social science research. During the last two decades, feminist social scientists have critiqued the research process and provided definitions of feminist research.

Bierema (1998a; 1998b) conducted an exhaustive review of the literature on feminist research and a preliminary analysis of 1997 AHRD proceedings. Based on the literature review, Worell and Etaugh’s 1994 framework defining feminist inquiry was selected as the model to evaluate AHRD research. Worell and Etaugh (1994), synthesized feminist theory and research in psychology and other disciplines to establish “Themes and Sample Variations in Feminist Research.” Worell adapted the list and suggests that feminist research:

1. Challenges traditional scientific inquiry.
2. Focuses on the experiences and lives of women.
3. Considers asymmetrical power arrangements.
4. Recognizes gender as an essential category of analysis.
5. Attends to language and the power to “name.”

We carefully studied this framework and modified it for the present study to make it appropriate for assessing HRD research. Refer to Appendix 1 for a description of the six categories.

We selected AHRD proceedings for analysis rather than the HRDQ, as we believe the proceedings provide a broader view of all HRD research, not only research that is published in journals. We intend to analyze the first ten volumes of HRDQ and complete analysis of AHRD proceedings prior to 1997 in the future.

Data Analysis

Four hundred and eight proceedings papers were critically reviewed for this study. After reading the articles, research methodology was recorded and each paper was assessed to evaluate whether or not it met any of the six categories. All papers were considered. Some papers such as forum debates or articles on how to publish in journals were not considered in the analysis, and were coded “other.” After eliminating these papers, 396 were analyzed according to our framework. Data were recorded on a spreadsheet. Papers qualified for each of the six
categories if they met one or more of the points specified by the Feminist Framework for Evaluating HRD Research (Appendix 1).

Findings

A wide variety of research methodology is applied in HRD. Studies were classified according to traditional (experimental, quantitative), non-traditional (multiple methods, qualitative), conceptual/theoretical, review of the literature, or other (forums, journals). Table 1 shows the breakdown by type of methodology applied. There is a balance of both quantitative and qualitative research in HRD. There were many conceptual/theoretical papers as well. This corresponds with Hardy's (1999) meta-study of HRD research. He suggests that emerging fields engage in a considerable amount of theory generation and qualitative research to form a theoretical foundation, and gradually shift toward quantitative studies to validate theory.

Table 2 shows the papers according the Feminist Framework for Evaluating HRD Research. It examines how many papers met the six categories. Each of the categories was assessed against the total manuscripts by year and cumulatively for 1997-1999. Challenging traditional scientific inquiry is the most frequent category with nearly 38 percent of the papers falling into this category over three years. The next most frequent category is recognizing gender as a category of analysis. Studies met this criterion over 10 percent of the time over three years. Far less frequent were the categories: 2) focuses on the experiences of women/diverse groups; 3) considers asymmetrical power arrangements; 4) recognizes gender/diversity as category of analysis. These occurred in 5-7 percent of the papers from 1997-1999.

Discussion

This section revisits the Feminist Framework for Evaluating HRD Research and assesses the findings against it. It also makes some recommendations for future HRD research. Although these criteria focus on research models that challenge scientific inquiry, experimental designs are considered feminist research if they meet the other criteria set forth in Appendix 1, and they were considered for this analysis. DeVault (1996) implores researchers to avoid favoring one philosophical research stance over the other and suggests that “feminists have made major contributions by finding concepts and practices that resist ‘dualisms’ and they urge resistance to the qualitative-quantitative division” (p. 31). Quoting Cannon, Higginbotham, and Laung, she points out that small scale projects may be more likely than quantitative studies to reproduce race and class biases of the discipline by including participants who are readily accessible to the researchers. She also advocates that “quantitative feminist work involves correcting gender and other cultural biases in standard procedure” (p. 31). Quantitative methods are customarily used in HRD research and researchers would improve knowledge about race and gender by heeding DeVault’s advice. Qualitative research is also widely applied in HRD research, however, very few authors acknowledge their role as the researcher or are forthcoming about their biases. We believe all types of research have value and encourage research that strives to eliminate bias, promote equity, reveal corrupt or harmful practices, and improve the standing of all employees.

Five percent of the papers over three years dealt with women’s issues and even fewer addressed diversity. Articles on individuals possessing a double minority status, such as Black women, were almost non-existent. We found no articles addressing how women have contributed to HRD history or that examine the multiple representations of women in society (they are not all white, middle class). We conclude that the questions relevant to working women and diverse groups, such as harassment, discrimination or job segregation, are not being adequately addressed in HRD research. We agree that HRD research must aggressively pursue these topics in a diversifying, globalizing workplace. Understanding how power is wielded in HRD is not a priority according to our analysis finding that only 5 percent of the papers addressed asymmetrical power arrangements. We found this particularly stunning considering the impact that group and power dynamics has on all organizational activities. We are encouraged that over 10 percent of the papers from 1997-1999 recognized gender as a category of analysis. What was surprising, however, was that many more studies report women in the sample, but fail to include analysis based on gender. All participants are lumped into the same category and measured. HRD research must move beyond counting women and diverse groups in the sample to analyzing the data according to these categories.

Although HRD discusses “undiscussibles” in the context of the learning organization, the field has not progressed to addressing undiscussibles related to gender and diversity in research. Five percent of the studies analyzed addressed language and naming. Perhaps we are caught in the fray of political correctness where the overt discussion of the dynamics and impact of racism and sexism cannot be stomached. This silence only contributes to a discourse that marginalizes women and diverse beings in organizational context. HRD needs to delve into the “isms” that are not readily spoken about. HRD needs to address workplace discourse and how it silences, teaches, and oppresses humans.

Although HRD is a field committed to organizational change, there is little advocacy of change beyond the walls of the corporation. Our findings are telling in that only 7 percent of the papers analyzed advocated social activism and change. These findings indicate that HRD lacks a social conscience where research is concerned.
realize that the space limitations of the proceedings papers may have inhibited thorough discussion of social issues, but we were startled at the established pattern of overlooking it in study conceptualization, analysis, and discussion.

Limitations

We acknowledge that this analysis is imperfect. This study was not a critique of the theories and practices of HRD, but rather an analysis of HRD research. We recognize that research cannot be free from culture, history or experience. We are committed to diversity and equity in both the workplace and HRD field. Both of us are white, able-bodied, heterosexual women. One of us is European and the other North American. Through our work in many different organizations and industries, we have different experiences with gender-related issues. We have trained in both HRD and adult education. The analysis of the studies was an inductive, subjective process that was influenced by our experience. To ensure consistency we had multiple discussions about how studies would qualify for each category and discussed studies that were questionable regarding their fit with the framework. We also talked at length about what would exclude a study. We shared long-winded dialogue about what should be considered advocating social change and about how much we could infer in the analysis. We are aware that organizational development and change has the potential to create workplace equity, however, we took a conservative approach to attributing the advocacy of social justice and change as a criteria. We considered only articles that made a strong statement advocating change in the organization that was committed to addressing issues of diversity or inequity. We also assessed articles that had the potential to have a social impact. Above all, we decided that social justice and change could not be inferred in our analysis, but rather had to be overtly stated by the author(s). Our work is not finished. We have yet to conduct a kappa statistic to validate our interrater reliability and have future plans to do this. We also intend to continue analyzing HRD research according to this framework. Finally, our bias is that the HRD field would benefit from research that is more critical and inclusive methodologically, and should strive to create knowledge that promotes social change and workplace equity.

Implications

This analysis of over 400 AHRD papers, representing the most comprehensive, current HRD research to date, discloses what HRD is not focusing on: issues of equity and access in the workplace. Although we are encouraged that HRD has some highly dedicated researchers who are creating knowledge that addresses the issues raised in the feminist research framework, we are also disheartened that the field is not doing more toward creating a diverse, empowered workplace. Other than promoting alternative research designs, and sometimes using women (or diversity) as a unit of analysis, HRD focuses little on issues of social justice in the workplace or larger social context. Women’s experience is ignored, as are asymmetrical power arrangements. Gender is not used as a category of analysis—even when data are collected by gender. Organizational “undiscussables” such as sexism, racism, patriarchy, or violence receive little attention in the literature, yet have considerable impact on organizational dynamics. Finally, HRD research has only weakly advocated change. These findings are cause for alarm. Is HRD research reproducing existing power relationships in organizations? Is HRD research in the service of corporate executives and shareholders? What are responsible HRD researchers to do? We suggest a modest starting point of reviewing the Feminist Framework for Evaluating HRD Research and assessing how planned, ongoing, and completed studies address the issues it highlights.

Although there is a dearth of feminist research in HRD, this trend is not unique to HRD. Conduit and Hutchinson (1997) examined eight major public administration and policy journals to assess how many women were publishing, their patterns of publication, and content of the research. They found that women are historically underrepresented in most, but more recently have been publishing at rates commensurate with their representation in the academy. They found a surprisingly small number of articles by women and men scholars that addressed traditional women’s policy concerns or applied a feminist perspective to the research. They conclude that public administration has yet to be significantly influenced by the research and theoretical contributions of the women’s movement found in the greater academic community. We concur with Condit and Hutchinson’s (1997) conclusion, that “when it comes to the question of the emperor’s new clothes, the emperor still seems quite bare” (p. 194).

Meeting the Informal Learning Challenges of the Free Agent Learner:
Drawing Insights from Research-Based Lessons Learned

Victoria J. Marsick
F. Marie Volpe.

The concept of the free agent learner has recently emerged as a factor important to attracting, developing, and keeping knowledge workers. This concept has roots in self-directed and informal learning theory. We draw on studies of such learning conducted over the last decade to discuss findings and implications relevant for the free agent learner. Discussion focuses on informal learning strategies and on relevant contextual, organizational, and environmental factors.

Keywords: Free Agent Learner, Informal Learning, Self-Directed Learning

In this innovative session we draw on a body of research on informal learning in the workplace that has been carried out over the last decade and that is featured, in part, in Marsick and Volpe (1999). The purpose of this session will be to identify lessons learned from this research for today's free agent learners, for those who work with this population, and for the organizations in which they work. Discussants focus on the way in which the lessons that they learned from research on informal learning can help to avoid pitfalls, as well as raise new dilemmas and issues for further research and practice.

Literature on the free agent learner frames this paper and our collective thinking for this session. We also describe a conceptual framework — informal learning from experience — that forms the basis for the research discussed in this paper. We then turn to an overview of lessons learned in the last decade about informal learning and a discussion of the role of the environment on self-directed and informal learning. We draw on the work of Kurt Lewin (1935) who hypothesized that behavior is a function of the interactions between a person and his or her environment. Lewin's work lays the groundwork for understanding the reactions of employees to changes in the psychological contract at work with respect to their own learning and to the role that the environment plays in their learning. Session leaders then highlight key lessons learned from their studies and relate these key lessons to research and practice around the free agent learner. The six studies have the following foci:

Copyright © 2000, Marsick, V, Volpe F.M., Brooks, A., Cseh, M., Lovin, B. K., Vernon, S., Watkins, W., Ziegler, M.
1) Critically reflective learning during a divestiture
2) Learning to become team members in a nonprofit setting
3) Learning in paramedic partnerships
4) Meaning making among managers of a small publishing business in transition
5) Learning how to manage in new European markets
6) Informal learning among service professionals.

Each contributor to this paper poses questions that will form the basis for dialogue groups. In the dialogue groups, participants will be asked to identify experience that they have had with research and practice around getting a better “fix” on the way in which free agent learners engage in informal learning. Each group will identify at least two group insights from this discussion around additional lessons learned, significant constraints and facilitators to such learning, dilemmas, and challenges in conducting research on this topic. These insights will be debriefed and further discussed in a closing plenary session. The conveners will help the group to identify themes that emerge, as well as lessons around the design and conduct of future research on this topic.

Free Agent Learners

Attention to the “free agent learner” has been increasing in the field of Human Resource Development. Caudron (1999) calls attention to these “independent and highly motivated adults who are taking responsibility for their own ongoing learning and development, as opposed to relying on employers to provide it for them. They’re people who understand the need for lifelong learning and are doing something about it” (p. 27). Cauldron draws on statistics from the 1995 National Household Education Survey that indicate that “76 million adults age 16 and older participated in one or more adult education activities during the preceding year” (p. 28). Cauldron goes on to say that this number is a 25% increase from four years earlier, and involves 40% of the adult population; that many of these learners already have college degrees and earn good salaries; and that over 50% are women. We note that the profile of these adult learners is very similar to the profile of adult learners in prior surveys on participation in adult education: “white, middle class, employed, younger, and better educated than the nonparticipant. Further, employment-related reasons account for the majority of participant interest in continuing education” (Merriam and Caffarella, 1999, p. 71).

Free agent learners are, in essence, what the field has been calling “self-directed learners.” They are proactive, and independently pursue their goals whether or not the environment is supportive to their efforts. Candy (1991) points out that self-directed learners are autonomous in their goals and/or their learning strategies. We know a good deal about self-directed learners from the literature (reviewed, for example, in Candy, 1991 and updated in Merriam and Caffarella, 1999), although there are gaps in the research that still need attention. One of those gaps is the way in which self-directed learners use informal learning strategies to augment their pursuit of more formally structured continuing education and training efforts. Marsick and Volpe (1999) describe informal learning as: 1) integrated work and daily routines, 2) triggered by an internal or external jolt, 3) not highly conscious, 4) haphazard and influenced by chance, 5) inductively occurring through action and reflection, and 6) linked to the learning of others. Informal learning may or may not be consciously used by free agent learners in pursuing their goals.

Another gap speaks to the impact of the environment on self-directed learning. Brockett and Hiemstra (1991) suggest a three-part definition for self-directed learning that examines the following: 1) The individual process of planning, implementing, and evaluating learning; 2) the characteristics of the learner; and 3) the organizational factors that facilitate and impede learning. Cauldron (1999) points out that the environment of many organizations today is not really ready for the free agent learner. After years of calling for employees to become more self-directed and proactive in their learning, companies are not always pleasantly surprised when people actively pursue knowledge and skills. Cauldron notes, “For lifelong learning to become a reality, companies have to be willing to accept the new ideas such employees are bringing to work” (p. 30). Cauldron reports two observations to the contrary by Charlotte Roberts, co-author with Peter Senge of a new book on implementing learning in organizations (Senge et al, 1999). First, free agent learners may threaten organizations because they are “less willing to do what they’re told and more eager to challenge authority. . . . Another way free agent learners threaten companies is that they expect their education to be used and expect to be rewarded for having obtained that education. If neither happens, they’re all too willing to walk.” (Ibid).

Conceptual Framework and Methods for Studies
Many of the studies reported in this paper are included in a recent volume of findings from research on informal learning in the workplace (Marsick and Volpe, 1999) which compliment earlier work around a theory of informal learning (Marsick and Watkins, 1990; Watkins and Marsick, 1993; Cseh, Watkins and Marsick, 1999). The two studies additional studies in this paper, that of Cseh and of Watkins and Cervero, extend the findings from the 1999 volume by focusing on recent developments in global management and professionalization. The model of informal and incidental learning developed by Marsick and Watkins is based on the work of John Dewey (1938) and Kurt Lewin (1935) and on thinking of scholars who have further elaborated an understanding of learning from experience within social settings (Argyris and Schon, 1978; Mezirow, 1991). The model suggests that people learn from their experience at work when they use challenges and problems as triggers for re-examining their understanding of a situation. The context comes to the fore because the environment is so turbulent, and little can be taken-for-granted. People need to re-examine assumptions about the context as they consider alternative actions, make choices and decisions about action, and gain new knowledge and skills to implement chosen alternatives. They can learn from intended and unintended consequences, and through a review what has occurred in order to extract lessons learned.

All of the studies reported in this paper are exploratory in nature, and most rely primarily on qualitative data collected through some combination of interviews, critical incidents, and observations. One of the studies also utilized a survey (Watkins and Cervero, 1999). The conceptual framework for these studies focus in some way on learning from experience, critical thinking, and the role of environmental factors in learning. Data are typically analyzed using the constant comparative method of content analysis, and often draw on elements of grounded theory (Glaser and Strauss, 1967; Strauss and Corbin, 1990). Studies typically use convenience samples that are selected with criteria in mind that will enable researchers to shed light on the phenomenon they are trying to explain. Hence, each study speaks to a unique situation or context, and cannot be used to generalize results. However, taken together and considered theoretically, the studies provide a basis for thinking conceptually about the informal learning of free agent learners. We use the data to pose questions for further consideration in relationship to research and practice.

How People Master Environmental Changes in the Workplace

As an HR professional, I undertook an interpretive case study in the late 1980’s to understand how people learn to master environmental changes in the workplace (Volpe, 1992). My overall goal was to be able to uncover new approaches and strategies to help employees in my own work as a Manager of Education and Development in a large multi-national corporation. The corporation had implemented major changes involving large-scale downsizings and reorganization that affected all parts of the organization. These changes were initiated by a newly installed President and a new Chairman. These events radically changed the corporate environment and, as such, it was logical to assume that it would have at the very least a disconcerting affect on employees. Given this set of events, I wanted to understand the extent and the degree of impact environmental changes had on the people in the organization. I made the following assumptions: 1) most learning in the workplace occurred in informal, non-structured situations; 2) the need for continuous informal learning heightened during periods of intense organizational change; and 3) an implied social contract existed between the organization and its employees.

Lewin’s (1935) theories provided the overriding construct for analysis and synthesis of the research findings. Lewin proposed that human behavior is a function of both the person and the environment – expressed in symbolic terms: B = f(P,E). This proposition seemed appropriate for understanding the learning behaviors of a represented segment of employees in the context of large scale change. Lewin advanced the concept of the life space by drawing on his understanding of the interaction between a person and his/her environment and the principle of contemporaneity (i.e., that only present facts can produce present behavior). Life space refers to the whole of psychological reality. It is the totality of all possible coexisting facts that influence the behavior of a person at a particular time. In other words, behavior is a function of the life space at a given time. The boundaries surrounding the person in the life space are permeable as are the boundaries that separate the life space from the greater physical world. Given this property of permeability, facts in the psychological environment can materially influence changes in the psychological environment. However, a fact must exist first in the psychological environment before it can influence or be influenced by the person.

Lewin’s theory in and of itself was not sufficient. I drew on frame theory described by Bolman and Deal (1984) to analyze the organizational environment of the corporation. Consistent with Lewin’s equation that behavior is a function of the interaction of person and the environment, Bolman and Deal provide a four-frame or four lens approach through which to analyze the organizational environment. These four frames are: 1) the structural – having
to do with all of the systems in place, how the corporation is organized and how it operates; 2) the human resources – refers to people issues, benefits, rewards, relationships, development, etc.; 3) the political – concerns the allocation of scarce resources, negotiation, bargaining, gaining advantage, etc.; and 4) the symbolic – the symbols that giving meaning to the corporate image. No one frame is better than another, they are simply windows through which to understand and analyze an organization.

Informal Learning: Interpreting the Changed Context

While this study set out to examine how the sample group learned to master change, a key finding revealed that the overriding issue for participants was to interpret and understand the changed environment. This preoccupation with interpreting the environment serious hindered learning informally because participants no longer held the same general view of the environment. Three distinct perceptions of the new environment emerged among participants and each of these perceptions held different implications for what needed to be learned:

1. Some held simply that the nature of work had changed and therefore the challenge was to learn the new ways of carrying out work, the new rules, roles and key players.
2. Others focused almost entirely on the fact that the company was no longer paternal and that the social, unwritten, contract had been broken. For this group, their learning was more introspective as they struggled to overcome their feelings of betrayal and re-examined their relationship and attitudes toward the company.
3. The most predominant group among all the participants were those who held the view that the environment was now highly political and one had to scrabble often at the expense of others for the scarce resources in the company.

All of these perceptions had an impact on the former practice of learning informally. Those who were introspective, whom I called the Heart Broken, were so intensely involved in their own feelings, they had nothing left to help others learn. Those who perceived the new environment as now highly political were unlikely to share information with others these were the Politicals. Thus, the remaining group, named the Structural, were those who focused on the changed nature of work. This group had far few people with whom they could share information. In light of this scenario, the informal network of learning had severely broken down.

Implications for the Free Agent Learner: Capacities of Human Resource Developers to Support New Learning

Questions posed by this study point to what is or isn’t known about the capacity of human resource developers who are expected to facilitate the development of free agent learners. These findings were among the earliest indications that the primary responsibility for learning had shifted from the employer to the employee. The message was loud and clear — the organization was no longer paternal. Each employee would need to begin a process of continuous learning in order to develop the skills needed to survive and thrive in a continuously changing environment.

In a more recent article appearing in the August 1999 issue of Training and Development, Caudron provides an update on the learning attitudes and strategies of today’s employee whom she calls the “Free Agent Learner.” What began, almost under duress in the late 1970’s and throughout the 1980’s and 1990’s has now become the new reality. Each individual is responsible for his / her own learning, for acquiring the skills needed in a continuously changing technology driven work environment. And the author tells us that today’s employees are relentless in pursuing and achieving their learning goals. At the same time, Caudron points out that this new fierce individualism has had an adverse impact on today’s modern organizations. She says many companies risk losing the brightest and best unless they find new ways to reward competent employees.

This study left many questions unanswered about learning in the face of the breakdown of networks and other mechanisms on which people had formerly relied for development. Free agent learners probably have totally different needs and may use the same mechanisms in different ways. Human resource developers, many of whom were participants in this study, were themselves struggling with the meaning of rapid change, and therefore, with appropriate ways to create and support new approaches to learning. A study of human resource developers who feel they have successfully made this transition might identify critical strategies that used to move forward and to then use insights from their own experience to assist others. It would also be valuable to find out if younger people in human resources, who began their work under a different set of assumptions about the psychological contract, approach the support of free agent learners in entirely different ways.
Critically Reflective Learning

Informal learning by free agents in organizations can be facilitated in three ways: the mental capacities of the learner, the quality and quantity of interactions between organizational members, and organizational structures. Brooks (1989) conducted a divestiture study that was focused initially on the informal critically reflective learning strategies of managers in one of the Baby Bell companies at the time of divestiture in the mid-1980's. The rationale was that the transformation from a regulated to a market-driven company provided a prototypical case of the kind of learning that was going to be required of all of us as we moved toward increasingly global and technologically-driven societies.

This study was conducted in one of the Baby Bell telephone companies during divestiture. The employees were being asked to re-conceptualize their work. The organization did not use the term “free agent learner,” but the leaders of the company did ask employees to function in a more proactive manner in an environment where the rules of the game were clearly changing. The study assumed that employees undergoing such a radical change needed the ability to reflect critically on themselves and the organization. Critical reflection was defined in terms of the capacity to identify and examine assumptions that shaped one’s actions.

The study was a qualitative case study. The sample was identified by asking the corporation’s senior internal organization development consultant to identify people he thought questioned the status quo and regularly took action to make change happen. A snowball sample of 29 managers was identified starting with this groups: 21 who consistently were named as being critically reflective (including entry level managers up to and including the chairman and CEO); 4 who were consistently identified as not being critically reflective; and 4 who were consistently named as having made a dramatic shift from not being critically reflective to being so.

Informal Learning That Was Critically Reflective

A review of some of the findings from the original study is useful for the insight they give us into the development and process of informal critically reflective learning. Different managers cited the following in-company experiences as having been central to their development of critically reflective learning skills:

- they had had a variety of work experiences within the company
- liberal arts education
- consciousness-raising seminars
- open-ended assignments
- modeling of critically reflective learning by others
- encouragement of questioning
- honest feedback
- participation in policy-making and implementation
- intercultural experiences (not necessarily part of an in-company experience)

In addition, critical reflection seemed to include some combination of the following mental and emotional strategies:

- empathic viewing of things from another’s perspective
- listening to intuition
- examining an issue from different perspectives
- monitoring thought processes (maintaining honesty, dealing with “real” issues, resisting categorizing people, looking for opportunities in any change situation)
- information gathering
- experimenting
- accepting help from others

Given these findings, informal critically reflective learners appear to have several needs: (a) a variety of job experiences, (b) clear goals, (c) access to information from the top, (d) exposure to multiple perspectives, (e) a chance to see what others are rewarded for, (f) freedom to determine their own paths to goal achievement, and (g) help in learning critically reflective learning strategies. Critically reflective learners are clearly proactive and want the organization to provide opportunities and resources for their learning without constraining their freedom to set and pursue learning goals of their own choosing.

Implications for the Free Agent Learner: Deign of Motivating Career Systems
One question posed by this study for practice is as follows: What kind of career system would attract, develop, motivate, and retain this kind of employee? An organization like the Baby Bell in this study said that it wanted an employee who is self-directing but a team player, critically reflective but creative, and takes initiative but acts responsibly. The following is a proposal of some of the important elements of such a career system. It is based on Liebowitz, Ferren, and Kaye’s (1989) framework for thinking about how human resource structures can link to career development (p.41). It addresses such aspects of career development as job acquisition and movement, development and reward, organizational information and planning, and individual information and planning. Its components include the following:

- **Job acquisition and movement**
  - Job description – in terms of goals of specific job
  - Job posting – on intranet
  - Recruitment – inside first, then outside
  - Transfer/promotion – can be initiated by employee or supervisor/employee rewarded for transferring to a position in which they can be more productive

- **Development and reward**
  - Training – employee chooses and pays for own formal training and education.
  - On-the-job developmental opportunities - Supervisors and managers rewarded for developing employees.
  - Compensation – awarded for concrete accomplishments that contribute to the goals of the organization. Determined in negotiation with supervisor or manager. Compensation records for all employees are public documents.
  - Benefits – basic benefits provided for everyone. Extras can be used in lieu of compensation.

- **Organizational information and planning**
  - Strategic planning – open-information. Employees rewarded individually or as team for concrete accomplishments that contribute to achieving strategic plan goals.
  - All succession positions are interim until a permanent person is recruited.
  - No skills inventories maintained since jobs described in terms of goals and many paths exist to the same end.

- **Individual information and planning**
  - Performance appraisal – performance appraised according to projects accomplished leading toward organizational goals. All employee reports of yearly performance are open information.
  - Company and employee split the cost of career counselors to help employees.

The above proposal is radical in that it dispenses with some of the shibboleths of “good human resource” management such as yearly performance appraisal, control of information, central control, and standardization. However, it is worthy of consideration in that it demonstrates the inseparability of freedom and responsibility. Employees can only take responsibility for their own performance and act as free agent critically reflective learners to the extent that they have the freedom to critique the systems within which they work and to transform those systems in ways that better meet company goals. Like all organizational structures, a career system can be developed to facilitate the development of such employees.
Learning to Become an Effective Team Member

One skill that has been identified as critical in meeting the challenge of the changing workplace is the ability to work as part of a team (Stephans, Mills, Pace, & Palphs, 1988). This ability is essential to successfully counter the high level of uncertainty experienced by workers faced with new technologies (Jacobs & Everett, 1988). Copeland (1988)—a researcher who focuses on diversity and multiculturalism in organizations and associated training and development activities—contends that team building is critical to managing a diverse multicultural workforce. Although education and training departments have developed numerous team-building programs to address changing human resource development needs, they have focused primarily on formal learning strategies. Yet, we know that only 10 to 20 percent of what employees learn comes from structured training (Marsick & Watkins, 1990).

A study conducted in 1990 explored how employees in a medium-sized, community-based, non-profit social services agency learned informally to work more effectively in teams. The agency serves women, minorities, and others in transition by providing legal advice, social assistance, education and training, and job placement services. Like many other non-profit agencies, it depends largely on public funding and on sources of “soft” money. Thirty employees participated in the study. They came from the managers’ team, the public policy and development team, the management team, and the clerical team. They worked in different functions and were diverse in age, ethnicity, gender, and educational background. Interviews, written critical incidents, and document analysis were techniques used to collect data. The participants also wrote up critical incidents, specific descriptions concerning how they understood teaming and how they learned to become members of teams. In addition, three team meetings were observed. The study shed light on the nature of teamwork, on strategies that are utilized to learn informally to be an effective team member and on facilitators of and barriers to learning effective team membership.

Strategies for Learning Effective Team Membership

Participants in the study described the strategies they used to learn effective team membership. Strategies included: structured on-the-job training, informal personal learning, and informal interpersonal learning.

Of the formal learning strategies used, structured on-the-job training—consisting of coaching, creating learning opportunities, and learning effective listening skills and feedback techniques—was portrayed as the most effective. Participants described access to new learning opportunities and effective feedback as critical to their growth as team members, as professionals and as individuals. These aspects of structured on-the-job training were important because they provided opportunities for employees to use informal learning strategies to add new skills to their repertoire, to affirm existing skills, and to consider how the newly learned skills might apply in a variety of settings.

Although the study participants cited both personal and interpersonal informal strategies as helpful in learning to be an effective team member, personal strategies were the most frequently used. The participants identified these strategies as questioning, listening, observing, reading and reflecting. Questioning, listening, reading, and observing were useful to obtain help, information, or support; to learn from alternative viewpoints; to gain the ability to provide effective feedback; and to consider alternative ways of thinking and behaving. However, only reflection allowed participants to form judgments about what was learned and to make decisions about current, future, and alternative applications of what was learned. They also used reflection to assess both the process and the outcomes of their learning experiences and of their interpersonal and trial-and-error experimentation. (Trial-and-error experimentation refers to reflecting on errors that occur because of what was done, on what was not done, or how something was done.)

The interpersonal informal learning strategies identified by the participants were mentoring, coaching, networking, and modeling. These learning strategies have been noted in the literature as powerful informal learning tools. They were not so regarded by the participants in this study, however. In fact, their descriptions of interpersonal informal learning strategies indicated a perception that the major purpose of networking, coaching, and modeling was to provide access to instructional materials or resources—that is, people materials and events—to help them in the learning process. Given this perspective, it is not surprising that the study participants cited modeling and networking as the most beneficial aspect of the interpersonal learning process. Through networking, participants were able to ask question that were meaningful to them and to obtain help, information, or support regarding effective team membership. Similarly, access to models provided opportunity to observe alternative ways of behaving. The reflective dimension of learner-centered, learner-initiated learning strategies solidified the learning that occurred among the participants.
The study participants described factors that facilitated their learning as effective leadership, effective facilitation, interrelational aspects of teams, and individual characteristics and capabilities. The role of team leaders was characterized as one of establishing the parameters of the team. The purpose and philosophy of the team as well as certain structural aspects of the team must be specified or negotiated by team leaders if members are to participate fully in team activities and benefit from the learning opportunities presented for team development. The study participants defined effective facilitation as providing an operational structure that ensures efficient team activity. Interrelational facilitators of effective team membership were defined by participants as practices that promote participation and maximum productivity from team members. Finally, individual facilitators were identified as a propensity for teamwork, high self-esteem, and the perception that one is an asset to one’s team as individual characteristics that facilitate the learning of effective team membership.

Implications for Free Agent Learners: Integrating Informal, Personal, and Interpersonal Strategies for Learning

Human resource development professionals can use informal, personal, and interpersonal learning strategies to aid in team building. Team members can be empowered by recognizing and using informal personal learning strategies. Participants were easily able to discuss formal strategies they used to learn to be effective team members. They were less able to discuss the informal strategies they used. But talking about these strategies increased their awareness of the power and effectiveness of informal learning strategies. Participants noted, though, that informal learning strategies carried less credibility than formal strategies in their own minds and within the organization. The lack of credibility became a disincentive to integrating the informal learning processes into their practice. This would sorely limit the learning of the organization as managers, supervisors, and coworkers fulfill the trainer's role and extend the community of learners, thereby creating a dynamic learning environment.

The findings of this study also have implications for management personnel who have responsibility for developing participatory practices — that is, teamwork — in the workplace. Under the best of circumstances, the manager's role can be extended to one of educator and the production mode to one that includes learning. Knowledge of personal learning strategies and the environments that facilitate their use are invaluable to team development.

Partners in Learning

When paramedics suggest that “two heads are better than one,” they are speaking from experience about the importance and potential of the unique working relationship that occurs between the men and women who staff our nation's ambulances. For paramedics almost always work in pairs — partners who respond to calls for emergency medical care that range from the ordinary to the terrifying. However, their statement also raises questions. Although considered equal by the state certifying agency, do these paramedics consider each other equals? Do they contribute equally to a partnership? How do partners complete the tasks of the job? Is the partnership an effective means for accomplishing the job? The answers to these questions exist in the type of partnership that develops when two paramedics are assigned by the organization to work together. These pairings have a direct bearing on what paramedics learn about how to accomplish the tasks of the job and how effectively these tasks are completed.

The nature of the paramedic partnership as well as that of the work itself, which occurs as a daily series of discrete events, provided the setting for a qualitative case study of informal workplace learning conducted by Larson (1991) [who now goes by the name of Lovin]. Twenty male and three female, full-time paramedics employed by a large southeastern provider of emergency medical services (EMS) participated. Each participant had had a variety of partnership experiences lasting as long as several years or as brief as one shift. Through written responses about the challenges of the job, individual semi-structured interviews, and extended observation of select participants, a picture emerged of distinct partnership types. How the study's participants handled the tasks of the job and what they learned from these experiences was directly affected by the types of partnerships each had developed with various partners during their periods of employment.
Informal Learning Strategies

Three less-than-ideal partnerships are evident from the study. The potentiated partnership, in which a paramedic mentor is paired with a probationary paramedic, is either an initial or remedial partnering experience. It is effective in the sense that mentors impart the organizational culture and customs while mentees admit to trusting what they learn from their mentors. However, potentiated partners do not consider each other equals. Mentors admit that they do not trust their partners. With patient lives at stake, mentors repeatedly take over patient care. The partnership yields to a single practitioner and the potential in the pairing is lost.

When experienced paramedics are paired for limited periods, an additive partnership is common. Here, the effectiveness of the partners is never enhanced by their working together because neither partner places value on the partnership. While job tasks are accomplished, the partners behave as if they were working on their own. This pairing is clearly a source of dissatisfaction to participants who recognize that it negates the potential inherent in a partnership. Further, there is no evidence that participation in either an additive or potentiated partnership is a useful strategy for learning how to be an effective, contributing partner. Such learning is not recognized as useful or necessary.

In an antagonistic partnership, each partner feels total responsibility for completing each job task. In such a performance, as partners interfere with each other’s activities, duplication occurs, effectiveness is sacrificed, and the potential of the partnership is lost. Again the culprit is lack of trust. The promise resides in a willingness of the partners to develop that trust and move the partnership forward.

Only the synergistic partnership achieves the potential inherent in pairing two paramedics. Here the whole is greater than the sum of its parts. The participants describe “two people that act as one,” “just mesh,” and “never say a word but talk the whole time, almost like telepathy.” These paramedics also recognize that the development of the synergistic partnership is a learning process undertaken not because of any directive from the organization but because of a perceived need-to-know. The pathway to the synergistic partnership is through the antagonistic partnership; for only here do individual paramedics come to recognize that the challenge of knowing how to effectively work with a partner may be as important as knowing how to handle the tasks of the job. If they then invest the time, energy, and attention necessary to this learning project, and if the project is not disrupted by organizational reassignment, it is often highly successful.

Learning from experience occurs most often when the learner is faced with an event or situation that is recognized as disconcerting or nonroutine. The daily work of the paramedic is to handle routine and nonroutine situations. The paramedics identify the nonroutine situations of their job as sources of learning. The four types of partnerships can also be categorized as either routine or nonroutine. Potentiated, additive, and antagonistic partnerships are viewed by participants as perplexing, uneven, and insecure. As such, all three partnerships are nonroutine. The remaining partnership, the synergistic partnership, is the only one that can be classified as routine because it is viewed by partners as stable and non-threatening. Organizational staffing practices may then present each paramedic with a workplace relationship which can be as disconcerting as many of the experiences of providing emergency patient care. While this suggests that the partnership may also be a learning opportunity, that is frequently not the case.

When presented with competing information, individuals make choices about where to focus their attention (Marsick & Watkins, 1990). Given the needs of patients in non-routine emergency situations, paramedics in nonroutine partnerships ignore the partnership in favor of caring for the patient. Doing so requires that they handle the situation as individuals which all but eliminates the effectiveness expected from the partnership. Even when the situation is routine, the approach of these paramedics is to continue to handle the situation as individuals, this time in tandem; one assumes a leadership role and the other follows. Throughout most of the time paramedics work together in nonroutine partnerships, each paramedic ignores the partnership in favor of completing work tasks because neither perceives a need to learn how to partner.

The effectiveness of pairing two paramedics is evident when synergistic partners handle routine and nonroutine work assignments. Because the partnership is routine the partners are free to focus on the task. These tasks are accomplished in a spontaneous fashion in routine situations and in a synchronized manner when the experience is nonroutine. Working together to complete these tasks is often a source of significant learning, for the potential for learning is not only in the task itself, but in how the task is viewed in terms of the partnership.
Implications for the Free Agent Learner: Jobs Designed to Consider Interpersonal Rapport and Trust

One question posed by this study for practice is as follows: How can organizations provide greater choice in job design and job assignments to free agent learners whose performance and expertise clearly depend on interpersonal rapport and trust among those who work closely with one another? There appears to be an increasing demand by the public for mistake-proof job performance from health care providers. In response, EMS organizations are providing additional content-based continuing education in an effort to insure that individuals are current in the subject matter of the discipline. Yet this study and the paramedics themselves say that most of their learning occurs informally as part of the job. In addition, it seems clear that the nature of one type of workplace relationship, the paramedic partnership, directly affects if, what, and when this self-directed learning will happen. And further, the ability of paramedics to respond in the most effective way to each patient care situation depends on the existence of the synergistic partnership where partners trust each other and consider each other equals. In direct contrast, most EMS organizations staff ambulances based on the assumption that any two certified paramedics versed in the organization's operating policies and patient care protocols will provide the same level of job performance in a given situation.

Rethinking how emergency service is provided from the point of view of the paramedic means addressing the importance of on-the-job self-directed learning and synergistic partnerships to the overall organizational effectiveness. With recognition of the importance of the partnership would come policies and procedures which bring consistency to staffing practices and no longer consider paramedics to be interchangeable parts. The development of synergistic partnerships would not be left to chance.

Formal and informal learning opportunities would emphasize the dynamics of working relationships so that individual paramedics would be adequately prepared to work effectively as partners. Strategies which could enhance self-directed learning would be discussed in terms of the needs of the learner. Lessons learned through on-the-job self-directed learning would be valued and opportunities provided to share and validate this learning. And finally, individuals working and learning effectively within partnerships would receive support and recognition from the organization and see the results of their efforts confirmed in the improved quality of care provided to patients.

Meaning Making in a Small Family Business

The owners and managers of a small family-owned printing business experienced a jolt when they received the financial reports that showed production was up, customers seemed satisfied, employees were working longer hours but profit was perilously down. In addition, the owners had lost interest trying to solve the myriad of problems that rarely seemed to change. The 45-year-old business had never before faced this same set of circumstances. To confront this threat to the survival of their business, the owners led an intensive learning journey to re-vision the future they would need to create to renew the company. No map existed to guide them through this transformational process.

Mary Ziegler conducted an interpretive case study to assess how the owners and managers of this small business perceived the changes that occurred in the company approximately eight months after they began their re-visioning process. Research questions included: 1) how does learning become part of the fabric of a business culture? 2) How does a company develop the capacity to become a learning organization? 3) Is organizational learning different from individual learning, and if so, how is it different?

Informal Learning Strategies

Findings resulted in provocative insights into how informal learning takes place at the individual and organizational level, particularly the way it denotes the beginning stage of intentional organizational change. The term “awakening,” used metaphorically by the respondents, captures their perceptions of the changes that occurred in the company. Awareness and insight, the first step in the change process, consisted of making meaning, challenging mental models, and experimenting. These learning strategies sensitized the company to the intentional learning activities that followed and proved to be far more ambiguous, messy and elusive than is depicted in the popular management literature.

Making meaning of their organization and its need to change was a critical step in their learning process. As one owner said, “Understanding the whys has a lot more to do with things than understanding the hows...” Rather than attempting to solve the next problem, they began asking why they had the problem and what the underlying
causes might be. Understanding the reasons for everyday activities had gotten lost over the years. Inquiry was a fundamental strategy for making meaning. They learned that common terms did not have common meanings so they explored and defined these terms and shared their new meaning with others. Intense involvement in the learning process enabled them to begin challenging their mental models. People made meaning by asking questions. They inquired into what terms and events meant, and then defined those terms and events to clarify them.

Mental models (Senge, 1991) are common taken-for-granted assumptions about reality. They are so ingrained they direct behavior yet reside outside normal awareness. When describing the change process, owners and managers reported that they had ceased clearly seeing their company because routine and habit had blinded them to the obvious issues that were jeopardizing the company’s future. By attending and reflecting, becoming aware of their assumptions, and challenging the long-held company beliefs, they began to think of their environment in new ways. They became aware of the skills they needed to increase in order to increase their confidence to make the changes they wanted to make. Challenging beliefs was at the heart of change. As one supervisor said, “It takes a while to change your thinking. But you have to change how you think before you can change the way you do things.”

Respondents reported that they acquired new skills by learning how to do things that they were previously unable to do. Although the skills being developed span a wide range, three skill areas stood out—interpersonal, cognitive, and technical. Most respondents reported that interpersonal skills were the principal skills they needed to develop. Listening was highlighted as a critical communication skill. Cognitive skills were cultivated as people began to document existing work processes, identify problems, search for root causes, and formulate solutions. Technical skills resulted in new technologies that enhanced the development of interpersonal and cognitive skills as well as improvement of work processes. These informal learning strategies—making meaning, challenging mental models, and learning how—were not separate from work because work provided the context that enabled the learning to make sense.

Although this study provided clues that would help a practitioner guide a small business through the start-up of a learning initiative, adult educators need new tools to help people in organizations develop their learning capacity and bridge the gap between thinking and acting.

Implications for the Free Agent Learner: Dilemmas, Implementation Issues, and Commitment

This study poses three questions in considering the learning of the free agent learner. First, how can people who began work under one dominant paradigm around learning resolve conflicts and dilemmas posed as they attempt to live and work in a new paradigm? The informal learning strategies the owners and managers used proved to be far more ambiguous, messy and elusive than is depicted in the popular management literature. In the change process, the old and new exist side by side. In one situation, it may be possible to think and act according to a new belief, while in another situation, the new belief may not emerge at all. What strategies to individuals use to deal with the inconsistencies of the learning process? Is this conflict less intense for younger free agent learners who come to the organization without as much prior mental “baggage” even though they may be impatient with the organization because it has not caught up with their mental model?

Second, what are the elements of the crucial step between taking on new convictions and implementing new behavior? The study reveals a large gap between acquiring new knowledge and the ability to effectively take action that is consistent with new understanding. The inability to convert new convictions into practice is a critical juncture in the learning process. For many of the respondents, this inability led to frustration with the learning process and with themselves as learners.

Third, what are the attributes of commitment to the deep kind of learning and change that was evident in this study? If we knew more about commitment, could we help people persist through the difficult stages of the informal learning process when the change demanded is so great? The study suggests that learning requires commitment. As informal learning begins, the commitment to learn may be implicit and outside conscious awareness and therefore difficult to access. Commitment enabled the respondents in this study to overcome significant obstacles to learning.

Unlearning in Eastern Europe

The study of the informal learning of managers in a rapidly changing Eastern European country leads to a focus on “unlearning.” As Villinger (1996) stated: “The learning process necessary in Eastern European enterprises also implies a great amount of forgetting. Differentiating between unlearning, on the one hand, and relearning or rather new
learning, on the other hand, promises further interesting considerations with respect to the learning process as a whole" (p. 191). The discussion in this paper is based on a study by Cseh (1998).

The purpose of Cseh’s study was to examine the critical learning experiences which enabled owner-managers of small private companies in Romania to lead successfully in the transition to a free market economy, to determine what triggered their learning, what strategies they used, and what lessons they learn. Information rich cases were collected through 18 in-depth, face-to-face interviews with owner-managers of successful (on the top list of companies compiled by the Chamber of Commerce at county and country level) small (2-99 employees) Romanian private companies. The interviews were conducted in Romania at the end of 1996 and beginning of 1997.

Managers were asked to describe at least three critical incidents from their managerial practice. A total of 72 critical incidents from 15 managers were analyzed for this study. The 15 managers selected for this study were between 28 and 62 years of age. They were selected to represent both genders and the nationalities (Hungarian and Romanian) specific to the two regions represented. There were six ethnic Hungarians and nine Romanians, and four female managers selected in the sample. The managers were highly educated and obtained their degrees and certificates from Romania. All but three of the managers had a university degree and one of them had a doctorate degree.

Informal Learning Strategies

The learning of the owner-managers was stimulated mostly by the ambiguity of a quasi-market economy. All the managers gave detailed accounts of their perception of the economic, political and social context in which they worked. Managers framed the business context in terms of the economic system (no help from the banks, the impact of high inflation and high taxes, uncertainty and instability) or the need to work with the government and state-owned-companies (no help and support from government and problems in dealing with state-owned companies). The economic system and the government institutions in place offered very little support or sometimes even seemed to raise barriers in the way of the small private businesses. Managers encountered people who worked within an old [regime] mentality/business work ethic; and they lacked professional and financial resources.

One of the major lessons learned by the owner-managers of small, successful businesses in Romania who participated in this study was that although many changes took place since the collapse of the communist regime, little has been changed in the way human relationships in conducting businesses were governed. Thus, those managers who did not have managerial experience in the previous regime had to learn how to work with the government and state-owned companies while those who had previous experience did not have a chance to forget or unlearn previous practices.

Almost all of the managers talked about their problems in working with state-owned companies which still have the monopoly in a lot of fields and especially as suppliers of raw materials. These companies also prefer to work with other state-owned companies, leaving the private companies on the fringe. Describing the preference of state-owned businesses to deal with their own, one of the managers who did not have managerial experience in the previous regime said:

They [state-owned stores] know that my products are good, but some of them just couldn’t care less, and they say, “why should I buy from him when the state-owned company’s products are good enough?”

...These old ways of deal makings are still in place. ... If I told them to compare the two products, they told me, “No, last year we bought our products from them, too.” This is exactly like the story with the street curve. Yesterday I drove in the other lane to cut the curve and nothing happened, so I can do it again today. They also bought the same products last year from that company, so this is the mentality.

The managers talked about their encounter with the old [regime] mentality/business work ethic of employees, other managers, people in general which unfortunately did not change and how that influenced their work. One of the managers stated that: “to change people’s mentality is the hardest thing to do. ...Time and education is needed, just like the communist system developed in fifty years its own kind of people. I am not saying that fifty years are needed to change people but at least a minimum of twenty five years is needed to develop a new generation who can really live and work in a democratic society.”

Another manager talked about the mentality of some other managers in Romania. He said:

And talking about managers, I think that they should try to gather good people in their companies, but this is again a contradiction of the previous mentality when the boss tried to get rid of all the good employees in order to eliminate potential competitors. You see, there are things like these which bring extraordinary contradictions and create problems because a lot of people have still the old mentality. They cannot realize
that if you have a good company and you gather around you only incompetent people you are doomed to failure together with your company. (p. 7)

**Implications for the Free Agent Learner: Nature and Facilitation of “Unlearning”**

This study poses questions for research and practice around the nature and facilitation of “unlearning.” According to Mariotti (1999) a major obstacle to embracing rapid change is that change requires people to unlearn old behaviors if they are truly to benefit from new learning. As Lei, Slocum & Pitts (1999) contend “Unlearning past management behaviors may hold the key to gaining momentum for change” (p. 24). Ramsey (1999) reminds his readers that much of what worked yesterday is unworkable today. In times when new developments are regular occurrences, each day presents unique challenges and new lessons to be learned and it is important to remember that part of progress and improvement is unlearning some of the old lessons that no longer are relevant to current conditions.

Addressing the need for learning amidst continuous changes McGill & Slocum (1993) believe that “organizational learning is about more than simply acquiring new knowledge and insights; it requires managers to unlearn old practices that have outlived their usefulness and discard ways of processing experiences that have worked in the past. Unlearning makes way for new experiences and new ways of experiencing. It is the necessary precursor to learning” (p. 79). They believe that for an organization to unlearn, it needs to free managers and their organizations from roadblocks that hinder learning and embrace new practices.

According to Magrath (1997) unlearning occurs in almost all forms of adult learning. In athletics, delays from unlearning occur regularly. In trying to improve a golf grip or swing, you must unlearn the one you've used for years, which has become second nature to you. Switching between relatively similar sports or art forms shows this unlearning phenomenon most clearly (e.g. from tennis to badminton, from ice-skating to roller blading, from skiing to snowboarding; from watercolors to oil painting). In the early 1960s, when America's finest young jet-fighter test pilots became NASA astronauts, they also had to unlearn many of their skill sets. The author believes that unlearning delays come from three sources - physical (dexterity unlearning is very awkward), emotional (pride can get in the way when trying to master something new where unlearning is required), and psychological (people have built-in defense mechanisms that send them back to their comfort zone). He also observed that until the unlearning process is not on its way the progress of learning is slow and proposed the following strategies that can help unlearning: total immersion often works better than staged learning; get help from a coach or mentor; learn with other learners at your own level; determine whether you need to be an expert or merely capable at the new learning; and when you become discouraged by unlearning delays take time out for studied inspiration by reading about those who succeeded.

According to Solovy (1999) to understand unlearning, one should begin with a concept known as the dominant logic. It states that “managers make decisions based on their preconceptions of the business and the environment. The dominant logic is the sum of current corporate assumptions and institutional history. It acts as a filter, focusing corporate learning only on data that conform to it. In other words, the process of turning information into intelligence is biased. As a result, firms miss opportunities and struggle to change” (p.30). In any change effort climbing the learning curve is only half the process. The other half is the unlearning curve sometimes called the forgetting curve which suggests that when a promising new idea fails, the dominant logic is getting in the way. As Magrath (1997) described:

Human potential and competency development are always works-in-process, whether in a business or nonbusiness setting. If all learning were instantly acquired without unlearning delays, we might be less reflective, less connected to, and less conscious of our own human histories and, indeed, less insightful in distilling their meaning. We might be 'all acceleration with no steering.' Unlearning is as necessary to learning as light is to shadow in an oil painting - without one, the other has no depth, no definition, no brightness. (p. 41)

Peters (1994) also talks about the importance of learning and forgetting. He states that “We rarely, if ever, directly discuss inducing forgetfulness. Planned forgetfulness? Culture busting?” and he poses the following two questions that should be addressed in strategy meetings: “What do we know that we believe for sure? How do we systematically go about forgetting what we believe before it strangles us?” (p.128).

The challenge faced by Human Resource Development professionals is in managing both the learning and unlearning processes by developing environments conducive to them for the free agent learners. Younger generation free agent learners may not need to “unlearn” as much as will the companies they join. Managers and human resource developers who have worked with companies for many years may be set within mental models that are no
longer appropriate to the support of the free agent learner. On the other hand, it is also true that companies cannot benefit from what free agent learners bring unless both sides can open up a dialogue in which to explore constructively different points of view. Both sides may need to surface and examine assumptions that they hold that affect both the ideas that free agent learners bring, and the challenge that these ideas may pose to the way in which the organization has typically conducted business. As illustrated by the Eastern European managers in this study, freeing oneself from existing mental models that constrain the way work is done is not easy to do. Human resource developers will need to be skilled in change management, critical thinking, and constructive management of conflicting points of view to help all parties reap the benefit of the new ideas that free agent learners bring.

**The Effect of Organizational Context on Informal Learning of Certified Public Accountants**

Watkins and Cervero (1999) sought to determine whether two different organizational settings of CPA practice produced substantially different or equivalent learning opportunities for a practicing CPA. The study was conducted to provide expert testimony for a lawsuit. The CPA worked for approximately 2 1/2 years in a registered CPA firm, at which point he changed jobs and became an employee of a financial services firm that was not a registered CPA firm. The questions raised in the lawsuit had to do with the time needed in either environment for professional certification. The study drew on three sources of data. First, the researchers took a sample of the CPA’s work history during the same six-month time frame in each of the setting exactly one year apart. Next, they constructed a survey that was answered by principals in the case to sample 31 possible formal, informal and incidental learning opportunities. Finally, they conducted interviews with the three principal parties to the case to identify examples and illustrations of learning opportunities available in each organization.

**Informal Learning Strategies: Availability Within Each Organization**

Analysis of the data showed that 25 learning opportunities were available at both organizations. The only differences were that the CPA firm had videotape courses and the financial services firm has not yet instituted these; and the financial services firm had tuition reimbursement while the CPA firm did not. The new CPA participated in 21 out of the 25 learning opportunities available at both organizations. The only differences were that he participated in the videotape courses at the CPA firm and that he has participated in professional association memberships at the financial services firm. Analysis of the critical incident interviews and work history documents showed that the new CPA had increasingly challenging work assignments and frequent opportunities for learning in both firms. He had 54 hours of continuing professional education at the CPA firm; he had 28.6 hours of continuing professional education at the financial services firm, but this was supplemented by 31.2 hours of professional reading for a total of 59.9 hours of learning within a comparable six-month time frame.

The new CPA’s supervisor at both organizations confirmed that the CPA worked with the same range of clients at both organizations and that her supervision remained constant in both situations. The supervising CPA, a member of the senior manager at the financial services firm and former owner of the CPA firm, said that learning in a CPA firm derives from two main sources, the clients and the supervisory structure of the organization. These were largely the same at both organizations. The financial services firm is more diversified. People get training in a wider range of fields and have the opportunity for cross-training. The financial services firm has 7 officers and 55 workers, while the CPA firm had two owners and nine staff. Thus, there are many more individuals from whom to learn, both among managers and peers, in the new work setting.

Watkins and Cervero concluded that there was a strong culture of learning and support for learning at both organizations. The supervisory structure was set up so that learning was intricately woven into the fabric of work through the review process. Managers were seen as coaches and had an explicit model for doing this. The model consisted of these stages:

- prescreening of work for developmental readiness,
- preliminary coaching regarding salient issues to attend to in new projects,
- the individual performs the task and asks questions of the supervisor whenever anything comes up that he or she cannot answer,
- then there is a review by the supervisor with points to clarify,
- the individual resolves each point,
- discusses again with the supervisor,
and a partner typically reviews it again. Work was developmentally assigned according to the level of knowledge attained; and therefore, both workplaces were structured to support the evolving learning of a CPA and significant attention had been paid to creating a context supportive of learning in both organizations.

**Implications for the Free Agent Learner: Habits of Continuous Learning**

Professionals generally develop a habit of learning, a conclusion that is supported by over two decades of research (Houle, 1980; Cervero, 1988). Organizations can learn from the structures and strategies supported by professional service firms because they hold relevance for intrinsically motivated free agent learners. Without question, the major location of learning in this study was the professional’s work settings. Scholars suggest that the most powerful learning in these settings derives from the particular work assignments and the ways in which the organization is structured to promote learning. Recent work on the learning organization suggests that organizations can deliberately and strategically build a continuous learning infrastructure (Marsick and Watkins, 1999; Watkins and Marsick, 1993, 1996). The organizational context can therefore be assessed for the degree to which it consciously provides opportunities for learning and development.

This study raises questions for learning from work by free agent learners in other contexts:
1. how individuals, under changing and challenging circumstances, perceive their work contexts;
2. how they decide what they need to learn and how they go about learning; and
3. how the organization supports or discourages these learning processes.

The organizational context matters by producing different work assignments, which, in turn, lead to different opportunities and priorities for learning. The organization can provide different incentives for learning such as tuition reimbursement, and can provide resources such as a library of reference material, subscriptions to professional journals, video courses, or computer-based courses. In particular, the organization can encourage peers to work and learn collaboratively (Marsick and Watkins, 1999; Watkins and Marsick, 1993, 1996).

**Conclusions**

Self-directed learning takes place just-in-time in response to a strongly felt challenge that is situated within a highly relevant context. Free agent learners are, theoretically at least, highly self-directed in their learning. The studies in this paper, however, point to the fact that much learning in work contexts occurs in unplanned ways. Informal learning might be intentionally sought by free agent learners, but informal learning is also tacit, non-linear, and serendipitous. The capacity of free agent learners depends, as well, on their ability to step back from their original perceptions and be open to other information in their experience: about themselves as people and learners, about others and the way they interact with them, about the dominant logic of their enterprise, about clues within the organization about priorities and valued practices, and about the nature of the external environment.

Organizations have changed the nature of the psychological contract, but they have not always adjusted systems, rewards, and cultures to support proactive, free agent learners. Organizations that want to keep free agent learners motivated and engaged need to:
1) make time and space for learning
2) provide mechanisms for continual scanning of the environment
3) stimulate heightened awareness around learning
4) build programs around goals and turning points
5) provide opportunities for reflection-in-action, and
6) work around problems engendered by climates that are often riddled with a lack of trust and high rewards for individual achievement at the expense of others with whom employees are supposed to collaborate.

Human resource developers have been adept at building visible, structured systems for learning that include training programs. It is much harder to create an infrastructure for informal learning that does not destroy what it sets out to encourage. The challenge is to build systems, rewards, and cultures that set high expectations around learning, provide resources and opportunities, create rewards that are appropriate for high levels of intrinsic motivation, and then get out of the way of those free agent learners as they set their own path to meet their own goals. On the other side, then, organizations must develop systems that enable and entice free agent learners to share what they have learned with others so that the organization also benefits from this enhanced knowledge. Organizations grappling
with the meaning and practice of knowledge management are now in the throes of working through this kind of challenge.

As we close, we note that one cannot assume that organizations are benign in their expectations and incentives around free agent learners and around informal learning. Although not the subject of this paper, recent work by Garrick (1998) and by Casey (1999) attests to explicit and covert processes in organizations, and among learners themselves, that create a climate of exploitation and/or repression. Future researchers should continue to explore the shadow side of organizations with respect to informal and free agent learning.

Identification of Power and Influence Styles in Program Planning Practice

Baiyin Yang
University of Idaho

This study explores the relationship between HRD practitioners using different styles of power and influence tactics in designing and planning programs and organizational political contexts. Power and influence styles were identified through cluster analysis: Shotgun, Tactician, Ingratiator, and Bystander. Bystanders had moderate power based but scored highest on the measure of conflicting. Tacticians had relative lower power base and perceived moderate high conflicting. Ingratiators possessed highest power base but faced lowest conflict. Finally, Shotguns had relative low power base and perceived quite high conflict in the planning situation.

Keywords: Program Planning, Politics in Organizations, Power and Influence Styles

The purpose of this study is (1) to identify power and influence styles used by HRD practitioners in the practice of designing and planning education and training programs; and (2) to explore the relationship between power and influence styles and organizational political contexts in adult education program planning practice. Both popular writers about power and politics and theorists reasoned that individuals typically use a variety of influence styles in exercising power in their interactions with others. Several instruments have been developed to measure power and influence behaviors in organizations. They include Profile of Organizational Influence Strategies (POIS) by Kipnis, Schmidt, and Wilkinson (1980), Influence Behavior Questionnaire (IBO) by Yukl, Lepsinger and Lucia (1992), and Power and Influence Tactics Scale (POINTS) by Yang, Cervero, Valentine, and Benson (1998). Unfortunately, very few studies have been designed to identify empirically the mixes of power and influence tactics and their relation to organizational political contexts.

The process of designing and planning educational and training programs has been long conceptualized as a rational procedure, which normally starts from assessing training needs, setting learning objectives, to organizing learning contents and activities and ends with evaluating learning outcomes. Nevertheless, the practice of program planning rarely follows a linear progression as assumed by linear thinking (Brookfield, 1986; Cervero & Wilson, 1994; Pennington & Green, 1976). Cervero and Wilson (1994) conducted three case studies and found that power and interests are central to program planning. They maintain that “planning is essentially a social activity in which educators negotiate with others in answering questions about a program’s form, including its purposes, content, audience, and format” (p. 28). They further proposed a negotiation theory of program planning. The underlying assumption of this theory is that educational program planning is a social activity, and the planner’s action is contingent upon the social and organizational contexts in which the program is shaped. Consequently, any adequate theorizing of program planning practice should take into account the social setting, and it should be able to explain practitioners’ planning behavior in the face of power. Human resource development researchers and practitioners have to understand that power and interests are involved in any HRD program. This is because ignoring political realities can be fatal to a program and even to the person who is responsible for the program. Unfortunately, little is known about how the HRD practitioners exercise their power and influence in their daily practice. In particular, there is a need to identify different styles of power and influence and their relationship with political contexts.

Theoretical Framework and Related Literature

According to Cervero and Wilson (1994), adult education program planning is a process of constructing educational programs and reconstructing power relationships and personal and organizational interests. A number of recent studies have shown the supporting evidence that adult education program planning is essentially a social process where politics matters (Cervero & Wilson, 1996; Yang et al., 1998). Yang et al. proposed a model of adult education program planning that specifies seven power and influence tactics in relationship with organizational political contexts. These seven tactics are: Reasoning, Networking, Appealing, Networking, Bargaining, Pressuring,
and Counteracting. They further developed an instrument that measures power and influence tactics in adult education program planning practice.

Few studies have been conducted to examine power and influence styles in organizational political process. These studies typically use cluster analysis technique to identify groups of individuals who use their influence tactics similarly. In a pioneering study, Perreault and Miles (1978) identified five groups of influencers. The first group consisted of individuals who used multiple influence strategies. The second group consisted of individuals who used their expert knowledge as a basis for influencing others. The third group consisted of individuals who used friendly tactics. The fourth group comprised individuals who used their positions in the organization. The fifth group consisted of those who did not use influence of any kind.

By using hierarchical cluster analysis of six organizational influence strategies, Kipnis and Schmidt (1983) identified three styles that characterized the way managers influence subordinates. “Shotgun” managers used the most influence and emphasized assertiveness and bargaining; “Tactician” managers used an average amount of influence and emphasized reason; and “Bystander” managers used little influence. In a subsequent study of upward influence styles, however, Kipnis and Schmidt (1988) classified four groups of individuals. “Shotgun” individuals scored high on all six influence strategies scales, particularly assertiveness; “Ingratiator” individuals used an average amount of influence and emphasized friendliness; “Tactician” individuals scored high on the reason strategy and had average scores on the other influence strategies; and “Bystander” individuals has low scores on all of the influence strategies.

Although the previous studies on power and influence styles are enlightening, they failed to offer a conclusive identification of similar influence behaviors. Different studies have offered different numbers of meaningful clusters. In other words, we are not clear the types of political participants in organizational dynamics. Moreover, none investigated the relationship between power and influence styles and the political contexts.

Research Questions

Two research questions guided this study: (1) what is the meaningful classification of power and influence styles used by HRD practitioners in the practice of program planning? and (2) what is the relationship between the power and influence styles program planning and organizational political contexts such as power and conflict of interests?

Research Design

Participants

The study was originally designed to develop and validate an instrument measuring power and influence tactics in adult education program planning practice (Yang et al., 1998). A total number of 226 adult educators responded to a survey in the validation study served as the subjects for this study. Four clusters from a purposive sample were used to obtain the data. Members of four professional associations participated in the study: members of Georgia Adult Education Association, Academy of Human Resource Development, Georgia Association of Association Executives, and the Georgia Society for Healthcare Education and Training. For each of the four organizations, the membership list was sought and an adjusted response rate of 23% was achieved.

Measurement

The participants were asked to recall a recent adult education or training program they involved and to indicate the effectiveness of different power and influence behaviors. The power and influence behaviors were measured in seven constructs: Reasoning (with 5 items and reliability coefficient alpha of .81), Consulting (4 items and alpha = .82), Appealing (5 items and alpha = .73), Networking (4 items and alpha = .74), Bargaining (4 items and alpha = .78), Pressuring (5 items and alpha = .63), and Counteracting (4 items and alpha = .68). Two organizational contextual variables were also assessed: planner’s Conflicting Interests (5 items and alpha = .76) and Power Base (3 items and alpha = .81). Here the Power Base was defined and measured according to French and Raven’s (1959) conceptualization of five interpersonal bases of power: legitimate, reward, coercive, expert, and referent. The Conflicting Interests was measured as the planner’s perception of the degree of conflicting between the planner and one of the most interacted person with regard to the program.
Several demographic variables were also included in the study, including age, gender, years working as an education or training professional, years working in the current organization and years working in the current position in the organization.

Data Analysis

The data analysis was performed in accordance with research questions. First, to identify the power and influence styles the data were submitted to the SPSS cluster analysis procedure based on seven attribute variables (power and influence behaviors measured on seven dimensions in the POINTS). The seven attribute variables were standardized and the cluster analysis was implemented based on z-scores. Second, means of two political contextual variables (i.e., Power Base and Conflicting) were calculated for each type of program planner based on the cluster solution in the previous stage.

Findings and Conclusions

Numerous cluster solutions (different cluster methods provided by SPSS with 3, 4, 5 and 6 cluster solutions) were requested and examined. Considerations in selecting a final solution were given to statistical properties and the classifications revealed in the literature. Ultimately, a four-cluster solution was selected as it suggested most interpretable results and similar pattern discovered by Kipnis and Shmidt (1988). These four clusters were named Bystander (N = 18), Tactician (N = 72), Ingratiator (N = 82), and Shotgun (N = 54) respectively. Figure 1 illustrates how planners in each of these four clusters scored in their use of seven power and influence tactics. Figure 1 is based on computations of planning behaviors’ corresponding z-score.

Figure 1. Use of power and influence tactics by four types of program planners.

The patterns of power and influence styles were similar to those revealed in the previous study (Kipnis & Schmidt, 1988). Cluster one corresponded to the previously identified Bystander style. These program planners had very low scores, compared with other groups, on most power and influence tactics except Counteracting. Their scores on the tactics of Counteracting were about average. So the Bystanders were very passive in the organizational political process while they might occasionally counteract the actions of others. They had extreme low scores on some rational strategies such as Reasoning, Consulting and Appealing (two SDs below the means), suggesting that the rational strategies were really not the options for them.

Cluster two was named as Tactician. This group of the influencers scored high on two rational strategies (Reasoning and Consulting) and had average scores on the other power strategies. They had relative low score on...
Bargaining tactics. Consequently, the power and influence style of this group suggested that Tacticians might have clear objectives to achieve and therefore they viewed rational strategies more effective.

Cluster three corresponded to Ingratiator. This group of the planners scored high on Appealing and Bargaining and had average scores on the remaining influence tactics. Ingratiator viewed friendly and interpersonal strategies as effective means in the interaction with others.

Cluster four planners scored high on four competitive tactics (Networking, Bargaining, Pressuring, and Counteracting), particularly on Pressuring and Counteracting. They had average scores on three accommodating tactics (Reasoning, Consulting and Appealing). The power and influence style of this cluster showed a nonjudicious use of offensive strategies. Thus this cluster was named as Shotgun.

Overall, the pattern of power and influence styles identified in this study was similar to that revealed by Kipnis et al. (1988). Consequently, the classification of power and influence styles identified by Kipnis et al. (1988) has been confirmed. It was then concluded that at least four power and influence styles could be recognized from the planners of educational and training programs.

The relationship between power and influence styles and the political contexts was examined by plotting the scores on Power Base and Conflict for each of the clusters revealed in the cluster analysis. Figure 2 presents this relationship by showing the standardized scores for each of the clusters. The means of power based and conflict for the four clusters of planners suggested they faced different political contexts. Bystanders had moderate power base but scored highest on conflict. Their scores on seven power and influence tactics showed that they did not want to be players in the organizational politics. Although this group of the planners had moderate power base, they were escaping from the organizational politics probably due to the situation of high conflict. Tacticians had relative lower power base and perceived moderate high conflict. This finding confirmed Kipnis and Schmidt's (1980) that tactician's power base resided in their performance of nonroutine work. The most viable strategy for them was to use rational tactics to justify their work and consequently to gain the influence. Ingratiators possessed highest power base but faced lowest conflict. This fact explained why they did not view two combative tactics (i.e., Pressuring and Counteracting) as effective ones. This finding also confirmed Yukl et al.'s notion that today's leader had to use a variety of appealing strategies to get the job done. Finally, Shotguns had relative low power base and perceived quite high conflict in the planning situation. This group of the planners were relative aggressive probably due the planning situation they faced. They had to be active politics players in order to protect their perceived interests and gain certain power.

![Figure 2. Relationship between power and influence styles and the political contexts](image-url)
In order to find the relationship between power and influence style and personal characteristics, these measured demographic variables were examined across four clusters of planners and appropriate tests ($\chi^2$ or $F$) were conducted. As it was shown in Table 1, no significant differences was found among four clusters of program planners in terms of the percent of female, years of educational experiences, years in the organization, and years in the current position. In other words, power and influence style is not found to significantly relate to the program planners' gender, years of educational experiences, years in the organization, and years in the current position. Major demographic variables have not been found to impact planners' choice of influence strategy.

Implications

This study confirms previous research findings that at least four distinct power and influence styles can be identified from organizational political process. It revealed that power and influence styles significantly relate to organizational contexts. It also suggests that planners' personal characteristics such as age, gender and years of working experience do not have significant impacts on their choice of influence styles. This study has both theoretical and practical implications.

The process of designing and planning educational and training programs has long been conceptualized as a technical process while politics has been viewed as noise. This notion implies that program planners should avoid politics and focus on some technical areas such as needs assessment and evaluation. Recent proposed theory of program planning challenges such notion and posits that educators should pay attention to organizational politics (Cervero & Wilson, 1994, 1996). This empirical study supports the recent theorization of program planning and confirms that planning behaviors have significant relationship with organizational contextual variables. Specifically, planners' power base and perceived conflict are the determinants of their interpersonal influence tactics in the program planning practice. Consequently, effective educators should be aware of the organizational politics. Adequate theory and model for designing and planning programs should take into account of organizational politics. More research and theorization are needed to investigate different impacts of politics and planners' strategies on the program outcomes. This study makes a contribution to the literature by identifying meaningful classification of program planners based on power and influence tactics. The classification of program planners revealed in this study provides a parsimonious framework for understanding different styles of program planners.

Although the classification of power and influence styles in this study has been found to be consistent with previous classification in the literature, some findings of this study remain uncertainty. The results of this study suggested there was no significant relationship between power and influence styles and personal characteristics such as gender. Literature has revealed mixed findings about this relationship. Drory and Beaty (1991) reported that males and females had different perceptions about power and influence tactics. It was discovered that males were more tolerant of political behavior than females and that both men and women view political manipulations of their own sex more favorably than those of the opposite sex. However Vecchio and Sussmann (1991) reported that there was no gender differences in their exercise of power except that female managers preferred to use coalition formation. More studies are needed to examine the impacts of personal characteristics on the exercise of power and influence.
This classification also provides a useful analytical tool for the practitioners to examine their own planning practice. For example, Bystanders had low scores on most of the influence behaviors. Although this group of the planners had moderate power base, they were escaping from the organizational politics probably due to the situation of high conflicting. This group of the planners might want to reflect their practice and consider other effective influence behaviors to get the job done. They had very low scores on three rational strategies (Reasoning, Consulting and Appealing) and scored average on Counteracting. It therefore can be reasoned that their power and influence tactics were not effective. They should consider using these rational strategies and make their political actions more constructive and effective.

Shotgun individuals faced the similar political situation as the Bystanders as they had moderate power base but encountered relative high conflict. Instead of avoiding conflict and escaping from the politics, as what Bystanders did, Shotgun planners favored these hostile strategies such as Pressuring and Counteracting. It would be difficult to assess the effectiveness of these power and influence tactics, but it can be reasoned that these tactics were not constructive for the educational and training program itself. Maybe the Shotgun planners had been pushed to act in this way by the organizational politics. Shotgun individuals should be aware of the destructive nature of their actions. This group of planners definitely needs to constantly evaluate their planning strategies and do not rely on some of the destructive interpersonal influences.

Gender Consciousness Development: A Critical Literature Review

Laura L. Bierema
Jessica T. Kovan
Michigan State University

A critical review of the literature was conducted to understand the empirical and theoretical underpinnings of gender consciousness development in work context. Key themes in the literature related to the development of gender awareness include identity, social context, and the learning process. There is not a cohesive body of literature on gender consciousness development and we conclude that more research is needed in this area.

Keywords: Gender Consciousness Development, Women’s Career Development, Learning

Research on career women has shown that some women exhibit low levels of gender awareness when reflecting on their career experiences (Bierema, 1994, 1996, 1999; Caffarella, Clark, and Ingram, 1997). Women in these studies report experiencing gender based hardship, discrimination, and harassment. Yet, often these women do not attribute their experience to gender, even when asked directly. Further, these women generally do not view themselves as feminists, some almost blanching at the word. Rather, they break through the glass ceiling by “playing by the rules,” ignoring sexual harassment, tolerating exclusion from the men’s network, and accepting less qualified men being promoted over them. Moreover, some of these women continue to follow a non-critical stance toward the patriarchal organization after achieving power and success.

There is a need to explore how knowledge is created about gender in the workplace, particularly as the numbers of women in positions of power increases. Marshall’s (1995) critical review of research on gender and management concluded that although wide-ranging, gender management is not a particularly coherent field. Reasons for this include the complexity of researching gender, and the assumptions surrounding gender issues. Marshall also contends that gender research is marginalized and unacknowledged in mainstream theorizing. Greenglass & Marshall (1993) observe that literature on women managers in psychology has been relatively absent, and attribute this deficiency to a predominance of positivist research in psychology at the expense of methods that would provide better insight to women managers in context such as qualitative, interpretive approaches.

The unexamined assumptions that contribute to the dynamics of society also complicate an understanding of gender in the workplace. Wellington (1996) in a speech to the Economic Club of Detroit explains, “Let me be clear, I believe that most obstacles to women’s advancement to the top are not intentional, they are the result of unexamined assumptions about women’s career interests and of policies and practices that have existed unquestioned over time in the corporate culture. With real commitment to change, the situation is remediable” (p.149). Meyerson and Fletcher (2000) argue that gender discrimination is embedded so deeply in organizational life that it is barely discernable to men and women. They note that, “gender inequity is rooted in our cultural patterns and therefore in our organizational systems” (p. 131). These unexamined assumptions make gender consciousness difficult to study, as it is not something that is thought of on a daily-basis.

There are many calls for research on women in work context, but few published studies. MacRae advocates for more research on women’s identity. She suggests that women’s identity has been conceptualized in terms of formal roles in the paid work arena dominated by male experience. Women’s informal roles in the realm of female experience, such as relationships and caregiving, have been ignored. Caffarella & Olson (1993) call for more data-based studies to develop the ideas, concepts, models, and theories about women’s development. They ask: “How would raising the consciousness of women about the ‘glass ceiling’ for women in organizations affect their life dreams and what they believe they can achieve?” (p.145). Marshall (1995) writes, “I think it is a significant theoretical and practical imperative to heighten awareness about, and challenge, processes which limit the scope of the gender and management field” (p. S54). Finally, Greenglass and Marshall (1993) suggest what is needed is “more study of the gender-related processes that affect management recruitment and operation. . . . We also need more complex models of social and organisational change processes to inform this field of study [women in management]” (p.287).

The purpose of this inquiry is to critically review literature related to the process of women’s development of gender consciousness in work context. The theoretical frames underlying this study fall into two main areas: Women’s career development and learning. Though interest has increased in women’s development and learning within the fields of adult learning and human resource development, there has been no published attempt to synthesize the research that exists concerning women’s consciousness development in the work setting. Our goals are to present an in-depth description of this literature, identify common themes, and suggest implications for human resource development.

Research Design

We conducted a critical review of the literature to understand the theoretical and empirical aspects of gender consciousness development. As suggested by Da loz (1986), Hayes (1989), Merriam & Caffarella (1991), and Caffarella & Olson (1993), a number of development paradigms are necessary when thinking about adults as learners. In this vein, we explored a variety of literatures including: adult education, sociology, women’s studies, management, human resource development, psychology and career development. We searched for published research on such key words as: gender consciousness, gender awareness, feminist consciousness raising, women’s development, gender and management, and women’s learning and development. After reviewing the articles, we thematically organized the literature.

To begin the review, a clear definition of gender was necessary. The term ‘gender’ in the past has primarily referred to the social expectations and roles attributed to or experienced by people based on their biological sex (Marshall, 1995). The term today, however, has taken on a much broader and more diffuse set of meanings. Marshall argues, “It has become a general label for talking about women, men, the relationships between them, related aspects of organizing, processes through which gender differentiated behaviour patterns are enacted and associated issues of power in various guises” (p. S53). In synthesizing the literature on gender consciousness, we focus on the relational process between women and men. Our interest is in how people create knowledge about this process in the work context.

We bring to this study the assumption that both knowledge creation and gender consciousness are multilayered, multifaceted processes. Giesbrecht (1998) notes that the “sense of identity is multi-faceted and encompasses both a personal self-worth component and a ‘self in social relationship’ component” (p.476). Kegan (1994) suggests that the conditions in the world combine with the developmental forces in the individual to provide the backdrop upon which meaning-making occurs. Merriam and Caffarella’s (1993, 1999) tripartite framework of adult learning suggests that adult learning occurs on three levels: the learner, the context and the learning process. This framework provides a natural bridge to viewing the literature in this manner, hence lending a systemic approach to interpreting our findings.

Findings

The literature was thematically organized around three main findings. First, identity is socially constructed. Second, the review clearly pointed out that the context where learning about gender takes place is dynamic, affected by organizational culture and policy, and influenced by discourse. Third, the learning process seems to holds particular relevance for understanding how gender consciousness is achieved. The findings are categorized under these three tracks.

Gender Awareness and Identity

Many fields, such as sociology, have broadly conceptualized self in terms of multiple identities, with individuals holding perceptions of themselves in terms of traits and values, attributes, experiences, thoughts and action, physical appearance, demographic attributes, and dispositions of various sorts (Leonard, Beauvais & Scholl, 1999). A common theme throughout the reviewed literature is that gender is socially constructed and a part of human identity development that is based on life experience. Self identity has been found to be created through participating in work, private life, community and other social entities.

In a study of women’s self-identity in later life, MacRae (1995) premises her work on the assumption that to understand identity, attention must be focused on the ways in which individuals participate in the social world, the totality of their experience, and their interpretation of that experience. De los Santos' (1989) research on high-
achieving, professional Mexican-American women also contributes the importance of understanding social class as an important factor shaping identity. MacRae distinguishes between social identity (others' perceptions of an individual) and "felt identity" referring to the self-meanings or perceptions. She treats felt identity synonymously with the concept of self-identity. This distinction is important when it comes to learning about gender in the workplace and understanding the diverse assumptions and perceptions at play.

Leonard, Beauvais and Scholl (1999) strongly note the "importance given to a particular role-specific identity is a function of an individual's social and emotional commitment to that role" (p. 979). Moore (1999) examined gender and occupational identities within the Israeli police force and found that women did not compromise their femininity even when their gender identity was not salient and when they worked in masculine organizations. Occupational identity appears to be more central than gender identity for both policemen and policewomen. In a study of senior management level women, Zane (1999) found that women began to place more importance on their identity as a women as their understanding of gender issues increased. Prior to gender awareness, she found that the senior women managers: (1) "believed their past success was linked to their competence and hard work," (2) "identified with men and male-bureaucratic values such as individualism, meritocracy and equal opportunity," and (3) "tended to avoid 'women's issues'" (p.17). Consequently, the question can be asked: What factors contribute to gender awareness being raised?

**Gender Awareness and the Social World**

Engagement with the social world also impacts the development of gender awareness. MacRae (1995) bases her research on women and caring on the assumption that "to understand identity, attention must be focused on the way in which individuals participate in the social world . . . the totality of their experience and, most important, their interpretation of that experience" (p.148). She explains, "a broad conceptualization of identity which encompasses more than social statuses and roles, and which focuses on experience and the individual's relationship to society, is particularly relevant to the study of the nature and basis of woman's identity" (p.148). She contends that "human action takes place within a social structural context and, therefore, humans face numerous structural constraints as they negotiate their everyday world" (p.147).

Focusing specifically on the world of work, Greenglass and Marshall (1993) argue that women as managers "cannot be fully understood outside the socio-political context within which they are found" (p. 287). Gehrardi (1994) took a symbolic approach to the study of organizational cultures and views the organization as a cultural artifact. Based on over 15 years of her organizational research and consulting, she concludes that humans are more adept at doing gender than producing knowledge about gender. Her thesis is that women's presence in the workplace breaks with the symbolic order of gender based on the separation of male/female, public/private, production/reproduction. Cassell and Walsh's (1997) findings add depth to Gehrardi's conclusions. They examined organizational culture and women's gender management strategies in context. They explored how women interpret organizational messages about appropriate behaviour at work, and how such interpretations affect women's everyday organizational behavior. Specific cultural expectations and rules regarding how women should behave were found, including six gender management strategies. These include: overfunctioning (working harder than male colleagues to achieve career success), underfunctioning (keeping a low profile and not publicizing career success), flirtation, the mask (withholding of personal information or construction an alternate image to compensate for not fitting in), working behind the scenes (looking after customers or things important to organization success but of little organization status), and mothering or nurturing (looking after male colleagues, asking about family and caring for others).

Howell, Carter and Schied (1999) explored the contradictions among critical feminist theory, HRD and reality of women's experiences in context of HRD programs in the workplace. They examined who controlled the goals, objective, and definitions of learning and work and for what purposes. In their critical ethnographic study, they found that organizations only allow positive, cheerful voices, not critical ones. HRD programs reinforce these discourses, with a tendency to be anti-feminist and anti-democratic. Feminist concept of voice were virtually absent in these corporate HRD programs. Organizational training and policy, hence, can transmits messages about how the organization regards women and how to behave in context. Peterson and Albrecht (1999) deconstructed a maternity leave policy to investigate ways gendered organizations may subtly but powerfully shape and define women's experience and ways of knowing and may reproduce hegemonic distinctions between male/female, and public/private life. They found that rather than being a benign, genderless text, HR policy—as the legally documented position of the organization—is a discursive site wherein gendered identities are produced and reproduced.
Gender Awareness and Learning

Although we have an incomplete understanding of the relationship between work, gender, and knowledge production, we conclude that gender consciousness development is achieved through the interaction of the individual in context. Developing gender awareness happens in a complex system and its aspects overlap and affect each other. Several themes emerged in the literature to describe the learning process related to gender awareness including life history and roles, relationships, otherness, and unlearning.

Life Experience and Roles Life experience and roles include, early family influence, social roles, socialization, and values. All of these interact to produce awareness about the world, including gender. Ruddick explains, “These relationships of gender are created in familial and social contexts that are marked by ‘ethnicity,’ ‘race,’ ‘normative and often compulsory heterosexuality,’ and economic and social ‘class’—abstract labels that themselves signify emotion-laden connections and disconnections with parents, siblings, extended kin, peers, teachers, and with the ‘world’ in which these significant others create and are (re)created” (1996, p. 263). Ruddick (1996) further explains that knowledge is embedded in personal history and psychological life and suggests that ways of knowing arise out of “practices.” Practices can be work or social roles (engineering, mothering) and through them learners acquire distinctive ways of thinking that are embedded in the practice. “It is within a practice, and in accordance with its aims, that people judge which questions are sensible, which ‘methods’ are suitable for addressing them, which answers are appropriate to them, and which criteria distinguish better or worse answers” (1996, p. 264). She also observes that practice-based knowing is gendered. Thus, learning about gender can occur in the practice of being a woman manager or executive.

Reingold and Foust (1998), using data from the 1992 American National Election Study, created a model of feminist consciousness. Their model incorporates a variety of variables measuring ideological predispositions in addition to variables measuring adult life circumstances and childhood and adult socialization. They conclude that women’s feminist consciousness is in large part, a function of ideological predispositions—of basic sociopolitical values and beliefs. They found that neither direct personal experience with nontraditional gender roles nor exposure to nontraditional ideas and role models accounted for much variation in consciousness. This contradicts other researchers who insist that consciousness is related to viewing oneself as different from the dominant culture. Whether or not experience with gender roles has an impact is worthy of further study. In another study, De los Santos examined how 10, high-achieving, professional Mexican-American women negotiated the Mexican-American and Anglo cultures. She found that the women’s early socialization determined how they experienced the dominant culture and that they used one of four patterns to interact with the dominant culture including acculturation, irritation, adaptation, and rejection. Acculturators identify with the dominant society and do not shift between cultures. Irritants identify with Mexican-American values and see themselves in conflict with Anglo culture. They work within dominant culture to foster change. Adapters move between both cultures seeing them as distinct and isolated from one another. Rejectors succeed in dominant culture but reject it in favor of traditional values. Life history and roles help women create meaning about gender, and much of the meaning creation happens through their relationships.

Relationships Relationships are also instrumental in helping women achieve gender consciousness. Relationships help foster reflection, a sense of connection, and group consciousness. Daloz writes, “Emancipatory learning is not about escape from but rather about a deeper immersion into the rough-and-tumble of human relationship” (forthcoming, p.24). Gender consciousness development is also fostered through reflection, which occurred primarily through relationships in the literature reviewed. Daloz (forthcoming) points out that “for mature transformation to occur, at some point there must be conscious, critical reflection on our early assumptions about ‘how life is’” (p.15). Defining and redefining identity occurs continuously and through this reflective cognitive process, individuals construct a set of personal standards (Leonard et al, 1999; Markus & Wurf, 1987). Dialogue and reflection were prevalent activities in for fostering gender awareness in the studies reviewed (Jones-Isley, 1999; MacRae, 1995; Zane, 1999).
Developing a sense of connection was important for achieving gender consciousness. MacRae (1995) found, in a study of elderly women, that the women tend to describe themselves in terms of their interpersonal relationships. Gilligan (1979) also argues that relationships and connectedness with others are of central importance to women’s development and writes, “the female comes to know herself as she is known through her relationships with others” (p.437). Giesbrecht (1998) found through factor analysis that in the construction and negotiation of identity, “male perspectives emphasized instrumentality and female perspectives emphasized social connection” (p.7). Ruddick (1996) notes that the idea of a relational self or that humans are composed by the relationships in which they participate, helps explain how women become connected knowers. Humans begin learning from their earliest relationships. Ruddick writes, “This fundamental ‘relationality,’ as I will call it, precedes both knowing and gender. A knowing self, like other aspects of selfness, is created within relationship (p. 263). She explains further that as the knowing self is created through relationships, gender is also, simultaneously constructed. Caffarella & Olson (1993) note in their critical review of the literature on the psychosocial development of women that: “What surfaced as central to the developmental growth of women was the web of relationships and connectedness to others” (p.135).

Relationships helped women foster a sense of group awareness as Zane observes, “When women come together in groups, they are able to forge links between their own experience and that of others, especially those within their own racial and ethnic class group” (Zane, 1999, p.21). The process of becoming a feminist is regularly described by women (and men) as a process of transformation, a struggle to develop new interpretations of familiar realities (Collins, 1991). Collins (1991) notes that Black women’s experiences stimulate a distinctive Black feminist consciousness. These common experiences lend to a distinctive group consciousness. The connection between experience and consciousness shapes the lives of all African-American women. Collins connects this consciousness to a self-defined collective standpoint. She notes that “a self-defined standpoint involves tapping sources of everyday, unarticulated consciousness that have traditionally been denigrated in white, male-controlled institutions” (p.26). The “interdependence of thought and action suggest that changes in thinking may be accompanied by changed actions and that altered experiences may in turn stimulate a changed consciousness” (Collins, 1991, p.28).

“Otherness” Gender consciousness depends upon understanding “otherness.” Daloz (2000) describes “otherness” as a process of constructively engaging with the political and social consequences of perceiving yourself as “other” (and usually marginalized) from the dominant culture. Using Nelson Mandela as an example, Daloz describes how during his life, Mandela gradually discovered that others were quite different from himself and regarded him as inferior. He was able to achieve this understanding only after was he relatively secure in his own identity. Mandela achieved an understanding of “otherness” on his own.

Recognizing “otherness” was a collective process for the women in the literature reviewed. Zane explains her findings, “It was only after being in the system for a number of years that some of the senior women began to notice the social and professional gaps between themselves and their male counterparts” (Zane, 1999, p.17). When the conversations among senior level women managers shift from individual gender issues to a more public arena, “there is a change from an individual orientation to a group-level discourse—their discussion links them as women” (Zane, 1999, p.18). Women’s networks and organizations can accelerate gender awareness and Zane (1999) work with senior level female managers who came to realize their collective experiences notes, “Through the power of ‘naming’ their own experiences and then collectively identifying what they saw happening for other women in the organization, the women became convinced that there were multiple standards operating, debunking the myth of an individualistic, gender-neutral meritocracy” (1999, p.18). Ruddick (1996) calls groups of knowers “epistemological communities” and explains that these communities provide knowing that is collectively produced and held. She suggests that these epistemological communities engage in “gender discourse” which dichotomizes human characteristics and associates them with masculinity or femininity. Zane concludes, “Women become more conscious of their identity as women and their connection to women’s issues when they have a forum for public conversation—‘naming’ themselves and the obstacles they confront in the process. When women have the opportunity to share their individual organizational experiences, the collective data provide a window into the systematic patterns within the organization. Learning that other women have similar problems enables them to see the world differently, and begin to see the processes by which their identities are negated and their affiliations illegitimatized. Their conversations help them overcome internalized negative images of themselves and other women, and serve as a springboard for strategizing new approaches to action” (Zane, 1999, pp.20-21).

Unlearning A theme of unlearning in the literature is prevalent concerning developing gender consciousness. Marshall (1995) notes that within the feminist contributions to the field of gender and management, a major theme has been that of emerging silence. Learning to become vocal, or what Piercy (1973, cited in Marshall,
1993) has termed "unlearning to not speak," is a process of gender awareness. Jones-Isley (1999) explored personal narratives of 12 self-proclaimed feminist (11 white, 1 Mexican-American) who started a women's center in a conservative Midwest town. Through narrative analysis she found that participants hold common threads of the pedagogies experience in formal and informal settings. One of their themes was unlearning of assumptions they held about themselves and others. Zane notes a process of budding awareness and unlearning in her research and writes, "as the women began to discuss the negative ways in which they and others were being treated, they started seeing patterns which raised serious questions about fairness and equity across genders... They also began to realize that what they had always assumed to be personality conflicts between individual women and their managers or their subordinates might be reflective of more generic problems for women in the organization" (Zane, 1999 p.17-18).

Discussion

First and foremost, we heartily conclude that there is a gap in the literature on the research and theory of gender consciousness development. We searched exhaustively and found few articles on this phenomenon. The articles we found lacked a systems perspective, which we believe is crucial to understanding the process of gender consciousness development. Our reviews show the overlapping nature of the elements that contribute to gender awareness and these processes must not be considered separately. Although the articles reviewed acknowledged the process of gender awareness, they did not identify factors either contributing to or inhibiting the learning process. We believe gender awareness is a process of transformative learning that may occur individually or collectively. What is not clear, however, is what events lead to transformation in consciousness? The literature provides little information about the learner herself and only a glimpse of how life experiences prior to work impact gender consciousness. There was no information on the emotional aspect of gender consciousness. Few empirical studies of this phenomenon exist as most of the studies are qualitative case studies. We found no explanation for why some people become aware, but others do not. Finally, although people achieve gender consciousness, how they use this knowledge is not discussed in the literature (such as educating others or taking action for change). All of these gaps are fertile ground for future research.

The literature corresponds with Merriam and Caffarella's (1999) configuration of the learner, context, and process, in that each of these themes was evident in the description of gender consciousness. Context was most often discussed, and we infer that this is because social, political, and economic realities are more visible than individual learner characteristics, experiences, and processes. Understanding the learner and the process is much more complicated and few studies address these aspects. We conclude from this review that reflective practice is critical to developing gender awareness, but the process and whether or how the learning is transformative remains to be illuminated through research. We've learned much about the observable elements of gender awareness, but believe there is much more to understand beneath the surface such as assumptions about self, identity, and context.

Daloz (forthcoming) examines the nature of transformative learning that occurs as a person develops a sense of social responsibility and outlines four conditions of transformation: presence of the other, reflective discourse, a mentoring community, and opportunities for committed action." We found evidence in the literature for otherness, reflection, and a community, although not necessarily one devoted to mentoring. We did not find evidence for how women take collective action based on gender awareness, other than in the feminist consciousness raising literature. Application of this awareness in work context was not discussed in the literature. We conclude that learning about gender is an ongoing process, although we are less clear how the learning takes form. This conclusion corresponds with Gherardi's (1994) observation that "doing gender" is easier than explaining it.

Interestingly, our conclusions parallel closely Taylor's (1997) critical review of the empirical studies of transformative learning theory. Taylor's review discloses that in understanding the learning process of transformative learning, a greater degree of recognition needs to be given to "the significant influence of context, the varying nature of the catalyst of the process, the minimization of the role of critical reflection and increased role of other ways of knowing and relationships, and an overall broadening of the definitional outcome of a perspective transformation" (p.34). With a slight change in wording, his recommendations could almost fit the needs for research on gender consciousness, hence suggesting close ties between gender consciousness development and transformative learning.

We conclude that learning about gender can happen individually or collectively. There were more studies in the literature that examined gender consciousness development in groups than individually. Daloz's observation that recognizing "otherness" is pivotal to developing awareness is a very important finding. A failure to regard oneself as "other" may be one explanation for why some senior level women in management do not see the differences in gender. The climb up the corporate ladder may have left them insecure in their own identity after
years of striving to conform to a male image. Future research should address how people learn to view themselves as "other" or different and how this knowledge informs their learning and action.

Finally, learning about gender often involves unlearning assumptions that women should emulate men, or that their experiences are valid. Unlearning tended to happen collectively for women in the literature which leads us to conclude that women's networks and organizations may be a significant vehicle for fostering gender awareness. Zane observes, "Affiliating as women is a contradictory notion in a male bureaucratic culture. In a male-dominated institution that promulgates individualism, merit and gender-neutrality, forming women's groups to challenge the distribution of organizational resources affronts the very assumptions on which the culture is based. The expectation is that women will act as neutered individual." (Zane, 1999, p.20).

Limitations of this Critical Review

This review has imperfections and our work is not finished. One of the limitations is that we reviewed literature from the for-profit world. There are many contexts where gender consciousness occurs, such as the public and non-profit sectors. These contexts need to be more fully investigated to understand how gender awareness occurs in them. Another limitation is that we did not find a definitive body of work related to our question, and this review is the was drawn from a number of disciplines and sources. Finally, we are both from the United States and are White, heterosexual women of privilege. Our positionality may have prevented us from seeing nuances in the literature, exploring certain search terms, and interpreting the findings to be inclusive of all women.

How this Research Contributes to New Knowledge in HRD

This critical review contributes to HRD through extending the literature on ways of knowing in work context. We attempted to take a systems approach to understanding this problem, and although the literature is not systematic, we are working to build a systems view of the development of gender consciousness. To that end, we are launching a study of this phenomenon and data collection is underway. While there is exhaustive literature on career development, far less attention has been paid to understanding the unique issues of women's career development. We have also found little literature on the learning processes related to gender consciousness development in work context and believe this research begins to address this void.

Marshall (1993) observes that gender research is marginalized. We agree and believe that not only is literature on this subject difficult to find, but also questions about gender do not often cross the radar screen of many researchers. We think more research must be done in this area and feel that this investigation validates our intention to study how gender awareness occurs among women. As Marshall advocates, researchers must ask the question: "In what ways is gender important here?" We believe that is a key starting point for future research in HRD. A metaphor that continually reminds us about the process of achieving gender consciousness in both life and research is that oftentimes we find ourselves in the middle of a tornado. When you are in the eye of the storm things may seem calm and inert, but in reality the world is being spun around you. Becoming aware of this reality takes openness, recognition of otherness, unlearning, and ultimately consciousness.

White Male Backlash: Practitioner Perspectives on the Phenomenon

Martin B. Kormanik
Organization Development Systems

White male backlash (WMB) has emerged as an American social phenomenon. Although there has been coverage of WMB in the popular press, it has not been adequately studied through empirical research. Specifically, there is a paucity of research describing WMB or identifying its impact on the contemporary workplace. A survey administered to a purposeful sample of practitioners generated quantitative and qualitative data on the phenomenon. Implications for practitioners and suggestions for further research are discussed.

Key Words: Diversity, Discrimination, Affirmative Action

A new social phenomenon has emerged in the United States (U.S.) during the 1990s involving White males who feel alienated, frustrated, and angry. The phenomenon is sometimes referred to as “White male backlash” and the individuals referred to as “worried” or “angry” White males. Although there has been coverage of the phenomenon in the popular press (Reeves, 1995; Yang, 1996), this phenomenon has not been adequately studied through empirical research. Specifically, there has not been any research describing the White male backlash (WMB) phenomenon or identifying its impact on the workplace. This was a study to generate empirical evidence on the WMB phenomenon.

Background

The U.S. has undeniably experienced substantial change during the last decade of the 20th Century. In discussing the impact of societal change on the workplace, many authors promote anticipation of rapid change as the norm (Drucker, 1989; Engels, 1995). Downsizing, increased globalization, deregulation, outsourcing, technological change, mergers, and acquisitions have created an environmental context for job transition (Gysbers, Heppner, & Johnston, 1998). Downsizing and a tendency for flatter organizations have meant there are fewer middle management positions, leaving diminished opportunities for steady career progression. The popular press has boldly proclaimed “the end of jobs” (Barnet, 1993; Bridges, 1994). Competition for the limited number of advancement opportunities has intensified (Yang, 1996). Traditional career assumptions no longer hold true (Hall, 1992). All indicators suggest that corporate restructuring and job loss are likely to continue in the near future (Eby & Buch, 1995).

Concurrently, the U.S. workplace has been affected by substantial demographic and societal shifts (Johnston & Packer, 1987). Their Workforce 2000 study suggests that 60% of new entrants to the workplace will be minorities by the year 2000. The workforce is also growing older, with the majority of baby boomers now in middle age. Later retirement has caused career progression bottlenecks in many organizations (Leibowitz, Farren, & Kaye, 1986). Gender representation in the workplace has increased (Rifkin, 1994). The increased presence of women has marked a shift in workplace power dynamics and changed the traditional patriarchal hierarchy. There have also been changes in workplace social dynamics as increasing numbers of women and minorities have entered the workplace and advanced to mid- and senior-level management positions (Johnston & Packer, 1987). Changes in society in general, and in the workplace in particular, have caused many employees to reassess conventional workplace “rules” (Kotter, 1995).

The WMB phenomenon has emerged amidst these changes in the contemporary work environment. While societal and workplace changes have affected all individuals, they have particularly affected males (Faludi, 1999). Faludi describes the phenomenon as a “male crisis” (p. 50). Birkenstein (1999) narrows the population to White males by noting that “we have a parade of White males who appear to feel that simply being a White male should still entitle them to certain benefits...This is the true and sick sense of disenfranchisement some men feel, which we must deal with if we are to begin to understand this ongoing problem” (p. 18). Other research has shown that White
males' commitment, self-esteem, and attachment to work has diminished as the workplace has become more diverse in terms of race and gender (Rifkin, 1994).

There is the suggestion that the WMB phenomenon has surfaced in response to Federally-mandated affirmative action (AA) programs (Faludi, 1991; Hoppe, 1996; Reeves, 1995; Yang, 1996) and formalized corporate diversity initiatives (Galen & Palmer, 1994; Rifkin, 1994; Whittenburg, 1999). The growing societal demand for "political correctness" in the workplace has been met with increased resistance. Studies on differences in the attitudes of specific demographic groups have shown White males' attitudes toward AA and diversity programs is significantly lower than that of other groups (Konrad & Linnehan, 1999; Lobel, 1999). What remains to be explored is the impact that White males' attitudes, as exemplified by WMB, is having on the workplace.

There may be other reasons for the distress experienced by White males. "[F]eelings of distress can be attributed to failures and deficiencies in coping with environmental demands as well as the experiences of personal failure and inadequacy which the individual sees as permanent. Lack of control over changes in the environment, real or fantasized dangers, humiliations, or loss of status are some examples" (Kets de Vries, 1995, p. 45). White males have counted on the traditional expectation that hard work pays off in steady career path progression, yet the danger is that career progression is no longer assured. Add to this the White males' perception that women and minorities are getting ahead due to AA programs and the situation is primed for a reaction from those White males who feel disenfranchised. Perceiving AA programs as unfair, some White males feel frustrated, alienated, and angry. "To be a White male in this organization means that I can kiss any chance of promotion good-bye," is a frequent lament, regardless of the statement's validity. Perceptions of humiliation or loss of status may follow.

Problem Statement

The general lack of empirical research on the WMB phenomenon and its impact on the workplace is problematic. Studies have shown White males' attitude toward AA programs is significantly lower than that of other demographic groups (see Bobo & Kluegel, 1993; Konrad & Linnehan, 1999). Lobel (1999) reports the same sentiments toward workplace diversity programs. What remains to be explored is the impact of White males' attitudes, as exemplified by White male backlash, on individual and organizational effectiveness. Rifkin (1994) suggests that if we do not help White males adjust to a diverse workforce, they will disengage, thereby compromising the desired benefit of diversity. Unfortunately, although anecdotal information and personal communications suggest the phenomenon is occurring and having a negative impact on individuals and work groups, there has been a paucity of empirical evidence documenting the phenomenon. Therefore, the purpose of this study was to provide empirical evidence describing WMB and its impact on the workplace in general, and on organizational effectiveness in particular.

In discussing the purpose for this study with fellow researchers, some could not see the need for studying the White male population. Their argument comes from the radical humanist paradigm focusing on the emancipation and empowerment of the alienated by raising consciousness (Burrell & Morgan, 1979). The intimation was that White males have traditionally been those with the power, so there should be no need to emancipate or empower them. Curiously, the argument was, "Why bother studying them?" This argument appears shortsighted. Although we are living in an increasingly pluralistic world, White males still account for the critical mass of the U.S. civilian labor force. It seems irresponsible to not learn more about the WMB phenomenon and its impact on the workplace.

Theoretical Framework

Sidanius and Pratto's (1999) social dominance theory (SDT) served as the theoretical framework for this study. SDT synthesizes political attitude and public opinion research with Adorno, Frenkel-Brunswik, Levinson, and Sanford's (1950) authoritarian personality theory, Rokeach's (1979) two-value theory of political behavior, Blumer's (1960) group positions theory, and Tajfel and Turner's (1986) social identity theory, among others. Social identity theory, in particular, provided the basis for examining the relationship between demographic group membership and values, beliefs, and experiences that affect attitude. The two constructs for this study were attitude and organizational effectiveness. The variable for attitude, the dependent variable, was the perception of the WMB phenomenon. Organizational effectiveness was a second dependent variable, identified as perception of a workplace problem.
connected to the WMB phenomenon. The proposition was that the WMB phenomenon is a workplace problem that detrimentally impacts organizational effectiveness.

Research Questions

The purpose of this study was to describe the WMB phenomenon and to see if there is a perceived link between the phenomenon and organizational effectiveness. This is a descriptive, exploratory study designed to provide empirical evidence on the phenomenon. The primary research question for this study was: What is WMB? Secondary research questions included: How common is this phenomenon in the U.S. workplace? How does the phenomenon play out in the workplace? Is it seen as an organizational problem? Does it impact organizational effectiveness?

Research Methods

Because of the exploratory nature and broad scope of this study, a combined qualitative and quantitative research design was used. Creswell (1994) recommends this approach as complimentary, allowing overlapping and differing facets of the phenomenon to emerge. The following sections provide information on the research setting, respondents, data collection, and data analysis.

Research Setting and Respondents

The research setting was the contemporary U.S. workplace. Although the data was generated from individual respondents, the level of analysis was the organization. A variety of public sector agencies (e.g., scientific, research, intelligence, defense) and private sector organizations (e.g., telecommunications, transportation, consulting, retail, healthcare) were included, to maximize the variation in the setting.

Firestone (1987) notes that “reality is socially constructed through individual or collective definitions of the situation” (p. 16). This antipositivist ontological perspective was appropriate for looking at the individual and collective realities of the WMB phenomenon. Reality is subjective and at the same time multiple, as experienced and seen by the individual (Creswell, 1998). This philosophical assumption had implications for the choice of study respondents. Maxwell (1996) suggests that respondents should be purposefully chosen among those who can most thoroughly inform about the issue under study and who can answer the research question. The respondents for this study were purposefully chosen using occupation as the criterion. Based on their perceived ability to answer the research questions and provide information-rich data, respondents included HR professionals, EEO and AA program officers, diversity program managers, and other related practitioners. An attempt was made to maximize the variation in race and gender of the informants.

Data Collection and Analysis

Because there was no existing instrument for examining the WMB phenomenon, a structured survey instrument was developed by the researcher. Independent variables included ‘organization,’ ‘race,’ ‘gender,’ and ‘occupation.’ These independent variables were also transformed to produce the two additional independent variables of ‘White males’ and ‘women and minorities.’ Dependent variables included two nominal response questions (Have you heard of the phenomenon of WMB occurring in the workplace in response to AA programs and diversity programs? Have you had direct workplace experience with the phenomenon?). Dependent variables also included two rated questions (Strongly disagree, Disagree, Don’t know, Agree, Strongly agree response to the statements: ‘WMB is a workplace problem’ and ‘WMB is a problem in my organization’). Qualitative data was generated from five open-ended questions. This combined quantitative and qualitative approach helped generate complimentary data, and allowed for the discovery and generation of possible hypotheses for further research.

The survey instruments were administered through e-mail and face-to-face to 76 contacts. The contacts were encouraged to forward the survey instrument to others who met the occupational criterion for respondents, helping to maximize the collection of data. The survey instrument informed respondents of the intended use of the data and the value of their participation in the study, along with assurances for the confidentiality of the informants and their
employers. Computer-based statistical software yielded frequencies and crosstabulations for the key variables. Data analysis also included reviewing the qualitative data provided by the completed open-ended questions to generate themes in the findings and assertions.

Findings

There were 45 usable responses, with 26 (57.8%) received through e-mail, two (4.4%) through U.S. Postal Service, and 17 (37.8%) through face-to-face contact. Eighteen (40.0%) were from private sector organizations. Twenty-seven (60.0%) were from public sector agencies. Nearly all the organizations were large (i.e., greater than 1,000 employees). Gender demographics included 21 (46.7%) males and 24 (53.3%) females. Because of the assumed connection between WMB, EEO legislation, and Federally-mandated AA programs, the survey used legally-defined terminology for race. Respondents included 25 (55.6%) White, 17 (37.8%) Black/African American, two (4.4%) Hispanic, and one (2.2%) “other” who self-identified as minority. Twenty-five (55.6%) were human resource professionals, including human resource management and human resource development functional specialists. Respondents also included five (11.1%) EEO and AA officers, seven (15.6%) diversity program managers, and eight (17.7%) “other” practitioner occupations (e.g., mentoring program manager, internal OD consultant).

Table 1. Summary of crosstabulation for key variables.

Table 1 provides a summary of the crosstabulation results by variable factor. For example, 61.1% of the private sector respondents had heard about WMB, versus 74.1% of the public sector respondents. Nearly 70% of all respondents had heard about WMB. Thirty (66.7%) respondents provided a comment defining WMB. Twenty-nine (64.4%) respondents provided a comment on the workplace impact of WMB. Eighteen (40.0%) respondents provided a comment describing their personal experience with the WMB phenomenon. Eighteen (40.0%) respondents agreed with the statement ‘White male backlash is a workplace problem.’ Six (13.3%) disagreed. Twenty-one (46.6%) did not know or did not respond. Thirty-seven (82.2%) respondents provided a comment about their response to this question. Twelve (26.7%) respondents agreed with the statement ‘White male backlash is a problem in my organization.’ Eighteen (40.0%) disagreed. Fifteen (33.4%) did not know or did not respond. Thirty-four (75.6%) respondents provided a comment about their response to this question.

Discussion
The descriptive respondent comments confirmed that WMB is the manifestation of some White males' reaction (i.e., attitude) toward factors that are upsetting the traditional social dominance of White males. The factors that are changing the taken for granted social hierarchy and power structure are varied. The three factors cited most consistently by respondents were Federal equal opportunity legislation, Federally-mandated AA efforts, and workplace diversity programs. Other factors cited by the participants included the changing workforce demographics (e.g., more women and minorities in the workplace), the need for continuous learning and skill development, and changing organizational structures (e.g., downsized, flatter, limited headroom, increased competition for jobs).

Bobo and Kluegel (1993) identify self-interest, stratification ideology, and racial attitudes as three factors that generate opposition to race targeting (e.g., AA programs). Self-interest may be the more substantial motivator for a negative reaction against programs that are perceived as "not for me" (Sears & Funk, 1990). The WMB phenomenon appears to be an issue more of self-interest, rather than stratification ideology or racism. Konrad & Linnehan (1999) suggest that "it is easier in contemporary society to develop socially acceptable arguments for opposition to a specific government policy than to justify racist sentiments" (p. 448). At the same time, the data from this study show that White males who oppose government-promoted AA and diversity programs are not necessarily perceived as racist even if they are seen as harbingers of WMB. Not all White males are racists. Not all White males exhibit WMB. Not all White males who demonstrate WMB are racist.

"When a man does not understand a thing, he feels discord with himself: he seeks causes for his dissonance not in himself, but outside himself, and the result is war with something he does not understand" (Chekhov, 1973, p. 278). WMB is a symptom of this war. The data show that WMB is evidence of some White males' reaction to societal and workplace change, and that the reaction is largely negative. Examples of the White males' dissonance include the perception that "the system" is unfair, the perception that promotions and other employment opportunities given to women and minorities are not tied to merit or performance, the unspoken upheaval in the White males' traditional sense of entitlement, and their desire for a return to "the way things used to be." The ontological assumption is that White males who exhibit WMB appear to be constructing their own reality based on their perception that women and minorities are getting an unfair advantage in employment opportunities, resulting in a loss of employment opportunities for White males. This is the White males' perception, even though the data from respondents indicate the White males' perception is largely inaccurate.

Both qualitative and quantitative data show that WMB is known as an issue in the contemporary workplace and is perceived as an organizational problem. There appears to be a considerable sense that the phenomenon is having a negative impact on the workplace, with 40% of respondents saying it is a workplace problem and nearly 27% saying it is a problem in their organization. On the other hand, description of what WMB looks like and its impact on the workplace varies widely from inactive expressions of negative attitude (e.g., 'griping,' resentment, apathy) to active behaviors (e.g., creating conflict in work relationships, detrimentally effecting organizational mission accomplishment, outright hostility, sabotage). In many instances, respondents identified that WMB is detrimental to organizational effectiveness. Respondents cited examples of underground newsletters, e-mail discussion groups, and anonymous letters generated by angry White males. In all instances, the impact of the phenomenon was described as negative, draining energies away from effectively accomplishing the organizational mission.

Although the WMB phenomenon is evident in both private and public sector organizations, it is more readily perceived in the public sector. The data suggests that this may be due to several factors. Namely, employment in the private sector is seen as more competitive based on merit, as compared to race or gender. Some respondents explained that workforce demographics, promotion information, and controversial issues are generally not discussed openly in the private sector workplace. Also, although the number of private sector organizations with diversity programs is growing, many do not have internal EEO officers and only those organizations with a government contract are required to have an AA program. Conversely, all public sector organizations have EEO and AA programs and program staffs. They also are more likely to have formalized diversity programs due to the Presidential management directive on diversity. Demographic and promotion information is readily available in public sector organizations, supporting more open discussion and debate.

Although both male and female respondents saw the phenomenon as a workplace problem, it was more readily perceived as a problem by females. Interestingly, compared to Black/African American respondents, more White respondents saw WMB as a problem in their organization though White respondents had nominally less direct experience with WMB. Also, the responses of White male respondents as a population subgroup were not substantially different from the responses of the population subgroup of women and minority respondents.

Diversity program managers were more likely than EEO/AE officers to have heard about WMB, had direct experience with WMB, agreed that WMB is a workplace problem, and agreed that WMB is a problem in their
organization. In turn, EEO/AE officers were more likely than HR professionals to have heard about WMB, had direct experience with WMB, agreed that WMB is a workplace problem, and agreed that WMB is a problem in their organization. As a population, diversity program managers also completed more open-ended survey questions and tended to be more descriptive in their comments. The differences in perceptions of these occupational groups may be due to their functional or program mission. Diversity program managers are charged with addressing broad issues affecting employee morale, whereas the focus of EEO and AA officers is largely limited to policy development, complaint processing, and special emphasis programming for underrepresented groups (i.e., women and minorities rather than White males). The focus of HR professionals is generally limited to their functional specialty (e.g., staffing, compensation, training) and have a macro focus on the organization, rather than a micro focus on the needs of specific employee populations (e.g., White males).

A number of respondent comments seemed especially peculiar, given who the specific respondents were and where they work. One example was the way in which some private sector HR professionals vociferously denied that WMB is an issue in their organization because due to sound HR practices which do not allow WMB to occur. The intimation was that having policies, procedures, and practices in place would eliminate any negative reaction to employment decisions. Another peculiar response came from the White female who responded that WMB is a hoax perpetrated by White males and not a real problem in corporate America. Yet another strange response came from a public sector White male who stated that he had not heard of WMB. What is peculiar is that he works in an EEO office that co-sponsored an agencywide White Male Issue Study Group that identified WMB as a major organizational issue. The respondent's comment may indicate he is out of touch with what is going on in his office and organization. On the other hand, it may be based on other factors such as denial or fear of reprisal.

Follow-up personal communications with another respondent from the same public sector agency, showed that the White Male Issue Study Group's internal 'administrative use only' report concluded that:

"[T]he agency’s White male problem includes White male backlash. We believe there are a small but significant number of White male employees who are extraordinarily angry.... The negative impact of this anger on the productivity of these men and the people around them is, in the group’s view, substantial. But the problem goes far beyond backlash. We believe there are much larger numbers of White males who ... are to one degree or another disaffected, disillusioned, disheartened and confused. This is a far more subtle problem, and yet in our view the cumulative energy diverted by the issue from accomplishing the mission of the organization is considerable."

A number of respondents commented about WMB under present environmental conditions (e.g., economic prosperity, organizational growth) versus in the future. While WMB was not currently perceived as a problem in their organization, the implication was that continued changes in workforce demographics and recessionary economic times would force the issue into the limelight.

Conclusions

This study attempted to describe the issue of the WMB phenomenon and its impact on the contemporary workplace. It in no way suggests that the WMB phenomenon should displace other issues of race and gender already evident in research and practice—chiefly, the history of discrimination against women and minorities. The data suggest, however, that White males are just as susceptible to self-interest perceptions of inequity and discrimination, and that their perceptions can be manifest in negative attitude and behaviors, such as WMB, that are detrimental to organizational effectiveness. White males remain the largest percentage of the American workforce. In large part, they also continue to hold positions of power and influence. The results of this exploratory study provide an imperative for understanding and addressing the WMB phenomenon, not only due to its own merits, but also because of its interdependence with the ultimate resolution of many other race and gender issues.

Contribution to New Knowledge

The results of this study provide data to describe and enhance understanding of the White male backlash phenomenon. Understanding the WMB phenomenon is important for both theoretical and practical reasons. For theory, this study provides empirical research on the WMB phenomenon. Konrad and Spitz (1999) suggest that "it is important to move beyond the treatment of demographics as either proxies for theoretical constructs or sources of
error variance that must be controlled. Research must identify the theoretical reasons why demographic groups are expected to differ and incorporate measures of the relevant theoretical constructs” (p. 4). In this regard, this research contributed to social dominance theory and, in particular, social identity theory.

For practice, the results of this study are useful for HR practitioners who must address the collective and individual needs of employees, including White males. Engels (1995) calls out the need for the “identification of general and specific implications for theory and practice working with humans of all ages and stages of career development, especially in terms of preventive strategies” (p. 84). Lack of career development appears to be a significant factor in WMB. Where White males who feel disenfranchised exhibit symptoms of WMB, HR practitioners must develop strategies for ensuring that any dysfunctional aspects of the phenomenon are minimized.

"As Americans deal with the reality of the shortened corporate ladder and organizations grapple with ethical and logistical issues in downsizing, the identification of factors that foster career growth ... are critical for individual and organizational survival" (Eby & Buch, 1995, p. 41). In these times of rapid change, promoting career growth is as crucial for organizations, as it is for individuals (Engels, 1995). Also, the results of this study provide insights to supervisors who have to select for limited advancement opportunities, who are charged with creating other developmental opportunities, and who have the most direct opportunity to positively influence White males who are evidencing WMB.

Limitations and Future Research

This was an exploratory study about a social phenomenon, not a study about the experiences of White males. It was a preliminary sensing study examining the practitioners’ concept of the WMB phenomenon and identifying their direct experience with it. It was limited by sampling methods. Respondents were purposely chosen using an occupational criterion (e.g., HR professionals, EEO and AA officers, diversity program managers), thereby limiting the generalizability of the findings. The assumption was the respondents would be informed enough to answer the research question. On the other hand, given their occupation, it could be seen as their self-interest to identify the WMB phenomenon as a problem. This study was also limited by the data shared by the informants based on their occupation, rather than their race or gender. The data, then, reflects perceptions of “others” about the WMB phenomenon.

The study was also limited by data collection methods. E-mail and face-to-face data collection methods may have influenced responses in that some respondents may have had concerns over confidentiality, attribution, and potential for reprisal. E-mail data collection was also limited in that there was no mechanism for verification of demographic information (e.g., race, gender). Also, information on the validity and reliability of the data collection survey instrument completed by the respondents was not available.

Although the data from this pilot effort does have limited generalizability, a more comprehensive effort with a larger sample size and greater statistical rigor is warranted. A larger sample size would improve the results in future research on the WMB phenomenon. Efforts should be made to ensure that the sample is representative of all demographic groups (e.g., Asian/Pacific Islanders, Native Americans), given that research has shown that demographic groups differ in their perceptions of EEO, AA, and other equity issues (see Bobo & Kluegel, 1993; Konrad & Linnehan, 1999; Steeh & Krysan, 1996). A survey instrument with more substantial quantitative questions could examine the forms WMB takes (i.e., how it is manifest, observed), perceptions versus actual experiences or behaviors, complaint activity or other outcomes as a result of WMB, and other relevant aspects. Statistical evidence on the relationship between WMB and self-interest, stratification ideology, and racial attitudes would be helpful. Lastly, what remains to be directly explored are the perceptions of the general population of White males about and experiences with the WMB phenomenon.

Should We Define the Profession of HRD? Views of Leading Scholars

Wendy E.A. Ruona
University of Georgia

Much scholarly discussion has been devoted to definitional issues in HRD. This dialogue has primarily focused on competing definitions, while comparatively little has explored the issue of definition in and of itself. This paper explores whether HRD should be defined and why, which was one theme that emerged from a qualitative study of beliefs of leading HRD scholars.

Keywords: Defining HRD, Professionalization, Qualitative

In 1992 Chalofsky asserted that Human Resource Development (HRD) is “a field in search of itself”. Is this true? HRD has made great strides in establishing itself in organizations and beginning to construct a knowledgebase to guide its practice, however it is also clear that much scholarly discussion during the last 10 years has been devoted to definitional or foundational issues such as the purpose of HRD. Recent literature reviews conducted by Ruona & Swanson (1998) and Weinberger (1998) uncovered 20+ different definitions of HRD. These definitions have been offered by some of HRD’s top scholars. In one respect, these varied definitions are useful because they foster introspection about issues related to each definition such as the purpose of HRD, for whom HRD does its work, and HRD’s primary activities. On the other hand, evident in these various definitions (and the debates that they instill) is also a fragmentation that some in the field fear could threaten HRD’s contributions and, ultimately, its sustainability. The current state of the field would seem to find that these issues of definition unnecessarily dominate discussion and supports Chalofsky’s 1992 assertion that HRD is “still looking for a unifying base to rally around” (p. 176).

However, the question remains—is HRD in search of itself? Are we looking for a unifying base around which to rally? Should we be? Thus far, the dialogue around definitions has primarily focused on competing definitions and debating which definition is more “right”. Comparatively little dialogue has explored the issue of definition in and of itself and probed whether the profession should be bound in some way and how that might look. It could be that much of the debate around definitions is actually rooted in very different ideas about the act of defining/bounding the field. Uncovering some of these deeply held assumptions may help HRD to be more clear about its future development.

Purpose

In a recent study exploring beliefs underlying HRD through the views of scholarly leaders in the field (Ruona, 1999), there was much discussion about this topic—whether HRD should strive for definition, why or why not, and what it might look like if the field pursues increased definition and bounding. The purpose of this paper is to share one theme that emerged from the analysis of that larger study.

To provide some background, the purpose of the overall study was to explore beliefs underlying the profession of HRD. In order to do this, the inquiry explored assumptions and beliefs of scholarly leaders in the field. Specific objectives of that study were to:

1. Explore core beliefs that are underlying participant’s ideas of excellencies to be produced by the profession;
2. Analyze the findings to identify common and divergent beliefs across participants of this study.

The findings presented, once again, represent only one part of the study’s findings which were quite extensive. The focus of what will be reported is limited to the issue of defining and bounding the field which was a naturally emerging theme from that qualitative data.

Methodology
This was a descriptive study, using qualitative methods. Initial in-depth, face-to-face, interviews were conducted with 9 of the 10 participants, and one was a phone interview. Each participant was provided with a worksheet to prompt their thinking which simply stated the following organizing question: "If the profession of HRD was excellent in all ways, what 5-7 things would be true?" Participants were directed to use this question as a springboard to spur conversation during the interviews and were instructed that the focus of the interview would not be on their list of excellencies, but rather on the assumptions and beliefs driving those ideas of excellencies. These initial interviews were unstructured rather than imposing too much structure that may have impeded discussion of the topics raised by the participants.

All interviews were approximately two hours long and were audio-taped. Interviews were transcribed professionally, and were carefully verified by the researcher. In addition, member checks (Guba & Lincoln, 1989) were conducted with each of the 10 participants to ensure accurate interpretation and to discuss follow-up questions. These were tape-recorded phone conversations that were then partially transcribed by the researcher.

Sample

Qualitative inquiry focuses on in-depth, small, information-rich cases selected purposefully. It was estimated that members of the scholarly community might be well-suited for participation in this study because of (a) their intense and scholarly interest in HRD and (b) the likelihood that this would be a pool of people who are quite familiar with a diverse range of issues facing the field, and have done some serious thinking on issues related to HRD. All participants were then chosen on the basis that they have served a leadership role in a scholarly association related to HRD. That is, each participant has been either: (a) an incoming, current, or past president of the Academy of Human Resource Development (AHRD), or (b) a current or past chair of the American Society for Training and Development's (ASTD) Research Committee. This sampling criteria was chosen because (a) these two associations represent the two primary scholarly associations of the field, (b) leaders of these associations are elected by their membership, (c) these are active scholars who have made marked contributions to the field of HRD. The current and previous four leaders from each of the associations were solicited for this study, and are listed in Table 1. All participants solicited agreed to participate in the study, and agreed for their names to be published. However, quotes/excerpts are not accompanied with a name, and information that might make it possible to identify the participant has been edited out of any published documents.

Analysis

Qualitative data analysis demands inductive reasoning with the purpose of searching for important meanings and patterns in what the researcher has heard and seen. The process used to analyze the data for this paper was based on the constant comparative method (Maykut and Morehouse, 1994) and generic coding procedures. An overview of the process, which was more recursive that can be described here, is summarized in Table 2.

Findings: Defining and Bounding the HRD Profession

The goal of this section is to provide a creative, descriptive, and interpretive account for this theme entitled "Defining and Bounding the HRD Profession". The focus is on reporting the sub-themes that emerged, with a heavy emphasis on hearing the voices of the participants of the study through excerpted quotes from the interview transcripts. Excerpts from actual interviews are separated from the text and are bulleted by a double-quote (") and italicized. For example:
This is the format of a quote that is excerpted directly from the text of a participant’s interview. It is indented, bulleted by a double-quote mark, and italicized.

The final part of this section then provides an analysis of this theme.

**Who Needs a Definition of HRD?**

A powerful theme that emerged during this study came from one participant in particular who passionately argued against a definition for the profession:

> Who needs a definition? Our field is strengthened by having different schools of thought and by its diversity. I firmly believe that. I am equally as strong about saying that I’m not right because I’m here and you’re not wrong because you’re there. We’re different. We’re going to work with different organizations, we’re going to work for different objectives with different goals. Fine. I don’t need to control your definition and I’m certainly not going to let you control mine.

Diversity of the field and the people in it were central values for this person, who also argued against positions that are too normative and that tend to lowlight the unique qualities that people contribute to the world:

> It’s always appropriate to have an opening definition—open for conversation and exploration and differences of opinion. Nothing wrong with defining. What get’s wrong, from my point of view, is when you say that I have the right definition. That’s when I’m going to resist. ... I am a person who applauds and celebrates ambiguity. I am distressed by the drive to have to find “the” answer. The normative perspective that you see in some areas of HRD drives me nuts just as I’m sure my willingness and openness to ambiguity has to drive other people nuts.

The drive to define was not an issue for this participant who went on to explain that they define HRD as a community of individuals who consciously and continuously choose to be a part of the HRD community:

> It’s only a problem if you are driven by trying to define your field and your expertise. I don’t feel a need to do that. I don’t think it’s appropriate to do that. You know, I’m perfectly OK with letting you define it any way you want to define it. If you’re comfortable being in there with me then you’re in the right place. If you aren’t, then you’re in the wrong place or I’m in the wrong place, so we need to figure that out. I think those individual decisions is what makes community. For me they are all one of the same system, so individuals are community when they come together.
One of the basic premises of this person's view was that the complex nature of systems and the real work that gets done in the world simply cannot be so clearly and statically defined:

"It's driven by the artifacts of organizational life that require us to define disciplines. This whole thing about disciplines emerging and maturing and going through stages and so on, I think it's all baloney. It's not baloney in the sense of how life is actually lived. I think it's an accurate description. But I don't think it's the way it has to be. Why do we have disciplines? Why don't we see life as a holistic complex of perspectives, values, theories, constructs coming together?"

"Is expertise needed in an organization? Yes, absolutely. Does that mean that we then segment our lives so that all of our life becomes this small, narrow, itty-bitty piece? This organization I was working in, the focus of the consulting is restructuring of the staffing of this office, and they have traditionally been organized in silos. When I did my interviews everyone was frustrated with that because they saw that that's not the world they live in. They have expertise there, but the world is much more complex than a silo.

And so if you see everything from a functional perspective you don't ever really address the important complex questions. The complex questions require multiple skills, they require multiple expertise, they require a view of the total organization as a system—you don't get that from a functional perspective. We're so pushed in our culture to get the right answer that we're not allowed to be creative, we're not allowed to live with ambiguity, we're not allowed to let things happen as they happen. We've got to have the answer. Well, that's not the world I live in. People have to work in the context in which they find themselves."

"That assumes a static world with static individuals. I can give you a definition now and you can come back to me in 2 hours and whatever has happened to me in 2 hours I might have twisted it and changed it, I might have raised questions about it."

Part of that complexity, too, is something that this person argued the western mindset does not naturally acknowledge and effectively deal with:

"I think it's driven by the western ethno-centric mindset of having to put things in boxes. I don't like that. It makes no sense to me. It's a continuum. But we don't like to think in terms of continuums in this country, and I think that's what drives us around defining our discipline, defining our competencies, credentialing, etc..."

Another participant also raised some concern about the complacency that can set into a field when there is a lack of diversity:

"If you read, for example, Thomas Kuhn's work and think about what he'd call normal science where the field has a general agreed upon paradigm and most of what goes on with that is incremental kinds of research and so forth and that there's actually a complacency that sets in when you reach that, if you ever reach it. And I'm not sure you ever do. In fact, I wonder if we ever should. Because then you also become insular. I'm not sure that it's a bad thing, in a research community in particular, that there are competing paradigms. I mean take psychology. Have they ever settled the behaviorism versus cognitivism debate?"

Finally, a participant also raised the issue of the diversity of roles inherent in the field and wondered whether the roles in and of themselves necessitated minimal definition:

"I think another issue is that there's a certain assumption that seems to come through that HRD is a unified field. I see huge differences between my colleagues who see themselves primarily as training experts and those who see themselves primarily as OD experts and those who see themselves as CD experts. There are vastly different values driving those functional components of HRD."
Define What HRD is and What it is Not

There were strong voices advocating for some explicit definition of the profession of HRD. A few participants explicitly called for it:

- In strategy you define yourself partly by what you are and what you aren't. And it is decisions when you say “we're not going to do that” that as much define your strategy as what you do decide. I think some of that logic carries over to defining an academic discipline. If you're everything, you're nothing. What are the streams of research? What are the domains of interest we study? How, then, can we distinguish ourselves from other kinds of things? I think that's important. You need some identity, and I think the struggle to do that in HRD constrains us some.

- I believe it goes back to our core beliefs as to what we do and don't do. You know, it all cascades. And if we don't do it, and it becomes an important issue, somebody else is going to run with it. And that's been the history of our field because we haven't had core beliefs and core processes...we haven't had a deep understanding of what we do and don't do and what we promise and don't promise, and then evidence of delivering on what we promise.

- And if we evolved a clearer fundamental perspective and a narrower view, although the view may be a broad view, but a view that is definable that people can recognize and understand...this would lead us more closely to becoming a profession.

Many more voices surfaced as participants discussed benefits of defining the profession. Specifically, a few key ideas could be identified. The first came from one person who passionately reflected on the ethics involved with HRD needing to define what it does and then deliver on that:

- ...well, I use the word integrity...but if we had any integrity at all then our core beliefs are an expression of that integrity. And if we don't have theories, tools, methodologies, and processes that in fact deliver on our core beliefs, then we have no integrity. So we get ourselves totally disconnected from our core beliefs...Some people want to argue about what we're in the business for—we're in the business of learning, we're in the business of performance improvement...I don't care! But if you say you're in the business of learning, show me that that happens at the end. And so if you haven't made that clear that this is your purpose or core beliefs, or value or mission, then you can get distracted very easily. The HRD profession would be excellent if it delivered on its promise.

Another person echoed the above sentiment in explaining that a definition of HRD is simply that which HRD says it is credible for:

- ...that's the definition of Human Resource Development—what is it that you're credible for. If you're a credible attorney, that means that you know certain kinds of things. If I come to you, I should be able to get, no matter you practice law, I would get the same answer. Now that isn't absolutely true, but it makes it clear enough...

A second powerful idea emerged when more than a few participants shared a particular reason why they felt so strongly that the field should define itself. In their view, if HRD doesn't define itself, the organizations that HRD professionals work in will.

- In a way we not only define ourselves as a group, as a profession, but our individual practice is also defined by the organizations we reside in. And, so if I reside in X organization and they say this is what HRD is going to be I'll still practice HRD. If I was an accountant or a social worker or a counselor or a therapist and I worked in an organization...well, you can't tell me I have to act or practice my profession a certain way unless, of course, it's unethical. Because I have certain standards and beliefs around which, you know, you don't fudge numbers if you're an accountant.
just because the organization wants you to. You don't reveal confidentiality if you're a therapist just because your organization wants you to, or tell people they have to operate in a certain way, counsel people to operate in a certain way...

Those professions are based on a given set of beliefs and standards around the profession, not around the organization in which they operate. But we don't have that grounding. So we walk into an organization and they say "do this" and we don't have anything to pull back on. What if we were able to develop and articulate and ground ourselves with a set of beliefs and values around who we should be, irrespective of what organization we work for and be a truly independent profession that stands on its own values, not on the organizational context in which we work? That to me is a radical view!

The reality is that employer's control entry into our profession and they don't know anything about HRD!

People in HRD, because they've come often with no training whatsoever in HRD and there's kind of a feeling in the organization that it can be this or that...it's not as strong as it used to be, but it's still enough out there that the notion that some kind of strong ethical foundation should drive your practice is wholly lacking.

Third, and related to not wanting the organization or context to define HRD, some people talked about how individual definitions of HRD should not be more highly valued than some type of definition that may be more representative of the community of HRD.

And hence if you said that you're doing Human Resource Development, that's what you're doing. If you say you don't feel that you are, then you're not, even though from my point of view you may be doing that. And I think that's what's hurting us.

So it's part of that whole idea of leaving things down at the individual-level. I think that's one of the beliefs that most people in the profession have—that individuals have the freedom and ability to decide for themselves what they want to do, when they should do it, how, dah, dah, dah. The minute you're making some decisions as a sub-system of this larger organization, it seems to me you have a different responsibility at that point. And so how you choose what's in and what's out is really important. And if you don't have tools and theories to make those decisions, it seems to me you're just going to be drug around or you're going to end up having some childish notions that you're responsive to everything, while the reality is that you can only be responsive to a limited number of things. So you feel an enormous burden and, in fact, you're getting no where. And we have a lot of people in our field that are like that, really burdened by it. They're goodness and the goodness of the profession, are really doing very little to help the people, let alone the organization. I think those are just two different things—core beliefs of the profession versus core beliefs for the individual.

And some people say "I have my own personal set of beliefs" and I believe many do. But many of those people have developed them over time, number one. Number two, they can afford to have them. That's a reality! I mean some have this reputation and a long history of experience that allows them to say "if I don't want to work with you, I won't". Some others of us who've got to put bread and butter on the table may not be able to afford to say that. You know, the starving...there's not a lot of starving artists among us that'll stand up if we've got to feed our families or ourselves. But if we had a set of beliefs, we could at least again start to move—stand on those and depart from them, but at least we're departing from something that is solid ground. It's not the quick sand that we stand on now.

There are a lot of behavioral psychologists around. That doesn't make them right, that's just because they're there. They see that as a way of managing a situation and
I say that's fine. It's not what should represent the profession, put it that way. It certainly might be an element of it, a part of it, but shouldn't be the driving force.

Embedded in the above quotes is also a premise that was articulated by some participants a little later in their interviews—that is, that HRD is, or should be, a community with some things in common.

The creation of the Academy of Human Resource Development, for instance, implies that there is a kind of a professional definition that can be associated with that group, otherwise why would we need to have such a group. It seems that if it's necessary for people to get together to achieve these objectives and to get organized that the implication is that it is possible to conceive of this as a kind of professional area.

Those participants who advocated not wanting individual definitions to dominate also offered their conception of the role of individual beliefs in terms of the profession's development:

I don't think an individual can raise their core beliefs above the workgroup. Now they can use their core beliefs to change the profession or change their workgroup. That makes perfect sense. But to think that you should have ten different people in a department with a set of totally inconsistent and incoherent beliefs and functioning day to day, I think is insane. So I think that if you can't find some higher level core beliefs that are widely held and articulated you're either compelled to mute yourself a bit, or to do the work. But they have to lead the profession at that point. It's not held quietly inside. I think that most individual core beliefs are held personally, deeply, and quietly and that's different from being public and publicly-owned. The journey is getting that to happen. That's work in itself. Either we have the scholarly role in leading that, or we have practitioners that are in highly responsible positions that are leading.

I think it should be educational. People should learn from these little debates and discussions and evolve a point of view that could be defined, described, and that would constitute something that would be acceptable among those people who are the major movers in the field. And if you're peripheral, if you're marginal, then that question should not control the discourse in the field. But I think if somebody has a point of view they should express it and that the field would be better for it if we can evolve a perspective, a point of view that is justifiable, then it would lead us closer to become a profession.

Finally, various participants of the study offered a variety of other benefits that they believed would result from defining the field. Due to space restrictions, these will only be presented during the symposium presentation or are available from the author directly.

Analysis of Findings

In the findings presented above, two themes were presented that described compelling arguments for and against defining the HRD profession. It is interesting to note two underlying premises of these arguments. First, those who argued for bounding the field seemed to be more focused on the external demands of the world. Their justification was largely grounded in recognizing external realities such as what seems necessary to become a credible profession and not letting organizations define the profession. The participant who rejects defining the profession also rejects this reasoning. Rather that person argued that needing to define is an artifact of the external world and that bounding things in this way is simply not reflective of how the world is and how real work gets done out there.

Second, one can also see in this data that those who advocated definition view HRD as a community and are concerned with that community acting in concert. A few participants, for instance, talked about how individual perspectives of the profession should not be more highly valued than those of the community. The participant who argued against defining, on the other hand, views community fundamentally differently as a process of individuals self-selecting into something that is close enough to their perspectives/values. This person also celebrated the
diversity inherent in a community, whereas those who argued for definition struggled with this fine line between individual and profession.

These two differences are central in truly understanding people's perspectives on this and many other issues central to the evolution of the profession. Part of the purpose of this paper has been to share each "side" of this argument a little more fully than what has been available in the past and to understand the assumptions that drive the argument that most are able to hear. In addition, it is so important to mention that these arguments are much more rich and full than can be adequately presented here. Most notable is that due to severe space restrictions it is impossible to share key themes that emerged from those participants who advocated defining the field and then offered specific possibilities of what that might look like. These themes are briefly introduced in Table 3 and warrant a future paper.

Contribution to New Knowledge in HRD

HRD is at a critical stage—growing from its early development to a more mature stage where it has the potential to make great contributions to organizations and the humans that work in them. Most people that come to HRD are drawn by their desire to help individuals and organizations in some way. It is that same motivation that draws scholars into thinking about the profession itself and that is the impetus for this study. Growth of the HRD profession should be a conscious process. Part of growing well is reflecting on HRD's evolution—where the field has been, where its going, and where it needs to go to optimize its impact.

This study provided a unique opportunity to listen-in on the conversations of leading scholars in the field about what they feel is important around this issue of bounding and clarifying the field—through results that have been systematically gathered and analyzed using rigorous qualitative methods. It is hoped that this will provide some new perspective and insight into the issue as well as provide ample opportunity for personal reflection about your own role in the growth of the profession.

Strategic Roles of Human Resource Development in the New Millennium

Richard A. Swanson
University of Minnesota

This paper discusses the foundations of strategic intent for Human Resource Development (HRD), the schools of strategic thinking, the strategic roles for HRD, and their implications for strategic organizational planning.

Keywords: HRD, Strategic Roles of HRD, Foundations of HRD

Problem Statement

The human resource development (HRD) profession has had a continuing fascination with means versus ends. The indicators of this are clear: HRD interventions focus on process techniques versus appropriateness to goal attainment (Swanson, 1996) and studies show that evaluation practices focus almost exclusively on individual perceptions versus actual knowledge and performance change (Bassi, L. & Cheney, S., 1996). When the profession does speak of strategy, the most it can typically see is the alignment of HRD activities with organizational strategy (Rothwell & Kazanas, 1989).

The problem facing the HRD profession is the need to develop a mature picture of itself. The resulting question, "What is the strategic role of HRD?" and the development of a theoretically sound and internally consistent response is the focus of this paper including sections on the foundations of strategic intent for HRD, schools of strategic thinking, and strategic thinking in HRD.

The Foundations of Strategic Intent for HRD

Organizational strategy is concerned with the match between the internal capabilities of the organization and its external environment (Kay, 1999). For human resource development (HRD) to contribute to organizational strategy, it must first create a clear picture of itself. The HRD foundations that contribute to strategic intent include: defining HRD, articulating core HRD beliefs, viewing HRD as a process within a larger system, and articulating the theoretical foundations of HRD. While there is no one right response to these foundational questions, having a thoughtful response with internal consistency among its components is believed to be crucial. The following is one thoughtful and responsible response as to the foundations of HRD.

Definition of HRD

HRD is a process of developing and unleashing human expertise through organization development (OD) and personnel training and development (T&D) for the purpose of improving performance.

- The domains of performance include the organization, work process, and group/individual levels.
- OD is the process of systematically implementing organizational change for the purpose of improving performance.
- T&D is the process of systematically developing expertise in individuals for the purpose of improving performance.
- The three critical related areas of HRD include human resource management, career development, and quality improvement.

Core HRD Beliefs

1. Organizations are human-made entities that rely on human expertise in order to establish and achieve their goals.

Copyright © 2000 Richard A. Swanson
2. Human expertise is developed and maximized through HRD processes and should be done for the mutual long-term and/or short-term benefits of the sponsoring organization and the individuals involved.

3. HRD professionals are advocates of individual/group, work process, and organizational integrity.

**The HRD Process Within the Larger System**

HRD is a process or system within the larger organizational and environmental system. As such, it has the potential of harmonizing, supporting and/or shaping the larger systems of which it is a part.

![Diagram of HRD Process](image)

**Theoretical Foundation of HRD**

The discipline of HRD, in order to understand, explain, and carry out its process and roles, relies on three core theories. They include: (1) psychological theory, (2) economic theory, and (3) systems theory.

- **Psychological theory** captures the core human aspects of developing human resources as well as the socio-technical interplay of humans and systems.
- **Economic theory** captures the core issues of the efficient and effective utilization of resources to meet productive goals in a competitive environment.
- **Systems theory** captures the complex and dynamic interactions of environments, organizations, work process, and group/individual variables operating at any point in time and over time.

The three component HRD theories and their integration are visually portrayed as a 3-legged stool. The legs represent the component theories, and the stool's platform represents the full integration of the three theories into the unique theory of HRD. While the stool rests firmly on the floor or the host organization, an ethical rug serves as a filter through which the integrity of both HRD and the host organization can be maintained.

The systems view of organizations, HRD as a process within the organization, and the organization function within the larger environment provides the big-picture framework with which to begin thinking about the strategic roles of HRD (Swanson, 1996, p. 251).
Schools of Strategic Thinking

Mintzberg, Ahlstrand, and Lampel (1999) have summarized ten schools of strategic thinking. They argue that having a wider picture allows managers, consultants, and academics to better understand and pursue strategy. The schools are summarized through comparison of their features including: sources, base discipline, champions, intended messages, realized messages, school category, and an associated homily.

1. Design School
   - Sources: P. Selznick
   - Base discipline: None (architecture as a metaphor)
   - Champions: Case study teachers (e.g. Harvard) leadership aficionados—especially in the USA
   - Intended messages: Fit
   - Realized messages: Think (strategy making as case study)
   - School category: Prescriptive
   - Associated homily: "Look before you leap."

2. Planning School
   - Sources: H. I. Ansoff
   - Base discipline: Some links to urban planning, systems theory, & cybernetics
   - Champions: Professional managers, MBAs, staff experts, consultants & government controllers
   - Intended messages: Formalize
   - Realized messages: Program (rather than formulate)
   - School category: Prescriptive
   - Associated homily: "A stitch in time save nine."

3. Positioning School
   - Sources: Purdue University work (D. Schendell & K. Hatten) then notably M. E. Porter
   - Base discipline: Analytical staff types, consultants, and military writers.
   - Champions: Economics (industrial organization) and military history.
   - Intended messages: Analyze
   - Realized messages: Calculate (rather than create or commit)
   - School category: Prescriptive
   - Associated homily: "Nothing but the facts, ma'am."

4. Entrepreneurial School
   - Sources: J. A. Schumpeter, A. H. Cole, & others in economics
   - Base discipline: None (although early writings came from economics)
   - Champions: Popular business press, individuals, small business people everywhere
   - Intended messages: Envision
   - Realized messages: Centralize (then hope)
   - School category: Descriptive (some prescriptive)
   - Associated homily: "Take us to your leader."

5. Cognitive School
   - Sources: H. A. Simon & J. G. March
   - Base discipline: Psychology (cognitive)
   - Champions: Those with a psychological bent—pessimists in one wing and optimists in the other
   - Intended messages: Cope or create
   - Realized messages: Worry (being unable to cope in either case)
   - School category: Descriptive
   - Associated homily: "I'll see it when I believe it."

6. Learning School
   - Sources: G. Lindboim, R. Cyert & J. March, K. Weick, J. Quinn, & C. Prahalad & G. Hamel

These roles help to understand the basis of strategic thinking in organizations and HRD. They also help explain alternative visions of future states and approaches to positive change. For example, most HRD leaders would more comfortably fit in the "Learning School" compared to the "Entrepreneurial School."

Strategic Thinking in HRD

Torraco and Swanson (1996) discuss the theoretical issues surrounding the role of HRD in strategic organizational planning. They note two factors that have influenced the evolution of HRD toward a more active role as a key determinant of business strategy: the centrality of information technology to business success and the sustainable competitive advantage offered by workforce expertise.

These factors work together in such a way that the competitive advantages they offer are nearly impossible to achieve without developing and maintaining a highly competent workforce. They go on to build the case for HRD that is truly of strategic value to an organization is (1) performance-based; (2) demonstrates its strategic capability, and (3) is responsive to the emergent nature of strategy.

Strategic Roles of HRD

HRD is defined as a process for developing and/or unleashing human expertise for the purpose of improving performance at the organizational, work process, or individual contributor levels (Swanson, 1996).
Furthermore, three strategic roles for HRD have been put forward by Torraco and Swanson (1995). These three HRD strategic roles used as the springboard of this inquiry are described as follows:

**Performance-Based HRD** HRD has a history of serving a wide range of organizational demands and interests from the personal development needs of individuals to organizational transformations involving everyone in the organization. When HRD addresses the personal interests of employees, it is most likely not being strategic. For HRD to offer real strategic value to the organization, it must contribute directly to important business goals and must be based on key business performance requirements (Swanson, 1996).

**Demonstrating the Strategic Capability of HRD** To fully demonstrate the strategic importance of HRD, it must be more than performance-based. HRD will only be perceived as having strategic value if it also demonstrates genuine strategic capability. As HRD demonstrates strategic capability, it earns respect and credibility as a full partner in forging the organization’s future direction.

**Strategic Capability** challenges HRD to contribute beyond interventions that support a given strategic initiative. Strategic capability is based on a HRD philosophy that reflects the value of human resources in the pursuit of long-range business goals and the conviction that people are the only organizational resource that can shape and recreate the ways in which all other business resources are used. HRD demonstrates its strategic capability to the organization’s business planning process by: (a) providing education and learning in the concepts and methods of strategic organizational planning to those responsible for setting the strategic direction for the organization and (b) having HRD professionals directly participate in the strategic organizational planning process. Together these two features dramatically emphasize HRD’s value to the business planning process and distinguish HRD as having strategic capability.

**Emergent Strategy and HRD** HRD traditionally has served a role supportive to strategy. HRD that primarily serves to support the execution of a given strategy fills an adjunctive role to strategy that is clearly more deliberate than emergent. Thus, a majority of the HRD effort purporting to be strategic provides the workforce with important expertise after the formulation and adoption of strategy by others. HRD cannot add value to the shaping of strategy if the strategy is already fully formulated.

If strategy is treated as both a deliberate and emergent phenomenon, the benefits of developing and using employee expertise to capitalize on evolving business opportunities can then be realized. The potential for HRD’s strategic leverage must exist by treating strategic planning as an emergent process. Further prescriptions for advancing the strategic contributions of HRD are of little value if strategy is fully formulated and adopted without the performance perspectives that HRD offers.

**Scenario Building and Strategic Planning**

Parallel to the concept of traditional strategic planning is the idea of scenario building. Schwartz (1996) defines a scenario as, “A tool for ordering one’s perceptions about the future environments in which decisions might be played out” (p. 4). This tool is most often in the form of a story or plot lines which allows the organization members to fully explore a rich story of possible future events. These scenarios are stories describing the current and future states of the business environment and they become ‘stories’ about alternative possible futures (van der Heijden, 1996).

“Scenarios deal with two worlds: the world of facts and the world of perceptions. They explore for facts but they aim at perceptions inside the heads of decision-makers. Their purpose is to gather and transform information of strategic significance into fresh perceptions” (Wack, 1985a, p. 140). Used in this way, scenario planning presents “...an efficient approach to strategic business planning, focusing on business ideas in an uncertain world” (van der Heijden, 1996, p. 2). The problem is one of not knowing the fit between strategic planning and scenario building along with the role of HRD in shaping and supporting strategic organizational planning.

Miller, Lynham, Provo, and St. Claire (1997) have provided a useful overview of scenario building for the HRD profession. The following summary mirrors their analysis of the scenario building component of strategic organizational planning along with the traditional strategic planning component:

As more organizations face continuous change as the order of the day, organizational professionals have developed expertise and tools to operate successfully in such an environment. The traditional tools of strategic planning, which are commonly extrapolations of the past to determine the future, are not effective when future forces do not mirror past forces (Mintzberg, 1994). In an environment of constant change and challenge, non-traditional tools for anticipating and planning for change are needed. One such tool is scenario building.

A scenario is “a tool for ordering one’s perceptions about alternative future environments in which decisions might be played out” (Schwartz, 1996, p. 4). The process of scenario planning generally involves development of several plots and supporting narratives that illustrate primary forces driving change within a system, their interrelationships, and uncertainties in the environment (Wack, 1985a). Scenarios help decision makers structure and
think about uncertainty, test their assumptions about how critical driving forces will interact, and reorganize their mental model of reality (Wack, 1985b).

Scenario development is described as an art rather than a science (Schwartz, 1996). By providing safe and often engaging opportunities to explore the implications of uncertainty and to think through ways of responding to it, scenarios enable planners to deal more confidently in the midst of uncertainty (Schwartz, 1996; van der Heijden, 1995).

Van der Heijden (1996) characterizes the individual and organizational learning process of scenario building: by organizing complex information on future trends and possibilities into a series of plausible stories, scenarios are seen as interpretive tools that create meaning and thereby guide action. The use of multiple plausible futures helps decision-makers think more expansively about change and to adopt multiple perspectives for the purpose of understanding future events. In the end, scenarios offer entrepreneurial and protective benefits to organizations (Wack, 1985a).

The Centre for Innovative Leadership (van der Merwe, 1997) describes the scenario development process as follows:

1. Identification of a strategic organizational agenda (including assumptions and concerns about current strategic thinking and vision).
2. Challenging of existing assumptions of organizational decision-makers by questioning current mental models about the external environment.
3. Systematically examining the organization's external environment to improve understanding of the structure of the key forces driving change.
4. Synthesis of information about possible future events into three or four alternative plots or story lines about possible futures.
5. Development of narratives around the story lines to make the stories relevant and compelling to decision-makers.
6. Use of the stories to help decision-makers "review" their strategic thinking.

Traditional strategic planning refers to the business planning and systems thinking required of those responsible for setting the strategic direction for the organization (Mintzberg, 1994). Presumably, those who participate in strategic planning possess the business acumen and understanding needed for meaningful contributions to long-term planning. However, strategic planning by itself requires a sophisticated array of conceptual, analytical, and interpersonal skills. Business planning involves strategic decisions that are frequently group decisions. Planners, therefore, need skills in problem definition, facilitating analysis by the group, resolving communication breakdowns, reaching consensus, and building commitment. Skills associated with strategic planning include environmental scanning, analyses of industries and competition, organizational analysis (e.g., "SWOTs"), competitive benchmarking, using systems frameworks to identify inconsistencies and threats to business development, and clarifying and articulating a unified organizational mission.

Together, scenario building and strategic planning are proposed as a holistic view of strategic organizational planning (SOP). Figure 1 graphically illustrates the SOP components and their relationships. The SOP "double funnel" graphically contrasts the roles and relationships between scenario building and strategic planning in the SOP process. Scenario building flares out the thinking in its expansiveness, and strategic planning reins in the thinking into an action plan. All the while, both SOP phases are operating in the complex environment and SOP is viewed as a continuing process. HRD engages in supporting and shaping the entire process.

Contributions of HRD to Strategic Organizational Planning

What, then, are the potential contributions of HRD to strategic organizational planning (SOP)? In order to explore this question a matrix of the three HRD strategic roles in context of the two SOP components, scenario building and strategic planning, is proposed in Table 1. It is important to highlight the definitions of scenario building as an expansive process and strategic planning as a reductionist process as being crucial to the exploration of the interpretation of HRD contributions to SOP.
The Strategic Organizational Planning Research Agenda facing the HRD Profession

The following research agenda is based on the contribution cells of the supporting and shaping of strategic organization planning matrix (Table 1). The three strategic roles of HRD are used as the major organizers of the proposed research agenda.

Performance-Based
1. From a strategic planning perspective, the profession needs to learn why HRD is not able to consistently provide a road map for developing and/or unleashing the human expertise required of an organization to achieve its strategic plan and is not able to consistently fulfilling its commitment to execute its related SP action plans.
2. From a scenario building perspective, the HRD profession needs to cull out valid tools for making critical judgments as to an organization’s probability of being able to develop and/or unleash the human expertise required of the various scenarios.
Table 1
Human Resource Development's Contribution in Supporting and Shaping Strategic Organizational Planning

<table>
<thead>
<tr>
<th>HRD STRATEGIC ROLES</th>
<th>STRATEGIC ORGANIZATIONAL PLANNING (SOP)</th>
<th>STRATEGIC PLANNING</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>PERFORMANCE-BASED</strong></td>
<td>Defined: SB is a process for ordering perceptions about the future environments in which decisions might be played out (Schwartz, 1991, p. 4).</td>
<td>Defined: SP is a process for developing a comprehensive statement of the organization's mission, objectives, and strategy</td>
</tr>
<tr>
<td><strong>Contribution:</strong></td>
<td>• HRD provides critical judgements as to the organization's probability of being able to develop and/or unleash the human expertise required of the various scenarios being proposed and what each would require.</td>
<td>• HRD provides a road map for developing and/or unleashing the human expertise required to achieve the strategic plan and commitment to execute related SP action plans.</td>
</tr>
<tr>
<td><strong>STRATEGIC CAPABILITY</strong></td>
<td>Defined: To demonstrate genuine strategic capability HRD (a) provides SOP education and learning, and (b) actively participates in the SOP process (Torraco &amp; Swanson, 1995).</td>
<td></td>
</tr>
<tr>
<td><strong>Contribution:</strong></td>
<td>• HRD oversees the SB education and learning required of personnel for building &quot;shared, integrated mental models of multiple plausible futures&quot; (Lynham, Provo &amp; Ruona, 1998, p. 6). • HRD experts serve as contributors of key human resource information and value all information being considered during the SB process.</td>
<td>• HRD oversees the SP education and learning required of personnel for planning strategy, including the analysis and synthesis of internal and external conditions. • HRD experts participate on the SP team and act as a catalyst to create new business based on the strategic development and/or unleashing of human expertise (Mintzberg, 1994).</td>
</tr>
<tr>
<td><strong>EMERGENT STRATEGY</strong></td>
<td>Defined: HRD assumes a deliberate role in the emergent nature of SOP (Torraco &amp; Swanson, 1995).</td>
<td></td>
</tr>
<tr>
<td><strong>Contribution:</strong></td>
<td>• HRD creates and maintains &quot;an institutional learning and memory system...and helps an organization avoid repeating mistakes&quot; (Van der Heijden, 1996, p. 2.) within the realm of core expertise and new learning requirements. • HRD assumes itself critical to the ongoing strategic SB conversations of the organization. SB makes &quot;discussing strategy a natural part of any [HRD] management task and not the exclusive domain of specialist&quot; (Van der Heijden, 1996, p. 22).</td>
<td>• HRD creates and maintains a system for ongoing learning (in the forms of internalization, comprehension, and synthesis) from its own SP effort. • HRD assumes itself critical in the catalytic information-sharing, strategic partnering, and strategy finding SP challenge facing its host organization. (see Mintzberg, 1994).</td>
</tr>
</tbody>
</table>

**Strategic Capability**

3. From a strategic planning perspective, the HRD profession needs to develop and validate a core strategy for overseeing the SP education and learning required of personnel for planning strategy (including the analysis and synthesis of internal and external conditions).

4. From a strategic planning perspective, the HRD profession needs to develop and validate a process (grounded in performance-based strategic contributions) for legitimizing their role as experts on the SP team in creating new business based on the strategic development and/or unleashing of human expertise.

5. From a scenario building perspective, the HRD profession needs to develop and validate a core strategy for overseeing the SB education and learning required of personnel for building shared, integrated mental models of multiple plausible futures.

6. From a scenario building perspective, the HRD profession needs to develop and validate a process (grounded in performance-based strategic contributions) for legitimizing their role as experts on the
SB team in contributing key human resource information and valuing all information being considered during SB.

Emergent Strategy
7. From a strategic planning perspective, the HRD profession needs to develop and validate a system for creating and maintaining ongoing learning and systems thinking (in the forms of internalization, comprehension, and synthesis) from its own SP effort.

8. From a strategic planning perspective, the HRD profession needs to develop and validate a SP process of information-sharing, strategic partnering, and strategy finding critical to its host organization.

9. From a scenario building perspective, the HRD profession needs to develop and validate an institutional learning and memory system that helps an organization avoid repeating mistakes within the realm of core expertise and new learning requirements.

10. From a scenario building perspective, the HRD profession needs to develop and validate a process of engaging in ongoing strategic conversations of the organization from the HRD perspective.

Conclusion
HRD has been traditionally relied upon to serve in roles that are supportive of the strategies chosen to guide organizations. Although the supporting role of HRD is important for operational success in assuring the employee competence to meet present performance demands, HRD offers even greater strategic value as a major force in the shaping of business strategy. This strategic role will most likely be achieved through a purposeful connection of sound theory and practice—the grist of Human Resource Development scholars around the world.

Note: The author wishes to acknowledge the contributions of Susan A. Lynham, Joanne Provo, Wendy E. Ruona, and Richard J. Torraco to this work.

Shaping a Learning Vision: Life Histories of Learning Leaders and Facilitators

Karen E. Watkins  
The University of Georgia

Victoria J. Marsick  
Columbia University—Teacher's College

In collaboration with Linda Honold  
Milwaukee, WI

In collaboration with Judy O'Neil  
Partners for the Learning Organization

This paper draws on life history interviews with learning organization facilitators to identify transforming events that shaped the learning visions of these key change agents. Interviews with organization developers and senior managers of organizations working to make learning a central driver of innovation and change were conducted. From these interviews, key lessons for facilitators and leaders of learning organizations were identified.

Keywords: Learning Organization, Life History, Qualitative Research

The learning organization is defined as an organization that has created an infrastructure to support continuous learning and knowledge creation. In this study, we use a model that defines the learning culture at the individual, team or group, organizational, and societal levels that is characterized by seven dimensions (Watkins and Marsick, 1993, 1996; Marsick and Watkins, 1999). From this theoretical framework, we have drawn implications for facilitators of learning organizations. What is less known is what learning the facilitators themselves bring to the task of designing learning organizations. The purpose of this study was to identify key attitudes, skills and knowledge of learning organization facilitators that evolve from critical life experiences. We asked: What life experiences do these people report as particularly influential in shaping their learning organization perspectives?

We adopted a constructivist perspective that suggests that people co-create meaning within lived experiences (Schwandt, 1990) to investigate the lived experience of learning organization facilitators. This was a qualitative study that drew on critical incident [Flanagan, 1954, Ellinger & Watkins, 1997] methodology for data collection. Convenience sampling of those individuals whose learning organization work we had followed for two or more years resulted in six interviews from four organizations. Interviews were conducted by the authors and by our two collaborators. We interviewed three senior managers and three organization developers. We drew on the biographical tradition in constructing these life history vignettes (Creswell, 1998). We used content analysis to develop themes from the interviews and to compare themes across the six cases (Miles and Huberman, 1994).

The Leaders: Jerry, Ralph, and Pete

In this paper, we draw on our interviews with three senior managers to peer into the paths that they took as leaders.  
I can't work where I can't trust—Jerry Marlar, CEO, Sulzer Biologica (formerly of Sulzer Orthopedics)

Jerry Marlar grew up in Oak Ridge, Tennessee where his father was a blue collar worker, working on the cyclotron project. Jerry said, “But I grew up in the Oak Ridge community where there were lots of smart folks. Most of my teachers in high school were Ph.D’s.” But before his family moved to Oak Ridge, his early schooling experiences were quite different. “I went to school in a one room school house. First grade. My aunt was the teacher.” Through his schooling experiences, Jerry saw a range of opportunities and resources. Yet, Jerry felt that his work experiences were equally significant. “I think probably now as I reflect, one of the other shaping events, I have
worked all my life. When I was in first grade I was chopping cotton.... I've worked forever." Jerry described what happened when he switched to a business major in college.

Well, I thought I'd gone to heaven. ... It was creative, and you could think and use sixteen ways to get there, not just the roadway to get there. ... I got out of school in Marketing and Sales Management, asked my professors who are the best organizations to go with to learn, because I had this thought that the first half of my career I would be in an environment where I'm learning. So I started to look around and said who are the best trainers, and I was told Johnson & Johnson was a great trainer.

Jerry was already thinking about his entire career, allotting half of it to jobs that would build a repertoire of skills for the second half. B., the owner of a small orthopedic manufacturing company, offered him a job which he turned down to take the job at J&J. B. later asked Jerry to be the head of Sales and Marketing for the whole company.

And I'll never forget this, making the decision....I said, "I made a conscious decision that if I come to the right manufacturing [company], and if after five years I have failed, I will learn more in that than staying with J&J five years, in the normal [course of events]. And so I made the commitment that I was going to have an opportunity to learn a whole lot more a lot faster.."

Six years later, Jerry went to the president and told him that the company had a lot of problems.

I went in to B. one day and said, ... 'These are ten issues you're not dealing with and not getting it done. And they're not in my area of responsibility. I have a deal for you. I want you to make me your General Manager, give me six months to get these corrected or on the path to correction. At the end of six months if I haven't done it, you can fire me. If I have done it, I want my title changed to General Manager permanently, and I want you to double my salary.' He looked at me, he says, 'Well, I don't mind paying ten thousand a year, so what have I got to lose?' So he looked at me and he says, 'Okay, I'll do it.' ... And he gave it to me. At the end of six months I had accomplished all but one, and one he had just said, 'No you can't do.' ...So I became the General Manager, and really started a learning curve then.

The small orthopedic company of which he was General Manager was sold to a much larger multi-national organization. Jerry was asked to go to run a company in France. He agreed to do so under six conditions, one of which was that he be given an option to return to Memphis when his work was done in France. Five years later, the President of the company called and asked him to come to headquarters. They could see that he was quite creative and entrepreneurial. Jerry reminded him of his six conditions. They argued about it for about a year and then Jerry made a difficult decision.

And I answered the six fundamental questions we all ask in every relationship: Why am I here? How am I doing, really? Why are we here? How are we doing, really? Are you committed to excellence? and Can I trust you? I answered the first five very, very favorably, and supportive, and thankful. I said all the things you helped me grow in, and learn, and do, and the experiences I've had, etc. But when I got to 'Can I trust you?' I said, 'I can't work for a corporation where I cannot trust the CEO to follow through with his personal commitments.' I had no choice but to resign.

Luckily, a head hunter had been trying to get him to be President of what was then Intermedics Orthopedics Inc so he took the position. He had already made up his mind that he wanted to implement learning organization principles. In 1992, Jerry Marlar became the CEO of the company and three months later, one-half of the executive team walked out of IOI on one afternoon and started a competing company. Marlar recounts this experience.

Three months after I had been there I was going to visit a customer in Dallas.... I got back to my room that night, Thursday night, had a phone call from the VP of sales. He says, 'Jerry, we got a problem.' I said, 'Great, what is it?' This is about 10:30, 11:00 at night. 'I've just found out that our VP of finance, the VP of R & D, the VP of marketing, the Director of Quality, the Director of Regulatory Affairs, the two key managers in this area [sales] and three engineers are all going to leave the company and go start a competing one with the former President.' I said, 'Okay, here's what we do. Call a meeting at 10 o'clock in the morning. I'll call the VP of Personnel ... and tell her what the deal is. We'll do all the legal things right. And we'll bring them in and tell them that we appreciate the fact they're going to go start a new company, and we want to help them get started now. No problem. Let's round up your personal possessions and your belongings, and we'll pay you all the right severance pay, we'll do all the things we should do. And we'll escort them out. My wife and I are going to be a retreat for the weekend. I will see you on Monday. We called it White Friday. We washed the slate clean and we started over. So now I knew I had a chance to build an organization and a team committed to the right things.

Marlar's clarity of vision about his own career also extended to a clarity of vision about where the organization had to go to be successful. Jerry attributes his personal faith experiences with providing him the
confidence to set a course and head steadily toward it, even with turbulence. Marlar's life is a story that he more than fate is writing. His have been conscious, thoughtful choices, built on a foundation of faith in God, himself, and others; love of learning, a strong ethical core and explicit values, and a vision of a learning organization.

My role is to live it—Ralph Stayer, CEO, Johnsonville Sausage, Inc.

Growing up in Sheboygan, Wisconsin, the son of a successful owner of a small niche market sausage manufacturer, Ralph Stayer, Junior had a life course almost set for him from the cradle. When Ralph Stayer, Senior stepped down as President, he left behind a company with a small market but a solid reputation as the premier bratwurst maker in the region. His son built the organization into one that had an international reputation with substantial growth in market share. We wondered what early incidents led Ralph to walk this path. Linda Honold interviewed him and asked Ralph if he could think of anything in his childhood or his early adulthood that led to his perspective on leadership for a learning organization.

No, there was none. That came from thinking it through... and a lot of reading. I have a basic observation on human beings. People really want to be great. I've been very good at, lucky, capable, or skilled, to take principles and to... connect them, and see how they might actually work in real life... I built a system where we all share in the profit. I incorporate everybody into this thing, then all of the sudden the problems aren't mine anymore. They belong to everyone. The first thing you need to look at is everybody wants to succeed. The second one is who owns the problem. As long as the problem rests with leadership, nobody else owns it. You need to build a system where you say I think you want to do a great job. I believe in you. I trust you. Let's define what a great job is. We work together and over a period of time... we actually change the values in the company. But we didn't go to change the values, we went to create the values of — we work together, we trust each other — and then that became the norm. A good Catholic education brought me up to believe that other people are good people. I believe others are brought up the same way.

Like Marlar, Stayer built his vision on core values and principles that he also sees as connected to his faith. There is a strong sense in Stayer's perspective that the learning organization must be a collective journey. Linda described him as a risk taker and asked him where this came from.

Part of my make-up comes from my parents. I'm the kid that figured out how to crawl out of his crib at a year-and-a-half. Well, they put chicken wire on top of my crib and everything in order to keep me in. When I was three I took a screw driver and my parents were gone for awhile and I took all the chairs apart. You know, those old chrome chairs with the plastic cushions. I had all the backs off and all the pieces laying on the floor. I was working on the table when my parents came in. Anyway, if your vision, your sense of what you want to accomplish, if your reason exceeds your needs, your concern about failure or your need for approval, you'll be a risk taker, period.

Linda asked Ralph to say how he saw his role.

First of all my role, it's leadership. It's taking us to the next place. It's not managing what we've got. [It's] getting where we need to be. Visualizing it. That's the role I've created for myself... At the top the leadership is in perceiving the vision, listening, and getting people organized around it. How can I measure it? How can I touch it? I can feel it, how can I see it from my perspective because they all see differently?

Execution is where all the excellence lies. After leadership the next thing is to stay with it. Stay with it. Work it. Go work it myself with a small group of people. Work it myself and make it work. You're right there. No broad proposals that I hand off, right down to the nitty gritty. As the leader that's one of my big jobs. And I did that back in the early 80s. I sat down with vice presidents. We went week after week after week after week, asking 'What are we doing? What are we doing? How's it working?' Working it, working it, working it, working it. It was continually asking, continually contributing my insights because I see stuff that most people don't see. That was the first team. We worked through it. What about? What about? What about? What about? With me as a catalyst. Me working with them, me right there with them, but them as owning and doing. It's always my job as the leader of this company to know what we want to get done. If I don't do that, I'm not doing my job.

My role is to live it. It's to embody it. To get anybody to believe in it, I've got to embody it myself the best I can. Show that I'm willing to do it. That's part of my leadership. Exhibit the fact that you're living it. Exhibit the fact that you care about people. Care about other people's success. I can't talk about success here unless people believe that I care about their success, that I want them to succeed. And I think that pretty much people think that I want them to succeed. That I'm interested in them and I'm proud of them and I'm happy for them when they succeed.
Whether his willingness to take risks came from early conditioning or a natural precocity is hard to say, but it would appear that the most important factor is an inner vision of what he wanted to accomplish. This vision also permeates his understanding of his leadership role. His is a personal vision, and one that is at the lived level, hands on, with sleeves rolled up, working side by side with the people who will enact the vision. Stayer emphasizes the persistence and conviction that people can succeed that are necessary to make this work. His insight that people need to understand and come to their own meaning of the vision is critical. Without this perspective, it would be easier to simply command that people enact his vision.

The ultimate vision: Business results-- Pete Cistaro, Vice-President of Distribution, PSE&G

Judy O'Neil interviewed Pete Cistaro and asked him to tell how he came to his current role as a leader of a learning organization. Pete has worked his whole career at PSE&G. Although educated as an engineer, his interest from the beginning was to work with people. Like Marlar, he made choices about the direction of his career. His early experience with the company taught him lessons about the best way to work with people.

Actually this is my thirtieth year with PSE&G. So I started here right out of school. I have an engineering degree. I knew when I went to engineering school that I really did not want to be an engineer... One of the things that drew me to this company was the fact that they offered more of a managerial training program. ... you'd be placed into a management role relatively early on in your career. ... In 1972 I was promoted to ... District Superintendent, which is equivalent to an Area Manager today. And I wasn't even twenty-six. ... you've got to see yourself as a 26-year-old person dealing with people who were in their forties, fifties... here you are the young kid telling these other people what to do. And that's why I guess I learned rather quickly that I wasn't going to tell them what to do... but I was going to try to get from them their experience, their capabilities, and sort of get them to use it better, and work harder, and work together to make that happen.

Pete saw the importance of working together, empowering people, achieving success together—rather than the command and control hierarchy common in the company. This learning repeated itself time and time again.

Then I was asked to ... head up the Labor Relations on the electric side of the business, which was a completely different thing for me. In fact, when I was asked to do that my immediate reaction was 'I don't know anything about the electric side of the business. How can I sit there and be the spokesperson and deal across the table?' And the answer was 'well you know enough about the agreement, you know enough about people, you handle yourself to the point where we believe that people have some trust and confidence in your capabilities, and don't worry about the technical stuff. That'll handle itself.' So, again, I think this effort of 'I don't know all the details. I'm not the expert here, so I need to rely upon other people to help me to get my job done' comes out again. ...

In addition to leading through working with others, Pete has other explicit views of his leadership role. These views are similar to other learning organization leaders—a focus on vision, the means to transmit that vision, and ways to achieve that vision.

I think a good leader has to first of all have a vision of what they see and where they want to bring the organization. I don't think that the organization can do that necessarily by a vote, or by some referendum, or by multiple choice tests. I think there needs to be some vision, and then that vision needs to be articulated so that you can get more and more people engaged to a) understand it, b) recognize that it's the right thing to do, and c) that they want to support it.

Probably one of the key phrases for Pete as he talks about his leadership role is "the ultimate vision, which is the business results." Pete believes you can achieve the right results through coaching but you can actually get in the way of the right results with behavior that is more directive. Cistaro also underscores a focus on people.

The Facilitators: Linda, Renee, and Bill

We also interviewed three individuals who were organization developers. We asked each of them to share with us incidents in their lives that they thought were critical in shaping their current thinking about how to create learning organizations.

We've only just begun-- Linda Honold, formerly with Johnsonville Sausage, Inc.

Sitting in Linda Honold's apartment overlooking the lake in Milwaukee, she talked about how she came to value learning. It really began at the age of 10 when a ruptured appendix had her flat on her back for three weeks
during which she read constantly. Her mother encouraged her to read. She deeply valued education and instilled in Linda a thirst for learning. But most significant to Linda's work at Johnsonville was probably what happened later when she was in high school:

When I was in the 9th grade, friends of mine broke into a house and stole some collectible guns. They were going to run away. I skipped school to talk them out of it and got caught and was given detention for missing two periods. I told my mother that I did not want to go to a school where you were given detention for helping your friends. Sister Mary Jo Donaldson of St. Bede's Priory had a vision of a school based on Summerhill. My mother had heard of it and so I investigated it and transferred to this private Catholic high school in Eau Claire, Wisconsin. This is how I ended up in a self-managed learning high school. At this school, I had to contract with a faculty member for what I would do. Each person had a mentor. You could be creative. I created a one-on-one course with Sister Mary Jo on Russian History and Russian Literature.

In many ways St. Bede's Priory was a visible model of how self-directed learning and empowerment could work. Later, after receiving her undergraduate degree, Linda worked for a printing company. She hated going to work every morning. Everyone else hated it too. She decided that there was something morally wrong with people spending one fourth of their time doing something that they hated to do. This led her to enroll in graduate school where she had several labor relations courses. Training in Industrial Relations inspired a decision to work from within an organization to make change.

Linda answered an ad for a Personal Development Coordinator in a project sponsored by the Joint Training Partnership Act that led to another significant learning experience. "The job was to work among Hmong refugees. I helped them get basic job skills, advocated for them with employers, then provided job support once they were employed." The job with refugees involved working with the whole person and seeing that, despite great disadvantage, these individuals could find and maintain employment with appropriate help. Later, at Johnsonville, Linda saw parallels in the lives of some employees who had stopped learning after they left grade school. Linda saw that opportunity and support could turn this around.

When Linda first applied to work at Johnsonville Foods, they hired another person. When this person left on maternity leave, Linda called Johnsonville Foods and inquired into the position:

I called and said that I was still interested. The job I was eventually hired to do was defined as 'to get people in a learning mode.' This sounded fun, creative, and exactly what I ought to do at this point in my life. I started educating myself on what this meant. I read the traditional learning literature. I ... decided that it did not fit. Then I read the career development literature and felt that this fit, but not rigidly. The key was making people responsible for their own development. I saw my job as creating opportunities and systems for them to learn. No one had the right to play God.

After five years working inside Johnsonville, Linda left Johnsonville to form her own consulting business. She continued to work as a consultant to Johnsonville as well. Linda said, "John Stuart Mill said that learning and change are somewhat synonymous. Get them learning, they will be more open to change." Linda's life history is clearly that of a person who has sought opportunities to learn and to change.

More will always be revealed—Renee Rogers, Director of Human Resources, Sulzer Orthopedics, Inc.

Renee Rogers of Sulzer Orthopedics, Inc., describes the incidents that she felt most significantly shaped her perspective. Renee recalled an experience from the 14 months she spent traveling in India in the late 1970's.

While I was in Calcutta, I stayed in the Salvation Army hostel. Each evening the rickshaw wallahs would park their rickshaws in a circle and all their families would form a temporary village. One night when we came back to the hostel, the rickshaw families were having a grand celebration. I still remember a baby sitting in a window sill, laughing out loud with her eyes shining. Since this was not usual, we asked someone on the street what was happening and they explained that one of the rickshaw wallahs had been given some chicken feet and the families were happily preparing a feast for that evening's supper. I left this scene and went into a three-week depression.

Renee was disoriented by the discrepancy between her view of life and theirs. She began to develop a nonjudgmental perspective of the "other." Renee reflected:

Gradually, as many people do who stay in India long enough, I began to integrate this experience. I developed a deep sense of acceptance and an understanding that my judgments, good or bad, were inevitably rooted in my own experience. I began to understand that it didn't work for me to judge the quality
of others happiness or pain. In fact during those three weeks, I was the one who was unhappy, not the child whose eyes I still remember. I often think of this experience in my corporate life today. I think how often people in organizations judge events and situations in light of their own experience; how there really are people who make $100,000+ a year and still feel underpaid and undervalued; how life satisfaction and quality of experience is a relative phenomenon that I'm better off not judging - only observing.

Renee's experiences continued to broaden her understanding of people and systems. When she was in graduate school, she did an internship with American Airlines in 1985. She worked as a curriculum specialist with a Vice President on a new five-week international security training program. It was piloted with 10 Security Managers in Frankfurt, Germany. Renee attended the course, took notes, and translated it into training materials and a train-the-trainer program so that they could implement it internally. Renee describes her interaction with the consulting group, and the insights she gained into what is involved in large-scale change:

The consultants who delivered the training were career Israeli El Al security employees who sometimes had problems with delivering the course in English. Because of my ESL background, I began working regularly with the consultants preparing for the classes each day. Because this was the first major contract for them, they really were designing the program as they went along. In fact, the consultants had deep knowledge of their subject, but I learned that not all high-powered consultants have their interventions all planned out in advance... they were good at co-designing with the client, adapting their expert knowledge to the particular situation of the client. This was also my first experience to support a large-scale, strategic program... so I was able to see the process as it unfolded.

Renee felt that she was not only learning what she had been trained to do, but also how to adapt it to fit the circumstances and the exigencies of a particular situation. She was also working with increasingly larger systems.

Renee's first OD job was with a municipal public utility, where the roles of employee relations and OD were intertwined. She later responded to an advertisement for a position at Intermedics Orthopedics and was hired. Renee found her first assignment there to be a critical learning experience. She explains:

My first assignment at IOI was to develop and implement a team training course for newly formed cross-functional product teams. I did this in the first year and implemented the training with 80+ technical/professional employees. By the second training, we had worked out all the bugs so the training was well received. However, what the training uncovered were numerous, significant system problems that prevented employees from applying the team skills being taught. The young organization lacked defined systems and processes for cross-functional product development and management. However, this was more than we were able to address in any meaningful way with a training intervention. So I reframed the work as organizational diagnosis where we were able to document many problems but were not able to solve them immediately.

The progression in this incident is worth noting. In the beginning, the assignment was to develop a course. By thinking more systemically and incorporating the knowledge she was gaining from employees in trying to implement the course, she was able to transform the assignment into an organizational diagnosis. But she was also not in a position to take action on what she had learned. Rather, the eight supervisors were. By later involving them in teaching courses, they were able to see for themselves that at least one significant barrier to implementing these team and quality concepts was the fact that workers lacked certain basic literacy skills. With their support, Renee was able to move from teaching a course on teaming to an organization-wide basic skills intervention.

When Renee had been at RN for one year, Jerry Marlar, the new President, transformed her role from training to Organization Development. He was initiating a company-wide visioning process and named her the internal point person in this endeavor. In this role she participated in the many sessions conducted at all levels of the organization, from the initial meetings with the executives, to the session with middle managers and then the joint total management meeting, and finally all the sessions with employees. Most recently, Renee has been promoted to Vice President of Human Resources. Her life history well illustrates the way in which working with increasingly larger systems helps a facilitator develop the skills needed for the whole systems change of creating a learning organization.

Ask me anything, I'll tell you a story Gardner, Director of Corporate Learning and Organization Development, Advanced Micro Devices

Advanced Micro Devices are making strides in the direction of becoming a learning organization. One key figure in this work is the Director of Corporate Learning and Organization Development, Bill Gardner. We asked Bill to think back on his life, from early family experiences to more recent experiences to identify those that had the
most significant impact on how he now thinks about his role as a facilitator of learning organizations. He did not find it easy to come up with a single incident. He spoke instead of the cumulative impact of growing up as an invisible minority. He sees this as central to his current role as a support staff. This enables him to raise questions from a position of being both on the inside and the outside at the same time. Bill explains:

I think back to a time when, ... I must have been maybe eleven or twelve. My father was an outstanding cook... my family or groups of people would get together at our house, and my father would cook these incredible things out in the yard.... And typically the men would stand around outside and, even though liquor was not legal in Mississippi, they’d usually have a few drinks, and the women would all be inside making potato salad, or something. And the children were sort of relegated to no person’s land... But there was this real desire in all of the boys in the family to be accepted into that circle, standing outside around the barbecue pit laughing and talking about whatever they were talking about.

And I vividly remember the first time that I was not run out of that ring. We had this little apartment behind our house, and that’s where they would go and mix these cocktails, or whatever. And we would walk in and they would order us out. But I remember the time that I got to stay. And so I was kind of overwhelmed with I’m now accepted in this circle. I am a man. I probably didn’t say that in my head, but I remember intensely the feelings of they’re not running me out. ... I may have combined a whole lot of incidents together, but I think the very first time that I was in there they were talking about a friend of my older sister’s who was queer. And they were laughing about it and everything. And I had this distinct, sort of schizophrenic feeling that I can be here, and I can be accepted here, but I’m not really. So I have to pay attention. I have to be hyper-vigilant here to not let them know that I’m not one of them or I won’t be able to be in here. But, maybe, there’s something I could do to get them to look at things differently. The truth, I guess, as I knew it.

Bill struggled with wanting to stand up for his sister’s friend because he knew something of what she might be feeling. But he also wanted to stay in the circle and be accepted. Bill related these feelings to situations in which he finds himself in the company where he has to be able to take both sides of an issue:

And I think about that a lot, because I have that feeling often when.....the people that I work with, I’m never a part of them. You know? They are either senior management, or executives, or something. So part of my role there is to not keep reminding them that I’m not one of them, but to help them get comfortable enough with me so that when I call up representing whoever it is I’m representing, be it the employees or just somebody who’s not an executive, that they can hear that and not discount it like they discounted it other times. With this values work that I’ve been doing several times I’ve said, ‘Okay. I’d like to sit down here for just a minute and take my facilitator cap off and speak to you as an employee of the company. But also as an employee of the company who did focus groups, and who saw the data from focus groups. Everyone in this room is a Director or a Vice-President, except for me. And you seem to keep forgetting that when we did focus groups, the focus groups that were done of Directors and VP agreed with what you’re saying right now, but the employees didn’t. And you keep speaking as an employee of the company, which you are, but you’re not representative of the vast majority of employees.’ And they’ll hear that, and they saw the data just like I saw it....

I’ve thought a lot that if I were not gay, I wouldn’t be near as effective as I am in corporate America. You know, which is just a complete contradiction, even as I say it, but I wouldn’t be. I mean, well certainly all the diversity stuff that I’ve done, but even separate and apart from that, all the other stuff is always having my head sort of in two places.

Like Renee, Bill draws power from having a different perspective, being able to see things that others do not. His experience of cultural separateness made it possible for him to both see from within the circle and without. This stance, somewhat like that of an anthropologist viewing oneself and one’s organization almost as an alien culture, enables the learning organization facilitator to see what others see while being able to gently help those inside the organization see it too by speaking in their dialect.

A final characteristic of Bill’s is his storytelling ability. Through stories, he is able to capture attention and direct change more subtly. Bill was surprised at the ease with which he tells stories, and the value that these stories have in helping people to make sense of things. With all of the different change initiatives going on, Bill had to switch back and forth frequently between five or six different projects in any given day. Stories carried the thread between meetings that might take place months apart. Bill used stories to bring himself and others up-to-date:

And when I would come into a meeting I seemed to be the only person that remembered what happened the time before. ... And so I’d draw pictures all during the meeting. I’d draw little icons to capture what’s going on, and write little notes down. And I can pick out a couple of pages and look at it and I remember what’s
happened. But I found myself more and more going in to start off a meeting on some task force, and I'd say, 'Okay. Now, let's review what's happened up until this point.' ...I just tell a story. ... And it helps now and then to get the thread and go from there, instead of having to go back and reconnect.

So now we're starting to draw... like do the icons, do a little road map. And I usually come in and put the road map up, and people just kind of look at it. I mean, I have one that I can do in, I think, thirteen minutes. Thirteen minutes for the entire two and a half years of the vision, mission, and values process....

The little file cabinet exploding with twenty-five archival analyses. But are there critical incidents that I could identify with me telling stories? Heavens no! My whole life, say anything, I'll tell you a story about it.

Bill's stories capture the organizational memory — and he also triggers memories with personal images and icons. As his family did before him at Christmas, he carries on the organizational change tradition through his stories.

Implications for Leaders and Facilitators of Learning Organizations

We have seen that those who facilitate these initiatives often have a vision of the future that stands against the status quo. Leaders are pivotal to translating learning into organizational results, while learning organization facilitators are pivotal to architecting the structures that will enable learning to occur. Leaders of learning organizations must transition from old notions of leadership to new roles, and bring a long term vision of what the organization might be coupled with dogged persistence to work with people to understand and to bring about that vision. These leaders also show that a force of character, a personality that is organized and driven by values is essential. Facilitators and leaders have a clear vision of themselves and how they want to work within the system. They like to see people grow and develop, so that they too can speak their vision for themselves. They are system thinkers who see themselves as part of a large, complex, interactive universe. They carry a sense of the organizational memory—and of the importance of embedding knowledge to stabilize a change effort. They recognize that meaning is constructed —more by what we do than what we say.

From a theoretical perspective, the life histories of individuals help us identify critical experiences that shape a learning organization philosophy and perspective. While we cannot prescribe a life experience, we can help others draw meaning from their experiences and understand how these experiences frame how they now view learning and change. The critical connection between experience and visions—both enabling and limiting visions—is underscored in these stories.

Where Have All the Young Ones Gone? An Analysis of the Graduates of an Human Resource Development Program

Douglas H. Smith
Jo D. Gallagher
Florida International University

The faculty of an human resource development program conducted a survey of graduates between 1998 and 1999. Forty graduates responded. Over 90% are working in HRD or AE or a related field. They indicated the program enabled them to adequately carry out their responsibilities. They identified areas of weakness, now being addressed. They also identified key competencies needed by graduates to be effective. A number of recommendations were given for other studies and for the program.

Keywords: Performance Measurement, Graduate Program Evaluation, Doctoral and Masters Students

Graduate programs in Human Resource Development (HRD) and Adult Education (AE) have experienced continuous growth over the past half century. The American Society for Training and Development (1999) has identified over 50 universities in Canada and the U. S. offering graduate programs in HRD, and the Commission of Professors of Adult Education (1999) lists over 60 universities offering AE programs. Thus, many graduates have received degrees in HRD and AE, and are engaged in a variety of occupations and professions. An important question to be asked is how well do we know what occupations and professions HRD graduates are engaged in, and equally important, to what degree did their graduate studies and degree contribute to their profession?

This was the goal of the study conducted by the Adult Education and Human Resource Development (AE/HRD) program at a major university in Southeast United States. The purpose was to determine the present positions and roles of graduates of the AE/HRD program, to determine the degree of impact the program had upon their professional life, and to seek their opinions and perceptions about the program. Two related purposes were to review the program in light of the graduates' comments, and to advise current students of actual positions and roles held by graduates of the program. This was the first such study conducted of this program, and the questionnaire and process would be of benefit to other HRD and/or AE programs.

The results of this also added to the knowledge base regarding professional continuing education in general, and AE/HRD graduate programs in particular. It has already provided the participating faculty and their students better information for academic and career decisions.

Theoretical Framework

The study is based on the theoretical frameworks in three areas: career counseling and development, total quality and continuous improvement, and the more recent development of performance-based learning. Career counseling and development has a long history of research (Ashar & Skenes, 1993; Vanderpool & Brown, 1994; Naretto, 1995, Evans, Forney, & Guido-DiBrito, 1998, Pascarella, & Terenzini, 1998, but relatively little at the graduate level and the assessment of graduate education as perceived by alumni.

Similarly, an increasing amount of research has assessed the impact of total quality and continuous improvement, with mixed results it should be noted (Lewis & Smith, 1994; Arcaro, J. S., 1995, Petrick & Furr (1995)). Similar to the research in career counseling and development, the assessment of the quality of education in general and graduate education in particular has received relatively minimal attention.

Finally, the transition from developmental to performance-based learning is presently occurring, with the theoretical framework still being developed. Research is mostly applied and within corporate and government environments (Brinkerhoff & Gill, 1994; Robinson & Robinson 1995; Swanson, & Holton, 1999; Gilley, Boughton, & Maycunich, 1999), with very few studies in higher education. Thus, this study will contribute to the growing research in these three respective areas.

Research Questions and Hypotheses

Two research questions and related hypotheses guided the study:

Q1 - How many of the alumni of the AE/HRD graduate program are now professionally engaged in Human Resource Development or Adult Education?

H1 - A majority of the responding graduates are working in AE/HRD or related positions and fields.

Q2 - What are the perceptions of alumni about the program?

H2 - A majority of the graduates perceive the program to be beneficial in their professional growth.

Research Design

A survey was sent to 179 people who have graduated over the past ten years (1989 -1999) from an AE/HRD graduate program (two masters degrees and a doctoral degree) in a major urban university in Southeastern United States. The survey was conducted as part of the renewal of regional accreditation of the university. The College of Education, where the AE/HRD program is housed, urged all faculty to assess the impact of their programs. The AE/HRD faculty used this opportunity to seek specific information from the graduates regarding their present lives and their perceptions about the AE/HRD program.

The questionnaire was derived from a general questionnaire the College of Education (COE) developed to solicit feedback from all graduates on the impact of the degree programs (undergraduate and graduate) had upon their present work and profession. The AE/HRD faculty used some of the items from the COE questionnaire, and added additional questions specifically addressing the AE/HRD program. The questionnaire was divided into three parts: (1) a preference rating of 23 outcomes of the graduate program and a request to identify the strongest and weakest aspects of the program; (2) the identification of the competencies a person must have when completing the AE/HRD program; and (3) their current position and future plans, and an optional opportunity to write a brief guided personal autobiography of their lives since completing their program, giving a summary of both their professional and personal lives. This paper presents the data and conclusions from parts one and two.

The analysis of the resulting data consisted of both quantitative and qualitative processes. The data from part one were tabulated, with a comparative analysis conducted based on degree received and year graduated (e.g., do masters graduates perceive the program differently than doctoral graduates; are there any differences in the responses from recent graduates, the last two years, and those who graduated eight to ten years ago?) A content analysis was conducted of the data from part two, with the identification of the strongest and weakest areas, and the ranking of the recommended competencies.

Findings and Discussion

Response Rate.

A total of 40 responses were received. As a quantitative measure, the response rate was at the minimal level of acceptance (22%). Therefore, extrapolation and generalization to the total population have been conservatively applied, as have the recommendations at the end of this paper. As this is the first survey ever conducted, it is the intent to continue surveying the graduates of the program at least bi-annually (see recommendations). The responses received in this survey, discussed below, have warranted further review and consideration in future planning. Such data should be periodically sought in future surveys.

Population.

The graduates responding were from all three degree programs: the doctoral program (EdD) in Adult Education and Human and Human Resource Development (n = 12), and the two masters (M.S.) programs in Human Resource Development (n = 8), and M.S. in Adult Education (n = 19). One graduate did not give a degree, but did complete the survey, and the data were included. The higher number of Adult Education graduates were not all adult education majors, as only one degree, M.S. in Adult Education, was offered up to Spring 1994, with an emphasis in HRD or
The graduates were asked to give their present occupation, indicating if they were in human resource development, adult education, a related field, or not in any of these fields. All but one (98%) responded. Table 1 summarizes the positions by degree and year. Over 90% are either working in AE or HRD (27, 68%), or in a related field (9, 23%).

* Place of employment was not requested, but is given, in generic terms, if stated in the questionnaire.
** Only one degree, M.S. in Adult Education, was offered up to Spring 1994, with a major in HRD or AE. As of
Survey Results.

Assessment of the Program

The graduates were asked in Part One to indicate their level of agreement (from strongly agree to strongly disagree) to 23 statements regarding their use of what they learned in their graduate program (see Table 2). The statements addressed four educational areas: knowledge (e.g., "Understand the ways that knowledge in my field is organized"); skills (e.g., "Use a variety of instructional strategies for diverse populations"); attitudes (e.g., "Engage in reflective research inquiry"); and "Be disposed toward employing critical thinking strategies in my professional roles"); and faculty and scheduling (e.g., "I found my professors to be competent in the subject matter they taught" and "Regarding the scheduling and sequencing of the courses, I got the courses I needed when I needed them").

The grand mean of all the responses was 4.36, with 5.00 = strongly agree and 1.00 = strongly disagree. Thus, the graduates generally agreed or strongly agreed that the knowledge, skills, and attitudes taught in their graduate program enabled them to adequately carry out their present roles and responsibilities. Two clusters of responses were below the grand mean and should be noted. First, an average of 12% of the respondents indicated they disagreed or were uncertain that the skills received in their program -- use instructional technologies to facilitate teaching and learning, and use a variety of instructional strategies for diverse populations -- were adequate. This was further clarified in later, short answer questions that are discussed in the next section.

In a second cluster, an average of 25% of the graduates indicated they disagreed or were uncertain that specific attitudinal areas -- interpret philosophical differences in educational thought, engage in reflective research inquiry, influence community political efforts, and being disposed toward professional leadership roles, and being disposed toward scholarly activity -- were adequately developed. As indicated above, these response statements were from the college-wide survey sent to all graduates, and, in retrospect, these specific items did not clearly apply to the abilities emphasized in the graduate program. The graduates answered the questions honestly; however, with the exception of reflective research (Table 1, item 14), these attitudes are not specifically presented in the program.

The graduates were asked to give recommendations to improve the offering of courses. The 20 (50%) responding collectively recommended more application, or "hands on" experiences, and greater coordination and scheduling of courses. This was recommended by masters and doctoral graduates, and younger and older graduates.

Two final program assessments questions asked the graduates to identify, in light of what they are doing now, the strongest and weakest areas of their graduate program. It appears that they took advantage of this opportunity to express their opinions, as 37 (93%) commented on the strengths of the program, and 27 (68%) on the weaknesses. Three major themes were identified as the program's strength: instructional design and development, adult learning and learning theory, and the development and management of AE and HRD programs. These themes reinforce the two major components of the program, educational (instructional) development, and organizational development. The relative weaknesses of the program identified by the graduates were a lack of specific applications (mentioned above), educational/instructional technology, and applied research. The ability to integrate specific applications is likely to be a continuing problem, as the diversity of the field contributes to the problem of giving appropriate examples and case studies. The emphasis of HRD is learning within organizations, while the emphasis of AE is learning by individuals. Programatically AE primarily takes place in the public sector, more specifically the educational sector, while HRD applies to the public and private sector. HRD in the public sector differs in many ways than HRD in the private sector, however.

The lack of educational technology reflects exponential changes of technology the over the past ten years that results in early graduates now needing skills not delivered when they were students. It also reflects the continuing development of the competencies of the faculty, and hardware and system, all of which are being addressed through further technical training and systems upgrading, and new courses in computer and web-based instruction.

Finally, the weakness in applied research is valid for two reasons. The first reason is tied with the first weakness: applied research is best understood when it can be applied within the context of the learner's environment (work or profession). The second reason is based on a persistent problem of the program being housed in the College of Education. The faculty receive continual complaints about non-AE/HRD courses -- courses in research, and educational philosophy and psychology required of all graduate students -- being too oriented to education in general and K-12 education in particular. The AE/HRD faculty work with these faculty, but this will remain a continuing problem as long as the universities and accreditation standards require demonstrated competencies in these areas, and that they be taught by faculty with appropriate training, albeit in primarily educational contexts.

Recommendations for improving the program

The graduates were asked in Part Two to reflect on the program itself and identify the competencies a person must have when completing their AE or HRD program in order to be a successful practitioner and professional in the field. They were asked to identify and rank the top five competencies. The response to this request was high: 34 (85%) graduates listed 170 competencies. The rankings varied: what were highly ranked competencies of one graduate may be lower ranked by another. For some, the competencies listed reflected what they were dealing with in their
present work, e.g., graduates are being given greater human resource responsibilities and now are seeing the need for
greater understanding of human resource management (HRM), and some are dealing with leadership and manage-
ment issues and would like to have more competence in gaining support from leadership.

Table 2 presents a representative selection of competency lists by degree and the year of graduation, showing
the similarity of responses regardless of their degree or when they graduated. The collective answers to this question
affirmed the responses discussed in Part One. The graduates believe the three competencies (i.e., most often listed as
the first or second competency) persons coming out of an AE/HRD program must have are (1) educa-
tional/instructional development ("needs/tasks analysis," "curriculum design," "ADDIE (analysis, design, develop-
ment, implementation, evaluation) principles"); (2) adult learning ("understand how people learn," "adult teaching
and learning," "adult education techniques for learning") and (3) organizational development ("ability to recognize
the environment for education," "leadership and management skills," "organizational consultation"). Other compe-
tencies identified in the top five were history and current trends in AE/HRD, critical thinking strategies, platform/presentation skills, principles of total quality management (TQM), delivery in multi-formats (internet, com-
puter, CD ROM), and working with and in teams.

* Only one degree, M.S. in Adult Education, was offered up to Spring 1994, with a major in HRD or AE. As of
Fall, 1994, an M. S. in AE and an M. S. in HRD was offered.
Conclusions and Recommendations

The study was conducted to determine the occupational/professional life of persons who graduated between 1989 and 1999 from a graduate (masters and doctorate) Adult Education and Human Resource Development program, and to seek their opinions and perceptions about the program. Forty graduates responded by completing a questionnaire that sought their opinions on specific outcomes, the strengths and weaknesses of the program, and the competencies they believe are needed to effectively work in HRD and AE. The study was guided by two research questions and hypotheses. The first was, how many of the alumni of the AE/HRD graduate program are now professionally engaged in HRD or AE? (H₁, A majority of the responding graduates are working in AE/HRD or related positions and fields.) As presented in Table 1, 36 (93%) of the graduates are either working in AE or HRD (27, 68%), or in a related field (9, 23%). Thus, the first question was answered affirmatively, and the hypothesis H₁ can be accepted.

The second research question was, what are the perceptions of alumni about the program? (H₂, A majority of the graduates perceive the program to be beneficial in their professional growth.) As presented in Table 2, the grand mean if the responses to 23 statements on their use of what they learned in their graduate program was 4.36 (5 = strongly agree). Thus, the second question was also answered affirmatively, and the hypothesis accepted. It should be noted, however, that the mean for 10 of the 23 statements was below the grand means (range 4.35 - 3.55), and, as present above, clustered around two areas - skills in instructional technology and strategy, and development of philosophical, professional, and scholarly attitudes. In other words, while the program was found to be high beneficial, there are areas that warrant further development.

The study further identified key knowledge, skills, and abilities needed in the field by asking the graduates to list the top five competencies they believe are needed in HRD and AE. As presented in the representative competencies in Table 3, the three primary competencies, or more accurately, the competency groups were educational/instructional development, adult learning, and organizational development. These also are the primary areas of development of the AE/HRD program. Thus, the responses can be interpreted as predictable, or the program addresses the needed competencies as indicated by professional practitioners. Their being graduates of the program, but also successful professional leaders and practitioners, it would be acceptable to concluded that both are interpretations are correct.

From this study the following seven recommendations can be made. The first are four recommendations pertaining to the study and its further followed by three recommendations specific to the program.

First, this is the first study of the program. While a exhaustive search of AE and HRD program evaluations was not conducted, the search via email and ERIC revealed that, while programs are evaluated, few evaluations are published. The first recommendation, therefore, is to have the professional bodies (Academy for Human Resource Development (AHRD) and the Commission of Professors of Adult Education (CPAE)) initiate a process of collecting program evaluation reports to use as a reference source of data, instruments, and conclusions and recommendations.

A second recommendation, from the first, is to establish standards of practice and performance. While this has been discussed, and the CPAE established standards in the early 1980's, little reference is made to them, and nothing is presently being discussed.

A third related recommendation is to establish a review process of program reports and possible site visits. Universities, prompted by performance based standards of regional and professional accrediting bodies, are establishing units (offices or departments) of continuous improvement who are given the responsibility of developing and coordinating the performance based evaluation systems.

It is also recommended that the questionnaire be revised to more accurately reflect the program goals and performance outcome. As stated above, the questionnaire was based on a general College survey being conducted as part of the regional accreditation review. While as an initial questionnaire it proved to be effective, it needs to be revised if used again, which the faculty plan to do on a bi-annual basis.

Regarding recommendations specific to the program, based on the study the primary recommendation is the addressing of the identified weaknesses of the program, i.e., instructional technology and strategy skills, philosophical and scholarly attitudes. As an indication of the faculty's perception of the importance of instructional skills, attention has already been given to greater experiential activities and projects in existing classes, and the addition of a methodology course in 1997.

To address the area of philosophical and scholarly attitudes, as stated above, this will remain a problem with the program being in the College of Education and the requirement of taking general research and educational phi-
losophy and psychology courses that are school (K-12) based.

Regarding the recommendation for better course scheduling, this also has been a persistent problem, as two complete masters and doctoral programs are offered at two campuses, taught by three faculty and occasional adjunct instructors. To address this problem a two-year schedule was implemented in Fall 1998, providing the complete degree programs at both campuses over two years. While the schedule is only in its second year, it appears that it has been favorably received.

Finally, while not a recommendation of the responding graduates, they were asked if they would like to receive a copy of the summary report, all said yes, and would they like to be included in an email listserv of graduates in order that the faculty could communicate with them for further input, internship opportunities for present students, an occasional request for financial support, and allow the opportunity for them to communicate with fellow graduates. All but four agreed.

It is the intent of the faculty to send this paper to all graduates, whether they responded or not and invite the non-responders to also be on the email listserv. It is as important to maintain contact with graduates as it is to seek information from them.

Few studies have been conducted on the effectiveness and impact of Human Resource Development and Adult Education graduate programs. With the increasing move toward performance based learning and outcomes, a foundation of specific outcomes and competencies are needed. This research hopefully contributes to the development of qualified HRD graduates as professionals in their discipline through a process of continuous improvement of the knowledge, skills, and abilities they develop and receive in their graduate programs.

Effective Strategies for Recruiting College Students: The Case of Louisiana State University College of Agriculture

Fredrick Muyia Nafukho  
Moi University, Eldoret, Kenya

Michael F. Burnett  
Louisiana State University

The purpose of this study was to determine whether a model existed that significantly increased the researcher's ability to accurately explain whether or not a recruited student in the College of Agriculture at LSU will enroll based upon the current recruitment strategies. The target population for the study consisted of 1,130 prospective freshmen recruited to attend the College of Agriculture in the fall 1997. The actual sample size was determined using Cochran's formula for categorical data to be 143. Since complete data on all the variables for the subjects in the accessible population was obtained, all 226 subjects in the accessible population were studied. The instrument used in this study was a computerized recording form. Data were collected by copying the variables of interest from university undergraduate admissions and the College of Agriculture data bases. Discriminant analysis was used to determine models that explained the subject's enrollment status. Results showed that substantively and statistically significant models exist which enhanced the researcher's ability to accurately explain enrollment status.

Key Words: Student Recruitment, Enrollment Management, Recruitment Models

For admission offices to be successful in their recruitment efforts today and in the future, they must use a growing knowledge base to guide their recruitment programs. There is need for the analysis of the huge student data bases maintained by university admissions offices and colleges. The field of high school student recruitment is tricky, therefore, colleges are challenged to develop appropriate strategies to compensate for reduction of students in traditional academic programs (Miller & Eddy, 1983). Durkin (1985, p.14) observes that competition has increased in the environment in which institutions operate. Today, institutions are highly visible in the advertising marketplace, not only in newspapers but also in magazines, through direct mail campaigns and even radio and television. A marketing orientation is now being used by colleges to recruit and retain students (Berry & Allen, 1977; Blackburn, 1980; Johnson, 1981; & Kotler, 1976).

Colleges must consider needs and wants of their customers when designing the educational product (Stewart, 1991). Even the most reputable colleges have to market themselves in the highly competitive market of student recruitment. Marketing as applied to higher education is a concept that allows college decision makers to think systematically and sequentially about the mission of the organization, the services it offers, the markets it currently serves, and the extent to which these same markets and possibly new ones may demand its services in the future (Ihlenfeldt, 1980a, p.13). Higher education deals with an intangible product that is more of a service than a commodity (Salee & Johnson, 1994). Admission officers therefore need to be careful when they apply marketing concepts to education. There is always some difficulty when it comes to quantifying intangible services such as education. Marketing can, however, enable college management to determine whether its mission matches student interests. In the 1970s and 1980s when the reality of declining students could no longer be denied, more astute college administrators recognized that marketing meant more than selling. It involved strategic decisions in other areas as well and the shift toward adopting a more “customer oriented” perspective began to surface in many institutions (Losher & Miller, 1983, p.9).

Kotler (1975, p.5) defines marketing as the analysis, planning, implementation, and control of carefully formulated programs designed to bring about voluntary exchange of values with target markets for the purpose of achieving organizational objectives. It relies heavily on designing the organization’s offering in terms of the target market’s needs and desires and on using effective pricing, communication and distribution to inform, motivate and service the markets. In higher education, Johnson (1979) observes that marketing tries to give first consideration to

Copyright retained by the authors
the student and societal needs. Losher and Miller (1983) note that one of the basic assumptions of an effective marketing program is that an institution is committed to the philosophy that colleges are in the people business and inflexible decision makers must yield to the needs of the consumers (the students) if they want to recruit them. Although marketing in higher education is mainly associated with promotion and recruitment, Johnson (1979), emphasizes that the scope of an effective marketing program should be more comprehensive and must include research, planning, communication and evaluation. Cox (1980) and Lovelock and Rothschild (1980) argue that marketing should be looked at as a total institutional concept which integrates trustees, faculty, administration and staff efforts into a cohesive team approach. They note further that the level of consumer involvement is of great importance in services marketing.

Unlike business enterprises that process raw materials into final products, colleges are in the ‘people’ business. The mission of colleges is to admit ‘raw’ students and process them into final products in the form of graduates. The concern for having the optimal number of students is now more pronounced than it was in the 1960s and 1970s. Faced with competition and limited financial resources, colleges are using several recruitment tactics to attract students. But to attract the required number of students, efficient recruitment strategies must be employed. Every college must develop its own unique selling points. An understanding of student college choice decision making is therefore critical in designing of unique selling points. For instance, while designing recruitment strategies at the college level, it is important to understand what motivates students to choose a given college. On the lack of data about student characteristics in many colleges, Brodigan and Dehne (1997) noted: “We find it strange how little most colleges know about the opinions, expectations, and satisfaction of current students.” (p.18). They emphasize that at a minimum, a study of current students allows a college to obtain insights into the kinds of students the college might wish to target for admission as well as for reaching them.

Colleges and universities need to promote themselves as a way of coping with the stiff competition they face in student recruitment. In the 1990s, promotion activities have included college catalogs, direct mail, public relations, outreach programs, campus visits, home pages that most universities maintain, and Telecounseling. Promotion aims at portraying a good image or reputation of the university and therefore influence high schools students’ decision to enroll. Psolka (1987, p.1) notes that for an increasing number of institutions, large and small, direct mail cements the strategies used to recruit the dwindling collegiate population. With regard to promotion as a recruitment strategy, Collinson (1987, p.8) observes that most colleges’ publications are examples of image advertising designed to attract students.

Given the various sources available to the students and their parents, the majority of today’s students understand how to research their college program and institutions offering it. Most students who decide to enroll in agricultural programs will take time to research existing colleges. The students’ personal reasons are narrowed down from a university to colleges that offer the relevant program. There is an urgent need for micro-level studies that focus at the college level. Such studies have the ability to estimate the effects of student characteristics, college characteristics, and their interactions on the probability that a student will choose a particular college (Paulsen, 1990). Specific colleges within the university need to establish factors determining student enrollment decisions in order to develop the most appropriate marketing mix of attractive institutional products, delivered in appropriate places, at acceptable prices and appropriately marketed to prospective and potential students. Individual colleges in addition need to establish recruitment models that can assist in explaining and predicting student enrollment status. To develop efficient recruitment strategies at the college level, research is essential.

Statement of the Problem

Recruitment is an essential part of university admissions today. Numerous factors influence the selection of a particular college/university by the students. All universities realize the importance of having sufficient enrollments hence recruitment forms a substantial part of the budgetary allocations of their admissions offices. Colleges within universities must also maintain enrollments. To maintain their enrollments, many colleges have initiated active recruitment programs that supplement university recruitment efforts.

Therefore, the primary purpose of this study was to determine whether a model existed which significantly increased the researcher’s ability to explain whether a student enrolled in the College of Agriculture at Louisiana State University based on recruitment strategies used by the university admissions office and the College.
Study Objectives

The following two specific objectives guided the study:

1. To establish whether a model existed that significantly increased the researcher's ability to accurately explain enrollment status among the freshmen recruited for admission in the College of Agriculture at Louisiana State University during the year of investigation, 1997-98 academic year.

2. To determine the most efficient recruitment model employed by the university admissions office and the College of Agriculture during the year of investigation, 1997-98 academic year.

Methodology

The target population for this study was defined as all prospective freshmen who were recruited to attend the College of Agriculture at LSU in the fall of 1997. The accessible population was comprised of fall 1997 prospective freshmen that resided on both the undergraduate admissions and the College of Agriculture databases. The university undergraduate admissions data base houses all undergraduate admissions contacts with students. The College of Agriculture data base equally houses all undergraduate admissions contacts with students such as: TAgger Day, telephone, WWW, and attendance at 4-H and FFA functions.

Sample. Each sampling unit was comprised of a student who received at least one contact from both the LSU admissions office and the College of Agriculture prior to fall 1997. The minimum required sample size for the study was determined using Cochran's (1953) sample size formula for categorical data. A comparison of 1,130 students who resided on the College of Agriculture's contact list of 1997 high school seniors, with the university undergraduate data base gave a total of 226 students who met the criteria for inclusion as a member of the accessible population. From the accessible population, the actual minimum required sample size was determined to be 143. However, since complete data on all the variables for all the subjects in the accessible population were obtained, all 226 subjects in the accessible population were included in the study.

Instrumentation and Data Collection. A computerized recording form was the main instrument used for data collection in this study. Specific variables from both the university undergraduate admissions database and the College of Agriculture admissions database were selected. The variables selected were those that addressed the objectives of the study. A file was established into which the variables were systematically copied. The primary criteria of recruitment variables studied included: 1) student demographics 2) Mail contact 3) Campus visitation programs 4) Outreach programs 5) Financial assistance 6) Telecounseling, and 7) use of Internet. Data was collected during the spring and summer semesters of 1998 by copying over 70 variables from the university's undergraduate admissions data base and 29 variables from the College of Agriculture's admissions data base.

Findings

The study was designed to answer one major question: Does a model exist that significantly increases the researcher's ability to accurately explain the enrollment status of the students in the study? This section presents and discusses the results of the prediction models.

Enrollment Prediction Models. Discriminant analysis was the statistical technique employed to establish whether a model existed that significantly increased the researcher's ability to accurately explain enrollment status among the freshmen recruited for admission in the College of Agriculture at Louisiana State University during the 1997 - 98 academic year. This technique was found appropriate since the dependent variable, enrollment status is a dichotomus variable (Klecka, 1980). Three types of models were examined, the comprehensive discriminant model which employed all the recruitment activities measured in the study as well as all demographic information collected by the researcher. The second model, the comprehensive recruitment model included as independent variables only those variables that were specifically designed as recruitment activities by the university admissions office and the College of Agriculture. The third model, the most efficient recruitment model, included the fewest number of recruitment activities employed while still providing the researcher with a model that was both substantively and statistically significant.
The Comprehensive Discriminant Model

This model included all available information from the university admissions office and the College of Agriculture. The comprehensive explanatory model aimed at maximizing the researcher's ability to correctly classify subjects on the dependent variable enrollment status, defined as whether or not the subjects in the study enrolled as students in the College of Agriculture at Louisiana State University. The model included all recruitment activities carried out by the university admissions office and the College of Agriculture as well as the demographic information.

Before conducting a discriminant analysis, the independent variables to be included in the analysis were examined for the presence of multicollinearity. Although several techniques exist for conducting a multicollinearity test, Lewis-Beck (1980) shows that the most powerful method for assessing multicollinearity is to “Regress each independent variable on all the other independent variables” (p.60). The strength of this method lies in the fact that it takes into account the relationship of each independent variable with all the other independent variables and a combination of other independent variables. Whenever the cumulative R² values approach 1.0, there is high collinearity. To ensure that there were no cases of collinearity between the independent variables, the cumulative R² was checked for all the independent variables. The regression equations for all independent variables revealed two instances of excessive collinearity. In each instance, one of the variables was eliminated from the final analysis to correct the problem.

The next step in conducting a discriminant analysis is to examine the computed standardized canonical discriminant function coefficients. As shown in Table 1, the centroids for the groups were determined to be -1.40 for the not enrolled group and .69 for the enrolled group. A total of 20 factors entered the discriminant model and produced an overall canonical correlation of R = .701. This indicates that the combination of the 20 factors in the model explained a total of 49% of the variability in whether or not students entered the College of Agriculture at LSU as freshmen.

b = standardized discriminant function coefficient  
$s = within group coefficient  
Rc = canonical correlation coefficient
The factors which were found to have the highest standardized coefficients were the dollar amount of financial aid awarded to the students, whether or not the student came from the state of Louisiana, the score obtained by the student on the American College Testing (ACT) examination, whether or not the student was awarded a departmental scholarship, whether or not the student's parent was an alumni of LSU, and whether or not the student received the LSU alumni association scholarship. A further examination of Table 1 reveals that the variable Amount had the highest within-group structure coefficient, \( s = .54 \). The variables that met the criteria for substantive significance (defined as those variables that had a structure coefficient of half or more than half the within-group structure coefficient of the highest variable) were whether or not the student came from within Louisiana, whether or not the student was awarded a departmental scholarship and whether or not the student was awarded a scholarship. Finally, the percent of correctly classified cases were examined. The comprehensive model was found to correctly classified 85.84% of the cases analyzed.

The Comprehensive Recruitment Model

Besides the comprehensive model, to accomplish objective two, a comprehensive recruitment model was determined. This model only included recruitment strategies. The demographic variables were eliminated.

Prior to conducting a discriminant analysis, independent variables to be included in the analysis were examined for the presence of multicollinearity. This was done by regressing each independent variable on all the other independent variables (Lewis-Beck, 1980). This procedure helped in establishing whether there were any cases of multicollinearity. The cumulative \( R^2 \) was checked to determine whether or not it approached 1.00. It was determined that there were no problems with collinearity. The computed standardized canonical discriminant function coefficients were examined. As shown in Table 2, the centroids for the groups were determined to be -1.25 for the not enrolled group and .63 for the enrolled group.

\( b = \) standardized discriminant function coefficient
\( s = \) within group coefficient
\( Rc = \) canonical correlation coefficient
Data in Table 2 shows further that a total of 15 factors entered the discriminant model and produced an overall canonical correlation of \( R = .665 \). This indicates that the combination of the 15 factors in the model explained a total of 44% of the variability in whether or not students entered the College of Agriculture at Louisiana State University as freshmen.

The factors which were found to have the highest standardized coefficients were the total dollar amount awarded to the prospective students in the form of financial assistance, whether or not the student was from within the state of Louisiana, whether or not the student was invited to Explore LSU program during the senior year of high school, whether or not the student received LSU alumni scholarship (Top 100), whether or not the student was invited to Tiger Day during the senior high school year and whether or not a departmental scholarship was awarded.

A further examination of Table 2 reveals that the variable “Amount” had the highest within-group structure coefficient, \( s = .62 \). The variables that met the criteria of substantive significance (defined as those variables that had a structure coefficient of half or more than half the value of the within-group structure coefficient of the highest variable) were, whether or not the student came from within Louisiana, whether or not the student was invited to Explore LSU Program as a senior and whether or not the student was awarded a departmental scholarship. Finally, the correctly classified cases were examined. The comprehensive recruitment model was found to correctly classify 83.19% of the cases analyzed.

The Most Efficient Recruitment Model

The most efficient model in this study was defined as the model which included the fewest number of recruitment activities while still providing the researcher with a model that was both substantively and statistically significant. To determine the model, the comprehensive recruitment model was used as a base and all variables meeting the criteria for substantive significance for both the discriminant function coefficients and the within-group structure coefficients were selected. A series of discriminant models (3 factor to 14 factor) were examined to determine the most efficient model.

Each of the models was examined for the percent of the correctly classified cases to select the most efficient model. All of the models examined (3 factors to 14 factors) had a total percent of correctly classified cases varying from 76.55% to 83.19%. In addition, when fewer factors were entered, the drop in the overall total correctly classified cases was very small. The model that was chosen as the most efficient was the 6 factor model, as it had a very high percent of enrolled cases correctly classified, 82.7%. This percentage was the same as the one obtained for the 14 factor model. The six factor model also had a very high total percent of correctly classified cases of 80.09%.

The initial step in examining the derived most efficient model was to compare the groups on each of the independent variables. Independent variables to be included in the analysis were then examined for the presence of multicollinearity using Lewis-Beck’s (1980) technique. The researcher determined there was one problem with multicollinearity, and one of the collinear variables was accordingly eliminated from the final analysis. Each of the factors that entered this model was statistically significant, however, fewer factors were found to meet the criteria of substantive significance for inclusion of the factor in the final model.

Since the purpose of this model was to determine the most efficient model, all variables were retained that met the statistical criteria for inclusion. As shown in Table 3, the centroids for the groups were determined to be -1.112 for the not enrolled group and .56 for the enrolled group. A total of six factors entered the discriminant model and produced an overall canonical correlation of \( R = .622 \). This indicates that the combination of the 6 factors in the most efficient recruitment model explained a total of 39% of the variability in whether or not students entered College of Agriculture at LSU as freshmen.

b = standardized discriminant function coefficient
s = within group coefficient
Rc = canonical correlation coefficient

Table 3 shows further that the factors which were found to have the highest standardized coefficients were the total dollar amount of scholarship awarded to the student, whether or not the student was from within the state of Louisiana, whether or not the student was awarded a departmental scholarship, whether or not the student was invited to Tiger Day as a senior in high school, whether or not the student was awarded a tuition honors scholarship and whether or not the student was invited to LSU preview.

Data in Table 3 show that the variables Dollar Amount (the total dollar amount awarded to the student), STATE (whether or not the student came from within Louisiana) and whether or not the student was awarded a departmental scholarship met the criteria of substantive significance for inclusion in the model. The variable the total dollar amount awarded to the student had the highest within-group structure coefficient of s = .70. While the variables STATE and Departmental Scholarship had structure coefficients of s = .55 and s = .39 respectively. The other variables that entered the model were retained since the purpose of this model was to establish the most efficient recruitment model. Finally, the correctly classified cases in the most efficient model were examined. This model correctly classified a total of 80.09% of the cases analyzed.

Conclusion

Substantively and statistically significant models do exist that increase the researcher's ability to correctly classify prospective students on their enrollment status at Louisiana State University in the College of Agriculture. Despite the fact that there are several factors that influence the college choice decision making process, the models in this study are viable. The comprehensive, the comprehensive recruitment and the most efficient models in the study not only identify factors that correctly classify the prospective students in the study, but also determine the specific students who were correctly classified as enrolled.

The researchers recommend refinement of the model by replicating the study, at smaller units. University admissions office, college recruitment personnel and all personnel involved in the recruitment of freshmen should engage in further study of the enrollment modeling as a way of improving enrollment management. The science of enrollment management is becoming complex and therefore requires more studies of this nature to help in explanation and prediction of student enrollment status. The College of Agriculture and all other colleges in the university require efficient and modern recruitment strategies that will ensure that students who 'fit' the mission of each college are recruited.

Limitations

This study mainly relied on quantitative methods of data collection and analysis. While this was necessary because
of the nature of the study, the findings of the study could have been strengthened by employing a mixed methodology. This could have been done by interviewing some of the subjects in the study.

The findings of the study can only be generalized to the sample of the 226 subjects who were included in the study and not the entire college of agriculture students who made initial contact with the college recruitment officers and the university undergraduate admissions officers during the year of investigation. Although limited in scope, the data generated from this study provide insight to enrollment management directors, faculty and all personnel engaged in the complex and unpredictable science of enrollment management.

Implication for HRD

Most of the existing HRD programs enroll graduate students. The findings of this study show that substantively and statistically significant recruitment models exist that can be employed in marketing undergraduate programs. In view of these findings, several implications emerge pertaining to HRD:

This analysis suggests that each HRD program like other university programs must endeavor to employ the most efficient recruitment models that will save dollars while admitting the students who meet the "fit" and mission of the program. Further, refinement of the model by HRD professionals engaged in the training of graduate students is necessary. As the HRD programs develop in the US and other parts of the world, student recruitment studies become necessary. The science of enrollment management is becoming complex and therefore those running HRD programs and Colleges of Education need to conduct more studies of this nature to help in explanation and prediction of student enrollment status. All admissions officers and faculty involved in the marketing of HRD programs should benefit from the results of this study. As the findings of the study show, student recruitment requires combined effort from enrollment directors, staff and faculty.

Innovative Techniques in The Training of Health Professionals: The Case of Moi University, Faculty of Health Sciences, Kenya

Simon Kangethe
Fredrick Muyia Nafukho
Moi University, Kenya

Alfred M. Mutema
Egerton University, Kenya

This article argues that innovative teaching/learning methods are quickly replacing the traditional methods which were characterised by straight lectures, large group demonstrations and apprenticeships. The current knowledge revolution requires innovative educational methods in the training of professionals. The current emphasis is to place the learner at the centre of the learning process. This emphasis shifts the responsibility of teaching/learning from the teacher to the learner. The paper specifically discusses the training of health professionals at Moi University and the innovative training strategies employed in the training.

Traditional teaching methods characterised by lectures and large groups demonstrations are quickly being replaced by modern innovative teaching/learning methods. The growing need for new and effective approaches was recognised by education in the field of basic and secondary school education in Kenya more than two decades ago when the calls were made to change curricula to make them more practical and relevant to the needs of the Kenyan people which led to the current 8-4-4 system of education. In this system, we have 8 years of Primary education, 4 years of secondary education and a minimum of 4 years of university education (Ministry of Education, 1984).

The interesting development is the recent recognition by some educators of the need for innovative education in institutions of higher learning particularly in the training of health professionals at Moi University.

The main emphasis of the innovative teaching method is to place the student at the centre of the teaching/learning process and to place the burden and responsibility for learning on the learner. The other major emphasis is to avoid rote-learning and to develop problem-solving and life-long learning skills for the learner; in short - teaching the student how to learn.

Hard core traditional educators who thrived in preparing lesson plans and then lecturing for hours to passive students find it difficult to change. They ask, “why do we need new teaching and learning strategies now, whereas we seem to have been doing well with lectures, practical demonstrations and apprenticeships for centuries?”

Some traditional educators who are responsible for training health professionals complain louder than all other educators. They ask, “why do health workers have to contend with the burden of how to learn besides the heavy burden of the immense subject matter of the various courses they have to take?” These questions and others sum up the problem and need for innovative education especially for health professionals who are involved in the field of training and development.

Problem Statement

Trainers of all professionals particularly health professionals have experienced a great need to adopt new teaching/learning methods which will ensure effective learning for their trainees. This need has arisen from the knowledge-explosion, and the rapid technological changes which characterise our modern world. The traditional lecture methods where experts talked for hours to passive students, coupled with demonstrations done by the experts to large audiences have fallen out of favour. As trainers flee from the traditional methods, they have found themselves in the middle of a new problem – the problem of identifying and applying the innovative teaching/learning methods thus replacing the out-dated traditional methods.
The primary purpose of this paper was to conduct a thorough review of literature to identify the innovative teaching/learning methods. The paper also discusses the application of the innovative teaching learning strategies at the college of Health Sciences, Moi University, Kenya.

**Research Questions**

1. What innovative teaching/learning methods are appropriate for training health professionals at Moi University, Kenya, given the new environment which is characterised by rapid increase of knowledge and rapid technological changes?
2. What do innovative teaching methods or techniques entail?

**Rationale for Innovative Teaching and Learning Strategies**

Increasing complexities of modern life call for adaptation to many changes that take place in many aspects of our daily lives, especially in this knowledge explosion era (Nafukho, 1998). Education ought to prepare professionals to adapt to the many changes, hence the need for innovative learning and teaching methods. Several powerful reasons have been offered as explanations for the rapid development of innovative educational methods. These have been articulated as follows:

1. Teaching methodologies that enable students to develop competencies required for successful, professional life, promote life-long learning, develop self-directed learning skills and problem solving skills have become more valuable than traditional methodologies.
2. Harden et al. (1986) noted that “through years at an authoritarian medical school, idealistic young doctors are moulded into rigid doctors who have lost much of their original ability.” Medical and allied health professionals have also identified the deficiencies of traditional methods of training which have been characterised mainly by lectures, and large group demonstrations. They have developed new approaches and methodologies to address the deficiencies of the traditional methods.
3. Information explosion and rapid increase of knowledge-bases around the world has overtaken traditional teaching methods therefore teaching “How to learn” and “How to find out” have become more valuable than teaching digested facts, or spoon feeding “facts” to students.
4. Rapid technological changes have further complicated learning. The technology which is taught, crammed and practised today is obsolete before the students graduate, therefore, teaching methodologies that promote life-long learning skills have become more valuable because they enable graduates to keep-on-learning and keep up to date even after leaving school (Nafukho and Holmes, 1998).
5. Professional life in modern times calls for adaptability, participation in change and interaction with different specialists in problem-solving teams. Teaching methodologies that enable students to develop competencies required for successful professional life have become increasingly preferable to the straight-lectures and the rote-learning traditional methods, commonly employed by Kenyan University Lecturers and trainers.
6. Fast changing society, an expanding body of knowledge (information explosion), and rapid technological changes demand Continuing Education. Therefore, learning skills developed during innovative education, enable doctors and other health professionals to do Continuing Education in a self-directed manner. Study and practice in the areas of medicine and health sciences is a life-long task.

Innovative education unlike the traditional education is a process which helps the student to develop skills such as:

- Self directed learning
- Problem-solving
- Critical thinking
- Communication
- Information searching
- Evaluation
- Clinical reasoning
- Continuing Education
- Emotional & Social support
- Interpersonal
All of these skills help to convert students into: independent learners

During the teaching/learning process traditional teachers/lecturers are converted from preachers (information conveyor belts) to people who simply:

- facilitate
- advice
- guide (control)
- inform
- participate
- withdraw

**Historical Development Of Innovative Medical Education**

In the mid 1970’s, many countries around the world had developed centres in faculties of health and medical schools with the growing recognition that a body of education/science needed to be understood by teachers of medical and allied health professions.

It was increasingly noted that by training teachers of medical and allied health professionals in educational methodology, the overall results were satisfying and rewarding. Specifically it was noted that modern medical education calls for teaching and testing beyond rote memorisation of facts and that training should be to done for:

- understanding of knowledge
- application of knowledge
- individual performance in realistic situations

As far back as 1951 a World Health Organisation (WHO) committee had made mention of the need for medical education. The first medical education program to meet the need for trainers familiar with appropriate educational methodologies was launched in University of Illinois WHO centre in 1959. In 1970 WHO began comprehensive co-ordinated long term programs for trainers of health professionals. In the same year an agreement was signed and WHO set up training centres for teachers of medical and allied health professionals. After establishing the Illinois Center, there was a proliferation of centres of educational Development for health professionals especially during the period 1971-73. The following centers were established during this period:

- For English speaking countries - WHO Regional Teacher Training Centre (WHO - RTTS ) at Makerere University, Uganda.
- For French speaking countries - WHO Regional Teacher Training Centre at University Centre Younde, Cameroon.
- For Americas - WHO - RTTC in Mexico, and in Rio De Janeiro, Brazil.
- For Eastern Mediterranean at Pahlari University, Shira, Iran.
- For Western Pacific - University of New South Wales in Sydney, Australia.

Innovative medical education has been developed in response to dissatisfaction of public and health professionals with res ults of traditional medical education. Innovative strategies were used the Greeks – in what were called the dialogue and questioning method (Plato) (Boud and Feletti 1991). Chamberlain (1889) advocated “Multiple-making hypotheses.” John Dewey (1916) recommended the use of Real-Life situations”, and problems to be presented as part of the learning process: John Dewey (1929) and Piaget (1969) had actually demonstrated the ineffectiveness of providing ready made solutions to learners. Frazer (1931) and Brunner (1961) demonstrated how problems may be used in education. Recently (1980) Cyert pointed out that “All professionals are problem solvers and should be taught in problem-solving processes.

Brunner is the main proponent of discovery learning which is an important aspect of Problem-Based Learning (PBL). Frazer founded the case study method in which a case contained the facts, opinions and expectations needed to trigger off and feed a process of learning.

In 1961 the application of the problem-solving approach to the whole medical curriculum was started by Ham and associates at Case Western university, Cleveland Ohio, USA, in a Haematology course. The results of a comparison between students taught in the didactic method and those taught in innovative way - PBL -SDL showed the latter to be superior in exam scores.

In 1969, Howard Barrows in McMaster University in Ontario, Canada established the first problem solving curriculum. The approach they developed was the PBL approach. This method resembled both discovery learning
and the case study method. In 1974, the university of Maastricht became the first European medical school to start an innovative medical education program, Problem-Based Learning (PBL).

The other well known universities to launch innovative medical education programs include:
- New Castle Medical School, Australia - (1979)
- Suez Canal University, Faculty of Medicine, Egypt - 1982.

WHO has contributed generally to the establishment of innovative medical education programmes. It supported the establishment of a net work of community-oriented educational Institutions for health sciences in 1979. By early 1990’s, it is notable that more than 50 institutions, had became members of the network. By mid 1990’s, more than 70 countries had signed up as collaborating members in Problem-Based Learning. In the case of Kenya, It is noteworthy that the college of health sciences of Moi University became a WHO Problem-Based Learning collaboration centre in 1994.

Theoretical Framework

The framework of this paper centers on the work done by World Health Organisation (WHO) in the area of effective education for health workers and the efforts of the college of Health Sciences of Moi University, Kenya to respond to the need for identification and application of innovative teaching/learning methods. As shown in the historical background of this paper, even before 1951 a committee of WHO had mentioned the need for measures which would ensure effective teaching of health workers. Since the health professionals make a major contribution to national development, it is crucial that their training should emphasize the application of the knowledge acquired during training.

Research Methodology

This is mainly a concept paper that has reviewed the pertinent literature in the area of medical education and the literature pertaining to innovative teaching/learning methods. This is then applied to the actual teaching practices employed by the College of Health Sciences, Moi University, Kenya.

Innovative Teaching at Moi University College of Health Sciences

The mission of Moi University is to produce graduates with practical and intellectual skills appropriate to the needs of present and future Kenyan society. The College of Health Sciences of Moi University strives to ensure that the students acquire such skills using modalities that encourage active learning in the context in which they will later function as health professionals.

The philosophy of the college, also embodied in the curriculum, entails training a doctor in the context of the community, in which he/she will later practise. It encourages the student to acquire the important skills of self-directed learning, problem solving, and effective communication. Moreover the college emphasises not only curative, hospital based medicine, but also, through its community oriented approaches, prevention of diseases and promotion of good health.

Research orientation and an inquiring mind are integral parts of the training of a medical student, as well as other health professionals. The college, therefore also lays emphasis on acquisition of knowledge and skills in research, so that the graduates from all her programs will be able to carry out research, in the health and health related issues in modern day Kenya.

As a result of the overall mission and philosophy of Moi University, the orientation of educational programs at the College of Health Sciences are population and community based. The teaching and learning strategies have been deliberately chosen to encourage acquisition of an integrated and holistic body of knowledge and skills through self-directed active learning methods. This supports the mission of Moi University of producing graduates who are practical in outlook and suited to meet the needs of the present and future Kenyan society.

Innovative Teaching Methods

The following are the common methods used in innovative medical education:
• Self-directed learning (SDL)
• Small Group tutorials/Discussions
• Competence-Based learning
• Community Based education & service
• S P I C E S
• Case study
• Project
• Demonstrations
• Illustrated/Overview Lectures
• Role-play
• Computer-Assisted Instruction (CAI)

**Self Directed – Learning**  Self-Directed Learning involves clear establishment of objectives by the learners. This may be done by individuals or groups of students. They may do it entirely on their own, or with some guidance from tutors. Information gathering commences and may lead students to either the library, learning resources centres, outpatient and in-patient hospital locations. It may lead student to consult either among themselves, their tutors, subject experts or guest consultants.

The major aspect of self-directed leaning is that students determine what they need to learn and to what depth. However, some guidance has to be put in place, and the availability of resources persons included whenever needed.

A special point worth noting in self-directed learning, is that tutor/guides, student guides, course booklets and curricula have to be available to students. This is in recognition of the fact that although some students may be fully capable of self directed learning, a small percentage require occasional guidance while a greater majority may require much more guidance from tutors. Student guides and other booklets may reduce the need for students to depend on tutors for their learning. SDL at Moi University is used in conjunction with Problem - Based – Learning (PBL). At times it is used entirely on it’s own as a method of teaching depending on the circumstances.

**Small Group Tutorial/Discussions**  Small Group Tutorial discussions, involves small number of students working together in the teaching/learning process. The number of students in a group ranges between 5 -10. Small group tutorials facilitate the development of many skills which are emphasised in innovative medical education and these include:

- Problem-solving skills
- Communication skills
- Reasoning skills
- Interpersonal skills
- Teamwork
- Attitude - shaping

Ideally small group tutorials should function under the supervision of a tutor whose role should be facilitatory as opposed to authoritarian. However, group dynamics need to be taught to students in order to prepare them for the interaction and the effects of this on student learning. Particularly, students need to know of the stages of group encounters and interaction such as:

- Forming
- Storming
- Norming
- Performing
- Teamwork
- End of group work

**Competence Based Learning**  Competence Based Learning emphasises performance of the learners in terms of knowledge, skills and attitudes, and is therefore an appropriate method for professional training.

**Competency Based Curricula**  The competency -based curricula have been used in designing and developing educational programs in health professions for many years. This model has been found to be quite appropriate in Problem-Based Learning, students-centred, community-oriented and integrated programs (Mutema, Kang’ethe and
Kivanguli, 990), Harden, (1986) described ten major steps that are critical in developing a competency-based curriculum. Table 1 presents the process of developing a competency-based curriculum in health professions.

</table>

Community Based Education and Service (COBES) Community Based Education and Service is basically aimed at providing students with opportunities for learning within the communities. During such periods, students learn the sources, the nature and magnitude of health problems and related problems. In exchange for learning in this real life environments, students provide needed health-related services to different communities, each according to need.

SPICES The S P I C E S method is an approach that is commonly used at the Faculty of Health Sciences of Moi University. It is more than a teaching/learning method it is also a curriculum development approach. The Spices model is another educational approach that has been found extremely useful in developing curricula in health professions and especially those educational programs that put emphasis on problem-based learning, students centered, integrated community-oriented, electives and systematic as the acronym "SPICES" shows. The spices model has been found appropriate in planning, review and tackling problems related to the curriculum and in providing guidance relating to teaching methods and assessment of student performance.

In recent years there has been increased interest in curriculum planning in health professions due to many factors which have been raised earlier. In planning the curriculum and especially in new faculties of health sciences, innovative approaches such as (SPICES) have been considered. These are shown in Table 2 and are compared with traditional approaches in medical education.

Table 2: Curriculum Approaches -- "SPICES" VS TRADITIONAL

<table>
<thead>
<tr>
<th>&quot;SPICES&quot;</th>
<th>Traditional</th>
</tr>
</thead>
<tbody>
<tr>
<td>S Student-Centred</td>
<td>Teacher-Centred</td>
</tr>

<td>C Community-Oriented</td>
<td>Hospital-Based</td>
</tr>
<tr>
<td>E Electives</td>
<td>Standard Program</td>
</tr>
<tr>
<td>S Systematic</td>
<td>Apprentice-Based Or Opportunistic</td>
</tr>
</tbody>
</table>

In the planning and developing of the Moi University Health Sciences curriculum the use of the "SPICES" had to be considered in order to assist the teachers to understand the particular educational strategies they needed to use in implementing their programs. Also, by examining each of these issues it gives teachers and policy makers a better understanding and insight into the whole curriculum. The competency-Based Model and the spices model of curriculum development are useful educational strategies that have been used at Moi University to develop relevant curricula which are responsive to the health needs of the community. The application of these models has also assisted in making rational decisions during the initial planning stages and also during the actual process of designing, developing, integrating, implementing and evaluating the curricula.
Case Study  This is a method in which medical and allied health professionals select cases and use them as the focus of study. Students take each case, read about it, analyse it, and make suggestions and recommendations regarding the case on the basis of the evidence they have gathered. Problem-solving skills including information searching skills are developed among other skills.

Project Method  This is a method of teaching/learning in which learners are assigned a task or group of tasks to carry out over a given period of time. At the end of the same period, the learners make a presentation or submit project reports for assessment. At Moi university students choose their own projects with guidance from their tutors.

Demonstrations  This is a most appropriate method, especially for teaching skills. In the innovative medical education, several points are emphasised with a view of facilitating maximum benefit from this process. The cardinal point of emphasis is that provision be made for students to practise and actively participate in the learning process. Therefore, such aspects as demonstration being clearly visible to learners, audible and correct in procedure are deemed as vital.

Illustrated/ Overview Lectures  In traditional medical education, lectures are typically cathedral type, boring and for the majority of students facilitate little learning. In innovative medical education lectures are to be over - view and spanning the major areas of study. As little time as possible is spent on direct lecture, with opportunities sought to interact with the learners whenever possible. - Use of handouts, posters, charts and other audiovisuals are encouraged in order to provide illustrations for the topics being addressed.

Role Play  This is an old method of teaching but increasing in popularity hence its inclusion among innovative medical education methods. Depending on the objectives of a session, a tutor or students, assign each other different roles. By acting out these roles, students learn various correct functions and responsibilities intended for the session. Active participation and team work are among the major benefits of this method. Clear statements of the goals and objectives of the session are however necessary.

Computer Assisted Instruction  Computers are being used increasingly in all spheres of education. Particularly, they are being used for teaching as well as assessment. Cox and Ewan (1988:244) indicate that three broad categories of computer programs are available for medical education which include:
- computer assisted instructions -CAI
- computer assisted assessment -CAA
- computer managed instruction-CMI

At the College of Health Sciences, Moi University, Introduction to computer applications is one of the courses that all students required to take during the first year of study. In subsequent years, students are encouraged to use computers which are conveniently placed in resource rooms and laboratories. Although computers may not currently be extensively used in the developing countries there is evidence of increased use in future especially in urban areas.

Contribution to Human Resource Development

The Human Resource Development field has a major role to play in promoting learning both at the workplace and at the learning institutions. As demonstrated in this paper HRD professionals who are engaged in training must employ innovative teaching techniques which aim at producing effective and creative professionals. The health workers who have been trained at the College of Health Sciences of Moi University, include three groups of medical doctors, environmental health officers and nurses. The three cohorts of students who have graduated from the College have been very successful in the field. The general feedback from their supervisors in Provincial and District hospitals where they work, has been very positive. The graduates have been described as being very practical and community oriented.

Conclusion

Preparing effective doctors and auxiliary health professionals for the 21st Century will require innovative teaching methods. Such methods will be important in preparing health workers to become independent learners who will be able to effectively deal with the health care problems of the 21st century. This paper has provided the rationale for innovative teaching strategies at Moi University’s College of Health Sciences, Kenya. Also discussed is the historical development of innovative educational programs world over. The paper has equally discussed in detail
innovative teaching methods employed in the training of health professionals in the College of Health Sciences, Moi University, Kenya.

Relationship Between Learning Organization Strategies and Performance Driver Outcomes

Elwood F. Holton III  
Sandra M. Kaiser  
Louisiana State University

In this study a new learning organization assessment instrument was administered to 440 employees (53% response rate) at a large nuclear power plant anticipating extensive changes. Initial factor analyses indicated 22 separate scales, all with acceptable reliabilities. Regression analyses showed initial evidence of criterion and discriminant validity. Hierarchical regression showed that instrument factors predicted 70% of perceived innovation and suggested mediated relationships for future structural analyses.

Keywords: Learning Organization, Assessment Instrument, Performance Outcomes

The learning organization literature suggests that adoption of learning organization strategies should enhance learning at the individual, team, and organizational levels. In addition, organizational learning should be related to change and innovativeness (Kaiser & Holton, 1998). And, it has been suggested that the ultimate outcome of organizational learning is performance improvement. However, Jacobs (1995) cautioned that research is needed to objectively test the claims of improved organizational effectiveness brought about through implementation of learning organization strategies. As Jacobs (1995) discussed, the deficiencies and the challenges include: 1) the lack of research supporting the claim that a causal relationship exists between learning and performance, and 2) research is overdue which demonstrates that the adoption of learning organization strategies lead to organization performance improvement. This problem has only recently begun to be addressed (Ellinger, 1998; Kaiser & Holton, 1998; Selden, Watkins, Valentine, & Marsick, 1998; Yang, Watkins & Marsick, 1998).

The purpose of this study was to empirically address some of these validation issues. This field study developed a new instrument to assess learning organization strategies; measured perceptions of learning organization strategies; and, provided a preliminary test of the relationships between the organizational variables and the outcome measures of learning, external alignment, and innovation. The complete set of research hypotheses can not be listed due to space limitations but the general research questions was: Would measures of learning organization strategies predict learning (team, experiential, and generative) and when combined with learning, predict innovation and external alignment?

Theoretical framework

Learning organization theorists have made the claim that organizational performance effectiveness should be improved by adopting the features described as basic components of a learning organization (Kline & Saunders, 1993; Kuchinke, 1995; Senge, 1992; Slater & Narver, 1993). However, they have struggled with the issue of empirically demonstrating relationships between the many prescribed learning organization strategies and performance improvement outcomes.

Holton (1999) provided a partial answer when he addressed the meaning of organizational performance. He drew the distinction between “performance” and “performance drivers” which clarified the roles of different strategic outcomes. Performance was defined as the tangible products or the services provided by the organization. Performance drivers were defined as elements of performance that build capacity to maintain or intensify the individual’s, processes’, or system’s ability to be effective or efficient in producing outcomes. Learning and innovation are examples of organizational performance drivers (Kaiser & Holton, 1998). As a set, performance and performance drivers explain the hypothesized cause and effect relationships in an organization’s strategy (Kaplan & Norton, 1996). They are both important to the successful attainment of organizational goals. In this conceptualization, the learning organization is an organization development strategy aimed at increasing organizational learning, which is defined as a performance driver.
While it would be ideal to measure the effect of LO strategies on performance as measured by traditional business outcomes such as financial indices and market share, that is often difficult to accomplish on a timely basis. An alternative study of the relationship between learning organization strategies and performance is to examine the effect of learning organization strategies on organizational performance drivers. Kaiser and Holton (1998) proposed that if organizational learning and innovation were conceptualized as drivers of organizational performance, the conceptual model shown in Figure 1 might explain the role of learning organization strategies in improving organizational effectiveness and performance. The model hypothesizes that adoption of learning organization strategies should lead to organizational learning. In turn, learning will lead to innovation in organizations that value creativity and innovation. Learning and innovation are predicted to act as performance drivers and should affect organizational performance effectiveness under the right environmental conditions.

Method

The site for a pilot study of this model was a large nuclear power plant. The electric power industry is currently undergoing extensive deregulation, similar to the changes that the telephone industry faced. The expected outcome of deregulation is a shift from a stable regulated utility environment to one of intense competition. Power companies are expected to separate the generation of electric power from the distribution function so that power distributors will be free to purchase electric power from any source. The prospect of a new, unstable, uncertain environment has led power companies to explore the learning organization as a strategy to cope with this new environment and enhance their competitiveness. This plant contracted with a university HRD program to conduct an organizational assessment. The purposes of the assessment were to evaluate organizational systems in relationship to learning organization characteristics and determine the scope of organizational change required to become a learning organization.

Instrument Development A review of the available learning organization assessment instruments at the time the project began suggested that none existed which completely assessed all the hypothesized influential variables of organizational learning. In addition, many existing instruments had not been validated with rigorous psychometric procedures. Accordingly, it was decided to develop a new instrument that would be a) grounded in a theoretical model of organizational change and effectiveness and b) be developed using sound psychometric procedures. The organization's management was open to a proposal that the consulting team develop a new inventory and to the addition of a research option to the project.

The development process involved two major components. The first step consisted of a series of five focus groups conducted with 48 selected employees. The employees represented the following job categories: classified craft, organizational support (clerical), first-line supervisors, professional (engineering), and middle management (superintendents). Each focus group lasted for approximately 90 minutes and was held in a private conference/training room with only three members of the research team in attendance.
Next, the research team used the Burke-Litwin model (Burke & Litwin, 1992) of organizational performance and change as the theoretical framework to develop a survey instrument. Its integrated variables portray the dynamic relationships in an organization system. When used with a learning lens, the Burke-Litwin model provided a means to integrate the organizational change literature and the learning organization literature; explore the important variables in organizational change and development as related to organizational learning; and establish a foundation upon which to assess both the process variables and the outcome variables important in learning organizations.

Our approach was to examine each of the model's constructs through a learning organization lens. Items were created to assess employee perceptions of the degree to which learning organization practices were present in the respondent's organization. In addition, scales were developed to assess respondents' perceptions of key learning organization outcomes. It is important to note that the employee focus groups were used to provide a reality check, but were not the primary source of the items. The instrument was developed primarily by integrating organizational change and learning organization theory.

The Kaiser-Holton model shown in Figure 1 does not attempt to describe the relationship between the learning organization strategies, but only the relationship of the strategies to learning and performance as an organizational development system. However, the Burke-Litwin model hypothesizes the relationship between the organizational factors that are the targets of the learning organization strategies. These two models used in concert were hypothesized to represent the relationship between the learning organization strategies, learning, and performance.

Learning Organization Inventory The Learning Organization Inventory contained a total of 212 items designed to tap employees' perceptions about various learning practices, beliefs, behaviors, and attitudes. This instrument has also been identified elsewhere in the literature under the name Assessing Strategic Leverage for the Learning Organization (ASLLO) (Gephardt, Holton, Marsick & Redding, 1997; Holton & Kaiser, 1997). The instrument was divided into nine construct domains: organization as a whole, work groups, business strategies and plans, general beliefs, senior management, managers/supervision, organizational support systems, organizational structure, and what is rewarded and expected. Each item used a six-point Likert rating scale (1 = not true, 2 = mostly not true, 3 = somewhat not true, 4 = somewhat true, 5 = mostly true, 6 = true). A demographic component addressed the respondents' work group, job category, level of attained education, and time of service with the company.

Sample The inventory was sent via intercompany mail to all 828 employees in the organization. A pre-addressed envelope was provided with instructions to use company mail to return the surveys to the university. No company personnel handled the completed surveys. A total of 443 inventories were returned with 440 usable for a usable return rate of 53%.

It became apparent early in the collection phase that there was a strong reluctance on the part of craft employees to participate in the assessment process. Suspecting that lack of time during the workday may have been a reason for the low participation, arrangements were made to provide employees an on-site opportunity to complete the inventory. This added only a few more inventories, bringing the number completed by craft employees to a total of 82 inventories, or 18.6% of the sample. Thus, craft employees are under-represented in the sample. A similar under-representation occurred with Senior Management; only seven of twelve responded. This lack of participation is perplexing because the learning organization initiative began with Senior Management. Professional/Technical employees were over-represented, with 222 respondents or 50.5% of the sample.

Analysis Exploratory factor analysis was deemed the most appropriate approach for scale development. While the instrument had a reasonably strong theoretical foundation, the integration of two theoretical bases made confirmatory factor analysis premature. Also, the large number of inventory items compared to the number of subjects prevented an exploratory factor analysis of all 212 items simultaneously. The decision was made to examine the items for underlying factors using the nine construct domains defined on the inventory. Each construct domain was a separate section on the questionnaire and had separate instructions. Items in each category were factor analyzed by principal axis factor analysis with oblique rotation (direct oblimin). Principal axis (common factor) analysis and oblique rotation are generally considered more appropriate when the purpose is to identify latent constructs for subsequent theoretical interpretation (Hair et al., 1998). Items loading at .40 or higher were retained. Item-respondent ratios ranged from 11.0 to 48.9, all in excess of the desired 10:1 ratio (Hair, et al., 1998).

It is clearly possible that a more parsimonious scale structure would emerge if the factor analysis were conducted with a larger sample and all items entered simultaneously into the analysis. However, the instrument specifically identified nine separate domains for which scales should be identified. Therefore, the current analysis is conceptually defensible for initial analyses, though these results should be considered preliminary.

Initial determination of the number of factors to retain was done using the eigenvalue equal to one criterion. However, this criteria is not always the most appropriate when the purpose of the analyses is to discover
latent organization entry constructs and not simply to reduce the number of variables used in subsequent analyses. Interpretable factors with low eigenvalues could capture important latent organizational entry constructs. Thus, the analysis also included examination of factor structures at least one above and below the number indicated by the eigenvalue equal one criteria for each set of items as well as examination of scree plots.

Multiple regression and hierarchical multiple regression analysis (Cohen & Cohen, 1983) was used to evaluate to determine predictors of perceived learning and innovation outcome variables. Hierarchical regression analysis is particularly appropriate in early stages of theory development as it not only evaluates predictive power but can also suggest possible mediated relationships for future path or structural equation modeling analysis.

Results

**Demographics** The sample consisted of employees who were predominantly working in professional/technical jobs (50.2%); had some college (28.9%) or a bachelor's degree (25.9%); and had been employed by the company 3-10 years (47.3%) or 11-15 years (33.9%). The inventory also had a choice of 23 work groups from which employees were to select the one most appropriate for them. The single most frequently selected work group was Site Engineering with 59 employees or 13.4% of the total respondents.

**Factor Analysis Results** Factor analyses identified 22 separate scales, all with acceptable reliabilities (see Table 1). In 7 of the 9 domains the factors retained were those that were a) identified when the eigenvalue equal one criterion was used, b) had a Cronbach's alpha reliability of .70 or higher (Nunnally & Bernstein, 1994) and c) had at least two items. It should be noted that Gorsuch (1983) recommends not retaining any factors with less than three items. However, given the early development stage of this instrument, it was decided to retain one factor with two items that appeared theoretically sound. Two domains (manager/supervisor, rewarded and expected) did not result in clean interpretable structures initially. In both cases, fewer factors than indicated by the eigenvalue equal one criterion were deemed appropriate. This is consistent with evidence that this criteria can result in over factoring, while the scree test may yield fewer factors (Gorsuch, 1997). The scales that emerged from the factor analysis were used to interpret the organization's data and complete the objectives of the project.

The 22 scales of this inventory assessed Burke-Litwin's transformational and transactional variables affecting change, learning and growth. Table 2 shows transformational and transactional variables suggested by the Burke-Litwin model, and what are believed to be the appropriate scales from the assessment instrument which provide a measure of each of these organizational variables through a learning lens.

Descriptive Results: Table 2 also shows the mean scale scores for the pilot site. Because this was the first use of this instrument, no norms were available to which these scores could be compared. Analysis of variance (ANOVA) was conducted for each scale within each of the four demographic classifications: work group, job category, education, and time with the company. Significant differences were found within the job, education, and service time categories. For job category, organizational support employees reported higher scale means than other groups on 11 scales. Classified craft/operators also reported some differences. A two-way ANOVA was used to explore the possibility that differences found among the job categories might be due to an interaction with educational level. No interaction effect was found. For educational level, employees with only a high school education reported significantly higher scale means on 17 of 22 scales. Finally, for length of service, employees with more than 15 years of service reported lower scale means on 6 scales.

Analysis of Outcomes: Five outcome scales were identified based on the conceptual framework underlying the instrument. It is important to note that these outcomes were all respondent perceptions of outcomes, not objective measures. As shown in column one of Table 3, they represent four system level outcomes (#1 - 4) and one team/group level outcomes (#5). The correlations among these outcome variables are also shown in Table 3. All of the correlations were statistically significant and moderately strong.
Next, measures of learning organization characteristics were regressed on each of the five dependent variables to gain initial insights into the predictive power of the variables as hypothesized in the instrument's conceptual frame. Table 4 shows the scales with significant standardized betas for each dependent variable, along with the $R^2$ for each model. The $R^2$ were high, ranging from .50 (experiential learning) to .71 (innovation). While one must interpret this finding cautiously due to the possibility of common method variance, the magnitude of the variance explained nonetheless provides initial evidence of criterion validity for these scales. Furthermore, the significant predictors varied with no predictor appearing in all equations. Knowledge creation and internal alignment appeared in four equations, management performance effectiveness and motivation/engagement in three equations, and the rest in two or fewer equations. This lends support to the discriminant validity of the scales.

Kaiser and Holton (1998) proposed that learning organization strategies such as those measured by these scales improve performance by increasing learning which in turn increases innovation and external alignment, leading to improved performance outcomes under conditions of environmental uncertainty. Thus, a second analysis was conducted using hierarchical regression to determine the extent to which the predictor variables added to the variance explained in each dependent variable. For space reasons, only the analysis for innovation is discussed here (see Table 6).

$(Adjusted R^2)$ | .48 | .68 | .58 | .69 | .56 |
Each set of learning organization strategy variables was entered separately in the analysis (steps 1-8) with learning outcome variables entered in step 9. Key findings included: 1) leader support for learning was a significant predictor in all steps, though decreasing in magnitude, 2) knowledge indeterminacy was also significant until learning outcomes were entered in the last step, 3) external monitoring and knowledge creation remained significant after entering the equation, 4) generative learning was not a significant predictor.

Conclusion

While these results are only an initial test of the instrument, they do offer initial evidence of construct, criterion and discriminant validity for the instrument. This research demonstrates that a more comprehensive learning organization assessment instrument could be developed with rigorous psychometric procedures. Significant portions of the variance in perceived learning were explained by learning organization constructs. Furthermore, significant portions of the variance in perceptions of innovation and external alignment, which are key performance drivers, were explained by learning organization constructs. While the instrument clearly needs further testing and refinement, the results are encouraging. In addition, the theoretical foundations of the instrument along with the pilot site test offer encouraging prospects for a more complete learning organization theory and empirical tests of that theory.

One limitation of this study is that the organization studied was not one that was known to be a complete learning organization. It did have some aspects of a learning organization in place as a result of prior development programs such as total quality and team oriented work. One interpretation of the regression results suggesting that constructs suggested by learning organization theory to advance learning, but not found to be significant predictors in this study, is that learning organization theory was not supported. Alternatively, these results may suggest that the organization needs to develop these areas of the organization as they represent current weaknesses. Further research in different organizations is needed to be certain which is the proper interpretation.

Note: Special thanks to Victoria Marsick, Martha Gephart, and John Redding who assisted with the early phases of instrument development.

An Empirical Assessment of the Relationship Between the Learning Organization and Financial Performance

Andrea D. Ellinger
The Pennsylvania State University - Harrisburg

Alexander E. Ellinger
Villanova University

Baiyin Yang
University of Idaho Boise

Shelly W. Howton
Villanova University

The concept of the learning organization has received considerable attention in the literature as firms are increasingly encouraged to leverage learning to gain competitive advantage. However, few empirical studies have examined the relationship between the learning organization concept and firm performance. To assess this association, managerial responses to the Watkins and Marsick DLOQ instrument were obtained along with both perceptual and objective measures of firm financial performance. Results suggest positive associations between the learning organization concept and firm performance.

Keywords: Learning Organization, Firm Performance, Financial Performance

Scholars have suggested that learning may be the only source of sustainable competitive advantage. Considerable attention has been devoted to the concept of learning organizations in the past several years. Yet, there have been more thought papers on why learning matters than on the processes required to building learning organizations and their potential impact on firm performance. Despite the numerous accounts and suggestions that discuss why the learning organization concept presumably works, few concrete studies exist that clarify how it works to achieve performance improvement (Kaiser & Holton, 1998). Jacobs (1995) suggests that there are little data supporting the claim that performance improvement is directly related to the adoption of practices associated with the learning organization literature.

Other researchers are concerned that the concept of the learning organization is being "oversold as a near-universal remedy for a wide variety or organizational problems (Kuchinke, 1995, p. 307). Because many of the contributions on the learning organization to date have been descriptive and prescriptive, the need for empirical research on this concept has been articulated by several scholars (Altman & Iles, 1997; Jacobs, 1995; Iles, 1994; Leitch, Harrison, Burgoyne, Blantern, 1996). In particular, one of the major research challenges is to establish the relationships between characteristics of the learning organization and organizational performance (Iles, 1994; Leitch, Harrison, Burgoyne, Blantern, 1996).

Recent studies have begun to establish a research base that examines the dimensionality of the concept of the learning organization (Watkins, Yang & Marsick, 1997; Yang, Watkins & Marsick, 1998). However, if firms are to create learning organizations by focusing on the implementation of practices and processes that promote learning at the individual, team, and organizational levels, the linkages to improved organizational performance must be more firmly established. Therefore, the current research examines the relationship between the dimensions of the learning organization and financial performance utilizing both perceptual measures of firm performance and secondary financial data drawn from the COMPUSTAT and the Stern Stewart Performance 1000 financial databases. Assessing the relationship between the learning organization concept and objective measures of firm financial performance represents an empirical methodology that has not been employed to date. The research also attempts to...
further validate the Watkins and Marsick Dimensions of the Learning Organization Questionnaire© (DLOQ) in a business context with mid-level managers as respondents.

**Theoretical Framework**

The theoretical grounding for this research is the Watkins and Marsick conceptualization of the learning organization (1993, 1996a, 1996b). The foundation of the Watkins and Marsick perspective is that the design of a learning organization depends upon seven complementary action imperatives: (1) create continuous learning opportunities; (2) promote inquiry and dialogue; (3) encourage collaboration and team learning; (4) establish systems to capture and share learning; (5) empower people toward a collective vision; (6) connect the organization to its environment; and, (7) use leaders who model and support learning at the individual, team, and organizational levels.

**Research Questions**

The study addresses the following research questions:

1. To what extent does testing the DLOQ instrument in a different context offer further validation for Watkins and Marsick's instrument?
2. What is the relationship between the seven dimensions of the DLOQ instrument and the perceptual organizational outcome variables as defined by financial and knowledge performance? [The DLOQ asks respondents for perceptual assessments of various measures associated with financial performance and knowledge performance].
3. What is the relationship between the seven dimensions of the DLOQ instrument and objective organizational outcome variables as defined by four secondary measures of financial performance? [return on equity (ROE), return on assets (ROA), Tobin’s q, and market value-added (MVA)]

**Research Design**

A mail survey methodology was employed to address the research questions. The procedures used to design the sampling frame correspond to those outlined by Dillman (1978).

**Sample.** A random sample of 400 mid-level managers at U.S. manufacturing firms was obtained from the Council of Logistics Management Membership listing. The selection of logistics managers as key respondents for this study was based upon the increasing role of supply chain management as a key element in corporate strategies that focus on service for the provision of superior customer value (Christopher & Ryals, 1999; Poirer, 1999; Stank, Daugherty & Ellinger, 1998). The logistics function must receive, assess, and act upon so much important customer feedback and data that firms with effective learning processes may be better equipped to provide their customers with better service. In addition, logistics managers must continuously interact with other corporate functions. Accordingly, logistics managers' perceptions of their firms' learning behaviors represent a unique platform from which to examine the dimensions of the learning organization concept and their impact on performance.

Potential respondents' firms were screened for the availability of secondary data for their firms on the COMPUSTAT database. Respondent firms from the random sample for whom data was not found on the COMPUSTAT database were replaced. Prenotification of prospective respondents is believed to increase response rates (Fox, Crask, & Kim, 1988). Therefore, each of the managers in the sampling frame was contacted by telephone to solicit his/her participation in the study. Additionally, since type of postage, the sponsorship of a university, and monetary incentives are also believed to be influential factors for increasing response rate (Fox et al., 1988), the initial mailing included prepaid return postage, a personalized letter on university letterhead, and a $2 bill as an incentive to respond. Non-respondents were contacted with a follow-up letter two weeks after the initial mailing. A total of 262 surveys were mailed and 208 completed surveys were returned resulting in a usable return rate of 52%.

**Instrumentation.** The DLOQ instrument (Watkins & Marsick, 1993, 1996a, 1996b) was used for this study. The seven dimensions in the Watkins and Marsick instrument are measured by 43 items. Previous research using this instrument has been conducted by Watkins, Yang and Marsick (1997), Yang, Watkins, and Marsick (1998), and Yang, Watkins, and Marsick (forthcoming). Accordingly, several stages of empirical research have
assessed the psychometric properties of the DLOQ. These analyses suggest that the seven dimensions have acceptable reliability estimates (coefficient Alpha ranges from .75 to .85). The seven factor structure was also found to fit the empirical data reasonably well (Yang, Watkins & Marsick, 1998). The previous examinations of the DLOQ utilized non-random samples of 116 and 469 respondents respectively from multiple organizations in instrument development and validation studies (Watkins, Yang & Marsick, 1997; Yang, Watkins & Marsick, 1998).

Perceptual Performance Measures. The two performance outcome measures on the DLOQ instrument, Financial Performance and Knowledge Performance, ask respondents to indicate their assessments of the organization’s current performance when compared to the previous year. The first performance variable, Financial Performance, is assessed in the following areas: return on investment, average productivity per employee, time to market for products and services, response time for customer complaints, market share, and the cost per business transaction. The second performance variable, Knowledge Performance, is assessed in the following areas: customer satisfaction, the number of suggestions implemented, the number of new products or services, the percentage of skilled workers compared to the total workforce, the percentage of total spending devoted to technology and information processing, and the number of individuals learning new skills.

Secondary Financial Performance Data. A database consisting of secondary measures of financial performance for the respondent organizations in the study was created with data obtained from the 1998 COMPUStat the Stern Stewart Performance 1000 financial databases. Specifically, four measures were chosen to obtain a comprehensive view of firm financial performance: return on equity (ROE), return on assets (ROA), Tobin’s q, and market value-added (MVA). The MVA data obtained for this study is from the Stern Stewart Performance 1000 and is 1998 data for 1,000 firms. MVA data is quoted in a dollar amount for each firm. Since the research here includes firms with varying sizes, MVA is standardized by total assets, a proxy for firm size. The ROA and ROE measures are from the COMPUStat database and are listed for each company under the data items of ROA and ROE. A proxy for Tobin’s q was calculated using a method suggested by Chung and Pruitt (1994). All of the data necessary to calculate the proxy were obtained from the COMPUStat database.

Data Analysis

To address the first research question, confirmatory factor analysis (CFA) was used to assess the dimensionality and validity of the DLOQ in a different context. The CFA was conducted with LISREL 8 (Joreskog & Sorbom, 1989, 1993a, 1993b). CFA is a procedure that examines the construct validity of an instrument with pre-specified dimensions. In this study, we are particularly interested in assessing whether, in a business context, the DLOQ measures constitute an adequate measurement model for the learning organization concept.

Two measurement models were examined to assess the DLOQ in the new context: one for all 43 learning organization items, and another for a reduced set of 21 items. An earlier study conducted an extensive series of exploratory and confirmatory factor analyses where the 43-item scale representing the seven dimensions of the learning organization was reduced to a more parsimonious 21-item scale. The resulting 21-item, seven-construct model yielded superior fit indices than the original 43-item model (Yang, Watkins & Marsick, 1999).

Canonical correlation was selected to assess associations between dimensions of the learning organization and perceptual and objective measures of firm performance (research questions 2 and 3). Canonical correlation is a technique for examining the association between two sets of variables (Stevens, 1996). The underlying principle is to develop a linear combination of each set of variables (both independent and dependent) in a manner that maximizes the correlation between the two sets.

Canonical correlation was chosen over structural equation modeling (SEM) as a more appropriate statistical technique with which to explore an omnibus impact of the dimensions of the learning organization on a set of financial performance indicators. The objective was to assess overall effects of the learning organization concept on firm performance rather than causal relationships.

SEM also requires more proven measures to be used in data analysis than were available for secondary financial performance. As no one measure is able to completely describe all aspects of a firm’s condition, it is important to collectively examine several different measures of performance (Brigham 1995; Peterson 1994). We selected a combination of traditional accounting and value-added indicators to reflect an adequate, but nevertheless exploratory, measure of the concept of financial performance. The canonical correlation analysis was performed by MANOVA procedure using the SPSS statistical package (Norusis, M. J./SPSS Inc., 1990).
Results of the Confirmatory Factor Analysis. Table 1 offers a comparison of the fit indices for the two measurement models. Six criterion indices were chosen to evaluate the fit between the proposed measurement model and that generated from the sample. The indices selected were the chi-square ($\chi^2$) test, Jöreskog and Sörbom's (1989) goodness of fit index (GFI) and goodness of fit index adjusted for degree of freedom (AGFI), Bentler's (1990) comparative fit index (CFI), Bentler and Bonett's (1980) non-normed fit index (NNFI), and Steiger's (1990) root mean square error of approximation (RMSEA).

The GFI and AGFI reflect the proportion of joint amount of data variance and covariance that can be explained by the measurement model being tested. The NNFI is a relative fit index that compares the model being tested to a baseline model (null model), taking into account the degrees of freedom. The CFI indicates the degree of fit between the hypothesized and null measurement models.

The RMSEA represents a real advance in the evaluation of model fit from both a statistical and a conceptual viewpoint. Browne and Cudeck (1993) argue that because theoretical models are at best approximations of reality, the null hypothesis for any measurement/structural equation model (i.e., the conventional chi-square test that the data fits the model perfectly) will rarely be true. Rather than testing the null hypothesis of exact fit between the covariance matrix of sample and that of model for population, RMSEA establishes a hypothesis of close fit between the model and population. RMSEA values of .05 or less indicate a very close fit between sample and theoretical model, accounting for degrees of freedom. Values less than .08 reflect reasonably well fitting models (Browne & Cudeck, 1993).

<td>.611</td>
</tr>
</tbody>
</table>

The CFA results for the new sample add further credence the dimensionality proposed by the DLOQ instrument developers. Specifically, the 43-item model with seven underlying dimensions fits the data only moderately, while the reduced seven-factor 21-item model forms a reasonable measurement model (RMSEA < .08). The proposed seven dimensions of the learning organization account for eighty seven percent of item variances and covariances (GFI = .87). Both the NNFI and the CFI are above the .90 level, indicating that the seven-dimension structure fits the data very well in comparison to the baseline measurement model.

Table 2 presents reliability estimates for the full and reduced set of items for the DLOQ. The reliability estimates do not decrease substantially when the number of items is reduced by half (with the exception of Continuous Learning). These findings suggest that the full and reduced set of DLOQ measures continue to demonstrate acceptable reliability in the new context.

Results of the Canonical Correlation Analysis. Table 3 shows the results of the canonical correlation analyses between dimensions of learning organization and the perceptual and objective financial outcome variables. Because our primary purpose was to examine the associated variability between the two sets of variables, rather than the structure of the variables, our discussion focuses on the overall effects of the canonical correlation analyses.

The multivariate tests suggest a statistically significant relationship between the seven dimensions of the learning organization and the two perceptual outcome variables: Financial Performance and Knowledge Performance (p < .001). Effect sizes of the canonical correlation range from .246 to .312, indicating that more than a quarter of the variability in the respondents' perceptions of organizational performance can be accounted for by the seven dimensions of the learning organization.

The canonical correlation between the seven dimensions of the learning organization and the four secondary measures of financial performance (ROE, ROA, Tobin's q, and MVA) is also statistically significant (p < .05). Moreover, different multivariate statistics reveal consistent effect size, ranging from .104 to .108. Thus, more than ten percent of the variance in the four financial indicators can be explained by the dimensions of the learning organization measured on the DLOQ.

In summary, our analyses offer support for the validity of the DLOQ instrument using a random sample of respondents in a business context. In addition, the results suggest a positive association between the learning organization concept and firm performance.

Implications and Recommendations for Research and Practice in HRD

The increased emphasis on and examination of individual, team, and organizational learning practices have stimulated tremendous interest in the concept of the learning organization. Although the concept is fairly well established, it is still evolving and a certain amount of confusion and ambiguity surrounds it (Leitch, Harrison,
Burgoyne & Blantern, 1996). Watkins and Marsick's (1993, 1996a, 1996b) DLOQ instrument studies have shown moderate evidence of construct validity for the scales measuring the dimensions of the learning organization. However, the researchers have acknowledged that additional studies are needed to cross validate the instrument with different populations of organizations and with larger samples in order to more firmly establish its utility and validity. This study further validates the instrument in a new context.

From an empirical perspective, the relationship between the presence and development of practices associated with the learning organization concept and organizational performance has not been adequately established. To assess this association, the current research integrates objective measures of firm performance obtained from the COMPUSTAT and the Stern Stewart Performance 1000 financial databases. This aspect of the study represents a unique methodology that, to date, has not been employed studies associated with the learning organization concept. Accordingly, our research findings suggest that the learning organization concept may positively associated with firm performance. Future studies should further investigate these exploratory results using a wide variety of financial indicators in different contexts.

There are several limitations associated with this research. The sample, although randomly drawn, included only firms for which secondary data was available. Different results may have been obtained if smaller, privately-owned firms were also included in the sample. This study includes only a limited number of secondary financial performance measures to assess the relationship between the dimensions of the learning organization construct and financial performance. The inclusion of other financial measures may have yielded different results. Perceptions of upper-level managers and front-line employees were not solicited for this study. It is possible that different results may be obtained by soliciting a larger, more holistic sampling strategy within each firm to assess the organization relative to the DLOQ. Each of these limitations, however, represent opportunities for future research in this area.

In conclusion, it has been acknowledged that creating learning organizations requires new roles for managers, human resource developers, and employees in building the capacity for learning at the individual, team, and organizational levels. Yet, there has been little empirical research to support the claim that performance improvement is related to the adoption of practices associated with the learning organization concept. Our exploratory research lends credence to the efficacy of the learning organization concept by suggesting that there may be a positive association between the learning organization concept and firm performance.

Translation, Validation, and Adaptation of an Instrument to Assess Learning Activities in the Organization: The Spanish Version of the Modified “Dimensions of the Learning Organization Questionnaire”

Miguel Hernandez
University of Georgia

This paper shares methodology and reports findings from a translation, validation and adaptation study of the Dimensions of the Learning Organization Questionnaire (DLOQ). Results indicate that the Spanish version of the DLOQ seems to be a valid instrument to assess learning activities in organizations with Spanish speaking populations, especially those of Latin America.

It can hardly be denied that technology, along with science, has historically been among the central engines of modernity. It is equally undeniable that the modern world is increasingly becoming a technological world. Technology is, by all indications, going to become the distinguishing feature of global culture in the coming decades. The business literature generally refers to at least three types of technology: product, process and management. Product technology is the knowledge used to produce any product - the information that specifies the product's characteristics and uses. Process technology is the knowledge used in production to organize the inputs and operate the machinery. It relates to processes by which a given product or service is produced. Management technology is the knowledge used in operating a business—the managerial skills that enable a firm to compete by using its resources effectively. Management innovation, like product and process innovation, depends on new technology. New technology for management, as for engineering, comes in the form of new knowledge, tools and methods (Stata, 1989).

A country cannot develop a highly productive network of production in manufacturing, agriculture, transportation and communication, or other sectors except by a progressive evolution of an industrial structure in which technological advances play a fundamental role. If a country’s advance in technology continues long enough, it will probably reach a stage at which here and there, in one field or another, it develops technologies beyond those known in the most advanced countries. Until it reaches this stage, its technological advance will consist in large part of the adaptation of technologies already in use in the technologically advanced countries. This process is described as the “transfer” or “transmission” of technology from the developed countries (DC’s) to the less developed countries (LDC’s) (Hagen, 1980).

The transfer of technology from the technologically developed world is a vital approach to bringing sophisticated technology to an LDC. Technology transfer is an important medium for generating a more efficient modern technology in a developing country. In this case, transfer of technology involves taking some equipment, techniques, and practices developed in some technologically advanced country to some LDC. The assumption or anticipation is that the local people in the developing country, will be able to acquire the techniques transferred to them. Acquiring techniques means being able to learn, understand, analyze, and explain the whys and hows of those techniques. It is also anticipated that the local technologist, who is the beneficiary of the transferred technology, will be able not only to adapt the received technology to suit the needs and circumstances of the developing country, but also to build on it and to use it as an inspiration to create new technologies appropriate to the development requirements and objectives of the developing country.

There has been a widespread belief among developing countries that unless technology is properly transferred from the more industrially advanced countries, there could never be an adequate industrial and economic development in general. Latin American countries have long recognized a need to use and adapt foreign technology to local conditions, and to generate indigenous products, processes and practices (Marton, 1986).

Industrial development has been the objective of most development programs in Latin America since the turn of the century. Although such development was often implicit rather than explicit in national efforts, the model of development has been based on industrial growth complemented by manufacturing, agricultural investment, and extraction of basic minerals. Many promising developments have been truncated by profound crises that have affected Latin American economies through the years. During the 1980s, for example, the entire region was plunged into deep recession and stagnation. Unprecedented inflation, unemployment, devaluation, and a sky-high foreign debt afflicted the region (World Press review, 1988). Compounding these economic problems was the dramatic political turmoil that ripped Latin American economies apart. Although some problems still remain, Latin
American countries are currently experiencing a revival brought about by new leadership and powerful external factors. A new generation of leaders are leading the states into progressive economic programs, are advising their governments, initiating proposals for deregulation, and encouraging greater regional integration (Clerc, 1990; Baker & Weiner, 1992). External factors have also been a major trigger of the ongoing reforms. The trend toward globalization of markets has forced Latin American countries to replace their old economic thinking. The strengthening position of regional blocks and the emergence of newly industrialized countries have resulted in a more diverse and fierce competition all over the globe, and most leaders in the region are starting to realize the dangers of being left out (Graham, 1990). In order to carve a position in this global economy, Latin America with a market of about 450 million people, an estimated gross domestic product (GDP) of US $900 billion (1990 figures), and abundant human and natural resources, is being forced to implement long overdue changes in their economic and trade policies as well as to take initiative to foster the role of science and technology in economic and social development. Specific policies on the importation and the local development of technology have been adopted in many Latin American countries, particularly in Argentina, Brazil, Mexico and the Andean Group (Peru, Venezuela, Ecuador, Colombia and Bolivia).

Recent studies suggest that the key to success for an organization is embodied in its ability to implement and appropriate new technology (Willmann, 1991). However, adopting new technology does not ensure its successful integration and its optimum use. A company must be able to adjust to the demands and opportunities the new technology creates in order to realize its full advantage.

There is no simple formula for making the changes required to fully exploit a new technology. Indeed, every organization is unique and must identify and implement the changes required to enhance its own effectiveness. Argyris and Schon (1978) describe this process of identifying and implementing required changes as organizational learning. They suggest that an organization is, at its root, a cognitive enterprise and it learns and develops knowledge. The concept of a learning organization has evolved from the ideas of organizational learning, but it differs in that it includes not only the learning of the organization, but learning within the organization (Ulrich, Von Glinow & Jick, 1993). Learning organizations create intentional processes that accelerate the creation and utilization of knowledge across the system (Marsick & Watkins, 1997). Watkins and Marsick (1993; 1996) delineate the learning organization as one that captures, shares, and uses knowledge to change the way the organization responds to challenges. They describe seven dimensions or action imperatives necessary for organizations to progress toward becoming a learning organization: create continuous learning opportunities (Continuous Learning), promote dialogue and inquiry (Dialogue and Inquiry), promote collaboration and team learning (Team Learning), empower people toward a collective vision (Empowerment), establish systems to capture and share learning (Embedded System), connect the organization to its environment (System Connection), and provide strategic leadership for learning (Provide Leadership).

These action imperatives form the basis for the Dimensions of the Learning Organization Questionnaire (DLOQ), a survey developed by Watkins & Marsick (1997) to assess learning activities in the organization. Watkins and Marsick added also additional items to the survey in order to measure Knowledge Performance which is defined as: Enhancement of products and services because of learning and knowledge capacity; and Financial Performance which is defined as: State of financial health and resources available for growth. Several studies have already established reliability and content and predictive validity of the DLOQ with and without knowledge and financial performance scales (Watkins, Selden, & Marsick, 1997; Watkins, Yang, & Marsick, 1997; Yang, Watkins & Marsick, 1998; McHargue, 1999; Watkins & Marsick, 1999).

In the context of this study, a learning organization is defined as the ultimate goal of a process that promotes continuous learning at the individual, group, and organizational levels in order to modify behavior and positively impact the organization's ability to deal with the change that a technology transfer process brings about. The major premise is that those organizations which develop as learning organizations are better at adapting to change (Kline & Saunders, 1993; Marquardt & Reynolds, 1994; Nonaka & Takeuchi, 1995; Senge, 1990; Swieringa & Wierdsma, 1992; Watkins & Marsick, 1993, 1996; Marsick & Watkins, 1999).

Much has been written to convince companies of the benefits of developing themselves as learning organizations, but little has been offered in terms of assessment tools and empirical data, particularly in a Latin American context. The DLOQ is a useful instrument that has consistently produced acceptable results in the United States, and may be used extensively in the areas of human resource and organizational development in Latin America. Hence, this study sought to translate, validate, and adapt the 7 dimensions of the learning organization and the knowledge performance scales so that could be used with Spanish-speaking populations. A method based on the four basic translation methods described by Brislin (1976, 1980) combined with additional activities was used, which consisted of 1) forward-translation, 2) assessment of forward translation for clarity, common language and cultural adequacy, 3) back-translation, and 4) assessment of back-translation for conceptual equivalence.

According to Brislin, Lonner and Thorndike (1973), "Unless researchers present empirical evidence to support their claim that different language versions of the same instrument are equivalent, translation problems will
always be plausible rival hypotheses for any obtained results" (p.32). The equivalence of measurements is therefore one of the central problems of cross-cultural research (Hui & Triandis, 1983). If equivalence of translation cannot be demonstrated between translations, it remains uncertain whether any differences noted between subjects could be attributed to differences in item translation, whether the translated scales are comparable to the original scale, and whether differing translations are equivalent in constructs addressed.

Methods

Sample

In the present study, a purposive, non-random sample was used. The target population was medium to large size private manufacturing corporations located in Bogota, Colombia. The decision to choose this country was based on the following criteria:

a) It is a Spanish speaking country.
b) Lists of population elements from which a sample may be drawn were available
c) Personal contacts were available.
d) This country is a member of the most important trading block of the region: the Andean Pact.

Furthermore, Colombia is one of Latin America's top performing economies. With a population of 36 million people. Despite the fact that the mere mention of its name conjures up images of guerrilla movements wreaking chaos, Colombia has had positive economic growth every year since 1948, has a history of stable exchange rates, and has never experienced a period of hyper-inflation, has never defaulted on its sovereign debt obligations, and never asked to reschedule its payments. In addition, the Colombian military has a history of non-intervention in internal politics and Colombia has always respected foreign ownership. These positive points indicate that the Colombian market is one in which foreign and indigenous organizations have had and still have a real chance to develop and succeed.

To be included in the sample, a company would have to meet several criteria: it must be 1) private, 2) engaged in manufacturing operations, 3) medium to large size (number of employees was the only metric used to determine its size.), and 4) be or have been a target of any form of technology transfer in the last 10 years.

Once the target population to be sampled was determined, the availability of a list of population elements from which a sample may be drawn was assessed. In an international context, this frequently presents difficulties due to the paucity of information available on industries, business, or consumer groups in other countries. Even where sampling frames, such as electoral or municipal lists, directories, telephone books, or mailing lists commonly used in the United States are available, they frequently do not provide adequate coverage, particularly in less-developed countries, and hence, give rise to frame error. Worldwide or regional lists of manufacturers can be obtained from sources such as Bottin International. This source registers names and addresses of more than 300,000 firms in 100 countries, under 1,000 product classifications, by trade and by country.

In this particular study, two lists were used: a) The Latin American Companies Handbook, b) Latin America 25,000/Dun & Bradstreet's key business directory. Thirty companies enlisted in both lists were selected and then information about the company itself was drawn. Initial contact with the company was by e-mail to the executive director, explaining the study and requesting authorization to survey employees at different levels within his/her organization. The names and a brief background of trained personal contacts in Bogota who were in charge of follow-ups on behalf of the researcher were given. Following this first contact, a hard copy of the electronic letter with a sample of the questions included in the SDLOQ was faxed to the same executive. The follow-up was done via telephone by a trained personal contact residing in Bogota, who coordinated and consulted with the researcher over the companies concerns via e-mail. Eight companies agreed to be part of the study. Data collection was done on site. The SDLOQ was distributed and administered directly by the researcher and a total of 906 valid responses were properly collected.

Forward Translation

The initial translation of the DLOQ from English to Spanish was performed by male and female bilingual translators whose mother tongue was the target language. The female translator was known to the researcher for her expertise in translation of documents and technical information. This individual is a professional translator, fluent in both languages and a lifelong member of the Latin American community in which the study was going to be conducted. The male translator was the researcher who is Peruvian-American, fluent in both languages and familiar with several Latin American cultures. Prior to beginning the translation procedure, explicit information regarding the use and intent of the DLOQ instrument was given to the female translator. Initial instructions included
a request to avoid focusing or centering on the use of Spanish terminology when completing the initial translation, to use common Spanish equivalents for all words and phrases, and to translate the original text as closely as possible.

**Assessment of Forward Translation**

The Spanish translations provided by the translators were then presented to a panel of four additional Hispanic individuals, with advanced degrees in different disciplines, knowledgeable of many Latin cultures, and originally from Argentina, Colombia, Peru and Venezuela. These individuals were asked to independently review each item of both translations and to choose the one which they judged to be the best in terms of clarity, i.e. the item must express a single idea, should not contain ambiguous terms, should be easy to read and understand; common language, i.e. the item is expressed with language used by the general population; and cultural adequacy, i.e. the item is appropriate and relevant for the culture for which it is being adapted. Following a discussion and agreement among the participants, a consensus translated version was developed consisting of item versions picked out from one or the other translation or a newly generated item.

**Backward Translation**

The consensus Spanish translation was then presented to an additional Hispanic bilingual proficient in both languages. This individual was requested to back translate the Spanish translation to English and to identify any corrections in grammar, word usage, or diacritical markings deemed necessary in the Spanish translation provided. The translator was an Argentinean-American female, whose native language was Spanish and who held a Bachelor’s degree in English and a Master’s degree in Spanish Linguistics.

**Assessment of Backward Translation**

Following this step, the back translation was reviewed by a panel which consisted of one of the developers of the DLOQ, a methodologist, and the researcher. The review process focused on the conceptual equivalence with the original version of the DLOQ. Item by item was reviewed and decisions on equivalence were based on the following options: a) both the wordings and the meanings have nothing to do with each other; b) the wordings are equivalent in some respects but they do not capture the same meaning; c) the wordings are not equivalent but they capture the same meaning; and d) the wordings are equivalent and capture the same meaning. Ninety five percent of items were found to be conceptually equivalent, 2 modifications in wording of the Spanish translation were proposed until an acceptable compromise was reached and a final version was approved.

**Results**

The translation technique used in this study aimed at putting the DLOQ in Spanish while preserving the same ideas across the linguistic and cultural boundaries. Item equivalence and conceptual equivalence was established by comparison of meaning between original and back-translated forms and comparison of meanings between the original and translated form, by bilinguals other than the translator (Brislin, et. al., 1973). It should be reported, though, that some conceptual discrepancies were identify in the back translated version of the instrument due to the meaning of the words “trust” and “empower.” In the forward translation the word “trust” was translated as “confianza” and “empower” as “autORIZAR.” Obiously, when these words were back translated they resulted in “confidence,” which is different from “trust” and “authorize” which is different from “empower.” Cultural considerations were necessary to consider in order to arrived at an agreement in terms of conceptual equivalence. This process was expedited due to the fact that the researcher is a native Spanish speaker, culturally indigenous (emic), and familiar with the theoretical underpinnings of the instrument in question.

**Statistical Analysis**

Cronbach’s Alpha coefficients for each dimension of the scale ranged from .791 to .835 on the SDLOQ. Overall, the reliability estimate for the entire scale is .960 for the 49 item version of the translated instrument. Table 1 below reports Alpha coefficients for each scale of this study (N = 906) and for previous USA studies. In all but except one case, the reliability estimate was comparable with the American studies. It appears that the Team Learning construct is not as tight a construct as it is in America or maybe, we could argue, that the reliability of this construct is curvilinear as the sample size increases. These Alpha coefficients, which are evidence of construct validity, suggest that the SDLOQ is a reliable instrument.
Predictive validity refers to the extent to which the instrument scores predict criterion measurement (Crocker & Algina, 1986). It is reasoned that the measurement's predictive validity will be shown if scores on the dimensions of the learning organization can successfully predict knowledge performance. In order to determine the predictive validity of the SDLOQ in terms of knowledge performance, multiple regression analysis was conducted where the measure of knowledge performance was designated as a response variable and scores on seven dimensions of learning organization were treated as predictor variables. The regression analysis results indicated that the multiple correlation between learning activities measured on seven dimensions of the SDLOQ and the measure of knowledge performance was statistically significant (p<.001). The estimated multiple correlation coefficient was .616 and the R-square was .380. This means that 38 percent of the variation in knowledge performance can be explained by the organizational learning activities measured on the SDLOQ. That is to say, the SDLOQ showed strong predictive validity in predicting knowledge performance in the organization. Table 2 below reports the R-square for this and previous studies.

Conclusions

The SDLOQ has revealed similar characteristics, in terms of statistical properties, to the original; in fact, in some instances, results have been even better than those registered with the original one (e.g. Cronbach's Alpha). Therefore, and as with the original scale, the SDLOQ seems to be a valid instrument to assess learning activities in organizations with Spanish speaking populations.

The present study has provided Latin American researchers and HRD practitioners with a Spanish version of the Dimensions of the Learning Organization Questionnaire (SDLOQ), an instrument that will assist them in generating data to assess the actual state of Latin American organizations with respect to the goal of becoming learning organizations.

Kaizen Blitz: Rapid Learning to Facilitate Immediate Organizational Improvement

Robert B. Gudgel
Pennsylvania College of Technology

Fred C. Feitler
Kent State University

Rapid and dramatic improvements in the organizational performance of a manufacturing firm after use of a series of kaizen blitzes are documented in this case study. Participants in these blitzes along with other employees and managers describe their experiences and the quantitative and qualitative results from these blitzes. A preliminary analysis of the theoretical basis for a successful kaizen blitz is offered with suggestions for future research and development of a theoretical framework.

Keywords: Adult Learning, Continuous Improvement, Employee Involvement

Conventional wisdom about organizational change, quality improvement, and maintenance of productivity is being turned upside down by current events affecting how business is done in the United States and globally. Rather than being a passing fad, these conditions, only dreamed about a decade or less ago, foretell a future of increasingly changing markets, flexible organizations, and rapid, if not instantaneous, response to continually fluxing global conditions and needs. This study examines the use of kaizen blitz as an answer to present and future requirements for rapid change, new ways of doing business, and continuing needs for employee identification with both quality processes and products. This case study of a small manufacturing firm in northeast Ohio provides a platform for understanding how the kaizen blitz process works as well as providing concrete results of improvements in productivity, quality, and employee morale.

Kaizen comes from Japanese approaches to promote quality in the workplace. As defined by Imai (1986), kaizen means improvement (kai=change, zen=for the better) and requires continuous improvement for all aspects of an organization, both management and workers at all levels. A kaizen blitz is a specific focus of these ideas on a particular problem in a short time frame of one to five days.

Classical notions about producing lasting changes in work organizations are described in minimum time frames of years, often three to five. With the advent of instant communication via new technological advances and concomitant revisions of the market place from local to world wide in less than a decade, firms must readily adapt to change. Kaizen blitz is an applied strategy, based on quality principles that can create rapid change, improved quality, and increased productivity in time frames of hours and days instead of months and years.

Use of kaizen change strategies in American and global business is not new. Total Quality Management, Just in Time Manufacturing, Quality Function Deployment, Continuous Improvement, are examples of such attempts to incorporate "quality" and kaizen practice. These have had only moderate success, however; failure to produce desired results exceeds successes (Hoffher, Moran, Nadler, 1994). The literature suggests reasons for frequent failure of these highly touted approaches: short term thinking, lack of management commitment, inability to train employees in a timely manner, poorly conceived implementation strategies, and unclear goals (Hoffher et al., 1994; Schonberger, 1982). The "blitz" integrated with kaizen may overcome many of the problems associated with implementation of the broader based kaizen approaches.

Research Problem

Bringing about successful change in business organizations has been a recurring source of interest and study. Similarly the study of leadership and organization development is largely focused on issues of change and productivity. The recent focus on "quality issues" is integrally related to change. Advocates for "quality" interventions such as TQM have described this as a process that incorporates change management. Unfortunately, in a majority of American cases the adoption of TQM or other quality programming has not resulted in significantly
improved practice, particularly when change is required. While there are many answers to why the problems and issues surrounding organizational change remain, the fact is organizations continue to need help in this area, particularly with issues around productivity, quality, and employee acceptance of change. Kaizen blitz holds a promise of responding to the problems described in this paragraph by offering a strategy that incorporates many "quality" features while appearing to avoid pitfalls of older, more touted methods for change.

This case study of the use of kaizen blitz examines the process of conducting a blitz, as well as how the participants experienced the process and what effects or results were seen as a direct result. The research question was, How does kaizen blitz affect productivity and quality in a manufacturing setting?

The experience of kaizen blitz is told by those who experienced this process and by one of the facilitators of the blitz. Group and individual interviews were used to collect data from study participants. The questions asked are:

What did you experience?
What was different about your experience with kaizen blitz compared to your prior operating experience?
What are results for you personally and for the firm?
How have "quality" processes been affected by kaizen blitz?
How have management and employee attitudes changed since kaizen blitz?
What has been learned from this experience?

Theoretical Foundations

Organizational Performance

Since the early 1980's, prescriptions to improve organizational performance have typically focused on: Continuous improvement or kaizen (Imai, 1986), employee involvement (Crosby, 1979), quality management (Feigenbaum, 1983; Deming, 1986), and customer focus (Ishikawa, 1986). In some form these elements are combined and labeled Total Quality Management, Continuous Quality Improvement, High Performance or similar terms. In essence they are all ways to improve the quality of products and services offered and improve the productivity of organizations (Lindsay & Petrick, 1997). Successful use of these approaches requires initiation and sustaining organizational change and organizational learning (Senge, 1990; Hoffher et al., 1994; Herron, Meyer, Bohan, 1997). Many organizations choose a deliberate and lengthy approach to initiate and sustain change that supports organizational improvement. When used, this approach consists of extensive planning and training of employees before improvement initiatives are begun (George & Weimerskirch, 1994; Soin, 1998).

This approach of extensive planning and education before starting actual improvements has had mixed success in launching and sustaining organizational improvement (Tunks, 1992; Hoffher et al., 1994). The reasons for failure include lack of management commitment and involvement (Tunks, 1992), focus on quality improvement methods to the exclusion of selecting important things to improve (Hoffher et al., 1994), and measurement of success by the amount of training conducted instead of actual improvements achieved (Herron et al., 1997). The most successful efforts have incorporated sustained leadership commitment and involvement, appropriate planning and employee training, and demonstrated tangible improvement results within a short period of time (Tunks, 1992).

Adult Learning Principles

The concept of andragogy as described by Knowles (1980) includes assumptions that adult learners have rich experience and knowledge they enjoy using to build new information upon, a desire to apply learning to current situations, immediate use of learning, and enjoyment of active learning processes that also allow them to be supportive of other learners. Adults are more likely to engage willingly in learning activities when the content is meaningful to them (Merriam & Caffarella, 1991). In contrast, in the typical workplace, the predominant forms of adult learning have been structured, classroom based activities, more instructor directed than learner centered (Marsick, 1988). This description of typical adult learning in organizations appears to fit Knowles' description of pedagogy and a "school based " atmosphere that is less likely to interest or promote learning (1980). Pratt (1988) suggests adults, in need of direction to learn an entirely new concept, should be taught from a teacher directed basis whereas those needing only moderate levels of direction and support should be approached from a learner directed approach. During a kaizen blitz both traditionally instructive and facilitative roles are needed to both introduce new concepts and facilitate participant use of these concepts.
Kaizen and Kaizen Blitz

Kaizen is a Japanese term that means continuous improvement by managers and workers to improve organizational performance (Imai, 1986). Improvements are intended to be ongoing in all aspects of performance such as quality, productivity, and employee morale and well being (Herron et al., 1997). Kaizen for the Japanese represents both specific actions to improve and a philosophy of never ending effort to make things better in organizational and personal life (Imai, 1986). The Japanese term kaikaku means dramatic improvement in a short time or revolutionary change. A kaizen blitz may be described by this concept of dramatic, quick change that accomplishes immediate, rapid improvement in a short time.

During a kaizen blitz the instructor teaches basic problem solving and quality improvement techniques and then facilitates immediate participant application of these techniques to the specific improvement need. The techniques used typically include the Plan, Do, Check, Act cycle, also called the Deming cycle (Shiba, Graham, Walden, 1993). This cycle includes: selection of an improvement focus for the blitz, data collection and analysis of causes of shortcomings (Plan), creation and implementation of a solution (Do), evaluation of results (Check), and standardization of accepted solutions or a return to the Plan stage for ineffective solutions (Act). Participants are taught to use tools such as cause and effect (fishbone) diagrams and Pareto charts on a just-in-time basis where they can immediately apply them. Blitz participants are able to experiment and try solutions as they think of them until they find a solution that works. Participants use their knowledge and experience throughout the blitz process in conjunction with new skills they acquire from the facilitator/instructor. Both management and non-management employees participate in the blitz as a team. The only assigned work for the team is the blitz during a 1-5 day period.

Case Study Methodology

Company Background and Need for Assistance

To fully understand the results of kaizen blitz activities from the focus company of this study, a brief history of the company is offered. The history is followed by a description of blitz activities and data gathering that gained perspectives of company employees about the effect of these blitzes. This company manufactures circuit boards to control gas flow to certain types of heaters. The company has employed between 90-150 people at various times in recent years and is owned by a larger corporation.

A Steering committee had been formed to investigate and select a methodology that would help the company improve quality and productivity. The committee consisted of the operations manager, materials manager, production planner, and a production supervisor. Members of the Steering Committee indicated they were keenly aware of the need for adjustment and improvement in how products were produced. They also knew that past efforts at improvement had yielded little benefit to either productivity or to quality. Their experience with outside consultants had not produced improvements; there was noticeable tension and conflict between departments responsible for production. Generally the Steering Committee members were skeptical about both the process and the likelihood of positive results from any proposed improvement activity.

In response to an invitation from a local productivity improvement center (Work in Northeast Ohio Council or WINOC), the Steering committee attended a program that explained the kaizen blitz process and featured a company whose representatives shared their story of dramatic improvements using this approach. The committee felt an immediate and dramatic improvement from a kaizen blitz would demonstrate to their company that change was possible and create confidence among the staff to attempt further improvements. Contact was made with WINOC to secure the services of two facilitators and an initial kaizen blitz was scheduled for April 1999. One of the facilitators was a co-author of this paper; the other co-author later interviewed employees to gather data for this article.

Initial Kaizen Blitz

The initial blitz team consisted of 12 members chosen from management and non-management employees. A cross section of departments and disciplines was represented. The focus or theme of the initial blitz was to increase the quality of circuit boards during initial production and reduce a high amount of rework necessary to make boards meet quality standards. During day one of the blitz, facilitators explained the purpose of the blitz, how the team would function together, and explored concerns and questions of participants. Some participants were skeptical about their involvement with the blitz. Facilitators also presented information about effective manufacturing principles and secured the team’s agreement as to the importance of pursuing this improvement task. The team
agreed there would be no "rank" among members for purposes of decisions or sharing information and consensus would be the method for decision making.

On day two of the blitz, facilitators introduced techniques such as use of cause and effect diagrams, Pareto charts, and brainstorming to participants. The team immediately applied these tools to the problem at hand to determine causes of shortfalls and create solutions that addressed these shortfalls. Later on day two, participants began experimentation to test the effectiveness of possible solutions. The facilitators encouraged and assisted participants to use their knowledge and experience to determine and prioritize problem causes, verify data that supported suspected causes, brainstorm possible solutions, and verify effectiveness/ineffectiveness of proposed solutions.

On day three, steps were taken to begin implementation and standardization of successful solutions and to try other solutions for those proven ineffective the previous day. Day four was devoted to planning necessary follow up to complete implementation, standardization, and adoption of successful solutions. The final activity on day four was a presentation to the company president and other managers of the results of the blitz.

Beginning in June 1999, three additional blitz activities were conducted that focused on reduction of production time for a high volume product, reduction in production time of a particular module, and reduction of indirect production time. The same two WINOC facilitators assisted with the second blitz, one WINOC facilitator and a company representative facilitated the third blitz, and company facilitators facilitated the fourth blitz. All blitzes used the same process as described for blitz one, each team had a mix of new and experienced participants.

**Top Management Support**

During all blitz activities top management supported the process by:

- Providing coverage of participant jobs during each blitz
- Allowing active experimentation to test solutions, accepting failure as a learning experience, and encouraging non-participants to cooperate with team members during experiments
- Agreeing to immediate steps with no "red tape" to speed implementation of solutions
- Explaining to non-participants why changes had been made to familiar processes and equipment so resistance by non-participants would be minimized
- Engaging knowledgeable, outside facilitators to start the kaizen process
- Active follow up for actions that helped implement and standardize solutions
- Demonstrated interest in and moral support for the process overall, including participation by a senior manager (operations manager) in several blitzes

External facilitators served as models for company representatives to learn the facilitation process for kaizen blitzes. At various points in time the facilitators served in more traditional instructive roles to acquaint team members with new concepts. New ideas were introduced on a "just-in-time" basis as they were needed and would be immediately applied. As soon as possible, however, the facilitators assumed a helping role and encouraged participants to use their experience and knowledge to effect changes.

In December 1999, the co-author who had not facilitated the earlier blitzes visited the company and conducted interviews with a variety of employees and managers to gain their qualitative perspectives about the effects of the blitzes. He also requested and was given quantitative data as to improvements in quality, productivity, and other important indicators of company performance. The results of this data collection are detailed in the results section.

**Results**

A group interview was conducted with the kaizen blitz Steering Committee. Individual interviews were held with the chief engineer, a line worker, the quality control group leader, a quality control auditor, a production group leader, a manufacturing engineer, and a long term temporary line worker who had not been involved directly in any of the blitzes. Length of employment of those interviewed ranged from 25 years to 3 years.

*How did you experience the blitz?*
An engineer commented, "We should have done this all along. Having a cross functional team involved was a major issue and very helpful. This was an engineering approach; very analytical." A team leader stated, "I knew what was going to happen. We needed to develop a new set of standards." A line worker did not know why she had been selected to be involved and said very little during the first day, but by the end of the blitz indicated she was actively involved and rather vocal about her ideas for improvements. "My self esteem was improved. My participation was important. I came up with the idea to use the racks." The quality control auditor reported being a careful observer and talking with people. "Before the blitz process we would not typically follow through with an idea." An engineer spoke, "I waited for them (line workers) to tell me. I listened to what the line members were doing." The temporary line worker noted a definite improvement in both productivity and in pride in workmanship.

What was different about your experience with kaizen blitz compared to your prior operating experience?

A group leader noted, "We were all equal. We attacked the problem from all angles. We looked at many ideas before taking action." An engineer spoke up, "This was the first time we had involved line workers. This bottom up approach was different." Another engineer said, "People from different groups had to work together. We divided into small teams to study and measure components of the job and gather results." A line worker added, "I was afraid of management before; we got to meet these people and we could communicate. I learned that management could be open to our ideas." Another group leader offered, "Before someone would tell us what to do; now they ask people on the floor."

What are results for you personally and for the firm?

Measurable Results:

A clear result of the blitz process has been a commitment and awareness of the value of collecting data about how products are made and about indirect process issues related to quality and worker satisfaction. The following were indicative of improvement in productivity and quality:

- On time delivery is up. In one year units delivered late decreased from 11,402 to 423 units. This is an improvement of 96 percent.
- Personnel costs and numbers are down over a year ago. Personnel needed to produce the same number of units has decreased from 97 to 64 workers, a decrease of 34 percent in one year.
- Units with some form of defect have decreased from 14 percent prior to the blitz to 8 percent less than one year later. This is a 57 percent improvement.
- Time required to fill orders is down. A year ago an order took 21 days to fill; now this takes four days. This is a reduction of 81 percent.
- At one time 130 employees were required to produce 5000 units per week; this compares to the current 64 employees producing 8,500 units that are more complex than the earlier products.
- Turnover is down.
- Overtime is markedly less, changing from 58 hours for a three month period to 2.5 hours for a similar period following the blitz. This is a 96 percent reduction in overtime.
- Employee satisfaction is up.
- Dollar value of inventory has dropped 22.5 percent.

Perceptions of Qualitative Change

Interviewees report there is greater cooperation, more data collection, greater communication between the floor and other departments, better control of production, agreement about quality standards, more questioning of each other and across departments/functions. In describing the blitz, the following words and phrases were used: "intense, time consuming, really proud, we were the experts, experimental ("we tried out our ideas"), manageable, fantastic, focus on immediate change, and small scope."
How have "quality" processes been affected by kaizen blitz?

An engineer stated, "Communication and cooperation have absolutely improved. They communicate openly with us." A group leader added, "Quality has increased. This brought departments closer together. Communication between departments is easier." Another group leader commented, "We work as a team. Before people fought with each other. We have better communication on the floor." A line worker reports, "Our improvements were tremendous. We eliminated errors. We are cross trained without a group leader." A quality control auditor reported, "Cross functional blitz teams allowed us to break communication barriers." An engineer spoke up, "We were asked to think of something new and try it. We can cut time in half. Quality control and production are working together." And a line worker without direct blitz involvement said, "I see an enormous change. My production has gone up." The operations manager indicated "we accomplished great strides with virtually no capital expenditures."

How have management and employee attitudes changed?

A line worker said, "Well, we didn't communicate before. People feel better about their jobs. People are more excited about their work. They understand how what they do affects quality and productivity." A group leader offered, "There have been tremendous improvements on the floor itself. We have positive changes because of kaizen." The quality control auditor stated, "People are listening to each other now. Workers are now interested in quality and productivity." Another group leader added, "Management is more interested in listening and considering ideas of employees. Employees are trying harder not to make mistakes. They like to see good numbers (results) on the board." An engineer suggested, "Employees see their direct link to productivity and profit."

What has been learned from this experience?

"We really are the experts."
"We didn't have a good problem solving process before the blitz."
"We used common sense."
"We can make changes ourselves."
"Bottom up works."
"Trying new ideas is good."
"Kaizen blitz got the job done where other approaches have not."
"The support of the operations manager and supervisors made this possible."
"My ideas can make a difference."
"We can follow through with improvement and change."

Discussion

A case study of one firm may not predict future success with other, different organizations. However, careful case study documentation can assist and guide future kaizen blitz users to success with improved quality, productivity, and employee satisfaction. Based upon this experience, we believe several factors are essential for duplication of these results in other settings. The following items are not ordered by importance:

- **Management Support** - commitment from the top is a requisite for success, not only during the planning phase but also during the blitz and with follow-up. Explaining to those directly involved with the blitz how and why this is important should come from the top. Assuring employees involved and those left on the floor that this is important and necessary work is required. Allowing the blitz teams to stop production to experiment directly with change is required, but could be very divisive without management providing explanation. As follow up to the blitz there will be changes in process and procedure and monetary costs may be incurred.
- **Recognition and attitude about improvement** - both management and workers recognize and support the need to improve in specific, measurable areas.
- **Willingness to work as a team** - the concept of "team" is a requisite notion for a successful kaizen blitz. An unwillingness to ignore conflicts, past power struggles, and perceived inequities will prevent or impede progress.
- **Use of andragogy principles:**
1. short, focused time frame - a key element of the blitz process is a 3-5 day, no interruptions, intensely focused commitment to a specific problem. Participants see immediate, tangible results of their improvement efforts applied to a problem of interest to them.

2. participant experience - work experience is fully used to discover the causes of problems and improvements.

3. Skills as needed only - as noted in the methodology section of this case study, skills are needed for successful blitzes. However skills are only introduced when and if needed, not as separate training or because this is "good for you". This just-in-time approach keeps the team focused on results, not the educational process. New knowledge is applied immediately rather than taught for unspecified future use. Participants practice and improve skills while new information is fresh.

- **A measurable, manageable problem** - having a measurable, specific problem to work on is critical and essential to a successful blitz. Our experiences with these four blitzes and others outside this study confirm this requirement. "Improving communication between supervisors and line workers" is too vague. "Decreasing the amount of waste on line three" is measurable and specific.

- **An improvement attitude** - the heart of kaizen blitz is that we can make improvements and workers can be an integral part of the process that produces changes in productivity and quality. This attitude is fed by measurable successes that give positive feedback to workers.

### Need for Further Study

While this case study provides an excellent example of successful use of the kaizen blitz process, there are cases where kaizen blitzes did not produce favorable results. Additional study is needed to determine why these blitzes were not successful. Some issues which may influence success include: amount of organizational support for the blitz process, need for visible results to create interest, and minimal essential methods of training and appropriate facilitation of blitz teams. These are but a few of the factors that should be studied to gain a more complete understanding of successful blitzes and the predictors of success.

Additional study is also suggested for other organizations that have been successful using the kaizen blitz process. The authors believe further study will help to develop a theoretical framework that explains successful and unsuccessful kaizen processes.

### Implications for HRD Professionals

Several important implications emerge from this study for Human Resource Development professionals:

1. The kaizen blitz process can be a helpful tool to create immediate improvements for an organization. Improvements reported in this study were accomplished with little capital expenditure as well. The blitz can serve as an important start for long term continuous improvement by demonstrating positive results that inspire and encourage people.

2. Proper application of adult learning principles can be a highly effective way to obtain organizational improvements, encourage learning, and use the skills and experience of employees. Proper application of adult learning principles has been recommended for several decades by scholars and practitioners. Unfortunately, many organizations have not used appropriate adult learning practices when attempting organizational improvements. Successful use of adult learning in this case study supports what scholars and practitioners have long advocated relative to effective learning in organizations.

3. The results of this study indicate that a supportive context for successful improvement activities is necessary. Success occurs when adult learning is augmented with management support.

4. Many companies have tried and failed to achieve lasting success using traditional improvement approaches. The kaizen blitz process may be a way to rekindle interest and belief within these organizations that have tried but failed in the past. Use of kaizen blitzes can dispel cynicism and disbelief as well as restore confidence in the ability of workers to create meaningful organizational change. Confidence is restored by demonstration of successful, visible improvements in a short timeframe. For those organizations that have not attempted formal improvement activities, the kaizen blitz approach can set an example of success to be sought in the future. Organizations can then build upon these successes to achieve more permanent change and create a true culture of kaizen or continuous improvement.

Organisation Identity: Exploring a “New” Avenue for Intervention and Performance Improvement

Christian L. van Tonder
Rand Afrikaans University

Commentary in the business press has suggested that organisational success is related to the notion of corporate identity or organisation identity. The present study clarified the nature of the various concepts and established a theoretical framework for researching organisation identity. A correlative study was undertaken to determine the relevance of the organisational identity concept at an applied level. The results of structured interviews conducted with 153 executives representing 10 listed companies indicate strong relations between organisation identity, specific organisational attributes and organisational performance.

Keywords: Organisation Identity, Organisation Character

Organisations have become a taken for granted phenomenon in contemporary society. Indeed they have steadily grown and assumed centre stage in societal evolution and development, with many latter day global corporations financially more powerful than smaller nation states. Startling results produced by a Royal Dutch / Shell study of enduring organisations (De Geus, 1997) have however revealed that the life expectancy of organisations is rapidly declining (currently between 40 and 50 years). Organisational decline and bankruptcy were increasing at disturbing rates (Korten, 1995; Labich, 1994) with wave upon wave of costly mergers, acquisitions, corporate restructurings, and related organisational change events adversely impacting on the workforce, their dependants and ultimately society at large (Offerman & Gowing, 1990).

Various approaches and many attempts at accounting for the premature demise of organisations have proposed that environmental forces and economic and managerial reasons are to blame. The popularity of these arguments have waned over time, with many a scholar now arguing that they are over-simplistic, focus on symptoms and do not acknowledge the more fundamental psychological nature of organisational decline (for example Levinson, 1994). More recent contributions in the popular and business press (Labich, 1994) have suggested that the expensive path to corporate failure could be linked to the “identity” of the organisation (more specifically the absence thereof). This proposed relationship between identity and organisational performance is however not a novel concept, with some business leaders in the USA acknowledging this linkage (Wathen, 1986). Moreover, it has been indicated in some quarters (Chajet, 1989) that corporate identity is increasingly being viewed by US executives as a mainstream business activity. In the South African business context, for example, the results of a recent opinion poll among chief executive officers listed growth, identity and entering new markets as the top strategic priority for the period 1999 to 2003, followed by global competitiveness and productivity (Robertson, 1999). The conclusions of, among other, the Royal Dutch / Shell study of enduring organisations (De Geus, 1997), which emphasise a strong sense of identity as one of four key survival factors for organisations, further bolster the view that identity is an important element in organisational performance. These views are significant in the sense that identity (or corporate or organisation identity) as a concept is beginning to surface in non-advertising and non-marketing arenas as a possible “theory” which could account for business failure (or success).

The Problematic of Identity

The term identity is derived from the Latin word “idem” meaning “the same” (Abend, 1974) with its first known use dating back to approximately 1570 AD when it was used as an expression to convey the quality or condition of being the same, being absolutely or essentially similar and referring to a sense of unity (Van Tonder, 1987). Erik Erikson who is generally credited with popularising the concept as a consequence of his work in the field of individual psychology (Westin, 1983) described it as an inner sense of sameness and a continuity of character (Erikson, 1959). The term is however more frequently described in terms of the uniqueness, solidarity, autonomy, continuity over time, and the discreteness of the person (referred to as objective identity), which is differentiated from the person’s sense of (having an) identity or subjective identity (Van Tonder, 1987). The notion of identity,
however, is itself problematic. While Erikson (1959, p. 102) stressed "...the term itself retains some ambiguity", Albert and Whetten (1985, p. 265) argued that identity is a profound and consequential issue, but so difficult an issue that it is best avoided.

Turning to the notion of identity within an organisational context, it is not entirely unexpected to find Albert and Whetten (1985) commenting on the inherent ambiguity and abstract nature of the organisation identity concept, and the absence of an adequate theoretical framework to guide research and practice. This ambiguity is further exacerbated by the practice of using the concept interchangeably with concepts such as corporate identity and corporate image. The interchangeable and im precise use of key concepts and terminology is in fact a common criticism of the field (Stewart, 1991; Van Heerden & Puth, 1995). Moreover, very little scholarly research has been conducted on the subject, with academics not devoting adequate attention to the subject of corporate identity (Stewart, 1991) and much of the available literature written at a fairly superficial level by consultants or executives of advertising agencies (Shee, 1988). Apart from the public relations and advertising perspectives, scant attention has been given to the notion of identity within an organisational context. Given this context, several fundamental research questions were formulated:

- Even though the concept of corporate identity has been popularised by the public relations and advertising disciplines, what essentially is organisation identity? Indeed, does it exist and can it be differentiated from corporate identity and corporate image?
- What would the role (purpose and function) of organisation identity be?
- Assuming organisation identity is measurable, will it differ from organisation to organisation, from industry to industry, or not at all?
- Can organisation identity be linked to organisational functioning, as Labich (1994) would have the reader believe?

Research which provides answers to some or all of these questions (and indeed the many more that could be phrased) should bring clarity to the prevailing confusion around the use of the various identity concepts and possibly provide alternative arguments to account for the less than desirable levels of organisational performance (and the premature demise of organisations).

The purpose of the study was consequently stated as to investigate and determine the theoretical and practical relevance of the organisation identity concept. Several more specific research objectives were stated, which focused on exploring and defining organisation identity from a theoretical perspective - in relation to similar concepts in use (corporate identity, corporate image). During the empirical phase the study would primarily explore the existence and relatedness of organisation identity as construct at an applied level.

Corporate Identity and Corporate Image

The prolific writing on the topic of corporate identity over the last decade or so is indicative of a growing awareness of the subject both in business quarters (Chajet, 1989; Wathen, 1986) and among behavioural science professionals (Gorb, 1992) and attests to the increasing theoretical and practical interest in the ideational dimensions of organisations (Alvesson, 1990). A substantial base of quasi-theoretical literature at a superficial level currently characterises the domain of corporate identity and corporate image. A great many viewpoints have been expressed and a vast array of definitions on these concepts have been published (Van Heerden & Puth, 1995). In the absence however of an adequate theory base and a lack of systematic research (Stewart, 1991), the conceptual boundaries of the concepts have become diffused and contributed to confusion and the practice of using the concepts interchangeably. While it is generally acknowledged that corporate image and corporate identity are associated (Ind, 1992; Stewart, 1991; Van Heerden & Puth, 1995) this relationship in itself appears to be a source of confusion. It is for example not uncommon to encounter views expressing either similarities between corporate identity and corporate image (Zinkhan, 1993), or indicating that the two concepts are closely bound together (Stewart, 1991). The conceptual proximity of the two concepts appears to have contributed to a reciprocal "spill over" of meaning from one concept into the domain of the other - to the extent that both concepts have adopted features of the other.

A source of complexity compounding the existing difficulties experienced with the terminology, is the existence of distinct schools of thought within the corporate identity literature (Balmer, 1995). The most established and prominent of these streams hails from the corporate communications and public relations field, and emphasises the visual and design components of the organisation as the essence of corporate identity. This perspective is represented by those that view corporate identity as the visual manifestation and projection of a desired identity, notably through means such as the company's name, its logo, corporate colours, tagline, slogans, and symbols (for example Schmitt, 1995; Schmitt & Pan, 1994). The emphasis placed on the visual components of the organisation as
a means to influence or manipulate (control and manage) the perceptions, which the public and other stakeholders develop in respect of the organisation, is a salient feature of this approach.

Less prominent, but gaining ground is the school of thought that relates corporate identity to the company's mission, philosophy, and culture - essentially arguing that corporate identity depicts the innate and distinct personality or character of the organisation (for example Ackerman, 1984; Balmer, 1995). Proponents of this view argue that the typical visual attributes of the organisation are (or should be) the manifestations of the underlying distinctive character of the organisation, and imply alignment or congruency between organisation character and appearance. This approach appears to be more closely aligned with the traditional, psychological concept of identity. Indeed, there is a growing recognition that corporate identity can be related to the fundamental and psychological concept of identity (Ackerman, 1984). In this context, corporate identity is idealised as the distinctive qualities or personality of the organisation, which reside within and drive the organisation. The professional and business publications are flushed with references to identity crises and variations such as "mistaken identity", "searching for a new identity", a "split identity", etc., which tend to reinforce a more psychological view of corporate identity. These conceptualisations however lack the psychological depth and sophistication generally observed in terms of the psychological concept of personal or individual identity. In practice corporate identity has not yet evolved to the point of incorporating the psychological fundamentals of the core or generic identity concept.

The reality that the identity of the organisation is more than the traditional concept of corporate identity (with its emphasis on visual cues) has been acknowledged. In this regard Ollins (1990, p. 22) has stressed that the "visual promise" of corporate identity must be underpinned by an improvement in the communications or behaviour of the organisation. Furthermore, a new logo or brand will not secure a new identity if these organisational symbols do not adequately reflect internal organisational reality (Ollins, 1996). Reflecting on the status of the corporate identity field, it must be concurred with Glover (1993, p. 38) that too much emphasis has been placed on the world outside the organisation and not enough on the world inside it.

While corporate identity appears to be concerned more with the purposeful projection or portrayal of the organisation - predominantly through planned and persuasive visual means, corporate image tends to be the result or effect of, among other, the efforts to project a desirable corporate identity. Descriptions of what a corporate image is, range from the relatively uncomplicated picture that a company's audiences have of it (Ind, 1992), to the more encompassing set of beliefs, experiences, feelings, knowledge, attitudes and perceptions stakeholders have of the organisation (Van Heerden & Puth, 1995). Generally though, corporate image conceptualisations tend to vary around the common core of a perception of the company (Van Tonder, 1999). Shee's (1988) observation that the majority of corporate image conceptualisations tend to view the concept as a manufactured rather than a true reflection of the organisation remains valid. The corporate image is essentially viewed as a marketing asset, a market-positioning device, and as part of the strategic agenda to be managed and designed for competitive advantage (Dowling, 1993; Stewart, 1991).

Of particular importance, is the claimed impact on the organisation's performance, of firstly, corporate identity, and secondly corporate image, which enjoys popular support. Authors such as Ackerman (1984) argue that corporate identity clearly and consistently sheds light on business success and failure. Several authors have more specifically stated that an inaccurate or inadequate corporate identity and perceptions of this identity (introducing the corporate image concept) will negatively impact on the company's sales and earnings, employee morale, ability to attract talented people and expansion capital, and general performance on Wall Street (Chajet, 1989). While many of these arguments appear to have some face validity, sound empirical studies are rare and more research is required before this relationship can be substantiated. As with corporate identity, claims as to the impact of corporate image on organisational performance abound (see for example Treadwell & Harrison, 1994, who cite numerous studies in this regard). Despite this observation, substantive empirical research in this domain is also lacking (Shee, 1988; Stewart, 1991; Treadwell & Harrison, 1994).

Organisation Identity

In stark contrast to the proliferation of quasi-theoretical contributions in the field of corporate identity, the literature reveals a marked absence of contributions on the subject of organisation identity. Although each of the rather limited number of theoretical contributions made in respect of organisation identity practically represents a different perspective, four major streams or paradigms can be identified.

The psychoanalytic approach, which is evidenced in the work of Diamond (1993) and Czander (1993), applies concepts from the domain of individual psychoanalytic theory to organizations. Diamond (1993) for example describes organisation identity as the unconscious foundation of organisation culture and suggests that organisation
identity be seen as an interpretative framework, from which the organisation can be analysed and the motivation and behaviour of its members be understood. As a theoretical perspective, it relies intimately on the psychoanalytic tradition and concepts – particularly those relevant during childhood and later ego-development and for this reason the theory is difficult to apply to the organisation as unit of analysis.

The social identity approach, which is more concerned with the identity an employee or person derives from his/her membership of an organisation, is premised on the work of Tajfel (1974) and is represented more pertinently by the work of Ashforth and Mael (1989). Social identity theory argues that the individual seeks to obtain a positive social identity by virtue of membership to a group or groups (or organisations) that are held in high regard. It acknowledges the existence of either a group or an organisation with an identity sufficiently attractive or alluring for a potential member or stakeholder to seek belonging to it. It is argued that a distinctive organisation identity will attract potential employees, customers and shareholders to the organisation, and will enhance the support and loyalty of serving members. Both Diamond (1993) and Ashforth and Mael’s (1989) articulation of organisation identity lean more towards the identity of the individual (as unit of analysis) and tend to understate the identity of the organisation-as-organisation (indeed may inadvertently diffuse the boundaries of the two identity concepts).

The communication approach to organisation identity (Hecht, 1993), essentially argues that organisation identity is a process of communication and self-expression, and messages about the self are exchanged during communication transactions. Identity is defined as a characteristic of the individual, stored as self-cognitions, feelings about self, and/or a spiritual sense of self or being. The character of the identity concept is clearly depicted through the basic assumptions of the theory, but the precise role and function of identity (its purpose) in terms of the overall functioning of the individual is less clear.

The fourth approach represents those researchers who focus on the identity of the organisation as an entity. The organisation identity concepts defined by these authors appear to incorporate one or more of the psychological parameters of the original identity concept as articulated by Erikson (1959, 1968). This school of thought is represented by the work of Albert and Whetten (1985), Dutton and Dukerich (1991), Dutton, Dukerich and Harquail (1994), and Van Tonder (1987) and can be referred to as the classical approach to organisation identity. Common to these authors, is the equation of organisation identity to the distinctive character of the organisation, which is evidenced in those features of the organisation that are considered core, distinctive, and enduring. In keeping with Erikson’s (1959, 1968) views of individual identity, organisation identity is considered a life cycle bound phenomenon, which may become more salient during different development stages – particularly during change (for example transitions from one life cycle stage to another).

Of the listed approaches, it is only the research by Albert and Whetten (1985) and Dutton and Dukerich (1991) that attempted to extend the theory to some form of empirical exploration (qualitative, case study approaches). A brief comparison of the various contributions within the identified approaches indicate that the term organisation identity in most instances, is a misnomer - frequently employed to indicate the identity of the individual employee. As such, it does not depict the organisation as unit of analysis, whose identity could more appropriately be referred to as organisation identity. A substantial degree of consistency is however observed within the classical approach in terms of the frequency with which the organisation’s identity is equated to its character or personality (used as synonyms) and, specifically, the distinctive / unique, central and enduring nature of the organisation. Secondly, while using different terminology such as frame of reference, schema, or cognitive gestalt, the theoretical contributions seem to suggest directly and indirectly that organisation identity is an integration mechanism or framework. Organisation identity itself is largely unconscious or hidden and only becomes salient when the organisation engages change (whether by choice or otherwise), when it is challenged, or when it finds itself in transition between two life cycle stages. While Albert and Whetten (1985), and Van Tonder (1987) provide more evolved theoretical perspectives on organisation and group identity, adequately developed theories of organisation identity remain elusive. The problem is compounded by the alternate vantage points from which theorists approach the concept with or without regard for the psychological origins of the concept – a situation having its roots in the complexity and ambiguity of the psychological concept of identity and which subsequently prompted a restatement of the organisation identity concept by Van Tonder (1999).

Regardless of the perspective employed, it does appear as if most of the cited theorists would concur that identity has potentially serious ramifications and a significant impact which is often more indirect, pervasive and enduring than may be immediately apparent. The anticipated impact of organisation identity on the organisational system is yet to be determined empirically.

A wide array of organisational attributes is nominated by the respective theoretical contributors as being important components of the organisation’s identity. Taken together, these include virtually all prominent features of the organisation, such as statements of ideology, mission, objectives, strategy, structure, organisational processes, shared values and beliefs, leadership, management philosophy, culture (frequently cited) and components of culture
(such as rituals, ceremonies, stories, symbols), organisational boundaries, relationships (between employees, management and subordinates), logos, slogans, appearance of the corporate headquarters; organisational climate, the skills, abilities, attitudes and interests of the organisation; communication, feelings, social roles and social affiliations, and physical attributes of the organisation.

While culture, structure and to a lesser extent leadership and management, and ideology/mission are repeatedly mentioned, it appears that identity-defining attributes can be any attribute of an organisation. To an extent, this serves to confirm the absence of empirical research in the domain of organisation identity. It is assumed that empirical observation will bring more clarity to this situation by differentiating between more and less prominent variables (features) of an organisation's identity.

From the various, though limited, theoretical contributions in the field and drawing on Van Tonder's (1987; 1999) reconceptualisation of the identity construct, organisation identity was finally redefined as a cognitive gestalt or integrative schema of the organisation's features which reflect its uniqueness or distinctive, central/core and enduring character. It is established largely at an unconscious level and provides the basis from which the organisation is consistently perceived as unique (one of a kind) and is clearly differentiated from other organisations in its environment (also referred to as the fact of identity or objective identity). The organisation's identity (or lack thereof) is experienced and expressed at a subjective level in the form of a sense of identity (referred to as subjective identity). This subjective identity of an organisation is an emotional manifestation of the more cognitive and objective identity (as stated above), and essentially describes the organisation's awareness of its identity (or lack thereof).

The purpose of organisation identity was stated as to ensure that the organisation was perceived as a unique entity when compared to similar organisations. This it achieves through differentiating the organisation from its environment (through social comparison, introspection and self-categorisation), which in turn enhances focus and consequently facilitates adaptation, and the future survival of the organisation. Moreover, organisation identity which is established and maintained primarily at an unconscious level, is a life cycle linked phenomenon that is sensitive to change during periods when the organisation was particularly vulnerable and more at risk (start-up conditions, rapid growth and decline stages). Depending on the organisation's capabilities and environmental sensitivity, it could drift into a situation of identity diffusion or inadequate or inappropriate identity, which is referred to as an identity crisis. The latter if left unattended can seriously jeopardise the organisation's functioning in the short term, compromise intermediate adaptation to environmental change and ultimately result in the organisation's demise. With this conceptualisation as context it was argued that organisation identity as the distinctive character or central, distinctive and enduring features of the organisation, could be differentiated on theoretical grounds from corporate identity (essentially the visual portrayal of the organisation's character) and corporate image (the perceptions stakeholders have of the organisation). At the same time it provides substantive grounds for exploring the meaning and relevance of the organisation identity concept at an applied level.

Empirical Exploration of the Organisation Identity Concept

Hypotheses developed on the basis of the literature review took the view that organisations do possess distinctive identities, which are related to specific organisational attributes or features. Moreover, that the organisation's identity is related to the organisation's performance.

The scant research base, devoid of any significant empirical studies and limited in terms of theoretical foundations, suggested exploratory research with a strong correlation component. An ex post facto field study with qualitative and quantitative data gathering methodologies was indicated to test the hypotheses of the study. Triangulation as methodology was pursued in the absence of a clear theory and empirical base, and both the independent variable (organisation identity) and the dependent variable (organisation performance) were operationally tested with several alternative definitions. Organisation identity was alternatively conceptualised as the company's total answer to the question "Who am I?"; distinctive character or personality; perceived uniqueness; and, that combination of organisational features which convey the unique, central or core, and enduring character of the organisation. Organisation performance was defined operationally as performance ratings provided by executives (covering a seven year period); published financial results for the 1997/1998 financial year; and overall rank order position of the company based on the frequency with which it has been cited in "top performing" and "worst performing" tables of the Top 100 Companies (annual Business Times survey) for a four year period.

---

1 For a more comprehensive argument on the theoretical fundamentals of organisation identity, see Van Tonder (1999).
A cluster sampling strategy, drawing on companies resorting among the “Top 100” and worst performing companies on the Johannesburg Stock Exchange in the 1997 annual survey of Top 100 Companies (conducted by the Sunday Times Business Times) was employed. A list was drawn up and 221 qualifying companies were approached, of which the participation of 10 listed and high profile companies from 7 industry sectors\(^2\) were secured. A structured interview (schedule) was used to obtain qualitative and quantitative data from the 153 top and senior executives who represented the participating companies. Qualitative data were obtained through structured, open-ended questions, the Twenty Statements Test (Rees & Nicholson, 1994) which is similar to an incomplete sentence procedure, and the use of respondent nominated metaphors to describe his/her company. Quantitative data was obtained through specific questions, which sought descriptions of the company in terms of various topics (e.g. uniqueness, culture, image, operational challenges, values), and required an assessment of company performance, focus, character and stage of development over a seven-year period. All quantitative questions employed rating scales.

Overview of key findings

Qualitative data were coded using a codebook approach and the frequencies so obtained were expressed as proportions of total responses by managers and companies. Cluster analyses revealed several distinct clusters of organisational characteristics. Companies differed from one another on these clusters with the best performing company (CO4, mining industry: coal) for example appearing more stable and low key than the worst performing company (CO3, mining industry: gold) which was more dynamic and risk orientated.

A series of clusters which described various identity states/statuses or conditions (the organisation’s subjective experience and/or awareness of its identity) also emerged from the self-reported descriptive company statements. These identity statuses ranged from a strong sense of unity and solidarity, a sense of identity search, experienced identity crises (diffused identity), a sense of enduring character, a focus on and preoccupation with corporate or visual identity, a sense of developing an identity, to an experienced identity loss, and a sense of possessing qualities relevant for establishing an appropriate identity. Results revealed that organisations differed notably in terms of identity status with the top performing company (CO4) displaying a strong sense of unity/solidarity. The worst performing company (CO3) by contrast experienced a strong sense of identity crisis.

Quantitative descriptions of the companies were similarly subjected to data reducing methodologies. A principal components analysis\(^3\) extracted 25, but ultimately only 21 usable factors (FM1 to FM25)\(^4\). Referred to as identity factors, these factors described various sources of uniqueness or distinctiveness, which ranged from an innovation-action culture anchored in, among other, unique leadership and management (referred to as an “innovaction” culture), to distinctive client-supplier relations and unique technology and systems. Notable differences in the profiles of participating companies were observed in terms of the identity factors.

Strong relationships between the organisation’s sense of identity (identity clusters) and the more objective organisation identity (identity factors) were recorded. For this research population a company displaying for example a strong sense of unity/solidarity or integrative character is likely to exhibit a less prominent and reduced social role, a strong stakeholder care approach, a sense of order and unity, a prominent performance/success culture, a clear long term orientation, strong adaptive/change capabilities, a reduced emphasis on organisational size, the presence of a distinctive market orientation, a positive work climate, and the belief that it is unique in terms of its systems and technology. Companies rating high on sense of unity/solidarity were likely to define their distinctiveness in the industry in terms of their culture, clients, systems, employees, and structure (smaller rather than larger). For these companies uniqueness was clearly not related (strong inverse correlations) to image, trading partners, role in the community, non human resources, or company name. The latter suggests that identity for them is not an externally acquired phenomenon, but is associated with internal (or core) attributes of the company.

A strong sense of unity/solidarity was also inversely related to the performance rank order\(^5\) the company occupied (an organisation occupying a rank order position of 1, being the top performer, was likely to exhibit the

---

\(^2\) Financial/banking, retailing, mining (gold), mining (coal), food, manufacturing - leather, pharmaceutical and medical.

\(^3\) The obtained factor matrix was rotated orthogonally (varimax rotation method) to maximise statistical independence of factors.

\(^4\) Factor scores for the participating companies were calculated and used during subsequent analysis.

\(^5\) Companies rank ordered on the basis of the frequency with which they appeared in top and worst performing categories (various financial performance measures) of the annual Business Times survey over a period of 4 years. The top performing company on all indices over the period, obtained a rank order of 1 (worst performing company in the research population was allocated a rank order of 10).
The empirical findings of the study were consistent with many of the theoretical assumptions regarding the nature of identity. Results furthermore suggest that processes of identity acquisition and the concept of identity crisis may be rewarding avenues for continued research. Conclusions, though constrained by the non-probability (convenience) nature of the research sample, nonetheless confirmed the relevance of organisation identity to organisational functioning and its linkage (and sensitivity) to changes in the organisational life cycle. The strong and
pervasive relationship of organisation identity with organisational performance indexes has important implications for an understanding of organisations, their management and survival, and generally the role of leadership. It introduces a hitherto unknown concept into the performance management domain, which, on reflection, suggests that many established managerial routines and practices may need to be reconsidered from an organisation identity perspective. For this research population, it is suggesting that management may comfortably direct managerial focus, energy, and other resources towards identity establishment, maintenance, and/or “management” with solid prospects for enhancing organisational performance – regardless of whether this relates to short or medium term results.

The findings, secondly, suggest that practitioners, consultants, and scholars in the field of human resource management and human resource development in particular, acknowledge that organisation identity (or distinctive character) needs to be factored into discussions when contemplating organisation and performance improvement. For this research population, organisational success was more likely when the organisation had a clear sense of unity and an enduring, distinctive character - of who and what they are. The converse is equally valid. Where identity or character was uncertain (diffused) organisational focus and performance were also adrift. For the practitioner, the reported results suggest that at best, organisation identity or character be measured and monitored, but at worst may imply concerted effort towards the establishment and maintenance of a clear and distinctive identity. Several entry points for diagnostic purposes are indicated. In this regard the organisation’s sense of identity (whether clear or diffused), organisational focus (whether clear and targeted or unclear/inappropriate or drift) and stage of development (for example entering, or emerging from, growth, consolidation or decline stages – indeed, any major change event) may provide avenues through which the organisational performance-focus-identity relationship can be explored. This is furthermore attainable through both qualitative and quantitative measures, such as those employed in this study.

Finally, while the exploratory nature of the current study precludes inferences about causality, strong foundations for hypotheses in this direction has been established. Confirmatory research may well entrench an alternative approach to improving and sustaining organisation performance, and extending the life expectancy of organisations to the benefit not only of the workforce and those affected by organisations, but also society at large.

Identification of Critical Work Environment Variables for Quality Performance in a Service Organization

Constantine Kontoghiorghes
Deborah Dembeck
Oakland University

The purpose of this study was to identify the critical work environment variables for quality performance in an organization. The theoretical framework of the study was based on total quality management and sociotechnical systems theories. This exploratory study concluded that the following organizational variables are the most important when it comes to quality improvement in a marketing services organization: satisfaction with internal processes; commitment of peers towards quality; having easy accessibility to others in the organization; few bureaucratic barriers to get the job done; effective communication channels within and between work teams; and achievement of ISO 9001.

Keywords: Quality, Socio-technical, Performance

The ultimate goal of all HRD interventions is to improve organizational performance. To a CEO, bottom-line organizational performance translates into improvements in productivity, quality, and cost reduction which in turn result in increased profitability and competitiveness. As the title of this paper implies, the focus of this study is the identification of critical variables for quality performance.

Successful organizations seek to proactively and systematically understand and respond to current and future, external and internal customer needs. Meeting and exceeding customer expectations is an area that has long been neglected by U.S. businesses. "The ultimate competitive advantage is established when an organization develops a culture that supports its internal customers" (Lindsay & Petrick, 1997; p. 7).

Despite high expectations, implementation of total quality management (TQM) interventions has produced mixed results (DeSimone & Harris, 1998; Whitney & Pavett, 1998). In particular, "the practitioner literature suggests that there is a high rate of success with TQM, particularly from the organization's perspective. Many companies reported that TQM has led to significant improvements in product quality and service leading to increased market share, profits, and company image" (DeSimone & Harris, 1998; p. 459).

Researchers, however, have also provided a contrasting view with regard to the effectiveness of TQM interventions. According to Spector and Beer (1994), "the TQM picture is far from rosy. There is a whole other set of data with which to contend, data to suggest that the 'failure rate' for TQM interventions -- that is, TQM efforts which failed to live up to the expectations of their champions within the organization - is upwards of 75 per cent, and that gloomy assessment remains relatively constant whether looking at organizations in the USA or the European Economic Community" (p. 63).

A limitation of TQM research is that its results are almost all based on case reports which in turn are generated by practitioners rather than researchers who follow sound research designs (Hackman & Wageman, 1995). Macy and Izumi (1993) in their organizational change, design, and work innovation meta-analysis study of 131 North American field studies described TQM research designs as "extremely poor" with severe empirical research data limitations.

Aside from the research design limitations, TQM research is also negatively impacted by the lack of uniform and consistent definition of quality (Reeves & Bednar, 1994). Reeves and Bednar argue that "continued inquiry and research about quality and quality related issues must be built upon a thorough understanding of differing definitions of the construct. Universalistic propositions describing the relationship among various variables and quality cannot be made when the meaning of the dependent variable continually changes" (p. 419).

According to Whitney and Pavett (1998), the academic literature has not yet devoted much attention to the study of quality management implementation. Hence, there are few studies and research-based tools available to facilitate total quality management (TQM) diagnosis and implementation. Because of this lack of research, the authors stress, that there is a gap in knowledge of how organizations function.

Aside from TQM, the sociotechnical systems (STS) approach has also been widely used in order to enhance organizational performance. However, the STS intervention as a stand alone approach has received scrutiny as well. More specifically, Persico and McLean (1994) in their comparison of the STS and TQM paradigms have concluded that
ST is ambiguous, theoretical, and may over-emphasize the social side of the organizational system, whereas TQM/CQI may be overly prescriptive and pragmatic and may over-emphasize the technical side of the system" (p. 11). Given the weaknesses of both paradigms, Persico and McLean (1994) suggest that the theories of TQM and STS are "in the process of being merged and combined with other approaches to enhance the transformation of industry" (p. 11).

With regard to the merger of STS and TQM theories, Manz and Stewart (1997) point out that limited effort has been devoted to the potential synergies that could be obtained from combining TQM and STS approaches. Manz and Stewart (1997) also stress the point that TQM and STS, widely recognized and implemented work system approaches, show inevitable weaknesses as stand-alone methods. The authors propose that by effectively integrating and synergizing the strengths of TQM with the strengths of STS the potential exists for creating work system designs that merit the large short-term and long-term investments required for work system redesign. Comparative strengths of the two approaches are described as follows: TQM provides a standardized system for measuring and tracking performance, STS provides a flexible structure that encourages adaptation to a changing environment; TQM focuses on coordination of multiple work processes, STS focuses on innovation through diversity of inputs. In short, the authors suggest, that "through better understanding and synergistic integration of TQM and STS, the benefits of simultaneous stability and flexibility, as well as innovation, psychological ownership, quality of worklife, continuous and discontinuous learning, and ultimately high organizational performance and customer satisfaction may be realized" (Manz & Stewart, 1997; p. 68).

The sentiments expressed by Manz and Stewart (1997) are echoed by Lindsay and Petrick (1997) as well. In particular, Lindsay and Petrick (1997) advocate that "the philosophies of the parallel movements of OD and total quality are now rapidly coming together as total quality advocates try to deal with the human factors in quality improvement and OD people attempt to deal with the technical and measurement factors that accompany the challenges of planned organizational change" (p. 4).

**Problem Statement**

Given the limitations of TQM research and the current direction toward merging TQM and STS theories, the main purpose of this empirical study was to identify, prioritize, and describe the most important STS and TQM work environment variables for quality performance in a marketing services organization. This study also addressed the limitation with regard to the lack of uniform and consistent definition of the construct of quality, by operationalizing the quality construct in terms of distinct and universal measures that could be applicable in a variety of settings.

For this study, the work environment was defined in terms of the following TQM and sociotechnical systems (STS) dimensions: (1) awareness of quality strategy; (2) continuous improvement emphasis; (3) commitment to quality; (4) quality policy alignment; (5) communication/information sharing; (6) customer satisfaction sensitivity; (7) process measurement; (8) peer team support; (9) quality culture perceptions; (10) availability of resources necessary for task performance; and (11) ISO 9001 compliance.

Quality performance was operationalized in terms of the following quality indicators: (1) satisfaction with quality of work output - the extent to which employees are satisfied with the quality of work output they receive from their fellow workers; (2) external customer satisfaction - the extent to which external customers are satisfied with the organization's services; (3) satisfaction with internal processes - the extent to which employees are satisfied with internal processes of the organization; (4) timeliness - the extent to which a service will be performed when promised; (5) accessibility and convenience - the extent to which employees have easy accessibility to others they need to perform their job; and (6) responsiveness - the extent to which employees react quickly and resolve unexpected problems.

In short, the main research question this study attempted to address was: What is the degree of association between the identified work environment variables and quality indicators?

**Theoretical Framework**

The theoretical framework of the study was based on total quality management and sociotechnical systems theories.

**Total Quality Management**

Proponents of total quality management maintain that there is a universal set of practices that if implemented will lead to high performance and organization development. Total Quality Forum recently defined total quality (TQ) as
a people-focused management system that aims at continual increase in customer satisfaction at continually lower cost. TQ is a total system approach (not a separate area or program), and an integral part of high-level strategy. It works horizontally across functions and departments, involving all employees, top to bottom, and extends backwards and forwards to include the supply chain and the customer chain. The principles and practices associated with total quality impact all the traditional OD approaches. (Lindsay & Petrick, 1997; p.20)

According to Whitney and Pavett (1998), TQM implementation is a major organizational change effort that requires "a transformation in the organization's culture, processes, strategic priorities, and individual attitudes, beliefs, and behavior" (p. 9). This type of change is so comprehensive, that successful implementation requires a total organizational paradigm shift (Whitney & Pavett, 1998). In all, the TQM approach embodies principles, ideas and tools from a variety of disciplines, including psychology, sociology, statistics, management, and marketing (Dervitsiotis, 1998).

The main objective of TQM interventions is to develop organizations which create value through greater satisfaction of all relevant stakeholders. "Through well structured processes, TQM aims to create an environment that encourages people to grow as individuals and learn to bring about both small but continuous (kaizen) and drastic or breakthrough improvements" (Dervitsiotis, 1998; p. 112). To be successful, TQM interventions must (a) have the commitment of management at all levels of the organization; (b) focus on the needs of both the internal and external customers; (c) insist on everyone's participation; (d) make decisions based on facts; and, (e) aim for continuous improvement (Dervitsiotis, 1998).

Sociotechnical Systems Theory

For many years now, organizations have used sociotechnical systems designs in order to improve organizational effectiveness. According to Pasmore (1988),

the sociotechnical systems perspective considers every organization to be made up of people (the social system) using tools, techniques and knowledge (the technical system) to produce goods or services valued by customers (who are part of the organization's external environment). How well the social and technical systems are designed with respect to one another and with respect to the demands of the external environment determines to a large extent how effective the organization will be. (p. 1)

In general, STS interventions focus on a combination of organizational structural demands, such as workflow, task accomplishment, and performance, social demands, such as relationships among workers, and external environment demands, such as meeting external customer expectations (DeSimone & Harris, 1998; Cummings & Worley, 1997; Pasmore, 1988). "STS interventions include quality circles, total quality management, and self-directed work teams" (DeSimone & Harris, 1998; p. 455).

Research has shown STS interventions are among the most widely used and effective OD interventions (DeSimone & Harris, 1998). A review of 134 STS studies by Pasmore, Francis, Haldeman, and Shani (1982) indicated that overall, 97% of the reviewed STS interventions resulted in quality control improvement. Another important meta-analysis study that contributed to the quest of determining the effectiveness of STS interventions, is the one conducted by Macy and Izumi (1993). In their seven-year long meta-analysis study, the authors considered 1800 field studies that took place between the years of 1961 and 1991. Out of 1800 only 131 field studies met the strict research criteria required for a quantitative meta-analysis utilizing individual study d-effects.

The purpose of the Macy and Izumi (1993) study was to provide information with regard to the success and failure of various organizational structure, human resource, technology, and TQM features or action-levers. According to the authors, "little empirical work is available to examine organizational transformations or systemwide change and its ability to improve performance" (p. 236). Furthermore the authors stressed that "the need for a standardized methodology assessing performance outcomes and their relationships with certain action-levers or design features across organizations in organizational development has become pronounced" (Macy & Izumi, 1993; p. 237). Since the authors did not find any empirical TQM field studies that met their research design and data requirements, they reported results on the structural, human resource, and technological design features only. In all, the authors identified 17 structural, 14 human resources, and 14 technological action-levers that were common among the field studies under consideration.
The findings of this meta-analysis study suggested that organizational design and change interventions are very effective in improving organizational performance. The meta-analysis showed that the strongest organizational improvements are made in the financial area in which costs go down and product quality as well as productivity improve.

The results of this extensive meta-analysis study also showed that human resource interventions alone do not result in large organizational improvements and can be more effective when introduced holistically, accompanied always by structural changes. Macy and Izumi (1993), further concluded that the design combination of technological, human resources, and structural change produced the highest and strongest organizational improvement. The latter conclusion not only exemplifies the importance of STS interventions, but perhaps it also explains why they have been found to be so effective when it comes to enhancing organizational performance.

Research Questions

As stated earlier, the main purpose of this empirical study was to identify, prioritize, and describe the most important TQM and STS work environment variables for quality performance in a marketing services organization. In short, this study attempted to answer the following research questions:

1. What is the degree of association between the identified work environment variables and quality indicators?
2. To what extent is satisfaction with internal processes associated with external customer satisfaction?
3. To what extent is having all necessary skills and knowledge to perform job associated with quality performance?

Methodology

Subjects

The sampling frame of this study consisted of 295 professionals at a marketing services company in the Midwest. The staff membership was comprised of Sales, Account Services, Editorial, Graphics, Print Production, Training, Consumer Marketing, Network Services, Systems Development, Program Administration, and Administration/Finance professionals. Each member of the organization received a survey and was therefore identified as a participant.

Instrument

The instrument for this study consisted of a 43-item questionnaire. The questionnaire was custom designed to assess the overall quality performance environment of the organization and was partly based on Lindsay's and Petrick's (1997) quality and sustainable productivity assessment instrument. The instrument also incorporated in its design three training transfer related variables in order to assess the degree to which supervisory support for training exists in the organization. The questionnaire further prompted the respondents to indicate the degree to which they had all necessary skills and knowledge to perform their job. Overall, the reliability of the instrument was measured in terms of coefficient alpha and was found to be 0.95.

Method

The procedure involved distribution of a questionnaire to be filled out by each employee and returned. A cover letter from the Executive Vice President of the organization accompanied the questionnaire and the respondents were assured of complete anonymity. A monetary incentive of one hundred dollars was applied to encourage participation and maximize the response rate. A series of three reminder/follow up e-mail notices were forwarded to participants. A second distribution of the survey and cover letter was issued two weeks following the original dissemination of the survey. The response rate for this study was calculated at 86.4% (255/295).

Data Analysis

After the data from the 255 participants was collected, both descriptive and inferential statistics were used to analyze it. In terms of research question 1, correlational and multiple regression analyses indicated the degree of association between the identified work environment variables and quality indicators. Correlational and regression analyses also
assisted in answering research questions 2 and 3. In particular, through correlational and multiple regression analyses the researchers were able to describe the association between satisfaction with internal process and external customer satisfaction as well as between the variable of having all necessary skills and knowledge to perform job and the quality indicators.

Results and Findings

Table 1 depicts the regression model that corresponds to each quality indicator. Aside from the adjusted R square values, Table 1 also depicts the pertaining Pearson correlations. Table 2 lists the correlations that relate to research question #3.

As shown in Table 1, the regression model pertaining to external customer satisfaction revealed that satisfaction with internal processes in the organization, availability of tools and equipment to perform the task, peer commitment towards quality, and enough time to perform the job in a professional manner were found to be the main predictors for external customer satisfaction. It is important to note that satisfaction with internal processes was by far the strongest predictor for external customer satisfaction. In other words, the more satisfied employees are with internal processes in the organization, the more likely it would be that the external customers will be satisfied with the organization's services.

According always to the data in Table 1, one can conclude that ISO 9001 implementation is a very strong predictor of satisfaction with internal processes in the organization. Other variables that were found to be predictors of satisfaction with internal processes are: a) the extent to which the organizational structure makes it easy to improve processes; b) the extent to which key processes are regularly measured and audited; c) the extent to which inputs are received from others in a timely fashion, and d) the extent to which others produce quality output and are quick to respond to unexpected problems.

Satisfaction with quality of work output by peers was found to be mainly associated with a) commitment of peers toward quality; b) have enough time to perform job in a professional manner, c) peers hold each other accountable for work produced, and d) emphasis on quality by senior management. What these four variables indicate is that satisfaction of the quality of work output will be more likely to increase if the whole organization is committed and emphasizes the importance of quality, employees have enough time to perform their jobs in a professional manner and are accountable for the work produced.

As the data in Table 1 indicates, employees will be more likely to receive inputs they need in a timely fashion if they have easy accessibility to others, excellent relationships exist between work teams, and the organizational structure makes it easy to improve processes. Lastly, employees will be more likely to quickly respond to unexpected problems if, a) effective communication channels within and between work teams exist; b) they have easy accessibility to others in the organization; c) are encouraged to learn new skills and knowledge; and d) if people in the organization share the responsibility for the success or failure of work produced.

With regard to research question #3, according to the data depicted in Table 2, having all necessary skills and knowledge (skills/knowledge) to perform one's job has a low to moderate association with quality performance. As shown in Table 1, the skills/knowledge variable did not load into any of the regression models.

Conclusion

In summary, the data in Tables 1 and 2 tells us that external customer satisfaction is greatly dependent on satisfaction with internal processes. Satisfaction with internal processes was in turn found to be strongly associated with ISO 9001 achievement and an organizational structure that makes it easy to improve processes and requires that key processes are measured and audited regularly. Since the latter falls under the IS 9001 umbrella, it is safe to conclude that ISO 9001 is an effective mechanism that directly facilitates satisfaction with internal processes and indirectly, external customer satisfaction. Further, the data in Table 1 reveals that satisfaction of the quality of work output is greatly dependent on the commitment senior management and other employees in the organization exhibit toward quality. Moreover, the detailed analysis of the quality dimensions that pertained to inputs being received in a timely fashion and employees being responsive to unexpected problems indicated that quality improvement is greatly dependent on an organizational

structure that a) is characterized by few bureaucratic barriers; b) allows effective communication and excellent relationships within and between work teams; and c) provides all the necessary time, facts, information, tools, and equipment in order for employees to perform their tasks in a professional manner.

Given that the skills/knowledge variable did not load into any of the regression models, and it was found to exhibit low to moderate correlations with the quality indicators, one may also conclude that having all necessary skills and knowledge to perform one's job is not as critical, when it comes to quality performance, as the identified TQM and STS variables. This conclusion is in agreement with the findings of the Macy and Izumi (1993) meta-analysis study, according to which, as stated earlier, human resource interventions alone do not result in large organizational improvements. Rather, human resource interventions can be more effective if they are introduced holistically, accompanied always with structural changes. As Macy and Izumi put it, "it becomes evident that the first action-lever implemented in transformation efforts must deal directly with power, control, and decision making issues. It would be necessary to be very naive to think that changing Human Resources systems by themselves will significantly change the financial performance of a firm. Top management has to be convinced that a flatter and leaner organizational structure combined with investment in Human Resources systems will improve performance" (p. 288). Having all the necessary skills and knowledge to perform one's job efficiently and effectively is obviously very important. But if these skills and knowledge are introduced in a system which is not designed for optimum performance, then it is doubtful that they will result in sizeable performance improvements.

Summary

Overall, the statistical analysis of this study identified the following organizational variables as critical components for quality performance in a marketing services organization:

- Satisfaction with internal processes
- ISO 9001 achievement
- Commitment of peers towards quality
- Easy accessibility to others
- Few bureaucratic barriers to get the job done
- Effective communication channels within and between work teams
- A structure that makes it easy to improve processes
- Availability of tools and equipment to perform tasks
- Having enough time to perform job in a professional manner
- Employees are quick to respond to unexpected problems
- Excellent relationships between work teams
- Key processes are regularly measured and audited
How this Research Contributes to New Knowledge in HRD and Recommendations for Future Research

Through empirical analysis, this study was able to bridge some of the existing gaps in knowledge by identifying the most critical work environment variables that pertain to distinct quality performance indicators. Further, by relying on both, TQM and STS theories, this study has helped create a more holistic conceptual framework for studying quality improvement in a service organization and reinforced the link between the two theories. In terms of HRD practice, this study may assist HRD practitioners better assess organizational needs relative to quality performance and thus be able to implement more targeted changes. These more targeted changes in turn could signify the importance of the HRD function and demonstrate how HRD efforts can be linked to bottom-line organizational performance and the strategic mission of the organization in general. Finally, by replicating this study in other work settings researchers will be able to determine the extent to which the identified critical work environment variables are indeed crucial in other work settings or industries.

Leadership Development: A Review of the Theory and Literature

Susan A. Lynham
University of Minnesota

Leadership development, a component of Human Resource Development (HRD), is becoming an area of increasingly popular practice. It is estimated that billions of dollars per year are invested in some kind of leadership development in US companies. Yet a review of available theoretical and scholarly literature suggests that less may actually be known about this area of human development than is implied by popular practice. With an increasing emphasis on human development and expertise as a source of sustainable competitive advantage it is unlikely that the expenditure on and investment in leadership development will decline in the next few years. Growing expenditure on leadership development suggests an increasing effort to utilize leadership development as a vehicle for performance improvement.

It is both timely and appropriate for HRD to become more critically involved in the study of the body of knowledge that supports and informs the practice of leadership development. This involvement will enable HRD to make explicit what really is and is not known about leadership development, and to consider the implications of such reflective study and findings for future research and practice.

Keywords: Leadership, Leadership Development, Leadership Education

There is a deficiency of real, scholarly knowledge about leadership development. Yet there is an increasing drive for and investment in leadership development in organizations (Boyett & Boyett, 1998; Clark & Clark, 1994; McCauley, Moxley, & Van Velsor, 1998). It would appear that the body of knowledge on leadership development has some distinct voids, some troublesome gaps, and that both may be well served by further purposeful and scholarly inquiry and study.

HRD is concerned with “the process of developing and/or unleashing human expertise for the purpose of improving performance” (University of Minnesota, 1994). As such, leadership development falls well within the general focus of concern of HRD. It is time for HRD to begin seriously studying not only the general phenomenon of leadership development, but also the link between leadership development and performance improvement. Both issues of leadership development offer HRD further leverage for strategic influence and action within organizations in the future (Ulrich, 1998; Torraco & Swanson, 1995).

Problem Statement and Theoretical Framework

For purposes of this study leadership will be taken to be a process whereby individuals influence groups of individuals to achieve shared goal or commonly desired outcomes (Northouse, 1997). Leadership development has been described as "as every form of growth or stage of development in the life-cycle that promotes, encourages, and assists the expansion of knowledge and expertise required to optimize one’s leadership potential [and performance]” (Brungardt, 1996, p. 83). In a 1996 article in the Journal of Leadership Studies, Brungardt provided an excellent scholarly review of leadership development and leadership education research. In this review he focused on “what is known about how leaders are educated, developed and trained” (p. 82). A similar but more expansive work has been more recently published by McCauley, Moxley and Van Velsor (1998) resulting in a Handbook of Leadership Development.

Not withstanding these two pieces of work on leadership development the question of what is really known about developmental processes aimed at growing and developing leadership capabilities and expertise, and the link between leadership development and performance improvement, still remains largely unanswered and certainly warrants a lot more study and attention. This paper explores the following leadership development related questions:

What do we appear to know about leadership development?
What do we appear to not know about leadership development?
What are the implications of the above "knowns" and "unknowns" for future research on and practice in leadership development?

Methodology

The methodology used was a conceptual analysis based on a review of related leadership and leadership development literature. Brungardt's (1996) article provided an important contribution in beginning to answer the above questions and played a fundamental role in the provocation of this study.

It is the purpose of this paper to present the current status of available theory and literature on leadership development. Through review, analysis and synthesis of related scholarly literature and theory a discussion of what is and is not known about leadership development is presented in four parts. The first part presents the current state of the available body of knowledge on leadership development. The second part highlights some of the core knowns in this body of knowledge. The third part presents some key "voids" or "unknowns" in the leadership development literature. And, finally, the fourth part offers some conclusions and possible implications of the insights gained from this paper for future HRD research.

Results

The Present State of the Body of Knowledge

Although there are innumerable authors on the topic of leadership, there are considerably less so on leadership development. Four notable authors who have endeavored to gather up the body of knowledge on leadership are Bass & Stogdill (1990), Gardner (1990), Clark & Clark (1994), and Northouse (1997). In Bass & Stogdill's 1182 page Handbook of Leadership, only one chapter (between 40-50 pages) is devoted to the topic of leadership development. In Gardner's book, two short chapters out of 17 touch on leadership development. And, in both Clark & Clark's work on Choosing to Lead, and Northouse's work on Leadership Theory and Practice, no insights are offered on leadership development itself. Instead these authors tend to focus on examples of leadership development programs (as an example of method) and in a few instances offer some insights on leadership learning and training.

The most noteworthy work on leadership development is a paper by Brungardt (1996) who appears to be the first to try to gather up some of this body of knowledge. He makes a good and noteworthy first stab at this rather complex and large task. Brungardts work is later followed by that of McCauley, Moxley and Van Velsor (1998) in their Handbook of Leadership Development. McCauley et al's work presents, however, more of a practitioner, how-to perspective on leadership development than a scholarly consideration of leadership development as a body of knowledge.

An initial literature search on the topic of leadership development revealed no papers of purely this topic, but rather 64 items concerning leadership development of two particular kinds, namely, of educational leadership and of military leadership. The literature on leadership development seems to be embedded in executive and management development, a tendency that is also reflected in the AHRD proceeding papers of the past four years.

A thorough review of the literature reveals that the body of knowledge pertaining to leadership development seems to reside in three key areas (Bass & Stogdill, 1990; Boyett & Boyett, 1998; Brungardt, 1996; Gardner, 1990; Jackson, 1993; Northouse, 1997; Schreisheim & Nieder, 1989; Yukl & van Fleet, 1992). The first of these three areas focuses on general approaches to leadership, and can be further divided into five categories, namely: (1) traits theory – emphasizing the personal attributes of leadership; (2) behavioral theory– emphasizing what leaders actually do and the identification of different styles and their effects on group performance; (3) situational theory– emphasizing the different demands different situations place on leadership and therefore leadership style; (4) power-influence theory– which explains leadership in terms of the amount, type and use of power and influence tactics; and (5) transformational theory– emphasizing the leader's role in the creation of culture and revitalization of organizations (Brungardt, 1996). Newer approaches, like the 3E's of Responsible leadership (White-Newman, 1993), Authentic Leadership (Terry, 1993), and Communal Leadership approaches (Bryson & Crosby, 1992; DePree, 1997) have provided frameworks for trying to integrate many leadership approaches – sometimes referred to as contingency approaches to leadership (Northouse, 1997; Terry, 1993; Yukl & van Fleet, 1992). Although these many approaches to and theories of leadership have provided us with different
insights into the nature of leadership it is only recently that the question of how a leader is developed has become addressed by the literature, and somewhat poorly, it would seem, at that.

A second area in which the leadership development body of knowledge seems to reside is in that of leadership development research, most of which fall into four categories, namely, early childhood and adolescent development, the role of formal education, adult and on-the-job experiences, and specialized leadership education. (Bass, 1990; Brungardt, 1996; Clark & Clark, 1994; Hughes, Ginnet, & Curphy, 1993) The third area that contains some of the leadership development body of knowledge is that of leadership education research, which covers leadership development in elementary and secondary education contexts, leadership development in higher education, leadership development training programs, and leadership development among senior citizens. (Bass, 1990; Brungardt, 1996)

In commencing the task of attempting to assess the current state of the body of knowledge on leadership development one would expect to be overwhelmed by the volume of available literature. On the contrary the author was overwhelmed on two unexpected fronts. First by the lack of a specific body of knowledge of leadership development, and second, by the extent to which this literature seems deeply embedded, even hidden, within leadership and other social sciences (notably psychology) literature.

The literature review therefore points to a substantial lack of knowledge about the topic and a general lack of a co-ordinated, coherent body of knowledge on leadership development (Brungardt, 1996). Having briefly considered the general state of leadership development as a body of knowledge, the next consideration is what this body of knowledge informs us in terms of what we do and do not appear to know about leadership development.

The Core Knowns about Leadership Development

Through a synthesis of the literature the author identified eight core knowns about leadership development.

1) Leadership development occurs in early childhood and adolescent development. 2) Formal education plays a key role in leadership development. 3) On-the-job experiences are important for the development of leadership. 4) Leadership development also occurs through specialized leadership education. 5) Leadership education focuses on three specific areas. 6) There are a number of factors that can act as potential barriers to the effectiveness of leadership development. 7) Leadership development is a lifelong process. And, 8) Leadership development is often confused with management development. Each of these points is expanded upon in the paragraphs below.

1. Leadership Development occurs in Early Childhood and Adolescent Development Studies on early childhood and adolescent development seem to provide evidence that experiences from early in life impact on adult leadership potential. These studies vary in nature from how personal traits are substantially influenced by childhood and adolescent experiences (Gardner, 1990) and family influences (Cox, 1926; Jennings, 1943), how treatment of parents and parental standards influence the development of leaders (Bishop, 1951; Bass & Stogdill, 1990), how a family life that emphasized a strong work ethic and high education standards and responsibility is directly related to leadership potential and success (Bass, 1960; Day, 1980), to how opportunities in childhood and adolescence allowed young people to practice leadership activity (Bass, 1960; Murphy, 1947), and the influence of mentoring relationships at school become influential in leadership behavior (Clark & Clark, 1994).

2. Formal Education plays a Key Role in Leadership Development According to Bass (1990) many scholars believe that a liberal arts education is the best for preparing young leaders as it provides a broader educational experience considered essential to leadership (Clark & Clark, 1994; Gardener, 1990; McCauley, Moxley, & Van Velsor, 1998). Brungardt (1996) and Bass (1990) however caution that there is very little research that has been conducted to study the formal role education may play in leadership development. Studies conducted in the British education system provide some evidence to this effect, however this approach to leadership development is centered on a philosophy of classical, conservative education, where leadership is considered education for the elite and that the elite are the best suited to rule (Boyd, 1974; Burns, 1978; Lapping, 1985). Bass (1990) and Brungardt (1996) brought our attention to the fact that there is research available that shows that formal education does positively correlate with achievement of recognized leadership positions, however Brungardt prudently cautions that a positive correlation between education and leadership does not reflect nor support causation.

3. On-the-job Experiences are Important for the Development of Leadership. Many authors in the field have pointed to the importance of challenging job opportunities as a source for learning leadership skills as well as
to learning from the people one works with and from the task one does as two valuable such sources for leadership development (Gardner, 1990; Hughes, Ginnet, & Curphy, 1993; Kouzes & Posner, 1990; McCauley, Moxley, & Van Velsor, 1998; Ulrich, Zenger, & Smallwood, 1999). In research work by McCall, Lombardo & Morrison (1988) researchers were able to identify the lessons learned from challenging assignments and experiences and link these back to leadership development. Other studies have found that learning from mistakes, developmental opportunities, job experiences and on-the-job mentors play an important role in leadership development (Copeman, 1971; Davies & Easterby-Smith, 1984; Lombardo, 1986).

4. Leadership Development also Occurs Through Specialized Leadership Education. Evidence of the bearing of specialized leadership education programs and training have also been shown, through numerous research studies, to have a positive impact on leadership development. A meta-analyses, by Burke & Day (1986), of the effectiveness of these programs revealed a positive impact on leadership development, pointing to a conclusion that in most reported cases specially designed educational activities seem to enhance the development of leaders. Studies reviewing the effectiveness of short versus long term leadership training programs or activities have revealed that leadership development as a longer term process does seem to be more effective and deliver more lasting results than those of a shorter (few days to a week) duration (Guetskow, Forehand, & James, 1962; Luttwak, 1976; McCauley, Moxley & Van Velsor, 1998). However, many of these last studies were conducted on management development training processes and may not be as applicable, if at all, to leadership development processes.

5. Leadership Training Focuses on Three Specific Areas. The purpose and content of leadership training appears to focus on three areas, namely, improving a leader's attitudes, skills and knowledge, training in success and effectiveness as a leader, and training and education on leadership styles (Bass, 1990). Studies on all three groups of training and education have revealed mixed findings and appear to rely heavily on participant self-reporting and perception reports of peers, subordinates and superiors (Brunsgart & Crawford, 1996; Cromwell & Caci, 1997; Daugherty & Williams, 1997; Field, 1979; Hand & Slocum, 1970; Rooh & Langone, 1997). However, as pointed out by Bass (1990), the results of these studies cannot be guaranteed. Other specialized leadership education programs include those that focus on management development, the education of science and engineering supervisors, military leaders, executive development, entrepreneurial and achievement motivation, leadership of and by minorities, training leaders for foreign assignments, and training community leaders (Bass, 1990; Brungardt, 1996; Yukl & van Fleet, 1992; Clark & Clark, 1994; Morrison, 1994). Many studies conducted on the effectiveness of training of this nature have again revealed mixed results (Bass, 1990), but with some showing more positive evidence than others, for example, training leaders for foreign assignments (Chemers, Fiedler, Lekhyananda & Stolurow, 1966) and training community leaders (Rooh & Langone, 1997; Williams, 1981).

6. There are a Number of Factors that can Act as Potential Barriers to the Effectiveness of Leadership Development. What does appear to be of importance in determining whether leadership development and education are effective are numerous factors that affect the outcomes of these efforts (McCauley, Moxley, & Van Velsor, 1998). Bass (1990) highlight and discuss studies that substantiate the following as such factors of note:
- The strengths and effects of the training depends on the criteria employed to assess these effects
- The composition of the training group
- The attributes of the trainer
- The occurrence of follow-up, reinforcing practice and feedback, and
- The congruence of training and the organizational environment.

7. Leadership Development is a Life-long Process. Leadership development is more a lifelong process than a series or collection of short-term developmental events and experiences; that, as pointed out by Brungardt (1996), leadership development includes the components of leadership education and training each of which are different to leadership development and involve a more narrow, specific focus, almost like interventions along the life-line of leadership development. Related research also reveals that research findings reveal mixed and often contradictory results (Latham, 1988; Rice, 1988) resulting in increasing debates over the empirical soundness of the field.

8. Leadership Development is Often Confused with Management Development. In many instances management and leadership are taken to be equivalent and interchangeable phenomena, with many early studies focusing more on skills, knowledge and attributes of management development and then been concluded for issues of leadership. Leadership studies and literature of the 1990's and today increasingly differentiate between these
leadership and management as different and less related phenomena, calling into question the application of studies of one kind to the other (Gardner, 1990; Kotter, 1990; Kouzes & Posner, 1996; Yukl, 1989).

**Vooids in the Leadership Development Body of Knowledge**

A number of compelling voids in this body of knowledge have been synthesized from the literature review. These voids must be studied and filled if this area is to mature in credibility of theory and practice. Four compelling such voids are discussed in the paragraphs below.

1. **There is a Lack of Boundaries and Mapping of the Body of Knowledge of Leadership Development.** One of these issues concerns the need to gather up studies and understanding of leadership development, and to conduct analyses of the evolution and nature of what is really known in this field. There is no clear and consistent answer to the question of what leadership development is and isn’t. Although the works of Gardner (1990), Clark & Clark, 1994, McCauley, Moxley & Van Velsor (1998) and Brungardt (1996) make attempts at answering this question they are not yet adequate in this regard. Until the general aims, ideals and specific purpose of leadership development is consistently mapped out and bounded it is unlikely to mature into a credible field of thought and practice. Indeed the very question of whether leadership development is a field of thought and practice with its own body of knowledge is at stake.

2. **There is No Clarity or Agreement on the Intended Outcome of Leadership Development.** A review of related literature on leadership development leaves one with a serious question about what the outcomes of this field are intended to be. Is its dependent variable one of individual growth and development, or is it one of performance? Indeed, what should it be? The literature highlights outcomes of leadership development as including the likes of improved subordinate and human relationships, improved attitudes, skills and knowledge, improved trainee leadership and group effectiveness, how to use major styles, improved decision-making style, sensitizing trainee’s to their management role, and developing and sharing personal and organizational vision (from key studies highlighted in Bass, 1990; Clark & Clark, 1994; McCauley, Moxley & Van Velsor; 1998).

The link between leadership, and leadership development and performance, seems to lie more in belief than in justifiable evidence (Bass, 1990; Meindl & Ehrlich, 1987; Ulrich, Zenger, & Smallwood, 1999). Studies conducted by Meindl & Ehrlich put forward compelling evidence for how the belief that leadership contributes to specifically organizational performance produces a 'haloing' bias on related evaluative studies. Definitions of leadership and leadership development do not place performance as an explicit outcome of leadership. Some definitions may include statements of achieving results, but what those results are is left at best only partially clarified and are usually of the nature of essential characteristics, roles and responsibilities, attributes, principles and practices (Bass, 1990; Bennis & Nanus, 1985; Gardner, 1990). Nowhere is there a definition of leadership, and by association, leadership development, that includes 'for improving performance' as a core dependent variable of this field of study and practice. Rather, performance improvement is inferred, implied and assumed as an outcome of leadership and leadership development. Given the increasing investment in leadership development by not only American organizations, but by organizations worldwide, this is a particularly worrying void in the field. This lack of a real, justified link between leadership development and performance links back to clarity of assumptions that govern the thought and practice of leadership development. Until these assumptions are made explicit and the field defined in congruence with these assumptions and beliefs, little progress can be made in building sound knowledge in the field, let alone methods for proper research and inquiry (Ruona & Lynham, 1999). Unless these strides are made the field will likely continue to reflect an empirically inadequate and lacking framework for thought and practice.

3. **Leadership Development Evaluation is Questionable.** A third important issue concerning incompleteness in the field relates to the nature of evaluative studies and thus evaluative conclusions based on these studies. The literature review revealed that the majority of evaluative studies on the effectiveness of leadership development (including education and training) rely firstly on self-reports from the participants, and secondly on 360-type feedback instruments (Bass, 1990; Clark & Clark, 1994; Ulrich, Zenger, & Smallwood, 1999). Both these measures of evaluation are highly questionable in terms of validity and reliability (McLean, 1995). 360-degree feedback systems are merely reporting on perceptions of behavior and attitude changes, yet they are sometimes masqueraded as valid and reliable measures of developmental effectiveness.
Largely missing from this field of study are directly observable behavior and attitude/style/performance changes and reports. Surprising, direct observation reporting has been used in research studies to determine what makes for leadership (Kouzes & Posner, 1989, for example, did a good job here). Yet, in studying the effectiveness of leadership development for these characteristics and practices direct observation and actual incident reporting on behavior and other changes is largely absent.

Furthermore, many of the evaluative research studies have been judged to be questionable due to poor design and control during the conduct of the research, calling into question the validity of the findings that have resulted from these studies (Bass, 1990).

4. **There is a General Lack of Knowledge about the Unique Method and Content of Leadership Development Processes.** A final area of concern in the field of leadership development links to the methodology and content of such activities and processes. Most of the research conducted in leadership development type studies are linked to specific models of leadership (for example, trait-theory, behavior-theory, situational-theory), yet leadership development encompasses many of these models and theories. This raises the question of whether research findings on the effectiveness of specific leadership theories will and do hold true when developed in combination with multiple and sometimes contradictory leadership theories. Can it be assumed that because some studies show a positive correlation between transformational leadership theories and group performance to fail to recognize the boundaries of theoretical models due to assumptions of commonality about human behavior and its universality. He said that this tendency causes us (in the social sciences) to assume that we can safely ignore the boundary conditions surrounding a given theoretical model, and described this tendency as an unfortunate intellectual habit of theorists and practitioners. He further suggested that the more we recognize that human actions may be different in different situations the more realistic we will be of the boundaries of theoretical models that we create. More work needs to be done on contingency theories that combine multiple approaches and perspectives on leadership and leadership development before such conclusions can be made.

**Contributions to New Knowledge in HRD**

Because HRD is concerned in part with the development and unleashing of human expertise for the purpose of performance improvement it should be concerned with the thought and practice of leadership development. To date most of this literature is embedded in the areas of psychology and management, lending this body of knowledge a predominant focus of either individual development or individual effectiveness, or a combination of both.

The HRD profession is struggling to find ways to partner more closely with business and to become more proactively involved in the strategic conversations of the organization (Torraco & Swanson, 1995). At the same time organizational expenditure on leadership development is on the increase with the apparently largely unsubstantiated belief and assumption that this development will lead, either directly or indirectly, to individual, group, and organizational performance improvement. It would appear that much inquiry and study is yet to be done in this area of human development. Because of HRD’s expertise in human development and human development technologies, it would appear logical for the profession to take a more active interest and role in the conduct of leadership development related studies and research. And, by so doing an active contribution in the development of this body of knowledge could provide invaluable leverage for further strategic impact by HRD on organizational performance.

**Conclusion**

The majority of the research in the field of leadership development has focused on the what of leadership, rather than the how of leadership development, resulting in a lack of knowledge and empirical evidence regarding the subject of leadership development (Ulrich, Zenger, & Smallwood, 1999). Brungardt (1996) offers a compelling conclusive summary of leadership development and education, namely, that: (1) although leadership development and education are not new topics scholarship in this area appears to be in its infancy, with literature in its early phases, and with both fields in the process of defining themselves and their research domains; and (2) that not only do leadership development activities lack documentation, but that there is a general lack of understanding of their impact, an understanding that may take years before being adequately supported by sound, and empirical research.

Developing Workplace Leaders Through Their Emotional Reactions: Creating Committed Change Agents to Build a Learning Organization

Darren C. Short  
Office for National Statistics, UK

Peter Jarvis  
University of Surrey, UK

Changes to organizations are challenging leaders to change their mindsets on their roles and responsibilities. In traditional bureaucratic organizations, that means looking for ways to create new structures and to build learning organizations. In such bureaucratic organizations, where will the leaders come from to create and to build? Are traditional leadership development programs, with their emphasis on the cognitive, able to produce these leaders and to change both mindsets and behaviors? This paper explores the concept and design of leadership development at an emotional level (learning through emotional reactions), describing a program of book readings, group discussions, and reflective writing. Wider implications for HRD are raised.

Keywords: Leadership Development, Learning Organizations, Emotion

The program described in this paper resulted from a period of personal reflection on my own experiences of leading, facilitating, and participating in leadership development activities. I had observed too many leaders attend, participate, and learn theories, models, and techniques, but rarely develop a commitment to change their behaviors. Those leaders had learned the need to changing their actions, but rarely moved beyond that cognitive appreciation. Something was missing from the programs; and my view was that passion could have a key role in bridging the gap between cognitive and behavioral change. As Ellinger, Watkins, and Bostrom (1999) pointed out, the curricula of management development programs designed to provide new knowledge and skills are often competency-based and focus on business functions and methods: those programs therefore need to be offered in different delivery formats. A leadership program was developed using such different formats to approach development at an emotional level—not to increase emotional intelligence (Goleman, 1998), but to approach learning through emotions. This paper provides an account of the program design and the pilot run evaluation.

Challenges facing leaders in organizations

Organizations are operating in a new dynamic environment caused by the increasing speed and turbulence of technological change, the influx of knowledge workers, and the move to a global and multicultural workplace (Bennis & Nanus, 1999). The concept of learning organizations has emerged in response to that changing operational environment. These are designed to involve everyone in identifying and solving problems; thus enabling the organization to continuously experiment, improve, and increase its capacity. In learning organizations, leaders emphasize employee empowerment and encourage collaboration across departments and with other organizations (Daft, 1999). That leads to a soft, intuitive model of organization with a horizontal structure, adaptive culture, linked strategy, personal networks, and empowered roles (Hurst, 1995). That links with the concept of boundaryless organizations which encourage free movement across vertical, horizontal, external, and geographical boundaries with the aim of increasing speed, flexibility, integration, and innovation (Ashkenas, Ulrich, Jich, & Herr, 1995).

The changes to a new dynamic environment with boundaryless and learning organizations have generated new challenges for organizational leaders. According to Hickman (1999), "this uncharted territory requires unparalleled innovative leadership that cannot be an extension or revision of the old model" (p. 3). The requirements for leadership in this new environment include (Allen et al., 1999): new systems thinking to design processes that increase inclusiveness and diversity in decision making; the design, support, and nurturing of flexible, durable organizations and groups, and systematic understanding needed to respond positively to change events; the
Building emotion into a leadership development program

This paper describes a leadership development program designed for a traditional bureaucratic organization in the public sector. That program was designed with two aims: to prepare leaders for the challenges of operating in a learning organization; and to prepare a cadre of leaders to act as change agents in shifting the organization towards a learning organization mode of operation. The setting was a British public sector organization employing 3,300 across five sites. The organization had a long-standing leadership development strategy with three main strands: (a)
formal training courses and development opportunities for individuals; (b) bespoke training events and consultancy support for work teams and groups of leaders; and (c) self-directed learning opportunities. The formal training courses contained a mix of trainer-led input on models, theories, and best practice, small group exercises, and sharing of experiences and practice.

From attending the existing courses, all leaders in the organization shared a common language on management and leadership as well as a common understanding of models and theories on: team building, leadership styles, communication skills, strategic planning, change management, learning, motivation, coaching, etc. However, the existing courses had been criticized by some leaders as covering management more than leadership, being more knowledge- and skills-based rather than encouraging reflection on experiences and attitudes, and delivering theories and models more than encouraging leaders to use experience to create their own.

The new program was designed as an optional module on leadership for those who had been through the existing courses, and was designed to challenge existing meaning perspectives, or frames of reference, with the intention of generating leaders who were committed to developing a learning organization. The program design was influenced by the work of Mezirow (1990, 1991) on transformative learning, but with the view that change was needed beyond the cognitive level addressed by Mezirow. Past research had provided empirical evidence that leaders’ meaning perspectives can be transformed, for example, Lamm’s (1999) study of the use of Action Reflection Learning in a corporate leadership program. This design, however, set out to expose participants to an emotional as well as cognitive experience – the aim being to create a passion for changing the role of leaders in the organization rather just a cognitive understanding of the need to change behavior. The importance of emotions to leaders was described by Goleman (1998), who reported his analysis of outstanding leaders and the finding that emotional competencies (as opposed to technical or cognitive cues) make up 80 to 100 per cent of those seen as crucial for success. However, the program was designed not to develop emotional competence, but to approach learning through emotional responses to learning materials and methodologies.

The program was designed to take between six and twelve leaders in groups who would meet for three hours every three weeks over a six-month period. At the core of the program was a reading list: Mezirow (1991) believed that meaning perspectives could change following a dilemma resulting from being in an eye-opening discussion of a book. Other authors had written about the learning potentials of book reading, such as Greene (1990) on the use of imaginative texts as occasions for gaining critical consciousness, and Shor and Freire (1987) on reading texts with different perspectives from the learners’ as a way of assisting them to ‘read the world.’

The reading list was created with the intention of challenging leaders on an emotional level. The selected books were: Tuesdays with Morrie, by Mitch Albom; Long Walk to Freedom, by Nelson Mandela; To Have or To Be, by Erich Fromm; The Story with my Experiments with Truth, by Mohandas Gandhi; The Art of the Impossible, by Vaclav Havel; I Have a Dream, by Martin Luther King; On Becoming a Leader, by Warren Bennis; and Insights Be, by Erich Fromm; The Story with my Experiments with Truth, by Mohandas Gandhi; The Art of the Impossible, books were: Tuesdays with Morrie, by Mitch Albom; Long Walk to Freedom, by Nelson Mandela; To Have or To

To take full advantage of the emotional impact of the reading materials, the decision was taken that the program should avoid traditional didactic delivery methods. Instead, other methods were selected that, from a literature review, were identified as being successful in transformative learning. They included:

• Critical incidents - brief descriptions written by learners of significant events in their lives based on a set of instructions that identifies the kind of incident to be described and asks for details of the time, place, and actors involved in the incident and the reasons why the event was so significant (Brookfield, 1990);

• Journals - their uses include: as an educational tool before learning something new, to aid reflection while learning, and as a means of post-reflection; as a tool to support reflective withdrawal and reentry (Lukinsky, 1990); and as a tool to build a documentary trail of how understanding of a problem has changed and to track influences on this shift in understanding (Marsick, 1990);

• Group discussions. According to Brookfield (1986), groups are considered to: encourage the collaborative exploration of experiences and the collective interpretation of learners’ individual realities; provide support, information exchange, a stimulus, and source of relevant resources; and provide a venue for experimenting with ideas, opinions, and alternative interpretations and for testing those out in the company of others engaged in a
similar quest. Brookfield and Preskill (1999) outlined many tools and techniques for using group discussions as a way of teaching:

- Distributed learning - the spreading of learning episodes over a period of time. Knox (cited in Brookfield, 1990) found that older adults were able to learn most effectively when learning episodes were distributed according to a rationale dictated by the content, and Mezirow (1990) suggested that ideally learners should meet as a group over an extended period of time to assess action steps taken throughout the process. Conger and Benjamin (1999) reported that distributed learning is rare in individual-based leadership development training, where programs are generally short, ranging from a few days to a few weeks;
- Narratives. Dominice (1990) described the use of educational biographies in an adult education seminar, whereby students presented life histories in the light of the education they had received and then over the following weeks produced new written narratives.

Comparing the designed program to Mezirow’s (1991) process for the transformation of meaning perspectives: book readings and group discussion would provide dilemmas to encourage change; readings, discussions, reflection, journaling, and exploring critical incidents would enhance awareness of the context of beliefs and feelings, encourage the critique of underpinning assumptions and premises; reflection and journaling would help identify and assess alternative perspectives; and narratives of commitment and distributed learning would assist in decisions on new perspectives and allow for action to be taken based upon those new perspectives.

The participants

The program was piloted between January and August 1999 at two locations in the UK. All 18 participants were in public sector managerial positions ranging from first-rung managers up to experienced senior managers of large teams. Participants came from work areas dealing with: data collection and analysis; information systems; finance; corporate strategy; methodology; and human resources. Their educational qualifications ranged from the equivalent of a high school diploma though to Master's degree level. Group A consisted of six middle managers responsible for teams of between 3 and 12 people and with between 4 and 24 years of experience. Group B consisted of 12 junior to senior managers responsible for teams of between 5 and 80 people and with between 5 and 25 years of experience. Of the 18 on the pilot, six were women, two left the organization before the program finished, and two others left the program before the mid-point.

Evaluation process

The trial program ran in the first half of 1999. Mid-way through, it was decided that an external evaluation was necessary to provide internal organization stakeholders with an independent perspective on the program design and impact. The second author acted in this capacity. The evaluation model was based on a qualitative case study design within one organization. Yin (1994) suggested the need for multiple sources of evidence in case study data collection so as to address a broader range of historical, attitudinal, and behavioral issues as well as to allow for data triangulation. Data were therefore collected through analysis of: end-of-meeting evaluation forms; participants’ written narratives of commitment; a questionnaire sent to participants four weeks after the program; a transcript of one meeting selected at random; and a focus group held three months after the end of the program. The evaluation tools were designed in collaboration with participants.

The authors were keen to also collect data from participants’ staff and managers; however, staff changes over the six months’ of the program and the following three months’ of post-course evaluation, meant that very few participants retained the same staff or the same manager over the full length of the program. Participants also expressed concern that many of the impacts of the program would become observable over a longer period of time than covered by this initial research. It was therefore decided not to seek data from the few staff and managers who could comment on pre- and post-course behaviors. Participant involvement in the data collection was voluntary, resulting in less than full response for each data collection method. The findings were subsequently validated by reporting back findings to all participants.
Results

Evaluation results are reported under three headings: impact of the program on participants; behavioral impacts; and reactions to the program design.

Impact of the program on participants. Outputs of post-course questionnaires, post-course focus groups, meeting transcripts, and end-of-meeting evaluation forms were analyzed to identify the three outcomes of changes to meaning perspectives described by Jarvis (1992): transformed perspectives, emancipated cognitive distortions, and new conceptual frames of reference.

Transformed perspectives. Most participants reported that their view of leadership was changed. For some, the change took the form of a broadening: “My view of leadership has broadened and I now appreciate more fully the nature of leadership (and followership) at all levels;” “My view of leadership has grown;” and “I now have a much wider appreciation of what others see as leadership.” For some, the change was a realization that they need to challenge their own leadership behaviors: “I now understand the importance of being a good follower, and I’m trying to act that way myself,” and “I now see the need to act as a servant leader, asking others how I can help them to achieve their goals.”

Emancipated cognitive distortions. Several participants reported that the program had encouraged them to question certain beliefs about leadership they held previously. Those included beliefs on: their suitability for leadership (“My view of leadership has changed greatly. I have gained in confidence, both that I have a leadership role to play and that I have the necessary qualities to fulfill the role well”); their desire for a leadership role (“I now see the difference between being a manager and a leader, and I’m not sure I want to be a leader”); the importance of various aspects of the leaders’ role (“I now place more emphasis on vision and the people-side of leadership”); and the process of leadership development (“I gained a realization that techniques get you only part of the way. You can’t fake good leadership – the lack of authenticity would show through.”)

New conceptual frames of reference. Participants reported that they gained new conceptual frames of reference as a result of combining readings on leadership with group discussions. Those took the forms of new leadership concepts, new philosophies, new role models, appreciation of other perspectives, and new theories.

Impact on behavior. As Conger and Benjamin (1999) stated, “it is important to see conceptual learning as only a first step in the process of learning about leadership” (p. 46). The extent of changed meaning perspectives should therefore be assessed in part through evidence of behavior changes. This was discussed in post-program focus groups with participants, who felt that it was too soon to expect many observable changes as a result of the program. Specific changes in behavior reported by participants included:

• Greater emphasis on servant-leadership behavior - “I am more open to admitting my lack of expertise, more confident to ask for help; acting more as a servant-leader and asking how I can help staff;”
• Increased risk taking - “The course has given me the confidence to take risks, and if you want to change things then you have to take risks;”
• Greater commitment to being a leader - “I now appreciate the distinction between having and being on leadership, and I am committed now to being a leader rather than to having a leadership position;”
• Changes to leadership styles - “I have changed my leadership approach. I used to tell people what to do, whereas my approach now is one of facilitation;” “As a leader, I now spend more time trying to understand the concerns of my staff. I am more honest with them about likely changes and my own plans;”
• Encouraging own staff to develop as leaders - “I encourage them to talk more openly about leadership issues;”
• Providing staff with greater level of support - “Greater delegation and empowerment - “I step back before diving in. I work with others to develop joint solutions. I have started asking my staff ‘what can I do to help?’”
• Greater openness on leadership - “I talk more frequently about leadership with my colleagues;”
• Changed leadership role - “I spend more time thinking about strategy and visions;”
• Inviting feedback on leadership performance - “I invite feedback from staff more frequently about myself as a leader and about how the work is done.”

Reactions of participants to the program. Participants’ reactions to the program took three forms: reactions to the program design, comparisons between the program and traditional leadership development training, and comments on improved reflection skills. Taking each in turn:

Reactions to the program design: Participants reacted positively to many of the methodologies, although no single methodology received universal acclaim. Book readings combined with group discussions based on those books were viewed as having the greatest contributing factor to participants’ learning in the program. In post-course evaluations, all participants agreed that they learned ‘a lot’ or ‘quite a lot’ from the readings and only one participant perceived s/he had learned little from group discussions. One participant stated that, “So much of what comes from
the course depends on the discussion groups and group dynamics within these. They can help to make sure you do the readings and journal writings." Another commented that, "The readings greatly improved my self-awareness."

There was broad agreement that the group discussions support learning over and above the benefits of reading the books. As participants commented, "The group discussions helped me to understand followership - I didn't get the importance from the readings alone;" "The group discussions helped greatly in translating the readings into the a context I could understand - considering how it affected me and how I could apply it in our organization;" and "The group discussions gave me the confidence to apply the reading material - other participants were supportive and encouraging."

Group discussions based on participants' critical incidents and examples of leadership from within the organization were also well received. However, of the various methodologies built into the program, journal writing and narratives of commitment received the least positive reaction, with reactions spread across the spectrum from 'learned nothing' to 'learned lots.' One participant stated that, "I found journal writing a useful experience - it was very useful to continually record my thoughts and compare them with others in the group, and continually assess the merits of my own views and opinions. The journal has proved useful for future reference." Another, commenting on narratives of commitment, stated, "The request to complete narratives was excellent to consolidate all my learning. It provided a means of setting targets, and having a future form of reference. My Narrative is dynamic and will change in the future."

In addition to those aspects of the program already mentioned, participants' reacted positively to negotiated agendas ("I benefited from a different method of learning, including the liberating experience of not being confined to learning from a set agenda or syllabus"), distributed learning ("The format and structure was much better than an intensive one week course."), and discussions controlled by the group rather than the trainer. Where groups invited guest speakers into the program, evaluation forms also showed a positive reaction.

Comparisons between the program and traditional leadership development training. It was interesting to explore participants' reactions to the program given its difference from the previous management and leadership training courses they had attended. Most agreed that the new program was a useful supplement to those traditional courses, adding an extra dimension to their development. As one stated, "Past courses were useful introductions to new models, and made me open to the thought of learning more about leadership. The new program gave me some ideas for taking things a bit further and made it clearer what what was leadership and what was management." A second participant stated that, "Reflections on Leadership enabled me to learn more about my attitudes and my own style whereas past courses were about tools and techniques, and they didn't turn me into a leader."

Reflections on results

The experiences of the pilot program have provided some initial evidence to support the claim that emotions can be used in workplace programs to develop leaders beyond the cognitive level - to move them into action after they understand the need to change and understand the theories, models, and techniques. That evidence was reflected in participants' comments of how the program developed them beyond their experiences of previous leadership programs, and was also reflected in self-reported accounts of behavior change. Participants' comments during the program, and in subsequent evaluations, provided evidence of an increased commitment to change behaviors and to change the organization. The evaluation findings also provided preliminary evidence that carefully selected reading material, facilitated discussions, and reflective writing exercises can combine to encourage an emotional response as part of learning. Some specific issues were also raised by the program design and evaluation, and these are discussed briefly in the following paragraphs.

Although the evaluation evidence supports the view that the reflective and emotional approach of the program produced changed meaning perspectives in participants, there remains the concern that the participants' passion for change will be quashed by the remainder of employees in the workplace (an issue of learning transfer). Conger and Benjamin (1999) described this concern as the failure to build the critical mass, which often comes from, among other factors, a shared language and a set of stories about what is valued. To minimize the effects of small participant numbers, support structures have now been set up, and others are planned: with program alumni still meeting on a regular basis, sharing their experiences via an electronic database, inviting leaders to address them as a group, and exploring options for mentoring with leaders internal and external to the organization.

The program operated as a pilot in 1999, mainly because it was viewed by the HRD function as so different from traditional programs run in the organization. For example, no other program or course used book readings, or distributed learning to the same extent, or such techniques as journal writing or formal critical incident techniques.
There was therefore some concern as to how the program would be received by key stakeholders in the organization. Introducing it 'through the back-door,' as an optional module of a long-standing leadership development strategy, allowed the HRD function to collect evidence on the impact of the program design for use in arguing for an expansion of the program in later years.

The evaluation results also raise some interesting issues for HRD teams inside organizations. On an operation level, they emphasize the need to continue to explore different delivery mechanisms for the development of leaders, including the use of reading circles, study groups, and action learning sets. They also raise the need for HRD teams to reflect on whether their existing leadership development programs go far enough in challenging participants emotionally. The program described in this paper produced in participants a degree of passion for change that past leadership programs had failed to achieve, in part because of the cognitive focus of those programs on models, theories, and techniques. In those programs, leaders were not sufficiently challenged to explore their passions, their commitments as a leader, the pains and glories of their past experiences, and the emotions of learning closely with a group of fellow leaders over an extended period.

At a strategic level, the program raises questions about how HRD teams can best assist organizations in the shift away from bureaucratic models – and how best to prepare for that shift when the HRD function is already several steps ahead of the organization's thinking. Radical development programs are unlikely to be sanctioned widely in bureaucratic organizations before significant commitment is given by senior leaders to building a learning organization. How then can the HRD function be ready for rapid responses to those commitments when they are eventually made, and is such 'back-door' development (as described in this paper) an appropriate route for advance experimentation? This raises questions about the role of the HRD function in creating momentum towards a learning organization with or without the agreement of key organizational stakeholders - should the HRD function, for example, be developing change agent leaders and planting them around the organization as a means of shifting the organizational culture, even when the senior leaders are not as yet committed to the need for such a change?

Contribution to new knowledge and limitations

The purpose of this paper was three-fold: to raise the issue of developing leaders at an emotional level; to describe a pilot program for such an approach; and to describe the preliminary evaluation of that pilot program. The empirical part of the paper suffers several major limitations: there has been only one run of the program so far and in only one organization; the sample size was very small (18); participants were self-selected and were biased towards white, male, and middle class; and there was a potential bias from non-response to post-program questionnaires and requests for written narratives and involvement in post-program focus groups.

However, the evaluation results have shown that, in the particular organization, the eighteen leaders benefited from the new program design. The conceptual arguments for leadership development through emotions, when combined with the evaluation results, suggest that HRD practitioners designing leadership development strategies should consider the potential benefits of including a more reflective component in their programs (based on critical incident techniques, journaling, book readings, groups discussions, and narratives of commitment).

In response to the need for further research, the program will be adapted based on the evaluation results, run for a further 40 participants in 2000, and re-evaluated in twelve months' time, allowing for the submission of an updated paper to the 2001 AHRD conference. Further research is needed to assess the generalizability of the findings to leaders of all types in other organizations using a considerably larger sample. Further papers will also explore other implications of emotional approaches to leadership development.

Investigation of a Leadership Development Program

Brad D. Lafferty
Air University

Christina L. Lafferty
The George Washington University

This study used Sashkin's Visionary Leadership Theory (VLT) to investigate whether leadership training at a certificated military leadership school affects individual leadership style and characteristics. A quasi-experimental recurrent institutional cycle research design was used to examine leadership scores over a three-year period, measuring effects immediately after the training intervention and one and two years later. Findings support VLT and suggest that exposure to the transformational leader has long-term effects that continue beyond the training intervention.

Keywords: Leadership, Military, Training

Air University, located at Maxwell Air Force Base, Alabama, is the institution central to Air Force leadership development. Air Command and Staff College (ACSC) is designed to prepare mid-grade officers for greater command responsibility; most future Air Force leaders will come from this select cadre. The college has attempted to implement a curriculum that is based on and incorporates concepts of transformational leadership (Sashkin, 1992; 1996a). One of the goals of this transformational approach is to foster the transference of transformational leadership from the leaders to the students (followers).

The theory of transformational and transactional leadership originated in the late 1970s (Burns, 1978). Some, (e.g., Sashkin, 1998) equate transactional leadership with management. That is, there is an exchange involved, a quid pro quo that provides the follower with something in exchange for performing as the leader directs. The "something" may be material, such as money, or nontangible, as in praise or affiliation. Transformational leadership, on the other hand, denotes revolutionary change that necessitates exploration of fundamental values and beliefs (Koerner & Bunker, 1992). The goal is to develop a shared vision and a unity of purpose among leaders and followers (Farley, 1992), and to develop followers who can themselves take on leadership roles when necessary (Burns, 1978; Sashkin, 1998). Visionary Leadership Theory (Sashkin, 1998; Sashkin & Rosenbach, 1998) takes the concept of transformational leadership to its logical conclusion. It integrates behavior, personal characteristics, and organizational culture into a systems approach to leadership.

In the fall of 1995 a longitudinal, quasi-experimental study began at ACSC to determine if a relationship existed between attending the school and changes in the students' transformational and transactional leadership characteristics. The study design included the concepts of change developed by Golembiewski, Billingsley and Yeager (1976), Golembiewski and Billingsley (1980) and elaborated by Thompson and Hunt (1996). Sashkin's (1996b) TLP, an extensively-researched assessment tool, was used to determine whether any changes observed in students' leadership behavior and characteristics were examples of alpha, beta, or gamma change, as defined by Golembiewski, et al. (1976). The Organizational Culture Assessment Questionnaire (OCAQ) (Sashkin, 1990) was used to provide a test for equivalence required by the institutional cycle design.

The central purpose of this initial descriptive study was to determine whether any changes in follower leadership style following attendance and completion of ACSC were of the nature of alpha change - simple improvements, beta change - changes in students' perceptions of the measurement scales, or gamma change - change in the fundamental dimensional structure of perceptions. Psychometric characteristics of The Leadership Profile (TLP) (Rosenbach, Sashkin, & Harburg, 1996) were also examined. The desired change forecast by the ACSC program is that the experience of operating in a transformational environment will result in a significant increase in transformational leadership behavior and characteristics, from the time the followers enter the environment to the time the followers conclude their time in the environment, a period of 10 months. The following specific hypotheses were investigated.
- H1 - Participants in the same year group, as measured by TLP scores before and after attending ACSC, will show an increase in both transactional and transformational scores.
- H2 - Participants in the same year group will show a continuing increase in both transactional and transformational TLP scores one year after the intervention compared to their scores taken immediately after the training intervention (H2A) and between one and two years after the intervention (H2B).
- H3 - The improvement in TLP scores post-intervention will be equivalent for all classes. All should improve. There should not be dramatic differences because both classes are selected the same way and go through the same program.

Sample Selection and Data Collection

The sample consisted of United States military field grade officers (major/lieutenant commander and lieutenant colonel/commander) and equivalent federal service civilians enrolled in the 1995-96, 1996-97, and 1997-1998 ACSC class. The total sample population was U. S. military officers attending ACSC in academic years 1995 (N=590), 1996 (N=587), and 1997 (N=592).

The recurrent institutional cycle design (Campbell & Stanley, 1963) was used to examine changes in leadership scores in the TLP for different groups obtained at the same and at different points in time. Data was collected from ACSC Classes 1994-1995, 1995-96, and 1996-97 as shown in Figure 1.

Figure 1. Overview of the Collection Design using the ACSC Leadership Database

Demographic Analysis

Demographic crosstabulation analyses were conducted to determine if any significant relationships existed between the ACSC classes’ TLP scores in each of the three leadership categories. Demographic variables analyzed were: (1) Rank, (2) Service, (3) Source of Commission, (4) Aeronautical Rating, (5) Gender, (6) Race, (7) Marital Status, (8) Military Spouse, (9) Number of Children, and (10) Highest Level of Education. In reviewing all possible relationships, only four were statistically significant, and were so small as to be practically of trivial importance.

Results

Hypothesis One

Hypothesis One posited that TLP scores for trainees in the same class would increase following the training intervention. The hypothesis was tested using two samples: a comparison of the ACSC Class 95-96 before and after the intervention and a comparison of ACSC Class 96-97 before and after the intervention.

Comparison of Classes
To assure initial comparability of the two classes, independent t-tests between Class 95-96 pre-intervention and Class 96-97 pre-intervention scores were performed for each of the three leadership categories of the TLP. Results showed no significant difference between the two classes' transactional behavior scores \((p=.521)\) (Table 1) or transformational behavior scores \((p=.118)\) (Table 2). However, the Class 95-96 pre-intervention transformational characteristics score was significantly higher than that of Class 96-97 (Table 3). This result may reflect changes in the overall Air Force culture between two points in time. Or, it may reflect perceived differences in ACSC culture as manifested in the OCAQ analysis discussed later in the Synthesis section. In any case, further analyses of data within each group and between the two groups showed effects that could not reasonably be attributed to the confounding effect of the initial difference in TLP transformational characteristics scores.

**ACSC Class 95-96 Pre-intervention Compared with Post-intervention**

Hypothesis One proposed that there would be significant increases in TLP scores after the training intervention. Paired t-tests of Class 95-96 showed significant increases in all three TLP categories. Further, each of the ten TLP scales, showed a significant increase except for Scale 8 (Follower-Centered Leadership) (Table 4).

* Significant at the .01 level  ** Significant at the .05 level

Hypothesis Two

Hypothesis Two predicted continuing significant increases in TLP scores in ACSC classes once the participants returned to the mainstream Air Force environment. It was tested using two comparisons: (1) a comparison of ACSC Class 94-95 one year after the intervention with ACSC Class 94-95 two years after the intervention, and (2) a comparison of ACSC Class 95-96 post-intervention compared with ACSC Class 95-96 one year after the intervention. The first comparison partially supported this hypothesis, while the second did not. ACSC Class 94-95 showed a significant increase in both transactional and transformational behavior scores but no significant difference in transformational characteristics (Table 5). ACSC Class 96-97 showed no significant increase in any category (Table 6). In fact, there was a significant decrease in transaction scores when their pre- and post-intervention transactional scores were compared.

ACSC Class 94-95 One Year Post-intervention Compared with ACSC Class 94-95 Two Years Post-intervention

Paired t-tests showed an increase in transactional behavior, but this change was not statistically significant (p=.053). There was, however, a significant increase in transformational behavior (p<0.001). Transformational leadership characteristics did not change significantly (p=.143). The transactional and transformational behavior increases are consistent with the increase delineated the discussion of Hypothesis One above, in which Class 96-97 also showed a significant increase in these categories during the same calendar period.

ACSC Class 95-96 Post-intervention compared with ACSC Class 95-96 One-Year Post-intervention
Paired t-tests for these classes show no significant difference in transactional behavior, transformational behavior, or transformational characteristics scores at training's end compared with scores obtained one year after.

</table>
Very little can be said about this class with respect to Hypothesis Two beyond the fact that Class 95-96 showed absolutely no change in group means or paired results of TLP scores between ACSC completion and one year out. Thus, attending ACSC had no long-term impact on these respondents.

**Hypothesis Three**

Hypothesis Three testing required comparing TLP scores between classes after training, under the assumption that the training would produce equivalent post-training changes. It was predicted that the improvement in post-intervention TLP scores would be the same for all classes. While all should improve, there should not be dramatic differences because both classes were selected the same way and went through the same program.

**ACSC Class 94-95 One-Year Post-intervention Compared with ACSC Class 95-96 One-Year Post-intervention**

This two-sample comparison supported the hypothesis. No significant differences appeared in comparing one class to another one year following the intervention. Therefore the results indicate equivalence between these two classes (Tables 7-9).

ACSC Class 95-96 Post-intervention Compared with ACSC Class 96-97 Post-intervention

Comparisons of these two classes fully supported the hypothesis. There was no significant difference between the classes' transformational behavior, transformational behavior, and transformational characteristics group mean scores. It is reasonable to conclude that the two classes are equivalent (Tables 10-12).

Synthesis Discussion

- Hypothesis One was supported. ACSC Class 95-96 pre-intervention compared with post-intervention as well as ACSC Class 96-97 pre-intervention compared with post-intervention showed an increase in both transactional and transformational TLP scores. Simple alpha change was evident in that both classes were responding to the curriculum.
- Hypothesis Two was partially supported. ACSC Class 94-95 one-year post-intervention compared with two years post-intervention showed a significant increase for transformational behavior scores but not for transactional behavior or transformational characteristics scores. ACSC Class 95-96 post-intervention compared with one year post-intervention showed no increase in scores. ACSC Class 94-95 possibly showed beta change while ACSC Class 95-96 showed simple alpha change. These findings are consistent with Sashkin's assertion (1995, 1996a, 1996d, 1996e, 1996f) that transformational leaders build cultures that effect change in the
participants over time. Further, exposure to both the transformational leader and curriculum results in continued individual improvement after the intervention, while exposure to the transformational curriculum alone may not.

- Hypothesis Three was fully supported. There was no significant difference between ACSC Class 94-95 one-year post-intervention and Class 95-96 one-year post-intervention or between ACSC Class 95-96 post-intervention and Class 96-97 post-intervention. One-fourth of the Class 94-95 respondents made unsolicited comments reflecting positively on their experience and leadership learning. This supports the suggestion in Hypothesis Two, that exposure to both the transformational leader and curriculum resulted in continued individual improvement after the intervention, while exposure to the curriculum alone did not.

- The Control test for equivalence was not supported. ACSC Class 95-96 OCAQ scores were significantly different from ACSC Class 96-97; however, demographic analysis showed no significant difference between samples. Findings are congruent with speculation that a shift in commandants over the period of the study had an impact on the respondents' view of their environment. Findings support Hypotheses Two and Three conclusions that transformational leaders build cultures that enable followers to continue their development as leaders even after followers are no longer exposed to the transformational leader. Thus, exposure to both the transformational leader and the training curriculum resulted in continued improvement after the intervention, while those exposed to the curriculum alone showed no such subsequent improvement.

Conclusion

This study explored the question "Does training make a difference?" using Sashkin's Visionary Leadership Theory as applied to a certificated military leadership school, Air Command and Staff College. Using a recurrent institutional cycle design, we examined three classes over a three-year period to determine the effect of a transformational educational intervention immediately after the intervention and one and two years later. While it was not within the parameters of this study to determine whether group changes were caused by the original architect and transformational leader of the program, findings of this longitudinal study provide some support to Sashkin's Visionary Leadership Theory. That is, the results show that a leadership development curriculum based on transformational leadership can, in all likelihood, result in significant increases in leadership assessment scores after the training intervention. Moreover, these findings suggest that exposure to the transformational leader as well as to an organizational culture and a training curriculum supportive of and focused on transformational leadership results in continued increases in assessed leadership scores, measured one and two years after the intervention, while exposure to the transformational curriculum and culture alone do not appear to produce such continuing effects.

The study has two main limitations: self-report data and generalizability. The former is in large degree counterbalanced by the longitudinal design, and future research may answer for the latter. Of greater importance is the value of these findings to HRD. The study provides support for Sashkin's Visionary Leadership Theory by linking it to a training intervention. It strengthens Sashkin's position that the presence and participation of the visionary leader is important by showing what happens to respondents when the visionary leader is absent but the intervention (i.e. curriculum) is the same. Finally it provides support for the use of Golembiewski, et. al., (1976) alpha, beta, gamma change evaluation model in a leadership training program. One of the fundamental tenets of HRD is to generate training that produces positive change. This study clearly demonstrates that it is possible to produce such change in a significant area of interest to HRD: namely leadership.

Training Companies Speak Out on HRD Industry Changes: Symposium Introduction

R. Wayne Pace  
Brigham Young University

Sweeping changes are occurring in both the way in which the human resource development field is structuring itself and the manner in which new electronic media are being used to deliver training to organizations. This symposium explores the process of consolidation in the field, how the internet is being used to deliver training, and the effect of computers on the facilitation of simulations.

Keywords: Consolidation, Internet, Simulation

In a recent article in Business Week (Grover, 1999), reviewing some of the difficulties involved in the merger between Franklin Quest and the Covey Leadership Center, Stephen Covey was quoted as saying that “it is much different when you go through it than when you look at it from some academic ivory tower” (p.49). Many similar experiences have taught scholars the serious difference between theory and practice. In fact practitioners often have many things to teach scholars, if we give an attentive nod to what they are doing. The academic community, as the AHRD tries to demonstrate on a continuing basis, can also provide valuable insights for even the very best practitioners. This symposium was organized to expose scholars to some changes occurring in the business of HRD and introduce a couple of innovations in delivery mechanisms.

In the business arena, the field of human resource development is making a number of rapid changes in the way in which the industry is being structured and in ways in which services are being delivered. Structural innovativeness is illustrated by the creation of alliances or partnerships (Limerick and Cunnington, 1993, pp. 98-101) among companies that were heretofore independent entrepreneurs. These mega-companies are designed to provide “one-stop” shopping for human resource development needs. Where the Ford Motor Company, for example, may have dealt with 2,500 different companies providing training services, in the future it may contract with a single conglomerate.

Dr. Brent D. Peterson, vice president of the Franklin Covey corporation and director of their Center for Research & Assessment, has been involved directly in some of the consolidation activities occurring in the field of human resource development. He describes some of the trends that are taking place and forecasts some of the consequences.

When Bill Gates was asked (Novak, 1999) how to make contemporary companies more effective, we were not surprised that he listed twelve ways to make digital information flow an intrinsic part of a company. Gates explained that digital electronic systems may “disintermediate” you by creating ways in which “buyers and sellers can easily find one another without taking much time or spending much money.” To illustrate how changes occur, Gates cited the case of Egghead, a retail software chain, that, after struggling for several years, closed all of its physical stores nationwide in 1998 and set up shop exclusively on the Internet as Egghead.com.

Judy Peterson is vice president, product development, for QuicKnowledge.com, an innovative company that provides training over the Internet. She has been involved directly in the establishment and development of all aspects of QuicKnowledge.com and explains the “working knowledge” paradigmatic base used in formulating QuicKnowledge products, training course configurations, and an evaluation model. QuicKnowledge.com is rapidly becoming the site of preference for solving training needs.

More than ten years ago, Keiser and Seeler (Craig, 1987) noted that “as computer technology has become more sophisticated, it has become more reliable and simpler to use. Game and simulation design can make better use of the technology rather than be governed by it. Expert systems—software programs which can act as a consultant to the learner—have the potential of playing a major role in the future” (pp. 458-459). Their prediction has come into full fruition with the customization of simulations for individual companies and individual managers. Technology has enabled designers to condense time and deliver results immediately.

Rachel Bello, C.Paige Hinkson, and Tracy Lotz, with Executive Perspectives of Brookline, Massachusetts, comprise a team involved with an Employee Retention computer-based simulation that helps managers develop...
skills needed to retain employees, even when more lucrative opportunities present themselves. They explain the theoretical base of the simulation and demonstrate its innovative features.

The Working Knowledge Paradigm

Judyth S. Peterson
QuicKnowledge.com

Advancing Internet technology has opened previously unimaginable opportunities to streamline the corporate training process. Human Resource Development professionals have a responsibility to identify and/or develop new instructionally sound methodologies that will for the first time in history allow businesses to meet all their training needs at a fraction of the cost and the time previously required to address only a small portion of their employees' training requirements.

Keywords: Technology, Instruction, Methods

Corporate training in the United States is a multi-billion dollar investment. Leadership and professional development account for a significant portion of that expenditure. While most companies intuitively know that training in these skills is an investment in their own future, neither corporate managers nor the training community have been able to reliably track and confirm a return on their training dollars in any areas, especially the "soft skills".

The existing approach to training is not responsive to today's training needs. High costs, lengthy training time and a lack of availability prevent the vast majority of people, both at work and at home, from receiving much needed basic soft skills training.

As Internet technology has opened opportunities for less expensive and more convenient soft skills training, industry professionals are eager to take advantage of its universality. This has led the training community to attempt to develop new instructional products that capitalize on the Internet's exciting possibilities. However, for the most part these training courses seek to replicate the typical classroom experience, substituting technical features for instructor interactions and group involvement. This creates a problem for the soft skills instructional designer who must now keep the trainee's interest at the computer for extended periods of time, thus suggesting the need for extensive multimedia and frequent interactions to relieve boredom and maintain attention.

While using the Internet to deliver these programs allows some potential improvements, it does not define a new approach to learning that responds to the needs of today's fast-paced business environment. It merely replaces some of the old technology—classroom instruction that is not individualized and may not be particularly interesting—with media bells and whistles that are required to coax trainees to engage in the material for extended periods of time.

QuicKnowledge.com's Working Knowledge Paradigm is uniquely designed to meet the current business imperatives for managers to have access to broad and practical information that is immediately applicable, relevant and supportive of optimal productivity and job performance. Focusing on the Working Knowledge level of competency provides the opportunity to give employees concentrated, substantive, relevant content that by its nature is engaging and meaningful.

The Working Knowledge Paradigm

What is the Working Knowledge Paradigm? A readily usable understanding of a given skill that permits immediate practical application by producing an intermediate level of competence based on the 80/20 rule. The learning model is based on these assumptions:

1. Acquisition of information/knowledge empowers individuals to try new and potentially more effective behaviors.
2. Best practices exist for the most common and basic business issues and challenges.
3. Adults learn best when they assume responsibility for their own learning objectives and experiences.
4. For most employees, a "working level" of competence is sufficient for a majority of their job responsibilities.
5. In order for new skills to be assimilated and retained, they need to be presented to the learner when they are perceived as relevant and immediately applicable.
6. The use of specific and effective methodologies can compensate for a lack of natural leadership abilities in many skill areas.

These assumptions form the basis of the Working Knowledge Premise: Most business people would prefer to have at least a basic, simplified understanding of how to consistently and effectively carry out the wide array of business functions that affect their daily performance, than to rely exclusively on unstructured input from their own business surroundings.

Consistent with these assumptions, QuicKnowledge.com has developed a training model that expedites delivery of useful tools, techniques and strategies to develop competence in basic business issues. It provides an opportunity for the participant to define their own learning objectives, test understanding with immediate feedback, and apply newly acquired information to real-life situations. In addition, job aids and worksheets are provided for continuous reinforcement during actual job performance.

Learning Principles

Working Knowledge modules conform to state-of-the-art multi-media instructional design principles. They generate high interest and retention by engaging the learner through generous use of humor and multi-sensory/modal stimulation. The individualized approach includes self-selection of topics, self-pacing, and a level of detail determined by personal choice, all of which have been found to encourage and support knowledge acquisition and comprehension.

The learning model provides for consistent presentations and methodologies, best-practices content, periodic reinforcement, individualized assessment and feedback, and application exercises for a working level of competence.

Current Training Methods

Traditional business training programs seek to provide the maximum amount of information available on a subject, with the goal that all the knowledge gained will be applicable at some time in the future as one’s experience expands. Eventually, by retaining all the knowledge that was initially imparted through the training process, and gradually assimilating it into future experiences, the trainee hopefully achieves a high measure of expertise in any given subject. By multiplying the impact over and over again by the number of employees in an organization, productivity is expected to climb dramatically over time. Unfortunately, these desired end results are rarely achieved.

There are approximately 20 different instructional methods employed by the training industry in presenting training material. Of these, the most frequently used is classroom programs, which was employed as part of the training curriculum by over 90% of major corporations in 1998. Workbooks and manuals are the next most-used method, at 74%. Other common methods include videotapes, CD-ROM, Internet, overhead transparencies and audiocassettes. Typically, some combination of methods is employed, and the methods of choice are most often a function of the presenter’s experience, the size of the group being trained, and the available budget for out-of-pocket expenses. Primary issues such as content, retention rate and total cost of training are frequently not given strong consideration in selecting the presentation method.

The average classroom training session consists of an offsite presentation to a large group of recipients usually requiring 8 to 24 classroom hours of attendance. This is generally at a cost of $100-500 per person per day, plus travel expenses and per diem, but without regard to the cost of lost work time. A live trainer provides guidance through written materials, experiential exercises, discussion, video or live demonstrations, artificial role-plays, and case study type applications. Timeliness, specific information, pace, individual needs, readiness, relevance, etc., may vary from person to person and session to session. More recently, computer-based training (CBT) has gained some limited acceptance in lieu of classrooms as a presentation medium. However, with the exception of CBT software tutorials, the CBT model is still based on the same conventional content, focus, depth and length of training that has been used for traditional training methods in the past.

Today’s typical training activity attempts to maximize the level of expertise to the trainee by presenting in-depth material on both core and peripheral issues. In the process, considerable time is allocated to background and supporting material that has only secondary benefit and documentation is often extensive and difficult to access.
after the fact. Despite the level of detail provided and the amount of time spent on a given subject, results as measured by performance improvement are typically found to be quite low whenever there is an attempt to measure them.

Based on training survey results by Training Magazine computer-based training was employed by an average of 54% of major companies for 1998. With the emergence of personal computers, the Internet and CD ROM capabilities, computer based training has recently been termed web-based training (WBT), and has become a much more accessible presentation method. For instance, WBT is now available to virtually every individual entrepreneur and all technology-based firms, both small and large, by virtue of the computer hardware/software infrastructure that prevails in these business settings.

Business Training Needs

Resource constraints place major limits on the number of people who can receive formal training, as well as on the number of topics those people can be trained in. Consider this: there is a wide array of subjects that affect the daily performance of business people, ranging from such issues as time management to conducting meetings; from leadership methods to team building; from reading balance sheets to managing projects; and the list goes on and on. Yet from companies with more than 100 employees in the U.S., less than 50% of the business managers received any structured training in 1997. What is most disturbing is that on average, they received this training for a little more than one subject per person. According to Training Magazine's 1998 Annual Industry Report on Training, U.S. organizations with more than 100 employees trained approximately 58 million employees for an average of 32 hours in the past year. Although this is an impressive number at first glance, it averages little more than one subject per employee, despite the Report citing almost 50 key subjects as being important. It also leaves an estimated 50 million employees who received no formal training at all. Add to this the belief that global training deficiencies are assumed to be even much more dramatic than those of the U.S.

It is very probable that the amount of structured training received by personnel from companies with less than 100 employees was substantially less than for these larger companies. The conclusion: while there are more than a hundred million people in the U.S. alone needing business training, and the number of separate issues they need training on easily amounts to dozens of subjects each, only a meager fraction of the required training is taking place. Meanwhile, the great majority of today's managers, executives and entrepreneurs struggle without specific guidance on key issues affecting their performance.

Despite these criticisms and open questions about effectiveness, the training market continues to grow, and both large companies and individual entrepreneurs clamor for some way to keep abreast of the effects of downsizing, increased technology and the never-ending drive for productivity improvement. At the same time, training budgets are not keeping pace with these demands. This is giving rise to a search by many large and small organizations into innovative and effective new training methods that are lower in cost, simpler to administer, easier to evaluate, and less time demanding.

Working Knowledge Training Course Configuration

The Working Knowledge emphasis, by definition, is on presenting an immediate, useable working knowledge of a given subject. This is done by focusing on the several primary factors that have the most influence on understanding the subject, while also providing supplemental information on a small number of supporting, but complimentary factors. Non-essential material is not covered in the core training session; however, additional information and references guide the trainee on where to obtain comprehensive coverage of the subject, should that be desired.

A summary description of each module is contained on the web site, and is accessible to the potential trainee prior to selecting the course. The complete training module itself consists of the following components:

- Definitions of main terms;
- Extensive navigation capability that allows rapid movement to any point in the training presentation;
- Interactive training session with state-of-the-art graphics, interactivity, animation and extended content linking;
- Printouts of summary notes, forms and/or other supporting material; and
• References on sources that provide in-depth information or training (e.g., Custom consulting, extended seminars, books, etc.).

An online “Managers’ Chat Room” and a “Message Board” are also being developed and tested to determine their effectiveness in providing customers with networking and support in applying the working knowledge strategies.

Performance Support

Unlike conventional training activities, whether traditional or online, one of the Working Knowledge Paradigm's primary objectives is performance support. Performance support consists of the application of proactive tools and aids to effectively implement the training. The following performance support activities are an integral part of the training solution.

1. Continuous access to all online material throughout the annual contract period for ongoing reinforcement
2. A process for rapid feedback on questions regarding implementation of any given skill
3. Consultation on methods for integrating soft skills performance support into such business programs as 360 degree feedback and leadership development
4. Coaching tools for both trainers and supervisors on how to apply or improve a given skill within a business setting
5. Unlimited access to all skill subjects, including new releases
6. Access to online material both at work and at home
7. Comprehensive reporting and tracking of the training that has been completed
8. Access by both the customers and their families to subjects covering not only business issues, but also non-business issues like personal development, family relations and parenting that are related to each other and to overall personal effectiveness, either directly or indirectly

Cultural Factors

The Working Knowledge Paradigm is the right idea for the right time. In the Information Age human beings, particularly in the industrialized world, are continually bombarded by an excess of information, consistently causing information overload. This is especially true in the business world, where managers and employees must sift through reams of information to glean that which is relevant and significant. This training model cuts right to those basic elements that provide focus and substance for improving job performance.

There has been a significant change in the employer-employee relationship. Companies no longer provide job security, and employees do not pledge their loyalty. Today’s managers are more concerned with their own personal/professional development than with their continued career path in any given organization. This has created a significant change in the way employers train their employees and in the expectations that employees have for professional development opportunities. Employers are reluctant to invest heavily in employees that may easily leave for a "better offer"; employees seek to develop broad competence and development to prepare for that "better offer".

The result of these cultural factors is a general condition in which intelligent, motivated, relatively sophisticated and upwardly aspiring individuals must take responsibility for their own development. The Working Knowledge Paradigm satisfies the culturally developed expectations of this group.

The Enterprise View

Resources are limited in today's dynamic and cost-conscious environment, and although enlightened organizations affirm that people are their most valuable asset, reality places limits on how much can be invested in the "people side" of the business and still maintain a competitive position. The Working Knowledge training model will allow a company to provide more opportunities for more people to develop critical skill areas without a significant financial
investment. Follow-up and evaluation of the model's effectiveness will take place in performance planning and
evaluation sessions, as job holders are asked to apply the best practices that have been presented in the training.

The responsibility for improved job performance as well as for career development can be appropriately placed
on the individual employee, since the investment is minimal and the material easily accessible. In addition, the
modules can be used to supplement the traditional formal training that already exists in the enterprise, again
enhancing organizational productivity without a major investment in time or money.

Traditional Approach to Training Evaluation

Human relations, communications, leadership, many business skills—these are called “soft skills.” They are called
“soft” because they don’t lend themselves easily to quantifiable data. The accuracy or defect rate of a product can be
measure with an instrument or counted. There is a “right” and a “wrong” way to assemble a part. Data can easily be
collected and tracked in technical skill areas. There is a much more direct connection between what an employee
knows and how he or she performs a task.

Soft skills can be measured, also, but not so easily. We tend to know more about soft skills than what we apply
in our daily lives. For example, most of us know what we should do to be a “good” listener, we could certainly
identify or pick out the behaviors that we should exhibit when listening, but few of us use those skills consistently.

Paper-and-pencil tests that attempt to assess knowledge acquisition are therefore relatively meaningless in predicting
how an individual will actually perform a skill in a real setting. Some training programs include “role plays” in their
methodology, but the situations are artificial and the results are usually not documented or reported, anyway.

The only meaningful evaluation of training, and especially soft skills training, comes from determining whether
or not the employee is using the skills on the job. To do this, someone has to be there to observe performance and
give feedback. While this is perhaps an oversimplification, the most simple way of assessment—a test—is
meaningless, and the only really useful way of assessment—performance—is cumbersome and time consuming. The
result of this dilemma is the traditional methodology for evaluating soft skills: none.

Working Knowledge Evaluation Model

Companies and the training community know that training has value only as it translates to improved performance.
Together they have spent years trying to assess return on the training investment. A number of assessment models
exist which are effective. Since these models already exist, what’s the problem? Why can’t we routinely and
accurately evaluate and report the return from the thousands of dollars that are spent on training in the “soft skills”?

The Working Knowledge Paradigm includes a new approach to evaluation, ultimately based on individual
accountability for results. This approach focuses on the quality, relevance, and soundness of the material itself and
promotes real-world feedback regarding its application in the workplace. The content of the modules will convey
the best current thinking and tried-and-true wisdom in presentations that use humor, style, and state-of-the-art
technology and methodologies to maintain the customer’s interest, provide interactivity, and enhance retention.

However, the customer will assume the personal responsibility to gather feedback from others regarding
improved job performance. Appropriate worksheets, assessment forms, and methodologies will be provided to the
customer to use in assessing personal performance and monitoring progress.

1. Best practices content (validated through current literature and research);
2. Entertaining and relevant presentation of content (validated by customer feedback);
3. Real-world assessment of improved job performance according to the customer’s objectives (validated
   through customer self-reports and customer surveys online).

Suggested Methodology for Training Evaluation

The trainee and his or her direct supervisor need to answer these questions in a mutual discussion:

1. Does the trainee use the job aids, and how well?
2. What feedback does the trainee get when he or she uses the Performance Feedback document?
3. How well does the trainee use the Performance Feedback document to continually improve performance?
4. On an organizational level, what are the organizational indicators tied to effective performance of this skill?
5. How do those indicators reflect improved performance by people who have completed the training?
The organizational manager and the trainee must take a collaborative approach in answering these questions, and plan whatever reinforcement or coaching is necessary to develop and maintain skill in this area. The Performance Feedback Self-assessment can be used for this evaluation, or other tools can be developed for management planning, follow-up and coaching as the need arises.

Evaluation of training activities is an area of significant controversy for conventional business training programs. The effectiveness of training under the Working Knowledge Paradigm is ultimately based on individual accountability. The customer assumes the personal responsibility to gather feedback from others regarding improved performance in, say, the workplace, while appropriate worksheets, assessment forms, and methodologies are provided to the customer to use in measuring personal performance and monitoring progress.

The Working Knowledge Paradigm is centered on providing training that is immediately useful. The learning goal is successful practical application, not scoring well on a test. To support organizations in assuring transfer of training to the work environment, a Manager’s Checklist is included for each module to assist the trainee’s immediate supervisor in establishing performance goals before the training and in coaching and assessing performance after the training. In this model, training effectiveness is evaluated where it can and should be done: by the trainee and his or her supervisor. The Working Knowledge principle suggests that training effectiveness evaluation is best and most accurately done by those closest to the job. With this collaborative effort, organizations will see a meaningful return on their training investment.

Training Effectiveness Features

Working Knowledge modules provide focused learning that can be organized according to the customer’s learning style and personal needs. They are permitted to access the material according to their own judgment and motivations. Whatever their style or approach, they are given significant support in applying the skills and concepts of the module.

- Effectiveness Indicators to help them focus on the RESULTS that can be achieved in applying the skills
- Application Aids—job aids, worksheets, checklists, reference guides—that enable them to take every action and apply every principle that has been presented in the module
- A Performance Feedback Document (Self-assessment) to allow them to assess their own performance, distribute to others to get performance feedback or to help set performance goals

Conclusion

QuicKnowledge.com’s Working Knowledge Paradigm is uniquely designed to meet the challenges of the Information Age, the needs of today’s labor, management and executive force in the business world, and individuals and family groups in private life. Fast-paced life and rapidly changing requirements demand that people now be knowledgeable in a wide range of subjects, and that essential information be readily accessible to them when, where, and how it is needed. In a time when personal energy as well as organizational resources are limited and yet more critical than ever, this new paradigm allows people to spend less time acquiring knowledge and more time applying it.
Human Capital Measurement

Joanne Provo  
Personnel Decisions International

Organizations have come to realize the value of effective human capital strategies and HRD initiatives. While momentum is building in this area, measurement systems that optimize human capital investments have not kept up. Most HR measures are based on financial accounting techniques that were developed to maximize return on capital, not return on people. These measures are often focused on the efficiency of HR investments and rarely consider the effectiveness or impact of these initiatives.

Keywords: HR Measurement, Human Capital, HR Effectiveness

While there may be some debate over the use of the term human capital, for purposes of this paper it will be used to demonstrate that like other assets that must be invested in to yield value, there is a return on human assets as well. A firm can leverage its human capital by increasing its collective ability to extract the best ideas and solutions from the knowledge of its people. Salamon (1991) uses human capital to refer to the skills, knowledge, and abilities of human beings. Underlying this concept is the notion that these skills and knowledge increase human productivity, and that they do so enough to justify the cost incurred in acquiring them. Human capital theory states that “human capital is the knowledge and skills (physical and intellectual) that an individual possesses that make that individual a productive worker” (Besanko, Dranove, & Stanley, 1996, p. 641).

Problem Statement and Theoretical Framework

Like any asset people should be seen as a source of strategic advantage and invested in as other tangible assets. Lewis (1997) uses the accounting perspective to enhance his case by noting that there is a growing recognition that organizations must invest in all assets appropriately if they intend to be successful in the long term. Further, he makes the point that all organizations need to invest in building intellectual capital and it can no longer be a luxury for a small minority of enlightened companies.

Information and technology are changing the way we deploy human assets, and with this there is a need to explore what it means to effectively manage the human capital that contributes to organizational wealth. It is certainly plausible to believe that what differentiates successful companies will be their accumulation, development, and deployment of human capital. Mirabile (1998) calls human assets the true measure of corporate wealth.

More and more organizations are announcing their plans to strategically manage their intellectual capital and see the cultivation and investment in human capital as an opportunity to enhance their market positions (Bontis, 1996). It is important to note here that the management of human capital is distinctive from managing physical assets and that an entirely different skill set is required. The management of an organization’s human assets is going to require a different set of management skills and the incorporation of organizational and measurement systems that appropriately reflects the value of investment in human capital.

Methodology

The methodology used was a conceptual analysis based on the review of human capital measurement literature. The review covers a broad spectrum of scholarly works and also incorporates practitioner-based literature. A consulting model was also reviewed against the prevailing literature to understand the alternative approaches to human measurement and analyze the application problems of many of the prevailing measurement processes.

While many of the works studied agreed on the need for HR measurement and often proposed a particular approach, a comprehensive and agreed upon set of measures has not resulted. Scholar’s and practitioners, (Huselid, 1995; Swanson, 1998; Welbourne & Andrews, 1996) have presented strong arguments that investments in human
capital yield value for the firm, yet these processes often rely on measures typically applied to the valuation of financial and not human assets. Boudreau & Ramstad (1997) present strong arguments against the application of these financial measures to human capital investment valuation. This paper will review the various positions and analyze an alternative approach.

The literature review provides a context for understanding how investments in human capital add value to the firm, discusses various evaluation techniques, and presents cautions against using financial measurement systems for human capital investment analysis. Finally the paper reviews an alternative approach to the positioning of HR investments and presents a process that HR professionals can initiate to demonstrate the value of investment in human capital initiatives.

The Case for Measurement

It is becoming increasingly difficult to participate as a strategic business partner within an organization without demonstrating the value that is generated through investment in the assets that you manage. In the case of human resource professionals that asset is people, an asset long thought to be immeasurable. There is a need for the development of HR measurement systems that accurately demonstrate the value of investment in HR initiatives. Walker and Bechet (1991) say that human resource staff functions need to measure both efficiency and effectiveness. They note that, "Efficiency addresses the relationship between key results and short term human resource activities. Effectiveness addresses the relationship between key results and longer term issues and strategies" (p. 235). They further identify that effectiveness is the extent to which human resources support long term business planning and strategies. Their caution is that efficiency may not be the goal of the human resource function. They provide the following example, "An 'efficient' source of new hires (defined in terms of cost per hire) may indeed be quite ineffective when many of the employees that are hired do not stay with the organization for an adequate length of time" (p. 243). Becker and Gerhart (1996) caution against the use of HR measures at the corporate level. In their view HR practices differ substantially across the business units and facilities and corporate measures may lose some of their meaningfulness.

Boudreau and Ramstad (1997) note that while HR processes have evolved from administrative activities to those having strategic significance, we have not seen a corresponding evolution in human resource measurement systems. Gray (1986) echoes the support of strong information systems, noting that it is difficult for a strategic planning system to reach its full potential without support of the appropriate control systems.

Evidence that a Focus on Human Resources Adds Value

In a review of the theory and practice of demonstrating the financial benefit of human resource development, Swanson (1998), summarizes a number of HRD studies that demonstrate how focused and systematic HRD interventions can lead to positive returns. Delery & Doty's (1996) study also shows strong relationships between individual HR practices, such as profit sharing, results-oriented appraisals, and employment security and important accounting measures of performance. Delaney & Huselid's (1996) study suggests "that progressive HRM practices, including selectivity in staffing, training, and incentive compensation, are positively related to perceptual measures for organizational performance" (p. 965). These and other studies have begun to make the case for investments in HRD. The two studies summarized below are frequently cited (Gubman, 1998; Pfeffer, 1998) as solid evidence that investments in HR lead to enhanced financial results for the organization.

Welbourne

The study by Welbourne and Andrews (1996) captured a great deal of attention in that it showed that an investment in human resources was a predictor of long-term survival and viability for organizations. The study focused on 136 non-financial companies that made their initial public offering (IPO) in 1988. These companies were evaluated to determine the extent to which they considered their employees to be a source of competitive value. The prospectus for each of these companies was examined and coded using the following criteria:

1. The company’s strategy and mission statements cited employees as a competitive advantage.
2. A training program for employees was mentioned.
3. An officer with responsibility for human resource management was listed.
4. The extent to which full-time rather than temporary or contract employees were used.
5. The employee relations climate.

The documents were also examined to determine if organization-based compensation programs (stock options and profit sharing) were available for all employees or only management.

The results of this study showed that while the companies that valued human resources were initially valued lower at the time of the IPO, those same companies had much higher values and survival rates five years later than those that did not recognize the value of human resources. The results are significant for two reasons: 1) this study clearly relates investments in people to organizational success and survival, 2) the financial valuations systems failed to recognize the value of investments in human resources and saw only the costs. It is this second point which surfaces the disconnect between what the financial statements reflect and the true value of an organization. The analysts who were conducting the valuation process to determine the initial IPO price saw employee profit sharing plans as a drain on the returns that would accrue to the stockholder’s and the market reacted negatively to firms using their capital for employee reward programs. The analysts were unable to account for the benefit that these policies would have on the efficacy of these organizations and thus they proposed a lower valuation for these companies. In examining these companies five years after the IPO, the researchers found that, “a firm that has a high level of human resource value and a high level of organization-based employee rewards boosts its chance of survival to .92” (p. 911).

Huselid

Huselid’s (1995) study was designed to be a comprehensive evaluation of the links between systems of high performance work practices and firm performance. In this study high performance work practices included comprehensive employee recruitment and selection procedures, incentive compensation and performance management systems, and extensive employee involvement and training.

Nearly 1000 firms participated in the study by submitting a questionnaire that had been mailed to the senior HR professional in each of the firms. The results indicated that high performance work practices lower employee turnover and result in greater productivity and corporate financial performance. In fact in this study the magnitude for returns on investments in high performance work practices was substantial. “A one-standard-deviation increase in such practices is associated with a relative 7.05 percent decrease in turnover and, on a per employee basis, $27,044 more in sales and $18,641 and $3,814 more in market value and profits, respectively” (p. 667).

This study is currently being replicated by other researchers to see if the results can be substantiated. While future researchers may find varying results in the financial performance associated with these practices, this study initiated that further research and broke ground by demonstrating that effective human resource practices can increase the value of the firm.

Beyond Evaluation

Evaluation techniques for many years have relied on the four levels proposed by Kirkpatrick (1994): reaction (satisfaction), learning results, changes in behavior (transfer), and organizational performance. In many cases, unfortunately, the evaluation of a human resource initiative rarely went beyond the first level (Holton, 1996). Increasingly organizations are expressing an interest in evaluating the results that can be demonstrated by an investment in human capital. The organization may proclaim that people are their most important asset, but that doesn’t mean they aren’t interested in the return generated for an investment in that asset.

Kaufman & Keller (1994) suggest that evaluation techniques are often underutilized and inappropriately applied in organizations. They identify three reasons for this:
1. The most-used definitions and models of evaluation often are too restricted,
2. we do not ask the right questions for evaluation to answer, and
3. the relationship between ends and means is not made clear in the evaluation, planning, and implementation process. (p. 371)

They propose modifications to Kirkpatrick’s model to include the consideration and determination of the value and worth of resources, and an added level, which deals with the impact and consequences in, and for society. They also support the extension of the evaluation model to organizational interventions beyond training.

Phillips (1996) model of evaluation gets right to the issue of effectiveness and performance. The three levels of evaluation in his model are:
1. Measures of Perceived Effectiveness
2. Measures of Performance
3. Measures of Return on Investment (p. 60)

While there are few human resource professionals who would question the need to measure beyond perceived effectiveness, there is little agreement and very few step by step guides that show how to measure performance. While human resource professionals readily grasp the concept, there is not a clearly understood approach to demonstrating this value. The mistake that some organizations make is in trying to apply financial ratio analysis and measurement models to human resource initiatives. A discussion of the problems arising from using these models and in particular the Return on Investment (ROI) methodology will be presented in the following sections.

**Cost – Benefit Analysis**

Swanson and Gradous (1988) presented a model and method for evaluating HRD outcomes for business and industry. Their HRD benefit-forecasting model and the methods that were introduced consisted of the following components: “(1) the performance value to result from the HRD program, (2) the cost of the HRD program, and (3) the benefit resulting from the HRD program” (p. 21). While this approach was relatively simple and straightforward it did provide focus on the performance value as the key component in financial benefit analysis.

Cascio (1987) uses a cost accounting platform for his cost-benefit approach to HR analysis. He recognizes as Swanson & Gradous (1988) do, that performance is a key factor. Cascio introduces the use of a performance ratio to measure individual productivity. He also introduces the Cascio-Ramos estimate of performance in dollars (CREPID) model to value an increase in productivity for an individual. The approach assumes that the employee’s salary is an economic value of the employee’s labor. The analysis is described as follows:

CREPID breaks down each employee’s job into its principal activities, assigns a proportional amount of the annual salary to each principle activity, and then requires supervisors to rate each employee’s job performance in each principal activity. The sum of the dollar values assigned to each principal activity equals the economic value of each employee’s job performance to the company. (p. 182)

This measure represents the performance value. Any investment in improving performance could be measured against the cost incurred in increasing that level of performance.

Jarrell (1993) notes that cost-benefit and utility analysis are used most often to evaluate human resource procedures and programs. But he warns, “Using cost-benefit analysis alone, it is difficult to determine or obtain precise estimates of human resource costs and usually impossible to obtain precise estimates of human resource benefits” (p. 239). However, he goes on to say that precise estimates of costs and benefits are not always necessary where the evaluation is intended to support the planning process. Approximate estimates are useful for allowing comparisons among several alternative programs, increasing planners’ awareness of kinds of costs and benefits, revealing hidden costs and benefits, and improving the ability of planners to judge value.

**Return on Investment (ROI)**

Phillips (1996) calls ROI analysis the “ultimate level of evaluation” (p. 61) in the evaluation of the actual return in HR programs. His discussion of when to use ROI illustrates that a measure of this type is not always appropriate. In fact in a table developed to provide guidance on when to use the ROI approach there are only two areas where he finds the use of ROI calculations to be highly appropriate. Those two human resource functions are in Safety and Health and Productivity/Quality Improvement (p.301). The conclusion that can be drawn by human resource professionals is that unless they manage or contribute to the effectiveness of either of these two functions they are unable to apply the ultimate level of evaluation to their programs.

Swanson (1998) cited several early HRD financial studies that used the ROI approach to demonstrate the value of HRD interventions. He noted that these studies “…demonstrated that HRD imbedded in a purposeful performance improvement framework -- and systematically implemented -- yielded very high returns on investments, an ROI of eight to one or more in year or less” (p. 289). These results are indeed impressive and demonstrate the clear value of HRD interventions. Unfortunately in the financial world high returns are associated with high-risk projects (Brigham, Gapenski, & Ehrhardt, 1999), and the reporting of high ROI’s reinforces the perception that investments in HRD programs are risky.
Cautions in the use of Financial Analysis Tools to Evaluate HR Programs

Early adopters of capital budgeting and financial accounting techniques to evaluate human resource programs were sharply criticized by Hunter, Schmidt, and Coggin (1988) who claimed in their view that “...many of these methods are often conceptually and logically inappropriate” (p. 522). Their skepticism and concern were driven primarily by the definition of utility and the translation of that concept to a financial analysis. Boudreau's (1983) early work on utility analysis presented one of the first applications for the use of capital budgeting as applied to such traditional human resource functions as selection and training. Boudreau believed that utility figures should be discounted, and adjusted for variable costs and the taxation effect. This resulted in a definition of utility as contribution to after-tax profits. While this early work broke critical ground in valuing human resource investments in a financial context, it is difficult to apply a single utility model to every situation. While Hunter, Schmidt and Coggin (1988) were critical of the utility model and the application to HR investment decisions, they were later challenged by Cronshaw and Alexander (1991) who argued that capital budgeting theory can be a useful framework for demonstrating the utility of human resource programs. Cronshaw and Alexander encouraged practitioners to use the utility analysis models and supported the use of capital budgeting techniques that rank investment alternatives. They supported providing capital budgeting analysis of HR programs to organizational decision makers as a means of identifying relevant investment decisions. This debate is central to the issue of whether financial measurement techniques are appropriate in the measurement of human resources.

Parsons (1997) lists the benefits and limitations of using financial analysis tools to evaluate human resource development programs. Her list of advantages follows:

1. The tools help HRD practitioners analyze programs through customers' eyes and ask strategic questions.
2. These tools guide practitioners in talking with other stakeholders about their programs.
3. HRD financial analysis tools provide a rationale way of making decisions.

While the application of financial models may provide some comfort in being able to demonstrate value in dollar terms, the measures are often misapplied. Parsons (1997) recognizes this factor in identifying the limitations of using financial models:

1. These tools are unidimensional, only capturing aspects of performance that can be financially translated.
2. HRD financial analysis tools have difficulty measuring aspects of performance where the feedback between action and effect is not immediate or direct.
3. The analysis is only as useful as the information and values on which it is based.

Her third point is true of most any analysis, although the values associated with people may understandably be more of a factor than the values of a capital asset. The result of using financial analysis for a human resource intervention is often a cost benefit analysis where the responsibility for justifying the assumptions falls back to the human resource managers to defend. This propose - defend trap is a sure way to frustrate the human resource professional and the line managers. The key is in demonstrating the value of investments in capabilities in a way that the line managers can understand and believe.

Drew (1996) notes that “...direct transfer of financial models to management of knowledge is limited in scope, presents conceptual difficulties, and if implemented could result in poor quality, over-simplified decision-making” (p. 13). Boudreau & Ramstad (1997) expound on the danger of simply applying financial accounting measures to human resources. They remind us that accounting systems were developed over 500 years ago to be used as an internal management control device. Applied to HR this is the activity monitoring function that provides insight on the efficiency of HR by measuring cost per hire or turnover rates, but does not provide insight into the impact that HR practices have on the competitive positioning of an organization.

An Alternative ROI Approach

Peter Ramstad at Personnel Decisions International (PDI), introduced a concept called threshold ROI (Provo & Neumann, 1998, Ramstad, 1998). Rather than scramble to develop the financial projections that are required to calculate the ROI, PDI's Return On PeopleTM approach presents an alternative process. This method may provide a better approach for human resource professionals for a number of reasons. First and foremost, the presentation of a definitive ROI percentage is discouraged. As mentioned above high ROI's are associated with high levels of risk. Investments in human resources are typically small relative to the benefits received and the reported ROI's do little more than signal management that the investment is risky.

Second, the line managers are involved and asked to quantify what an increase in performance is worth to
them. This process has been demonstrated to work even for highly skilled jobs where output has been difficult to measure. The following example illustrates how this would happen for a particular client case.

Case Example

The XYZ Corporation designs software products. XYZ determined that its ability to sell and build products was a key source of competitive advantage. Design capabilities were the single biggest factor keeping XYZ from meeting its strategic goals. The HR management team wanted to identify the best HR investments for the coming year and to quantify the impact of increasing software designers’ capabilities. The following process demonstrates the threshold ROI approach for estimating the dollar value, or impact, of increasing design capabilities.

Step 1: People who knew the job well ranked the current software designers in order of job performance.
Step 2: The experts were then asked to think about the differences in performance between people who were in the 75th percentile vs. the 25th percentile. The brainstormed differences were:

- Designs better solutions,
- Reaches a higher percentage of milestones on time,
- Identifies synergies with other products, and
- Provides more accurate cost estimates.

Step 3: The experts were then asked to quantify the value of these performance differences. Since there was naturally a bit of disagreement around the exact value, agreement was obtained on the minimum value of the differences by using the lowest numbers that were proposed.
Step 4: The values assigned to these performance differences were summed, providing a total value of $80,000. Dividing $80,000 by 1.3 (the number of standard deviations represented by the difference between the top and bottom 25% of performers) resulted in an estimate of $61,500 as the dollar value of changing the performance of the software designers by one standard deviation.

A Strategic HR Measurement Approach

"The key to financial accounting is the consistent application of accounting rules producing comparable information across organizations" (Boudreau & Ramstad, 1997, p. 350). Given this rationale it is a short leap to supporting the notion that HR measurement could be used much the same way where certain HR practices could be evaluated across organizations or even across divisions in a decentralized organization. Human resource managers need a set of measures that appropriately account for the return on their assets, people. Boudreau and Ramstad (1997) use the differentiation between accounting and finance to differentiate between the professional and strategic applications of HR measures.

HR measurement systems should focus beyond simple descriptions of past activities, similar to traditional accounting. They should not be satisfied with measurement systems that merely satisfy regulatory requirements. Instead, HR measurement should adopt a predictive perspective, similar to finance. (p. 351)

Boudreau & Ramstad (1997) are also clear in their recommendations for applying lessons learned from financial history to the strategic role of human resources. They note that it is critical to establish linkages between business needs and HR processes and to understand constraint analysis as a way of developing appropriate and useful measurement systems. Specifically they recommend that HR professionals:

- **Build on the value chain.** One way for HR to be a "business partner" is for HR managers and their constituents to truly understand the value chain and what it reveals about key constraints.
- **Search for constraints.** For HR measures to create change, they must identify and alleviate critical constraints.
- **Use data models even if the data are imperfect.** Both financial measurement and marketing measurement do not require perfectly objective information. In fact, their evolution shows that they began with very imperfect data, but with very coherent models of the value linkage. (pp. 352-353)

Figure 1 shows the Return On People™ Model. This approach provides the business case context needed to enhance the role of human resource professionals as strategic partners. The model demonstrates that planning should be initiated by considering the impact that additional capabilities can bring to the organization in the form of increased profits. Effectiveness is measured by how well the investments contribute to increased capabilities. This
approach provides a context for making a decision on what to invest in those capabilities.

Summary

It is difficult to participate as a strategic business partner without demonstrating the value that is generated through investments in the assets you manage. The challenge for HR professionals is to demonstrate the value of investments in an asset, people, which has long been thought to be immeasurable. Measurement of human capital investments needs to consider effectiveness, efficiency, and impact. Unfortunately most HR measurement systems are focused on measuring efficiency alone.

Human resource professionals should be cautioned against the application of financial accounting techniques to evaluate their initiatives. Financial techniques were developed to ensure maximum returns on capital, which for decades has been considered the scarcest resource in an organization. Today the scarcest resource is human capital and measurement systems that optimize capital and not people will result in the misapplication of resources. This paper suggests a variant on the traditional financial techniques and incorporates the strategic positioning of HRD initiatives. Application of human capital strategies and measurement tools that appropriately leverage the constrained resource have the ability to provide greatest impact on the organization.

References

Until recently, little attention has been given by HRD to intellectual capital (also known as intangible assets), primarily because of the difficulty of measurement. This paper explores several definitions, measures, and indicators of intangible assets. A model is provided as a basis for customization by research institutes and colleges.

Keywords: Human Capital, Intangible Assets, Financial Returns

The discussion of intellectual capital (also referred to as intangible assets) appears to go back to Becker (1962) who initiated human capital theory. Capital usually refers to financial capital, but Becker categorized both school-based education and on-the-job training as human capital investment, both of which are expected to increase future real earnings over a lifetime. School-based education is considered general human capital investment and is expected to increase productivity irrespective of the specific job or occupation the person pursues. On-the-job training is specific human capital investment and is generally not applicable to other firms, leading to minimal transferability.

Research shows that investment in intangible assets is important because: a) technology, work systems, and organization (all influenced by intangible assets) may determine the competitive edge for the organization; b) the pillar of economic structures is being transformed from a skill-based manufacturing industry into high technology and service industries, which emphasize innovation, work systems, and information; and c) flexible production systems require such assets. It is regrettable that managers and investors often neglect intellectual inputs and outputs, though these may well outweigh the importance of physical assets. In fact, research provides some evidence that intangible assets account for the difference between stock market value and net book value. Firms in information technology, or the so-called high-tech industries, like Microsoft or Intel, have a high ratio of intangible assets to market assets. According to research reported by Sveiby (1997), many electronics companies, like Hewlett-Packard, had a fairly low proportion of intangible assets to market value, compared with those of media companies, waste management companies, and many other branded consumer product companies, like Coca-Cola, which had high proportions.

There are many types of research on the measurement of the impacts of human capital, HRD programs, or HR practices. Medoff and Abraham (cited in Strober, 1990) used performance ratings by immediate supervisors as the measure of productivity and examined data on education, experience, productivity, and earnings for about 7,600 white, male, full-time managers and professional employees in two U.S. manufacturing firms. Their findings showed a positive correlation between experience and earnings, although the relationships between experience and productivity were zero or negative. Bartel (1995) showed positive relationships between training and job performance, using a company database. Bassi and Van Buren's (1998) research revealed a possible link between organizational investments in human capital and organizational measures of performance, including market-to-book value, by utilizing a national cross-industry survey of over 500 organizations. The research, while not conclusive, suggests that training, by itself, in one year may enhance a company's market-to-book value the next year.

Using a laboratory study with students participating in a business simulation game, Dermer and Siegel (1974) found no significant or systematic relationship between any of the four behavioral variables: motivation, effort, group cohesion, and satisfaction, and performance measured by sales, earnings, return on investment, and stock price. However, if valid relationships and reliable bases can be established upon which accountants can base measurements, such measures can be utilized to complement traditional accounting information. Paperman (1976) examined the effect of human resource accounting measures on investment decisions and attitudes regarding measurement of human resources, using CPA subjects in a laboratory experiment composed of two simulated
investment decision cases. The research results indicated a change in investment decisions when information on human resources measures was added to earnings per share trends.

It has been suggested that HR management practices constitute a core competency of organizations in the long run and affect organizational performance. As a result, there have been efforts to examine the relationship between human resource management practices and firm performance. Research by Huselid, Jackson, and Schuler (1997) and Becker and Gerhart (1996) empirically shows that task rotation, small circle activities, autonomous work teams, functional teams, performance-based pay systems, education and training, and management participation, all of which are designed to increase intangible assets or enhance the sharing of intangible assets and information among employees, exert a positive influence on firm performance.

These studies, however, provide little pragmatic guidance to HRD managers about ways to measure assets related to intangible or invisible assets. Therefore, the following research questions are suggested in order to guide practical decisions made by HRD managers.

Research Questions

While there are many definitions of intangible assets, there has been no consensus. The major questions to be answered by this research were: "What are the dimensions of intangible assets for organizations, especially for research institutes and colleges?" "How are intangible assets measured in organizations, especially for research institutions and colleges?" and "What are the indicators for intangible assets for research institutes and colleges?"

To pursue these research questions, generic definitions and classifications of intangible assets are reviewed, and then proper dimensions of intangible assets for research institutes are suggested. Similarly, the measures of intangible assets categorized by different scholars are examined, and then a set of measures of intangible assets proper for research institutes is developed. Finally, a list of indicators of intangible assets for research institutes is suggested in order to develop and manage intangible assets of research institutes and colleges. Research institutes and colleges are the focus of this research because of the affiliation of the authors of this paper.

Definition of Intangible Assets

A number of scholars have defined intangible assets or intellectual capital. For instance, Lowendahl (1997) and Haanes and Lowendahl (1997) defined intangible assets for the strategic management of professional service firms. According to them, intangible assets are categorized into intelligible resources, intelligible assets, capabilities, and competence. Stewart (1997) classified intellectual capital into human capital, structural capital, and customer capital. Human capital includes "the capabilities of the individuals required to provide solutions to customers" (p. 76). Human capital is an important resource because it is the driving force of innovation and renewal. Structural capital consists of internal structure and external structure. Internal structure is generated by employees and owned by the organization. The components of internal structure include patents, concepts, models, computer and administrative systems, corporate culture, and mentality. External structure includes the relationship between customers and suppliers, such as brand names, trademarks, corporate reputation, and images. Customer capital indicates "the value of an organization’s relationships with the people with whom it does business" (p. 77). Customer capital includes repeat customers and brand value. Similarly, Edvinsson and Malone (1997) also defined intellectual capital as human, structural, and customer capital. All individual capabilities, including the knowledge, skills, and experiences of the firm’s employees and managers, are included under the category of human capital. Structural capital is defined as the embodiment, empowerment, and supportive infrastructure of human capital, as well as organizational capability, including the physical systems used to transmit and store intellectual material. Customer capital includes the relationship of a company to its customers, critical to the company’s value.

According to Brooking (1997), the intellectual capital of an enterprise can be split into market assets, intellectual property assets, human-centered assets, and infrastructure assets. Market assets are "the potential an organization has due to market-related intangibles" (p. 13). These comprise various brands, customers and their loyalty, repeat business, backlog, distribution channels, various contracts and agreements, such as licensing, franchises, and so on. Intellectual property represents the legal mechanism for protecting many corporate assets. Examples include know-how, trade secrets, copyrights, patents, and a variety of design rights. Human-centered assets include the collective expertise, creative and problem solving capabilities, leadership, entrepreneurial and managerial skills embodied by employees, and psychometric data and indicators of how individuals may perform in given situations. Infrastructure assets are defined as those technologies, methodologies, and processes that make the organization able to function. Examples comprise corporate culture, financial structure, databases of information on the market or customers, and communication systems, such as e-mail and teleconferencing systems.
According to Sveiby (1997), the invisible assets of an organization's balance sheet can be classified as a family of three components: employee competence, internal structure, and external structure. Employee competence involves the capacity to act in a wide variety of organizational settings to create both tangible and intangible assets. The internal structure includes patents, concepts, models, and computer and administrative systems, as well as the organizational culture or spirit. The external structure refers to relationships with customers and suppliers, in addition to brand names, trademarks, and the company's reputation or image.

Hall (1991) categorized intangible resources into assets and skills, using the criterion of belongingness. The scope of intangible resources which may be classified as assets includes the intellectual property rights of patents, trademarks, copyrights, and registered designs, as well as contracts, trade secrets, the reputation of product and company, and databases. Skills, or competencies, include public knowledge (such as scientific works, the people-dependent or subjective resources of know-how of employees, suppliers and distributors), networks, and organizational culture. Reputation can be categorized as an asset because of its belongingness feature.

Intangible resources may also be classified as follows (Hall, 1991). The having capabilities represented by intangible assets are patents, while the doing capabilities represented by skills and competencies are know-how. Reputation is people dependent, while databases are people independent intangibles. Trademarks are protected in law, while organizational networks are not protected in law. Among intangible assets, trademarks, patents, copyrights, registered designs, contracts, trade secrets, and databases are legally protectable, while information in the public domain, reputation of product and company, and organizational and personal networks are not legally protectable. Intangible resources, the competencies or doing capabilities, are classified into functional skills or cultural capabilities. Functional skills include employee know-how, supplier know-how, distributor know-how, and servicers' know-how, such as advertising agencies, while cultural capabilities comprise perception of quality standards, perception of customer service, ability to manage change, ability to innovate, and team working ability.

Weston Anson, an MBA and lawyer who runs a company called Trademark & Licensing Associates, Inc, in California, categorized intangible assets into three groups:

1. a technical bundle (trade secrets, formulas, proprietary test results, etc.); (2) a marketing bundle (copyrights, corporate name and logo, warranties, advertising, package designs and copyrights, trademark registrations, etc.); and (3) a skills and knowledge bundle (databases, manuals, quality control standards, asset management processes, security systems, business licenses, noncompete clauses; proprietary management systems, etc.). (cited in Stewart, 1997, pp. 235-236)

A simple, yet measurable and useful definition of intellectual capital is proposed by Ulrich (1998) as follows: intellectual capital = competence * commitment. This equation indicates that intellectual capital requires both competence and commitment. A low score on either competence or commitment significantly reduces overall intellectual capital, because the equation multiplies rather than adds. Firms with high competence but low commitment have talented employees who can not get things done. Firms with high commitment but low competence have less talented employees who get things done quickly.

Scholars differ on definitions of intangible assets, though some components are similar. Table 1 shows that Stewart's (1997) definition of intangible assets is similar to that of Edvinsson and Malone (1997). The human capital component of Stewart (1997) is similar to the human-centered asset concept of Brooking (1997), while the internal structural capital of Stewart (1997) is a comprehensive concept to which both the intellectual property assets and infrastructure assets of Brooking (1997) belong. The external structural capital of Stewart (1997) is similar to the market assets concept of Brooking (1997) and Anson (cited in Stewart, 1997).

For the definition and classification of intangible assets for research institutes, the definition of Brooking (1997) was followed in that it reflects to a large extent the human resources, research functions, and infrastructure of research institutes. That is, intangible assets of research institutes are classified into market assets, intellectual assets, human-centered assets and infrastructure assets.

**Measurement of Intangible Assets**

The measurement of human assets is a critical function in enhancing human resource development in organizations although it has been questioned in several aspects (Sackman, Flamholtz, & Bullen, 1989). First, critics argue against mathematically computing the cost and value of human resources as assets for internal management or external corporate financial statements because, they argue, it diminishes their humanity and treats them as objects. However, proponents of measuring human resources hold that what is being measured is not human resources, per se, but the investment in human resources or the services that human resources are expected to provide. Thus, such measurement does not reduce people to things but, rather, reflects value to the resources. Second, there are arguments regarding specific training as a necessary but not sufficient condition for the existence of human assets. Third, the uncertainty of human resource measures and the potential for manipulation of earnings exist not only if we capitalize investments in human resources, but also if we fail to capitalize them. Fourth, measurement of human resources is difficult.

There are two major goals for measuring intangible assets and two main interest groups involved (Sveiby, 1997). For external purposes, the organization needs to describe itself as accurately as possible to stakeholders, customers, creditors, and shareholders so they can assess the quality of its management. For internal purposes, management needs to know as much as possible about the company so it can monitor its employees, processes, structures, and capital. In other words, measurement of intangible assets plays an important role in a management information system. This again raises the question, should the value of intangible assets at a particular time be measured or should the attempt be to get a feeling for changes and flows? The parallel to this question in financial resources is a comparison of a balance sheet with a profit and loss statement. Change is the important question when managers are most interested in flows and trends. In this situation, they are more concerned with the speed with which intangible assets are measured than with accuracy.

Buhner (1997) suggested three major reasons why traditional financial and accounting indicators are not appropriate measures for human resources. First, employees are often regarded as costly liabilities rather than as valuable assets, while tangible assets, such as machinery or buildings, are treated as investments. Second, traditional financial measures, such as return on investment or earnings per share, are subject to arbitrary management decisions, so a company may appear successful in the short term but will not deliver long-term profitability. Third, traditional accounting data do not provide real-time feedback for continuous improvement or preventive action programs.

Based on human resource accounting theories and models, many firms and government agencies are engaged in developing indicators of human resources. For example, Stewart (1997) classified intellectual capital into human capital, structural capital, and customer capital and then presented tools for measuring and managing intellectual capital as follows. The simplest measure of intellectual capital is the difference between its market value and its book equity. In this context, market value equals price per share multiplied by the total number of shares outstanding. Tobin's Q, developed by Nobel prize winning economist James Tobin, compares the market value of an asset with its replacement cost. This indicator was originally designed to predict corporate investment decisions independent of macroeconomic factors, such as interest rates. However, it can be a good measure of intellectual capital, as suggested by Federal Research Chairman, Alan Greenspan, who noted that high Tobin’s Q and market-to-book ratios reflect the value of investments in technology and human capital.

Human capital measures include innovation, employee attitudes, tenure, turnover, experience, learning, and the knowledge bank. Innovation is measured by the percentage of sales attributable to new products or services. A measure of gross margin from new products is another measure. Some research shows a strong relationship between employee attitudes and customer attitudes, providing evidence of the interplay between human and customer capital. Correlational studies between morale and financial performance show a positive relationship. Another approach to measuring human capital is to maintain indexes of human resource inventories. These indexes include the average number of years of experience employees have in their professions, turnover among experts, seniority among experts, value-added per expert and per employee, the percentage of customers who are competence-enhancing, and rookie ratio, the percentage of employees with less than two years' experience.
Structural capital measures consist of measures of the values of accumulated stocks of corporate knowledge and measures of organizational efficiency, i.e., of the degree to which the company's systems augment and enhance the work of its people rather than obstruct them. In order to measure corporate knowledge, the first job is to look at an intangible asset's uniqueness, breadth of use, incremental profit margins, legal status, life expectancy, and so on. Then, the relative strength of the asset is measured by comparing the organization's assets with comparables. As a measure of operating efficiency, working capital turnover, i.e., the number of times each year that working capital cycles through a company, is suggested. This measure was devised by George Stalk of the Boston Consulting Group and used by Allied-Signal, GE, and others. Some customer capital measures are customer satisfaction and the net present value of the customer base. Customer satisfaction should satisfy the link between increased customer satisfaction and improved financial results. Happy customers are featured by loyalty (retention rates), increased business (share-of-wallet), and insusceptibility to a rival's price tolerance. To calculate how much a customer is worth, four steps are suggested: first, decide on a meaningful period of time over which to do the calculations; second, calculate the profit customers typically generate each year; third, chart customer life expectancy, using samples to determine annual erosion of the customer base; fourth, calculate the net present value of a customer.

Brooking (1997) categorized intellectual capital into market assets, intellectual property assets, human-centered assets, and infrastructure assets. Methods for measuring market assets comprise customer survey, customer interviews, analysis of sales data, analysis of cost of sales, market research, audit of agreements, competitive analysis, evaluation of ROI, and analysis of payments. Methods for evaluating intellectual property assets include survey for market pull, competitor analysis, ROI, audit of agreements, ROI on legal fees, survey for know-how, and analysis of payments. Methods for evaluating human-centered assets are interview, test and assessment, knowledge elicitation, self-assessment, manager assessment, peer review, and track record assessment. A portfolio of knowledge measures is suggested in Drake (1997) to include economic, strategic, user-based, and outcome measures. Economic measures comprise replacement value, external market value, and internal time/money allocations. User-based measures consist of insight creation, sense-making, uncertainty reduction, and assurance increase. Strategic measures include maintenance, depreciation, replenishment, and anticipatory measures. Outcome measures include patents, new products, customer retention, and innovative practices.

Measuring intellectual capital is a multidisciplinary task. Developing a variety of measurements for a particular organization requires energy and time, so it is suggested that HRD managers look for similar measures and test whether they fit the organization. Customized measures are most desirable. Stewart (1997) suggested three principles to guide a company in choosing what to measure: first, keep it simple—choose no more than three measurements each of human, structural, and customer capital, plus one number that gives you a whole picture; second, measure what's strategically important; and third, measure activities that produce intellectual wealth.

Following Stewart's (1997) advice and Brooking's (1997) definition of intangible assets, dimensions of intangible assets for research institutes are suggested as follows. The measures of market assets for research institutes may include name values of a particular research institute; customers and their loyalty; continuous research and business; channels for printing, publication, and distribution; types of research; and so on. The measures of intellectual assets may consist of know-how, copyrights, patents, models, design rights, and trade secrets. Measures of human-centered assets may include academic degrees, experience, leadership, creativity, problem solving ability, self-development efforts, on-going research, entrepreneurial spirit, and management techniques, networks, work attitudes, turnover, and tenure. Finally, the measures of infrastructure assets may include financial structure, computer systems, including both hardware and software, communication system, information-sharing corporate culture, financial structure, and databases of information on the market or customers.

**Indicators of Intangible Assets**

The indicators of intangible assets for research institutes and colleges have rarely been implemented in organizations. Grojer and Johansson (cited in Sveiby, 1997) reported that few attempts to convert people and competencies into dollars have proved useful for managers, although they are theoretically interesting. Celemi, a Swedish company, was the first company which made an assessment of the performance of intangible assets based on the data that the firm provided (Sveiby, 1997). Celemi's "invisible" balance sheet classified intangible assets into external structure, internal structure, and competence according to its knowledge-focused strategy. Each category of external customers, internal structure, and competence had measures of growth/renewal, efficiency, and stability. In fact, the choice of indicators was dependent on the firm's knowledge-focused strategy. The following is an example of indicators for intangible assets used by Celemi.

Edvinsson and Malone (1997) reported the following indicators based on Skandia’s early intangible capital annual reporting. For the infrastructure, PCs/employee (#), administrative expense/employee ($), IT expense/employee ($), IT staff/total staff (%), IT literacy of employees (#), and others were listed. The renewal and development indices included share of training hours (%), training expense/employee ($), share of employees under age 40 (%), R & D resources/total resources (%), and satisfied employee index (#), among others. Leadership index (%); motivation index (%); empowerment index (#); number of employees/number of employees in alliances (%); full-time permanent employees as percentage of total employment; per capita annual cost of training, communication, and support programs for full-time permanent employees; and average years of service with company (#); were some of the indicators belonging to Skandia’s human focus factors. The indicators for customer focus included satisfied customer index (%), number of contracts (#), and customer IT literacy (%). A list of tentative measurements for a hypothetical organization includes number of company patents (#), average age of company patents (#), patents pending (#), employees based at partners’ facilities (#), and partners’ employees based at company’s facilities (#), out of over 60 listed.

To pave the way for developing indicators of intangible assets for research institutes and colleges, some plausible indicators are suggested in Table 3 based on the dimensions of intangible assets as follows, although it is suggested that each research institute or college needs to develop its own indicators, reflecting on its vision and strategies.

Contributions to HRD

Even though HRD managers may recognize the importance of intangible assets and their impact, few appear to know how to integrate intangible assets and their measurement with human resource development. This research, then, is important in examining and comparing ways of measuring intangible or intellectual assets. Different definitions of intangible assets may provide HRD managers with a new perspective of the knowledge organization in order to assist in developing new assets for their organization. Second, as Brooking (1997) pointed out, measurement of intellectual capital enables managers to understand where value lies in the company and provides a metric for assessing success and growth in those assets. Further, as suggested by Flamholtz (1985), measurement of human resources has the potential of leading to a reconceptualization of managing and developing human resources in organizations. In addition, the research provides HRD managers in research institutes and colleges with detailed and concrete information of their intangible assets and demonstrate that the role the model could play in measuring and ultimately developing their intangible assets. “knowledge economy.” Sveiby (1997) suggested that a knowledge-focused strategy will earn increasing returns from intangible assets, assets that convert invisible revenues into tangible revenues. Finally, the indicators developed research institutes and colleges will provide a baseline with which a research institute or college can develop a customized set to fit their particular vision, strategy, and culture.

The Corporate Curriculum: A Working-Learning Environment

Jaap van Lakerveld  
Joukje van den Berg  
Kees de Brabander  
Joseph Kessels  
University of Leiden, The Netherlands

Organizations that offer a powerful learning environment to their employees, tend to be more innovative and to provide better quality than those that do so to a lesser extent. This hypothesis has been explored and tested in a large number of institutions of public Health and Welfare in the Netherlands. The research project described provided promising data to support the theory tested. Furthermore the project led to the construction of a diagnostic instrument for organizations to analyze their own work environment as for its quality as a learning environment.

Key words: Knowledge productivity, Corporate curriculum, Learning

The paper focuses on the development of a corporate curriculum: a plan for learning in service organizations, health care, business and industry in the context of a knowledge economy. Partly it provides a theoretical framework; partly it presents a report of the second phase of a three-phase research project conducted in the Netherlands in 42 institutions for Public Health and Welfare.

The following aspects will be addressed:

a. The impact of a knowledge economy on learning in organizations  
b. Knowledge productivity as a dominant indicator for successful performance  
c. The corporate curriculum as a set of learning functions that gear toward knowledge productivity.  
d. The results of research activities supporting the theory presented

The main question dealt with in this paper, is the question what elements in the working environment contribute to the learning processes needed in organizations in order to adapt to, or be ahead of developments in society.

Theoretical framework

Knowledge productivity

Nowadays challenges of increasingly fast extending information and knowledge have profound implications for the way in which organizations operate and compete. The most effective organizations are those that are capable of signaling new trends and developments, those that are able to develop new knowledge and that know how to disseminate and apply this newly developed knowledge. In doing so organizations will prove to be more capable to innovate and to provide better quality services and products. Organizations that have the ability described here, we call knowledge productive. In the design of this study, knowledge productivity was elaborated along two lines.

1. The innovative ability of an organization. (change)  
2. The ability to enhance the quality of existing approaches (improvement)

The corporate curriculum

The process needed to enable both individual professionals and their organization to be knowledge productive basically consists of learning. The learning processes meant might be triggered by the environment in which the individuals operate. The work environment thus functions as a learning environment. It is this work-learning environment we refer to as the "corporate curriculum". Theories of learning provide a basis for analyzing the richness of such an environment seen from a learning perspective.  

The corporate curriculum consists of all the intended and not intended conditions that affect the learning processes among the workers in organizations. In order to emphasize that the concept of the corporate curriculum
does not only include the intentionally planned elements in the work environment, we like to refer to this curriculum as something that is a mix of natural and man made conditions. The corporate curriculum should be viewed as a rich landscape in which personnel and teams find their ways and construct knowledge. An organization that tries to improve its knowledge productivity will focus on the analysis and support of the following learning functions (Kessels 1996):

1. **Subject matter expertise**: Acquiring subject matter expertise and skills directly related to the target competencies. The competencies related to acquiring subject matter expertise have been the main objective of training and development.

2. **Problem solving**: Learning to solve problems in new and ill defined problem areas by using domain specific expertise.

3. **Reflective skills and meta-cognitions**: Developing reflective skills and meta-cognitions aiming at the identification and understanding of determinants of successes or failures in learning.

4. **Communication skills**: Securing communication skills that provide access to the knowledge network of others and that enrich the learning climate within a workplace.

5. **Self-regulation of motivation, emotions and affection**: Procuring skills that regulate the motivation and affections related to learning.

6. **Peace and stability**: Promoting peace and stability to enable specialization, synergy, cohesion, and integration.

   Peace and stability are necessary for gradual improvement.

7. **Creative turmoil**: Causing creative turmoil to instigate innovation. Creative turmoil brings the dynamics that push towards radical innovation and leaving traditional paths behind. Creative turmoil requires a certain amount of existential threat.

Of the seven functions mentioned, five refer directly to distinct learning processes. Two of them refer both to conditions of learning (peace and stability and creative turmoil), and to the processes of learning how to control those conditions. This ambiguous nature of these functions made us decide to focus on the first five functions and leave the sixth and seventh function for the third phase of the project.

The policies, the activities, and the conditions an organization develops to promote the learning functions form its **corporate curriculum**: the plan and the conditions for learning to increase knowledge productivity. Knowledge productivity in turn is assumed to have an impact on the eventual organizational performance.

---

**Problem statement and research questions**

The theory outlined above may be summarized in the following statement, which at the same time serves as our general hypothesis:

*The more powerful the learning environment provided by an institution, the more an institution will prove to be knowledge productive, which eventually will show in a better organizational performance.*

Phrased slightly different, this means the more elaborated, or the richer the corporate curriculum, the more knowledge productive people and work units, working in that particular environment, will prove to be. The increased knowledge productivity will become evident in better processes, better products and better services. The assumed relation is visualized in the following scheme:

```
Corporate curriculum
   ↓
Learning processes
   ↓
Learning results

Knowledge productivity

Organizational Performance
```
a. The ability to adapt to contextual changes and
b. The quality of work processes, products and services.

In order to find the evidence needed, the following four research questions were formulated:

1. To what extent are the functions of the corporate curriculum fulfilled in the investigated organizations?
2. What elements in the work environment promote these functions?
3. Is there a relation between the extent to which functions are being realized and the innovative ability the organization appears to have?
4. Is there a relation between the realization of the functions of the corporate curriculum and the quality shown in work processes, products and services rendered by the organization?

Research methodology

The project was set up as a two-phase design. A third phase, which is not yet completed, was added later. The first phase consisted of a number of case studies and study of literature to identify possible variables operating within a corporate curriculum. A number of sources of literature were analyzed in order to identify the variables that should be included in further investigations.

Five institutions were selected, that were considered rich and well elaborated cases in various sectors of Public Health and Welfare. In each of the cases interviews were held from a variety of perspectives. Interviewees were asked to describe their career and identify important learning opportunities and experiences. Furthermore they were asked to describe the information, communication and documentation arrangements in their organization. Finally they were asked to describe the history of their organization and to identify important moments of progress for the organization. Based on both the study of literature and the interviews a series of questionnaires was developed.

Then a more extensive second phase of the project followed. It is this particular part of our research on which we concentrate in this article. This phase included a survey among 82 working units in institutes for Public Health and Public Welfare. It was decided to choose work units as our focus instead of organization as a whole. This decision was made on two grounds. First of all for reasons of feasibility and reduction of complexity. That was the weak part of our choice. Secondly it was made for reasons of utility of the instruments to be developed. We felt that work units rather than organizations would be the entities that decide to do a self-analysis and to develop their own learning environment and policies. Especially in the larger organizations we identified a strong tendency towards decentralization, leaving the decisions to the units.

The perspective chosen is a learning perspective. For each of the functions of the corporate curriculum questions were constructed in order to identify to what extent the investigated learning processes actually could be identified. For each of the learning processes related to the first five functions of the corporate curriculum items were developed. The items are meant to identify whether, and if so, to what extent motivating conditions, a rich environment, room for experimenting and feedback are available and effective.

In addition to that, respondents were asked to mention conditions they experienced as either facilitating, or obstructing the processes involved (instrument 1).

Furthermore an inventory was constructed to inquire about the elements included in the work environment, that might be promoting these learning processes according to the outcomes of the first phase of the project (the elements in the work-learning environment, instrument 2). The first instrument was mainly based upon theoretical concepts of learning; the second instrument mainly upon organizational theories, enriched with the variables mentioned in the interviews held in the first phase of the research project.

Thirdly an instrument (3) was designed to investigate what innovations (within a few national policy trends) the units being studied, had implemented over the last years. A general trend in the field under analysis, is an increasing need for more client centered approaches and more tailor made provision of services. Concerning this trend respondents were asked to identify to what extent their organization has been effective in developing new strategies. The questionnaire consists of items to identify to what extent the organization has been able to signal national developments, to actually work out new strategies and to implement these new approaches. The respondents had to answer a number of questions keeping a particular innovation in mind. The questions, however are the same regardless the innovation chosen.
Based on quality indicators recognized and used in the sectors being investigated, an instrument was developed to identify the level of quality provided by the studied work units (instrument 4). In order to develop this instrument we could include a number of items of existing quality-instruments. Finally an existing instrument was selected. This instrument measures a related concept. In this particular case an instrument was chosen that measures the four competencies of a learning organization (Sprenger, 1995). This fifth instrument was included as a means for external validation of the concepts used in the first two instruments. The concept measured in this particular instrument includes many elements of what we consider the components of knowledge productivity.

In sum, the first instrument identifies the learning processes taking place. The second instrument checks whether organizational conditions that might be influencing these processes actually may be identified. Together the first two instruments give a full picture of the corporate curriculum in operation in an investigated work unit. The third instrument indicates the innovative ability of the unit, while the fourth instrument provides an indication of the level of quality of the work processes of the unit. Together the third and the fourth instrument measure the concept of knowledge productivity. The fifth instrument is included for validation purposes.

The relation between the concepts and the instruments

Instrument 5: external validation of the concept of a corporate curriculum with a comparable concept (the learning competencies of an organisation).

The investigated institutions, units and staff

In the first phase of the project we selected a number of cases (5). Instead of selecting them at random we deliberately decided to choose a small number of 'avant garde' organizations. We hoped to be able to see more of the dynamics of the processes we intended to study in organizations that were actively dealing with matters of learning, innovation and quality enhancement.

In the second phase, the survey phase, we chose another way of selecting work units. We tried to choose the units in such a way that they would cover:

a. the various distinguished sectors within the field of Public Health and Welfare;
b. both innovative and more conservative organizations;
c. units within large organizations as well as units of smaller organizations.

In reality we approached the intended coverage quite well, but it appeared impossible to actually choose particular organizations. To some extent we just had to accept the organizations that happened to be prepared to cooperate. 48 institutions were included in the project, each participating with two work units, making 96 units in total. Each work unit in turn participated with three workers and one head of the unit. Besides that, two persons either responsible for training or professional development, or for quality enhancement or quality management participated on behalf of the institution. This makes 10 respondents per institution.

Not every respondent appeared to have followed the instructions for filling in the questionnaires, so in the end it appeared that from the 96 units that would have been included only 82 could actually be analyzed. In total the number of respondents was 381, 271 of which are workers, while the others are either managers or people responsible for quality management or training.

Research analyses

In the first phase of the project, we did case study research. Literature searches and analyses were done, semi structured interviews were held, cases were described based on the interview data. The cases were fed back to the respondents and authorized. Furthermore the cases were analyzed both together with the respondents (in focus groups) and with groups of experts (expert groups). Within case analyses and cross case analyses were carried out.
Based on these analyses variables were identified and questionnaires were constructed. At this point the survey among a large number of organizations started. Vast amounts of data were collected and processed. To find answers to the research questions, two kinds of analyses were conducted:

1. A principal component analysis, to check the quality of the individual items and to find out what are the most important dimensions within the concept being measured;
2. Canonical correlation analyses, in order to identify the strength and the nature of the relation between the concepts measured with the different instruments.

The following scheme shows what the different instruments contribute to finding support for the different research questions.

**The relation between the research questions and the instruments**

</tbody>
</table>

**Outcomes**

The instruments used were analyzed. A few items had to be skipped. The principal component analysis showed that the instruments 1 and 2 form together a valid instrument to map the elements in the learning environment (instrument 2) and measure the power of the learning environment (instrument 1). Instrument 1 appears to measure a homogeneous factor, the power of the learning environment. The analysis revealed two contrasts. One was interpreted as a contrast between social and individual learning, the other as a contrast between the learning of subject matter and a kind of meta-learning, learning how to learn. In our view these contrasts coincided with the curriculum functions we had distinguished between, to such an extent that we felt we could stick to the original categories within our questionnaire.

In the second instrument we found also a strong first factor and furthermore confirmation of most of the distinctions we made in constructing the instrument. The components found are shown in the 6 figures included in this section of this article. Those found in the instruments 3, 4 are also shown in these figures. After analyzing the instruments separately, we concentrated on the relation between the instruments.

The study shows a very strong correlation (0.831) between the learning processes identified and the elements included in the work learning environment (figure 1). In that sense it strongly supports the findings of the first phase of the project. The second and the third relation (figure 2 and 3) we have not yet been able to interpret satisfactory.
The corporate curriculum appears to contribute significantly to the ability of organizations to change (figure 4). Especially the functions of reflection, communicative skills and social skills appear to contribute to the effect. The other functions also show a significant correlation with the ability to change.
The realization of the different functions of the corporate curriculum significantly correlates with the ability of work units to provide quality. Only the function of social and communicative skills does not appear to correlate significantly (figure 5).

*Variables printed in bold show the strongest relation*

The outcomes of the first instrument strongly correlate with the outcomes of the fifth instrument which was included in order to validate the first instrument by comparing its results with the results of a similar instrument (figure 6).

The developed instrument offers more possibilities to differentiate between the different functions of the corporate curriculum than the fifth instrument. The fifth instrument measures a more homogeneous factor. A diagnostic instrument was developed out of the two first instruments. It includes both the learning processes and the elements in the work learning environment that may contribute to these processes. The instrument measures a coherent factor, the power of the work learning environment (the corporate curriculum). In addition to that, the instrument makes it possible to differentiate to some extent between the distinguished functions of the corporate curriculum.

The diagnostic instrument shows to those who apply it, what elements are included in the work environment or what are not included. It provides work units with a basis for discussing directions in which to go in order to strengthen or enrich the work/learning environment. Finally a first tentative overview over the investigated sectors of health care and social welfare could be given.

Conclusions

*Empirical evidence was found to support the used theoretical concepts.*

A positive relation could be identified between the corporate curriculum and the ability of organizations to change. Especially reflection contributes to that. Reflection often suffers from a lack of time. Yet it shows that reflection is no luxury. Time used for reflection is said to pay itself back in terms of a growing ability to adapt to the changing contexts organizations are facing.

The more powerful the corporate curriculum, the better organizations will be able to develop quality of processes, products and services. By paying attention to the learning environment, an organization improves its
potential to innovate and improve its work.

**Instruments were developed**

The instruments used make it possible to measure the power of the learning environment (the corporate curriculum). As compared to the instrument available (the fifth instrument) to measure the four competencies of the learning organization, it gives a more differentiated picture of the analyzed situation. From the instruments used, a diagnostic instrument was derived to be applied in organizations for purposes of organization development.

**Some conclusions may be drawn concerning the state of affairs in this field of work (health and welfare)**

Most respondents feel that their work situation to a high extent may be considered a learning environment. Reflection is the function most often mentioned as suffering from lack of time. Still this is the function that appeared to be the most crucial for raising the ability to change and important for the ability to improve the work.

The responses show that among the participants learning still is associated with being taught. They attribute more learning effects to the more traditional ways of being taught (courses) and less to more implicit learning situations like cross organizational cooperation, or participation in research activities. This may very well be the consequence of their implicit definitions and beliefs about learning and being taught.

**Discussion**

The data collected and analyzed in this project strengthened the empirical basis of the theory presented in beginning of this paper. Still we have to realize that the data being presented involve perceptions of facts; not facts. The learning processes people claim to have experienced appear to have a strong correlation with the way they claim the work is organized and the quality and changes they say it produces. The questions asked have been put in such a way that they were factual rather than judgmental. Still we must realize we found relations between perceptions. There definitely is a need for further research to try to replace some of the perceptions by actual facts. The challenge will be to prove the relationship between actual learning results (acquired in the working situation and brought about by that very environment) and the actual level of quality and of ability to change organizations show. An important step forward has been put. Still there is a need for harder evidence.

The concepts of corporate curriculum, of knowledge productivity and of organizational performance are interrelated and each show a certain complexity, which makes it difficult to avoid the pitfalls of tautology. We tried to keep the concepts distinct but yet we feel we have to stay alert in order to avoid the risk mentioned.

The data did not suffice to reach firm conclusions about the state of affairs in Health and Welfare. Here again further systematic work is needed to build up a database about institutions for each relevant sub sector in the field. That way, organizations will be able to use this base as a reference to compare themselves with.

**Perspective**

Already initiatives were taken to start a third phase of the project including

a. Pilot projects to explore the practical applicability the instrument and the guidance it provides to those who use it. The group of consultants participating in the pilot projects meet regularly in order to share and discuss their experiences and translate them into plans for further action.

b. Further dissemination of the concept of knowledge productivity to extend the number of work units involved. That way more units may be observed, in order to build up an empirical data base, both to strengthen the theory and to develop a set of standards for comparison per sector. After the completion of the second phase of the project at least 30 units could be added to the built up databases.

c. Further explorations focussing on issues of peace and stability on one side and creative turmoil on the other. Here the assumed relation to be investigated is that the creative turmoil will be operating mainly in favor of the ability to bring about radical changes, while peace and stability may show a stronger relation with the
ability to improve already established work procedures.

d. Attempts to get more firm evidence of actually increase organizational performance. The operationalization of that performance still is one of the major issues in this third phase of our project.

Cross-Organizational vs. Localized Participation: A Case Study on Workplace Diversity Dialogues Implementation

Martin B. Kormanik  
Organization Development Systems

Daniel A. Krieger

Timothy E. Tilghman  
Organization Development Systems

Dialogue encourages self-reflective conversation and inquiry that breaks through tension and conflict created by difference. Some organizations are exploring dialogue as one initiative in their diversity programming efforts. This case study of diversity dialogues implementation provides a comparison between one group of dialogue participants drawn from across the organization and a second group drawn from one particular organizational component. Discussion highlights strategies for implementation in the workplace, implications for practitioners, and suggestions for further research.

Keywords: Workforce Diversity, Dialogue, Group Composition

Multiculturalism. Managing diversity. Valuing diversity. Cultural diversity. Regardless of what it is called, diversity is a highly-charged topic in today's workplace. Workforce diversity has become a major area of focus in the contemporary organizational environment, with many organizations striving to increase the understanding and effective management of a diverse workforce through formalized diversity programs (Whittenburg, 1999; Wilson, 1997).

Formalized programs on diversity in the workplace generally include multiple components or initiatives (Kormanik, 1994), one example being diversity dialogues. The theory and practice of dialogue provides a process for opening up conversation that enhances awareness and understanding of controversial and divisive subjects (Roth, Herzig, Chasin, Chasin, & Becker, 1995). The dialogue process is now being applied as a model for enhancing awareness and understanding of workforce diversity issues (Todd, 1994). In these instances, the dialogue process is primarily designed to enhance individual growth and effectiveness through understanding, rather than focusing on organizational or work group effectiveness.

This paper presents an in-depth study of the implementation of a diversity dialogues initiative. The purpose of the study was to provide an explanatory narrative in a cross-case comparison of the implementation of two pilot dialogues. The narrative is augmented with descriptive statistics. This is not an assessment of the effectiveness of the diversity dialogues as a diversity program initiative. A comprehensive analysis of the efficacy of the initiative would require a long-term, posttest evaluation to ensure validity (Dixon, 1990). Rather, this is a case study of the implementation process, and a discussion of the lessons learned from that process.

Background

The problem section includes two areas. First is a description of the development of formalized diversity programs. Second is information on specific diversity program initiatives.

Development of Formalized Diversity Programs in Contemporary Organizations

The growing awareness of how our melting pot society impacts business has provided the impetus for diversity programs that help organizations deal with societal attitude and demographic changes (Caudron, 1993). It has been only since the late 1980s, however, that private sector organizations began committing the resources (e.g., time, money, people) to establish formal diversity programs. The broad scope of diversity programs in the workplace
context has involved changing the culture of the organization to better manage the impact of changing workforce demographics and to fully capture the potential in a diverse workforce (Caudron, 1990).

Organizational effectiveness requires viewing broad diversity issues (e.g., communication, team building, interpersonal relations) as systemic in nature (Beer & Eisenstat, 1996; Denton, 1996). A diversity program, therefore, represents a long-term change process, not an isolated event (Caudron, 1993; Johnson & O'Mara, 1992; Winterle, 1993). It is not surprising that organizations with successful diversity programs have generally used a systems approach to program development (Laudicina, 1995; Rynes & Rosen, 1995). Diversity program development is also enhanced through a participative process involving many stakeholders (e.g., management, employees, customers) (Delatte & Baytos, 1993; Gunsch, 1993).

An organization development (OD) approach is often used in the process of diversity program development and implementation. The process starts with an organizational culture audit addressing the organization's informal culture, policies, and management practices. This serves as an organizational needs assessment (i.e., baseline study) and establishes a measure of the current status of the organization. From this baseline, management develops a comprehensive diversity strategy, including: the vision/mission for the diversity program; specific objectives the program is to achieve; specific actions, projects, and initiatives to undertake in support of the diversity program vision; supporting policies and procedures; and a plan for implementation. Senior management in organizations with successful diversity programs suggest that the success of the program is due to close alignment of the diversity program strategy with the organization's business strategy (Caudron, 1993).

Specific Diversity Program Initiatives

Diversity program objectives generally focus on three areas (Kormanik, 1994; Washington, 1995). Increasing representation of underrepresented groups is the first area. Increasing awareness and sensitivity is the second area. Developing an organization culture that supports change is the third area. Each of these foci have implications for planning specific diversity program initiatives.

When the diversity program objective is representation, initiatives concentrate on enhancing recruitment and retention efforts. These diversity initiatives are often unconsciously linked to affirmative action (Laudicina, 1995). Organizations establish affirmative employment programs focusing on the recruitment, advancement, and retention of underrepresented populations (Patterson & Sturdevant, 1980). When the diversity program objective is increased awareness, initiatives emphasize diversity factors associated with legislation under equal employment opportunity (EEO) (e.g., race, gender, religion) and provide a foundation for understanding the legal implications associated with managing diversity in the workplace (Laudicina, 1995). Awareness, skills, and education initiatives frequently emphasize sensitivity and understanding of particular ethnic group traits and behaviors. These programs may be designed to develop an individual's awareness of diversity issues from pre-encounter or intellectualization to encounter, empowerment, and integration (Kormanik, 1999). Some programs focus on changing workplace behaviors, and sometimes even attitudes. Often called encounter sessions, these Gestalt-based training programs provide the opportunity for developing new insights or changing old ones (Bayles, 1960).

When the diversity program objective is systemic culture change, program initiatives promote adaptation and organizational learning. Culture change initiatives entail examining the organization's informal culture, along with awareness and skill building activities that foster culture change. Examining organizational culture involves looking at the shared values and basic beliefs that employees use to govern their behavior (Schein, 1992). The organization culture, or "collective programming of the mind" (Hofstede, 1980, p. 13), may support or impede effective management of workplace diversity issues. Where the organizational culture impedes effective management of diversity, diversity initiatives are designed to promote culture change.

Implementation of Diversity Program Initiatives

According to Karp and Sutton (1993) effective diversity program initiatives include intact work groups to maximize the likelihood of cultural change. Bion's (1961) work with groups at the Tavistock Institute of Human Relations highlights the benefits of working with the group in which the individual functions, as opposed to working only with the individual out of the group context. Initiatives with participants from intact work groups fare better than those with "open" participation, allowing participants to relate first-hand to the diversity factors of the people that they work with on a day-to-day basis. Using intact work groups supports transference back to the workplace.

Hersey and Blanchard (1982) identify knowledge (i.e., facts, information), individual attitude (i.e., mindsets, values, biases, stereotypes), individual behavior (i.e., actions), and group behavior (i.e., mores, norms) as four building blocks of change. Group behavior in this context corresponds to Hofstede's (1980) collective mental programming and Schein's (1992) organizational culture. Hersey and Blanchard suggest that change happens in one
of two cycles. Change is either participative, based on personal power (e.g., personality, education, experience, expertise), or directive, based on position power (e.g., law, regulations, guidelines, rank, title).

A diversity program generally includes initiatives that entail participative and directive change cycles. Management has the power to mandate that all employees participate in diversity program initiatives (i.e., directive change). Conversely, participation in the initiatives increases the individual’s knowledge base, providing motivation for the individual to change through a participative process (Abella, 1986). Knowledge gained from participation leads to individual attitude change, which theoretically leads to individual behavior change. Using Hersey and Blanchard’s (1982) model for change, once a critical mass of individuals change their behavior, group behavior change occurs (i.e., organizational culture change). The change cycle is then complete.

A training initiative—the cornerstone of most diversity programs—is the mechanism most often used for accomplishing all three foci of diversity program objectives (Rynes & Rosen, 1995). Training, however, may be only one of many initiatives sponsored under the diversity program banner (Kormanik, 1994). Other examples include a “diversities day,” formal recruitment programs, a poster campaign, EEO and legal issues seminars, brown bag discussions, guest speaker series, focus groups, team building retreats, and diversity dialogues.

Problem Statement

The lack of information on optimal strategies for diversity dialogues implementation in a workplace context is problematic, given the amount of resources (e.g., time, money) allocated to the implementation of a large-scale diversity dialogues initiative. Embarking upon a diversity program without having clear goals in mind can often create more problems and tension than if nothing had been done at all (Rynes & Rosen, 1995). Organizations who are undertaking diversity programs because “they are afraid of doing nothing” often wind up frustrated and troubled (Evans, 1995). Careful planning is needed to ensure alignment with the organization’s diversity strategy and to optimize the success of each diversity program initiative.

Theoretical Framework

The theory and practice of dialogue focus on opening up conversations to enhance awareness and understanding of controversial and divisive subjects (Roth, et al, 1995). The dialogue process is often applied to discussions of polarizing societal issues like abortion, capital punishment, and gay marriage (Study Circles Resource Center [SCRC], 1993). Dialogues as a workplace diversity program initiative most directly address the diversity program objective of increasing employee awareness and sensitivity.

Dialogue, however, is different from sensitivity training, active listening, debate, and other such communication processes in that it is collaborative, with two or more individuals working toward finding common ground (SCRC, 1993). Dialogue “emphasizes the idea of a ‘meaning’ that flows between people from which emerges a greater understanding—possibly even a shared meaning” (Weinstein, 1995). Dialogue requires temporary suspension of one’s beliefs, opening up to critical reflection, and reevaluation of underlying assumptions (SCRC, 1999). The open-ended nature of dialogue suggests that there are no “right” answers, nor is there a need to find a solution. It is the process of engaging individuals in the dialogue that is most important to the learning process.

One of the distinctions of adult learning is that adults have a life of experiences to draw from. An adult’s “frames of reference” represents the assumptions through which they understand their life experiences (Mezirow, 1997). Frames of reference define the adult’s life world and shape the adult’s mental and behavioral activity. Adults tend to reject factors (e.g., ideas, values, associations, feelings, responses) which are not in sync with their frames of reference. Mezirow identifies “point of view” and “habits of mind” as two dimensions of frame of reference.

“Habits of mind are broad, abstract, orienting, habitual ways of thinking, feeling, and acting influenced by assumptions that constitute a set of codes. These codes may be cultural, social, educational, economic, political, or psychological. Habits of mind become articulated in a specific point of view—the constellation of belief, value judgment, attitude, and feeling that shapes a particular interpretation” (p. 5).

Habits of mind and point of view are emblematic of Hersey and Blanchard’s (1982) individual attitude construct.

Mezirow (1997) identifies four processes of learning: elaborating on one’s existing view, identifying new points of view without changing one’s own, transforming one’s point of view, and transforming one’s habit of mind. A diversity dialogue focuses on the transformative learning processes identified by Mezirow.

“We can have an experience in another culture that results in our critically reflecting on our misconceptions of this particular group. The result may be a change in point of view toward the group involved. As a
result, we may become more tolerant or more accepting of members of that group. If this happens over and over again with a number of different groups, it can lead to a transformation by accretion in our governing habit of mind” (p. 7).

The dialogue process is designed to transform point of view, reveal assumptions for reevaluation, and cause introspection on one’s own position (i.e., challenge habit of mind) (SCRC, 1993). In Hersey and Blanchard’s (1982) terms, the dialogue process is oriented toward participative change, rather than directive.

The dialogue process is structured to encourage the active involvement of all participants (Roth et al, 1995). Abella (1986) shows that getting people involved and showing application to day-to-day life, versus didactic presentation of theoretical or legal information, is the more effective methodology for a diversity program initiative. The dialogue structure also entails a dialogue group meeting at regular intervals to continue the questioning, listening, and reflection processes (SCRC, 1993). Part of the structure comes from a prepared package of materials comprised of a statement of the purpose of the dialogue, ground rules for participation in the dialogue, and an array of articles on the dialogue topic that provide a diversity of perspectives (SCRC, 1999).

The dialogue process indirectly addresses the diversity program objective of systemic culture change. Although dialogue is primarily oriented to the individual level of analysis, the process is also applicable to the organizational setting as a way of cutting through the communication barriers separating organizational subcultures (Schein, 1995). Over time, individuals within the same organization who engage in dialogue will develop shared mental models (i.e., frames of reference), including assumptions about the world, the way the things gets done, and the way things should get done (Boyett, 1995). Organizational learning occurs through the development of these shared mental models. Without shared mental models, organizational learning may be stifled because individual efforts might not be directed towards group or organizational goals.

Many authors suggest that a structured dialogue process involving critical reflection should be the foundation of effective action within any organization (Marquardt, 1999; Schein, 1995; Weinstein, 1995). Schein (1993) argues that “dialogue is necessary as a vehicle for understanding cultures and subcultures, and that organizational learning will ultimately depend upon such cultural understanding. Dialogue thus becomes a central element of any model of organizational transformation” (p. 40). Unlike many diversity initiatives, diversity dialogues move beyond shaping behaviors to changing personal attitudes and challenging prejudice and stereotypes. This change process is ideally suited to a diversity program initiative.

Research Questions

The purpose of this pilot study was to examine the process of implementing diversity dialogues in a workplace setting prior to undertaking a large-scale diversity dialogues initiative. There were two research questions: should dialogue participants be chosen from across the organization or from within a local jurisdiction, and what strategies should be used for implementing diversity dialogues in a workplace setting, given a particular organizational culture?

Methods

This was a study of a single entity bounded by time and activity. Lincoln and Guba (1985) suggest that such a case study be conducted in a natural setting, noting that phenomena “take their meaning as much from their contexts as they do from themselves” (p. 189). The organizational context provided the natural setting. Qualitative data was collected from multiple sources. The summaries of each of the dialogue sessions, developed by the dialogue participants and two of the authors, were the primary source of data. The third author provided personal observations as a key stakeholder. The qualitative data also includes first-hand observations from the authors’ journaling during the duration of the study. Data came from other stakeholders, including the EEO Program Office, human resources, and management representatives. Physical artifacts were examined, including the organization’s strategic plan, a recent employee opinion survey, diversity statement, and other documents.

The qualitative data was augmented with descriptive statistics. Quantitative data was collected using an instrument administered after the last dialogue session. Information on the validity and reliability of the instrument was not available prior to this study. The instrument asked for participants’ reaction to the diversity dialogues initiative, as well as their perceptions on the dialogue process, its applicability to the organizational context, and whether the stated objectives for the diversity dialogues were met. The body of the instrument consisted of 32 statements. Participants responded to the statements by indicating “Strongly Agree,” “Agree,” “Undecided,”
"Disagree," or "Strongly Disagree." Thirteen of the rated statements produced data addressing the research questions in this study.

Data analysis included description and identification of themes in the findings and assertions. This study used a highly participatory mode of research, involving dialogue participants in every phase of the study. Dialogue participants provided notetaking during the dialogue sessions and member checking of the summary reports of prior dialogue sessions.

The Site

The site for this study (the Agency) was a 3,200-employee component of a larger Federal organization. The Agency's mission is scientific and extremely technical in nature. Primary focus and priority is given to technical issues. Technical proficiency is highly valued, and the Agency has a enjoyed a history of leading in technical competence. The high focus on technical competence has greatly de-emphasized the importance of "people" issues, leaving the perception that mediocrity on people issues is acceptable. As a result, the Agency has faced difficulty in recruiting and retaining employees. This compounds the issue of having a representative workforce and has brought the issue of workforce diversity to the forefront. A 1997 employee opinion survey and focus groups conducted in 1998 and 1999 also have increased attention to diversity issues.

Beginning with a 1987 retreat for key stakeholders, the Agency has conducted many diversity programs initiatives. These initiatives have addressed all three areas of diversity program objectives identified earlier (e.g., demographic representation, awareness and sensitivity, systemic culture change). Specific initiatives have included training programs; the establishment of a multi-cultural advisory team; the development of a Diversity Management Plan in 1994; diversity "celebrations" with educational speakers, ethnic food, and entertainment representing different cultures; and several seminars that dealt with specific aspects of diversity in the workplace. Diversity dialogues were the latest in the series of planned diversity program initiatives.

Pilot Diversity Dialogues

An OD approach was used in planning the diversity dialogues initiative. Discussions with Agency representatives over several meetings and telephone conversations helped to assess the current state of the organization prior to the implementation, clarify the desired state, identify the barriers to attaining the desired state, and a plan of action for implementation. The project was intended to enhance personal growth and development, provide an opportunity for surfacing diversity issues, foster individual perspective and behavior change, and help participants understand and model appropriate workplace behaviors. The project was not intended to provide an organizational solution to diversity issues, remedy the past, or replace other diversity program efforts.

Diversity dialogue sessions were envisioned as a follow-on training initiative that could have implications in various workplace settings. One such application was for intact work units to come together and engage in dialogue about diversity and related topics that affect the local work climate. Another was for "change agents" from across the organization to have a forum to discuss their experiences at the organization from a personal perspective and to be able to work together to make the organization more inclusive and effective in the future. These two perspectives resulted in the plan to pilot two diversity dialogues groups.

Twenty-five dialogue participants were purposefully chosen based on their interest or involvement in previous diversity activities or for having supported workforce diversity through their individual actions. It was assumed that these individuals could provide a balanced perspective on the diversity dialogues pilot. The 13 member "cross-organizational" group was contacted personally by a member of the staff of the Agency's Director and asked if they would be interested in participating. The 12 member "localized" group was chosen from one directorate within the organization. Participants were selected by the Directorate Head, who made personal contact with each participant by asking if they would be interested in participating. In both instances, participants were chosen to maximize the diversity in each pilot group, using such diversity factors as age, race, national origin, and occupation.

Using a structured framework to guide discussion, the diversity dialogues included 10, two-hour sessions were scheduled over a six month period. Initial sessions were scheduled one week apart, with the duration between sessions expanding to four weeks by the last session. All dialogue sessions were conducted on-site, at various buildings in the Agency's campus-like setting. The first session was an orientation for all dialogue participants. Participants were given a dialogues package which included the project purpose and objectives, expectations, framework, schedule, excerpts from the Agency's Management Plan and values statement, and articles illustrating differing perspectives on diversity. A summary of the previous session was e-mailed to each dialogue participant several days in advance of each session. The facilitators opened each session by reviewing the summary and the expectations for the current session. The articles were used to stimulate thought and discussion. Several
management models were also used to examine the individual's approach to change surrounding diversity in the Agency's work environment.

Findings

This section reports the findings for the two research questions. First is data on the choice of dialogue participants (i.e., localized vs. cross-organizational). Second is data on strategies for implementing diversity dialogues in a workplace setting.

Localized vs. Cross-organizational

On average, eight participants of the cross-organizational group were present for each session. Attendance for the localized group averaged five participants. In this group, one participant stopped attending, citing that the dialogue would not help in career progression. Another cited job demands. One session was canceled after only two participants showed up. Several participants stopped attending without any explanation.

Discussions with participants in both groups indicated several reasons for low attendance. The dialogue activity was not valued, placing the activity at a lower priority when compared to mission-specific activities. Some participants wanted a direct connection between participation in the dialogue sessions and career advancement. The irregular scheduling and location changes were also cited as reasons for low attendance. In the last dialogue session, several localized group participants noted they initially thought participation was “mandatory.” When two group members who were perceived as highly-visible in the directorate dropped out, perception that participation was mandatory shifted to “discretionary.” The lack of a sustained management challenge to participate showed several of the remaining participants that the diversity dialogues were not that important.

Qualitative survey data show 100% of respondents thought participants in a diversity dialogue group should be representative of the diversity of the Agency. The majority (85.7%) thought participants in a diversity dialogue group should be drawn from across the Agency, not from the same directorate. Only 21.4% thought that participants in a diversity dialogue group should be from intact work groups. The statement that having people from the same work group inhibited dialogue discussion received a mixed response, with 35.7% disagreeing and 42.9% agreeing.

There was high agreement (92.4%) among respondents that their own supervisor should participate in a dialogue group. It was unclear, however, whether employees would like to have had their own supervisor participate in their dialogue group, with 35.7% agreeing and 35.7% disagreeing. While 35.7% agreed that including employees and their supervisors/managers in the same dialogue group would impede the dialogue, 21.4% strongly disagreed.

Implementing Diversity Dialogues in the Workplace

The culture of this workplace gives priority to the technical mission, almost to the exclusion of all other activities. Participants suggested that managers and employees do not see diversity as an integral part of mission accomplishment. They noted that, in this scientific environment diversity is seen as amorphous, without easily calculated metrics or solutions. Participant observations of management reaction to diversity issues have included denial, disregard, and avoidance. Discussion of diversity detracts from mission accomplishment and should be avoided. Diversity issues are ignored unless there is an associated problem with the task at hand. When data indicates a diversity problem, there follows a request for more data for analysis rather than any attempt to understand and address the issue.

Discussion of diversity in the workplace is difficult, takes time, and involves risk, making it hard to do in a risk-averse environment where time is a highly-guarded resource. This workplace culture leaves employees doubtful of the importance of diversity to the overall business strategy and to mission accomplishment. Dialogue participants continually talked about mixed signals when examining the Agency's response to diversity issues. The value of the diversity dialogues initiative was questioned. One participant summed it up with, “I have to get my job done, so my interest in coming to the sessions doesn’t matter, just like my diversity doesn’t matter.”

Other data regarding implementation of diversity dialogues in the Agency are worth noting. Given the Agency’s culture, it was not surprising that 64.3% thought participation in the dialogue should be mandatory for all employees and managers. Although 78.6% disagreed that each session should be limited to one hour, 85.7% agreed that two hours for each session was sufficient time for dialogue. Participants (78.6%) agreed that dialogue sessions should be scheduled at regular intervals (e.g., weekly, biweekly, monthly). There was equal (42.8%) agreement and disagreement that scheduling 10 sessions over six months was appropriate for the dialogue, however, 35.7%
strongly disagreed. Only 14.2% agreed they were not interested in facilitating a diversity dialogue at the Agency in the future.

Discussion

The research questions focused on participant mix and strategies for implementing diversity dialogues in a workplace setting. This section includes a separate discussion of each research question, although the findings suggest a great deal of interdependence between the two issues.

Localized vs. Cross-organizational

The data on the issue of participant mix indicate that a cross-organizational group would be preferable to one chosen from within a localized jurisdiction. While it was anticipated that the localized group in the study would establish relationships and explore diversity issues more quickly, this was not the case. The cross-organizational group progressed more quickly. This finding conflicts with the literature suggesting an intact group would fare better (Bion, 1961; Karp & Sutton, 1993).

In both groups, administrative employees had a greater drop out rate than employees from core occupations. This was surprising, given the Agency culture. The expectation was that participants holding core occupations would drop out at a greater rate because they felt pulled to the "real work." The findings suggest that individuals who are already regarded as "second class citizens" (e.g., administrative and support employees) cannot afford to increase the perception that they are not contributing to mission accomplishment by participating in "peripheral" activities. It is ironic to note that the majority of participants to drop out of the localized group were in administrative/support positions.

Attendance and level of involvement were higher for the cross-organizational group of employees. Participants from the localized group viewed the dialogues as another competing demand, albeit one with low priority. Consistent with the emphasis on the mission, dialogue participants generally opted to attend technical meetings over the dialogue sessions. There were perceived negative consequences to missing work-related meetings, while there were no perceived consequences for missing dialogue sessions.

Attendance for both groups was helped by reminder notices preceding each session. The notes highlighted the previous session and introduced discussion questions and reading assignments for the upcoming session. Participants found the reminders helpful in providing information and structure, and in helping them to give the sessions priority on their work schedules.

Implementing Diversity Dialogues in the Workplace

Fundamentally, a diversity initiative must create awareness of diversity, its impact on the workplace, and its impact on the bottom-line (Johnson & O'Mara, 1992). Diversity initiatives generally must link the diversity program to the corporate culture and business objectives of the organization to be successful (Karp & Sutton, 1993; Winterle, 1993). The dialogue process represents a major shift from this philosophy. It also represents a major change for the Agency's task-oriented employees. Clearly, organizational learning was impeded by the lack of shared mental models linking diversity program initiatives and mission accomplishment. The focus on task was detrimental to dialogue attendance. Employees are quick to use the scientific method, collecting and analyzing data to solve a technical problem. When faced with a diversity issue, they take a different, more cautious approach.

Dialogue participants wanted tools and the "right answers" to questions about diversity issues. This expectation is anathema to the dialogue process. Studies show failure of diversity initiatives is often due to unclear expectations (Delatte & Baytos, 1993; Karp & Sutton, 1993). Even though participants understood the purpose, they sometimes viewed the dialogues as "training" and were frustrated at times when there were no "right answers" available. Despite the occasional frustration, participants commented that they learned about self and had a greater appreciation for other participants, as well as a better understanding of diversity issues through the dialogue.

Several participants noted that the dialogues were the only option for open discussion of diversity issues in their workplace. Even though participants in the study may have been predisposed to support diversity and perceived the need to participate in the dialogues pilot, they opted for work-related meetings when given a choice. The data indicate that individuals want to talk about these issues but, at work, they see the emphasis on, think they'll be rewarded more for, and would rather spend time on work directly related to mission accomplishment.
Conclusions

This study looked at the issues of participant selection and strategies for implementing diversity dialogues in an organizational setting. The data show that using a cross-organizational group of participants was preferable to a localized group. Regarding strategies for implementing dialogues in a workplace setting, it could be inferred that the Agency's culture was not conducive to the diversity dialogues process. The workplace focus on task to the exclusion of other activities, the de-emphasis on discussing non-work issues, the limited communication skills of employees and managers, and the inability to see the nexus between diversity and mission accomplishment surfaced as challenges to effective dialogue implementation in a workplace setting.

The data from this study show that the organization's management can increase participation in the diversity dialogue initiative by increasing the status of the initiative. One way to accomplish this is by directive change, making dialogue participation mandatory. Alternative options, such as showing visible support and personal participation from management may prove more beneficial to changing the culture through a participative change cycle, similar to that described by Hersey and Blanchard (1982). Mezirow (1997) suggests that in attempting a transformative learning process, an individual's "points of view are more accessible to awareness and to feedback from others" (p. 6). Transforming habit of mind requires heightened awareness and critical reflection of generalized bias. This commonly indicates the need for participative change. While mandating the program for all employees may improve attendance, the quality of that participation may not support transformative learning.

The purpose of the study was to provide an explanatory narrative in a cross-case comparison of the implementation of two pilot dialogues. It was not intended to examine the effectiveness of diversity dialogues as a specific diversity program initiative. Further research is needed addressing the larger issues of diversity program effectiveness and the linkage between diversity programs and organizational performance. This study was also limited to one organizational context and the dialogue focus limited to the issue of workforce diversity. Comparison of these results with research in other organizational contexts and focusing on other dialogue topics is warranted.

Contribution to New Knowledge in HRD

There are two primary contributions to new knowledge for HRD practitioners. First, the data show that using a cross-organizational group of participants was preferable to a localized group. Second, yet more substantive findings dealt with the issue of strategies for implementation of dialogues in a workplace setting. Arguably, there are numerous reasons for the failure of diversity program initiatives. Kormanik and Geffner (1995) show three primary restraining factors: a lack of personal responsibility and accountability, a lack of positive leadership at all levels, and a lack of visible management commitment. All three of these barriers surfaced in this pilot study, and must be strategically addressed in any workplace implementation of diversity dialogues.

Specific strategies, however, may enhance the success of dialogue implementation. Strategies include visible management endorsement giving diversity priority on par with the "real work;" senior management participation, direct involvement, and scheduling flexibility; increased positive communications throughout the workplace to give the activity greater status and priority; and an increased premium on developing "soft" skills (e.g., communication, interpersonal relations, team building). All of these may represent systemic organizational culture change.

Evaluation of Diversity Initiatives in Multinational Corporations

Rose Mary Wentling
University of Illinois

The purpose of this study was to provide information on the evaluation of diversity initiatives in multinational corporations. Eight multinational corporations headquartered in the United States were selected for this study. Two methods of data collection were used: semi-structured face-to-face interviews with diversity managers/directors, and document analysis. The study revealed that despite the difficulty in determining the impact of diversity initiatives, the corporations are making efforts to come up with measurements that can lead them to confirm the value that diversity initiatives have to the organization's profitability.

Keywords: Diversity Initiatives, Evaluation, Multinational Corporations

The changing workforce is one of the most extraordinary and significant challenges facing many organizations today. Workforce diversity is a demographic phenomenon playing upon not only American organizations but also multinational corporations and institutions in other countries around the world (Littlefield, 1995; Morosini, 1998). In addition, other business forces such as global competition and the need to remain competitive are driving diversity into organizations regardless their geographical location.

Theoretically, international business has been one of the pioneer fields in valuing diversity (Simons, 1992). Diversity, in this case, has emerged as a need for survival and success. Multinational corporations are forced to develop and implement initiatives that could lead them to capture and retain diverse customer bases not only nationally but also throughout the world (Albert, 1994; Fernandez, 1993; Fiorkowski, 1997; Norton & Fox, 1997). They are also required to recruit and retain a diverse workforce that mirrors its diverse market.

During the last decade, many organizations have responded to the increase in diversity with a variety of initiatives designed to manage diversity in the workplace (Arredondo, 1996; Baytos, 1995; Cross & White, 1996; Hayles & Russell, 1997; Loden, 1996; Thomas, 1996). For the purpose of this study, diversity initiatives are defined as specific activities, programs, policies and any other formal processes or efforts designed for promoting organizational culture change related to diversity (Arredondo, 1996). Examples of such initiatives include nontraditional work arrangements, such as flextime and home work stations; education and training programs intended to reduce stereotyping, increase cultural sensitivity, and develop skills for working in multicultural environments; career management programs designed to promote constructive feedback to employees, mentoring relationships, and access to informal networks; and new employee benefits, such as parental leave and dependent-care assistance (Arredondo, 1996; Hayles & Russell, 1997; Jackson, 1992; ).

Morrison (1992) grouped the diversity initiatives found in 16 exemplary organizations in four groups: (a) diversity; (b) accountability; (c) development; and (d) recruitment practices. Similarly, by using several case studies based on large American corporations, Gottfredson (1992) was able to group diversity initiatives into five categories: (a) procedures to reduce ethnic and gender differences in career outcomes; (b) procedures to accommodate immigrants to the United States; (c) changes in organizational climate to value and utilize ethnic and gender differences; (d) changes in procedures or climate to accommodate individual differences among employees; and (e) decentralized problem solving to accommodate local conditions. The first three categories listed above address diversity issues related to ethnicity and gender, and the last two categories encompass all individual differences and are directed to all employees.

Several of the nation's major employing companies have started implementing a great number and variety of diversity initiatives. There are many reasons companies are implementing these initiatives in the workplace. Some of the purposes that drive diversity programs are: Compliance, harmony, inclusion, justice, and transformation (Rossett & Bickham, 1994). Wentling and Palma-Rivas (1998) interviewed diversity experts from across the United States and discovered that companies are managing diversity because it helps organizations improve productivity and remain competitive, form better work relationships among employees, enhance social responsibility, and address legal concerns. However, "it is unknown whether these programs are, in fact, producing expected gains, because so few organizations have evaluated their outcomes" (Comer & Soliman, 1996, p. 473).
Even though there are many reasons to evaluate the impact of diversity initiatives, the lack of attention to evaluation of diversity initiatives has been reported by several authors (Comer & Soliman, 1996; Johnson, 1995; Wheeler, 1994; Triandis & Bhawuk, 1994). “To ascertain if their investments are cost effective, mechanisms should be in place to measure the success of diversity efforts” (Comer & Soliman, 1996, p. 473). Casse (1991) stated that diversity programs should be evaluated to measure the nature of return on investment to match the cost involved in them and to compare the situation before and after the program. It is also possible that “well-intentioned diversity efforts can cost an organization a great deal of time and money and yet not create any significant, lasting change” (Morrison, 1992, p. 230). According to Comer and Soliman (1996) lack of appropriate measures does not exclude organizations from assessing the impact of diversity initiatives. Conversely, it underscores dramatically the need for practitioners and researchers to develop such measures in order to determine whether organizational efforts to manage diversity are really effective.

Purpose and Scope of the Study

The purpose of this study was to identify practices, strategies, and processes that are used to evaluate diversity initiatives in multinational corporations. Overman (1992) reported that companies concerned about the value of diversity are still “struggling to find concrete ways to measure whether they are succeeding” (p. 38). An in-depth understanding was provided through this study to contribute to diminishing the lack of knowledge in the evaluation of diversity initiatives in multinational corporations. Specifically, this study addressed the following four research questions:

1. How are diversity initiatives being evaluated in corporations?
2. How is the success of diversity initiatives measured in corporations?
3. How effective are diversity initiatives in corporations?
4. What components of diversity initiatives are difficult to evaluate in corporations?

Methodology

This was a descriptive and exploratory study. Two major methods of data collection were used: semi-structured face-to-face interviews and document analysis. Interviews were conducted with workforce diversity manager/directors who are responsible for diversity initiatives in multinational corporations headquartered in the United States. The data obtained through the interviews consisted of words in the form of rich verbal descriptions (qualitative data), as well as quantitative data. Essentially, this study used a qualitative approach to answer the research questions. A quantitative method in the form of frequencies and percentages were also used to support the qualitative data. The second major method of data collection used was document analysis. Documents related to the evaluation of diversity initiatives in the multinational corporations were collected from primary and secondary sources. Documents were solicited from the corporations and from standard literature sources, such as, annual reports, community relations reports, world-wide-web, newspaper articles, and diversity-related books in which the corporations were featured. The data obtained from these documents provided insightful and enriched information that was used to confirm and verify the information provided by the study participants during the face-to-face interviews.

Population and Sample

The population for this study was composed of the 30 multinational corporations in a mid-west state in the USA listed in the book entitled, Directory of Diversity in Corporate America (1994). From those 30 corporations, a sample of eight was randomly selected to participate in the study. The population and sample that was selected for this study was ideal because in order for a corporation to be included in the Directory of Diversity in Corporate America (1994), it must meet the following criteria: (a) have extensive experience with workforce diversity, (b) be multinational corporations, (c) be allocating resources to diversity initiatives, and (d) have launched successful corporate diversity initiatives.

Eight diversity managers/directors at eight USA based Fortune 500 multinational corporations were interviewed. The diversity managers/directors work in corporations with sales varying from $10 billion to more than $50 billion, and asset from $12 billion to more that $60 billion. The number of employees in these corporations ranged from 48,100 to 378,000. The average number of employees in these eight corporations was 125,250. The study participants are employed in a variety of industries, which include the following: Food (3); Electronics (1); Chemicals (1); Petroleum (1); Pharmaceuticals (1); and Specialist Retailer (1).
Data Collection

The data were collected through interviews and document analysis. The researcher conducted face-to-face interviews with eight workforce diversity manager/directors in charge of diversity initiatives in eight multinational corporations in a mid-west state in the United States of America. The researcher developed a semi-structured interview guide to assist in collecting the data from the interviews. Semi-structured interviews were chosen because they are "reasonably objective while still permitting a thorough understanding of the respondent's opinions and the reasons behind them" (Borg & Gall, 1989, p. 452).

In addition, the researcher conducted a document analysis of written and printed materials related to the evaluation of diversity initiatives in the multinational corporations. According to Gall, Borg, and Gall (1996), by studying past documents researchers can achieve a better understanding of present practices and issues. In addition, documents can be accessed at a time that is convenient to the researcher and saves time and expense in transcribing (Creswell, 1994).

A study advisory committee, made up of four human resource development (HRD) educators from a leading university in the USA, who have expertise in diversity, evaluation and qualitative research methods, reviewed the interview guide and study procedures. Also, to determine content validity and appropriateness of the interview guide, a pilot study was conducted with two diversity directors of the same target population for the study. There was agreement by the study's advisory committee and the pilot test participants that the study procedures, interview guide and the data being collected were appropriate for meeting the objectives of the study.

Data Analysis

The data from the interviews were content-analyzed. Content analysis is a research technique for systematically examining the content of communications—in this instance, the interview data. The researcher and another researcher associate independently analyzed the participants’ responses and the related issues that arose during the interview process. No major discrepancies were found when the analyses from both researchers were compared. The researchers read the responses, put them together as complete quotations, and filed them according to the topic or issue addressed. Responses were analyzed thematically. Emergent themes were ranked by their frequency of mention and finally categorized. Data obtained through the interviews were analyzed qualitatively and quantitatively. Quantitative data were used to provide the basic research evidence, while qualitative data were used to round out the picture and provide examples.

Documents were collected and analyzed prior to, during, and after the interviews. All together there was a total of 47 related documents analyzed. Related documents obtained from the world-wide-web, corporate sources, books, newspaper articles, and so forth were all included in individual files for each of the corporations in the study. The researcher coded the related documents by relevant topic as they related to the major research questions. To further assist in ensuring the reliability of the data analysis, the researcher invited a diversity manager from a multinational corporation in the west coast to review four of the interviews. The ratings (frequencies of emergent themes) of the diversity manager matched the researchers’ ratings in all of the four interviews reviewed. The same procedure was followed for the related documents analysis, which produced similar results.

Results

The results of this study are summarized in four major sections which parallel the research questions: (a) Methods for evaluating diversity initiatives, (b) How the success of diversity initiatives are measured, (c) Effectiveness of diversity initiatives, and (d) Components of diversity initiatives that are difficult to evaluate.

Methods for Evaluating Diversity Initiatives

Six (75%) of the organizations evaluate diversity initiatives. A basic theme that emerged from the study participants was that evaluating diversity initiatives effectively was difficult and time consuming. Despite the difficulty of evaluating diversity initiatives, all of the organizations in the study were attempting to measure their effects on employees and the organization. The study participants together cited twelve methods for evaluating diversity initiatives. The range of evaluations methods cited by participants numbered from 3 to 7. The average number of evaluation methods used was 4.8. Table 1 presents participants in rank order by frequency all the methods for evaluating diversity initiatives that were cited by the study.
Six (75%) of the study participants indicated they used employee surveys, and another six (75%) stated that they tracked employee data to evaluate the effectiveness of diversity initiatives. The employee surveys were used to gather data from employees to determine their perceptions one to two years after the original employee survey was conducted. The data collected from these surveys gave the organization a basis for comparison from the point at which it began the initial diversity initiative effort. The corporations that tracked employee data reviewed the information to determine where improvements had been made in such areas as turnover rates, retention, hiring, and promotion of women and minorities. In addition, data were reviewed to determine if people from diverse groups were represented at all levels of the organization, especially at the top management ranks.

Half of the corporations in the study used management annual performance reviews and another half used 360-degree feedback as methods for evaluating diversity initiatives. The management annual performance reviews were used to determine if the manager's business unit was reaching effective and profitable results by fully utilizing a more diverse workforce. The 360-degree feedback process was used to provide employee feedback to management related to his or her skills and abilities in addressing diversity issues. This information was then used to better develop managers in dealing with diversity issues.

Three (38%) of the study participants reported using focus groups as a method for evaluating diversity initiatives, another three (38%) used benchmarking, another three (38%) used diversity-specific surveys, and another three (38%) used customer feedback. The focus groups were used to gather information from employees to determine their perception about the progress of diversity initiatives in the organization. Benchmarking was used to assess the company's progress related to diversity in relation to other companies who are exemplary in addressing diversity. Diversity-specific surveys were used to obtain information about the climate of the company from various diverse employee groups. Customer feedback was used to determine if their diverse customers' needs were being met by the company's products, services, and employees. In addition, informal employee feedback, informal employee group feedback, employee attitude surveys, and peer reviews were methods of evaluation of diversity used by two (25%) or one (12.5%) of the corporations.

**How Success is Measured for Diversity Initiatives**

The study participants were asked to specify how success is measured for diversity initiatives in their corporations. The study participants cited fifteen methods for measuring success of diversity initiatives. The range of methods cited by participants numbered from 5 to 12. The average number of methods used was 8.5. Table 2 presents in rank order by frequency all the methods for measuring success of diversity initiatives that were cited by the study participants.

All of the study participants indicated that they looked at leadership commitment as a way of measuring success of diversity initiatives. According to the study participants, there is an indication of success if leaders in the organizations are committed and supportive of diversity initiatives and are willing to allocate resources to help ensure the success of diversity efforts. All the participants also reported using representation of diverse populations at all levels of the organization as a method for measuring the success of diversity initiatives.

Six (75%) of the corporations studied measured their success by observing goals and objectives attained, and another six (75%) noticed if diversity initiatives were assisting in meeting the goals of the company’s strategic plan. If they achieved their goals, then they could conclude that the diversity initiatives were successful.

Five (63%) of the study participants reported using promotion rates, hiring rates, turnover rates, retention, and absenteeism rates as methods for measuring success of diversity initiatives. These measures were set to obtain their objective of creating and maintaining a diverse workforce and also of meeting Affirmative Action requirements.

Three (38%) of the study participants indicated they use performance rates, attitude and behavioral change, and employee satisfaction as methods for measuring success of diversity initiatives. These measurements were often achieved through performance appraisals, conducting informal employee feedback, and general observations.

Complaints about diversity issues, work group performance, and external recognition and award were used by two (25%) of the corporations studied as methods for measuring success of diversity initiatives. It is interesting to note that although only two (25%) of the study participants identified external recognition and award for measuring success, the review of the related documents revealed that all of the corporations had received widespread public recognition for their exemplary human resource practices related to diversity. For example, half of the corporations in the study were included in the book, The Best 100 Companies for Minorities, three (38%) were included in the book, Best Companies for Working Mothers, two (25%) had received the Catalyst Award for innovative efforts in providing equal opportunity for women and minorities, and another two (25%) had received the Manufacturer of the Year Award for its community citizenship and commitment to women and minority employees.

**How Effective Diversity Initiatives Have Been**

The study participants were asked to specify how effective the corporation's diversity initiatives had been. Six (75%) of the study participants stated that the diversity initiatives have been very effective and have had a positive impact on employees and the organization. Two (25%) of the study participants indicated that the
effectiveness and impact have been average, meaning that diversity initiatives have had a relative success. These two research participants based their opinions on just perceptions because (a) it was too early to judge the effectiveness or impact of the diversity initiatives and (b) there was no hard data available at the time the interviews took place.

The following statements were made by the study participants on the degree of effectiveness or impact of diversity initiatives.

"Some examples of our success are the positive feedback that we get from our employees regarding the benefits of our diversity efforts, such as training. Also, the positive feedback we get when we do presentations about how and why we are addressing diversity. From what I sense and hear, diversity is very well received in this organization. The employees are beginning to feel much better and they sense that managers are now walking the talk."

One of the study participants indicated that their diversity initiatives have been successful because (a) the minority representation has changed throughout the organization and (b) their diversity initiatives are being highly benchmarked. For them that meant that many other organizations have followed their example regarding diversity initiatives. This study participant stated,

"We know that the number of women has increased tremendously. There was a time when very few women were working in this corporation. We know that there is a major shift in the employee make up. Women are now represented in all key departments and this is a major shift in terms of how we've grown and changed. Sometimes we get external recognition by impartial organizations for our efforts in providing opportunities for women."

Another study participant said, "We have very good results based on our diversity initiatives and top management is very happy with our work and progress and the impact we are having on the company." Still another study participant stated,

"We have been very effective in that we have raised diversity awareness throughout the entire organization from top to bottom. The organization as a whole understands the value and business impact of diversity. This has resulted in many more business units implementing diversity related initiatives."

The two study participants who indicated that it was too early to judge success and effectiveness of diversity initiatives had this to say: "Effectiveness and impact should be data driven. I can't give you any hard data because I need another year. However, based on perceptions and generally speaking diversity is well supported."

The other study participant stated,

"It is going to take a while before we really know how successful and effective we are going to be, because we are talking about a cultural change and this is going to take time. We realized that it is going to be at least a three to five year effort. Therefore, it is too early for us to judge our successes and effectiveness."

Components of Diversity Initiatives That Are Difficult to Evaluate

The study participants were asked to identify the components of diversity initiatives that were difficult to evaluate. The study participants cited six components of diversity initiatives that were difficult to evaluate. The range of components cited by participants numbered from 2 to 4. The average number of components cited was 3. Table 3 presents in rank order by frequency all the components of diversity initiatives that are difficult to evaluate that were cited by the study participants. Six (75%) of the study participants indicated that impact of diversity on bottom-line (profitability) was difficult to evaluate. Another six (75%) stated that impact of diversity on productivity was difficult to evaluate. According to the study participants, bottom-line (profitability) impact and productivity are two of the greatest challenges in evaluating the effectiveness of diversity initiatives. The reasons for these challenges were that bottom-line (profitability) and productivity are influenced by so many factors that it was difficult to isolate the specific diversity initiatives that caused the increased productivity or profit levels.

Five (63%) of the study participants found it extremely difficult and time consuming to evaluate the return-on-investments of diversity initiatives. These participants indicated that they did not have an effective method for measuring the profitability gain that resulted from the money invested on diversity initiatives.

Behavior changes and employee attitudes were mentioned as difficult to evaluate by three (38%) of the study participants. Attitudes and behavioral changes were seen as difficult to evaluate because they may take a long time to occur and many times may go unnoticed. One of the study participants stated that internal readiness to launch diversity initiatives was difficult to evaluate. Internal readiness meant that employees and managers were ready to accept diversity as part of the organizational culture. This was seen as difficult because there was no effective way to determine if organizational members were ready for this change, which was seen as necessary and critical for effective implementation of diversity initiatives.

Discussion

This study found that all corporations were attempting to evaluate the effects of their diversity initiatives on employees and organizations. The study also revealed that, in an attempt to evaluate their diversity initiatives, each company uses a variety of methods. This finding does not support the findings reported by Morrison (1992). She found that very little is being done in evaluating particular diversity practices. What this study revealed is that evaluation of particular diversity initiatives seems to be rather new among the corporations that participated in the study. This study also found that effectiveness of evaluations is a major concern. The corporations in this study seem to recognize that diversity initiatives need to be evaluated. Because of the emphasis on evaluation and well-elaborated tools some corporations have to evaluate diversity initiatives, it is possible to conclude that evaluation is becoming a more important part of the process of diversity initiatives. Other authors have also emphasized the importance of conducting evaluations for diversity initiatives (Arredondo, 1996; Jackson and Associates, 1992; Morrison, 1992; Rynes and Rosen, 1995). Evaluation is an on-going process and is critical to the success of any diversity initiative.

This study also examined how corporations measure the success of their diversity initiatives. Leadership commitment and representation of diversity at all levels of the organizations were the most common ways for measuring success. These findings are consistent with results obtained in this area by Wheeler (1996). He examined the corporate practices in diversity measurement, and what he found was that leadership commitment is a critical measurement component to ensuring that the organizational culture supports diversity initiatives.

This study identified impact on bottom-line, impact on productivity, and return-on-investment as the components most difficult to evaluate for diversity initiatives. Similar areas difficult to evaluate were reported by a study conducted by Wheeler (1996). Wheeler’s study revealed that productivity, growth, and profitability of diversity strategies remain the most challenging and difficult areas to measure. There seem to be at least two reasons people in corporations have identified bottom-line, productivity, and return-on-investments as difficult to evaluate. These areas are usually affected by many variables, and it is difficult to isolate cause-effect relationships (Wheeler, 1994). Interestingly, even when there might be an increase in profitability and productivity due to diversity initiatives, it is difficult to prove that diversity is the reason for such improvement (Morrison, 1992). Another reason might be that people do not have the necessary knowledge, skills, and experience to determine the overall impact of diversity initiatives. Despite the difficulty in determining the impact of diversity initiatives, the participants in this study were making efforts to come up with measurements that can lead them to confirm the value that diversity initiatives have to the organization’s profitability.

Change: The Japanese Workplace and the Aging Workforce

Mary E. Repass
Letitia A. Combs
Virginia Polytechnic Institute & State University

The Japanese workplace is changing as the workforce ages. Japan's population is aging faster than any country in the world. In 2000, one in four workers will be over the age of 55. Lifetime employment, fewer advancement opportunities, and retirement issues are problems arising in the Japanese workplace. The impact of this aging workforce is crucial for the employees and for the companies as they plan for employment opportunities of the 21st century.

As the 21st century begins, the workforce of Japan is aging faster than any other country in the world. In 1997, the Japanese population aged 65 years and older exceeded the number of children under 15 years of age by 50,000 (Kawanishi, 1997). Although 50,000 is a relatively small number in populace terms, this occurrence advanced Japan to the forefront of countries that are also experiencing an increase in their older population (Japan Insight, Population, 1999).

Soon Japan’s population of over 125 million will experience even more demographic changes. First, there is a declining growth rate that dropped to 0.25 percent in 1999 (“Population Grows,” 1998). Second, life expectancy in Japan has greatly increased due to the drop in infant mortality, advances in medicine, and a general interest to maintain good physical fitness (Campbell & Campbell, 1991; Japan Insight, Background, 1999). Immediately after World War II, few Japanese could expect to live past the age of 55. Now a Japanese woman’s life expectancy is 83 and a Japanese man’s life expectancy is 76 (Kawanichi, 1997; Japan Insight, Population, 1999; Campbell and Campbell, 1991). By the year 2020, these emerging population trends will result in a society where one out of every four people in Japan will be 65 years or older (Japan Insight, The Graying, 1999).

Japan recognizes that this graying population has a far-reaching impact on the Japanese workforce and human resource issues now and in the future. In 1998, the Japanese Ministry of Labor predicted that one in four workers in Japan would be over the age of 55 by the year 2000 (Japan Insight, The Graying, 1999). This fact reflects new corporate changes that include: (1) higher labor costs, (2) fewer senior positions, (3) greater financial demands for severance pay of retirees and pension benefits after retirement, (4) lack of employment opportunities for older employees who want to continue to work, (5) lower mobility for workers, and (6) change in training methods. The retirement age of 55 is changing to age 60 and beyond, and new hiring, training, and retraining methods are being initiated in order to eliminate workforce problems (Japan Insight, The Graying, 1999). Although many traditions and lifestyle preferences of the Japanese work environment remain constant, the increase of older employees in the workforce in the 21st century is definitely creating change.

Problem Statement

Japan’s workforce is aging rapidly. Many of these older employees were secure in lifetime employment, a practice long associated with Japan. Employees worked for the same company after graduation from high school or college until retirement. Companies recruited young workers directly from school and directed their careers through in-house training and development programs. Today, as a result of this aging workforce, changes are occurring not only in the lifetime policy, but also in workforce practices and retirement issues. These changes are creating new challenges and redirecting hiring, training, and development programs for Japanese companies. After decades of job security, many Japanese workers are experiencing changes in their employability and uncertainties of job opportunities and career advancement.
Research Questions

The research considered the following questions:

- What social influences have made an impact on the Japanese workplace?
- What workplace changes are the Japanese older workers now experiencing?
- As the Japanese workforce ages, what human resource development (HRD) and retirement issues are evolving?
- What future work opportunities are available to Japanese pre- and post-retirement workers?

Theoretical Framework

Many Japanese workers are now in the post- or pre-retirement stages of their lives. They have worked diligently throughout the post-War era and have been instrumental in building Japan into one of the world's leading industrial countries. Most have lived through the phase of urbanization that developed with massive post-War migrations from the agricultural areas of Japan to industries and businesses of the cities (Japan Insight, Background, 1999). The lives of this post-War generation of older workers, mainly the men, have been dominated by routines of working many hours a week, commuting long distances to work, and having limited family and community involvement. Although they are eligible to retire or are near retirement, many are active, healthy, and want to continue working ("Population Grows," 1998). Japanese companies are being challenged to decide how older workers can best fit into the workplace and how they can adjust to the transitions of change both before and after retirement.

Methodology

This international study focuses on the impact of aging employees in the Japanese workplace and their transition to changes occurring in the workplace. Several qualitative methods were combined for this investigation. Information on current changes in the Japanese workplace was obtained through literature written in English or translated from Japanese into English.

Case Studies

Case studies involved both in-depth interviews and observations of persons who represented older employees. Discussions spanned a one-year period and focused on their preparation for training or re-training before or following retirement. Each case study offers a viewpoint of personal work habits and future lifetime choices. In addition, the case studies offer a view of lifestyle changes that occur in pre-retirement and post-retirement stages of life. The four case studies in this paper include persons between 55 years to 68 years old. Although a similar focus of discussion topics was used in all the case studies, a flexible format permitted adjustment to differences in interests career experiences, and lifetime transitions.

Interviews and On-Site Visits in Japan

In addition to literature reviews and interviews with case study participants, company site visits in May and June of 1998 afforded an opportunity to meet with a cross-section of employees. During these visits, meetings and interviews were arranged with persons who would soon be retiring or have already retired; with non-retiring, younger employees representing the general views of workplace employees; and with managers from several Japanese companies. Because the majority of Japanese workers are men, most of the interviews were with men.

Results and Findings: New World Influences in the Japanese Workplace

Currently Japanese employees find themselves in the midst of a rapid revolution of technological and social changes that are occurring throughout the world. The course of change includes two major periods in the past fifty years ranging from post-World War II to the present. First, Japan began a high growth industrial period following the war that successfully established the country as a powerful economic world player and a strong competitor in the global marketplace. Incorporated in this industrial period were the factors of mass production and automation, coupled with an intense work ethic based on a philosophy of hard work as the basis of a good life (Naisbitt, 1997).

Second, Japan has now entered into the post-industrial period, also called the information age or the infosphere (Spear & Mocker, 1989), which is oriented toward services and information technology. As a result,
interaction among people has become more important in society. This new society extends far beyond Japanese boundaries. Changes in lifestyles and new social trends are transforming all of Asia with unprecedented speed (Naisbitt, 1997) in this post-industrial era. Because of this evolution, older Japanese are finding that their responses to change are influencing their fundamental work routines and day-to-day lives. The quality of their futures relies on their successful transitions and adjustments to these changes.

**Internationalism**

Several noteworthy trends have propelled Japan into the international arena. First, as a resource-poor nation, Japan has become one of the most powerful industrial nations in the world. With the importation of raw materials, Japan manufactured products for the strict purpose of exportation. “Made in Japan” became a slogan that created a strong economic base for a post-World War II Japan. As manufacturing increased, the Japanese yen grew stronger and by the 1980s, Japan became immersed in the “bubble economy.” Japan’s economy flourished as companies made foreign investments and Japanese manufacturers moved production sites to foreign countries (Makino, 1997). However, in the 1990s the economy slowed and new international initiatives have become vitally important for the future of Japan.

The workplace has become more internationally involved. Currently many foreign workers travel to Japan to secure jobs. Along with the influx of foreign workers, there are also thousands of Japanese who are working in other countries as Japanese companies expand (Naisbitt, 1997). Workers have become sophisticated in world issues as they experience different cultural norms and workplace values.

**The Information Age**

The evolution of the Information Age is characterized by the growth of information technology and communication. The development of the silicon chip, satellites, and computer expertise instigated changes and the expansion of Japanese industries. Japan’s manufacturing-based economy has changed to an information-based economy where an organizational system of top-down management may not be as applicable. The information-based society is oriented more toward individual input and the efficiency of each worker (Makino, 1997). Managers, who traditionally are the older and more senior employees, have had to adjust to the wave of information technology or have had to adjust their management approach to a more individualistic workforce.

Most managers previously relied on a support staff to perform the company’s communication requirements. Computer literacy was not mandatory for job performance. Now many managers are finding that in order to communicate with clients or staff throughout the world, they must be trained in computer skills. Computer literacy has become a requirement, not a choice. Computer communication is rapidly eliminating past methods of conducting international business via the telephone and facsimiles. Also, senior managers must now apply new management skills to a computer-literate, younger staff. These changes bring more requirements to prepare, train, or retrain the workforce in order to compete internationally and to meet the demands of future jobs. Both the expansion of training programs and the retraining of workers within companies are increasing and more programs are becoming routinely necessary.

**Workplace Changes**

Older Japanese workers of today were recruited as new employees in the 1960s. They graduated from colleges or high schools and became the workers and salaried employees devoted to the kaisha, “the company,” throughout their careers. The kaisha offered security with lifetime employment and became the pivotal focus of their lives. With this system, the company takes care of its employees and both the employees and the company give total commitment to each other. Dedication is more than contractual; it is also emotional (Narushima, 1995).

Companies that follow the lifetime system provide their own training and career development programs. These programs are focused on contributions the employee makes to the company. The possibility that the worker would ever leave to work for another company is not considered. Following comprehensive on-the-job training, the company gives various assignments as needs arise or positions open. By following this plan, employees become trained in a variety of tasks and also become familiar with the company’s total organization.

Besides lifetime employment, other elements of the company’s responsibilities include seniority-based wage systems, promotions systems, and enterprise-based union structure. These benefits create an organization that has a dependable, programmed compensation plan; a step-by-step career advancement system; and total dependency of employees on “the company.” Long hours of work, lengthy commutes to and from work, and “after hours”
that 33.5 percent of retirees aged 50 or over had left before retirement age, and 9.3 percent had taken advantage
of retirement policies (Campbell, 1991). Therefore, a variety of retirement policies may apply.

Many companies. The teinen system refers to age limits that are set by an organization and is a method used mainly
to constrain employees. Because they continue on the payroll even though their job responsibilities have decreased, they are considered to be
redundant (Suzuki, 1996). Retirement or teinen, meaning "prescribed years," is a major issue in the workplace for
employees. "Shoulder tapping" (katatataki) to encourage employees to resign voluntarily. Occasional companies engage in "shoulder tapping" (katatataki) to encourage employees to resign voluntarily. Those who remain may be called "window gazers" (madogiwazoku) or "marginal employees" (genkai shath).

Middle-aged and older employees are finding that horizontal transferring from department to department may be impossible, and those in upward mobility or career advancement roles find securing managerial positions more difficult, if not impossible. Traditionally, companies created positions for those at a career plateau by corporate growth that created new positions (Suzuki, 1996). However, with the state of today's economy, companies are downsizing rather than expanding. In the 21st century, new company policies affect every part of the organization. Employability and employees' specific skills as they relate to company needs are now crucial factors for permanent employment or advancement.

Issues of Retirement

The aging working population of Japan has a direct impact on changes in the Japanese workforce. Because one in four workers in Japan is over 55 years of age, companies are experiencing: (1) higher average labor costs, (2) a lack of senior positions, (3) financial demands for severance pay for retirees when they retire, (4) financial demands for pension benefits after retirement, and (5) lack of employment opportunities for the older workers (Japan Insight, Graying, 1999).

Companies with subsidiaries often transfer older workers to these firms with the idea that the transferees will serve as a liaison between the company and the subsidiary. However, problems often pass to the subsidiary companies as the transferred employee waits for the formal retirement age (Japan Insight, New Ways to Work, 1999). These employees who come from the parent company are described by the subsidiary staff as "descending from heaven" (amakudari) and many times cause frustration if top positions are assumed by these older employees (Suzuki, 1996). On the other hand, many "parachuted" employees have positive experiences in the subsidiary company and often provide significant services for the subsidiary.

Many companies are making efforts to accommodate the older employees. Some older or retired employees are asked to remain as consultants or to assume training or mentoring positions. Others may be rehired, hired on a part-time basis, or designated as a non-regular staff member. Even though their wages and benefits decrease, many retirees find this to be a role they enjoy. At times, companies may assist employees by establishing private businesses, developing training programs for new employees with older employees or retirees serving as lecturers, or contracting with outplacement companies to assist in finding them other employment (Suzuki, 1996).

Many larger companies now encourage early retirement in order to prevent some of these problems. Occasionally companies engage in "shoulder tapping" (katatataki) to encourage employees to resign voluntarily. Those who remain may be called "window gazers" (madogiwazoku) or "marginal employees" (genkai shain). Because they continue on the payroll even though their job responsibilities have decreased, they are considered to be "redundant" (Suzuki, 1996). Retirement or teinen, meaning "prescribed years," is a major issue in the workplace for many companies. The teinen system refers to age limits that are set by an organization and is a method used mainly by larger companies. Small companies, farmers, and the self-employed may not have the same rules (Campbell & Campbell, 1991). Therefore, a variety of retirement policies may apply.

According to a survey conducted by the Ministry of Labor in 1996, twelve thousand employers reported that 33.5 percent of retirees aged 50 or over had left before retirement age, and 9.3 percent had taken advantage of
early-retirement packages. This was twice as many as had retired the previous year (Japan Information Network, Old Hands, 1999).

The establishment of a mandatory retirement age has been a political issue in Japan for years. In the 1970s, the mandatory retirement age of Japanese workers was 55 or younger. In 1980, approximately half of Japanese corporations had 55 as their mandatory retirement age and half had 60. During the 1980s, the older employees expressed the desire or the need to continue to work past age 60. In 1986, the government enacted the Law Concerning the Stabilization of Employment for the Elderly People in an effort to encourage companies to retrain or hire older workers and offered incentives if the mandatory retirement age was raised from 55 to 60. By 1991, 70 percent of the companies had raised their retirement age to 60 or over. Ninety-five percent of companies with over 5,000 employees had initiated the 60 or over policy, but only 67 percent of companies with 100 employees or less had adopted the 60 or over policy.

In 1994, more legislation was enacted and in April 1998, the mandatory retirement age in Japan became 60. This action also brought the retirement age closer to the age when pension payments would begin (Japan Insight, Graying, 1999). Eligibility for pensions will be raised from 60 up to 61 in fiscal 2001, and to 65 in fiscal 2013. Employees who leave work prior to that age will not receive income until they reach the specified age (Japan Information Network, 1997).

Although many older workers look forward to retirement, others regard the pension policy with concern and express a need to continue working. Personal financial requirements are the first and major concern of retirees, but others enjoy working and want to remain active and independent. Overall many retirees do continue to work in some capacity of employment or in “second-chance” careers. Many are seeking educational or training programs to prepare them for employment in a field that may be totally different from their previous jobs. With this expanding number of retirees, adult education programs will become increasingly popular and, more importantly, specifically needed to accommodate the rapidly expanding, older population of retirees.

Case Studies

The following case studies illustrate some of the retirement issues that Japanese workers currently face. They have experienced the post-World War II workplace changes and have varied backgrounds. Many of their experiences have influenced their approach to retirement.

Case Study 1: Lawyer and Company Executive

When Mr. A entered college, he chose law for a career. The main reason he decided to pursue a law degree was to study the actions of people. He found that by observing and interpreting people’s actions, he could formulate a psychological study of human nature. He finds the study of people from different cultures and their approach to living particularly challenging to understand. After graduating from Tokyo University with a degree in law, Mr. A became a traditional Japanese businessman who was employed by a company directly out of college and worked for one company throughout his career. Because of this traditional work pattern in the Japanese culture, he never thought about moving or changing jobs or joining another company. He was dedicated to the company throughout his total working career. The company provided him with security, stability, and lifetime employment.

As a participant in this lifelong career system, Mr. A proceeded through the standard steps of advancement and promotions within the company. Exhibiting managerial skills, he assumed a career track that led him into the executive level of the company. During this time period, his only education or on-the-job training came from co-workers or by observation and participation. There were no classes or formal educational programs.

One trait that Mr. A has always had is curiosity. This curiosity led him to ask questions and to want to know more about the total business operations. One specific area was international business. After working for his company for over twenty-five years, he decided to apply for an overseas position in the United States. After being selected for the position, he became a vice-president of the company’s corporate office in the United States.

When he first arrived in the United States, he felt he was in a classroom of cultural differences and surprisingly found his English to be much less proficient than he had thought. He began to adapt to the Western corporate environment, American’s traditions, business procedures, and cultural differences. After five years as the corporate vice-president, he and his family returned to Tokyo where he assumed his previous position in his company. Upon his return, he recalls he had cultural shock to Japanese workplace culture. Commuting schedules were different, work hours were different, business procedures were different, and dedicated company time was now more demanding. He had to totally readjust to the Japanese workplace cultural environment.
Because of his age, Mr. A changed job positions and was reassigned as a corporate manager to a subsidiary company of his parent company soon after his return. Again, Mr. A found new challenges and did not look upon this time in his life as a "downsizing" time. It was a leveling time; it was a time to look toward the future. Knowing that he would retire at the end of three years from the subsidiary company, he began to make retirement plans. He began an intensive training program to acquire computer skills and to learn about software applications. Mr. A knew that when he officially retired at 65, he would enter a new career. He wanted to work as an international consultant. To do this, he had to be current in all aspects of his profession as well as technology. His international experience offered him choices throughout the world. Currently, Mr. A is working in the United States as a consultant and hopes to remain active in the workplace for several more years.

Case Study 2: Company Manager

Growing up in a small rural village in northern Japan, Mr. B was interested in pursuing a career in business. Through the traditional steps of education, he graduated from college with a degree in economics. Following college graduation, he began the process of becoming an employee in a lifelong employment relationship. Mr. B joined a large Japanese trading company and began a career that involved business management. One of his job requirements involved international travel. When Mr. B was offered the opportunity to move to England to assume a managerial position, he eagerly accepted and felt that this step could lead to more professional advances within his company. At the end of his three-year assignment, he and his family returned to Japan and Mr. B assumed his previous position.

As prescribed by many Japanese workplace policies, he followed gradual advancement in managerial roles within his company. He had an office staff and did not need to use a computer or to learn computer skills. His on-the-job training was through learning the new skills necessary following promotions or advancements. He participated in only a few formal educational programs.

Mr. B will soon retire and expresses concern for many of the issues that he is facing in the near future. He does not want to accept a position in the Silver Society, a Japanese term for old-age status. Some of the issues he is facing involve what to do with his life, how to fill his days with activities that are of interest to him, and how to adjust to being at home fulltime. The last issue is of particular concern because his normal daily schedule has been leaving home early for work and getting home late. He feels that both he and his wife will have many adjustments to make and a need to become reacquainted.

Mr. B is not particularly interested in computers or in learning how to use them. He is interested in golf, but feels the cost is prohibitive in Japan. He does not have many friends in his home community and his work friends are either still working or live long distances away. Because of his work schedule, he has been limited in developing hobbies and presently finds reading to be the most relaxing and satisfactory way to spend his leisure time. He is not sure that participating in either educational or volunteer programs is what he wishes to do immediately upon retirement. Mr. B will retire in a year. His company has downsized his managerial role and he is presently performing in a mentoring capacity for younger employees.

Case Study 3: U.S. Military Employee

Ms. C, at the age of 69, looks forward to new challenges and exhibits a great curiosity for life. Born in Yokosuka, Japan, in 1930, she saw Yokosuka grow from a small naval port town to a suburban city of Tokyo. By 1941, Yokosuka Naval Base was well known throughout the world for shipbuilding, and by the beginning of World War II, this area was a major player for support as a military command center (Thompkins, 1981).

Early in Ms. C’s education, her family had other plans for her. Because of her "good brain," she was destined to pursue a formal education in the public schools of Yokosuka rather than follow the typical education of Japanese girls. Her education was influenced by many of the changes made to the school systems under American Occupation. One of the major changes made by the Occupation forces was the elevation in the status of women. Military authorities felt that since Japanese men were working to support their families, the Japanese women were better suited to assist in reconstruction efforts (Thompkins, 1981).

Because of this woman-oriented initiative, Ms. C had a career "door" of opportunity opened for her, an opportunity unheard of for women. She had been a diligent student and had chosen "hard" subjects instead of "soft" studies ("girl-stuff such as cooking") in her education programs. With a talent for languages, she was top in her English class. She was introduced by one of her teachers to an American personnel representative on Yokosuka Navy base. At the age of 20, she was temporarily employed by the base to work in the housing department. Later she was hired to be a negotiator-interpreter for American military staff and families who moved into the Yokosuka
area. Because of the lack of base housing, living quarters were often needed off base. Ms. C served as a “go-between” for the U.S. Navy housing office in Yokosuka and Japanese realtors or individuals willing to rent to Americans.

In her early years of employment, this was a difficult job and the position demanded much diplomacy for success because of suspicions between Americans and Japanese. However, through this job, she felt that she was able to learn many things. Although she never obtained a college degree, she was exposed to many learning and educational experiences. She relates, “I learned much knowledge in psychology, communication, and international relations.”

Ms. C was one of the few Japanese women at that time who worked in a professional position. She also is one of the few Japanese women who began her career as a young adult and continued working until 1988 when she retired at the age of 58, the mandatory retirement age at that time. Through these years, Ms. C saw many changes in the workplace; however, in her role most were American military changes, not Japanese policies. The military from 1950 to 1988 hired many Japanese nationalists and the workplace environment often was a mixture of cultures. Other changes were use of computers and an increase in the number of women in the workplace. During the discussion of her career, she expressed that the workplace was a part of her life that always required adaptation to change.

Case Study 4: International Executive

Mr. D has had a career transition similar to that of Mr. A and Mr. B. Within the Japanese traditional role of a businessman, Mr. D has followed the lifetime track of education, company employment, company promotions, and career advancement. His personal life has included a college degree, long work hours, little family time, and limited formal or on-the-job educational or training opportunities.

Two differences occur in Mr. D’s profile. First, his job required frequent travel and he was away from Japan for many weeks or months throughout his career. He is internationally astute, having been on short-term assignments or recurring travel to many different countries throughout the world. The second difference is that he retired two years ago but is in the “boomerang” position where he is continuing to work for his parent company as a consultant. This trend of rehiring former employees, particularly as consultants in managerial positions, is becoming more visible in Japan.

Mr. D enjoys his new position and, although his hours can still be long and some travel is necessary, the overall demands of his position have lessened and he is able to have more leisure time with his family. Through necessary job-related computer requirements, Mr. D is a novice in operating a computer. He does not discount that improving his computer skills may be an educational option he will pursue when he has to permanently retire next year. He feels that computer literacy is a necessity for everyone in today’s business world.

Conclusions and Recommendations

The changes in the Japanese workplace come with challenge. Today’s generation of older workers is facing workplace and lifestyle challenges that are different from any previous generation. This Silver Society of Japan, the 55 or older individuals, has worked hard to build the economy after World War II. They are postwar pioneers who have initiated new technology to meet the challenges of the 21st century.

The majority of this generation joined in a postwar exodus from rural surroundings to urban or suburban areas in the cities of Japan. This generation has adapted to Westernized innovations and technology and assisted in establishing Japan as one of the major industrial nations in the world. However, today’s workplace is changing. No longer can an employee depend on lifetime employment. The information age has arrived and computer skills are essential for job performance. Internationalism and the global economy have opened the workplace to all areas of the world. Workplace values, competitiveness, and new competencies are evolving.

Change has also occurred with the older and retiring employees. Many older workers are rejecting traditional retirement roles. They are healthy and active and want to pursue new career opportunities, to work part time, or to volunteer in community organizations. Most are more self-reliant than previous generations; they are more affluent and better educated; and they are ready to adapt to a more independent lifestyle.

Change and diversification are key factors in the values and lifestyles of this generation and are apparent in their attitudes. Culturally, many older adults hold fast to traditional concepts and feel that society is changing too fast. They are concerned that the old ways are being cast off too readily. They fear that respect for the elderly and for the wisdom that supposedly comes with age is diminishing among the younger generation. Many feel that
society now views older workers or retirees as post-productive individuals who create a potential burden to workplace and to society. With these observations, many express the belief that change is inevitable and that they need to become a participant in society rather than an observer.

Research Contribution

The goal of this research is to enhance and expand the knowledge of HRD by:
- Exploring new trends that are occurring and have developed in the Japanese workplace.
- Contributing to the understanding of changes occurring in the lives of the Japanese older worker.
- Highlighting the challenges and choices of future work for older adults in Japan.
- Generating further research questions on the roles and workplace options for older adults.

Conceptualizing Global Leadership From Multiple Perspectives: An Analysis of Behavioral Ratings

Allan H. Church
W. Warner Burke Associates Inc.

Multirater feedback data collected from 264 senior managers, 825 direct reports, 1,001 peers and 264 supervisors of a large global organization in the automotive industry were used to examine the underlying nature of global leadership behavior and self-other ratings agreement. Consistent with prior research, findings suggested the singular importance of having a systemic learning orientation. Other non-standard differences by rater type were evident. Implications of these results for understanding global leadership are discussed.

Keywords: Global Leadership, Managerial Behaviors, Multirater Feedback

The last decade of the twentieth century has seen a number of significant and highly influential changes in the worldwide business environment that have fundamentally altered the form and function of organizational existence. From email to e-commerce, from disk-based to distance-based learning, and from international trade to global economics, it would be hard to argue that we are aware of the full impact of these changes on the process of leading and managing on a day-to-day basis (Chandler, 1994; Galagan, 1990; Rhinesmith, 1996; Tichy & Sherman, 1993). Although there are a variety of interesting human resources related issues that might be explored in this regard, such as the role of the internet in recruitment processes (e.g., Stanton, 1999) or the effect of changing workforce demographics (e.g., Jackson, 1992), one area of particular importance and with specific relevance to the uniquely systemic perspective of HRD and OD practitioners (Burke, 1982; Katz & Kahn, 1978) is the impact of globalization on leadership in this new environment.

What is globalization? Rhinesmith (1996) defines globalization as follows: "To be global, a company not only must do business internationally but also must have a corporate culture and value system that allow it to move its resources anywhere in the world to achieve the greatest competitive advantage" (p. 5). Further, he states that in order to support such a value system, leaders and managers need to develop a broader, more systemic perspective that encompasses attention to such areas as cultural flexibility, systems thinking, change management, and continuous learning (Rhinesmith, 1993; 1996). Although not entirely new, these constructs do represent somewhat lesser explored areas for executive and management development efforts and are therefore probably worthy of further examination.

Of course, this type of systemic perspective is not merely a useful framework in its own right. In today’s global economy and marketplace, the process of inspiring and motivating employees to think systemically and across boundaries presents a real challenge, particularly when this takes attention away from the immediate aspects of one’s job. Nonetheless, some authors (e.g., Drucker, 1992; Hamel & Prahalad, 1994; Rhinesmith, 1996) have argued that having a global mindset may well be a necessity for the continued viability of an organization. If organizations cannot compete or manage in such an environment they will ultimately cease to exist.

But what do we know about leadership and management in these types of settings? Some interesting initial work has been done linking leadership style (i.e., transformation vs. transactional) to certain sets of global leadership practices among executives. More specifically, based on a sample of 391 executives headquartered in the United States, Church and Waclawski (1999a) found that global leadership consisted of four primary components or dimensions: systemic thinking, relationship management, managing change, and learning orientation. When compared with a standard measure of leadership style, it was evident that transformational leaders were seen as being significantly higher on each of the four global leadership dimensions than were those with a more transactional style. Their findings support a number of related theories and approaches regarding the importance of having both a systemic as well as a learning-based perspective when managing others (e.g., Burke & Litwin, 1992; Rhinesmith, 1996; Senge, 1990), not to mention the importance of the process (or people) skills that continue to be overlooked by many in research and practice.
Although an important early step, questions regarding the global applicability of such findings remain. For example, while systemic thinking and a learning orientation may well be applicable across different cultures and settings, a focus on building strong interpersonal relationships might be expressed and experienced (and therefore perhaps rated) differentially in different types of contexts. Similarly, the behaviors comprising the managing change factor in this prior study reflected such actions as being proactive, open to and accepting of changes, clearly communicating reasons for change and providing support to others, which do not appear to reflect management styles in other less individualistically oriented countries (Hofstede, 1980). More research is certainly needed, and with different types of samples in this area of study in order to improve our understanding of the fundamental and consistent facets of global leadership behavior and their impact on managerial performance.

The same argument, of course, can easily be made regarding the need for ratings research using non-U.S. based samples. While numerous published studies now exist that examine feedback from multiple sources (e.g., Church & Waclawski, 1999a; 1999b; Furnham, & Stringfield, 1998; Nowack, 1992; Mount et al., 1998), relatively few authors have focused on more diverse populations such as those from truly globalized firms. Thus, while we are quite familiar with self-other ratings trends (e.g., over-rating) and low levels of agreement among standard populations, these patterns have neither been confirmed nor disconfirmed with other types of populations.

The purpose of the following study is to address these needs in the literature by presenting an applied analysis and potential replication of the structure and relationships among behavioral ratings-based data collected from a set of senior leaders (and their direct reports, peers and supervisors) in a global organization headquartered in Japan. By relying on data from a truly global organization, it will be possible to advance the field of global leadership study by providing a comparison of leader behaviors with those from prior research samples. In addition, the nature of the self-other rating relationships will be explored relative to those exhibited in more traditional populations.

Method

The following study was based on data collected for 268 senior level managers from a large global organization in the automotive industry with its corporate headquarters in Tokyo. Representative of its global operations, these managers were stationed throughout the world including the following countries: Australia, Azerbaijan, Bangladesh, Belgium, Brazil, Canada, China, Colombia, Ecuador, Germany, Guatemala, India, Indonesia, Italy, Japan, Korea, New Zealand, Philippines, Poland, Portugal, Russia, Singapore, South Africa, Sweden, Syria, Taiwan, Thailand, United States, and Venezuela. Given the extreme diversity of location, however, no single country represented more than 5% of the total. Although the sample was comprised primarily of senior level managers (i.e., country heads) in this organization, due to the cultural sensitivity of the rating process in the present setting, no demographic questions were asked on the ratings form, thus these data (e.g., gender, age, tenure, etc,) were not available for possible moderator analyses.

In total, leadership ratings were collected from 264 focal managers (self-ratings), 825 direct reports (M = 3.33, SD = 1.55), 1001 peers (M = 3.78, SD = 1.52), and 264 supervisors. Since all focal managers were instructed to distribute 6 direct report and 6 peer forms each, these data represent response rates of 51.3% and 62.3%, respectively. These figures are somewhat low compared with prior studies of senior level populations (e.g., Church & Waclawski, 1999a; 1999b), which may reflect culture differences with respect to response tendencies (e.g., most report ratings research samples in the literature are typically heavily biased toward individuals located in the United States). Almost all participants and their supervisors, however, did respond to the assessment process (98.5% for both rater groups).

All behavioral ratings were collected in conjunction with a multirater feedback-based executive development initiative designed to enhance the leadership skills of those attending. A process frequently used by practitioners for a variety of developmental and appraisal purposes (e.g., Antonioni, 1996; Bracken, 1994; Church, 1995; Church & Waclawski, 1999b; McLean, 1996; Tornow, 1993; Van Velsor, Taylor Leslie, 1993), multirater feedback provides a number of opportunities for research as well. The results were delivered in the form of individual feedback reports in an offsite setting by experienced facilitators, which is common in these types of feedback-based efforts. Since the assessment process was intended to be developmental in nature, all instructions, instrumentation and follow-up procedures stressed the confidentiality of the process as well as the standard protections associated with reporting procedures (e.g., no data are provided unless 3 or more responses were received from direct reports and peers). This approach was taken in order to enhance the validity and utility of the data obtained (Bracken, 1994; Church & Waclawski, 1998; Harris, 1994; Ostroff, 1993).

The measure used in this analysis was a 27 item instrument designed to assess various elements of global leadership in the present organization. Although a few of the items were specifically created and/or modified for this
setting, the majority were chosen from a larger set of practices (and many from a related global leadership instrument) that have been used successful with other organizations and samples. The HR function of the organization and an external consulting firm were actively involved in the development of the instrument. All items were positively worded and rated on a 1 to 5 extent scale, where 1 = to a very small extent, 3 = to some extent, and 5 = to a very great extent. Averaged direct report and average peer ratings were used for all analyses since these represent a closer approximation to the true score for a given behavioral set (Nunnally, 1978). Overall, the internal consistency for the total instrument (i.e., for the summary scores) was strong, particularly since these were only 27 items in total, ranging from a low of .83 for self-assessments to a high of .96 for direct reports.

Although not a central component of this research, in order to compare data from this sample with other studies, self-direct report ratings congruence—an operationalization of the construct of managerial self-awareness (Church, 1997)—was also computed. This was done using two different methods: (a) the collective level of agreement between senior manager and average direct report ratings using a standard index of profile similarity d, (e.g., Church, 1997; Church & Waclawski, 1999a; 1999b; Nunnally, 1978; Tisak & Smith, 1994); and a four-group categorical agreement method (e.g., Church, 1998; Church & Waclawski, 1999a; Yammarino & Atwater, 1997) whereby participants are classified as under-raters, lower performing accurate-raters, higher performing accurate-raters, or over-raters based on a comparison of total scores.

Results & Discussion

First, analyses were conducted using total scores for all 27 items to explore basic ratings effects for this sample by perspective. Table 1 provides an overview of the descriptive statistics and correlations for the summary scores and self-direct report difference score. In general, these correlations were actually quite consistent with prior ratings research (e.g., Church, 1997; Church & Waclawski, 1999a; Harris & Schaubroeck, 1988; McLean, 1996) with low to moderate correlations among various rater groups. Thus, it would appear that typical ratings effects reported in other studies are consistent across the present global context as well.

Note: * p < .05, ** p < .01, reliabilities are printed on the diagonal

The only finding of particular note among the correlation matrix was the fact that self-direct report and self-peer relationships were generally higher (r = .26, p < .01 and r = .23, p < .01, respectively) than co-worker correlations (e.g., direct report-peer, direct report-supervisor, peer-supervisor). This is considerably inconsistent with prior research and meta-analytic findings (Harris & Schaubroeck, 1988) where other-other rating correlations are almost always higher than similar self-other values. While it is impossible to know for certain why this trend occurred, one strong possibility is the impact of cultural differences between samples—i.e., perhaps the managers in the present global organizational setting reflect a slightly more collectivist orientation (Hofstede, 1980) than those from prior research, most of whom were based primarily in the United States. If such were the case, however, one might expect the self-other correlations to be even stronger than those reported here, which were typically low overall. Nonetheless, there would appear to be a somewhat different pattern emerging here, particularly given the lack of significant relationship between direct report and supervisor ratings.

Another interesting difference inherent in the present dataset was the fact that these senior executives actually tended to rate themselves significantly lower than did their direct reports (t = 3.71, p < .001), reflecting the possible presence of a modesty bias of some sort. Although supervisor and peer ratings were also higher in value among the present sample than were self-assessments, these differences were not statistically significant. The former pattern, however, is again atypical among datasets based on samples of managers from the United States (e.g., Church, 1997; Church & Waclawski, 1999a; 1999b; Nowack, 1992; Van Velsor et al., 1993), the United Kingdom (e.g., Church,
1998), and even Australia (e.g., Carless, Mann & Wearing, 1998). In fact, the standard ratings pattern is almost always the opposite—i.e., self-ratings are the highest, followed by almost any group other than direct reports.

Finally, while the value of the profile similarity as calculated among the present sample was not particularly unusual (i.e., reflecting an adequate but not superior level of managerial self-awareness as compared with prior samples), it was interesting to note that self-direct report agreement was entirely unrelated to supervisor assessments. In other words, increased levels of self-direct report agreement (without attention to level) were not directly related to supervisor assessments.

Next, in order to examine the underlying structure of the global leadership behaviors assessed and to be able to compare it at the construct level with prior theory and research, a Principal Components factor analysis was conducted using the averaged direct report ratings. This source was used because presumably the direct report perspective more than any other would most accurately reflect leadership style as opposed to those directed more at political (e.g., supervisors) or competitive (e.g., peers) ends. Three factors emerged from this analysis, which accounted for 60.2% of the total variance. Table 2 provides a description of each of these factors.

Table 2. Summary of Global Leadership Factors

<td>7</td>
<td>5.3</td>
</tr>
</tbody>
</table>

Interestingly enough, the factor reflecting a systemic learning orientation (with managerial behaviors focusing on marketplace analysis, utilizing best practices, identifying skill sets, and improving teamwork and integration) accounted for the overwhelming majority of variability explained across all direct report ratings (45.9%) despite taking less than half the total number of items on the instrument. The prominence of such high level systemic issues and concerns among these senior managers is consistent with prior research on global leadership using more typical samples based (Church & Waclawski, 1999a). However, it is important to note that the systemic thinking and learning orientation dimensions, which were distinct in the U.S. sample, factored together as a single construct here.

The second factor to emerge from the PC analysis was comprised of behaviors reflecting an attention to cross-cultural differences among various individuals. Although somewhat different in orientation than the more general relationship management component identified in other samples (Church & Waclawski, 1999a), it does make sense that acomen in this area would be important when working with various types of interdisciplinary and culturally diverse teams. Of course, given the somewhat varying item content between the two studies, the differential nature of this factor may simply be a more global reflection of the need for relationship management skills in more traditional leadership and management contexts. In other words, being effective at interpersonal relationships in a global setting probably translates to being aware of cultural differences and how these manifest in work and team settings.

Finally, while the third and final factor--problem solving--identified here is not an exact match with prior research, the behavioral emphases on being proactive and improvement orientated do correspond, at least to some
extent, to behavioral content of the managing change, and portions of the learning orientation dimensions (e.g., solutions and risk) from the U.S.-based research. Thus, although not identical in structure, these components are at least moderately consistent with prior factors and theoretical elements of globalization discussed elsewhere (Church & Waclawski, 1999a; Rhinesmith, 1993; 1996). In sum, there would appear to be some significant consistency across the different types of samples regarding the need for a more systemic thinking and learning perspective among global leaders. There was also some degree of overlap regarding the importance of relationships skills and being proactive with respective to problem solving situations.

Although the similarity in findings regarding the underlying nature of global leadership is important in general, the emergence of a primary factor regarding systemic learning across studies should be particularly encouraging for two reasons. First, from a research and practice perspective, this consistency would suggest that efforts directed at enhancing systemic learning skills for future global leaders should be of significant value almost regardless of context. Second, while OD and HRD theory has long been grounded in an open systems perspective (e.g., Burke & Litwin, 1992; Katz & Kahn, 1978; Rummelr & Brache, 1990), research that supports this contention at the individual behavioral level should be helpful for future practice as well. All too often, for example, consultants and practitioners are faced with client mindsets from leaders, managers and even internal HR personnel that are far too micro in focus. By demonstrating that one of the key leadership skills for the future is in fact a systemic mindset, new opportunities for organization development and improvement may be opened.

Next, in order to explore differences in the three leadership factors by rater type, subscales were created for each of the four perspectives (self, direct report, peer and supervisor) for additional analysis purposes. ANOVA results for subscale scores by rater type revealed significant effects, however, for the systemic learning factor only $F (3, 1037) = 8.12, p < .001$. Once again, lower than usual self-ratings were responsible for the majority of significant effects, although Scheffe comparisons also indicated that direct report ratings were significantly higher than others' ratings. Moreover, based on the pattern of means (see Figure 1), it would appear that ratings on the systematic learning dimension were responsible for the more general findings observed at the summary score level, given the lack of differences by type on the other two dimensions.

**Figure 1. Subscale Means by Rater Type**

![Subscale Means by Rater Type](image-url)
Although this finding should not be particularly surprising given that the systematic learning dimension did account for the majority of the variance explained in (direct report) ratings, it was interesting nonetheless to see this aspect of global leadership driving the results. Moreover, post-hoc comparisons indicated that mean scores on this dimension were significantly lower, compared with ratings on the other dimensions across all four rater types.

The final set of analysis regarding the level of managerial self-awareness was conducted using the four category method of agreement (Church & Waclawski, 1999a; Yammarino & Atwater, 1997) and was relatively straightforward in nature. Based on a comparison of self and direct report mean scores and variability, senior managers were identified as belonging to one of four groups—i.e., under-raters, accurate lower performing raters, accurate higher performing raters, and over-raters—which were then used for additional analyses. Simple ANOVA results of mean ratings and profile similarity scores and average item differences (added solely for interpretation purposes) indicated typical significant results by groups (see Table 3).

Significant Scheffe Group Comparisons

For example, while self and direct report ratings differed significantly by group (as would be expected given the computations involved), peer and supervisor ratings did not yield significant effects in this regard. Thus, as with the regression results involving the profile similarity index, self-direct report levels of agreement (or disagreement) had little relationship among the present sample to assessments given by peers or supervisors.

The only other finding worthy of note here is in the comparison of the present values of the profile similarity index with those from prior studies. More specifically, while prior research using the three and four group methods often reveal over-raters to have the largest levels of item discrepancy and under-raters to demonstrate very similar (and sometimes not significantly different) levels of self-awareness when compared with the accurate-rater groups, the present actually data show the opposite pattern. For these senior managers, the under-raters represented the most significantly different, and therefore least self-aware group, while over-raters were much closer to the accurate individuals. Moreover, the self-ratings for the under-rating group were particularly low relative to what might be found in other studies. Thus, these differences might suggest that the population studied may indeed be somewhat different in the level of self-perception and assessment behavior.

Summary & Limitations

The purpose of this study was to explore and potentially replicate the nature of the relationship of global leadership ratings from multiple sources, using a more culturally diverse and global sample of senior managers than has been seen in prior research of this nature. In general, the results discussed above would suggest that the nature of global leadership is relatively stable across different organizational samples and settings. While the factors varied to some extent in the present study, there was considerable consistency regarding the importance of the underlying structure of the systemic learning component. Moreover, relationship skills (particularly one's relating to working with individuals and teams from other cultures) and taking a proactive rather than reactive stance appear to be key aspects of global leadership as well. Clearly, in terms of implications for HRD and OD, it is useful to note that all three of these areas are quite familiar to practitioners and well suited for future initiatives and development efforts directed at global leadership. Finally, while there were some interesting differences in the present sample with respect to behavioral rating trends (e.g., lower than normal self-assessments, higher than average self-other correlations), none of these were so unusual as to suggest truly unique interpretations. In sum, the results of this study point to the existence of more similarities than differences in leadership across the global business environment examined here.
The following research does have several limitations, however, which should be noted. First, senior managers from only one organization was studied. Moreover, due to confidentiality concerns among the individuals responsible for the feedback process, very little demographic information (beyond location) on these individuals was available, making moderator and grouping analyses impossible. Although by and large demographic variables such as gender, age, and tenure do not typically yield major moderating effects (e.g., Church & Waclawski, 1999b), it is still useful to have these available for analysis and comparative purposes. Further research using other samples is required to determine whether or not the issues discussed here will apply equally well to global leadership in other firms, industries, and contexts.

A second limitation of this study concerns the sample itself. Participation in the assessment process was tied to attendance in a feedback-based development program. Aside from the inherent difference in the nature of ratings obtained for development vs. appraisal purposes (e.g., Antonioni, 1996; Bracken, 1994; Church & Waclawski, 1998; McLean, 1997), this situation may also have implications for generalizability for other samples with respect to potentially greater levels of feedback seeking interest and motivation to change on the part of some individuals. Although participants were selected for participation by senior leadership and the vast majority of senior managers in this corporation were involved in the process, there may still be some biases present.

The third major limitation concerns the nature of the instrumentation used. Although based on prior theory and research on global leadership (Rhinesmith, 1993; 1996) and tested with other samples (Church & Waclawski, 1999a), it is always important to remember that the content of the measurement tool itself defines the nature of any results obtained. Thus, a different set of items pertaining to a competing conceptualization of global leadership, for example, might have produced divergent results. Perhaps some other unmeasured concept, such as the ability to motivate and inspire others, for example, is even more significant for global leadership than having a systemic learning orientation. Similarly, questions reflecting some other construct or skill set entirely would most certainly yield a different factor pattern, though the trends among rater types observed here might well be similar. As with most research efforts, further work is required before conclusions of any sort can truly be offered.

Comparing Managerial Careers, Management Development and Management Education in the UK with the US: Some Theoretical and Practical Implications

Graeme Martin
University of Abertay Dundee

Mark Butler
San Diego State University

This paper explores some of the issues surrounding changing patterns of managerial careers, management development and management education in the UK and the US. It addresses three lines of questioning: the new rhetoric of careers in the new economy, the evidence on changing organizational forms and the implications for careers and management development and education, and the future of management education and the role of business schools. The contribution of this paper is a “think piece” and it acts as a backdrop for a comparative study of management development in Scotland and California currently being undertaken by the authors.

Keywords: Management, Careers, Education

The poor state of management development in the UK was recognized as a major contributory factor in the lack of progress of the UK economy during the 1980s (Constable McCormick, 1987; Mangham & Silver, 1986), especially in comparison to major international competitors which included the US (Handy, 1987). Although there are signs that progress has been made in terms of the quantity and quality of management development and education in the UK (Thomson, Mabey, Storey, Gray & Iles, forthcoming), there is little systematic evidence of how the UK is currently doing in comparison to major economies, especially evidence that is up-to-date and reflects on past and current practice. For example, the most recent and as yet unpublished work in the UK (Thomson, Mabey, Storey, Gray & Iles, forthcoming), whilst otherwise excellent, does little more in its introductory chapters than provide a brief summary of the characteristics of different national systems and provides little or no empirical evidence or pointers from which the UK could learn. It is against this background that we wish to explore some of the more recent issues that impact on management development and education in the UK and US so that we can ask more relevant questions during our forthcoming empirical investigation.

Thus, in this paper, which provides the background to work-in-progress on a comparison of management development in Scotland and California1, we address three, related lines of questioning:

1. What do the experts say about changing patterns of managerial careers and management development in the US and UK?
2. Is there any substantive evidence of changes in organizational forms that would support the rhetoric on changes in managerial careers and management development in both countries?
3. If, so what are the implications for management educators and developers and the business schools?

What’s New? Changing Patterns of Managerial Careers

Our review of the mainly-US literature on careers has pointed to major changes in rhetoric, in which researchers have pointed to new “boundaryless”, “protean” and “cellular” patterns career patterns and orientations (Allred, Miles & Snow, 1996; Arthur, Inkson & Pringle, 1999; Hall & Moss, 1998) accompanying major organizational changes, most notably the end of internal labour markets and the “old deal” (Cappelli, 1997, 1998).

There is not the space to review the new deal literature in full (for an outline and critique see Dunford, 1999; Herriot, Hirsh and Reilly, 1998; Roehling, Cavanaugh, Moynihan & Boswell, 1999). However, a

significant line of the argument is that market and organizational changes have occurred during the 1980s and 1990s in the US and the UK (see Gallie, White, Chen & Tomlinson, 1998) but organizational career philosophy has yet to catch up in all but those most “enlightened” organizations which are attuned to current and future trends (Arthur & Rousseau, 1996; Rousseau & Arthur, 1999). In its more extreme form, this is sometimes referred to as the “end of career thesis” or “boundaryless career”; in a less apocalyptic version it is the essentially normative argument concerning the new transactional contract or new deal of employability currently being offered by some employers. For example, the UK researchers, Adamson, Doherty & Viney (1998), have recently argued that “Most organizations are now talking of opportunities for advancement and/or progression but of opportunities to improve marketability and employability (their emphasis)” (p. 255). They outlined key changes in career philosophy that were predicated on the break-down in long-term employer-employee relationships and future time orientation of careers. Thus, they foresaw that career progression was no longer likely to involve upward hierarchical movement in the one organization but is more likely to involve lateral development. They argued that, given the current economic and competitive climate, “from both the organizational and individual perspective, in is no longer so apparent how a logical, ordered and sequential career might evolve” (p.255). Thus, as can be seen, the metaphors underlying much of this line of argument is of balancing “agency” (individual and organizational freedom of choice) with “community” (social relations) (Rousseau & Arthur, 1999) and of “career lattices” (Thomson, Mabey, Storey, Gray & Iles, forthcoming) or “jungle gyms” (Gunz, Jalland & Evans, 1998) in which individuals scramble over “upwards, sideways, downwards, diagonal, or in any direction that the jungle gym allows” (p. 22).

Echoing Handy’s (1989) comment that lifetime employment represents “bad economics and bad morals”, much the same argument has been put forward by Cappelli (1997; 1998) in the US, who has argued that the “old deal” and the recent attempts by some well known US firms to recapture its features was in complete denial of the current market situation in the “post re-engineering era”. This strategy, at least according to Cappelli, was unlikely to succeed and may even result in companies, particularly those which operate in knowledge-based industries, losing out in competitive labour markets.

A common theme in these works is of managers requirements to display “career resilience” and to participate in the management of their careers by taking greater responsibility for their learning to make themselves more employable (Thomson et al., forthcoming; Waterman, Waterman & Collard, 1994). For example, Hall and Moss (1998) have argued that the myth of old style organizational career contracts in the US is dead (and, in effect only applied to about 5% of the workforce). Instead, they offer the concept of the “protean career” (see figure 2) in which:

“...the person, not the organization, is managing. It consists of all of the person’s varied experiences in education, training, working in several organizations, changes in occupational field, etc. The protean person’s own personal career choices and the search for self-fulfilment are the unifying or integrating elements in his or her life. The criterion of success is internal (psychological success) not external” (p. 25).

So Much for the Rhetoric: What about the Facts?

Thus, as we can see, the rhetoric implicates organizations in some radical and substantive adoptions to the New Economy, which, in turn, have impacted on managerial careers and management development in particular ways. In the context of this comparative study, however, at least two questions need to be addressed. First, are there likely to be some substantial and lasting differences between the US and other countries such as the UK in their responses to environmental changes? On this point, as Lewin (1999, August) made clear, it is no longer good enough for researchers and managers to continue to believe that US organizations act as a model for the rest of the world: that may have been the case in the 1950s when the US accounted for 75% of global economic activity but is certainly not the case when the US accounts for less than 17%. Second, how widespread and substantive are these in the US and the UK?

2 Although Herriot et al. (1998) have pointed to various forms of new deals, Roehling et al., (1999) have undertaken content analysis of the academic and practitioner literature to show that there is agreement, at least at a general level, on what constitutes the “new deal”.
The career is managed by the person, not the organization.

The career is a lifelong series of experiences, skills, learnings, transitions and identity changes (career age not chronological age counts)

Development is:
- continuous
- self directed
- relational, and
- found in work challenges
but is not necessarily
- formal training, retraining or upward mobility

The ingredients for success change from:
- know how to learn how
- job security to employability
- organizational career to protean careers, and
- from “work self” to “whole self”

The organization provides:
- challenging assignments,
- developmental relations, information and other development resources

The goal is psychological success

In attempting to answer both questions together, there are some indications of differences between the two countries from research into their respective career literatures. For example, Hall & Moss (1998) have raised doubts as to whether the US was ever characterised by an old deal. These authors have suggested that no more than 5% of US firms were responsible for the traditional picture of careers, thus implying that researchers, in setting up a dualism, have created something of a “straw man”. In the UK, researchers have been more sceptical of “breaks with the past”. For example, Guest & Conway (1998) have pointed to a much greater sense of stability in careers. On this issue, recent large-scale survey evidence (Gallie, White, Chen & Tomlinson, 1998) highlighted some paradoxical findings that have relevance to our discussion. On the one hand there was clear evidence that (a) employers had been investing more in training and development over the last five years, (b) that employees perceived that their jobs required more skills and (c) that they have received more training than five years ago. This finding was particularly connected to the widespread adoption of new technologies (p.292). On the other hand, one of the most notable of their findings was that employees were less likely to believe that their future careers lay in their current organizations, especially given the evidence of de-layering and lack of career promotional prospects in their organizations.

By far the most convincing evidence, however, comes from impressive research by Andrew Pettigrew and colleagues on a world-wide study of corporate re-structuring and new forms of organizing (for some early indications see Ruigrok, Pettigrew, Peck & Whittington, 1999). This work does not provide a much support for the “end of organization” and “end of traditional career” assumptions underpinning the new career literature. At recent conferences, Pettigrew (1999, August; Pettigrew & Whittington, 1999; September, 1999) presented the early results of a large-scale, longitudinal project involving international collaborators from Europe, the US and Japan. The aims of the research were to (a) map the extent of changes in new organizational forms in Europe, Japan and the US with surveys of large scale and middle sized employers, (b) assess the effects on performance of these change, and (c) examine the processes involved in changing from one form to another. They defined changes in organizational forms to mean changing structures (e.g. de-centralizing, de-layering, project organizations), changing processes (vertical and horizontal communications, investment in IT and investment in novel forms of human resources) and changing boundaries (down-scoping or de-diversification, outsourcing and development of strategic alliances). Among the key questions which they addressed were (a) to what extent was there convergence in Europe and between Europe and the US, (b) were there any contingencies such as country effects or knowledge intensity of firms or industries, and (c) were changes supplementary to existing

---

4 The US results have yet to be analyzed.
organizational forms or were they supplanting traditional organizational forms, as implied by the more apocalyptic tone of the literature discussed in the previous section of this paper?

The early findings on country effects suggested that there was indeed a common direction of change but from different starting points and that there were variations in the pace and depth of changes in different kinds of firms. In Europe, flatter, decentralized more fluid forms were emerging but the directions and movement varied. There was a large growth in project forms of organizing between 1992-96 and evidence of process changes in terms of investment in horizontal linkages. These changes, however, had to be seen in a context of equally large changes in vertical linkages. Thus they found evidence of a number of dualities, including simultaneous investment in building networks and hierarchies but no real evidence of destroying hierarchy (largely because of the importance of performance cultures). To make these more complicated but flatter structures work more effectively, there was evidence of large-scale investment in IT. There were also widespread changes in boundaries with outsourcing particularly prevalent. The trends on de-diversification, however, were much more complex, with little evidence of net de-diversification and a movement into the middle (e.g. conglomerates divesting themselves of some peripheral businesses whilst single product firms were diversifying). Thus, the general picture in Europe was of widespread but not revolutionary changes in which firms, as you would expect, were supplementing rather than supplanting their existing structures. Interestingly, these researchers also found that change in Japanese organizational forms was much slower and less widespread than in Europe, a feature explained by the relative success of Japanese companies during the 1980s and early 1990s.

Pettigrew and his colleagues analysis of these results has produced some interesting conclusions and some important lines of future enquiry for management development and education First there are some important country differences, a finding that is borne out by some early work by Lewin and his colleagues (1999, August). Second, internationalization seemed to be positively related to decentralization and the formation of strategic alliances, whilst the use of project organization, downscoping and strategic decentralization was related to knowledge intensity. Finally, high performance organizations were found to be those that innovated in the three areas of structure, processes and boundaries in a complementary fashion whilst negative performance was found to have been associated with small-scale innovation in only one area (Pettigrew & Whittington, 1999, September).

The conclusion that changes in organizational forms in Europe had been supplementary rather than transformative is echoed by what is probably the best and most recent large-scale survey evidence on trends in managerial careers and management development in the UK by a team of Open University researchers (Thomson, Mabey, Storey, Gray & Iles, forthcoming). Their data, which is based on a survey of AMBA graduates and a survey of more than 500 companies, addresses many of the issues that have been referred to above. Their main conclusions point to a marked degree of variation among companies in their adoption career planning for managers, existence of policies on management development such as succession planning and fast tracking etc. However, there was no strong evidence that companies had abandoned internal labour market policies and their responsibility for developing managers. Nor, from the survey of Association of MBA graduates, was there a widespread feeling that these managers had taken on board the complete responsibility for the own development, although there was some evidence of the emergence of protean and cellular careers. Instead, these researchers have characterised the position in many UK companies as resembling a partnership model, in which both parties accept responsibility for management development.

So What? What are the Implications for Management Development and Education

In line with this less apocalyptic evidence of changes in Europe and, one suspects, the US if we leave aside the arguably, over-hyped knowledge-based sectors of Southern California, Boston and North Carolina, it appears that changes in organizational forms and accompanying career structures are emerging, albeit more slowly and less obviously than the new rhetoric on careers would suggest. Moreover, these changes are broadly in line with a greater degree of (and need for) career resilience and self-development among managers. Thus, while accepting that some companies do take on a degree of responsibility for managing careers, Thomson et al (forthcoming) concluded that, for UK managers, “the psychological climate has changed (and) that managers are losing their sense of their companies as being the career anchors to which they attach expectations of on-going support”.

The emergence of protean career orientations, networking and cellular career structures have significant implications for management development, management educators and for those interested in
learning transfer. For example, as Allred, Miles and Snow (1996) have pointed out, the competencies required for the future will be different from those in traditional organizations and will involve:

- Knowledge-based technical specialities, involving managing oneself as well as managing others and greater computer literacy,
- Cross-functional and international competencies,
- Collaborative leadership competencies,
- Self-management skills, and
- Personal competencies such as flexibility, integrity and trustworthiness.

Moreover, as Rousseau and Arthur (1999) have argued, firms will need to pursue agency strategies (respect for individual interest and choice) as well as community (mutual support and collective adaption) strategies. These might include offering (a) choices to individuals in designing their employment terms, jobs and career patterns to give them more discretion, and (b) designing employment terms and career opportunities that maximise employees’ external, as well as internal, visibility. In doing so, they enhance individuals’ employability and thus may well become employers of choice (Cappelli, 1998).

What of the Future?

On both sides of the Atlantic there have been serious reflections on the future of management education and the role of university business schools in providing support to managers, particularly if they remain committed to a Mode 1 style of learning, e.g. a focus on knowledge produced by scientists for scientists, university-focused, discipline-based and validated by peer review (Gibbons, et.al., 1994). For example, Huff (1999) at an address to the British Academy of Management and Argyris (1999) have queried the ability of UK and US schools to meet the challenge of the new Mode 2 learning, which is characterised by “knowledge for application”, is transdisciplinary, group-based, is validated-in-use and is time critical. In a similar vein, at a recent Academy of Management symposium on the future of management education (Weick, Mintzberg & Senge, 1999, August), Karl Weick made the following points that management educators may find worth reflecting on. His argument was that if we accept some of the previously-discussed rhetoric and assumptions made about the changed nature of organizations and management in the 21st century, managers will require a different set of competencies and a very different response from business schools.

Assumptions about management in the 21st Century (Weick, 1999)

- Managers will approach the limits of their capacity to take on new information created by changing conditions and will suffer from overload. They will need to be roughly right and fast.
- Faster change produces weaker situation, thus values and individuals will become more important.
- Information processing is going to produce increased ambivalence. Paradoxically, more information is going to mean that people are less able to act.
- Signals of disaster are going to occur more quickly but they will be weaker and more ambiguous.
- Macro-organizational assumptions and corporate values may decline in their appeal. Although there will be larger alliances, there will also be more emphasis on gifted individuals, protean and boundaryless careers, entrepreneurs, etc.

These assumptions, as Weick argued, imply that management will be more about perception and exception; less about long-term vision and strategies because of the rapid pace of change and more about situational awareness, e.g. projects, and managing in particular contexts. Broadly in line with Allred, Snow and Miles’ (1996) speculations on the future of managerial careers, Weick offered a series of modules and issues that managers might find useful to learn about in the future. Interestingly, few of these modules and issues form part of the curriculum of most UK and US business schools.

Manager Education for the Future

1. The dynamics of trust to enable more effective collaboration in larger strategic alliances
2. Collective enquiry and situational awareness to improve early diagnosis of increasingly weak signals of change
3. The craft of practitioner research to deal with the needs of knowledge creation and learning to learn
4. The limits of human functioning, so that people can identify the cues of breakdown through stress, etc.
5. Speaking up to power so that bad news can travel fast and in an upwards direction
6. The skills of disengagement, so that people can get in and out of projects fast
7. Updating skills to help people seek and deal with disconfirming information
8. Listening skills

Interestingly, both Weick's (1999, August) and Huff's (1999, September) advice to the business schools appears to be: “do not to attempt to compete on Mode 2 territory”. Huff believes that university business schools do not have the resources to match the large consulting firms or corporate universities that are and will continue to dominate Mode 2 knowledge creation and learning in the future. Instead, as Weick argued, business schools should help managers deal with the increasingly unknowable world by preparing them to see how vested interests work, the universality of vested interests and power in organizations, and to speak up and, if the need arises, to act out alternative interests. As situations weaken and the world of business and organizations becomes more idiosyncratic and pluralistic, the number of “real worlds” will increase: thus business schools would better serve their students by teaching “wisdom rather than vocation, mindfulness rather than rationality and character rather than technicalities” (Weick, 199, August).

Finally, we have to ask the questions: how should management education be carried out and who should be the recipients of this education? The data and arguments so far imply more learning of “softer skills” and “learning in context”. Unfortunately, we believe that the record of most US business schools, and a considerable number of the more traditional UK schools are weak on soft skills, whilst the evidence on learning transfer from “schooling” to the workplace does not provide encouraging reading for educators (Lave & Wenger, 1991; Fox, 1997).

On this first point — the record of business schools — Locke (1996) and others (e.g. Raelin, 1994) have argued that US graduate schools of management have been lacking in their contribution to the US economy and the practice of management in general. For example, Robert Kaplan (1992, quoted in Locke) claimed that American schools had contributed almost nothing to significant developments in the business world during the past half century, whilst Robert Samuelson (1990, quoted in Locke) condemned them for teaching “pseudo skills” such as strategic management, instead of providing students with on-the-job experience. Moreover, As Locke (1996) commented:

*Their professors are chastised for building elegant, abstract models and their graduates condemned for being critters with lop-sided brains, icy hearts and shrunken souls.*

On the second point — the transfer of learning — we have to acknowledge the importance of informal learning at work, the role of communities of practice in facilitating learning in management (Sealy-Brown & Duguid, 1994) and the negative consequences of teaching management out of context (Fox, 1994). Whilst the calls for managers to become involved in lifelong learning implies more learning in the classroom, perhaps, as Woodall & Welchman (1998) have pointed out, we need to place much greater emphasis on how we can assist firms in taking work-based management development more seriously and, at the same time, learn to integrate our educational efforts into action learning projects, job rotation, internal consultancy and mentoring schemes. In this connection, one of the most interesting examples is Roth’s (1999) learning history approach that combines traditional research skills with situated learning.

Mintzberg (1999, August) recently addressed these issues in a typically robust and iconoclastic fashion. His presentation was directed at the questions of: who gets into the classroom and what should they do when they get there? In a presentation directed mainly at the US business schools, one of his major conclusions were that US MBA programs were directed at the “wrong people” (full time students with no real experience of management); using the “wrong ways” (too much emphasis on prescriptive cases and disconnected theory instead of learning in context) and for the “wrong reasons” (by creating a genuine business class that believed they had the right to lead because of credentials earned in the classroom). Thus, whereas, US schools produced 100,000 students per year, most were full-time, in contrast to the UK which, although educating far fewer, focused on part-time, executive managers. Among his main pointers for the future of MBA programs were:

- Programs should be aimed at training practising managers. Thus part-time students who were company sponsored should be the focus of management education, as distinct from technical education which should be the subject of specialist masters degrees,
- Teaching methods should focus on action learning and reflective learning, in which tutors literally “drop in” learning material to managers to fit with their agenda. These student managers could then make what use they like of it and learn from each other. The corollary of this action learning and reflective learning would be to de-emphasize “lectures and have you any questions” approaches and prescriptive case study pedagogy, during which inexperienced students were expected to pronounce on situations where they had no previous experience.
• Program should dispense with “silo” design, in which participants coming from functional backgrounds were immediately put back into their silos, instead of focusing on the management of integrated business problems,

• Programs should be international and collaborative to reflect the world of business.

His model for MBA programs for the future, as distinct from the kind of specialist masters degrees that are common in Europe, was the Masters in Practising Management (MPM) program run collaboratively with McGill (Canada), Lancaster (UK), INSEAD (France), the Indian Institute of Management, and a number of Japanese universities. Interestingly, this is a model that is become increasingly widespread in the UK and mainland Europe (including a more modest one operated by one of the authors).

Conclusions

In this paper, we have attempted to summarise some of the literature and evidence on changing managerial careers, management development and education in the UK and the US. Although we find that the mainly Us rhetoric is outstripping reality - especially in the UK and Europe - there is robust evidence of substantive changes in organizational forms and in career patterns. Boundarylessness, career-resilience and protean contracts are likely to become more prevalent and will have significant implications for management development and education. The most important of these implications is that there is likely to be increasing demands on employers and business schools to provide management development and management education. However, it is likely that such development and education will need to emphasize general transferable knowledge and skills to meet individual and employer demands for employability. Increasingly, in knowledge-based economies, “knowing how” rather than “knowing what” will be demanded by both parties to the employment relationship. And in line with Weick (1999, August) and Mintzberg’s (1999, August) arguments on the future of management education, business schools should concern themselves with teaching “wisdom”, “mindfulness” and “character” rather than compete on vocation and technicalities with the increasingly powerful corporate sector. As Mintzberg in particular has argued, however, the US schools may have something to learn from the increasingly international schools in Europe in providing more relevant wisdom and greater insights from more “real worlds” in the global arena. In turn, European schools have much to learn from the professionalism of the US schools in delivering a brand of business education that is still envied by much of the rest of the world.

The Impact of Facilitative Leadership: Multi-rater Measurement of Behavioral Outcomes of Managerial Leaders

Valerie L. Weisman
PricewaterhouseCoopers
George Washington University

The outcome of this study reveals that perceived facilitative behaviors are critical in best practices of leaders. These findings link performance outcomes of leaders and members and demonstrate the importance of multi-rater feedback measures. The facilitative managerial-leadership model is very effective in harnessing resources and human capital to meet business challenge. This reinforces the need for evolving and revolutionary managerial-leadership practices to keep pace with the changing demands of the marketplace.

Keywords: Leadership, Management, Organizational Change

Everyday, we awake to front page and business section stories about the changes that come with the globalization of markets, collaborative work structures, and the drive for e-speed and innovation. W. Burke speaks about significant shifts in organizational dynamics from "moderate to warp speed" from "micro to macro" and from "management to leadership" (Burke, 1994). As we sip our morning coffee, we may not always think about how these changes create an ever-increasing demand for savvy managerial-leadership skills and competencies. But as we move from home to office, we understand that this demand and need have never been greater, or more complex. We witness and are apart of the drama of how the compression of organizational hierarchies are creating more responsive "networked" organizations that are more fluid in structure, processes and politics. These revolutionary organizational and cultural changes underscore new business realities with new definitions for leadership.

"Leadership is not so much the exercise of power itself as the empowerment of others" (Bennis and Nanus, 1997). We've heard that e-word before it was ever associated with email or e-speed. The difference today is that empowerment is no longer a "nice-to-have" trite concept, but the cornerstone of how to grow business by helping employees and customers become enterprise "owners" and partners. The top ten of The 100 Best Companies to Work For (Fortune, January 2000) are noteworthy because of their financial success, but because they also use the power of empowerment to draw and retain talent in a competitive labor pool market. Southwest Airlines, Cisco Systems, Synovus Financial listen to employee input and make changes accordingly, realizing that "what differentiates top companies from their competitors is often the quality of their highly skilled workers." (Levering & Moskowitz, 2000). The savvy CEOs at these companies "understand that having a special relationship with employees is key to their success." (Ibid.)

In fact, "best practice organizations always assess the impact of their leadership development process." (Fulmer & Wagner, 1999). Smart organizations such as General Electric, Hewlett Packard, and Johnson & Johnson realize that the development of leadership becomes a competitive strategy to keep their companies alive and thriving in the midst of change. The need to explore a broader range of leadership styles suited for these "empowered," collaborative environments becomes apparent (Bass & Avolio, 1997).

The Impact of Leaders: Bad News and Good

Unfortunately, the literature reveals a high failure rate for leaders. Some researchers indicate that between 60 and 75% of leaders fail (Hogan, Raskin, & Fazzini, 1990). This may be a modest estimate. What are the implications of such widespread failure? There is little doubt that replacing leaders is expensive in terms of money and in terms of the impact on others. The stress to employees and the financial impact to organizations are high. It has been estimated that replacing failed leaders can cost organizations hundreds of thousands, or even millions of dollars (Kaplan, 1991). Within the management, behavioral sciences and human resources disciplines, there is a need to
better understand the complexities of managerial-leadership as a means of enhancing organizational performance and effectiveness.

While leadership is multidimensional and often difficult to operationalize, research has shown that leaders derail because they fail to build successful relations with others (Kram, 1997; Van Velsor, 1997, 1998). Leadership, which is a social phenomenon, is constructed through interpersonal interaction (Berger & Luckmann, 1966, Kouzes & Posner, 1995; Vaill, 1989). It emerges as a result of the constructions and actions of both leader and associate. Management and business practice is being increasingly influenced by research that recognizes the impact of group dynamics, leadership traits, and motivation. Organizational climate studies reveal that 60 to 70% of employees, regardless of occupation or industry, report that the personal relationship to their leader is the most stressful part of the job (Hogan, Raskin, & Fazzini, 1990).

This bad news about the impact of leaders may be good news for human resource and change management professionals. It points to the need for accurate performance metrics that are aligned with the organization's values and goals. It points to the potential for those in human resources to become a strategy partner in helping an organization reach beyond "as is" states to what it can become. It requires a solid research basis for building a foundation that closes the gap between theory and application.

Manager or Leader?

The literature reveals a conceptual polarity between "leadership" and "management." This polarity tends to pit these two supposedly divergent schools of thought. This study points to the need to explore a new managerial-leadership model with best practice behaviors and attributes from each domain. For example, managerial-leaders need to be able to see ahead of today's realities to anticipate consumer needs and the changing demands of the marketplace. Concurrently they ensure that managerial resources are harnessed to get today's work done. Those who evolve into higher-performing managerial-leaders will begin to implement the behavioral practices that create innovative outcomes based on the ability to accomplish challenging goals through and with others.

Such change does not come easily. Old habits do not pass on by means of fairy dust magic or by brandishing the latest empowerment fad about. Managers and leaders will tend to reinforce the organizational rules that heretofore served them well. In doing so, they may actually work against employee participation and the development of self-responsibility, self-initiative, and self-control (Smircich & Morgan, 1982, in Kolb, Rubin, & Osland [Eds.], 1991). Yet, these are the very competencies required for success in participatory work structures.

Facilitative Managerial-Leadership

What then, is the facilitative managerial-leadership model and why is it important? The findings of this study indicate that effective managerial-leadership is significantly connected to perceptions about facilitative attributes. These attributes relate to a leader's congruence, positive regard, empathy, ability to challenge the process, inspire others, enable others to act, model the way, and offer satisfactory rewards. The word facilitation or facilitate is derived from French and Latin etymological roots. Facilis means easy to do and facere means to do or make (Webster's Deluxe Unabridged Dictionary, 1983). In the realm of psychology, facilitation has to do with "increased ease of performance of any action, resulting from the lessening of nerve resistance by the continued successive application of the necessary stimulus: opposed to inhibition" (Ibid., 1983). Facilitative leadership by definition lessens resistance and increases the likelihood of success. This is accomplished by becoming more facilitative and more skillful at effective managerial-leadership attributes and practices.

Traditionally, leaders have been identified as being focused on "big picture" issues, whereas managers have focused on specific work plans and outputs. Facilitators have been identified with focusing on assisting work groups in working together more effectively. However, managerial-leaders need to be flexible enough to manage, lead, and facilitate. All of these roles are important for organizational success. No single style is appropriate in all situations (Bass, 1985, Bass & Avolio, 1997; Tichy, 1997; Weaver & Farrell, 1997).

The facilitator role provides the bridge between what seems to be two disparate roles. Decentralized, participatory organizations need leaders who are facile in seeing beyond the work being accomplished today to be able to anticipate changing requirements for the future. The facilitative managerial-leader will become increasingly skilled in a number of roles that encompass knowledge, skills, and attributes in tactical, strategic, operational, and organizational science arenas. This is needed to succeed in an ever-increasing complex, changing environment.

What do some of these new managerial-leadership practices look like? This study examines perceived behaviors of "leaders at their best." An example of a best practice, is the ability to "challenge the process." Jacques Nasser, the CEO of Ford Motor Company is driving significant change in a seemingly unusual manner. Nasser states that "we have to change our fundamental approach to work—we have to change our DNA" (Wetlaufer, 1999). He is overseeing a far-reaching, cascading education program that involves all of Ford employees and leaders. The
teaching is multifaceted using a “train the trainer approach” and 360-degree feedback. Nasser believes that teaching drives change better than any other way, and Ford now has more than 1,500 leader-teachers worldwide who have reached a total of 55,000 salaried employees” (Ibid.). When managerial-leaders teach their employees, they are encouraged to actually practice the concepts espoused. This “modeling the way” behavior, in turn, assists constituents to learn and practice facilitative managerial-leadership behaviors in their jobs. Employees become “shareholders” who are more highly motivated to be fully present and involved in their work lives. This evolving and transformational managerial-leadership model uses self as instrument, understands group dynamics, assists others in clarifying their task and task completion, and helps groups progress toward their goals (Weaver and Farrell, 1997).

**It’s About People**

Research on managerial-leadership is best approached from a multi-disciplinary collaborative approach. This should include management, psychology, sociology, and organizational development and other disciplines. An extensive literature search of numerous sources across these disciplines was performed, which produced a wide range of factors describing the qualities, skills and socio-emotional attributes of effective managerial-leaders. In particular, it is important to appreciate the complexity of individual and organizational systems that factor in managerial-leadership success or derailment.

Leaders tend to fail because of relationship problems with others, including boss, peer, and subordinates. Leaders are enmeshed in a web of relationships (Lawler, 1986; Tichy, 1983 and 1997). Tichy’s description of the technical, political and social aspects of organizational systems helps explain why technical brilliance alone will not create success. Viewing the impact of leadership from this lens helps to explain the cascading political and economic outcomes of derailed leaders. It points to the importance of understanding personal and group psychology and the informal, socio-aspects of system of relationships. Peter Vaill, a well-respected organization development specialist, has argued, “all management is people management, and all leadership is people leadership” (Vaill, 1989). Thus, regardless of whether one calls oneself a manager or leader, the common thread has to do with people.

Many business leaders will not recognize the name of Carl Rogers, one of the preeminent 20th century American psychologists who developed a human relations theory based on clinical practice. Nonetheless, most leadership and management textbooks and articles refer to the importance of interpersonal skills such as active listening or some variant of Rogers’s non-directive approach as a prerequisite for employee empowerment, team building or humanistic management (Kramer, 1997). An influential source for this study is previous research performed by Kramer, who utilized Rogers’s theory and brought it out of the shadows. This pivotal study offered a statistical methodology that captured leaderly listening factors from empirically driven data (Ibid.). These ideas and the Kramer approach helped to crystallize this researcher’s interests in measuring perceptual feedback, which is critical in improving facilitative managerial-leadership abilities.

**It’s About Perception**

The importance of understanding the power of perception cannot be overstated. This study denotes that leadership outcomes—effectiveness and satisfaction with the leaders and employees’ willingness to perform beyond expectations—are indelibly tied to the employees’ perceptions about their leader. This study focused on the behavioral outcomes of managerial-leaders measured by instruments that elicit constituents’ perceptions of their leaders. An aspect of behavior that has not been consistently emphasized is the process of perception, especially that of person perception (Zalkind & Costello, 1962, in Kolb, Rubin, & Osland [Eds.], 1991). The notion of person perception is particularly important because managerial-leaders symbolize the organized situation in which they lead. Their behaviors and verbalizations create imagery in the minds of the organizational members, thus influencing actions within the setting as a whole. It is important to recognize and emphasize the power that the leader’s position has on the frame of reference of others (Smircich & Morgan in Kolb, et al, 1991).

How should employee perception and feedback be handled for managerial-leaders? In the past, the information flow and feedback came from the top of the organization to the bottom, with leaders giving evaluative feedback to constituents only. Leaders and managers were rarely given the kind of behavioral outcome information that could help them improve their performance and effectiveness (Hesselbein, Goldsmith, & Beckhard [Eds.], 1996; Kahnweiler, 1991; Lawler, Mohrman & Ledford, 1992; Schein, 1987; Weaver, 1997; Weisbord, 1987, 1992). In the story of “The Emperor’s New Clothes,” the leader lacked critical operational and perceptual feedback data. What we know in terms of performance improvement is that what is unmeasured remains hidden from awareness and unchanged. The development of reliable and valid multi-rater assessments may help pave the way for enhanced communication within an enterprise.
Research Design and Questions

Rationale and Importance

This study addresses the gap in providing reliable data from a bottom-up perspective about beneficial managerial-leadership attributes in participatory environments. The issues that arise in relating to and with others must be addressed constructively (Harrington-Mackin, 1994). Measures of individual work behavior create a bridge between theory and practice (Naylor, Pritchard, & Ilgen, 1980). Performance measurement provides an impetus for performance improvement (Rummel & Brache, 1995). It provides a means to help make organizational expectations and standards explicit (Austin et al., 1991). The inference is that experiences and perceptions about leadership behaviors affect performance, and impacts the emotional and financial health of organizations as well (Zalkind & Costello in Kolb, et. al., 1991).

Perceptions often become reality. As we have previously seen, perceptions can be costly in terms of the reality of leadership derailment. The increase in collaborative work structures and processes has also influenced the flow of communication within an organization, which has subsequently created the need for exploring new questions about leadership. Confidential, perceptual feedback from constituents is needed to provide input in order to understand and clarify perceptions and to aid in interpersonal development. Multi-rater assessments, such as 360-degree feedback, may provide an avenue for constructive expressions about the social-emotional aspects of leadership that, if ignored and left to fester, can lead to failure for work groups and leaders.

Methods for Measurement

Three multi-rater assessments were used in this research to collect data on the multiple dimensions of managerial-leadership. The Kramer model provided a foundation for using multiple performance measures and studying convergence and correlations. The positive results of that study, based on the human relation's theory of Rogers, called for further evaluation.

The three multi-rater assessments used in this study included: Leadership Practices Inventory (LPI) by Kouzes & Posner; Multifactor Leadership Questionnaire (MLQ) by Bernard Bass; and Relationship Inventory (RI) by Barrett-Lennard. The key variables measured and the measurement tools used are outlined in Table 1 below. These tools assessed perceived leadership practices relating to challenging the process, inspiring and enabling others to act, as well as attributes of routine, transactional management behaviors such as active management-by-exception. In addition, they addressed congruence, positive regard, and empathy as perceived by employees. Each assessment instrument has extensive research handbooks available that detail the statistical reliability and validity.

The three facilitative factors were derived from Rogers's human relations' theory based on his clinical experience. Rogers observed that these three fundamental conditions must be present in the therapeutic relationship for improvement to occur. These included empathy (accurate understanding), positive regard (respect), and congruence (genuineness). For his doctoral dissertation as a student of Rogers, Barrett-Lennard developed the Relationship Inventory (RI) in 1959. He developed the methodology based on the notion that the subjective experiences of individuals "can be meaningfully and usefully represented on a scale of quantity, provided the origins, procedures and main presumptions of such measurement are held in view" (Barrett-Lennard, 1986).

Since its validation in 1959, the RI has become a highly respected instrument in behavioral science research, used in over 400 research studies. Most reliabilities across the scales are .85 or above. The RI's diverse application is found well beyond the client-therapist relationship to other key relationships such as individuals and groups and supervisors and employees (Barrett-Lennard, 1986).

The Leadership Practices Inventory (LPI) was developed from the realm of business management and organization development. Kouzes and Posner's five practices of "leaders at their best" (see Table 1) were derived from their extensive research on the factors that managerial-leaders drew upon to be their personal best at leading others to get extraordinary things accomplished (Kouzes & Posner, 1995). Test-retest studies of the LPI on a database of nearly 60,000 respondents from around the world are ongoing. On the basis of a sample of 43,899 respondents from a wide array of professions, internal reliabilities ranged from .82 to .92 on the five factors. Test-retest reliabilities were at .93 or above.

The factors of routine, transactional management and the outcome factors (see Table 1) were derived from Bass's Multifactor Leadership Questionnaire (MLQ). According to Bass, who has also done extensive research on leadership and performance issues, there are two types of leaders: transformational and transactional. "Transactional leadership is a process of gaining compliance from associates through contracts with the leader. The contractual relations may be explicit or implicit. The leader clarifies expectations and may exchange promises of reward or disciplinary threats for the desired effort and performance levels" (Bass, 1997). Bass (1985) established
the construct validity of the MLQ scales. In a series of nine samples ($N = 2,080$), based on leadership assessments made by members on MLQ Form 5X-Short, the average alpha coefficient reliability's for the 21 items ranged from .74 to .94 (Avolio, Bass, & Jung, 1996).

Research Population

The feedback data were collected in 1998 from members ($N = 182$) of a business unit of a large government-contractor systems engineering firm outside of Washington D.C. Anonymity and confidentiality of responses were guaranteed as part of this study. Empirical, quantitative research was conducted to test hypothesized relationships between factors pertaining to facilitative behaviors, best practices of leaders, leadership outcome factors and aspects of transactional, routine management. In the analyses, factor analysis and multiple regression statistical tests were performed. Redundancies were reduced by means of multivariate analyses. The numerous statistical tests were performed to ascertain whether the hypotheses, which relates to the three research questions, could be supported. The key statistical tests and the results will be outlined in the next section.

Hypotheses and Research Questions for Exploration

The key hypothesis was that facilitative conditions and best practices of leaders would show strong correlation. Furthermore, if a strong correlation existed, these combined factors could be labeled Facilitative Leadership (FL). Another hypothesis was that facilitative leadership qualities carry more weight (or explain more variation) in terms of employee’s perceptions of leadership outcomes than aspects of routine, transactional management Routine Management (RM). The leadership outcomes relate to perceived effectiveness, satisfaction, and willingness to perform beyond what is expected (enhanced performance).
Three questions were posed for testing these hypotheses in the design of this study. They included the following. First, how strongly do the three facilitative conditions (congruence, regard, and empathy, based on the RI) correlate with the five practices of “leaders at their best” (challenging the process, inspiring a shared vision, enabling others to act, modeling the way, and encouraging the heart, based on LPI)? Second, to what extent do a leader’s facilitative behaviors (congruence, regard, and empathy) predict each measure of leadership outcomes (employees’ assessments of perceived leadership effectiveness, satisfaction with leaders and willingness to perform beyond expectations)? Third, does perceived facilitative leadership have more impact on leadership outcomes than aspects of routine, transactional management? If so, what is the added value of leaders’ facilitative behavior (based on the scales in the RI and the LPI) above and beyond three attributes of routine management (based on the MLQ) of contingent reward, active management-by-exception, and passive management-by-exception?

**Statistical Tests and Results**

In the following paragraphs, a concise summary is given of all of the statistical tests performed for each research question and the significant outcome. These paragraphs are ordered in “steps” to correspond to each question posed. The findings indicate that effective leadership is significantly connected to perception about facilitative attributes. But, just how much of leading is facilitative?

**Step One:** Did the facilitative conditions correlate with the five best practices of leaders at their best? If they did, how strong was this correlation? Factor analysis and canonical correlation were performed using the three facilitative conditions as the independent variables (IV) and the five best practices as the dependent variables (DV). Facilitative leadership factors explained more about members’ ratings of leaders’ effectiveness and satisfaction with the leader over and above aspects of routine management. The redundancy index suggests that 44% (at .0001 significance level) of leadership practices overlap with relational/facilitative factors. Pearson and factor analyses were significant. A high canonical correlation produced (80%) and the redundancy index of 44% provide evidence that facilitative behaviors can be mapped onto practices of leaders at their best. This relationship between IV and DV was labeled “Facilitative Leadership” (FL). Question One was supported.

**Step Two:** Was a link demonstrated between constituent’s views of a leader’s facilitative behavior and the leader’s outcomes? Multiple regressions were performed with the dependent variables (DV) of the three leadership outcomes (see Table 1) and the IV of the facilitative condition set, producing significance ranging from 52 to 73%. Canonical correlations between the DV set and FL produced the canonical variate Y that measures the phenomenon of leadership practices overlap with relational/facilitative factors. Pearson and factor analyses were significant. A high canonical correlation produced (80%) and the redundancy index of 44% provide evidence that facilitative behaviors can be mapped onto practices of leaders at their best. This relationship between IV and DV was labeled “Facilitative Leadership” (FL). Facilitative leadership by itself accounts for 73 to 85% of the variation in the three leadership outcome measures. Based on these findings, we can use facilitative assessments of leaders to explain outcomes of member ratings on the perceived effectiveness of leaders, members’ satisfaction with leaders, and members’ willingness to perform beyond expectation. Question 2 is supported.

**Step Three:** What is the added value of facilitative leadership above and beyond routine, transactional management? Stepwise multiple regressions found that facilitative leadership is the strongest predictor of effectiveness (82%) and satisfaction (55%). However, reward was the strongest predictor for willingness to perform beyond expectations (54%). Strong negative correlations for transactional management and outcome measures were revealed. Contingent reward, an aspect of routine management, proved important to worker’s willingness to perform beyond expectations. Reward can be facilitative when used to support the growth needs of members (Bass & Avolio, 1997). Questions 3 is supported with the understanding that contingent reward is also a critical outcome variable.

**Discussion**

Numerous tests were performed in the data analyses to ascertain the outcome of the research questions. The high multicollinearity between the predictor and criterion sets indicated a possible underlying pattern or positive relationship between facilitative/relational attributes and best practices of leaders. Facilitative leadership by itself explains between 73 to 85% of the variation in leadership outcomes. 44% of best leadership practices are facilitative in nature, shown by the overlap with relational/facilitative factors.

The findings indicate that employees are willing to perform beyond expectations when they perceive facilitative managerial-leadership behaviors (such as modeling the way and enabling others to act). In addition, performance is tied to the appropriate use of contingent rewards (e.g., recognition or bonus plans), usually considered part of the domain of transactional or routine management. This sends a message about the importance of connecting performance issues to employees’ need for facilitative managerial-leadership behaviors and tangible...
evidence of appreciation for their efforts. As previously indicated, this coincides with Bass's notion that reward can provide a facilitative means for growth and transformation if it connects with what is rewarding to employees.

In terms of possible limitations of this study, caution must be exercised in how correlational studies are interpreted. With any correlational research, causality of relationships cannot be assigned. Multivariate statistical analyses were applied to intact rather than experimental groups. A "random assignment of objects to experimental treatments is necessary for the validity of our analysis and any inferences of causality between the experimental variable and the criterion variable." (Kachigan, 1991).

This, of course, is not to say that correlational data cannot reveal factors that are almost certainly causally related, "but... the relationship may also be due, either in whole or in part, to other unidentified confounding variables" (Ibid., 1991). There is also the possibility that other variables, such as gender, race, functional disciplines, or cultural background may be related to the facilitative predictor set or the leadership criterion set or both. To maintain confidentiality, it was not possible to include demographic information in this study. Also, it is difficult to generalize the findings to other industries or occupations with different population characteristics. However, it can be noted that in Kouzes and Posner's extensive leadership research, their "...findings are relatively consistent across people, genders, and ethnic and cultural backgrounds, as well as across various organizational characteristics (such as functions the organization employs, size and its public- or private-sector status)" (Kouzes & Posner, 1995).

Implications for HRD Professionals and Conclusions

There are several reasons why this study is important and relevant for HRD and change management professionals. For one, it is critical that the knowledge base for understanding key managerial-leadership factors related to positive outcomes is increased through sound research. Second, there are numerous implications for how this data and knowledge can be applied in HRD and change management practices. These include providing: selection criteria for managerial-leaders and succession planning; strategic means for measuring and increasing productivity and profitability; a consulting basis to decrease conflict and to increase worker satisfaction and willingness to perform beyond what is expected; research data for improvements in formal and informal managerial-leaders' and work teams' training and development; competency-based performance improvements; a means for structuring incentive pay and rewards to boost performance; and assistance to decrease turnover, leadership derailment, and monetary losses and product failures.

These results may be useful in increasing social and emotional intelligence for working with and in work groups. They offer learning benefits to current and future managerial-leaders at all levels in organizations. It also raises the need for additional research on multi-rater assessment tools and perceptions.

In closing, this article has presented theoretical underpinnings, key research findings, and discussion of results, limitations, and implications for HRD professionals based on this empirical research. The need for an understanding how to improve organizational effectiveness through facilitative managerial- leadership and collaborative work structures is vital. To remain competitive in this aggressive market environment, managerial-leadership attributes and behaviors need to keep pace with changes that are creating collaborative, agile work structures and strategies that encompass innovation and speed.

We have seen that complexity and speed of change are increasingly influencing HRD and managerial-leadership practices. These changes make it even more important to recognize the impact of group dynamics, leadership behaviors, and perception. HRD professionals need to understand and stay current with research in order to assist organizations in integrating a facilitative model that will also serve the business objectives of the enterprise. The HRD and change management professionals, as effective strategic partners in organizations, are in positions to influence managerial-leaders to become more facilitative as they challenge the process and model the way.

Why HRD Practitioners Can Lack Respect: Sizing the Credibility Gap Between What Top Managers Want and HRD Professionals Deliver

Robert L. Dilworth  
Virginia Commonwealth University

Timothy McClernon  
People Architects, Inc.

There has been a great deal of discussion in recent years about the credibility of HRD practitioners. Does what they do and deliver make a difference in the “bottom line” of the business? How well integrated are the HRD specific programs with the overall strategies of the business? A small team of HRD scholars and practitioners looked at the issues involved and available research in arriving at ten reasons why HRD practitioners can be seen as outside the mainstream of the business and lack credibility. Their findings were then used to leverage a “threaded dialogue” over the Internet by HRD scholars and practitioners around the world.

Keywords: HRD Credibility

Some issue areas are difficult to address. Given all the important contributions made by those who consider themselves HRD practitioners, talking about credibility problems in the profession can be an uncomfortable endeavor. While there has been a healthy tendency to admit that professional practice may be lagging behind real-world business needs in certain areas, there has been less inclination to try and isolate perceived shortfalls and their causes.

It can also be difficult to clearly identify gaps between what the top leadership of a company wants and HRD practitioners deliver. It is not necessarily what you talk about in open forums. Such problems are usually held closely within the organizations experiencing them. In fact, such problems may well prove “undiscussable” within the companies involved. HRD can as a result live what might be called a “twilight existence”. HRD is there and does its job, but not always to the accompaniment of high praise. If there is dissatisfaction, it can be quietly expressed via termination of employment and selective “downsizing” of the human resources function. When displeasure is expressed openly, it frequently relates to the inability of HRD to prove relevancy or deliver metrics that unequivocally prove linkage of HRD interventions to performance, productivity and profitability.

For all the reasons already given, examination of shortfalls between what HRD delivers and the top leadership wants is a complex undertaking. The fact that it is difficult to research probably accounts for the lack of a strong and definitive research history in this area.

Problem Statement

What are the gaps between what HRD delivers and top leaders and managers want? What does the research show? If there are gaps, what are they? How can we go about closing or at least narrowing them?

Theoretical Framework

Several HRD scholars and practitioners (most qualify as both) associated with the Research Department and the Research and Practice Committee of the American Society for Training and Development (ASTD) labored for the better part of a year with this multi-faceted problem statement. The Research Department is internal to ASTD. The National Research and Practice Committee is affiliated with the Research Department and is made up of scholars and practitioners who volunteer their time to encourage research studies related to Human Resource Development, stimulate the wider dissemination of research findings related to the field and promote a broader understanding of research design and methodology. The Research and Practice Committee has a rich blend of scholars and

Copyright © 2000, Robert L. Dilworth & Timothy McClernon
practitioners, including senior corporate HRD practitioners from companies like General Motors, Andersen Worldwide, Union Carbide, and Lockheed Martin. The universities involved include Columbia, Johns Hopkins, Oklahoma State, Virginia Commonwealth, Marymount and Indiana State. The Center for Creative Leadership is also represented, as are a number of consulting firms; such as, W. Warner Burke Associates, Inc.; People Architects, Inc.; and, the Institute for Strategic Learning. For this particular investigation, five individuals became most directly involved, with the internal Research Department and Research Committee of ASTD operating as a seamless entity:

1. Robert L. Dilworth, Associate Professor, Virginia Commonwealth University.
2. Timothy R. McClernon, Principal Partner, People Architects, Inc.
3. Lyle Yorks, Professor, Teachers College, Columbia University.
4. John Redding, Executive Director, Institute for Strategic Learning.
5. Mark VanBuren, ASTD’s Director of Research.

The proposal authors were a part of this effort. Much of the work was done through independent review of research sources. Each investigator also had a network of associates in business and higher education that they could tap into for ideas. There were also innumerable teleconferences over the course of a year, as well as frequent e-mails that shared what was being learned, and even a few revelations.

In a sense, the “Gap Team”, as it came to be called, cast its net widely. It then progressively sifted what was being uncovered looking for common themes. The scope of what was being identified was gradually narrowed down and clarified. It was a tedious and at times frustrating process. The theoretical framework was both inductive and deductive. The team looked for specific indications of problems even as it looked at the big picture, including the dynamics of the global market environment and business climate in which HRD is embedded.

The idea of creating web sites centered on real issues facing the profession, germinated as this effort was underway. It resulted from two publications released by ASTD in 1997. Both of these publications were under the general title of “What Works”. One publication addressed several areas related to Training and Development Practices and the other focused on Assessment, Development, and Measurement. It seemed the appropriate time to pursue a real time on-line approach to creating dialogue in critical areas, with even a tighter link between research and practice. The desire to create a web-based dialogue mechanism ended up being combined with the efforts of the Gap Team. The research cited in this proposal constituted the pilot test in moving to a more web-based approach to critical dialogue.

Research Questions and Propositions

Three questions drove the research. They set the stage for the ASTD web site that was launched in late October, 1999. These questions are:

1. Why does HRD often experience low levels of credibility within our organizations?
2. Why do many of our senior managers see HRD as not being a credible contributor to the bottom line?
3. Why do so many managers continue to believe that the cost of training is more than the benefit to the organization?

Methodology and Research Design

The “Gap Team” worked to develop the “leading reasons” of why HRD professionals can end up enjoying “little or no respect.” Arriving at the list was an iterative process. In the end, ten over-arching reasons for failure to earn respect were identified. In each case, the Gap Team developed the following substructure:

1. Sound familiar? Examples were developed of the type of situations commonly associated with a given reason.
2. What do we know? Factors bearing on the problem and ways to overcome it were cited, as well as research studies that can provide added information.
3. What can you do? Here, specific remedies were outlined.
Those wishing to have background information on a research study being cited can directly index a one-page summary of the research study that is a part of the web site. The summaries of research studies are organized as follows:

1. Author.
2. Year.
3. Title.
4. Source.
5. What was done?
6. What was the bottom line?
7. What does this mean to me?

The Gap Team results were then built into a special web site that allows members of the profession to call up and review the investigative results in a variety of ways.

Because the report was the product of a small team of investigators, two additional steps were taken before opening up the web site to threaded conversations/dialogue around the issues. The first step was to have a group of leading scholars, individuals who had not been involved with the study, visit the web site and open up a dialogue that could later serve as a “discussion starter”. The next step was to have leading HRD practitioners visit the site and do the same thing. These two preliminary steps also served to underwrite the study effort, surface points of view that had been overlooked and identify any additional research sources. They served to triangulate what had been turned up by the Gap Team. Did the team miss something? Was there another way to view earlier study results?

Following these two “discussion starter” steps, the web site was opened up to anyone having an interest in entering the dialogue. From a “research design” point of view, the process used is considered a very effective way to bringing informed dialogue to bear on a critical area. The “Gap Team” in effect, prepared the “playing field” for the profession at large.

Results and Findings

The top ten reasons identified for the gap (why the profession can fail to enjoy respect) were:

- We don't understand how globalization impacts HRD.
- We are kept out of the loop.
- We don't/can't take the initiative.
- We don't know how to prove the value of HRD.
- We have a narrow range of skills.
- We are part of HR functions that also lack credibility.
- We keep using the same hammer: classroom training.
- We spend time doing things that senior managers do not value.
- We disagree with senior managers about the purpose of HRD.
- We don't know much about our business.

All of the reasons are significant, but in order to show the texture of the findings, as ultimately made available on the web, reason number 4 will be looked at in depth. This will also allow a full examination of the format used. What follows is a verbatim extract from the web site presentation.

Reason No. 4: We don't know how to prove the value of HRD.

Sound Familiar?

1. “I know this training program makes sense. But I can't prove it in dollars and cents. I can't do a Kirkpatrick Level 4 evaluation and an ROI analysis on every training program”.
2. “Our company keeps talking about how customers are important. Yet the only thing we seem to really care about are sales and profits”.
What we do know.

1. Certain types of HRD programs (if executed very well) can produce an 8:1 return on investment. However, most managers do not recognize the potential financial impact of training.
2. Not all HRD programs should be measured in terms of short-term financial results. Probably the best measures are those that are directly related to the company's business strategies.
3. There is still a strong tendency to use financial measures as the major way to measure business performance. However, this is changing. Most companies are currently trying to implement balanced scorecard systems that treat non-financial measurements (including human resource related issues) as important as financial measurements.
4. It is possible to create a value-chain analysis that will directly link key HRD factors to business performance. Sears has done this very successfully.
5. It is not always necessary to do a Level 3 or Level 4 (Kirkpatrick) assessment. Well-designed-Level 1 evaluations are effective in predicting changes in performance.

Study Resources. Six study resources were provided and are listed below. While other pertinent studies were identified during the literature review, they were not considered in-depth research.

5. The Employee-Customer Profit Chain at Sears (Rucci & Quinn, 1998).

What Can You Do?

1. For programs that are designed to produce immediate, short-term impact on financial performance (many sales programs fit into this category), conduct ROI studies to show training's financial impact.
2. Find out if your company is implementing a balanced scorecard system, or a similar measurement system. If so, learn all you can about it. Help the company develop useful HR related measures as part of the scorecard. Use the balanced scorecard measures to assess the effectiveness of HRD initiatives.
3. Work with senior managers to do a value-chain analysis, in which HRD factors are directly related to business performance.
4. Modify your Level 1 assessments to focus on two questions: (1) What have you learned that will help you back on the job? (2) Do you intend to apply what you have learned back on the job?

Summary: The brief sketch-out just provided reflects the conciseness of the commentary around each reason for limited credibility and how to deal with it. Address of other reasons is equally straightforward, with each designed to provide a platform and stimulus for informed dialogue.

Conclusions and Recommendations

1. There is merit in building a framework for review of an important topic area in the profession, as was done in this case. It began with a team of respected scholars and practitioners who came to believe that their own dialogue advanced understanding of an area that has not received much research attention. That effort then transitioned into use of the World Wide Web as a medium for even broader debate.
2. The review effort undertaken was useful in determining areas that seem to require additional research in relation to research credibility. For example, it clearly points to the need to develop better ways of measuring the impact of HRD on business success.
3. The design of this "research" excursion caused emphasis to be placed on the relationship of research to practice.
4. Such an investigative process provides for in-depth probing of areas that can help define the profession and trace the cutting edge.

5. This type of effort allows for experimentation in effective use of the World Wide Web to accelerate and broaden our ability to focus on key areas quickly. The process is much faster and more comprehensive than developing ideas in books and journal articles (if not electronic) where the dialogue tends to be initially one-way, discontinuous and slow to materialize.

6. The act of generating information and reflecting on a critical issue area represented a substantive learning experience for those who engaged in this effort under the aegis of ASTD.

How this Research Contributes New Knowledge in HRD

As already suggested, there are several ways such research can contribute new knowledge to the profession:

1. It brings key scholars and practitioners together around what is considered to be a critical topic area.
2. In terms of research design, it directly relates research to practice.
3. The concentrated integration of existing studies with perceived shortfalls in HRD credibility, as occurred in this study effort created new knowledge.
4. The design of the research in this instance caused a wide-ranging environmental scan to take place vis-à-vis HRD as a profession. Such efforts can only serve to better define the field, pinpoint areas in need of improvement, extend the cutting edge by leveraging research resources and “thought leaders” and help create a learning community in the profession.

Issues in Human Resource Development in Central and Eastern Europe

Geoff Chivers
University of Sheffield

Despite evident commitment of former communist countries of Central and Eastern Europe to education and training in the cause of national modernisation, there are now serious problems in the HRD field. This study addresses the main problems and considers their causes and how these may be overcome. A large scale empirical study in the Baltic States and Slovenia is combined with data obtained from less formal visits to organisations in Central and Eastern Europe, and literature available in English to generate general conclusions and recommendations for improvements.

Key words: Central and Eastern Europe, Vocational Education and Training Reform.

As contact with the former communist countries of Central and Eastern Europe continues to grow, the opportunities increase for a deeper dialogue about lifelong learning between Western European HRD experts and senior managers of public and private organisations undertaking modernisation programmes. (Autleytner, 1999). The European Commission is very aware of the need to develop the state education and training systems in all the central and eastern countries of Europe which are pressing to join the European Union, (the pre-accession countries). A large number of collaborative projects have now been funded by the European Commission with the aim of bringing expertise from Western European countries to the assistance of leaders of organisational change in the context of developing younger and older people to cope with the challenges facing the former communist countries.

The author has been involved in a number of such projects and has had the opportunity to travel to a number of the countries concerned to investigate the situation and advise as appropriate. This paper is based on these experiences and raises research questions which are relevant to most of the Central and Eastern European countries as follows:

1. Given the commitment of the post war Communist governments to strong state education and training systems in the quest for modernisation, why are these now seen as so poorly developed for the next millennium?
2. Why is the concept of HRD so alien to most work organisations in the public and private sectors (leaving aside western companies now established in Central and Eastern Europe)?
3. Why is learning seen as difficult to carry out except within the context of didactic class based teaching methods, such that open and distance learning methods for example are still so poorly developed?

Research Approach

As indicated above, the research reported here has been conducted on an opportunistic basis, largely as an offshoot of practical development project work, or short term consultancy. Indeed, the research questions above have been driven deeper into the author’s psyche by the fact that so many evidently different problems in different countries have boiled down to the same problems.

As time has passed during the 1990’s these questions have moved increasingly to centre stage, so that during visits to relevant countries, and when the author has received visitors from these countries, increasingly purposeful efforts have been made to gather more data relevant to the questions.

Copyright © 2000 Geoff Chivers
The data collection approaches have included interviews with a very wide variety of stakeholders in the business of learning, from government ministers to members of chambers of commerce, and from professors to students, and schoolchildren. A large volume of publications has been collected from the countries where projects have been carried out. While there can be language problems, a surprising number of such documents are in English, partly due to the requirements of the European Commission relating to the national accession programmes for future EU membership. The European Commission itself has been a valuable source of information, and more so the European Training Foundation in Turin, which has a major role in regard to modernising vocational training systems in Central and Eastern Europe.

Standard literature searching has been of some value (Kulich, 1995) although the focus of much literature on the social, economic and political problems of the former communist countries is on finance, marketing and the steps to improve quality and productivity of manufacturing, etc, rather than on learning and HRD. A few quotations best illustrate the nature and extent of the problems faced by Central and Eastern European countries in the years following the collapse of the Communist system.

Dietrich and Kurzydlowski (1992) state:

"Modern Polish industry has to a large extent developed under strict central planning and as such is characterised by a low standard of competitiveness. Polish industry is based on large, inefficient state-owned enterprises hiring thousands of workers and run by executives with little knowledge of what it takes to compete in a market economy. In addition, the decision making process is hampered by a lack of clear regulations defining the duties of managers."

Driefelds (1996, p129) writing about manufacturing in Latvia following the Soviet period states:

"One of the most invidious relics of the old system is lack of competition. Factories became complacent because they had an assured market and hence issues of price, quality, variety and customer orientation did not receive much attention. Soviet factories often became centres for socializing and welfare with production and work taking on secondary importance. Questions of discipline and labor productivity could not be resolved under conditions of labor scarcity.

As yet, the dominant orientation of managers is to protect their redundant workers by keeping them on the payroll. For example, during the first two months of 1993, 16 per cent or 343,000 of the paid industrial workers had not worked a single day in their enterprises. Such artificial maintenance of employees increases the cost of production and of products, that, as a result, become less competitive and often cannot be sold. The working employees cannot receive increases in wages because of this burden of "hidden unemployment" and their productivity and work satisfaction decrease and they become demoralised. All this misplaced paternalism only increases the likelihood of a total shutdown of production"

Klenovsek (1998, p47) reports for Slovenia:

"It now became clear that in the centralised (socialist) economy there used to be employed a non-productive (unproductive) workforce. By the end of the eighties it became evident that this was the cause of the bad productivity results and of productivity decreases which had been going on for several years. In 1992, when the registered unemployment rate grew rapidly to 13.8% we still believed that the growth would somehow get stabilised within the following five year period. The most optimistic prognosis had even predicted its decrease. Unfortunately the data showed the opposite, the registered unemployment rate shows an increase to 15% in 1995, a slight decrease in 1996. In 1997 it has been around 14.5% (last December there were 128,572 unemployed people in Slovenia)."

Klenovsek (1998, p48) goes on to report on market conditions and government interventions to deal with the unemployment problem as follows:

"The labour market condition is still rather bad which is particularly true for specific groups of the unemployed.

There is a particularly poor offer of free jobs in new areas. For the last two years we have been noticing an increased structural unemployment, which means that for some specific jobs there is..."
no properly qualified or trained workforce. Partly we try to solve this issue by training the unemployed. But this does not happen in an intense enough way."

Velovski (1995, p70) writing of the particularly difficult labour market situation in Macedonia, following independence from Yugoslavia, refers to the tendency for the education system to exacerbate the situation:

"--- education appears as an agency in the accumulation of (a) surplus of cadres and (an) increase of unemployment in the country. This kind of phenomenon is especially present in the sphere of university education. In the race for higher profitability, the university institutions register and produce cadres in such a dimension that the labour market in the state would not be able to absorb them for the next 20 years. If this kind of educational and registration policy continues, Macedonia has a chance to rise to a high point among the countries in the world with the highest rate of functionally non-useful university educated cadre.

The situation of the unemployed without any qualification is alarming as well. If we take into account the escalation of modernisation of the technical and technological base of working process and increase of the lower limit of professional qualification compatible with this kind of trend, then the number of 74,594 persons without qualifications or 42.1% of the complete number of unemployed, is a strong indicator of the bad perspective of this category of potential workers in the next period."

Velkovski (p71) then addresses the issue at the heart of this paper by referring to:

"---the extremely bad situation in the sphere of adult education and its placing on the margins of social interest, the chance of this category of unemployed and all the others with a lower educational level and degree of qualification, to change their qualification status by means of further education, changing of qualification or further qualification are depressingly small."

This point is constantly reiterated in the literature concerning adult and continuing education and training in Central and Eastern European countries.

Nor is the outlook for those in employment satisfactory in regard to employer support for lifelong learning. Taruskiene, writing about continuing professional development in Lithuania (1998, p143) could be considering the attitude of many employers in Central and Eastern Europe when she states that the outlook of employers is determined by:

- "Socio-cultural environment. Cultural values in society affect employers’ outlook towards CPD of their employees. As long as a culture of lifelong learning is not consolidated in society, employers are unlikely to encourage CPD, even if they have resources to spare. A learning culture may be created within organisations, but it will not be achieved without the support of management. Therefore, it is important to introduce values of democratic leadership and learning organisations to management in Lithuania.

- Legislative basis. Legislation supports CPD only for those unemployed who do not get a job within 6 months after they registered at the Labour Exchange. Generally, employers are neither directly (e.g. through taxation) nor indirectly encouraged to their employees’ CPD.

- Economic development of the country. The economic situation in Lithuania is unstable, legislation is changing constantly, and the system of taxation is unfavourable to business and industry. Many firms and enterprises are highly uncertain about their future and, therefore do not make long-term plans. In such a situation it does not seem wise to invest in employee CPD. Common practice is to look for competencies already available on the labour market.

In general, employers are still passive with regard to CPD for their employees."

**Intervention Strategies of the European Commission.**

As mentioned above, the European Commission is now very active in regard to the political, social and especially the economic problems of the countries of Central and Eastern Europe. It is now clear that nearly all
of these countries wish to become members of the European Union at some time in the future. If this is to be the case a great deal of reform and reconstruction of all aspects of life and work will be necessary. While the European Council of Ministers and the European Parliament are broadly supportive of these accession aspirations, it is clear that they are not willing to pour unlimited amounts of money into the relevant countries in the hopes of improvements and modernisation. Those countries most willing to go forward under democratic and capitalistic economic principles are treated favourably in terms of strategically planned interventions involving EU derived resources (advice, expertise, finance, etc).

While much work is focused on the development of the physical infrastructure of these pre-accession countries, there is considerable concern to modernise the education and training systems. The aim is to help develop the capability of the countries to build and sustain modern societies through their own efforts. This policy has major implications for human resource development, and given the problems outlined above means that the European Commission is required to put much effort into developing strategies for vocational education and training in all the pre-accession countries. The European Training Foundation based in Turin has a major responsibility for this work, undertaking research and consultancy, and leading on initiatives to improve the situation, drawing upon the resources of the EU PHARE programme for reconstruction in each country. National 'observatories' for vocational education and training reform have been set up in support of this work. In the PHARE area, observatories have been set up in Albania, Bulgaria, Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Romania and Slovenia (European Training Foundation, 1997). The role played by PHARE funding can be best illustrated with reference to an example, such as Latvia. In 1994-1996 the PHARE programmes in Latvia were funded at the level of 5.5 million Euros (approximately the same amount in dollars at today's values). These programmes aim to support the initial modernisation and reforms of the vocational education and training system in the areas of curriculum development, teacher training, upgrading of teaching equipment, partnership with EU schools, education policy development and the dissemination of results. One of the programmes refers to the post secondary area in business and adult education. The focus on initial vocational training in the public sector is notable, and does not address the problem of establishing HRD policies for those in employment, or seeking employment in adult life. In the PHARE context, the EU emphasis on open and distance learning should be stressed. As already indicated, one of the issues coming out of the research, and further described below, is the lack of emphasis in former communist countries on methods of learning for adults which are not classroom based. The European Training Foundation is well aware of this problem and is now managing the PHARE Multi-Country Programme in Distance Education. This programme aims at promoting co-operation in the area of distance education among the PHARE assisted countries, including the promotion of co-operation between the PHARE region and EU member states. The programme will specifically support the establishment of trans-regional distance education infrastructure and the development of a substantial portfolio of distance education and training courses in the PHARE countries. National distance learning centres have been designated in each of the relevant countries, with a modest operating budget. Funding became available in 1997 for the development of distance learning course modules with an indicated budget of 4 million Euros (European Commission, 1997).

The literature reviewed above, further uncited sources, visits to some of the countries mentioned, and visitors from some of these and other relevant countries, have raised the three research questions listed at the beginning of this paper above other HRD related issues. While these data sources offer some insights and possibilities in the search for answers, the greatest help has come from research I have conducted with colleagues in the Baltic States and Slovenia. This has been carried out in the context of the LEONARDO Da VINCI Programme, which is a major initiative of the European Commission concerned with the improvement of initial and continuing vocational training in the EU countries. The research was conducted because this Programme is opening up to the pre-accession countries of Central and Eastern Europe. All of these countries are expected to face challenges in implementing this complex and demanding programme. The research was carried out to determine the state of readiness of the Baltic States and Slovenia to enter into this programme, and the priorities which should be addressed in terms of the HRD needs of these countries. A full and lengthy report of this research has been submitted to the European Commission (Chivers et al, 1997) and the next section summarises the empirical research strategy without revealing confidential details.

Given the way that data has accrued, some well before the broad research questions above were formulated, then the research approach is best described as inductive and drawing on the grounded theory model of Strauss and Corbin (1990). These authors hold that in complex areas of study involving many variables, and which
initially are poorly perceived, researchers should not begin with a theory, and then try to prove it. Rather, they should begin with a broadly based inquiring approach, which is modified iteratively as data is collected and meaningful patterns can be determined from it. Thus, in this study, early involvement with vocational learning issues in Central and Eastern Europe indicated to the author that much was awry, but there was no initial clarity about the specific problems to address from a research viewpoint.

**Empirical research in the Baltic States and Slovenia**

The European Commission announced in Spring 1996 that a consulting team was sought to investigate the issues arising from the proposal to introduce the LEONARDO Da VINCI Programme in the Baltic States and Slovenia. A bid for this contract was prepared by myself and colleagues from the Division of Adult Continuing Education, University of Sheffield, in conjunction with the consultancy company UNECIA, which is a not-for-profit organisation based on a consortium of English universities which includes the University of Sheffield amongst its partner institutions. The bid was submitted by UNECIA in the summer of 1996 and proved successful in competition with many other bids.

The overall project involved six consultant researchers, including and overseen by myself, visiting the four countries for short periods (typically 3-5 days). A very large number of interviews were conducted by the researchers in these short periods, these being organised by the facilitators of the project in the four countries. These interviewees were mainly government civil servants with a strong background in vocational education and training. The interviews were usually carried out on a 1:1 basis in the premises of the person being interviewed, unless there was a need for an interpreter. Although a wide variety of experts from a large number of different organisations were interviewed, it was agreed that a semi-structured interview approach would be employed, utilising a standard set of 16 questions, followed by an open ended discussion. For the most part this procedure was followed, although some variation was necessary due to the behaviour of the interviewees. For example, some interviewees found certain questions irrelevant to their organisations, while others gave lengthy responses to early questions which in effect answered later ones.

The interviews were generally conducted over a 30-40 minute period, although some important figures were spoken with at greater length. The question responses were recorded as brief notes for each question, against each number, while an open ended discussion was summarised in writing and everything checked back with the interviewee at the end of the interview.

The interview questions moved from very general ones concerning the interviewee’s definition of vocational education and training (VET) to their awareness of VET priorities in their country, through to their current and proposed VET activities, and then to questions specific to the technical aspects of the LEONARDO Da VINCI programme and how it would benefit the country and their organisation.

The number of people interviewed in each country, and the nature of their organisations varied from country to country, partly due to the national circumstances but also because of the extent of preparation work carried out by the national facilitator. In Latvia for example 63 people were interviewed, with interviewees ranging from Ministry of Education officials, to university rectors and heads of vocational colleges, to staff of the Employers Confederation and the Chamber of Trade and Commerce. In Lithuania interviews with 48 people were conducted, covering a similar range of organisations. In Estonia 43 people (or in a few cases, groups of people) were interviewed, with a stronger focus on private sector employers and employers’ organisations (as there are more of these in Estonia). Only 11 individual interviews were conducted in Slovenia, where there was more reliance on extensive reports in English, and focus group discussions with teams of staff from employing organisations.

The interviews and meetings produced a large volume of recorded data, which was written out more clearly on laptop computers during the country visits, and then brought back to the UK for analysis. The analysis was conducted on a country by country basis by those researchers who had undertaken the visit. The outcomes of the structured parts of the interviews were considered on a question by question basis, while the statements recorded in the open ended discussions were read and re-read for key content until meaningful patterns and correlations were established.
Additionally, a large volume of reports was consulted, involving the national facilitators and colleagues in a great deal of translation work.

The draft reports were submitted to myself as research director, and I then read these and interviewed the visiting researchers to ascertain their own views and impressions. Where I was a researcher, I discussed my views on the visits undertaken with the other researcher who accompanied me for verification. All the researchers read the reports of the other research teams and raised points of clarification or concern.

I wrote the final report based largely on the findings of the country research teams, and this was checked by them and then submitted by UNECIA to the European Commission in June 1997. This report identified a large number of VET issues and needs in these countries, but nevertheless took a very positive line in terms of the possibilities of the LEONARDO Da VINCI programme operating effectively and beneficially in all the countries.

Following further development work in the Baltic States and Slovenia, these countries entered the Programme in 1998, soon after other pre-accession countries such as Poland and Hungary and the Czech Republic. Spin off work from this major research project has been conducted in Latvia and typifies the kind of ongoing development work I am conducting with partners in the pre-accession countries (Buligina and Chivers, 1998).

As well as generating a mass of detailed findings and recommendations, these formal studies are able to verify general overall impressions gained by the author from visits to these and other Central and Eastern European countries, attendance at conferences in these countries (and in Western Europe involving researchers from the pre-accession countries), and discussions with visitors to the University of Sheffield from these countries. The only relevant country with which there has been no direct face-to-face contact with national experts on VET is Slovakia. It should be noted that the author has also worked extensively in the east of Germany since 1989, in the context of vocational and higher education reform, retraining of the unemployed, and economic regeneration via small firm initiation and development.

The research results and findings reported below draw together the empirical data from the LEONARDO Da VINCI survey, with the author’s reflections on all the contact he has had with VET and HRD experts in the pre-accession countries, and all the papers, reports, institutional brochures and other documents I have read about this subject over the past decade.

Research results and findings

It is notable in all the former communist countries that many features of everyday life remind one of Western Europe in the 1940’s, despite the computers appearing on office desks and the televisions in many homes today. The communist ‘command economy’, and the almost total absence of commercial competition made for slow progress on all fronts. While this is most immediately noticeable to the visitor in terms of the state of the roads, the dearth of telephones, and the poor service in restaurants away from the capital cities, in fact the lack of change is most noticeable over time in the mentality of local people. Driefelds (1996, p11) argues that many people lived under regimes which went beyond authoritarianism to totalitarianism.

"The most relevant distinction lies in the extensiveness and depth of the structural penetration of society by the state, and the almost total absence of independent organisations."

Unless people have lived in the West, or had a lot of contact with Westerners in their own country, their whole outlook, beliefs and values are likely to be closer to those of people in the 1940’s in the west, rather than westerners in the 1990’s. There is of course wide country to country variation, with some regions, such as the Baltic States, having been much more influenced by the extremes of the Soviet communist system. (Driefelds, 1996). Although people are well aware of how different life is in Western Europe (let alone North America), and although they want to introduce the changes which will allow them to rapidly catch up and lead a modern, affluent life, they are much less aware of how out of step their mentality is from ways of thinking in the West.

The majority of people in Central and Eastern Europe for example still think in terms of stable employment patterns, despite the evidence in front of them of collapse of whole industries, and widespread unemployment. These are seen as aberrations arising from the collapse of the communist system rather than features of the
global economy. In consequence, the state education and training systems are still geared to the development of young people for a stable labour market. To a considerable extent young people are still being selected and developed to undertake jobs that no longer exist in their region, and will doubtless never return. In other cases they are being developed to slot into specialist jobs which are predicted to be needed in the new, capitalistic future. In reality these jobs may never materialise, or will take a different form in terms of knowledge and skills needed from what was predicted. Trying to come to terms with strategies for initial education and training to prepare young people for an unstable and constantly changing labour market is difficult enough in the West, but is proving beyond the powers of imagination and creativity in some former communist countries as exemplified by Velkovski (1995).

Within work organisations there is rarely a recognisable human resource management function, (HRM), let alone an HRD function. In communist times the state sponsored trade unions looked after the welfare of workers in terms of working conditions, organised recreational activities in work groups, and pension rights. In the absence of wage negotiation responsibilities, the trade unions were able to devote their efforts in these directions and offered much group and individual advice and support. Management was not therefore required to interest itself in personnel matters (Ardagh, 1988).

When the communist system collapsed the trade unions also disappeared leaving a void in the people management area. In this situation it is hardly surprising that few companies have any recognisable HRD function, and there is much to do in building both the HRM and HRD functions in the pre-accession countries.

Further difficulties arise because of the ranking of science as a discipline above all others. This results in the most academically able young people being geared towards the study of mathematics and science (especially the physical sciences), in schools which specialise in these fields. Senior positions in academic life are held by scientists to a great extent, which further unbalances the education and training systems in societies where the study of psychology, sociology, as understood in the West, and western languages was discouraged. The vast majority of senior policy makers in government are also physical scientists and technologists by background, which limits their interest in, and understanding of HRD (Driefelds, 1996, p 129).

In regard to the learning needs of the adult population, these were seen in doctrinaire terms, and most continuing education provision was influenced by communist ideology. Vocational learning for those at work was seen as readily achievable in the workplace, because of the very slow rate at which job tasks changed. Retraining was rarely necessary since workers rarely changed their jobs, and certainly not their vocation. Higher professionals were exceptional in this respect, either because they were more influenced by scientific developments, or because of the need for them to have contact with the West. Even for such professionals, however, their further learning was more likely to be in the context of their advancement in the Communist Party rather than the direct needs of their professional work.

In the totally planned economy, young people were told what their work would be and where their job will be located, followed by many years of service with the same employer. Hence the need for human resource management at the company level was limited. HRD was an alien concept because there was no perceived need to purposefully develop workers, given that their work was not expected to change, and they were discouraged (or forbidden) from changing jobs, moving to another area for new work, etc. Even where the state allowed young people to choose their own career field and first job there was little scope for later career change (Ardagh, 1988, p 329).

Indeed, it has proved difficult to convince senior managers of organisations, and even senior educators that older workers are actually capable of significant new learning. This is especially notable when the learning need is seen to lie in the affective domain. There is a deep belief in Central and Eastern Europe that interpersonal behaviour for example is unchangeable, and many well educated people would be sceptical of proposals for any HRD programme that is focused on behavioural change in this context. Autleitner (1999) states that in Poland:

"Education for adults is a great but underestimated problem. Under communism it was assumed that a university diploma was lifetime insurance."

Equally problematic in the HRD context is the deep seated sexism and racism which abounds in Central and Eastern Europe. Again, in listening to discussions between local people the author has been much reminded of conversations between the older generations when he was a boy, when the strengths and limitations of people were seen as strongly bounded by their gender or ethnicity. Clearly the strongly affirmative equal opportunities
assumptions embedded in Western HRD approaches today will struggle to find fertile ground in the former communist countries. The recent wars in the Balkans, and the treatment of minorities in many Central and Eastern European countries are testament to such deep seated attitudes.

Turning to teaching and learning methods, the very strong emphasis on didactic classroom based teaching is clearly related in part to the 'old fashioned' nature of society, alluded to above. Didactic approaches to teaching and learning at every level, from primary schooling, to company training and university teaching also held sway until recently in the West. Deference to authority was doubtless strongly established in the former communist countries, and respect for age, experience and wisdom a value that some in the West would appreciate today! In such respects these countries could perhaps be compared with the countries of South and East Asia, where didactic teaching methods still hold sway. In any education and training environment, reverence for the role and the power of the teacher will at least sustain, if not encourage, didactic teaching methods, and there is a big challenge to teacher and trainer educators to bring forward new learning methodologies through the next generation of teachers and HRD professionals. The new technologies are seen by younger people as exciting and certainly open up a window to the West. The first need is to convince policy makers and practitioners in the HRD field that people can learn well using computer based approaches, and be self-directed in their learning.

A further challenge will be to convince workers that important vocational learning needs to be carried out on an individual basis as well as in collective work groups. Such thinking cuts across the 'group activity' approach entrenched under communism. Trying to 'get ahead' of workmates by individual learning effort can still be seen as anti-social. As recently as 1987, Ardagh (1988, p332) was reporting on East Germany that:

"In other words, under their teachers' supervision these young people are set to watch and assess each other, in a manner that certainly militates against non-conformity."

This past history makes the introduction of open and distance learning difficult, although the glamour of the new technologies is clearly a countervailing force here.

Conclusions and recommendations

Currently, a great deal of money is being spent in Central and Eastern Europe to develop and modernise the state education and training systems in the hope that the next generation of workers will be ready to transform the political, social and especially the economic circumstances of each country. Much hope is being placed in the introduction of new technologies, and indeed it is true that experiential learning via computer use offers much hope for the future.

However, it is necessary to challenge very traditional thinking at all levels of society about: the nature of work; its organisation and transformation; the purposes of education; how differently people learn best; the affective domaine of learning; lifelong learning in and for work as well as for the good society; and power relations in the learning context.

As part of this challenge to change overall thinking, there is a challenge to western HRD professionals to demonstrate to senior managers in all kinds of work organisations the worth of HRD professionals, and the added value from developing the workforce on a continuing basis. Undoubtedly there is an important role for western companies based in Central and Eastern Europe, and who have a well developed HRD function, to share their expertise with local company managers. There needs to be much more emphasis on bringing potential HRD managers from Central and Eastern Europe to the West for work placements alongside experienced HRD professionals. Educators and trainers in the public services need much more development to gain expertise in modern approaches to vocational learning, and a remit to develop learning programmes of benefit to small firms in their respective countries. The infrastructure for general adult education also needs to be rebuilt in many countries, and lifelong learning strongly promoted.

Western HRD professionals acting as consultants and advisers in Central and Eastern Europe require further development to gain deeper appreciation of the effects of 45 years of communism on the mentality, beliefs, values and behaviours of managers and workers in all kinds of work organisations in the relevant countries. Throwing money at education institutions, and tinkering with curricula will have little effect long term if there
are no real changes in the mentality of stakeholders in learning developments. This is clearly demonstrated in the case of Russia, where the problems discussed for the countries of Central and Eastern Europe are much more deep seated, and where major efforts are yielding poor returns (Adamson, 1999).

An old adult education adage is to 'Start where the learners are'. Open and distance learning systems involving computer conferencing and the Internet mean little to workers who have no access to computers in countries where a very average modern personal computer costs the average yearly wage of an industrial worker. Western management development courses for senior managers will have little meaning to senior industrial managers who were used to taking their daily instructions from Moscow, with no more autonomy than Americans would think normal for a shop floor supervisor. The more well meaning Westerners can understand how it was under communism, then the more help we can be to make a better tomorrow for our highly educated, hardworking, committed and long suffering colleagues in Central and Eastern Europe.

Human Resource Professional Support for Work-Based Management Development

Jean Woodall
Kingston University

This paper reports on some of the findings of a recent research project investigating senior human resource professionals' awareness and encouragement of 'work-based' management development. The main findings were that HR professionals were very enthusiastic about 'work-based' development, but were not well-informed about the forms that this could take; were uncertain about the acceptability of using developmental challenges; and did not have conscious strategies for support, guidance, and facilitation of learning through work-based activities. The implications of this are discussed within the context of implementing strategically-focused management development.

Keywords: Human Resources, Work-based, Development

In as much as it is possible to generalise, since the mid 1980s, the consensus is that in the UK, organisations are more aware of the strategic significance of management development (albeit that this does not indicate a full integration within organisational strategic management processes) and more managers are involved in management development activity as measured in the number of 'off-the-job' training days. Constable and MacCormick, 1987; Handy, 1987; Institute of Management, 1994a; Institute of Management, 1994b; Thomson et. al., 1997). However, this is being supported by smaller in-house management development teams aided by greater individual responsibility for self-development, and greater use of external management development consultants and flexible learning support. Finally, it is generally agreed that a larger proportion of management development activity is being undertaken on-the-job, and it is this issue which is of main concern to this paper. The popularity of work-based learning activities has been boosted by a number of business environment pressures and public policy initiatives. The identification and effective use of work-based learning opportunities have become essential means of underpinning corporate strategies of human resource development which emphasise competence-based development, organisational learning, personal development planning, self-development, and development for 'employability' within new psychological contracts. Growing flexibility of job roles means that continuous learning is more likely to take place through experiences at work.

The Research Problem

The problem is that although there are many studies exploring the relationship between work-based development and the HRD interventions mentioned above, we have little information on the extent to which those responsible for management development within organisations are actively encouraging and supporting work-based management development. The questionnaire surveys of respondents drawn from the Institute of Management membership database (supplemented with limited face to face or telephone interviews with senior HR personnel) present problems in terms of an appropriate research design, namely: lack of clarity and consensus over what constitutes 'on-the-job' or 'work-based management development', a tendency to focus upon formal developmental experiences; and a questionable assumption about the ability of individual respondents to provide reliable responses for their organisations (Woodall, 2000, forthcoming). In particular, the views of senior HR professionals responsible for management development appeared to be under-researched. If claims about organisational commitment to management development in the UK are to be authoritative, research may need to give more attention to the 'architects' of management development within organisations, namely HR professionals plus other managers with this responsibility. Their perspective on the purposes and content of management development activity, within the wider HR policy and organisational context are central to understanding the scope and place of work-based management development.
Theoretical Frame

The research design attempted to go beyond defining management development in terms of formal interventions, be they either ‘off-the-job’ or ‘on-the-job’ (see Table I). It drew upon the substantial US research in the field of adult learning, human resource development, and career development to generate a more inclusive set of workplace opportunities. With the exception of earlier work by Davies and Easterby-Smith (1984) and Burgoyne and Hodgson (1983), most of the research on how managers might use work-based learning opportunities originates in the US (Dechant, 1994; McCall et al, 1988; McCauley et al, 1994, 1995; Marsick and Watkins, 1990, 1997). To date, very little of this has been assimilated within UK research on management development.

Marsick and Watkins (1990, 1997) drew attention to individual ability to learn from ‘trial and error’ in everyday tasks and interactions, but at the same time argued that organisations needed to support individuals in maintaining an openness towards new experiences and perspectives, in disciplined reflection, and in translating learning into practice. Other research would emphasise the importance of providing support in critical reflection (Brookfield, 1987; Mezirow, 1991) or ‘guided reflection’ (Wood-Daudelin, 1996) as a means to get individuals to challenge their own underlying frameworks of assumptions.

Conversely, McCauley et al (1994, 1995) take a ‘tough love’ approach when they argue that on-the-job learning is most likely to occur when managers are faced with challenging situations which place them in dynamic settings full of problems to resolve under conditions of risk and uncertainty. Their empirical research based upon the fifteen item ‘Developmental Challenge Profile’ (McCauley et al, 1995) which identified a number of developmental components of managerial jobs encountered in work situations involving transition, creating change, high level responsibility, non authority relationships and obstacles. They found that the degree to which managers are exposed to the developmental challenges was dependent upon a combination of personal qualities (a proactive ‘self-starting’ managerial style was advantageous), gender, job-related tasks (such as special projects, tasks for membership, job-rotation, cross-functional teams and internal secondment) and work-context.

Research Questions

The research reported on here was commissioned by the Institute of Personnel and Development, and conducted during 1998. It focused on human resource manager perceptions and experience of using work-based management...
development as part of their overall organisational management development policy. The underlying assumption for
this research design was that corporate support for work-based management development would depend largely upon
HR professionals’ awareness of the range of development interventions and the support required. In the absence of
this it could be assumed that the managerial workforce would be unlikely to make effective use of this way of
learning. The main research questions were:

- are senior HR and management development professionals fully aware of the whole range of formal work-based
development activities (see Table I) plus the possibility of informal and incidental learning?
- do senior HR and management development professionals recognise the significance of developmental
challenges (see Table II) as a means of learning?
- how aware are senior HR and management development professionals of the need for organisational support and
resources for guidance and facilitation of such learning?
- and what do senior HR and management development professionals perceive to be the main factors and
obstacles to effective work-based management development?

Research Design and Methodology

An interpretative research design was used (see below), with a purposive sample of organisations judged by a panel
of experts (officers of the UK Institute of Personnel and Development, plus other academic researchers on
management development) to be confronted with radical change in their business environment of a magnitude that
would encourage them to give particular attention to management development. In addition the original intention was
to ensure a broad spread of organizations across different sectors: information technology systems and software
development, retail, leisure and tourism, financial services, engineering and public services, and to include some
SMEs employing 50-199 employees as well as larger employers. Problems of access were only experienced in the IT
sector as a number of organisations were in the process of introducing radical structural change and so were
understandably reluctant to participate. Also, in the end only four organisations with 50-199 employees were
included, and organisational size by employment ranged from a food retailer with 130,000, four organisations
employing between 40,000 and 60,000, eight employing between 5,000 and 25,000, and a further eight employing
between 1,000 and 5,000. The remaining were five medium sized organisations employing between 200-999
employees - a total of 31 organisations. All the organisations were given pseudonyms to maintain confidentiality (see
Table II)

Data were collected by semi-structured interviews with key informants. These were senior HR managers responsible for devising management development policy for their organization - or other members of the senior management team who held this responsibility. The interview schedule was designed to collect basic factual information about management development activity for middle and senior level management (supervisors and first line managers were excluded), as well as key informants' perceptions around a number of themes, including:

- major business issues of current strategic concern
- the overall aims and principles underpinning management development policy
- the formal elements and framework for delivering that policy including succession planning arrangements
- awareness of a range of formal work-based management development activity (see Table I), and the extent to which these were encouraged and supported
- recognition and encouragement of the potential to learn from developmental challenges (see Table II)
- support for managers and line managers in identifying, using, and reflecting upon such development opportunities

This paper reports on findings relating to the last three points: namely the awareness of the range of work-based management development activity and support for this. Work-based development was defined as:

*development that occurs in the course of or as a consequence of the real work activities that constitute a manager's job role.*

The interviews took place in 1998, and were supplemented by analysis of documentation supplied by the organisations, including management development policy statements, and frameworks for delivering support, competence frameworks, learning support materials, and performance appraisal documentation.

Most interviews lasted an average of 75 minutes, with some very much longer, and a couple just under 60 minutes. In five organizations the research team interviewed more than one respondent, and in three of these, senior HR and management development professionals were interviewed together. Interview transcripts were compiled immediately after each interview. Although the semi-structured interview schedule provided a template for reporting responses to the more open questions were scrutinised to identify relevant units of data. These were then organised into themes. Both members of the research team participated in independent review of the interview transcripts, in order to identify relevant themes and units of meaning, and subsequently to confirm analysis of the findings by sector as well as in general. The aims were to follow the conventions of qualitative data analysis that would meet the criteria of credibility, transferability, dependability, and confirmability (Lincoln and Guba 1985: 316; Denzin and Lincoln, 1994).

**Findings**

**HR Professional Awareness and Use of Work-Based Development Interventions**

There appeared to be tremendous enthusiasm for management learning from everyday work activities: *It's almost the only way there is* ('Quality store') *the most important vehicle for learning* (RFSO2) *hour-for-hour you get much more from work-based activities than you do from going on a course* (Marinenge)

However, when pressed, most respondents were unable to elaborate upon what this might involve, and conceded that it was left to chance: *We do it by chance, rather than in a planned and recognised manner* (Family Store) *It is a question of trying to get people to think in terms other than courses for management development* (Museum)*It has happened, but it has been done by default* (Superco) *It's limited - things are happening, but people are not learning* (AC1)

When asked about which of the most commonly recognised forms of formal work-based management development (see Table I) were consciously promoted, most respondents only identified coaching and special projects. Role models, shadowing, mentoring, and secondment only received indirect encouragement. Acting-up (deputising for a manager in their absence) and delegation were not perceived as developmental tools, but rather as operational necessities. Job rotation and Action Learning were seldom used (many respondents were unfamiliar with the latter). Coaching was seen as the key work-based management development intervention by almost all those interviewed (with the exception of some public sector organisations and one organisation in engineering and...
construction), but explicit guidance on using both coaching and special projects was rare. Surprisingly, HR professionals responsible for management development were often unclear about what other work-based management development tools might be used, and when and how to use them.

**HR Professional recognition of the Significance of Developmental Challenges**

There was little immediate recognition of the development potential of both positive and negative challenges (see Table III) that commonly arise in the course of everyday work experiences: We are still in our infancy - we are trying to encourage more of such learning (Bookco); The trouble is that many of these are not perceived as learning opportunities. People do not think about the opportunities and career development created in handling a mature, declining business. (Paperco); All (developmental challenges) stretch in different ways, confronting traditional assumptions about how people learn...crisis situations demand challenge - having to solve problems that individuals have not come across before. Things spin off from what they are doing day-to-day and stretch them (Big Six)

</tbody>
</table>

Not a single organization specifically encouraged learning from developmental challenges, although many HR and management development professionals admitted that on reflection they could cite examples of learning in this way.

A pattern emerged whereby the most positive challenges of 'high profile responsibility', 'developing new directions', 'unfamiliar responsibilities', and 'influencing without authority' were more likely to be perceived as developmental. The more negative experiences ('dealing with inherited problems', 'making decisions on cutbacks', 'dealing with difficult/incompetent employees', 'managing a diverse area of work', 'handling a high workload') were seen as unwelcome operational requirements of the job. There was near universal agreement that obstacles such as 'handling adverse business conditions', 'dealing with a lack of top management support', 'dealing with a lack of peer support', and 'handling a difficult boss', were most unlikely to be developmental (see Table III).

**Provision of Support, Guidance and Facilitation for Learning through Work Activities.**

The HR and management development professionals were questioned in depth about organisational arrangements for support, guidance, and facilitation of such learning. While this involved consideration of the use of established HR tools such as personal development plans, learning contracts, learning logs and diaries, plus other examples of guided reflection, the scope of enquiry extended into wider aspects of HRM policy and practice and organisational culture. In many cases these factors did not provide an encouraging environment for work-based management development. 'People's expectations are built around upward promotion, but because of the flatter organisation, development has to be in and around the job...where managers are under a lot of heavy pressures, it can be hard to get people to use developmental tools - development of individuals tends to take second place...' (Oilexplore); we are an aggressive, demanding organisation in terms of time (Paperco); this organisation does not look at what individuals have put into a job - as long as they achieve their objectives, we don't look at other things' (Government II); 'we are an organisation full of activists and pragmatists, with few reflectors - it is very difficult for
the latter to operate and be valued' (South County); ‘as a culture, we are the least reflective organisation I have met in my life - there is a constant focus upon active learning (Cosmetico); ‘in the past five years we have moved from a ‘done-to’ culture, and now it’s more of the ‘if it’s to be it’s up to me’ culture' (RFSO2).

Most organisations made use of personal development plans, but this was usually as a follow-up mechanism to a formal off the job development programme or as part of a competence-based approach. Yet there appeared to be little facilitation of PDPs, and few resources devoted to supporting guided reflection: scant use was made of learning logs and diaries, personal development planning workshops or individual development counselling. Espoused learning cultures of self-development (see below) were not embedded, and unless there was regular follow-up activity on the part of both line managers and HR and management development professionals, it was readily admitted that such instruments as PDPs, learning logs etc. would rapidly fall into disuse. Action learning was perceived as a useful means of encouraging learning from developmental challenges in two public sector organisations (‘South County’ and “NHS’). Some organisations in the public sector (‘Government II’, ‘South County’, and ‘CCT’), plus others in engineering (‘Oilxplore’, ‘Oilenge’) provided encouragement for mentoring and networking.

The wider HRM policy environment appeared to be an important factor. The general trend towards slimmer central HR teams, aided by internal HR consultants in business units within a framework of devolved responsibility, had limited both the availability of HR and management development professional support. In particular, facilitation of work-based managerial learning by developing the awareness and skills of line managers, and the ability to control implementation of central policy was reported to be severely constrained. Every respondent cited lack of time as the key-limiting factor in providing support. In addition managers in delayed organisations were perceived to be more cautious and risk-averse, and reluctant to take on negative challenges (see Table IV) which provide potentially rich learning opportunities. Also, the ratio of the managerial workforce to other employees was an indication of how much time and support were available for management development. Small managerial workforces in leisure and tourism, contrasted with the higher ratio of managers to employees in retail, financial services, the public sector and engineering and construction.

Furthermore, other HR policy developments can obstruct work-based management development. This is particularly true of performance management systems. A focus upon tasks, objectives and outcomes gives priority to short-term considerations, and squeezes out long term development. This goes a considerable way to explaining the poor record of line managers in facilitating the development of their direct reports. Line managers may potentially have a key role in assisting development through providing an opportunity for debriefing and guided reflection, but with little training in coaching skills, and a strong signal that meeting targets is the priority, this is unlikely to show the desired result. There was only patchy evidence of the use of separate development reviews (mainly in the IT, retail and public sectors), and training in development skills for managers was only noticeably in evidence among retail and public sector organisations. Elsewhere in financial services organisations, it tended to be narrowly focused upon conducting appraisal and personal development plans. While obviously this is significant for the rest of the workforce, it is particularly important in respect of the development of junior and middle managers.

Another HR process that can obstruct integration of work-based management development within the wider HR policy environment is succession planning. Nearly every respondent acknowledged the importance they attributed to succession planning, but in the same breath admitted to current shortcomings. The most sophisticated succession planning systems were to be found in ‘Superco’, ‘Qualitystore’, ‘Bookco’, ‘Big Six’, ‘Oilxplore’, and ‘NHS Trust’. Other financial services organisations (‘RFSO1’, ‘RFSO2’, and ‘Insureco’) also had sophisticated charting and software systems, but these were becoming increasingly irrelevant in the context of ever more frequent organisational restructuring. A similar experience was encountered by many of the central government organisations. Yet, even here it was admitted that succession planning decisions are often based on informal impressions rather than recorded information - especially that available via the personal development planning process. Although respondents recognised that the recorded experience of work-based management development potentially provides an important basis for succession planning decisions, they admitted that their succession planning arrangements made no attempt to draw upon anything more systematic than anecdotal evidence of such activity - a situation that gives concern on grounds of both efficiency and equity. Postings were usually dealt with in an ad hoc manner with strong involvement from the senior management team, and hence, image, exposure and impression management were important.

There are a number of issues that arise in respect of organisation culture and leadership style, and especially the ‘learning culture’ of an organisation. Many organisations had espoused a self-development culture within a competency framework, but as already mentioned, a task- or client-focused culture can inhibit individual managers from giving priority to development. It is possible that total quality management processes with a ‘right first time’ ethos can encourage risk aversion and discourage the use of informal learning experiences and developmental
challenges which do not have guaranteed positive outcomes. In the same vein, negative learning experiences, and especially the use of negative developmental challenges might be shunned as unacceptable within a positive learning culture. That ‘dealing with inherited problems’, ‘making decisions on cutbacks’, ‘dealing with a lack of top management support’, and a ‘difficult boss’ (see Table IV) might be developmental given appropriate support was inconceivable even in organisations which were highly committed to work-based development (Quality Store, Oilexplore).

Finally, two other aspects of learning culture are relevant. Many organisations were so task-focused that the use of time to reflect on learning was perceived as an indication of individual underperformance! Only in the large accountancy practice (Big Six) was there an awareness that line managers needed to provide an opportunity for reflection and debriefing upon experience, in order for learning to take place, but even there, access to certain developmental challenges was highly dependent upon seniority and experience. Other organisations (especially in retail financial services and the public sector) were making the painful transition from a passive to an active learning culture. Management styles, in certain industries - especially the leisure industry were far from empowering, and a transactional ‘tell’ leadership style constrained the ability of managers to take advantage of work-based learning opportunities, as did a lack of senior management commitment to learning.

Conclusion

It was quite clear, that senior HR and management development professionals were enthusiastic about work-based development. There was overwhelming evidence that they thought that the workplace was the most important place for management learning. Yet, even where a high level of professional expertise might be expected, there was little awareness of the full range of formal work-based interventions and potential developmental challenges that could be used and little systematic promotion and support for this way of learning - learning in the workplace was expected to ‘happen’ as a consequence of individual managerial work on personal development plans. This increased reliance upon work-based learning as a key component of management development policy does not sit easily with the lack of active promotion and support. It certainly begs the question of whether more managers are actively self-developing and making effective use of work-based learning experiences in the absence of opportunities for guided reflection.

The are also wider implications for the strategic role of management development. Even if it is conceded that management development is seldom well integrated with wider corporate strategy, it is even doubtful whether it is well integrated with other HR processes, especially performance management, and succession planning. Contrary to recent research (Armstrong and Barron, 1998), development processes may be suffering in the context of integrated ‘all-singing-all-dancing’ performance management systems, and the failure to rethink succession planning in favour of a bottom-up ‘developing potential’ approach (Hirsh, 1990; Hirsh and Jackson, 1995) is indicative of weak internal HR policy integration.

Both of the above points have important implications for HR professionals who are responsible for management development. Firstly they need to be made more aware of the full range of work-based management development interventions, including developmental challenges, and how this relates to informal and incidental learning. Secondly, if greater reliance is to be placed on work-based management development as part of organisational management development strategy, then HR and management development professionals need to assemble the resources required for support and facilitation. In particular, more management development specialists will be needed, working either as internal or external consultants to line managers, offering support in coaching skills, running personal development planning workshops, and providing confidential individual development counselling. Finally, HR professionals need to scrutinise other aspects of HR policy and practice (especially performance management and succession planning arrangements) to ensure that they compliment and do not impede the effectiveness of work-based management development. Performance management systems are needed that create the space for separate development reviews with sufficient time for reflection, and which have as a key performance indicator evidence of line manager facilitation of the development of their direct reports. Similarly, without resorting to excessive bureaucratic record keeping, succession planning that draws upon more valid and reliable evidence from personal development plans is to be encouraged.
Acknowledgments

The author would like to thank the Institute of Personnel and Development for sponsoring the research on which this paper is based, Rosemary Welchman who conducted the bulk of the fieldwork, and actively participated in all stages of the process of data analysis and the drafting of the final report, and Stephen Gourlay for comments on an earlier draft.

Leadership Development as Transformative Pedagogy

Olga V. Kritskaya, John M. Dirkx
Michigan State University

The pace of change in society and its institutions is contributing to an increasing sense of uncertainty, ambiguity within organizations. In this context, leaders increasingly struggle, as change forces them to continuously choose between detachment and meaninglessness or "deep change." Choosing the former represents a slow death of the self and possible organizational disintegration. To address the demands of this highly tumultuous context, leadership development needs to be grounded in the notion of deep change in one's self, as well as in the organization. Relatively few studies, however, have focused on the pedagogical environments which seek to foster the "inner work" or transformative learning implied in this form of change. In this qualitative study, we examine the nature of such instructional environments, focusing specifically on the dynamic interplay among the teachers' beliefs, the learners' experiences, the content, and the instructional methods. The findings suggest five themes which characterize the instructional environments studied, in which participants construct, through myths, rituals, imagination, and creativity, a "metatext" which mediates the inner work of leadership development.

Keywords: Leadership Development, Transformative Learning, Instructional Environments

Fueled largely by rapid advances in technology, organizational leaders are confronted with escalating rates of change. While the most obvious of these changes is the decay of instrumental knowledge, advances are also bringing about dramatic change in personal, social, and cultural dimensions of organizational life. They are effecting how individuals understand their lives in and out of the workplace, how they define their place within the organization and within society, and how they relate to one another as people and as co-workers. These changes are sending shock waves through our culture, disrupting and calling into question long-held values and core beliefs, and luring us into roles of the powerless victim or passive observer (Quinn, 1996). To allow ourselves to be drawn into these roles, however, contributes to an increasing sense of meaninglessness and suggests a slow death of the self, manifest in feelings among professionals and organizational leaders of being disillusioned, overwhelmed, tired, worn down, or "burned out." This problem, however, extends beyond the inability or unwillingness of individual leaders to cope with this level of change. As Quinn (1996) points out, this notion of slow death of the self eventually results in a gradual disintegration of the organization.

The rapid pace of technological, social, and cultural change is bringing about a need for "deep change" at both the individual and organizational level. This notion of deep change implies a different way of thinking about leadership development, one that stresses inner work (Palmer, 1998) transformative learning (Cranton, 1996) and deep personal change (Quinn, 1996). In contrast with more traditional forms of incremental change, deep change "requires new ways of thinking and behaving. It is major in scope, discontinuous with the past and generally irreversible...Making a deep change involves...walking naked into the land of uncertainty" (Quinn, 1996, p. 3). It challenges our very sense of self-identity as organizational leaders. To engage in deep change is to enter, at a personal level, a transformative journey of profound dimensions - a dark night of the soul (Moore, 1992). Recent efforts to develop and improve leadership preparation programs represent attempts to address this context of change. Yet, these efforts seem to fall short of what is being demanded in this climate of change. For example, a number of graduate programs in educational leadership (McCarthy et. al., 1988; Murphy 1990; Tompkins 1996), as well as MBA programs (Boyatzes et. al., 1996; Porter & McKibbins, 1988) have been criticized for their ineffectiveness in developing human potential.

To prepare leaders able to engage and embrace deep change, leadership development programs need to be fundamentally grounded in the notions of inner work and transformative learning. Yet, we know relatively little about such instructional contexts or how they might be designed. The purpose of this study was to explore pedagogical practices that seek to foster transformative learning within a leadership development program. Specifically, we focused on the instructional environment and the dynamic interplay among the various elements of the instructional process, including the instructors' beliefs, the methods of instruction, the content or subject matter being taught, and the learners' perceptions of their experiences.
Conceptual Framework

Transformative learning represents a fascinating and challenging framework for understanding how professionals learn to become leaders. Theorists have pointed out the transformative potential inherent in contexts of professional development (Cranton, 1996) and, in particular, the study of leadership development. Quinn (1996) suggests that, when dealing with organizational problems, we sometimes need to alter our assumptions, rules, or paradigms and develop new theories about our surrounding environments and ourselves. To develop oneself as an effective organizational leader, Quinn argues, is to develop a new self. Quinn’s notion of deep change parallels Mezirow’s (1991) concept of transformative learning, which he defines as “the process of learning through critical self-reflection, which results in the reformulation of a meaning perspective to allow a more inclusive, discriminating, and integrative understanding of one’s experience.” Stimulated by Mezirow’s (1978) provocative study of women’s re-entry into community colleges, this focus on transformative learning and the need for “inner work” is reflected in other forms of professional development and continuing education as well (Cranton, 1996; Dilworth & Willis, 1999; Palmer, 1998). Integral to transformative learning is integration of the learning task with learners’ biographies and experiences. Such integration provides opportunities to reconstruct meanings associated with these experiences and the contexts in which they took place. According to transformation theory scholars, this process may lead to fundamental changes in one’s sense of self (Dirkx, 1998) or in broader social structures in which one’s life is embedded (Cunningham, 1998).

Much of the research and theory, however, has focused on the nature of experiences and cognitive structures associated with the meaning-making processes characteristic of transformative learning (Cranton, 1994; Mezirow, 1991). For the most part, these studies have paid relatively little attention to the specific contribution that content or subject matter and the instructional methods make to the transformative learning process (Taylor, 1997). This lack of attention to content in transformative learning is curious, given its almost universal presence in educational and training programs. It is our belief that content is not merely incidental in transformative learning but can actually mediate the process of inner work, transformative learning, and deep change. In leadership development programs, this content often reflects an emphasis on concepts of leadership. Connecting these concepts with learners’ lives through experience-based learning strategies can help create learning environments that contribute to meaning-making and transformation (Dirkx, 1998). Palmer (1998) argues, “[W]hat we teach will never take unless it connects with the inward, living core of our students’ lives” (p. 31). The idea of transformative learning as inner work is not merely a narcissistic, me-oriented perspective. It recognizes that “the work of the world” can only be accomplished through a deep sense of personal identity and integrity. Palmer (1998) refers to this process as doing the outer work through an inner journey. O’Reilley (1998) speaks of a pedagogy that allows the spirit to come home, “to Self, to community, and the revelations of reality” (p. 3). We can only be open to the needs of the world if we are open to a deeper awareness and understanding of our selves.

To better understand how we might design and implement such environments, however, requires us to attend to critical elements of the pedagogical context (Pratt, 1997). It is this problem that shaped the focus of our study. Our focus was on developing a better understanding of pedagogy as transformative. We were interested in the dynamic interplay among instructor’s beliefs, the teaching methods used, the content, the learners’ perceptions of their experiences, and how these features contributed to an instructional environment characterized by a potential for inner work and transformative learning. We sought to understand the beliefs, assumptions, and values which guided the instructors’ practice, and how they viewed their pedagogy as transformative. We were also interested in understanding how the text or subject matter connects in a deep way with learners’ lives and how the methods employed facilitated this process.

Research Design

The context for this study was a professional development experience for individuals pursuing graduate study in educational leadership. Both instructors included in this study espoused ideals consistent with the aim of fostering transformative learning. The study utilized an interpretive approach aiming to understand actions and meanings in particular contexts (Muncey & McQuillan 1996). Our approach to this study was open-ended, allowing themes and emphases to emerge from the observations and the data, rather than specifying from the start particular relationships or expected outcomes. We began this investigation with an interest in students making sense of instructional content but, beyond that, we were not sure where our investigation would lead. An ethnographic approach was selected as the most appropriate research methodology because our focus was on the social and cultural context of instruction within a particular setting, the various ways in which meaning came to be construed, and how these meanings
shaped and influenced the participants behaviors in this context. As Muncey and McQuillan (1996) suggest, our methods were not "just relying on interviews, but drawing on observational data and cultural artifacts" (p.297). Our time commitment to this context was consistent with similar ethnographic investigations of educational contexts. One of the authors immersed herself in the context, enrolling in the classes and taking field notes related to instruction on a continuous basis. This participatory approach provides the advantage of the insider’s perspective on the continuity of classroom events across time. While questions of bias can be raised, we believe multiple sources of evidence address these concerns.

The setting consisted of the classroom instruction of two teachers of a graduate program in educational leadership at a large midwestern university. One of the instructors1 is a white, middle-aged man while the other is a woman of color, also of middle-age but several years younger than her male counterpart. Both are well established in their academic careers and are well respected in their respective areas of study. Both instructors are well-known by students and colleagues as utilizing deeply engaging pedagogical practices. They described their own practices as aiming toward transformative learning. The masters level courses selected for inclusion in this study were: Organizational Theory, Leadership and Organizational Development, and Schools, Families & Communities. These courses represent a critical aspect of the leadership development program in this institution and they are exemplars of how these two professors model the patterns of transformative pedagogy in their instructional approach when teaching leadership.

Data collection occurred over nine months and included participant observation while attending all the class sessions and document analysis (syllabi, tentative agenda sheets, handout materials, students written works). In-depth interviews, lasting approximately 90 minutes, were conducted with each professor and a selection of students who were engaged in the same experience at the time. The course materials and instructional approaches were the same for all students. We used a convenience sampling of students, based on their availability at the time of interviewing. Both professors and students were interviewed after completion of the courses. All data were subjected to ethnographic analysis, examining and comparing the data embedded in the interview transcripts, documents, and observation notes in a way which allowed us to identify themes characterizing the instructional approach used by the professors. These themes, in turn, helped describe the observed instructional environment and allowed us to make some conclusions regarding its implications for professional leadership development.

Findings

Our findings are represented in five key themes which characterize these instructional settings. We will identify and briefly define these five themes. Then, through discussion of particular case vignettes, we will further illustrate their overall nature and how they contributed to the transformative pedagogy practiced by these two instructors. While we present and briefly discuss these themes separately, it is important to realize that, in reality, they are all intertwined within the complex and dynamic environment of these instructional settings.

The five themes that emerged during the analysis of data and which described key features of the instructional environments were: (a) leadership viewed as a field of inquiry, (b) opportunity for students to explore new roles, (c) presence and processing of social conflict, (d) opportunity for action and reflection on that action, and (e) the creation of myths and rituals within the learning setting. The instructors use their curriculum in a way that conveys a sense of leadership as a field of inquiry. In studying leadership, learners name and explore complex relations within their real jobs and as those relate to themselves. For example, in the class on organizational theory, leadership concepts helped learners unpack the structural, symbolic, and political frames of organizations. The instructors use these concepts as a framework to consider issues around leadership. The concepts are introduced by means of propositions structured in the form of experiential exercises, selected and ordered by the instructors so that learners' experiences in class were associated with certain concepts of leadership. Research and theory is used as a lens through which to understand and makes sense of these experiences.

The instructional context also provided participants with opportunities to experience situations in new ways. Through a variety of instructional strategies, the students encountered and lived through new roles, which often differed and contrasted with those in which they lived in their daily lives. Students' beliefs about self and their understanding of educational leadership were challenged by means of those experiences, which involved the probing of new roles. The learning environment we studied was also characterized by the surfacing and processing of conflict within the group and among its members. The instructors believe that, in a transformative environment, the

1 Although our oral agreement with the professors did not include a pledge of confidentiality or anonymity, we are using pseudonyms as the professors' names. We are also using direct quotes from the interviews.
experiencing and processing of social conflict by the students is critical to the whole learning experience. Their approaches stressed the need for students to experience novelty, ambiguity, and anxiety under unpredictable circumstances. The various ways in which instructional strategies were selected and used reflected this overall commitment to the value and significance of conflict in the development of leadership skills.

Engaging learners in action and reflection on that action was also a critical dimension of these instructional environments. As one instructor put it, "Educational leadership is about action." If educational leadership is about doing, than it has to have a pedagogy that allows learners the opportunity "to do and reflect on their actions; in all instances, the real material of the class is as much the experience of the students as it is what their reading is." Participants were consistently involved in experiential activities, which authentically engaged them in real and concrete organizational and leadership issues. A significant dimension of their learning experiences involved reflection on and processing of the actions in which they were engaged. Finally, pedagogical practices in these contexts involved the creation of rituals and myths within the formal learning setting. Active forms of imagination, such as myth, symbol and drama, were used to surface, name, and interpret meanings associated with the learners’ own work experiences, the new roles they were experiencing in this setting, and the conflicts that ensued around these active and reflective forms of learning in which they were engaged.

In the following two cases, one from each instructor's practice, we will illustrate more fully each of these themes and how they are actually interwoven within this instructional context. In this first selection, these five features of the instructional environment reflect Malcolm’s commitment to the use of image and symbol as a way of making sense of our experiences of leadership and what we are learning through its formal study.

Case 1: Drama and Symbol of "Organizational Stories"

When introducing the students to different frames of organizations in the course on organizational theory, Dr. Malcolm used an approach which is described in the literature as "organizational stories" (Ochs, Smith, & Taylor, 1990). She would not view them as monologues or cultural artifacts but would focus instead on how they are told and on the meanings, identities, and ideologies that emerge in the process of telling them. The stories can be told both verbally and non-verbally, so that myths and rituals can be created within the space and time of a session. An example of using the creation of myths and rituals is "A Close Examination of Culture" session. The idea here was to introduce the content - the concept of the cultural frame of organizations - in ways that make immediate and fundamental sense to the students. Malcolm introduced the word Ecotonos as an analogy for the multicultural nature of a society, an environment formed by overlapping, adjoining communities. This session was a drama played by different groups of students, spatially arranged in circles. Each group had to think about and represent attitudes, beliefs, time orientation, and kinesthetic space that were characteristic of exotic communities they were representatives of: Anthiens, Delphinians, Aquilians. While the first represented the nurturing, peacemaking attitudes, the Delphinians resembled a modern American culture which is more individualistic. The last group lived "by examples of our Father" and related to the family ties.

Within their assigned "culture," the participants had to understand the language of artifacts (daily agendas, rituals, tasks), language of time (the one lived referring to the values of the past while the others might have been oriented into the future), and language of space (physical kinesthetic relationships). Representation of this sort, it was thought, aims to push the students to understand organizational culture beneath all the structures of the cultural environment and to present their understanding as a metaphor to the rest of the class in a creative way. By drawing on the image, which symbolized the culture, the students were to apply their metaphor to a concrete task that the professor passed around. The task was given in a form of a case study and was entitled The New Plant Site. The different "cultural communities" were to determine the best site for the new plant. Time was of the essence in the student decisions. Space was another critical dimension in relationships between the students. There was a certain spatial language within each of the cultures - gestures, distance between the speakers, etc. So part of the story here was exploring how things work in different cultural contexts, and one reason for that, presumably, was to get some perspective on how "to assess the cultural/symbolic tenor of the organizations where students work" (excerpt from the course syllabus).

By means of such a game-session, Malcolm was modeling the analysis of the organizational cultural language for the students to understand; What is going on within the "cultural community"? In the assignment sheet, she described the purpose for such a class: "This is a purposeful activity that asks you to employ the chapters of Bolman & Deal, and Morgan to articulate: What we do, How we talk (utilizing specialized language), Reveal the tangible objects, Examine the use of space and time, and Assess the levels and kinds of participation with attention to diversity and forms of leadership." This excerpt shows how the subject matter or the formal text of the theoretical
course—the concept of the cultural frame of organizations as interpreted in books by Bolman & Deal and Morgan—are explored by means of applying the concepts of leadership to the student experiences as a framework for analysis. This framework has its spatial, temporal, and material dimensions, which manifest through social interactions among the students and are amplified at the interface of the individual and the social meaning making processes.

On the one hand, while moving back and forth between individual perceptions of the culture being represented and the contradictions of instructions given in the assignment cards to different groups, developing a group metaphor and confronting the opposite beliefs from "other cultures", the students developed novel meanings of selves. Excerpts from the student interviews reflect this finding: " [The activity] was good for me because I learned about the lack of my knowledge about myself."; "When you are going to interact with somebody, you can't put your own perceptions on that person. I felt that's what the professor was trying to get us to click on. I think a lot of that is coming from my own being a Native American, from my native environment. It's crucial to that learning... I use a lot that we did in class in my work with [residence assistants] where we have to communicate, to interact, and to listen to everybody."

On the other hand, by virtue of creation of "the space of shared boundary" (Briskin 1996), while exploring the organizational culture, the students were also developing novel meanings between them. In Eisenberg's (1990, 142) terms, they were not only focusing on any one individual's "compliance-gaining strategies", but rather were investigating the emerging pattern of group behavior and its influence on decision making process. All players of this drama were exposed, in a metaphorical way, to a controversial situation (e.g., a school board meeting), thus illuminating the complex issues of what it takes for teachers to take leadership to do the best for kids. This would be an example for a dilemma which may be faced by the students in their real work organizations and which is modeled by the professor in class by means of an experiential activity that involves much of the participants' imagination and metaphoric thinking.

This case selection represents, in a dynamic way, the five themes which characterized the instructional environments observed: inquiry into the phenomenon of leadership, opportunities for the experience of new roles, engaging and processing social conflict, and acting and reflecting on that action. Dominant throughout this instructional setting was the use of images to deepen understanding and meaning of these experiences (Dirkx 1998). The next case selection also demonstrates the presence of these five themes but how they are dynamically inter-related within the broader issue of naming and processing conflict. Johnston believes that this is achieved by creating instructional environments, which get learners out of their comfort zones.

**Case 2: “Crossing Comfort Zones”**

In his instructional approach, Dr. Johnston focuses on differences among people within organizations, and how they struggle with each other's attitudes when making decisions. He is convinced that social and personal conflict promote change in the structures of society, in organizations, and in the individual's psyche. According to Johnston, the responsibility of leadership is not to suppress conflict but to surface it, deal with it, manage it, make it productive. Within his course, an arena for experiencing ambiguity and surfaced conflict was the Bone Game, adapted by Johnston from the Indian folk tradition. The interviewed students mentioned this game as one of the strongest experiences of the course. Many limitations of the game rules (e.g., separate location of the groups; communication between the groups only through a representative; one person talking at a time) engaged learners in a series of conflicts. These conflicts revolved around communication, finding ways for collaborative decision making, and dealing with their own individual assumptions that had been roughly tested. As the interviewees recalled, some students look exasperated and some felt pushed by the rules to feel guilty for "every injustice on the earth."

The idea here involved the learner choosing these feelings and consciously, taking the focus off him or herself and how he or she feels in class, and placing the focus on the feelings of those group members who were trying to share their experiences with the learner. In other words, learners were being asked to concentrate more on identifying with the worlds of others. As one learner described his impression of the experience, "It was a very powerful experience. We were forced really to work together, and there was no way to go around it, no way to hide from that... It was long, it was tedious, I was really embarrassed some times." These observations reflect those of Scott (1991), where people "entered into the action-reaction-reflection process; they became aware of the distortion of their assumptions through the action of those assumptions and reflection through critique." The whole class was so engaged in surfaced these sociolinguistic meaning perspectives that they forgo their break. At the same time there was a lot of anxiety present in the instructional setting. "Still", the same student suggests, "I really wanted to get this experience what this was supposed to be. I was getting [at times] into frustration and, sometimes, anger...
But I felt pride of accomplishment. My anger and my frustration were worthwhile." In this situation, students were frustrated with the way messages were sent and received, and the meanings that were spoken out in different languages by learners who had different intentions, feelings and desires. These processes seem critical to a deeper understanding of transformative pedagogy.

In a different way, this case selection also reflects the dynamic interplay of the five themes discussed earlier. Both Malcom and Johnston structure the study of leadership as a form of active inquiry into one's experiences, both in the classroom and in one's own practices. They both also rely on the creation and experience of new situations and roles as a means of mediating that form of inquiry. In this case, however, Johnston uses differences among participants to surface, name, and process conflicts that are clearly evident within the learning experience. The processes used to act on and reflect among these conflicts is an attempt to mirror how one might understand and approach differences and conflict within organizations. While Malcom stressed the use of imagination and creatively construing meaning from learning experiences, Johnston emphasizes a more reflective approach. Yet, his use of indigenous practices also reveals his commitment to myths and rituals as a means of structuring and shaping the meaning of the students' experiences.

Discussion

Beyond the dynamic interplay of the five themes discussed and illustrated in the previous section, the analysis of the instructional setting investigated in this study suggests some key dimensions of a transformative pedagogy. As it is illustrated in the practices of these two instructors, transformative pedagogy involves the construction by the group of learners of a metatext. It is this metatext, rather than the formal text, which serves to mediate the transformative experiences within the setting. In engaging in an active, reflective, and imaginative inquiry of leadership, participants construct a text which itself becomes the focus of study. This metatext, resulting from or arising out of these activities, represents the common or shared meanings that the group-as-a-whole has constructed and provides further focus for both individual and collective inquiry into the meaning of the experiences being derived.

It seems clear that this metatext results from imaginative and creative engagement with both the formal text and with each other's lived experiences. Participants—teachers and learners alike—have to have some way of making sense of the material that is put forth within these contexts, some means of integrating it within their own frames of reference (Mezirow, 1991). The use of stories, myths, and rituals provides the basis for participants to engage this "content" on their own terms, yet within a "vocabulary" that is common to the group. Finally, the metatext and its imaginative construction provide the means for engaging in the difficult but necessary inner work involved in deep change (Quinn, 1996).

We can think of the content that is negotiated in the group and the meaning which is to be constructed by the students as representing what Palmer (1998) refers to as "outer work." But to confront the process of deep change, the teachers need to engage participants in a process of negotiation of this text in ways that would be most authentic to their "inner journey". This "inner journey" implies one's questioning of the current assumptions and beliefs. It resides in one's own real life contexts, and has a potential to foster significant change in ways in which one thinks and acts. Strategies to embark on such a journey can be found in the pedagogy of drama as well as in the ancient ways of performance embedded in different cultures throughout the world. This aspect was evident in the Bone Game where participants exercised new roles, often in situations of discomfort and anxiety, even conflict. The situations of social conflicts, simulated by the instructors in a certain sequence and organized around certain issues of educational leadership, fostered the students' inquiry into the self and, by virtue of this, a more intensive inquiry into the issues and controversies of leadership.

This notion of a metatext, constructed through imaginative and creative engagement with the text and each other, and mediating inner work and deep change, addresses one of the most challenging aspects of leadership in this era of rapid and pervasive change. It helps us understand how, in leadership, constructive action can occur under conditions of limited shared understandings. We have seen that such conditions are increasingly the hallmark of this era of change. Yet, the processes described here provide us with a sense of how participants may derive satisfaction and meaning, even in situations where experience does not follow the norms of communicative clarity and openness and may involve only minimally disclosive exchanges. The metatext, a product of the work of the group-as-a-whole, represents something powerful enough to allow group members to derive meaning and satisfaction from acting together. The transformative pedagogy described here to foster leadership development relied not on a strong degree of certainty, instrumental learning, and technical-rational problem solving, but rather coordinated action and the balancing of autonomy and interdependence in organizing action. Eisenberg (1990) refers to such processes as jamming, analogous to improvisational, coordinated actions in music and sports.
Thus, what participants are learning through this form of transformative pedagogy is that leadership involves a high degree of improvisation. It is through this act of jamming or improvising that the real work of leadership is carried out, in a way similar to how the groups observed here constructed a metatext. Like jamming, one cannot predict ahead of time what the outcome of the activity will be, but, if participants enter into the process in a spirit of reflective inquiry, are open to novel experiences, and authentically and imaginatively engage the task and each other, music will result. The difficult part is that educators may not feel prepared to deal with what might be uncovered in the process of individual and collective critical reflection on psychic assumptions.

Implications for Leadership Development and the Practice of HRD

Leadership development as transformative pedagogy implies a shift in instructional emphasis from structure to process. This shift also involves a move from enforcing the learners’ competence to engaging them in actions or improvised performances that would allow them to develop familiarity with the dialectics of the ongoing processes of interpersonal and within-group relationships in all kinds of communities of practice. A series of performances can become a series of mediations into the learners’ study of self. These performances can help learners gain insights into difficult personal and organizational issues (the formal text) confronting leaders today (Quinn, 1996). In this view, creating learning environments assumes a change in the perspective of the training environment, from static structures to “sociosymbolic fields” (Turner, 1986, p. 21). That is, pedagogical contexts are seen as more than locations for instrumental learning and technical-rational problem solving. Rather, they represent specific contexts in which and through which participants are able to construct or reconstruct individual and collective meaning, through the presence of symbols and images which constitute this location of learning. Formal text, like the issues and controversies of educational leadership, can be introduced and negotiated through symbolic action, the genre of which would be shaped by both instructor’s beliefs about the text and learners’ conscious reflecting on cultural representations in which those issues and controversies of professional leadership are embedded. The symbolic messages and signals, which learners exchange inside the frame of the selected activities, designed by the teachers and improvised by the students, rely on the students’ real life contexts. They serve to build a projective system, a shared meaning perspective—a metatext. In turn, this metatext functions as a pedagogic tool, providing data for further student reflection on and analysis of self.

It is still often the case in the field of HRD that focusing too much on bottom line results ignores the feelings and exploration of self. As Swanson and Arnold put it (1996), “a line is sometimes drawn between those who view HRD as tied to business goals and focused on the bottom line and those who would like to take a more humanistic stance” (p. 17). In this study, we described an instructional approach to leadership development that has the potential to bridge this gap. It invites participants to embark on leadership development as doing the outer work through inner work, relies on their imagination and creativity, and provides opportunity to experience the power of symbol and ritual embedded in the collective reflecting on the instructional content. This work represents an exploratory venture into the possibilities of transformative pedagogy for leadership development. We are only on the cusp of a fundamentally different way of understanding learning for organizational leadership.

The Added Dimension: Using the Learning and Change Model as a Means for Understanding Professionals' Performance

Brenda Edgerton Conley
Johns Hopkins University

Sharon J. Confessore
George Washington University

This study describes the change and learning process as it relates to professional practice among a selected group of 24 school principals. It identifies patterns of change and learning. The study uses a qualitative approach similar to the study of change and learning among physicians conducted by Fox, Mazmanian, and Putnam (1989). The study presented an additional factor to the investigation of professionals' learning by attempting to discern the differences in learning of designated "successful" and "unsuccessful" professionals.

Keywords: Learning, Performance, Professional Development

Improving professional practice is a major concern of all professional groups, and providing effective mechanisms for this improvement is a critical task of HRD practitioners. Improving practice is linked to educational activities and learning events. Thus, for the most professionalized occupations, such as law and medicine, as well as the quasi-professional occupations, such as education and management, it is expected that all individuals will continue to learn, and that this learning will accrue to better professional practice (Cervero, 1990; Houle, 1980; Nowlen, 1988).

Fox, Mazmanian, and Putnam (1989), in an investigation of physicians, theorized that professionals continue to learn because of changes in their lives and their practices. They proposed a theory of change and learning and an accompany model for this process that can best be described in the following statements. The model assumes that professionals have the capacity to develop a plan for learning and to develop capabilities to make needed changes in practice.

1. The change process begins with an intrinsic or extrinsic force.
2. After the professional accepts that the force for change is important, a mental image of what kind of change is necessary develops.
3. With this change in mind, the individual judges the extent to which he or she is able to make the change, whether or not the present level of knowledge and skill is adequate compared to the level of knowledge and skill needed to make the change.
4. If he or she believes his or her capabilities are sufficient, the change is made. If not, a plan for learning to develop capabilities to make the change is pursued.

They studied what, how, and why physicians change in their personal and professional lives and the role of learning in the change process. Their findings essentially reversed the usual model of training, where the learning intervention is presented, and the change in practice occurs as a result of the intervention. By focusing on the changes that occurred in the physicians' lives, they determined that the size or impact of the change (accommodation, incremental or structural) and the force (personal, professional, social) that caused the change, influenced the amount of learning that would occur. A host of similar studies, each focusing on a different professional or quasi-professional group (Confessore and Smith, 1997; Fox and Harvey, 1994; Katzman, 1996; Price, Knowles and Confessore, 1993) substantiated these findings. However, there were some unique characteristics by profession. Price (1997), for example, in his study of architects found that while the patterns of change and learning are similar to those of Fox, et al., experience and the culture of the professional also frames the changes that professionals initiate, and as a consequence, the learning that will occur.

Improving practice is a key purpose of continuing education, both formal and informal. These studies provide much rich information describing how professionals learn, and gives us some insight into the triggering events that cause learning to occur. What they fail to do is directly describe or help us understand how professionals' learning experiences can be linked to their performance as professionals. This is the central problem.
addressed by this study: Whether Fox et al.'s theory of change and learning can be used to identify distinctive learning among professionals categorized as being in “successful” or “unsuccessful”.

This categorization of “successful” and “unsuccessful” acknowledges that school performance is determined by more variables than just the performance of the principal; however, substantial research evidence demonstrates that the principal is key to the success of planned change, school improvement, and effective schools (Murphy and Beck, 1993; Fullan, 1991). Principals are expected to transform schools into collegial environments where effective teaching and learning take place. In this environment, an individual principal’s performance evaluation is inextricably tied to school performance. In this district, for example, principals’ whose schools failed to meet standards set by the state after three years were dismissed from their positions.

Methodology

The research was designed to answer three primary questions: (1) How do principals, as professionals, learn and change; (2) How do successful and unsuccessful principals describe the change and learning process; and (3) Is it possible to discern differences between the two categorizations of principals?

Setting and Selection Criteria

The study took place in a large urban school district in the Middle-Atlantic region of the United States. The district has 122 elementary schools and 60 secondary schools. The sample was drawn from the 122 principals assigned to elementary schools. School principals were selected as the population for this study for a number of reasons. Principals, as school administrators, are expected to transform schools into collegial environments where effective teaching takes place. Fullan (1993) declared that managing school change and improvement is one of the most complex tasks of school leadership. As school reform efforts around the country continue to raise expectations for principals’ performance, the demands and expectations for principals as individuals increase. While the public school system is a very unique context, the roles, duties, and expectations for its leaders are very similar to corporate organizations. The principalship is seen as a quasi-professional occupation, placing it at the lower end of the professionalization continuum, as described by Cervero (1988). The site was selected because the district had been selected to participate in a state-mandated school performance program, which utilized a comprehensive and complex process for assigning performance ratings for each school. This provided a consistent means for determining “successful” and “unsuccessful” categories. To determine these categories, the State Board devised school rating list was obtained. The list was then divided into quartiles, with the 1st quartile being designated as successful and the 4th as unsuccessful. Only those principals who had served in a school for three years or more were included in the sample, insuring that no principal was assigned to a school after the state index categorization had been established. Fifty-three of the district’s 182 principals met the above criteria, with 26 falling in either the 1st or 4th quartile.

Data Collection

Interviews were conducted with 24 of the 26 participants. The interview protocol devised by Fox et al. was used for these interviews, with minor changes made to the language to reflect the professional circumstances of the principals. The Fox protocol includes 26 structured and semi-structured interview questions, and a prompt sheet. The prompt sheet provides examples of potential areas of change, and was developed by Fox et al. (1989) to provide some probing questions to help respondents remember the changes that had occurred in their lives or in their professional activities. In addition, demographic data was also gathered, including gender, age, and length of service with the district. All interviews were audio taped and transcribed. Interviews lasted approximately 1 to 1 ½ hours.

Findings

Principals’ change and learning

Principals reported all three types of changes: accommodations, incremental, and structural. Accommodations are small, simple acts of adjustment in practice, where very little learning occurs. The principals
reported the fewest number of changes in this category. Examples of this type of change include checking the fax machine more often to respond to the central office more immediately than before, or learning how to complete new reports. Incremental changes, requiring adapting to more complex situations or new information, accounted for the most changes with these principals and included examples such as sharpening mentoring skills to improve quality of work with new teachers and developing strategies to decrease the number of hours spent working on school assignments at home. Finally, the principals also reported structural changes, or very large, complex changes. These changes often involved major life events and led to the most in-depth learning experiences. Examples of these types of change include the decision to retire or to implement a complex professional development system for the faculty of the school.

The data were also analyzed in terms of the forces for change that the principals reported. Personal-professional forces most often precipitated the accommodations. These are situations where the impetus for change was largely for personal reasons, but was also related to the principals' work. For example, a principal reported the need to be better organized in her personal life in order to be able to respond to the many inquiries and requests for information that she confronts daily. Incremental changes were most often associated with professional forces for change; situations where the principal made a decision to change practice in order to improve professional practice. An example of this type of force and the resulting practice change occurred when a principal stated, "I have participated in activities designed to sharpened my mentoring skills to improve the quality of my work with new teachers." Finally, structural changes were most often associated with personal forces, such as when a principal described fundamentally altering the way that she did her job to incorporate new ways of thinking that she learned in formal courses.

When analyzing the types of activities the principals reported and the considerations they made when determining the learning activities they would choose, four factors emerged: (1) the principals' perception of the complexity of their professional environments, (2) the structure of the school system, (3) how much time they felt they had to learn, and (4) the principal's own assessment of current knowledge level and learning needs. The principals reported being very limited in the amount of control they believe they have over their own essential practice decisions. One can speculate that this lack of professional control may be a strong influencing factor in their self-perceived capacity to engage in their own learning.

When talking about the changes that they undertook, the principals did not report having a clear image of the desired change. Principals described their work environments as ones where they had limited control over their work tasks and even less ability to determine the priorities for their schools. Thus, their descriptions of change and learning were very reactive—there was limited planned response to the changes, and apparently no opportunities to consider their own learning "gaps."

**Differences between successful and unsuccessful principals**

In analyzing the data by category of principal, no differences were found when a simple count of the numbers or types of changes was made. Similarly, in analyzing the transcripts, there did not appear to be any substantive differences between the groups when they described forces of change that precipitated the learning. It was possible, however, to discern differences in (1) the amount of learning the principals reported as a result of the change; (2) the way that successful and unsuccessful principals described how they organized and planned their learning activities and (3) the way they attributed the need for the incremental type changes.

Unsuccessful principals reported making changes without any learning occurring while the successful principals reported that they learned from the changes. They also reported a greater use of deliberative learning methods, defined here as those that emphasize thought over action, to make changes regardless of the type of change that occurred.

In describing their incremental changes, successful principals talked more frequently about making these changes for internally driven reasons, such as the desire to be more efficient, while unsuccessful principals, in describing their incremental changes, attributed them more to the effects of the external forces inherent in the job, such as being "forced" to introduce new faculty development programs.

Although none of the principals appeared to be especially proactive in their pursuit of their learning opportunities within the context of specific practice situations, the successful principals more often reported seeking out opportunities for generic learning, meaning that they engaged in activities such as taking courses at the local colleges, or enrolling in doctoral studies so that they could improve their practice and become more effective principals.
Conclusions and Recommendations

The purpose of this study was to determine if it was possible to discern differences between the change and learning behaviors of quasi-professionals who had been categorized as successful or unsuccessful. The Fox et al. (1989) theory of change and learning did prove to be an effective means to distinguish the motivations and type of learning activities of successful and unsuccessful professionals, the model did not adequately account for situations where professionals believe they have limited control over the conditions of their work, where they lack respect from their constituents, and where the time of professional training is short and the knowledge base is neither complex nor specialized.

The patterns of change and learning the principals are similar to those discovered in the study of physicians; however, important differences were found. Most notable was the lack of new learning associated with the changes made by the principals. This lack is attributed to the principals’ perceptions of lack of control. Unlike physicians, the principals believe they have very little control over their work environments and conditions for delivery of services. In contrast, the physicians in the Fox et al. study were very autonomous in their practices. Although managed care is changing this sense of autonomy, physicians’ work is still focused on meeting the needs of individual clients while principals are generally responsible for multiple constituencies many of whom are outside of their immediate control.

Similar findings were also obtained in related studies of architects, teachers, and real estate professionals. Their change and learning behaviors were consistent with the original physicians’ study. However, as with the physicians, these professionals report a high degree of autonomy and personal control over their professional practice, and the issue of “reactive learning” does not seem to occur. Thus it appears that this belief of lack of professional control may be a strong influencing factor in the capacity of principals to effectively learn from the changes presented in their practices. Smith’s (1997) study of change and learning of real estate agents is particularly instructive, because Smith used a population of individuals who can be categorized as less professionalized than principals. She found great similarities in the learning behaviors of these individuals and those in the most professionalized occupational groups. Again, these individuals had very great autonomy in the conditions of their professional practice—perhaps the most control of all of the professions who have been studied.

Another factor that may account for this difference is the lack of extended professional preparation, and general lack of respect of society for the principals. Smith (1997) found that the real estate agents were distinctive in that they sought opportunities to learn “how to be a real estate professional.” She speculated that this need was driven by the fact that real estate professionals are poorly trained, and are not particularly respected by society. Principals are similar in both of these regards. The knowledge base needed to perform effectively as a principal is not sufficiently distinctive to be perceived by the public as complex and specialized. Because principals lack the extended training of traditional professionals, including “a set of values, preferences, and norms which they use to make sense of practice situations, formulate goals, and directions for action and to determine what constitutes acceptable professional conduct” (Schön, 1988, p. 33) they may feel more pressure to respond to all demands of the varied constituencies who believe they have a right to direct the activities of the principal. At the very least, they are poorly prepared to undertake the role of principal, particularly at a time when schools, and their personnel are under attack as failed organizations, subject to extensive pressures and demands of a society who spends large amounts of tax money to support them. Thus, this “reacting” behavior may be the only way that principals can even begin to meet these professional demands.

Intriguingly, the finding that the only real difference between the successful and unsuccessful principals was the greater amount of generic learning reported by the successful principals supports this assertion that perceived lack of control is a key issue for change and learning of the quasi-professional group. It was clear that the successful principals were aware that they had limited opportunities to control and influence their work environments. They believed that theoretical knowledge would help them to get the job better under control. Thus, these learning opportunities were a way to find some control, even help them become more pro-active in their practice.

Implications for HRD Practice

The circumstances of practice encountered by corporate managers are similar to those of school principals. Management can be categorized as a quasi-profession, whose members are faced with many demands and little control over their work situations. Similar to principals, managers lack a coherent knowledge base and generally are not highly respected by the larger society. The findings from this study provide an intriguing perspective to address the lack of learning by managers. These findings suggest that learning is inhibited by the speed of the changes and
the complexity of the environments. This is a particularly important, because the workplace of the new century is increasingly complex and the rate of acceleration of change is undeniable.

It appears that the Fox et al. framework for studying professionals' learning provides HRD professionals with a means to investigate the specific learning needs of their managers. The finding that successful quasi-professionals utilize generic learning activities to help achieve some sense of control and mastery over their professional practices provides one way to begin to develop learning programs for managers. Once the HRD professional understands the forces for change and then learning, they will be able to devise mechanisms and strategies to help managers understand their learning needs.

Learning as a key to improving professional practice is a fundamental premise of HRD. By linking performance to the change and learning model, a critical dimension to understanding how to best help professionals is added, helping to improve the practice of professional managers.

Recommendations for Further Research

This study provides the most basic first steps to understanding differences among professionals' learning needs and proclivities. Further research is needed to expand this initial work. Specifically, we recommend:

1. That this study should be replicated with other quasi-professional groups. In addition, the designation of "successful" and "unsuccessful" professionals was done using a mechanical and somewhat artificial mechanism. A future study, using other assessment tools, would provide an alternative means to define effective practice.

2. While the change and learning model held in terms of forces for change and types of change, the idea of public perception of profession as an influencing learning factor is intriguing, but highly speculative. Other studies focusing in this area would provide important additional understanding of professional's learning.

3. Finally, better understanding of how to improve the practice of school principals is an important national priority. The Fox et al. model appears to have efficacy as a mechanism for understanding how school principals learn. More work needs to be done with larger and more diverse populations.

A Methodology for Narrative Inquiry: Examining the Role of Narrative in Framing for Action

Nancy Lloyd Pfahl
College of DuPage

Narrative inquiry is a research methodology that beckons a researcher as interpreter, artist, and composer (Price, 1999). This paper builds a case for using narrative inquiry to examine the role of narrative in framing for action in an organizational context. It presents (1) a conceptual framework for interpreting the methodology and (2) an innovative research model. The methodology has evolved narratively as the researcher has used it to examine the contribution of narrative processes to learning how to change. She expects to complete this doctoral study in the spring and encourages others to adapt its methodology in other organizational settings.

Keywords: Narrative Inquiry, Learning from Experience, Organizational Learning

We all know from daily living that sometimes we learn from our own experience and from the experience of others. In our professional practices we frequently recount what has happened, describe what we have been engaged in doing, and tell others what we hope to do and how we plan to do it. Very often, however, we find it challenging to explain how things actually happened, even when we have achieved desired results. Connecting past, present, and future events narratively is one way of making the meaning of what has happened more accessible. When we engage in this kind of dialogical exchange, sometimes we tell stories. Stories trigger new insight that differs from learning that emerges from analysis. These different thought processes that lead us to adopt beliefs fall into at least two categories, first differentiated by Bruner (1986) as analytical and narrative.

Analytical and narrative processes each assume an epistemology of the nature and grounds of knowledge. Analytical processes are linear patterns of thought that follow rules of logical argument. The purpose of argument is to convince us of truth. Using analytical processes helps us understand what is happening. One familiar pattern of analysis is to separate a subject of analysis into its logical components to gain better understanding of the whole. The notion of modern scientific progress has been built on such deductive processes.

Narrative processes, on the other hand, rely upon inductive reasoning that acknowledges and values contextual elements. Narrative thinking encompasses hermeneutic processes in which story emerges as a means for interpreting relationships and action. Integration is a dominant narrative pattern that we use to create and share informative narratives that interpret reality. The purpose of story, as differentiated from argument, is to convince us of lifelikeness or verisimilitude, rather than truth. In my research I have found that examining narrative processes contributes to understanding how things actually happen in an organizational setting.

My desire to research part of this complexity led me to design the proposed methodology. Because narrative processes frequently are more intuitive than intentional, most people use them with limited self-awareness. Narrative inquiry lends itself to studying such tacit knowledge (Polyani, 1966). The act of narration seems particularly relevant to study personal practice knowledge of educators, since that knowledge often remains unarticulated (Schon, 1987). We educators frequently "know more than we can tell" (Polyani, 1966, 6). This kind of knowing includes both theoretical and practical knowledge, both the what and the how of our practice. In this case nine participants, members of an established leadership team and learning group, engage in activities that respond to the question, "How can higher education learn how to change?" (Eckel, Hill, and Green, 1998).

The research literature, however, includes fewer systematic models than I had expected (Josselson and Lieblich, 1999) for studying tacit knowledge, particularly given the pervasiveness of story (product) and narrative (process) in organizational contexts (Boje, 1994; Czarniawska, 1997). This gap in the literature led me to develop a conceptual framework to lend credence to the proposed research model. It combines both analytical and narrative thinking, supports a constructivist interpretation of experience, and leads to findings presented as story. The methodology has enabled me and my co-researchers, the participants, to understand more clearly how narrative processes have contributed to their learning how to frame for action. Just as importantly, it has contributed to reducing the volume of collected data. The latter contribution is significant, for it is the task of a writer of qualitative
research “not to gather as much data as possible but rather to get rid of as much as possible, to ‘winnow’ the irrelevant from the essence” (Wolcott in Price, 1999, 17).

This paper (1) interprets the conceptual framework from which my approach to narrative inquiry derives; (2) poses the research question addressed by the paper; (3) describes the research model and its narrative evolution; (4) presents results and findings related to using the methodology; (5) draws conclusions and recommendations for further application of the methodology, and (6) acknowledges potential contributions to HRD.

Conceptual Framework

In preparation to conduct this narrative inquiry, I first reexamined the tenets of modernity and post-modernity and their implications related to learning from experience. Postmodernity is “culture that is self-consciously and sympathetically informed by an understanding of (1) the interpretative nature of human perception; (2) the indeterminate, contextualized, and fragmented nature of knowing and being; and (3) the dedifferentiated and generalized nature of contemporary communication” (Bagnall, 1999, 5). Postmodern theory provides a particular lens for viewing the learning of individuals, groups, and organizations. It underpins my interpretation of the story of how we construct meaning in a postmodern world, how we value our experience and the experience of others, how we use language to interpret experience and to construct meaning, and how the nature of research has changed. I decided to tell you about this four-part conceptual framework before presenting my research design because my interpretation of these issues explains the research design.

How We Construct Meaning in a Postmodern World

Knowing and learning are two means available to us to construct meaning in a postmodern world. If belief and knowledge are provisional and partial at any time, and if they are determined interpretatively by a learner, then the value of trying to answer a fundamental question becomes apparent. How can researchers as learners approach knowing and learning so as to empower themselves to develop a capacity to learn in more meaningful ways? Because “it is difficult to have faith in the traditional stories” (Czikszentmihalyi, 1993, xv), a researcher must believe that identifiable processes for making meaning do exist, and must also develop and trust a personal capacity to learn how to change.

Making these two foundational assumptions motivated me to develop a narrative methodology that contributes to understanding how to construct meaning from fragments of personal experience and from the experience of others. If you and I, for example, were to experience the same event, and we both were motivated to act on the basis of our shared experience, each of us would construct coexistent, but different, meanings of our experience, each informed by the singularity and similarity of the other. Our interpretations would reflect different past experience, different frames of perception, and different ways of interpreting our shared experience. Furthermore, each of us probably would choose to act differently in one way or another on the basis of that experience. Each interpretation would be true within the inter-subjective, linguistically mediated frameworks of our beliefs (Bagnall, 1999).

Working with teams of educators in my resource development practice, I have learned that making meaning of experience requires viewing the world through two different lenses and then interpreting and merging the related images into a perceptual collage. This process reflects selected aspects of a flow of thought from modernity to postmodernity. Movement in the figure that follows this discussion reads from left to right through past, present, and future time, from analytical thinking and problem solving, to narrative thinking and storytelling. As we move along this spectrum from deductive to inductive modes of reasoning, our motivation to act changes. As our motivation to act changes, we tend to select different means for learning. Multiple interpretations of what is happening become more plausible than a single representation, a consequent recognition that derives in part from using different means to learn, or from accepting or not recognizing deterrents to learning.

The ebb and flow of movement from analytical to narrative does not privilege one form of thinking over the other. It suggests an ecology of learning (Bateson, 1980) that balances analytical thinking, more suited to problem solving, with narrative thinking, better suited to building relationships. Using the two modes of thought affords a researcher a more holistic, ecologically sound means for interpreting the meaning of experience.

Although I have drawn Figure 1. A flow of thought from modernity to postmodernity: a spectrum from analytical to narrative as two dimensional and directional in its representation of learning in a narrative field, I want to emphasize that the analytical and narrative processes described are recursive and non-linear. They represent four
possible cycles of action, reflection/refraction, and learning: \(1+\text{CR}+2, 3+\text{CR}+4, 5+\text{NR}+6, \) and \(7+\text{NR}+8\). Action is an integral part of both life experience and narrative. Reflection is an analytical process, and refraction, a narrative process, that both contribute to learning. "All significant experiential learning is a change in a learner – a change in behavior, in interpretation, in autonomy, in creativity, or in any combination of the types of change" (Cell, 1984, 28). The significance of individual changes in an organizational context relates to how the changes might prompt action with potential to impact advancement toward achieving a mission and related goals.

Within this narrative interpretation, cycles of action, reflection/refraction, and learning occur. The cycles prompt (1) questioning; (2) renewed enactment; (3) narration of experience as a form of reflection in relationship to the experience of others, connecting that experience to the self and to fragments of a narrative whole; and (4) patterned initiation of linguistic communication cycles of storytelling and retelling. When we tell others what has happened, and we listen to their responses and to our own voice, we are using narrative processes as a way of reflecting upon experience. Very often past experience informs the present in a way that empowers us to learn better ways of mapping what to do in the future. In this way narrative helps us frame for action.

**How We Value Our Experience and the Experience of Others**

Experience is the raw material from which we construct meaning; it is an unpredictable text in a continuous state of flux. Our experience influences our interpretation of and interaction with the world in ways that contribute to learning (Cell, 1984; Schon, 1987). Once narrated, experience becomes a text that embodies potential for multiple interpretations of its content and context. Stories are "a way of exploring possible worlds out of the context of immediate need" (Bruner, 1986, 123).

Interpreting experience as both potential content and context for learning implies a particular view of learning in organizations in which action, reflection upon the experience of acting, and learning from experience have become recognized as a pre-eminent organizational learning strategy (Watkins and Marsick, 1993). This view implies an intrinsically narrative nature of organizations. Our need to understand the relationships among individuals engaged in learning is implicit in Senge's (1990) challenge that a team or group, rather than an individual, has become the learning unit of an organization (Kasl, Marsick, and Dechant, 1997).

As human development theorists have pointed out, individuals embody a capacity to change from within to the extent that they are able to access experience (Kegan, 1994). When experience is pooled in a group, the likelihood increases that change will happen. Accessing experience requires taking action, reflecting upon that action, assessing its potential implications, and learning from it by imagining other possibilities. Organizational
experience shapes and is shaped by individuals as learners and as group participants whose frameworks of belief and values becomes more clear as they work, narrate experience, and learn together.

Narrative captures experience in any environmental context. Boje (1994) and Czarniawska (1997) suggest that narrative processes play an important role in organizations. They imply what Revelas and Razik (1998) write, that not all organizations can be understood fully by using only a diagnostic view since contradictory elements continually enter any system. Within any organization, “the major mode of communication, in purely statistical terms, is in fact narrative” (Czarniawska, 1997, 21). What organizational narratives do is to capture the nomadic quality of becoming as opposed to being. “The function of the story is to find an intentional state that mitigates or at least makes comprehensible a deviation from a canonical cultural pattern” (Bruner, 1990, 49-50). If this assertion is correct, then organizational stories chronicle cultural shifts, and organizational storytellers create new ways of acting. "It is the storytellers who construct the categories-in-use, the frames-in-use, the histories-in-use, and the capitalism-in-use in their discipline and governance of organizational learning” (Boje, 1994, 434-435).

How We Use Language to Interpret Experience and to Construct Meaning

How we use language as a learning tool reflects how we view the world. How we interpret experience to make meaning of what happens constitutes learning from experience (Cell, 1984). First experiencing, and then interpreting what happens, enables us to understand our reality. Theorists in disciplines as diverse as adult learning, communication, narrative, and psychology emphasize the centrality of language to learning and meaning making. Some theorists interpret learning as a collaborative process that occurs in dialogue (Senge, 1990).

A constructivist epistemology espouses using language to acquire knowledge about the world. It assumes a difference between representation of reality and construction of reality through interpretative processes that focus upon experience. Two different ways of using language are representational and interpretative (Bagnall, 1999). Representational language attempts to re-present reality in a way that represents the truth. A modernist sensibility espouses using language in a representational way to mirror reality. This kind of thinking tends to be convergent, analytical, and deductive. It is well suited to solving problems, leading to what are perceived as correct solutions. On the other hand, a postmodernist uses language interpretatively (Ibid.). Interpretative language acknowledges that there is no single reality to re-present and constructs story. An interpretation itself becomes a reality within a framework of beliefs and values that emanate from a narrator’s life experience in linguistically mediated contexts. Narrative provides a means for conceptualizing, structuring, and presenting interpretations of individual, group, and organizational experience (Czarniawska, 1997). Using linguistic processes in narrative ways holds potential to contribute to learning (Bruner, 1986; Polkinghorne, 1988). However, “In contrast to our vast knowledge of how science and logical reasoning proceed, we know precious little in any formal sense about how to make good stories” (Bruner, 1986, 14). Contributing to this lack of understanding about narrative processes may be the complexity that story must construct simultaneously a “landscape of action” via a “story grammar” and a “landscape of consciousness,” what the actors “know, think or feel, or do not know, think or feel” (Ibid.).

Organizational narrative processes, including storytelling and re-telling, move from the particularities of one concurrent story to the next. They interpret meaning through themes, patterns, and referents that occur. The constructivist intellectual tradition “argues that experience doesn’t happen to us; we make experience. Events happen to us, but we make experience by interpreting events” (Brookfield, 1995, 182). A constructivist assumes that an individual and a group learn how to learn by experiencing recursive cycles of enactment, followed by critical interpretation of what happened, taking action again, and reinterpreting it for its meaning on another level.

How the Nature of Research Has Changed

A view of the nature of research as dialogical and collaborative flows naturally from the preceding interpretations of knowing and learning, experience, and language use (Mishler, 1986, 1990). In this conceptual framework, a researcher is no longer the knower or the voice of authority. A researcher and participants become co-researchers and co-learners. A primary human attribute, narrative knowing is a methodology for the human sciences (Polkinghorne, 1988). Through narrative inquiry, perspectives of a narrator become more meaningful, knowable, and able to be made explicit (Cresswell, 1994).

Narrative inquiry appears to be one of the “new tools for inquiry” (Revelas and Razik, 1998, 135-136), a reflective strategy to promote learning and change from within, both within an individual and within an organization. In using it I have interpreted narration and interview as discourse (Senge, 1990).
Research Question
Can the application of this research model to conduct a narrative inquiry advance our understanding of how an organization learns to change and how narrative processes contribute to that process?

Research Design and Methodology

Narrative is both the research methodology and the subject of this study. My choice of narrative inquiry to interpret the meaning of stories of experience of nine participants engaged in learning how to change seems appropriate for several reasons. First of all, I am interested in examining not only the what, but also the how of what has happened. Variables cannot be identified easily, and the topic requires examination and exploration in a natural setting. Narratives, the centerpiece of this examination of narrative processes, "are a valuable transformative tool. They allow us to communicate new ideas to others, and to discover new meanings by assimilating experiences into narrative schema" (Gudmundsdottir, 1995, 34).

Narrative inquiry aids us in understanding the "storied" nature of life experience. It is a natural, human approach, for humans exhibit "protolinguistic" readiness to organize experience narratively (Bruner, 1990, 67). Narrative inquiry offers a compatible way to study narrative processes (Reason and Hawkins, 1988). I have used the methodology to study how narrative thinking has contributed to learning how to change for professionals committed to learning from their experience in higher education. Public consensual acknowledgment, achieved through extended dialogue about how uncontrollable, changing contextual variables have rendered some traditional practices and beliefs inadequate, has contributed to their desire and capacity to learn from experience.

In designing this methodology, I aligned the research method with the research purpose to access the meaning and implications of the participants' experience. I wanted to focus on both the singularity and similarity of their experience of learning how to change by using a holistic, collaborative approach.

Preparing for Collaborative Research

Although I am a knower in my own professional setting, as co-researcher and co-learner with study participants in an unfamiliar setting, I relinquished that status. I wanted to listen to their voices and to focus on how they used language to create meaning. From my practice I understood the need for collaboration and the extent to which both context and the experience of others inform collaborative learning. I laid groundwork for interviewing during several visits to the field. During the visits I met with the learning group to observe their interaction, to discuss mutual research interests, and to tour the campuses. This fieldwork contributed to developing trust with study participants, who then felt more comfortable to speak willingly and honestly in interviews. My field experience also contextualized the methodology before I used it in the research setting.

Drawing Upon Several Research Traditions and Data Collection Techniques

Combining several traditions of inquiry -- case study, ethnography, phenomenography, and phenomenology, -- strengthens this study. To study a unique, revelatory case with organizational boundaries requires in-depth description and holistic interpretation that derives from narrative inquiry. The methodology uses ethnographic techniques and multiple sources of information within the field of the case (Cresswell, 1998). It encompasses inductive reasoning, heuristic possibilities for generating new understanding, "thick" description encompassing vast amounts of data, and the particularistic nature of each participant (Merriam, 1988). The study is phenomenographic in that it describes the meaning of the lived experiences of nine individuals engaged in the phenomenon of learning how to change (Marton and Booth, 1997). It relies upon phenomenological practices with participants reading and responding to stories to ensure they are trustworthy interpretations of their experience.

This methodology employs four data collection techniques: interview, observation, document analysis, and journaling. Interview is the heart of the research design. I have conducted three two-hour interviews with each of nine participants. I have used data from observation, document analysis, and journaling to augment the voices of the participants, who have told me almost two hundred stories that lay embedded in their interview texts.

Piloting the Interview Protocol

When I piloted the interview protocol, I was uncertain and hesitant to risk asking only one question during the first of three two-hour interviews. My approach was to lead a participant through a process of deconstruction, to
move away from institutional culture and language toward a personal perspective. In my first two pilots, I encouraged each participant to interpret experience using her own voice. When we reached a point of apparent readiness, I said, “Tell me the story of your experience of learning how to change.” I had prepared a series of prompts to encourage story flow. What I learned from these pilots was that when a researcher asks a participant about something that is meaningful, a story of that experience tells itself with minimal prompting if the researcher does not interrupt the natural flow of a participant’s narrative thinking.

Since I had considered my research role to be that of an active learner and co-researcher with the participants, and because I wanted to understand change from within, I conducted a third pilot of the methodology by simulating the process with myself. This simulation gave me better understanding of what a participant might experience during narrative inquiry. The self-pilot offered me a means for becoming more self-aware of the meaning of participating in narrative inquiry. It gave me better understanding of the implications of the process in which I had planned to engage others. It helped me internalize the extent to which narrative research prompts learning in a way that I had not experienced before. I learned the extent to which this kind of linguistic exchange reaches into subconscious memory, connecting elements of experience in new and meaningful ways through telling and retelling, through interpretation of that text, and through increased self-awareness of one’s own learning processes, the narrative processes inherent in the methodology.

In this way the methodology itself began to emerge as a narrative. My learning from the first two pilots informed my self-pilot; my learning from the self-pilot informed my first set of interviews; and each subsequent set of interviews continued to inform the next. Throughout the process, even though it has been collaborative, I have had to acknowledge my privileged position as the one person who has had access to all of the data.

**Learning How to Present Data as Story**

Collecting a body of concurrent stories from participants in an organization yields a panorama of interpretations of what is happening. Such a collection offers a potential critique of the dominant discourse or public narrative advanced and espoused by the organization (Brooks 1998). A challenge to the methodological design was how to lift stories of everyday events from interview texts, sculpting them to amplify participants’ voices so that the stories resonate with their memories. When storied interpretations of individual experience ring true, they juxtapose varied perceptions of events that are trustworthy for a local culture. They attest to what each teller “believes in” rather than what each “believes that” (Ricoeur, 1981, 21). Reciprocal modification of the self by the other, and vice versa, contributes to increasing self-awareness and learning; to challenging previous conceptions; to risking confusion and disruption; and to increasing the possibility for change (Schaafsma, 1993, xi).

In addition to acknowledging multiple interpretations of a text, narrative inquiry also “pays attention to the forms in which knowledge is cast and the effects that these have on an audience” (Czarniawska, 1998, 6). Different genres produce different effects. Stories told within organizational cultures are “mental models” (Senge, 1990), or guides for action. Stories of experience become seeds from which new theories and practices can grow, for narrative draws upon memory, connecting conscious and subconscious, as well as past, present and future time.

**Summarizing the Research Model and Process**

The following two tables provide a template of this narrative research model:

### Table 1. Narrative Analysis

<table>
<thead>
<tr>
<th>Analytic Sequence</th>
<th>Focus of Analysis</th>
<th>Process and Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>A. Narrative Analysis</td>
<td>What are the stories being told?</td>
<td>Tell the stories of the participants, using first person voice, lifting them from the interview text, and using text to title each. Write them as a form of creative non-fiction, using quotation marks and traditional narrative format. Give individual repertories of stories to participants to read for trustworthiness and verisimilitude and to determine the extent to which they hear their own voices. Revise collaboratively as appropriate.</td>
</tr>
</tbody>
</table>
B. Interpretative Analysis

What is the meaning of the stories in the form of emergent themes?
Identify the themes of each story paying attention to those elements of the story related to learning, narrative, and change. Summarize data on worksheets.

What is the meaning of the themes in the form of emergent patterns?
Theme the themes to identify patterns, paying attention, for example, to what repeats itself, the nature of the patterns, how to describe related differences, what circumstances prompt the patterns, and what the repetitions mean. Group stories according to emergent patterns for presentation. Summarize data on worksheets.

What are the referents that occur?
Identify key words that are not themes, but are meaningful to participants. Use data from observations, document analysis, and journaling to clarify the meaning of such referents and to augment the interview stories with observation, document analysis and journaling for clarity for first time readers being introduced to the study.

C. Interrogative Analysis

1. How do professionals, working individually and as group participants in a contemporary organizational context, use narrative processes as part of their effort to learn how to change?
Determine the extent to which the complete repertory of stories that contextualize each other contributes to answering the research questions of the study. Summarize on worksheets to use in writing the findings of the study.

2. What kinds of narrative processes do they use?

3. What conditions influence their use of narrative processes?

4. How and to what extent do they perceive that narrative processes contribute to their learning?

5. How and to what extent do they perceive that narrative processes contribute to their capacity to change?

6. What kinds of individual, group, and organizational change do narrative processes influence?

7. Are there other findings unaccounted for by these questions?

As I have written and analyzed the stories, I have tacked back and forth between narrative and theoretical analyses, asking myself, "Does this story confirm, contradict, or augment what theorists have said?" Because this study focuses on how framing for action happens, in my literature review I interpreted selected content from each body of theory as a series of action statements. The following table summarizes key concepts of narrative theory and experiential learning theory that I have compared with the emergent, concurrent narratives. Once I have completed this comparison, I will revise my preliminary findings and conceptual framework as appropriate.

Table 2. Theoretical Data Analysis

<table>
<thead>
<tr>
<th>Body of Theory</th>
<th>Theoretical Concept</th>
<th>Interpretation of Data</th>
</tr>
</thead>
<tbody>
<tr>
<td>A. Narrative</td>
<td>Narrative structures thought and experience to create reality. Narrative interprets life experience as action. Narrative contributes to the construction of both individual and communal identity. Narrative provides a way to reflect upon experience. Narrative creates meaning and generates knowledge from experience.</td>

B. Experiential Learning

Experience functions as a moving force that is a starting point for learning and for changing behavior.

Reflecting critically upon experience to discover its meaning provides us with a way to learn from experience by reinterpreting past experience.

Dialogue creates space to reflect critically upon experience with others and to examine processes of analysis and interpretation.

Socio-cultural context informs both dialogue and learning.

Learning that is meaningful frequently leads to change in behavior, in interpretation, in autonomy, in creativity, or in a combination of these changes.

Identify textual passages and stories that confirm, contradict, and/or augment the theory. Summarize on worksheets to use in writing the findings of the study.

Implicit in building this research model for narrative inquiry is a logic that has required me to dance back and forth between analytical and narrative thinking. This dance also characterizes the process of analysis and synthesis that I have described. The model respects both the singularity and similarity of the experience of each participant in learning how to change. It also attempts to encourage their use of both analytical and narrative thinking during our inquiry. The text of the interviews drives the first part, writing the stories. Then the stories drive the analytic process. Finally the theory provides a counterpoint to assess what we have learned.

Results and Findings

Preliminary findings suggest that this research model advances our understanding of how an organization learns to change and how narrative processes contribute to such learning. By applying this systematic narrative methodology, my analysis of the study seems to be unfolding in much the same narrative way that the participants' stories have emerged. It is possible that I have experienced how pre-existing narrative schema pattern our thoughts to a greater extent than we realize (Bruner, 1986). I have found it beneficial to respect an inherent narrative structure of what has happened, both in the research setting and while using this methodology. One analytical key to unlocking the meaning of the data is to continually interpret narrative flow as it happens, moving from one story to another in much the same way as a painter changes colors on a brush. The stories are there, waiting to be lifted from the interview text; the art is to foster their emergence. It requires a light touch and a tough mindedness of multi-tasking that I had not anticipated. Having this template to follow, however, has made my task not only doable, but also enjoyable since the emergent narratives hold surprises and learning. I have experienced for the first time the "promise of narrative research" (Brooks, 1998) and creative potential of case study.

Contribution to New Knowledge in HRD

We will achieve the promise of narrative research (Brooks, 1998) only when we use various approaches to narrative inquiry in other singular contexts that share some similarities with the research setting of this study, and if we continue retelling our stories about what happens during the process of narrative inquiry. Therefore, I have presented this research methodology not to imply that: (1) it is the only way to examine narrative processes, (2) this model is a finished product that achieves an ideal without limitations, or (3) other existing studies have not been based on sound research models and techniques. This model is a time intensive narrative work in progress, a work being informed both by my learning from the experience of using it and by my academic training in American and English literature. It is but one approach among others chronicled by Price (1999).

I have written this paper as a call to contribute to new knowledge in HRD by using narrative inquiry more frequently in organizational settings. I have emphasized (1) the extent to which the singularity of any narrative inquiry requires a researcher to approach a study creatively (a) by adapting existing research models and strategies and (b) by developing new ones as the narrative process of research unfolds; (2) the significance of interpreting narrative processes and their implications for learning how to change in an organizational context; and (3) the application of what appears to be a new model for conducting narrative inquiry.

Strategies for Facilitating Interaction When Using Technology-Mediated Training Methods

Jeffrey S. Lewis
Gary D. Geroy
Colorado State University

Orlando Griego
Azusa Pacific University

Technology-mediated training methods are becoming more prevalent in scope and usage. These methods cause a difference in the ways that trainees interact. Trainers often have the role of facilitating the interaction between trainees and thus must develop new skills to accommodate the different communication styles associated with technology-mediated methods. This paper focuses on some of the differences between face-to-face delivery and technology-mediated delivery and will provide strategies for facilitating interaction when using technology-mediated training methods.

Keywords: Technology-mediated Communication, Training, Facilitation

As educators and trainers who incorporate technology-mediated interaction into our curriculums, we have noticed that technology influences the way learners interact. Trainers often have the role of facilitating the interaction between trainees and thus must develop new skills to accommodate the different communication styles associated with technology-mediated methods. This paper will focus on some of the differences between face-to-face delivery and technology-mediated delivery methods. In addition to providing evidence of the differences resulting from quantitative data and experiences, we will suggest eight strategies that trainers can incorporate into their methodology to accommodate trainee interaction within technology-mediated training methods.

Technology-mediated Training

Technology-mediated communication has gained significance in education and workplace training. Many students are receiving undergraduate and graduate degrees through interaction with instructors and peers using Internet and CDROM technology. Trainers have also incorporated the technology and have used it to deliver many different types of programs to their organizations and clients. The importance and significance of the method is growing (Hiltz, 1986; Sproul & Kiesler, 1991). The use of technology and training can provide a unique set of challenges that can have a profound affect on the training and learning process (Murphy, Drabier, Epps, 1997). The trainer’s role changes when incorporating computer mediated communication into the course (Gunawardena, 1992). The challenges we want to address are related to the fact that students interact differently when using technology-mediated training methods instead of traditional face-to-face training methods.

There have been a number of differences and similarities identified in the research pertaining to the comparison of face-to-face training and technology-mediated training. Communication effectiveness is similar when comparing the two methods, but face-to-face participants report a higher level of satisfaction with the interaction experience (Warkentin, Sayee, Hightower, 1997). Sexual exclusionary behavior has not been found to be greater, but female influence and contribution has been found to be lesser in technology-mediated methods (Ross, 1998). Technology-mediated methods have caused instructor-student interactions to be more informal and student-student dynamics have been found to be more awkward (Treadwell et.al, 1998). One of the most significant differences between the methods is the feeling that participants have of anonymity. In many cases, the participant’s personal and professional characteristics are masked which plays a very large role in face-to-face interaction (Treadwell, et.al., 1998). The differences brought about by technology-mediated methods challenge trainers to change the way they facilitate interactions with and between their learners.
The Study - Examination of Learner Differences

The purpose of this exploratory study was to compare the difference in interaction perceptions between two groups of learners. Our goal was to define what attributes in learner behavior were the same or different depending on the interactive medium for learning. Two groups of learners participated in the same graduate level course titled Management, Leadership, and Team Dynamics. The difference between the two groups was related to the medium used for curriculum delivery and student interaction. Medium A was a live, traditional in-class interaction between the instructor and the students. Medium B was a technology-based interface between the instructor and the students that allowed for synchronous and asynchronous communication without any face-to-face interaction. Learners self-selected to the group and medium that was most appropriate to their personal needs.

The traditional in-class group (Medium A) met once a week for three hours during an eight-week period. A Professor, who had taught the course multiple times, delivered the curriculum in lecture and discussion format. The technology-mediated learners (Medium B) received a three-hour videotape each week of the lecture and discussion that occurred in class. The expectations, reading materials and assignments were the same for the face-to-face learner group and the technology-mediated learner group. The learners were segmented into smaller teams of four to seven participants and were required to submit five team assignments. In addition to the three-hour class period, the Medium A learners met as smaller teams for approximately two hours per week to complete assignments. The Medium B learners used an Internet based education service to participate in synchronous team meetings, asynchronous bulletin board discussions and synchronous discussion sessions which were facilitated by a post-graduate teaching fellow.

During this course and others we have participated in, we observed differences in learner-to-learner interaction when comparing Medium A and Medium B learners. The observations sparked a curiosity to examine the issue in a quantifiable manner. We decided to solicit the learners to identify their perceptions of interaction. Three primary levels of interaction were identified and defined: contribution, hard-type communication, and soft-type communication. The three primary levels of interaction were defined by the researchers for this exploratory study. The contribution construct relates to a learner’s perception of the level of contribution or effort they expended throughout the experience in relation to previous learning experiences. The hard-type interaction related to the learner’s perception of communication based on our five hard interaction variables: boldness, conflicts, confrontation, frankness and frustration. The soft-type interaction related to the learner’s perception of communication based on our three soft interaction variables: disclosure, encouragement and personableness. Table 1 illustrates the constructs, variables and definitions that were used in the survey.

Research Questions

The following three research questions were established as we constructed the study and the data collection instrument.

Research Question 1: Is the perception of contribution of face-to-face learners (Medium A) different from the perception of technology-mediated learners (Medium B)?
Research Question 2: Is the hard-type interaction between face-to-face learners (Medium A) different than technology-mediated learners (Medium B)?

Research Question 3: Is the soft-type interaction between face-to-face learners (Medium A) different than technology-mediated learners (Medium B)?

Methods

We used a survey instrument designed to measure three constructs of the perceptions of learner interaction. The survey consisted of ten two-part questions that asked the learners to rate their perceptions of interaction involving themselves and their co-learners. We wanted to determine if the in-class and technology-mediated learners had different perceptions of the degree of activity/work load, hard aspects of learner communication and soft aspects of learner communication. Each question asked for the learner to reflect on their personal involvement perception and their observations of other learners in the class interactions. Available ratings for each of the variables were significantly more, moderately more, moderately less, and significantly less. The learners were asked to relate their experience in the class to their previous experiences as a learner. The respondents were asked to identify themselves as a technology-mediated student or traditional in-class student. They were not asked for any additional personal information.

Subjects

A convenience sample was used for this exploratory study. The subjects for the study are graduate students enrolled in a Master of Business Administration program at a state university. All learners have received a Bachelor's Degree and have at least three years of work experience since graduation. The technology-mediated learners (Method B) were geographically dispersed across the continuous 48 States in addition to a few sojourning participants located in Europe, South America and Japan. The traditional classroom students (Method A) lived within a 50-mile radius of the University. There appeared to be an equal amount of male and female learners. Ethnicity, income and industry variables were not measured in this study.

Data Gathering Procedure

The group of Method A learners included 19 possible subjects. The voluntary survey was distributed during the last class meeting and 15 completed surveys were returned. The population of Method B learners included 249 possible subjects. An electronic message was posted for all technology-mediated learners. The message included a request that all students complete the survey that was posted on a separate web site. The survey was written as a HTML form and the participants were given the opportunity to complete the survey on-line. The surveys that were completed on line were converted to anonymous email messages and sent to the researchers. A request was made to complete the on-line survey within two weeks, at the end of the two-week period 39 completed surveys had been returned from the Method B learners. In an attempt to create equal groups, 15 surveys were randomly selected from the 39 completed surveys submitted by the Method B learners to match the 15 surveys collected from the Method A learners.

Data Analysis

The data from the survey responses were entered into a SPSS table and one way ANOVA calculations were performed to test the variables associated with: contribution, hard interaction, and soft interaction.

Activity Construct

The variables for the activity construct included accountability and contribution. The data for level of activity was analyzed using an ANOVA analysis calculation and the results indicated a significant difference between the two groups of learners (Table 2). From an examination of the means, the Method A students have indicated that they have the greater perception of activity/workload when compared to the Method B learners.

Hard Interaction Construct
The variables for the hard interaction construct included boldness, conflict, confrontation, frankness, and frustration. The data analysis for the hard interaction was analyzed using an ANOVA calculation. There is a significant difference between the hard interaction variables when comparing the Method B and Method A learners. The plot of means reveals that the technology-mediated students have more hard side communication in their interactions.

Conclusions

Answers to the Research Questions
As a result of the data collected from the learners and the statistical analysis we have performed, the following answers to the research questions are presented.
Research Question 1: Is the perception of contribution of face-to-face learners (Medium A) different from the perception of technology-mediated learners (Medium B)? Yes, because of the perceptions of accountability and contribution, face-to-face learners perceive a higher level of activity when compared to technology-mediated learners.
Research Question 2: Is the hard-type interaction between face-to-face learners (Medium A) different than technology-mediated learners (Medium B)? Yes, technology-mediated learners perceive a higher level of hard-type interaction when compared to face-to-face learners.
Research Question 3: Is the soft-type interaction between face-to-face learners (Medium A) different than technology-mediated learners (Medium B)? No, there is no difference in the soft-type interaction when comparing face-to-face learners and technology-mediated learners.

Implications
As a result of this study we believe the following inferences can be made:
- Facilitators of technology-mediated learning experiences may need to increase the individual accountability aspects of the experience.
- Because the technology-mediated learners do not have to communicate "face-to-face," they are more likely to interact on a hard level.
- Facilitators of technology-mediated learning experiences should be aware that some hard levels of interaction may need to be mediated.
Because the level of soft interaction was equal between the two groups, the technology-mediated learners do not perceive the technology-based media as being without human factors.

Learners who are intimidated by the technology-mediated technology may need to become aware of the occurrences of soft interaction.

Eight Strategies for Mediating Trainee Interaction

The following eight strategies for mediating trainee interaction have been provided to assist trainers who choose to use technology-mediated training methods. We suggest that trainers consider these themes in designing and conducting any training that utilizes technology.

Strategies Based on Activity Construct

Strategy 1: If the trainees will be working within groups, require the groups to write an agreement or charter that will define levels of contribution and commitment.

Strategy 2: Increase accountability by requiring trainees to write self-assessments and team member assessments.

Strategies Based on Hard Interaction Construct

Strategy 3: Be prepared as a trainer to mediate interactions between students that involve an increased level of boldness, conflict, confrontation, frankness and frustration. These situations may occur more frequently than a typical face-to-face arrangement.

Strategy 4: Prepare your trainees by communicating to them the possibility of encountering an increased level of boldness, conflict, confrontation, frankness and frustration.

Strategy 5: When trainees use take advantage of the anonymity and make bold statements, use the opportunity to challenge ideas and facilitate a deeper level of communication.

Strategy 6: Be prepared to moderate conflicts and discussions between trainees that become heated or emotional.

Strategy 7: When students present an unexpected attitude, take the opportunity to challenge the attitude and pursue a deeper understanding of their perspective.

Strategy 8: Take notice of trainees who appear to be uncomfortable with the level of interaction and encourage them to stretch beyond their comfort zone.

Summary

Technology-mediated training methods have an interaction effect on trainees that should be addressed by trainers who incorporate the methods. The trainees who are learning at a distance, through technology-mediated methods, are more likely to use hard interaction characteristics and need additional aspects of accountability. It is also important to note that technology-mediated methods are not sterile, personality-less environments. Because of the differences in learner interaction, trainers must understand and become skilled in facilitating technology-mediated interactions. Trainers can make efforts to incorporate strategies to ensure the success and satisfaction of their trainees.

The Determination of Factors Affecting User Acceptance of a Computer-Based Training Support Tool in the Workplace

G. Dale Wagner  
Department of Defense

Daniele D. Flannery  
Pennsylvania State University

Computer-based training support systems now make it possible for employees to manage their own training solutions right at their desktop. As a result, it is critical for educators to know and understand the factors that influence the user acceptance of these systems. This study attempts to identify and empirically test factors thought to influence the user acceptance of a training support system among selected employees at a government agency headquartered in Maryland.

Keywords: Autonomy, Self-Directed Learning, User Acceptance

Human resource developers are increasingly being challenged to meet just-in-time training needs. To enable "competent human performance" (doing what the job requires, when it is required) and measure the impact of training on that performance, employees must be willing and able to access computer-based training on demand (Shandler, 1996, p. 21). The purpose of this research is to identify and empirically test factors that may influence the user acceptance of a computer-based training support system. For this study, user acceptance means that a person will use a computer-based training support tool to meet most, if not all, of his or her education and training needs.

Theoretical Framework

Literature from across a number of different areas was reviewed for this study. These areas included human resource development, adult education, instructional systems, psychology, human-computer interaction, computer-based training, business management, computer science, information systems, and organizational management. The applicable literature found to support this study can be summarized into the following four topical areas.

Self-Direction in Learning

In Adult Education, autonomy becomes the central component for the understanding of adults as self-directed learners. Chene (1983) identifies three major elements of an autonomous learner: independence, the ability to make critical judgments or decisions, and the ability to articulate the norms and limits of a learning society. Candy (1991) adds to Chene's perception of the autonomous learner by characterizing autonomous people as those with a strong sense of personal values and beliefs. These values and beliefs provide them with a firm foundation for conceiving goals and plans, exercising freedom of choice, using rational reflection, having will power to follow through, and exercising self-restraint and self-discipline.

"Much of the research into personal autonomy has been based on the notion that it is a context-free disposition; once people 'become' autonomous, they will behave autonomously in whatever situation they find themselves" (Candy, 1991, p. 114). But, as Candy points out, there are two flaws with this line of reasoning. First, autonomy is not a product but is more akin to a process. This means that an individual does not "become" autonomous in the absolute sense. Instead the individual is able to think and act autonomously dependent upon the situation or circumstances at the time. Second, although some adults display more self-assurance or clarity of purpose across a range of situations when compared to others, it is impossible to judge whether or not an individual is autonomous without identifying the context within which this autonomy will, or might, manifest itself.

As a result, Candy (1991) is urging researchers to adopt an "interpreter research approach," an approach that allows for individual features rather than ignoring or denying their existence. At the core of the interpretative orientation are the purposes, intentions, and frames of reference every adult learner brings to bear on each learning experience.
situation or circumstance. These three factors have the ability to influence everything from the individual’s initial willingness to engage, to the type of help sought and resources used, to the outcomes that emerge from any learning encounter.

Too, there is a crucial dichotomy in the meaning of self-direction. The distinction is between self-management, "the variable quality of being self-directing within one’s field of constraints of free actions," and self-determination, "the variable quality of being self-directing to the extent that one is in charge of one’s destiny" (Candy, 1991, p. 20). For this study, self-determination refers to the amount of control an individual feels when identifying his or her own education and training needs whereas self-management refers to an individual’s ability to manage and control his or her own training plan. Although it would seem rational that self-determination would be the quality most advocated and desired, “it is arguably self-management which, in many cases, is articulated, elaborated, and attained” (Bagnall, 1987, p. 91). Both aspects of self-direction are processes, dependent on situations or circumstances at a particular time (Candy, 1991; Garrison, 1997).

Perceived Ease of Use and Usefulness

Even though there is a considerable amount of literature that focuses on the technical aspects of computer technologies, most of it is primarily written for designers and software engineers, often addressing the needs of the industry’s “typical user” (whoever he or she may be). In fact, only a few studies have been conducted in which the primary focus has been upon the cognitive and affective attitudes of the end-users, typically after the subjects were introduced to a new type of computer technology. These latter studies have typically used Davis’s (1986) technology acceptance model (TAM); an adaptation of Fishbein and Ajzen’s (1975) theory of reasoned action (TRA).

The TAM is a highly reliable tool that can be used to predict and explain computer-related usage behavior. The model’s independent variables include behavioral intentions, perceived usefulness, and perceived ease of use. Davis (1989) defines perceived usefulness as “the degree to which a person believes that using a particular system would enhance his or her job performance” and perceived ease of use as “the degree to which a person believes that using a particular system would be free of effort” (p. 320). Using these two definitions and a multiple studies approach, Davis refined and validated two six-item scales to measure perceived usefulness and perceived ease of use. With limited exceptions (Robey, 1979; DeSanctis, 1983), this is one of the first studies to empirically validate measurements that can be used to predict the user acceptance of technology.

Computer Anxiety, Individual Characteristics, and Attitudes toward Use

Computer anxiety, software anxiety, and attitudes toward use are affective response variables (Davis, Bagozzi, and Warshaw, 1989; Fishbein and Ajzen, 1975). Attitudes indicate an individual’s reaction to an object, such as a training support system, on a like-dislike continuum (Fishbein and Ajzen, 1975) whereas computer anxiety is the tendency of an individual to feel uneasy, apprehensive, or even fearful about the current or future use of computers (Raub, 1981). Similarly, software anxiety refers to the tendency of an individual to feel nervous and apprehensive about using a specific software package or application. Researchers, most of which are in the management information systems field, continue to study computer anxiety in a variety of settings and, in doing so, investigate other variables that affect it (Igbaria and Chakrabarti, 1990; Marcoulides, Mayes, and Wiseman, 1995; Maurer, 1994). These variables typically include individual characteristics, such as age, gender, academic major, education, computer experience, and computer attitude. However, after conducting a thorough literature review on computer anxiety, the authors found it very difficult to make generalizations based upon the results of these studies. Many of the studies seem to suggest the significance of a specific attribute as it refers to computer usage, only to have the significance called into question in another similar study. Unfortunately, the majority of the research lacks focus, making it difficult to support any particular claim. The same is true for software anxiety.

Organizational Characteristics

Several studies from the management information systems field suggest both information and management support may influence the user acceptance of a training support system. In one such study, Igbaria (1993) sought to find empirical evidence to support the prediction made by Davis, Bagozzi, and Warshaw (1989) that perceived usefulness is influenced by organizational characteristics. As a result, Igbaria divided organizational characteristics into two attributes-information support (includes the presence of an information center staffed by professionals who
provide recommendations and assistance to computer users when needed) and management support (includes the support and encouragement by top management to use computers). Igbaria found information support to have direct effects on perceived usefulness and attitudes toward use. He also found information support had both direct and indirect effects on behavioral intentions and perceived usage via computer anxiety and perceived usefulness. Management support was found only to have a direct effect on behavior intentions.

In this study, information support refers to the availability of on-line and off-line assistance and the accessibility of necessary on-line instructional information and training courses available through the computer-based training support system. Management support refers to top management's encouragement and the necessary allocation of resources to properly support a computer-based training support system. Management support is also a function of how much control each employee has over his or her own professional development and growth.

Hypotheses

This research was guided by individual hypotheses that predicted each of the following variables will affect the user acceptance of the computer-based training support system (TSS): behavioral intentions, perceived usefulness, self-determination, self-management, computer anxiety, software anxiety, attitudes toward use, individual and organizational characteristics.

Methodology

Research Setting

The specific purpose of this study was to identify and empirically test factors thought to influence the user acceptance of a newly integrated training support system among selected employees at a government agency headquartered in Maryland. The system, which became fully operational in July 1997, provides an interface and the capabilities necessary to electronically deliver over 400 Web-hosted computer-based training (CBT) products on demand to employees' personal computers over the Internet.

Sample

Employees selected to participate in this study were required to have an active account for the computer-based training support system and a minimal amount of experience using the Web-based tool. From 1529 possible subjects, 1020 people were invited to participate in the study. This sample population was identified using the stratified sampling technique. This ensured that the appropriate number of males and females as well as civilians and military personnel were drawn from the homogeneous subsets of the population.

Instrumentation

A questionnaire survey comprised of items taken from 12 separate subscales was developed to measure the context characteristics that might affect the user acceptance of the training support system (TSS). These subscales included individual characteristics, browser experience, computer training, information and management support, perceived usefulness, perceived ease of use, self-determination, self-management, computer anxiety, software anxiety, attitudes toward using training support systems, and behavioral intentions. Of the 1020 questionnaires distributed, 50 came back undeliverable. Respondents were given three weeks to complete and return the questionnaire either electronically via the Intranet or physically using internal mail. During the response period 446 respondents returned questionnaires, 345 electronically and 101 using internal mail. This equated to a 46% response rate.

Data Analysis

The data was entered onto a spreadsheet accessible using SPSS version 7.5 for Windows. Prior to the actual analysis, the data were checked for blatant data entry errors as well as outliers and rogue values. The one-way analysis of variance (one-way ANOVA) procedure was then used to examine the variability among the sample means. As a result, several subtle differences were discovered that suggested there might possibly be two
subpopulations present within the data. There was also evidence that suggested three subscales—attitudes toward use, perceived ease of use, and software anxiety—all collected data that might have measured aspects of the same variable. Further analyses using the stepwise regression selection method strongly suggested that: (1) the civilians be grouped separately from the military personnel, (2) the perceived ease of use subscale be removed from further analysis, and (3) questions contained within the software anxiety scale that pertained to attitudes toward use be removed. A numerical value for each scale was then obtained by adding the individual item responses together for each scale. The composite reliability of each measure was then determined using Cronbach's alpha. These values ranged from a high of .9425 for perceived usefulness to a low of .5812 for computer experience.

The statistical analysis method chosen for this study was multiple regression/correlation analysis, a highly general and very flexible data-analytic system that may be used whenever a dependent variable is to be studied as a function of, or in relationship to, any factors of interest expressed as independent variables. One of the benefits of using this method was that it provided the researchers with the ability to present quantitative data in a manageable form. It also allowed the dependent variable's variation to be explained in terms of a number of other independent variables, which in this study were measurable. Furthermore, the stepwise regression selection method was used for controlling the entry and removal of independent variables from the regression models.

Results and Findings

The respondents all held various positions across a wide range of functional areas around the world. Of the 448 participants, 41% were civilians and 59% military personnel. Males outnumbered females by a ratio of 3:1. (These percentages are consistent with the population contained within the database at the time of the study: 35% civilians, 65% military and 76% male, 24% female.) Considerably more military respondents (25.8%) were requested to take courses using the TSS in comparison to the civilian respondents (13.7%). More military respondents (73.6%) than civilian respondents (33.4%) reported their intention to take computer based training courses available through the TSS to earn equivalent college credits.

The one-way ANOVA technique was used to reveal the first clues to the possible relationships that existed among the variables used within this study. These and other potential relationships were then tested using multiple regression/correlation analysis. As a result, numerous regression models were generated and compared. Below are the resulting regression models that were identified to represent the relationships among the variables.

User Acceptance as the Dependent Variable

A regression model for user acceptance (Table 1) was first derived for each of the two groups of respondents. The civilian model had an $R^2$ value of .203 and an $F$ statistic of 19.985 ($df = 159$). The military model had an $R^2$ value of .124 and an $F$ statistic of 31.341 ($df = 222$). Behavioral intentions (BI) were a strong predictor of user acceptance in both models whereas self-management (SM) only appeared in the civilian model. The self-management variable was removed from the military model after its $t$ value fell significantly below two ($t = .981, p > .05$).

Behavioral Intentions as the Dependent Variable

A regression model for behavioral intentions (Table 2) was then derived for the two groups of respondents. The civilian model had an $R^2$ value of .465 and an $F$ statistic of 37.121 ($df = 175$). The military model had an $R^2$ value of .412 and an $F$ statistic of 41.720 ($df = 242$). Attitudes toward use (ATU), perceived usefulness (PU),
educational level (EDLEVEL) and browser experience (BROWEXP) were predictors of behavioral intentions in both models.

Perceived Usefulness as the Dependent Variable

A regression model for perceived usefulness (Table 3) was separately derived for the civilians and military personnel. The civilian model had an $R^2$ value of .509 and an $F$ statistic of 86.530 ($df = 169$). The military model had an $R^2$ value of .435 and an $F$ statistic of 60.421 ($df = 238$). Attitudes toward use (ATU) and management support (MS) were strong predictors of perceived usefulness in both models. Computer anxiety (SA) was a predictor only in the military regression model.

Attitudes toward Use as the Dependent Variable

The last dependent variable investigated was attitudes toward use (Table 4). Again, a regression model was derived for the civilian respondents and another for the military respondents. The civilian model had an $R^2$ value of .625 and an $F$ statistic of 92.261 ($df = 169$). The military model had an $R^2$ value of .679 and an $F$ statistic of 161.497 ($df = 232$). Software anxiety (SA) and information support (IS) were strong predictors of attitudes toward use in both models. Self-determination was a predictor only in the civilian model. Self-determination (SD) was removed from the military model because its $t$ value fell significantly below 2 ($t = 1.077, p = .282$). Gender was a predictor only in the military model. Similarly, gender was removed from the civilian model because its $t$ value fell significantly below 2 ($t = 1.155, p = .250$). Age was not a factor in either regression model.
Conclusions and Recommendations

The results from the multiple regression analysis indicated that the determinants selected to approximate the user acceptance of the TSS differed slightly between the civilian and military respondents. The most notable difference was that self-determination and self-management were not present in the military's structural model but were in the civilian's structural model. The civilian model indicates that as self-management increases, the user acceptance increases. The effect of self-determination on user acceptance, on the other hand, was mediated by attitudes toward use, perceived usefulness, and behavioral intentions. Furthermore, as self-determination increases, attitudes toward use decrease.

The results across both groups confirm the importance of individual and organizational characteristics in influencing perceived usefulness. The results found that perceived usefulness plays a very important role in mediating the relationships between attitudes toward use and management support, and behavioral intentions. Educational level and browser experience also had a direct relationship with behavioral intentions. Behavioral intentions had a direct effect on user acceptance.

The statistical analyses in this study revealed that behavioral intention is the primary determinant for the user acceptance of a training support system. Users' acceptance of a training support system can be reasonably well predicted from their intentions. Furthermore, the results also demonstrated that determinants selected to approximate the user acceptance of the training support system differed between the civilian and military respondents. The results suggested that the civilian respondents were more autonomous and more concerned about the system's perceived usefulness than the military personnel.

It is recommended that autonomy become the central component for understanding adults as self-directed learners. For contemporary organizations, such as those described by Shandler (1996), management must be willing to address the unique attributes of new professionals. Today's professionals, for example, have expertise gained from prolonged specialized training. They often expect to be given the opportunity to determine and manage their own educational and training needs. Moreover, they tend to be fully committed to their work and profession (Von Glinow, 1988). These attributes need to be reflected in the training support systems used within these organizations.

Limitations

Although the results from this study are useful for describing the characteristics of a large population, the generalization of the results are limited to the population sample of the governmental agency used in this study. Agency employees are not completely representative of the entire population of professionals. These employees are younger and, as a group, probably more computer literate than their counterparts in industry and education. Hence, ease of use may have been less of an issue for this sample than it would have been for professionals more generally. The computer-based training support system investigated, while typical of the types of training support systems available, is still only one system. With more difficult or complex systems, ease of use may have had a greater impact on intentions.

Another limitation may have been the usage measures. These measures were self-reported as opposed to objectively measured. It is not known how accurately self-reports reflected actual behavior. Likewise, most of the variables in this study were based on people's subjective feelings and did not necessarily reflect objective reality.
However, this limitation was overcome by having access to: (1) the number of system accounts that had been activated, (2) the average number of courses that have been completed per account holder, and (3) the types of problems/concerns most frequently addressed by support personnel.

Research Contributions

This study makes several significant research contributions to the field of HRD. First, in the necessity for HRD to provide just-in-time training, often computer-based, this research makes a major contribution by investigating factors that affect CBT. This study also contributes to a further understanding of adult learners and issues of autonomy and training so trainers can access learner’s readiness to use CBT. This study determined to what extent self-determination and self-management, in correlation with the other independent variables, influenced the user acceptance of a training support system. A major goal in this investigation was to determine the relationship that these two dimensions had on the user acceptance of such as system. Now that these relationships are better understood, corrective action can be taken to increase the likelihood that more users will accept future training support systems.

Second, the study contributes to HRD research. By including self-determination and self-management in this study, this research has helped to expand the understanding of autonomy, particularly the aspects of self-determination and self-management as it relates to training and adult education. One future question to be researched is which of these two personal qualities is more predictive when it comes to the user acceptance of a training support system?

Third, this study has highlighted the potential for the field of adult education to inform other areas of study. Unfortunately a number of researchers and practitioners have overlooked the contributions adult education has made, typically through the lack of knowledge or proper understanding of the field. This study highlighted the fact that adult education can provide meaning to other areas, such as informational systems, management information systems, social psychology, and organizational behavior.

Distance Education at the University of the West Indies - Positioning the Institution as a Catalyst for Human Resource Development in the Caribbean region: A Case Study

Carmeta Tate-Blake, Ed.D
University of the West Indies

The data show that the UWI appears to have made progress in the production of course materials and in the number of courses being offered through distance education. The UWI has also made progress in the quantity and quality of its distance materials and progress in the enrolment of distance students and in student support services, but there are still quality issues revolving around the timely production and shipping of the materials. While there is increasing acceptance by the University's faculty of the need to adapt traditional instructional development styles for distance, this transition remains one of the challenges of the University's overall distance education program.

Keywords: Dual Mode Institution, Regional Distance Education, HRD Via Distance Education

In 1983 the University took on distance as a major thrust. It obtained funding from numerous sources (UWIDITE Report 1986-1993) to expand its operations. This expansion in the 80s was set up as the University of the West Indies Distance Teaching Experiment (UWIDITE). The stage had been set for the development of UWIDEC's expansion in distance education from a 1993 Caribbean Development Bank loan of "$US9.896 million and a grant of $US0.211 million over three years" (UWIDITE Report, 1986-1993, p.1). The loan funds provided for the technical expansion to accommodate simultaneous audio-conferencing capabilities to the sites across the Caribbean. It would also enable the Centre to establish computer labs at the sites and facilitate the acquisition of audio/video teaching possibilities through compressed video technology. The University has moved apace with its plan to maximize its effort in positioning itself as a major force in the education of adults, and in 1996 became a dual mode institution offering courses by distance alongside the 50-year tradition of on-campus classes. In a speech by the Vice Chancellor, at his installation ceremony, Professor Rex Nettleford noted:

The UWI must now be seen as part of an articulated educational system operating within and beyond national and regional boundaries . . . [by] deepening and heightening the commitment to distance education as a priority and bring into the loop of UWI's outreach the entire academic staff and thus afford to the increasing willing numbers greater access to quality university education. (1999, p. 3).

The Vice Chancellor of the University Professor, Rex Nettleford, has also been very declarative about the critical role the University had to play in the development of the region's people.

Many of the UWI's early scholars understood "a university is a living organism that draws its nutrients from the society it serves and that cloistered isolation in an ivory tower by scholars who see their remit exclusively in the past rather than correspondingly in the present, itself tomorrow's past, is a recipe for irrelevance . . . It is in this sense that the University of the West Indies can happily reclaim its central role in making it possible for the future Caricom Caribbean to build up the capability for self development and the capacity to respond innovatively and sensitively to the unpredictable shifts of change in a world in doubt at the end of [the] century (1999, pp. 8-9).

Problem Statement and Theoretical Framework

The University of the West Indies has found itself in the mix of a growing number of North American universities vying for the brightest and the best of the region's potential students who cannot find places in the lecture halls. The UWI is cognizant of the competition and of its advantage in knowing the region and the diverse needs of its potential students within the wider geographic area of the Caribbean. Notwithstanding, UWI understands that complacency does not guarantee dominance even in the face of such advantage. The Renwick, Shale, and Rao (1992) report was instructive. The report found that enrolments from the Non-Campus Countries (NCCs) had
declined during the years 1989-1990; for example in 1960-61, NCC countries represented 13% of the enrolment while in 1989-90 enrolment declined to 5%. The report also noted the need for an organized department to properly execute the distance courses of the University's programs. The University felt the push towards distance delivery could boost enrolment from NCCs.

Consequently, distance education at UWI must quickly establish an image of quality in content; effectiveness and timeliness in service to students; flexibility and responsiveness to faculty and University representatives; competence, responsibility and accountability in the relationship with the University hierarchy and non-University consumers of its service. (p. 12, Distance Education at the University of the West Indies - Strategic Plan, September 1996).

Since the inception of the dual mode initiative there has been no study or evaluative process of distance education process within the context of the dual mode operation. This study therefore sought to answer the following propositions: (a) The Distance Education Centre has played a role in improving production and delivery of material appropriate for distance students; (b) The Distance Education Centre has played a role in facilitating the retention and increase in student enrolments, impacted traditional students strong desire to use materials designed for distance students, and facilitated the transition of traditional instructors to the distance mode.

Several theories inform this paper. The history of the development of distance education at the University of the West Indies seems grounded in the foundation theories of general education. In fact, Keegan's (1993) theory of distance education bears strong resemblance to the UWI's distance operations. Keegan feels that "distance education can be seen from the perspective of three developmental stages – correspondence, teleconferencing, and computer-based learning" (p. 17). He further believes that the foundation theories of distance education really emanate from the grounded theories of the general education. Garrison (1989), on the other hand, feels that technology plays a greater role in the way distance education is shaped and argues that technology and distance education are not mutually exclusive, and that much of the theory and practice in distance education has evolved because of sophisticated instructional technology.

Central to higher education, and by extension higher education through distance mode, is the theory of adult learning. Verduin and Clark (1991) have identified self-directedness as a necessary ingredient for successful distance learning. The notion of self-directed learning was antithetical to traditional pedagogy and it was this notion that led to research which found that adults were in many cases in charge of most of their learning situations. Researchers like Houle (1984) and Tough (1978) conducted studies to define self-directed learning as a valid way for the adult learner to take charge of his or her own success in the adult learning environment. They found that the adult learner was capable of directing his or her own learning assignments for a greater percentage of the learning transaction. In addition, traditional classrooms are rationalizing their approach as the use of technology presents challenging possibilities for learners. Keegan (1995) has posited that the impact of new technologies on distance education could even change the traditional definition of distance education to incorporate the notion of a virtual classroom. He has suggested that interaction through face-to-face, live two-way audio and video communication is possible with the virtual classroom "electronically linking instructor and students at various locations" (p. 3). Knapper (1990) has added that the technological advances do not only have the potential to reduce the physical distance in distance education, but can also reduce the psychological distance in affording the learner who really has a preference for independent study to take advantage of distance education courses. It is this potential that has not eluded the University of the West Indies, and as Hoffman (1995) stated, it may be instructive to combine the traditional mode of education with the distance education mode.

Methodology

This is a qualitative study based on longitudinal observations at a traditional University in the Caribbean at its originating campus (Mona, Jamaica). The institution offers courses leading to the baccalaureate, masters, and doctoral degrees. The institution is 50 years old and this year had enrolment of 11,045 students including 1,607 distance students (Campus Principal, October 1999).

Researcher as Instrument

The writer of this paper has been an observer of the distance education process at the University of the West Indies since the early 1980s. These earlier approaches have provided data to place the current paper into contextual perspective. Research culminating in the production of this paper continued in May 1999 using the Mona experience as the case. The research process continued through one-on-one exploratory interviews, examination of documents and ongoing observations of all aspects of the distance education operations at the UWI. Data were collected solely by the writer who brought some bias to the research process. One obvious bias was the notion that...
distance education is different from traditional education and that by definition distance education requires different approaches. Another obvious bias was that distance education requires new approaches in instructional techniques for traditional staff, ongoing training for transition, and initiation programs for new members of the educational community in a dual mode institution.

**Data Collection, Analysis and Interpretation**

Observations involved examining documents pertaining to distance education, and open coding was done in the categories of structure, production, delivery of material, structure of the organization, quantity and quality of distance education materials, student enrolment and retention, and faculty preparation and involvement in distance education. These data were verified through triangulation. Data collected from interviews were verified through secondary data and by cross-referencing with distance education senior staff, departmental reports, and existing distance education reports.

Data were verified in a second round of data collection during one-on-one meeting with faculty writing for distance; attendance and discussion at distance education curriculum meetings; discussions with senior management of the DEC; observation of students studying via distance education through audio-conferences, and consultations with agencies using the distance education facilities. These data were validated by records of meetings and through personal communication with individuals working in distance education at UWI. In the case of student enrolment, the data were verified through triangulation of figures presented from DEC Mona, Registration, Mona, and from the Principal's office, Mona. Where there were discrepancies in these figures the researcher deferred to the figures from the Principal's office. The data were coded according to the propositions posited for this paper. The findings are presented herewith and the writer would like to caution that no generalizations should be inferred from the data to the wider community of distance education; rather, the data is case related and very limited in scope. However, while this is so, it is fair to suggest that although this data originated from one of the three major campuses at the University of the West Indies, some generalizations of the findings can be attributed to the entire University's distance education program.

**Findings, Conclusions and Limitations**

Since 1996, when the Distance Education Centre was established, the distance education operations of the University have been organized and managed to cater to 26 sites, 10 of which are intra-island (Jamaica). The Centre falls under the Board of Non-Campus Countries and Distance Education under the direction of a Pro-Vice Chancellor (see Figure 1).
Decisions for distance education fall within the purview of the Pro-Vice Chancellor for BNCCDE and the organizational structure indicates a definite industrial process enunciating a team rather than an individual process. This organizational structure represents a radical shift from the previous operations of UWIDITE which operated with just 7 persons, (UWIDITE report 1986-1993) with many doubling in roles. The current operations of UWIDEC are structured along clearly defined roles. Although the structure is clearly defined with faculty playing a critical role, there is still difficulty incorporating faculty within this structure. With a structured Distance Education Centre, most Course Packages are organized along a print-driven mode based on a systems design development scheme (see Figure 2).
As you can see in Figure 2, there are several quality processes and interchanges with faculty/course writers before the student finally gets the material.

Since 1996 UWIDEC has instituted a system of quality standards for the production of materials for the distance students. The Centre has moved towards a primarily print-based delivery away from the traditional oral-delivery via the audio-conferencing network. The typical delivery style at the University is print-driven with tutorial and telecommunication support. The Curriculum Development Unit of the Centre develops and produces the distance education material and since 1996 the CDUs have developed print-based materials for programs in education, construction management, the Social Sciences and applied sciences. UWIDEC warehouses the materials for these courses and these are shipped out to the students at the distance sites at the beginning of each semester. At present there is no built-in quality check at the faculty level with respect to content through peer review or otherwise, or at the printers to see that materials are up to par before actual delivery. However, after the final editing, the course writer is asked to verify that the final product is accurate in content and style. The Curriculum Development Unit (Mona) is suggesting a new system where faculty will physically sign off to the authenticity of materials. The dual mode system does not absolve the faculty or the content expert of the ultimate responsibility for the content.

In June 1999 at a Curriculum Development Meeting in Barbados, participants discussed and rationalized the nomenclature of the Course Package to make it reflective of its content. For example, self-instructional materials to be developed as of that date will be called "Course Materials", with the title page reflecting the subject name. The participants at the meeting also reinforced the University’s commitment to creating its own self-instructional materials relevant to the needs of the region.

Although the University has a structured system (see Figure 2) for the production and delivery of materials for the distance students, the program is not without its setbacks. In many instances, the writers of distance education materials are the same faculty who have heavy workloads teaching face-to-face students and find deadlines for completion of course materials difficult to meet. This sometimes resulted in piece-meal distribution to the students and less than ideal packaging.

**UWIDEC Facilitating Increased Enrolment and Retention**

The establishment of University sites and the creation of computer laboratories for the distance sites have given access to the distance students which they might not otherwise have had, for example, the use of the internet.
email and word processing. The data show that despite setbacks and complaints there is growing interest and increased enrolment as reflected in Table 1. For example, "the inaugural teleconference in March 1983 had only 5 sites . . . However expansion in the telecommunications industry now allows [UWIDEC] to reach [26] sites in [14] countries around the region" (Odle, K. 1996, p. 3).

Source: Principal's Office: University of the West Indies, Mona, October 1999.

According to data from the Principal's Office, (October 1999), the projected enrolment, (on-campus and off-campus) by the end of 2002 is estimated at 13,300, which is an estimated 20% increase over the 1998/99 academic year. The report to Academic Board October, 19, 1999 projects that this increase will be due "to a large extent in the expansion of distance education" (p.3).

**UWIDE Facilitating Transition of Traditional Faculty to the Distance Mode**

Workshops and symposiums have been held during the early transitioning period 1995/1996 and a workshop was held as recently as May 1999 to facilitate the writing and development of the Master of Science in Family Medicine and Psychiatry program slated for the year 2000. The Centre has had several training sessions for Tutors, most of whom are instructors in TLIs (Tertiary Level Institutions) and while the Centre fields some discontent in that area, that aspect of the operation appears to be working effectively. In August 1999, UWIDEC once again embarked on a "Train the Tutor Workshop". This training exercise was designed essentially to prepare these trainees to train new inductees.

On the other hand, there has been no organized ongoing training for faculty involved with distance teaching and preparation of distance teaching material. UWIDEC has been involved in some workshops on an as-needed basis even though the strategic plan (1996) calls for ongoing training. UWIDEC has prepared a Quality Standard Manual which guides the writers of distance education, but the dynamics change so often that ongoing training in a scheduled fashion seems to be important but lacking at this time. Dirr's (1999) Commonwealth sponsored study is particularly poignant and points to the need for ongoing training and awareness. He notes that "What has proven particularly difficult to change, however, is the weaning of staff away from proprietary course development towards a team approach" (p. 54). Notwithstanding this observation the Centre has managed to implement measures to improve production and delivery of materials and has had success in gradually winning over faculty to the industrial process of distance education.

**Conclusions**

The new thrust for distance education and the University's serious commitment to dual mode course offerings gave rise to increased and improved student support systems in respect of distance student registration, orientation programs for distance students, in-house summer program orientations, and increased awareness about distance education. The availability and packaging of the distance education materials for the University's various
academic programs, tutorial, and improved audio-conferencing systems have given rise to increased enrolment, one of the major aims of the dual mode operations. In fact, the 1998/99 enrolment figures for distance education jumped dramatically (see Table 1). The audio-conferencing system needs further upgrading and digitization to maximize the system's output. The tutorial system used at UWIDEC works in the Caribbean context, as the distance student, while accepting of distance is still mentally oriented to the traditional mode of delivery and looks forward to this contact with someone who can help to clarify or cement a point of difficulty with content. Since 1998, the University has also instituted within its library facilities direct contact for the distance students where they can (through their site coordinators) request library materials and have these couriered to their sites. However, this support program is still young and needs more coordination.

The University of the West Indies Distance Education Centre has played a vital role in carrying out the mandate of the University as a dual mode institution committed to delivery of educational programs that are as transparent in distance as they are in the face-to-face mode of delivery. The setting up of a Curriculum Development Unit in 1996/1997 has been instrumental in facilitating the development and production of self-instructional course material. This has enabled more material to be produced and marketed with some identity of quality in content and packaging. This professional look and presentation has found favor not only with the distance students, but also traditional students within the UW and the TLIs for use of these materials in traditional face-to-face settings. The University's strong commitment to improving the print materials for distance students is a very pragmatic approach, since heavy reliance on technological means would disenfranchise a large number of prospective students. This conscious decision to embrace a print-based, manual-distribution platform appears to be a good move by the UWI given the economics of scale of other modalities and the inadequacies of technology in the region at the present time. The present platform has afforded the distance students of the region the anytime, anywhere, anyplace concept of studying without worrying about technology. However, it should be noted that the University might need to consider including some other technology as part of its ongoing improvement process as the dynamics of technology and access change.

Limitations

Although limited in scope (preliminary and exploratory), the data from this case study should provide insights to the stakeholders of the University of the West Indies with regards to its dual mode operations and by extension its role as an engine of growth in human resources development. Further, while the findings and recommendations of this case study should not be generalized beyond the population of the study, the data give rise to a new theory for greater understanding of the structure and delivery of distance education programs within the context of a dual mode institution. It also gives rise to an understanding of how the cultural change process of a University community has identified and accepted the changing needs necessary for human resource development of its constituents. Grounded in this data is the theory that the transition from traditional mode of delivery to the distance mode or a mixed mode of delivery bring with it challenges which are only conquered through training, staff development, and built-in awareness programs. In addition, despite the limitation of the study, the data suggests a valuable explanation of how a cultural change process influenced by changing needs can result in innovative programs to meet human resource development in a community.

Recommendations

Despite the embryonic success of the dual mode operation, one issue that needs greatest attention for the continued success of this operation, lies with the potential of faculty. Greater mobility and expansion still remains with how faculties perceive their role in the dual mode scenario. The University needs to provide this clarity so that faculty can adequately prepare for the smoother transition as we move into the next millennium and distance education takes on more prominence.

The University must embark on an ongoing training and initiation program to upgrade skills, create awareness for team efforts and move apace with advanced and improved technology in education. This can be planned through consultations with the Deans of the Faculties, the BNCCDE, UWIDEC and Faculty. It should be a reengineering process, a retooling to meet the changing demands and heightening of awareness in the teaching and learning acts (Verduin and Clark, 1990). The training for all concerned in distance education cannot be a one-shot approach and a "Strategic Plan for Continuous Training" should be developed and implemented. This training is
essential, especially as we compete with a growing number of educational interests in the region. It is important also in the context of changing dynamics and the incorporation of new media technologies.

The University should begin needs assessment research to determine the feasibility of incorporating the use of the computer into its delivery systems as part of its overall distance education program. The notion of online education is offering tremendous possibilities for both traditional and distance education. In keeping with the thrust of most Caribbean governments to push computer literacy in preparation for the twenty-first century, it would be prudent for UWI to take the lead in offering higher education courses incorporating the use of the computer in the distance education programs and courses offered through UWIDEC. However, this should not be done without ascertaining how many of the people could truly access such programs and at what cost if implemented.

The Use of Internet Courses in HRD Programs

Robert C. Schwindt
Pittsburg State University
Ping-Lun Tsai

This poster presents the findings of a survey of AHRD members in an attempt to identify the use of Internet courses in Graduate HRD Programs. Of 27 valid responses, 10 offered Internet courses and 17 did not. Of these 17, two planned to add Internet courses in the future. Advantages and disadvantages, reasons for not offering Internet courses, problems in establishing Internet courses, and Internet related policies are displayed.

Keywords: Internet Courses, Web-Based Courses, Distance Learning

One of the major innovations in human resource development is the use of Internet courses as indicated in a recent ASTD National HRD Executive Survey on Learning technologies. Respondents projected that by the year 2000, 35 percent of all training will be delivered by learning technologies, and the projected top three learning technologies will be Multimedia, LAN/WAN, and the Internet/World Wide Web (ASTD, 1997). Today, many universities are changing the way they conduct programs or offer curriculum "to meet the customer's needs, to compete with other institutions and possibly even to survive" (Nixon 1998, p54). With the help of information technology, many universities are now offering Internet courses.

Those courses take advantage of information technology and are more flexible on the time and place for learning and teaching. Hence, the Internet is truly a different environment for learning and teaching. There are many questions that need to be answered. "What is different about the Web place for teaching and learning? What wisdom or knowledge might guide us in learning how to teach and learn in the new place? What design guidelines should we use" (Boettcher 1998, p45)?

Significance of the Study

This study was significant in that it helped identify the current use of Internet courses in HRD Academic Programs. It provides HRD faculty members insight into what other Universities are doing so they can keep programs current and competitive. It helped identify some of the problems that departments and faculty members had in setting up Internet courses, which should make it easier for others to develop these courses in the future. The addition of Internet courses should make graduate HRD programs more accessible to those students who have schedule or location conflicts.

Research Methodology

This was a descriptive study where questionnaires were sent to faculty members at 58 institutions and 32 (55% response rate) were returned. The first member from each university listed in the membership directory of the Academy of HRD was selected. Five questionnaires were eliminated due to incomplete responses. The final sample consisted of 27 universities that offered HRD related programs. These universities were divided into two groups for data analysis and interpretation purposes. One group included 17 universities that did not offer Internet courses in HRD graduate programs, and the other included 10 universities that offered Internet courses in HRD graduate programs.
Related Literature

With the help of information technology, the Internet and the World Wide Web became a new environment for teaching and learning. Internet courses are the products of these two technologies. Some define Internet courses as "Distance Education Via the Internet" (Verbrugge, 1997).

Advantages of Internet Courses

The Internet provides some advantages that other distance learning methods can not offer and has the potential to compete with traditional learning methods. Advantages of Internet courses include the following:

1. Time and place flexibility. Students can log onto a class whenever and wherever they want. An instructor can work with colleagues from other locations, and institutions may cooperate with each other to share learning resources (Wulf, 1996; Glener, 1996).

2. Multi-platform capability. Using Hypertext Markup Language (HTML), and TCP/IP protocol, barriers between operating systems are reduced (Wulf, 1996; Kruse, 1997).

3. Easy, affordable distribution. Using the Internet to access course content can reduce the cost of delivering and producing learning materials (Wulf, 1996, Kruse, 1997).

4. Up-to-date content. Text and graphics can be updated in minutes, and current information can be provided, which cannot be done with video and CD-Rom (Wulf, 1996; Kruse, 1997).

5. Learner control. Students have more control of their pace and can ask for help while applying what they are learning (Wulf, 1996). "The idea of static, linear training programs has changed to a fluid and individualized learning model" (Glener, 1996, p57).

6. Potential to reach a global market. Students can access learning materials even if they are geographically isolated from training institutions (Armstrong, 1996).

Disadvantages of Internet Courses

While Internet courses provide many advantages, they also have disadvantages. These can reduce student participation, and instructor and institutional development.

1. Changing nature of technology. Using video on the Internet is limited by bandwidth. The reliability of an Internet address can interrupt the learning process and affect the learning performance. Network systems are becoming more complex (Wulf, 1996; Pritchard, 1998).

2. Reliance on student initiative. Compared to traditional courses, students are more responsible for maintaining their motivation and desire to learn. Therefore, self-motivation will affect the learners' and programs' success (Wulf, 1996; Black, 1997).

3. Faculty workload. In a traditional classroom a faculty-student conversation during a class break may take 30 seconds. However, in an Internet course the student can be anywhere at anytime and information is exchanged by e-mail. This may take 2 to 3 minutes so the faculty workload may increase dramatically (Boettcher, 1998).

4. New mode of training. The Internet and World Wide Web still are new environments for trainers. Determining the appropriate training style is still a problem. Also, there is a change in the relationship between teacher and students (Westera, 1999).

5. Copyright issue. "Fair Use" has not been defined for the Internet, and putting course material on a web site may violate copyright law (Gallick 1998).

6. Accreditation. The value and prestige of a degree is based in part on the accreditation of the program and institution. Some virtual universities have no physical campus. It is hard to apply current standards to virtual universities and online courses (Gallick, 1998).

7. Privacy. In the world of the electronic network, information is transferred through a series of servers and all the servers keep a log within their database (Descy, 1997).

8. Information Overload. Most information sources students find through a web search engine are not well organized. When students search for a specific term, they may find many thousands of matches. Teachers and students need to put much effort into evaluating the accuracy and the reliability of the information found on the Internet (Descy, 1997).

9. Academic Honesty. Gray points out that with the Web-based instructional tools available today, instructors have more ways of controlling the testing environment (1998).
10. Intellectual Property. Boettcher stated that "it is important that we find ways to acknowledge the right of a faculty member to his/her own work, and the right of an institution for reasonable access to the work of faculty members" (1999, p. 36).

11. Completion Rates. Parks, a web-based training designer has found that up to 50 percent of learners are not finishing online-learning modules (1999).

Findings and Poster Exhibition

The major findings from this study are presented in the following four tables. These four tables will be presented on two posters for this session. A narrative description is also provided for some of the other survey questions.

Reasons Universities do not Offer Internet Courses

Problems in Setting up Internet Courses

Internet courses were most often developed by the instructors, and seldom or rarely developed by graduate assistants or outside providers. All ten respondents indicated their Internet courses always included text and interactive exercise and 90% of them had hyperlinks to external web site. A limited number included audio or video components. The relationship between experience and perceived advantages, perceived disadvantages and problems in setting up Internet courses should be examined.

Factors Influencing Employee Participation in Training: An Empirical Investigation

Reid A. Bates
Louisiana State University

This study tests a mediated model of employee participation in training activities in a public sector highway department. Results showed the combined predictor sets accounted for a significant proportion of the variance in an objective measure of training attended and a self-report measure of intentions to participate in training. Although the mediated model was not supported for both outcome measures, the findings suggest that adequate job-related workplace literacy skills are important factors contributing to employee participation in training.

Keywords: Employee Development, Training Participation, Basic Skills

Participation in learning, training, and other developmental activities is a major strategy for employee and organizational growth. For example, notions of continuous learning and lifelong learning stress individual responsibility and ongoing, active pursuit of learning as a means of career and personal development (Rosow & Zager, 1988). Organizations increasingly use learning to meet the adaptive demands of a dynamic environment. Organizational interest in learning and training is reflected in literature addressing 'learning organizations' (e.g., Pearn, Roderick, & Mulrooney, 1995) as well as rising investments in training, estimated at over $60 billion in 1998 (Lakewood Research, 1998). In addition, research suggests an organization's ability to learn is directly proportional to the degree to which employees themselves are willing and able to learn, change, and succeed at work (Bartel & Lichtenberg, 1987; Cohen & Levinthal, 1990). Although training is sometimes mandated to meet a variety of certification or regulatory requirements, involvement in most organizational learning and training activities is primarily a result of individual employee initiative (Noe, 1999). For these reasons, it is critical that HRD researchers and practitioners understand the individual and organizational factors that influence training participation.

Recent research at the individual level has begun to address antecedents of continuous learning and participation in training and developmental activities. Variables such as exchange of information, complexity of task assignments, perceived task uncertainty, and managerial support for development have been associated with technical updating orientation (Kozlowski & Farr, 1988; Kozlowski & Hults, 1987). Efficacy beliefs about personal skills and abilities, motivation to learn, perceived need for improvement, and social support have been found to be associated with participation in training (Maurer & Tarulli, 1994; Noe & Wilk, 1993). Research has also shown some employees receive less training than others as a function of position in an organization (lower job levels receive less training), job tenure and age (increases in each is associated with less training participation), and gender (Carnevale, Gainer, & Villet, 1991; McEnrue, 1989), suggesting organizational membership characteristics are related to training participation.

This body of research, however, has not yet addressed a number of other critical variables. For example, research has not yet examined the role that workplace literacy plays in training participation. Workplace literacy refers to the ability of individuals to effectively respond to the literacy demands of the workplace (Gowen, 1992). Workplace literacy skills are the basic skills needed by employees to successfully perform job duties, learn, and apply learning on the job. These include skills such as reading, writing, mathematics, and listening (Department of Labor, 1991). The relationship between workplace literacy, attitudes, and employee participation in development activities is important because it may influence an individual's awareness of development needs, his/her choice to participate in learning and other developmental activities, and his/her capacity to develop and improve performance through learning.

Research has also established that several dimensions of development climate can affect employee participation. These factors include both situational supports (e.g., manager feedback) and situational constraints (e.g., lack of money or time) affecting employee participation (Kozlowski & Hults, 1987). Research has not yet examined the role of more macro-level variables such as an organization's continuous learning culture (Tracey, Tannenbaum, & Kavanaugh, 1995). This is important because of the pervasive effect that an organization's culture can have on employee behavior (Noe, Wilk, Mullen, & Wanek, 1997).
Finally, work by Sonnenfeld and Peiperl (1988) suggests that an organization's staffing policies may influence participation in training. That is, employee training attitudes and activity may be influenced by the extent to which they perceive their employer relies on the external labor market versus internal promotion to fill staffing needs. Employees in organizations that tend to promote from within rather than recruit from outside may believe that training participation is an important vehicle for promotion.

This study seeks to extend current research by examining the relationship between previously untested variables and employee participation in training. The study uses a conceptual model developed by Noe and Wilk (1993) to examine the relationship between antecedents, mediators, and training participation. The model (Figure 1), shows that the influence of workplace literacy, continuous learning culture (Tracey, Tannenbaum, & Kavanaugh, 1995), and staffing strategy is mediated by employees' need to improve performance, implicit training contract, and motivation to improve work through learning. Position in the organization is shown having a direct influence on training participation. A good deal of research has established that organizational membership variables such as position, job tenure, and so on have a significant relationship with developmental participation (Kozlowski & Farr, 1988; Kozlowski & Hults, 1987). For example, supervisors and individuals in relatively higher level positions are likely to have more opportunity to participate in training (e.g., see Lakewood Research, 1998).

Figure 1: Conceptual model of training participation

Sample

Participants in this study are 1079 individuals employed with a state highway/transportation department in the Southern US. The following general job groups were included in the study: Mobile equipment operator, highway foreman, engineering technician (entry level), engineering technician advanced/supervisor, and highway maintenance specialist/superintendent.

Procedure

The data in this study was collected as part of a larger needs assessment project conducted to address a number of organizational issues including workplace literacy and training transfer problems. The workplace literacy assessment instruments and the survey instrument were administered under the guidance of a Needs Assessment Team, co-directed by the researcher, with the assistance of the organization's District Training Specialists. On-site District Training Specialists administered the assessments to the participants during the months of January and February 1999. Of the 1218 individuals selected to participate in the assessment, 1079 (88.5%) completed the instruments. Participants were required to attend the data collection sessions but could decline to complete the instruments if they so desired.

Antecedent Measures
Work Keys®. Data on employee workplace literacy levels were assessed using two scales from the Work Keys® assessment system. Work Keys is a set of eight criterion-referenced basic skills assessment tests. The tests measure an individual's cognitive and interpersonal skills against the proficiency required to successfully perform a specific job. Required proficiency levels are established by profiling specific jobs across the eight skills assessed by the Work Keys® system. Work Keys measures work-related rather than academic proficiencies.

Two Work Keys skills were assessed in this study. The reading for information assessment measured an individual's skill in reading and understanding work-related instructions and policies. Employees were tested on their ability to understand reading passages, based on actual demands of the workplace, that were in the form of memos, bulletins, notices, letters, policy manuals, and governmental regulations. The applied mathematics assessment measured an individual's skill in applying mathematical reasoning to work-related problems. The assessment required the examinee to set up and solve the types of problems and to do the types of calculations that actually occurred in his/her job. Examinees could use a calculator. A formula sheet was provided that included, but was not limited to, all required formulas. For each assessment, examinees were given 40 minutes to solve 30 multiple-choice problems.

Proficiency levels for these assessments were established based on jobs previously profiled by Work Keys that were functionally similar to the jobs examined in this study. Because the focus of this study was determining whether satisfactory proficiency levels of workplace literacy skills influenced voluntary participation in training, individual scores for both assessments were dummy coded based on whether the individual met or did not meet the proficiency level for his/her job. The job groups and the proficiency levels required for each are shown in Table 1.

Continuous Learning Culture. Continuous learning culture (Tracey et al., 1995) is a construct that assesses the extent to which individuals perceive the work environment to be supportive of learning and the use of new knowledge. It is likely that the existence of a continuous learning culture within an organization will be an effective precursor to motivation to participate in training activities. Research has shown similar such work environments influence employee attitudes and participation in development activities (Kozlowski & Hults, 1987; Noe & Wilk, 1993). Continuous learning culture was assessed with a 15-item scale (α = .91) developed by Tracey (1992). Sample items included “Job assignments challenge employees to learn new things” and “Co-workers are willing to listen to new ideas”.

Staffing Strategy. Employees who believe their organization values expertise and prefers to develop and promote expertise from within rather than recruit it outside the organization will likely exhibit higher levels of motivation to participate in training. Individual perceptions of organizational staffing strategy was assessed by a four-item scale developed by the researcher (α = .74). Sample items included “This organization promotes from within rather than hiring new people from the outside” and “In this organization, higher level positions are filled by promotion from within the organization”.

Both of these scales were rated on a five-point scale with anchors from (1) strongly disagree to (5) strongly agree.

Mediator Measures

This study tests the notion that employee participation in training is directly influenced by individuals belief that they need to improve performance and that effort directed at performance improvement through training will pay-off in terms of favorable outcomes. This study tested this perspective using six scales that assessed various dimensions of training-related motivation. All mediator measure used a five-point response scale with anchors from (1) strongly disagree to (5) strongly agree was used for all mediator scales.

Perceived Need to Improve. This variable was assessed using a 4-item scale (α = .71) developed by the researcher. This scale examined an individual’s perceived need to enhance personal knowledge, skills, and abilities
in order to improve job performance. Sample items included “There are areas in which I need to know more to do my job better” and “There are ways in which training can help me do my job better”.

**Motivation to Improve Through Learning.** This study examined a new construct, motivation to improve work through learning, as a mediator of training participation. This second order construct is posited to more completely capture training-related motivational influences because it includes both motivation to train and motivation to transfer elements (Naquin & Holton, 1999). Five scales were selected to measure this factor. Three of these scales (transfer effort – performance expectations, performance-outcome expectations, and motivation to transfer) were taken from the Learning Transfer Systems Inventory (LTSI) (Holton, Bates, & Ruona, 1999). This 68-item instrument was developed to measure factors affecting learning transfer in work settings. Exploratory factor analysis of the LTSI has revealed an exceptionally clean and interpretable sixteen-factor structure (Holton et al., 1999). The transfer effort-performance expectations scale is a four-item scale ($\alpha = .81$) that assessed the extent to which individuals believed that applying skills and knowledge learned in training would improve their performance. Sample items included “My job performance improves when I use new things I have learned” and “The harder I work at learning, the better I do my job”. The performance-outcomes expectations scale (five items, $\alpha = .79$) assessed the degree to which individuals believed that applying skills and knowledge learned in training would lead to recognition they value (e.g., “When I do something to improve my performance, good things happen to me”). These two scales address expectancy beliefs about the capacity of training to improve performance and the likelihood that changes in performance will lead to outcomes valued by the individual. The motivation to transfer learning scale (four items, $\alpha = .80$) examined the degree to which individuals were motivated to utilize new learning on the job. Items included “Training increases by personal productivity” and “I get excited about using my new learning”. Two other scales were used to assess motivation to improve work through learning. These scales were taken from the Strategic Assessment of Readiness for Training (START) instrument. The START instrument (Weinstein, Palmer, Hanson, Dierking, McCann, Soper, & Nath, 1994) consists of eight 7-item scales designed to provide a diagnostic assessment of learning strengths and weaknesses in a work setting; provide baseline data about readiness to profit from training or other learning experiences; and to increase an individual’s awareness of strategic learning strengths and weaknesses. The attitude toward training scale ($\alpha = .80$) indicated the value or importance individuals placed on participation in training for personal or professional development (e.g., “I enjoy training programs that help me to develop knowledge and skills that will be useful in my work”). The motivation to participate in training ($\alpha = .68$) scale examined the degree to which individual’s are willing to participate in training and complete the tasks and work assigned to him/her (e.g., “I try hard not to miss any of the sessions during a training program”).

**Control Measures**

Since the primary interest of this study was in identifying the variance in amount of voluntary training participation accounted for by the predictor sets independent of job group and previous mandated training, these variables were always entered first in the regression equations.

**Job Group.** Five different job groups were included in this study: mobile equipment operator, highway foreman, engineering technician (entry level), engineering technician (advanced), and highway maintenance specialist/superintendent. Job group data came from organizational records.

**Previous Mandated Training Attended.** The focus of this study was on identifying factors associated with voluntary participation in training. Because the amount of mandated training individuals were required to attend was presumed to limit the time available for voluntary training, time spent in mandated training was controlled. This factor was measured by a single self-report item that asked employees to indicate how many mandated training courses they had participated in over the past 12 months. Response categories ranged from 1 (zero) to 7 (six or more).

**Outcome Measures**

Two outcome measures were used in this study. The objective measure of participation in training included the total number of organization-sponsored training events that participants attended in the 12 months between January 1, 1998 and December 31, 1999. Data for courses attended by each respondent were generated from the organization’s training database. A single-item self-report measure asked respondents to estimate the number of
days of voluntary job-related training they intended to complete in the next 12 months ("How many days of job-related training do you intend to complete in the next 12 months, assuming the courses are available and the decision to attend is left completely up to you?). Respondents were given a blank space on the questionnaire and asked to make their best estimate.

Results

Individual employees were the unit of analysis in this study. To assure a consistent sample across the analyses, observations with missing data were deleted. This reduced the regression sample size to 569 complete observations.

Descriptive Statistics. Means, standard deviations and intercorrelations of all variables included in the study are shown in Table 2. Data indicated that proficient levels of reading and math skills were positively associated with courses attended \((r = .13 \& .16, p \leq .05)\) and intentions to participate in training \((r = .16 \& .18, p \leq .05)\) but not with participation in mandated training. Job group showed no association with courses attended but was negatively associated with intentions to participate \((r = -.15 \& -.32, p \leq .05)\), suggesting employees in job requiring relatively higher levels of basic skills intended to participate in less training than lower level employees. Respondents' scores across the five motivation to improve work through learning scales were moderately high \((M = 3.0)\) but not with participation in mandated training. Job group showed no association with courses attended but was associated with courses attended \((r = .13 \& .16, p \leq .05)\) and intentions to participate in training \((r = .16 \& .18, p \leq .05)\). The positive correlation between mandated training attended and intentions is surprising because it was expected that increased time spent in required training would leave less time for voluntary training.

Regression Results. Table 3 presents the hierarchical results for the total and unique effects of the predictor sets for both outcome variables. The combined predictor sets accounted for a significant proportion of the variance in both the objective measure of training attended in the past year \((R^2 = .19)\) and self-reported intention to attend training in the future \((R^2 = .17)\).

* Effects of other variable sets uncontrolled

* Effects of other variable sets controlled

* Antecedents (continuous learning culture, staffing strategy, adequate/inadequate job-referenced reading and math proficiency) and mediators (perceived need to improve, transfer effort-performance expectations, performance-outcomes expectations, motivation to transfer, motivation to train, and attitudes toward training)
Model Evaluation. Hierarchical regression analysis was also used to determine whether the model provided a reasonable description of the relations among variables as specified. Because the focus of this study was on predictors of training participation independent of mandated training attended and job group, these factors were always entered first in the regression models. An analytic procedure suggested by Cohen & Cohen (1983) was used to test the relationships suggested by the model. This analysis contrasted total effects, or the direct and independent proportion of variance accounted for by each predictor set, with unique effects, or the proportion of variance accounted for by the predictor set when the other sets were controlled. Direct relationships suggested by the model should produce significant total and unique effects. This would indicate that variance was not shared among predictors and therefore could not be mediated. Mediated relationships should show significant total effects but non-significant unique effects.

The effects of perceived need to improve and motivation to improve work through learning were hypothesized to mediate the influence of workplace literacy skills, continuous learning culture and perceptions of staffing strategy on actual training attended in the past year and intentions to participate in training in the future. Examination of the total and unique effects of antecedent and mediator variables provided mixed support for the model. After controlling for job group and mandated training attended, basic skill levels, perceptions of continuous learning culture and staffing policy had a significant total effect on intentions to participate in training and on courses attended. Comparison of the total and unique effects indicated the antecedents did not account for any unique variance in courses attended. Thus for this outcome variable it appears the effect of the antecedent measures was mediated by the motivational elements (perceived need to improve & motivation to improve work through learning factors) as hypothesized. However, the mediated relationship did not hold for self-reported intentions to participate in training.

Although the mediated model was not supported for both criterion measures, the predictor sets explained significant variance in both measures of training participation. Analysis indicated that control variables (job group and mandated training attended) accounted for .14 and .15 (p < .05) of the variance in courses attended and intentions to participate respectively. The regression models that included control and antecedent variables indicated the latter explained significant variance in both courses attended ($R^2 = .18, p < .05$) and intentions to participate ($R^2 = .15, p < .05$). Examination of the regression models that included only control variables and motivational elements also indicated that these variables accounted for significant variance in intentions to participate for both outcome measures ($R^2 = .16, p < .05$). Data show that antecedents and mediators added comparatively little to the variance explained in the outcome measures ($R^2 = .04 & .03$) beyond that accounted for by the control variables.

Examination of Beta weights (Table 4) in the unique effects equations indicated which variables accounted for significant variance in the training participation measures. Number of mandated courses attended was the only factor to have significant total and unique weights for both outcome measures, suggesting a direct relationship with courses attended and intentions to participate. Results indicate math level had a direct significant relationship with courses attended and job group made a significant negative contribution to intentions to participate. Significant unique contributions to both outcome measures were made by motivation to improve work through learning variables, specifically, motivation to transfer, transfer effort-performance expectations, and attitudes toward training. This implies these factors make a meaningful contribution to training participation.

Conclusions and Discussion

Several important findings emerged in this study that contribute to the understanding of training participation. First, the study suggests that employees who meet the basic skill requirements of their jobs participate in more training and intend to participate in more training than do employees who do not meet the basic skill requirements.
Satisfactory math skill levels made a significant positive contribution to courses attended and both satisfactory math and reading levels were positively associated with courses attended and amount of intended participation. These findings suggest that adequate job-related workplace literacy skills are important prerequisites for employee participation in training activities and that employees who meet the workplace literacy requirements of their jobs are apt to participate in more training than do employees who do not. On the other hand, it is interesting to note that large negative correlations emerged between reading and math skills and job group \((r = -.40 \& -.55, p \leq .05)\). These data indicate employees in jobs that required relatively higher basic skill levels were less likely to meet the required proficiency level. Job group was also negatively associated with intentions to participate in training. Taken together, these data suggest employees in job requiring basic skills beyond current ability levels may intentionally avoid participation in training. Future research should confirm and examine these relationships in more detail. Specifically, research is needed to examine the interaction between job level, basic skills proficiency and training participation and whether changes in literacy levels are associated with changes in training participation rates. Research should also address whether employees with satisfactory workplace literacy levels are more aware of their development needs than employees with unsatisfactory levels and the extent to which workplace literacy levels affects participation in other types of development activities (e.g., career assessment and planning).

Second, the results did not support the proposed model across both dependent variables. Although motivational elements emerged as significant mediators for courses attended, they did not for intentions to participate. Also, the control variables explained a substantially larger proportion of the variance in outcome measures than did antecedents and mediators combined. It is unclear whether these results are sample-specific or due to some other factor. On one hand, it is also possible that other unexamined factors were at work. For example, the findings could indicate that intentions to participate in future training participation are influenced by different factors than past training participation. Intentions to participate may be contingent on an individual’s perception that training will enhance adaptability to work demand or anticipated job changes, or will contribute to career advancement. Past training participation, on the other hand, may be more contingent on perceptions of organizational support for training and its application (Kozlowski & Farr, 1988; Noe et al., 1993). It is also possible that employees in this study did not distinguish between mandated and voluntary training participation. Subjects in this study were relatively low-level public sector employees who were not typically encouraged to make voluntary requests for training. Although employees in this organization could voluntarily elect to attend training, training was a primary requirement for advancement. This may have generated the view among employees that training was largely mandatory. As a result, the study may have in effect attempted to predict voluntary training participation using measures that reflected mandated training. Future research should test this model with a different population of employees in settings where voluntary participation in training and development activities is emphasized. Longitudinally designed studies would add to our understanding of future development intentions and actual future participation.

Third, significant unique contributions to both outcome measures were made by motivation to improve work through learning variables, indicating these factors make a meaningful contribution to training participation. This is important to the extent it suggests this factor is an important precondition for training participation. Further work is needed to more fully understand the role of this construct in employee development. Research is needed to confirm its role as a mediator in training/employee development activities and identify what individual characteristics, training-related factors, and work environment features contribute to this factor in the context of employee development.

Finally, a number of constructs suggested by previous researchers as potentially important predictors of development activity did not emerge as such in this study. Continuous learning climate (Tracey et al., 1995) was not significantly associated with either measure of training participation, although it did exhibit strong positive correlations with the motivation to improve work through learning scales. Organizational staffing policy (Sonnenfield & Perperl, 1988) was weakly associated with courses attended and was not a predictor of either courses attended or intentions to participate. This latter finding was somewhat unexpected given that the public sector organization in which this study took place had an explicit policy encouraging internal promotions based in part on completion of training. Future research should reexamine the role of these variables in predicting voluntary training participation as well as other kinds of employee development activity.

‘Personal development-I’m not really interested!’: Perceptions on Barriers to Learning for Mid-Career, Middle Level Managers in the Scottish Life Assurance Industry

Martin McCracken
Sandra Watson
Napier University of Edinburgh

The paper discusses literature relating to potential barriers to learning for all managers, and then concentrates on the position of middle level mid-career managers in more detail. For example, flatter organisational structures, and changes to the traditional ‘psychological contract’ (Hiltrop 1996) can affect participation in learning, training and development activities. Empirical evidence from a qualitative study of mid-career managers in five life assurance institutions in Scotland is presented.

Keywords: Barriers to Learning, Middle Management, Life Assurance

All sectors within the Financial Services Industry have undergone significant and extensive transitions throughout the 1990’s (Park, 1999). Changes relating to increasing globalisation, competition, demutualisation, technological advances and merger and acquisition activity have intensely affected the nature of the insurance sector, with life assurance in particular continuing to be characterised by extreme volatility (Matthews, 1998; Genetay, 1999; Murray, 1999; BBC, 1999). Flatter organisational structures and shifts in the traditional ‘psychological contract’, which are felt to be responses directly attributable to upheavals occurring at the macro level, are characteristics of many organisations (Beer et al., 1984; Hiltrop, 1996). An important consequence of these developments is that managers can no longer rely on the job security which was once associated with the industry. Major downsizing and the threat of redundancies are present even amongst the most successful companies (Cressey and Scott, 1992; Gall, 1993; Storey, 1995; Antonacopolou, 1999; The Scotsman 6 February 1996). Given this background, a central assumption made in this paper is that shifts occurring at the environmental level will influence managers’ participation in effective learning and development activities. However the decision to participate and complete training is an individual choice, which will be influenced by individual perceptions of barriers to learning. It is therefore necessary to examine barriers to learning from this perspective to build a greater understanding of learning in organisations.

Effective learning and development is felt to be a fundamental condition for organisations and individuals aiming to build a sustainable future (Garratt, 1960; Salaman & Butler 1990; Senge, 1990; Nonaka, 1994). This paper reports on findings from a study which focused on managers in the Scottish life assurance sector occupying mid-career middle level managerial positions. The mid-career manager has been defined by Maguire & Fuller (1995) as, “Someone who is in their mid-thirties and forties who, having attained some experience in managerial jobs, is looking to progress or at least consolidate their careers.” The role of middle management has been described by Floyd and Wooldridge (1997: 465) as “performing a co-ordinating role where they mediate, negotiate, and interpret connections between the organization’s institutional (strategic) and technical (operational) levels. The core aim of this study is to contribute and build upon existing literature which explores managerial participation in learning by empirically investigating the perceptions and experiences of middle level, mid-career managers in the financial services sector in Scotland.

Before the actual findings from this study are presented, environmental factors, which influence managerial learning, are presented. Secondly, a discussion on the barriers to learning is undertaken (Temporal and Boydell, 1981; Stuart, 1984; Mumford, 1988). Finally the impact of organisational change on the role and position of middle level, mid-career managers is presented.
Management Learning Environment

Antonacopolou (1998) examines management development and learning at societal, industrial, organisational and individual levels. Her model provides a holistic view of where learning takes place moving from the individual learner through to society in general, identifying the interdependent nature of the various levels. Allied to Antonacopolou's framework, is the model which deals with the different actors within various levels of training provided by Mabey, Salaman and Storey's (1998) 'Strategic training and development: a stakeholder approach' illustrates the factors which can influence how individuals learn in organisations.

These frameworks highlight the complexity and interdependency of a range of internal and external influences on learning. The purpose of this paper is to build an understanding on barriers to individual learning through the presentation of data focusing on both intrinsic and extrinsic blocks to managerial learning.

In this study, the learning activities which are investigated relate to activities which theoretically further a managers skills and competences in their professional or vocational life. Factors which impact on managerial participation in such activities are analysed by Temporal and Boydell (1981) and Marsick and Watkins (1990), who deal with the issue of managerial learning and development in the organisational context. Temporal and Boydell (1981) explore the nature of managerial learning behaviour, the factors that help or impede managers in the development of general learning and the effect that the general learning climate within the organisation has on the development of the individual. Temporal and Boydell (1981) have formed the 'Organisational Model of a Management Learning System', comprising four interrelated constituents influencing the process.

The first component relates to both the formal learning structures in the organisation within which managers have to operate, such as job descriptions, and to the externally set management development and training objectives. The second is concerned with everyday working relationships as well as the more specific opportunities which can offer developmental prospects for the manager, such as internal and external training and development courses. Thirdly, the qualities of the individual learner are considered. The intellectual and cognitive ability which the individual has for new learning, is viewed as vital to overall development. Temporal and Boydell (1981) also propose that the learning climate plays a significant role in determining the extent to which learning and development is effective in the organisation. Essentially, this aspect relates to the company culture which they define as 'those elements within the managers' environment which encourage or discourage learning or desirable behaviour' (Temporal and Boydell, 1981:2).

The work of Marsick and Watkins (1990: 7) closely mirrors many of the key aspects of the learning system described above. In their assessment, employees in organisations can experience three different types of learning: the more formal type which may have been traditionally delivered in the classroom; informal learning which occurs through a manager's day-to-day interactions, and lastly incidental learning which is described as a "by-product of some other activity such as a task accomplishment, interpersonal interaction, sensing the organisational culture or trial and error experimentation".

Other observers such as Thomas and Al-Maskati (1997) and Antonacopolou (1998) stress the importance of the specific organisational context. Temporal and Boydell (1981) underline the fact that the four components are inherently interconnected and ultimately determine the efficacy of such learning for individual managers. For example, an organisation could provide excellent opportunities for learning and development but these may be irrelevant unless the individual either has the capacity to understand what is being taught or opportunities to use the skills engendered through such development.

Barriers to Learning

Temporal and Boydell (1981) categorise a full range of barriers or blocks to learning that may be encountered by these managers. These are separated into intrinsic factors, which are described as being 'owned by' the learner, and extrinsic or external factors, which are consequences of environmental forces and pressures. From these two major headings, Mumford (1988) has developed a classification of ten categories. Table 1. illustrates the range of potential managerial barriers to learning.

Source: Adapted form Mumford (1988: 26)

The first seven of these barriers are closely aligned to the intrinsic factors as defined by Temporal and Boydell (1981). For example, perceptual barriers to learning may exist where managers do not perceive there to be any requirement for further development due to their apathetic attitude regarding current position or future career security. Another example of an intrinsic factor is the emotional barriers to learning. Mumford (1988) proposes that these are linked to fear or insecurity which may inhibit participation in further development activities. The final three learning barriers are linked to the extrinsic environment. These may be either linked to the physical aspects of the manager’s work location or to the attitudes of senior managers or colleagues towards mid-career managers' participation in development activities.

By categorising the comments and observations of the managers, we can begin to assess the impact of each barrier and expose the interrelationships between these elements. At this point, it is necessary to understand the differences between the two groupings. It is felt that intrinsic barriers are ‘owned by’ the learner and these are therefore perceptions over which they have control. On the other hand, extrinsic or environmental barriers are outside the locus of their individual control. In this way, it follows that the variables that are present in relation to the intrinsic values lead to diverse perceptions on the extrinsic. For example, the perceptions, motivations and emotions of one manager from another may dictate a different response to a physical or situational barrier according to his or her locus of control.

In order to clarify these extrinsic factors it is necessary to understand current changes in organisations that are impinging upon the role and position of middle level, mid-career managers in the financial services sector of the Scottish economy.

Organisational Change

Much of the literature on recent organisational change describes an increasingly insecure position for middle managers in modern organisations (Dopson and Stewart, 1993). Fenton O’Creevey and Nicholson (1994) point out that when organisations implement rationalisation programmes there are many perceived negative implications for those in middle management positions. These are associated with issues of future job security, career prospects, and the nature of the work for those who are survivors of corporate downsizing and redundancy programmes. The obvious implication of delayering on learning and development is that, with fewer middle managers around, there will be increasing work pressure on those who do remain in flatter organisations, which may hinder their continued participation. Therefore time becomes a major constraint for further development. Pessimism surrounding those in mid-career and middle level management may induce a varied set of factors which inhibit participation in learning activities. For example, middle level managers who perceive there to be a threat to their positions may contend that it is pointless participating when it appears to provide little security to former colleagues.
Associated with the development of flatter organisational hierarchies is what is described as the early career plateau. If this is a feature in organisations the manager may only have the option of lateral moves in the organisation's hierarchy for renewed interest and challenge (Evans and Gilbert, 1984; Nicholson, 1993). Given this background, embarking on new learning opportunities may appear to be futile to middle managers faced with such a scenario and may lead to them looking for other avenues in life outside work for challenge and stimulation.

The emergence of a 'new deal' between employers and their managerial employees is another aspect of organisational change, which has been the focus of recent studies (Kerfoot & Knights, 1993; Stiles et al., 1997; Knights & McCabe, 1998). These 'new deals' have, in effect, amounted to a re-negotiation of the traditional 'psychological contract' (a phrase first coined by Argyris in the 1960s). In the past organisations (especially in the life assurance sector) offered contracts that were paternalistic in nature, where loyalty and commitment generated security, regular promotions, the provision of high quality training and development and salary increases. Recent changes include the use of more temporary and agency staff as well as the provision of more short and fixed term contracts for employees in financial services organisations. This has resulted in a reciprocal and 'what's in it for me' attitude amongst employees influencing the employment relationship. (Herriott et al., 1996; Hendry and Jenkins, 1997; Hayes and Hudson, 1995; IRS Employment Trends, 1997)

When specifically considering training and development provision as part of the psychological contract, Stiles et al. (1997) argue that managers attach significant emphasis on what development opportunities they are offered, viewing these as symbolic of how the organisation views their future career prospects. Hence, in the past, training and development was seen to be employer led and was designed to prepare employees for a career within the organisation. However, as careers have been redefined, Stiles et al. (1997) have found that emphasis on training and development in the new psychological contract has been realigned towards providing employees with skills which promote their overall employability. In addition, more emphasis has become attached to individuals taking a greater responsibility for their own development.

What effect do these changes in the psychological contract have in relation to participation in learning for middle level mid-career managers? Again Stiles et al. (1997) make the important point that, in the organisations that they studied, there were apparent differences between the philosophy and the practice of these new psychological contracts where the intended aim of these 'new deals' was to encourage benefits like increased flexibility for employees in the external labour market. However it would seem, in reality, that changes in the psychological contract, allied with other changes in the employment relationship, have produced more frustration amongst employees. Many of these issues are revisited when the findings are discussed in more detail.

**Research Methodology and Data Collection**

This research used a qualitative mode of inquiry. In order to explore barriers to learning, middle level mid-career managers from five of the largest life assurers boasting a Scottish head office data was collected using depth interviews. There are several reasons why such a qualitative methodological approach is taken. The most important of these relates to the contextual environment where the research is to be carried out. The issue of control over the actions of the units of analysis that are being investigated is of importance here. As Yin (1994) points out, the researcher needs to be aware of the influence which he or she has over the study subjects, and how this may impact on the findings. The major advantage in using qualitative semi-structured interviews with middle level, mid-career managers, (68 in total and an average of 13.5 per organisation) was to allow the interviewees to discuss using their own terms and expressions, their attitudes, motivations and perceptions of the world. It was accepted that the individual manager's perceptions would be influenced by the social constructs of both the organisation and wider environment. The main aim was to allow the study to remain open and holistic to achieve an understanding of the interplay between the individual managers' perceptions and the wider environment.

In terms of the practicalities of the data collection, in selecting managers for interview attempts were made to ensure that all the main functional areas in typical life assurance organisations were represented, i.e. Administration/Pensions, Investment, Information Systems, Marketing, Actuarial, Compliance and Personnel/Human Resource Management. In order to capture an organisational perspective and a contextual overview of Training and Development strategies in each of the organisations, managers who were responsible for Training and Development were also interviewed. As this paper is primarily considering the individuals perceptions of barriers to learning the findings from these interviews are not discussed.

In the interviews conducted with middle level mid-career managers the questions covered a wide range of issues. The first section which concentrated on personal experiences and perceptions of learning, consisted of
gauging the managers' comments on issues such as their reasons for undertaking certain learning activities; their preferred methods of learning; the factors that had inhibited them in the past; how they felt their career could develop in the future, and their perceptions of how management training and development could influence this. In the second section, the focus shifted to the most important pressures which the managers thought were taking place in the external environment, and how these might affect the training and development culture in their organisations.

For reasons of confidentiality neither the name of the organisation nor the manager who forwarded the information is given. Instead, pseudonyms which are based on Scottish geographical regions are employed to conceal the organisations' identity (Central Life, Lothian Life, Highland Life, Grampian Life and Borders Life). However, the gender, job title and age of the participants are supplied to help provide a context for the reader.

Empirical Findings

In this section examples from the actual transcripts have been isolated to illustrate the experiences regarding the various barriers to learning. Firstly, barriers which are linked to the managers' intrinsic attitudes, motivations and perceptions are presented. For example, their previous experiences of learning activities or their perceived need for future participation in learning activities. Secondly, those barriers related to the organisation or other environmental forces are addressed.

Perceptual Barriers to Learning

In Mumford's (1988) analysis a perceptual barrier is felt to occur when the 'individual does not see that there is a problem' in relation to participating in potential learning activities. Many of the managers felt that they were professionally successful and often did not see any 'problems' in their work (related to what they personally could do) which participating in learning activities would change. The following examples illustrate this:

“I’ve probably been around for so long here that I feel I know enough thank you very much”... , Female, Life Customer Services Manager, Age 47: Central Life.

“I’m maybe getting close to that point where I’m quite happy here... So in terms of my personal development, I’m not really interested.” Male, IS Technical Manager, Age 36: Central Life.

An interesting aspect related to this is that some interviewees expressed a preference to concentrate on their work in the shorter term. Development and learning activities were something in which they were not interested.

“Some people that have done MBAs do appeared to have advanced but I’m not interested in gaining academically in that way. I’d rather concentrate on improving myself for the job or similar jobs...”. Male, Assistant Marketing Manager, Age 45: Highland Life.

Cultural Barriers to Learning

Mumford (1988) describes cultural barriers to learning as when a manager is constrained from engaging in learning activities because of 'the way things are here'. Such intrinsic barriers may originate as a result of exposure to the culture of the workplace and domestic life. Often, concerns over the time spent with one's family appears to take precedence over continued learning and development, particularly when considerable effort is needed to achieve the required levels of motivation to complete useful learning. One quote from a manager illustrates the problems associated to this:

“An MBA crossed my mind but.....with 3 young children, I’m not convinced how much time I would be able to devote....” (Male Pensions Manager aged 38 - Lothian Life)

A number of managers mentioned that they tended to be quite conservative. This trait is something that is often associated with the financial services industry and the Scottish life assurance sector particularly, which has a reputation of being built on prudence. Therefore it was not surprising that some of the managers appeared to express such tendencies when it came to learning and development activities. For example, several managers across the organisations described themselves and their organisations as being 'conservative'.

Emotional Barriers to Learning

Emotional barriers to learning are associated with individual insecurities, which may cause reluctance to take action in certain areas and hence hamper participation. Some managers clearly exhibited certain emotional barriers.
For example, uncertainty and insecurity about their organisational positions. This point is particularly relevant when considering issues concerned with organisational change. One female manager described her expectation that the issue of early retirement would arise before she reached statutory retirement age.

"I still envisage that there will be a time, long before I reach retirement age, where they'll say you're on early retirement or there isn't actually a job for you anymore". Female, Process Improvement Manager, Age 46: Highland Life.

Some managers were pragmatic in assessing their chances of potential success in terms of learning activities at the present time (particularly formal learning and development). A common response was their perception that certain learning activities were risky, given the pressures that already exist in their jobs and the very real possibility of failure.

"From a personal level, I like to lead a full life and I was looking with a view to do the part time/weekend MBA course and I realised there wasn't enough hours - I'm certainly more motivated to study, but I wouldn't ...set myself up for a fall, ... I would want to fully commit myself and give it a good shot and I don't think I would be inclined to start something...only to fall at an early hurdle. That would de-motivate me." Male, Process Support Manager, Age 35: Borders Life

Another related reason was how far one could go before reaching a level of incompetence.

"I'm realising that I'm reaching my limits... I'm close to my limits and I don't really want to go to a point where I'm not doing the job very well or I'm having to say, well I don't really want to do that." Female, Process Improvement Manager, Age 46: Highland Life.

Motivational Barriers to Learning

Motivational barriers to learning were felt to arise for managers who were unwilling to take risks to participate, or who were simply not interested in further learning. As can be seen from the literature, these concepts of risk, uncertainty and insecurity in the workplace are very real concerns for mid-career managers in financial services. It was therefore not surprising for managers to forward opinions questioning the real benefits of participation in learning activities.

"I suppose your motivation to do it really, I suppose to be convinced that it was worthwhile, whatever worthwhile might mean... I don't suppose we have had a tremendous opportunity to become involved in anything much." (Manager aged 39 Lothian Life Compliance Male)

"One of the reasons I stopped was ...because the job I'm doing just now is fairly busy and pressurised and everything at work is changing. I feel that the return on investment is probably not there, for where I am career wise.... I think it does no harm, but I'm not convinced that it's a great thing." Male. Project Manager, Age 41: Highland Life.

For some the predominant feeling was that it was more beneficial to place emphasis on their actual jobs and core tasks.

If we consider that, for some of the interviewees and especially those who are qualified Actuaries, Accountants and Insurance Officials (Association of Chartered Insurance Institute), it may have taken five or six years to become qualified, it is perhaps not surprising that the thought of more formal qualifications was prohibitive. The following comments explicitly illustrate this:

"I've done the actuarial qualifications... where there was an intense amount of study. Since then.....I really have no plans to do any more exams." Male, Client Services Manager, Age 44: Grampian Life.

Cognitive Barriers to Learning

The previous learning experiences were considered to be an important source of potential blocks. What can be ascertained from previous experiences and perceptions of learning was whether these affected decisions regarding further study. Some managers felt that they had not exactly enjoyed their previous experiences at school or university.

"I was shocked quite frankly when I got to University and it was so poor - you know I was expecting something much better than I had experienced at school - I was disappointed I think."

and

"I did also go to ...evening University classes in management development and that was 'rueful' - ...what you are really looking for I think is practical -... hints, tips and real life examples and really the benefits of other peoples real experience of dealing with people." (Female Compliance Manager aged 43; Lothian Life)
Environmental Extrinsic Barriers to Learning

As has been previously mentioned, these are particularly turbulent times for the financial services sector in the UK. Considering this contextual background it is not surprising that those barriers connected to the wider environment, beyond the direct control of the individual learner will impact on participation. Evidence was found that the managers felt that elements of all three extrinsic barriers greatly affected where, what and how they participated in learning activities.

A significant theme relating to travelling to, and location of development opportunities emerged. Many of the managers expressed concern about inadequate provision of courses, seminars and conferences, in the Scottish geographical area. The criticism that 'London or the South', and increasingly abroad, would normally be chosen to host relevant events was also made. As a result of this many felt they would be less likely to participate in such events. One manager summed up the situation quite graphically when he pointed out that:

"I have a problem in that these things( I.T.conferences) hardly ever happen in Scotland .....I do feel that Scotland is treated as a kind of backwater." Male, IT Customer Services Centre Manager, Age 47: Grampian Life.

As well as feelings regarding the actual location of the learning activities several managers also brought up the issue of participation and reward in this context. It would seem reasonable to suggest that, in order to encourage participation in renewed learning and development activities, benefits or rewards would require to be in place. Given the level of uncertainty which surrounds this industry at present, it would be expected that the rewards would be linked to providing some security in the future.

It was also apparent that a number of managers across organisations had problems in interpreting the organisational value of certain vocational qualifications and development activities.

"An MBA crossed my mind but, ... there's no evidence that the company treats this in a particular way, you might think, for someone with an MBA and someone without one, that should be the first point. There's no guidelines or feedback from management or personnel that it is something they recommend." Male, Pensions Manager, Age 38: Lothian Life.

The issue of time and space for pursuing and completing learning activities has arisen. In responses across all the organisations the vast majority of managers singled out severe time constraints as the most biggest perceived constraint to participation. Managers summed up the problem that exists for them as a result of these time pressures as follows:-

"I'm learning but I'm not learning as much as I could, I'm bogged down in admin. and paperwork quite a lot of the time that is preventing me from developing in other areas." (Manager aged 38: Pensions Manager: male)

"Now though the barrier to learning and further learning is without doubt the office activity - I'm busier now than ever before and there's no sign that that's going to diminish... More is expected now than ever before, workforces are generally are leaner and fitter and all that means is that they are turning more stuff out with fewer people... So that is the barrier now but that's life...." (Manager aged 40: All Lothian Life)

As well as these physical pressures, which proved to be a common feature of contemporary managerial careers, the obligation to work long and demanding hours as a result of the current economic climate was felt by many managers.

"...certainly on the level, one or two down from the top, the management level if you like there's probably a fairly intense pressure for most people...and getting worse." Male. Project Manager, Age 41: Highland Life.

The above statements clearly highlight the pressures simply to survive, which in turn impact on undertaking any new learning and development activities. The specific environment of the organisation does play an important role in determining participation in learning activities. These are integrally associated with the support that managers receive for learning. In this study an attempt was made to understand the organisation culture in relation to learning and development. The prevailing issue to emerge was that top level do not take learning and development seriously enough. Phrases like 'lip-service' constantly arose when senior managers and training and development were mentioned together.

"They're making a positive attempt to encourage management development.... The difficulty with all management courses is applying it when you get back in. Four or five of us at my level went to a strategic management course - it's fascinating, very interesting and relevant and it's very obvious who should be doing it but it's not a priority as far as senior management is concerned." (Manager aged 46)

In general what can be observed from the findings is that there are very real barriers to learning. However, emphasis is given by all managers to extrinsic factors, which appear to be caused by the turbulent external environment. In effect the main finding in this study would suggest that as a result of the increasingly uncertain environment in which these managers work many of the intrinsic barriers and blocks to learning are amplified to the...
point where the manager is severely constrained to undertake any kind of activity which has a longer term development perspective.

Conclusions

Elements of all the barriers, identified in Table 1 were in evidence, however less emphasis was found on intellectual and expressive barriers to learning. These factors are associated more with learning process, rather than participation and are therefore out with the scope of this paper.

Although, classification of barriers to learning is useful for providing a structure to explore the subject matter, a significant proportion of respondents experienced multiple learning barriers. The initial analysis of the data has highlighted the critical influence of the extrinsic barriers to learning. However in order to gain a better understanding of the locus of these multiple barriers, the next stage of the research will be to integrate Mumford’s (1988) classification with Mabey, Salaman and Storey’s (1998) Stakeholder Approach to provide a three dimensional perspective of learning barriers. The intention is to interpret which barriers are most relevant at which levels of learning. Initial superficial analysis shows that:

1. At the societal level, as an adult learner the middle manager must deal with family responsibilities and non-work interests, and therefore there are physical and situational barriers to consider.
2. At the industry/sector level, there are pressures relating to the managers’ position and job security, due to the sector changes and pressures.
3. At the organisational level, specific examples are seen in relation to support by department and colleagues. Unfavourable / un-supportive culture and political environment in the organisation, were also cited as learning barriers.
4. At the individual level there were personal/ intrinsic pressures in the themes of emotions, perceptions and motivations which were presented as barriers.

These initial findings highlight the fact that barriers exist at all levels, reinforcing the interdependent hierarchical nature of learning barriers. This in turn has implications affecting the choice and content of interventions used by organisations to encourage and harness management learning.

It may be necessary to explore ways in which the organisation can support managers participating in learning. Individuals with an internal locus of control are more inclined to be proactive in taking up opportunities, and therefore the organisational culture should be explicitly geared to improving the perceived locus of control. Crowder and Pupynin (1993), using Rotter’s (1966) definition, propose that ‘individuals with an internal locus of control believe performance to be contingent on their own behaviour while individuals with an external locus of control believe that outcomes are beyond their personal control’ Crowder and Pupynin (1993:19). However, the findings illustrated that there are managers who have reached a stage in their career where they are happy with their quality of life and are lacking in the motivation to progress any further. Learning interventions, for these individuals, needs to be predicated on an overall organisational culture which forcefully stresses the philosophy of continual change, reinforcing the message that learning is vital to organisational survival and growth.

Lifelong Learning and Knowledge Transfer to the Workplace: A Longitudinal Case Study

Graeme Martin
Judy Pate
University of Abertay Dundee

Phil Beaumont
University of Glasgow

Jim McGoldrick,
University of Abertay Dundee

This paper explores the influence of a program of lifelong learning on knowledge transfer to the workplace in a longitudinal study of a major UK employer. Drawing on quantitative and qualitative data from a cohort of 114 participants in a company-sponsored program of continuing education, our findings indicate the kind of benefits that organizations may expect in terms of knowledge transfer to the workplace. They also provide support for proponents of "schooling" and situated learning theorists.

Keywords: Knowledge, Transfer, Workplace

Interest in company investment in human resource development (HRD) through programs of lifelong learning has rarely been higher, with governments keen to promote continuing education as a means of achieving economic objectives. As many economists, however, have argued, the notion of national interest is not always consistent with organizational interests since old style guarantees of job security and career development may be a denial of current labour market conditions (Cappelli, 1998). Instead some employers and academics have called for "new deals" that promote the idea of self-development among individuals as a means of enhancing their general transferable skills for employability in return for short term commitment and loyalty (Garavan, 1999).

These ideas of employability and general transferable skills being a source of mutual advantage for organizations and individuals are sometimes seen as little more than a convenient rhetoric for employers wishing to escape their traditional commitments to old-style psychological contracts (Herriot, Hirsh & Reilly, 1999) and may be based on a false sense of what is necessary for individual and organizational learning. On this last point, much of the newer literature on workplace learning has highlighted the importance of situated learning and the need to de-privilege formal, abstract knowledge which underpin the case for generic transferable skills being a source of individual and organizational advantage (Seely Brown & Duguid, 1994, Torrance, 1999). It is against such a background that we address the question of whether company-based programmes of lifelong learning through continuing education provide significant returns to the company in terms of knowledge transfer?

The contributions of this work are at least three-fold. First, we believe that the findings have some important theoretical implications, especially for the employability debate and the workplace learning literature. Second, they have implications for sceptical employers who believe that continuing education and investment in HRD benefits employees but does little to develop firm-specific skills. Third, the findings have relevance for educationalists who wish to contribute positively to the agendas of employers and governments by providing relevant continuing education (see the debate over Mode 1 and Mode 2 learning, Huff, 1999, September).

Performance Improvement, Psychological Contracts And Knowledge Transfer

The Epistemology of Knowledge Transfer

In discussing knowledge management, learning transfer and organizational learning, it is necessary to consider two alternative perspectives or epistemological orientations found in the relevant European and US...
literature (Huemer, von Krogh & Roos, 1998; von Krogh, Roos & Kleine, 1996). The first of these has been labelled *representationalism*, which is a view of knowledge that (a) represents a pre-given, universal and objective world, (b) is relatively easy transferred and, (c) can be used directly to solve problems in a somewhat detached fashion. The second is *autopoieticism*, which rejects the notion of a pre-given, objective world that, for example, can be easily represented by mapping techniques (Weick, 1994) or other such static representations (Chia, 1999), and also rejects the abstract nature and ease of transfer of knowledge. Instead, autopoietic theorists argue that organizational knowledge (a) cannot be separated from the observer but rather should be seen as something that is produced and shared among members of a community of practice (Lave & Wenger, 1991; Seely Brown & Duguid, 1994), (b) is rooted in an organization’s history, and (c) demands and relies on the creation and development of a common language or discourse of practice among community members (Lave & Wenger, 1991).

Because our initial research aims were essentially practical and demanded a strong element of measurement in producing evidence on the outcomes of continuing education initiatives, initially, at least, we adopted a representationalist perspective on knowledge. During the course of the research, however, we have gradually come to the view that our approach was both limited and limiting. This recognition was, in part, a consequence of the findings of the survey data but, more important, because we found participants in our study had difficulty in identifying with the key assumptions of representationalism. These difficulties were most obvious during the interviews when respondents had problems in disentangling the relationship between individual learning and workplace learning and in separating themselves from their communities of practice as a source of innovation and improvement. Thus, to interpret some of our findings and progress the research aims further, we have also considered questions that draw on an autopoietic epistemology.

*The Current Orthodoxy: Performance Improvement, Psychological Contracts and Knowledge Transfer*

The current, representationalist orthodoxy on the knowledge and learning at work has been, and continues to be, heavily informed by cognitive psychology (Fox, 1997). However, the specific issue of the link between HRD and performance improvement constitutes a relatively new body of literature that has attempted to combine economic theory (e.g. human capital and sustainable resource theory), psychological theories (e.g. behaviourism and cognitive approaches) with systems models. These models have stressed the interdependence of the environment inputs-processes-outputs and feedback in positive HRD interventions (Swanson, 1999). Unifying features of this literature is its emphasis on hard and soft outcomes and on the properties of good measurement (Bates, 1999). At the individual level, a number of attempts have been made to identify the effects of HRD interventions on hard and soft dependent variables including job competences, complex relational skills and cost reduction (Mulder, 1999). A related line of recent research is the attempt to link HRD to employee perceptions of psychological contracts (Guest, 1998; Martin, Pate & McGoldrick, 1999), which also incorporates work on the perceptions of organizational justice and fairness (Wooten & Cobb, 1999) and trust relations. There is neither time nor space to go into the voluminous literature on psychological contracts (for a full and up-to-date discussion, readers are referred to the special issue of the Journal of Organizational Behaviour, Volume 19, 1998). However, as Guest & Conway (1997) and Guest (1998) have argued, fairness, trust in management and the extent to which the “deal” is delivered are key components of psychological contracts and have important consequences for organizational commitment, job satisfaction, organizational citizenship, intention to stay, employee performance and, by implication, knowledge transfer.

Drawing on Guest’s (1998) framework (see Figure 1), we can link his notion of “delivery of the deal” to what cognitive researchers have called the “knowledge transfer climate” (Tennant, 1999). This latter idea has allowed these researchers to take on board the influence of local context in transfer by focusing on the quality of the transfer climate, the main elements of which are:

- Manager support, including assistance and feedback  
- The opportunity to use knowledge  
- Peer support, including assistance and feedback  
- Manager indifference or opposition  
- Positive personal outcomes, including career advancement  
- Negative personal outcomes, such as being overlooked for salary increases  
- Group resistance to applying new forms of learning

---

1 This research is part of a wider programme of work funded by the Carnegie Trust of Scotland.
Thus, by making a minor adaptation to Guest's (1998) framework of the causes, content and consequences of the psychological contract, we can treat employee perceptions of psychological contracts, including the transfer climate, as intermediate or mediating variables between investment in HRD through education and training and outcomes such as job satisfaction, organizational commitment, intention to stay and knowledge transfer for improvements and innovations (see Figure 1).

This framework poses two general lines of questioning that, among others, have theoretical and practical relevance and which we have attempted to answer in our case study.

1. Was there a pay-off to the organization in knowledge or learning transfer at the individual level? More specifically:
   - To what extent was such knowledge perceived by participants to be valuable to the company, now and in the future?
   - To what extent did participants believe that they used formal knowledge to make improvements/innovations in their jobs?
   - How did formal or explicit knowledge rate against other source of learning for job improvements?
2. Was there a relationship between positive perceptions of the transfer climate and the willingness to transfer knowledge, as predicted by the "transfer climate" literature?

Figure 1: A Framework for Understanding the Relationships between HRD investment, the content of psychological contracts and their outcomes. (adapted from Guest, D. E. (1998) Is the psychological contract worth taking seriously, Journal of Organizational Behaviour, 19, 649-664.)

Alternative Approaches to Learning: Situated Learning

Psychological research on the sources of knowledge and learning transfer has suggested that merely having knowledge is not enough for learning to take place and that one must learn to use knowledge in particular contexts (Singley and Anderson, 1989). Certain strands of research in this field has not been promising for educationalists, in
so far as transfer from the classroom into the workplace does not seem to occur in a meaningful or significant way. As Tennant (1999), however, has argued, this conclusion may be a consequence of the rigorous and narrow definition of transfer used by a number of psychologists, which tends to stress “embrained knowledge” (Blackler, Crump & McDonald, 1998) rather than tacit (Nonaka & Tageuchi, 1995) or “encultured knowledge”. Such research also excludes the role of educationalists in facilitating transfer.

One recent approach that has much to offer, both as an alternative theory and as a critique of cognitive approaches, is situated learning (Lave & Wenger, 1991). Following from its autoepistemic roots and methods of data collection, situated learning, naturally enough, has emphasised the social and practical elements of learning that occur at work outside of the classroom:

- The focus on work practice as the key to learning and on communities of (work) practice rather than practitioners
- The role of communities of practitioners in socially reproducing communities of practice through an asymmetrical “apprenticeship system” of masters and newcomers. Thus, gradually, newcomers, who engage in “legitimate peripheral participation”, essentially watch and learn-by-copying skilled practitioners rather than from engaging in formal learning in detached classrooms.
- The overlapping and interdependent nature of communities of practice, in which communities depend on others for services, ideas and other resources, including new entrants.

The critique of traditional education implied by Lave & Wenger (1991) and others (e.g. Marsick & Volpe, 1999; Seely Brown & Duguid, 1994) is that classroom learning or “schooling” produces adults who know what rather than know how. Moreover, because they engage in distinctive “communities of discourse”, they run the risk of becoming detached from their communities of practice. The effects of this detachment process are significant because in separating adult students and their teachers from practice, schooling effectively alienates learners, in a sociological sense, from the performative world of work. Furthermore, as researchers have stressed, since learning is a communal activity and the tacit knowledge that results from such learning resides in informal communities of practice, formal attempts to capture such knowledge through project teams and the like may be self-defeating because they ignore or overwhelm the informal sources of knowledge creation.

As Fox (1997), however, has noted, Lave and Wenger’s (1991) position is not anti-schooling, but is intended to highlight the problems of traditional, formal education and to show how much of what we learn occurs during informal practice. Moreover, as we have already noted, these communities of practice rely on, and operate through, a discourse of practice that may be heavily influenced by “academic discourse”, depending on the professional knowledge base and socialization of practice members. Finally, the educationalists traditional response to such criticisms of “relevance”, were forcibly illustrated by March (1999, August) in his address to the Academy of Management. Adopting a similar position to critics of competence-based approaches to human resource development (e.g. Holman & Hall, 1996), he argued that education had to be detached from immediate relevance to transcend the specific, localised levels of tacit knowledge that cannot be transferred to other situations and to avoid the vested interests and “blindspots” (Weick, 1999, August) that bedevil much of what passes for practical knowledge.

This brief discussion of the situated learning literature has led us to address a further, third line of questioning among participants in the study:

3. Did formal knowledge gained through schooling (i.e. “talking about practice”) help them to engage more effectively in a discourse of practice (i.e. “talking within practice”) or in practice itself?

Method

The Case of NCR (Dundee) and Education-for All

The case study is of NCR (Dundee), a Scottish subsidiary of a major US multinational enterprise (MNE). The Dundee plant is a world leader in the design and manufacture of automatic teller machines (ATM’s) and has won a number of awards for its exporting and manufacturing performance (Wheatley & New, 1997). In the early 1990s, the Scottish plant’s senior management began Education-for-All to produce significant organizational change and achieve the Dundee company’s strategic objectives of growth through continuous innovation, customer-focus and cost-competitiveness.

The EFA programme, which has been in operation for eight years, embodies the principles of lifelong learning. First it has committed the company to learning for all employees with a broad focus on education rather
than training in skills development for a selected few. Second, education has been made accessible through easy access to well-stocked flexible learning centres in the company and through close links with local universities and colleges. Third, the company has encouraged self development through a well-developed career management system and courses in career development for employees, by paying the fees for any education course broadly related to the company's business and by giving employees time off work to undertake such courses.

The take-up on courses has been impressive with participation in education courses rising from 9% of all employees in 1991 to 20% in 1998. Such courses have included an introductory electronics certificate for all shopfloor staff, an extensive engineering degree programme designed to upgrade technicians, participation in a consortium masters programme and support for doctoral programmes.

The backdrop to the research project is as follows. After a decade of mass redundancies during the 1970s, the NCR plant has experienced nearly twenty years of growth in sales and profits, largely associated with the market for ATM’s and other financial service machines. From the mid-eighties onwards, with the exception of only a few years, it has been the global market leader in the design, development and production of ATM’s. In 1997, however, a change in (US-driven) corporate direction towards a “solutions” strategy resulted in significant outsourcing and in the recent sale of world-wide manufacturing facilities. These changes have had a clear impact on the EFA programme which has come under close scrutiny by corporate headquarters.

**Data Collection**

The first stage of the data collection process occurred during the period May – July, 1999 and involved a survey of a cohort of employees who participated in at least one EFA course beginning in 1995. These data were compared with a matched sample of employees who undertook no EFA course during the period to provide benchmarks for career movements, salary differentials and perceptions of psychological contracts. This control group were matched as closely as possible for age, grade and department.

The cohort of participants who were surveyed numbered one hundred and fourteen and exactly the same numbers were surveyed in the control group. These people completed self report questionnaires during group sessions that were arranged in working time, individual “drop-in sessions” for those who could not make the groups sessions and, finally, e-mailed questionnaires to the remainder. This three-pronged approach resulted in response rates of 63% and 55% for the EFA group and control group respectively.

The characteristics of the EFA respondents (hereafter referred to as the “sample”) and the control group respondents (“control group”) were very close in gender (approximately 85% male) and in age, although the sample modal age was 36-40 compared to 31-35 for the control group. Educationally, as might be expected, the control group had a greater preponderance of people with only school qualifications, whilst people with HND’s and postgraduate qualifications were much more evident in the sample. However, the two groups were closely matched in terms of first degree level qualifications.

Following this survey stage, we undertook in-depth interviews with a random sample of twenty-five participants and compared the interview transcripts with a matched sample of non-participants. The aim of this stage of the investigation was to dig deeper into perceptions of participants of their psychological contracts and, especially into their perceptions and views on knowledge transfer. The interview material was transcribed and analyzed for key themes with the assistance of NUDIST.

**Findings**

1. **The Payoff to the Organization in Learning Transfer to the Workplace**

(i) In the survey, we asked the sample and control groups to think of an innovation or improvement that they had made in their jobs and then to indicate from a number of alternatives the most important source of knowledge that they had drawn on to make the change in their work environment. As predicted by situated learning theorists, Table 1 below showed that previous work experience was the most frequent response. The table also showed, however, that the sample group was nearly as likely to record formal or explicit knowledge as a source of improvement or innovation and was significantly much more likely to mention this source than the control group.

(ii). The sample group was asked a series of questions concerning their perceptions of the transfer of their learning from their EFA course(s). Table 2 below provides encouraging reading for proponents of formal knowledge since respondents agreed that they had used their knowledge and skills from their courses to enhance
their work performance and were even more likely to have agreed that their courses were likely to lead to benefits in the future. The interview data showed a greater degree of variation on the direct contribution of formal knowledge to improvements and innovation. First, most respondents found difficulty in separating the sources of knowledge that they drew upon to make changes in their work environment. However, the majority of interviewees valued the formal aspects of their knowledge as an input into work practice. Interestingly, a difference was found between those who had attended technical courses, of which interviewees had high expectations regarding "usefulness" and those who had completed management qualifications, most of whom had lesser expectations of immediate relevance. Somewhat surprisingly, given the greater surface relevance of technical courses, interviewees found the content to be more abstract and theoretical and, thus, less useful in their work environment. This negative aspect of their education was all the more marked because of their initial high expectations of such courses. In contrast, the lower expectations that participants had of general management courses coupled with the relatively high use value of these courses showed them to be of greater benefit, especially in providing a holistic understanding of the business environment.

2. Perceptions of the Transfer Climate and Knowledge Transfer

Although the survey data showed that what had been "promised" in career terms had largely been delivered, (Martin, Pate, Beaumont & McGoldrick, 1999, September), the company was generally perceived as having failed to create a positive transfer climate. For example, 60% of the sample and 57% of the control group claimed not to have had a career development interview in the last two years, despite it being company policy to do so for most grades of employees. Moreover, two thirds of the sample claimed that their managers took little or no interest in their studies. Consequently we wished to ascertain the extent to which these features and other aspects of the transfer climate may have mediated the effects of EFA on knowledge transfer.

Somewhat surprisingly, our data showed no significant correlation among any of the transfer climate variables and our questions concerning the extent of learning transfer. Similarly, there was no significant correlations between aspects of the psychological contract such as fairness or trust in management and knowledge transfer. The only variables to correlate significantly with the extent to which knowledge had been used from EFA programmes to improve work performance were: (i) the degree of continuance commitment \((r=0.375, p=0.002)\), (ii) the extent to which EFA had improved their view of NCR as an employer \((r=0.377, p=0.002)\), and (iii) pride in the company \((r=0.273, p=0.025)\). These findings on the effects of the transfer climate have to be tempered by some of the interview data which indicated that incentives to innovate which were built into the appraisal systems of engineers did have a positive effect on learning transfer.

3. Talking about Practice, Talking Within Practice and the Effects on Practice

As might be expected given that the kind of knowledge gained from schooling is likely to be at an abstract, theoretical level, the data also showed that the learning from their course had helped employees to gain an understanding of their general work environment. Arguably more importantly, however, the survey data also showed that participants felt that that their courses had given them led to a greater ability to communicate in the business environment. The subsequent interviews highlighted two major effects of the "new language" gained during their courses: first, by providing learners with greater confidence and, second, by giving them a greater understanding the role of different departments and their relationship to them (e.g. marketing.)

During the interviews, we pressed the sample group to elaborate on how formal knowledge had been used to make improvements and innovations in their jobs and to compare such schooled knowledge with tacit knowledge borne out of experience as a source of innovation. From the responses, we gained two strong impressions. The first of these, as already noted, was that participants had great difficulty in disentangling the various sources of knowledge from each other as they merged together over time. The second was that organizational improvements and innovations were rarely seen to be made as a consequence of individual intuition, but were mostly described in communal terms. Interviewees either talked positively about "creative brainstorming" and how "they tossed ideas around" in their workgroups to come up with innovations, or else they described, in more negative terms, how individual ideas were constrained by the need to ensure that the effects of their ideas did not effect other departments. In effect, significant improvements and innovations were seen to be a function of the workgroup or constrained by the need for organizational integration.

Discussion

The overall pattern of results provides general support for the argument that this programme of investment in lifelong learning has paid off for the employer in providing a basis for individual and organizational learning in the workplace. As Crossan, Lane & White (1999) have argued, one cannot have organizational learning without individual learning taking place beforehand. The process of feeding forward from individual to organizational learning rests on a process of "intuiting" that combines learning from formal schooling and informal experience.

The key findings from the study were that:

- Participants in EFA perceived that the knowledge gained was useful in providing them with a discourse of practice and an holistic understanding of their working environment (Lave & Wenger, 1991). As such, this greater ability to talk about practice appears to have given participants greater confidence to talk within practice and understand their role in the wider business environment. There was also some evidence from the survey that education had been used to make small improvements in their immediate job context.
In line with the arguments of situated learning theorists, however, participants found it hard to identify the specific sources of learning and, if anything, stressed the informal and tacit rather than the formal, schooled sources of knowledge as key sources of innovation. Moreover, learning and innovation were seen to be a communal activity and facilitated or hindered by the extent of departmental integration and, as the interviews showed, positive incentives to use their learning.

Where the company was perceived to have been less successful was in creating a strong transfer climate, especially in the lack of supervisor support for learning transfer.

What is most surprising, at least as far as the literature is concerned, is that negative employee perceptions of the transfer climate did not seem to be associated with learning transfer, except in general terms. One possible explanation may be that the sample was composed of career resilient, self starting individuals whose goals were more characterized by personal development, employability in the long term and psychological growth (Hall & Moss, 1998). Thus so long as departmental managers were not actively blocking or discouraging the sample group, these people were likely to use their knowledge to meet their personal goals. In short, the absence of career development systems, e.g. appraisal etc. and tangible rewards did not seem to prevent these individuals from using their knowledge. Moreover, contrary to much of the human resource literature, it is at least questionable that investing time and effort in improving these systems would have much effect.

We recognise the limitations of generalising from single, particularly atypical cases. Moreover, we are fully aware that our measures of knowledge transfer were self-perceptions. However, we hope to undertake some participant observation among informal groups to explore the processes involved in feeding forward from individual learning to group and organizational learning (Crossan, Lane & White, 1999). This will allow us to explore workplace learning from a situated learning perspective, particularly as it relates to communities of practice. However, given the these limitations, the case study data is sufficiently robust to suggest that employers who follow such (atypical) policies may reap significant rewards and which are a genuine source of competitive value.

Emotion Work And Perceptions of Affective Culture in a Military Nonprofit Organization

Jamie L. Callahan  
Virginia Polytechnic Institute and State University

David R. Schwandt  
George Washington University

This paper explores the emotion work conducted by men and women in a nonprofit organization and their perceptions of the feeling rules in the organization. The study found that qualitative differences showing that women performed more emotion work than men were supported by a quantitative survey that measured perceptions of affective culture. Specifically, women were more likely than men to say that the culture of the organization required members to be affectively neutral (p<.007).

Keywords: Emotion Work, Culture, Non-profit Organization

Goleman (1995) reports a number of studies that highlight that very young boys and girls handle emotions quite similarly. However, as they mature, girls begin to respond differently than boys in many situations. Damasio (1994) points out that emotions have both a “nature” and a “nurture” component; indicating that socialization may modify an individual’s emotional response, including how one experiences emotion and how one perceives the environment that drives the emotion. It is very possible that women have different emotion responses to situations because they perceive the situations differently than men. These situations may be expanded to include broader generalizations of an organizational culture. This paper looks at men and women in a nonprofit organization and explores their differences in their management of emotions and their perceptions of organizational affective culture.

Problem Statement

The management of experience and expression of emotion can be referred to as “emotion work” (Hochschild, 1983). Emotion work has been studied in a wide variety of organizations, including airlines, police departments, bill collection agencies, and health care agencies (e.g., Hochschild, 1983; Pogrebin & Poole, 1991; Rafaeli & Sutton, 1991; Smith & Kleinman, 1989). Although women have often been the focus of these studies, the reason for that was because women are often employed in positions that require more emotion work (Hochschild, 1983). Wharton and Erickson (1993; 1995) have specifically looked at women’s roles in a variety of contexts as they were related to emotion work. Certainly emotion work studies have looked at gender within a marital or intimate relationship context (e.g., Duncombe & Marsden, 1998; Hochschild, 1990). In general, however, studies have not looked at the differences between men and women in the performance of emotion work. The present study was an outcome of a larger study that looked at how patterns of emotion work in general were associated with actions in a nonprofit organization (Callahan, In Press). A key finding of that study was that men and women in the organization had different patterns of emotion work. Specifically, women performed proportionately more emotion work than men did and this was particularly manifested in actions associated with the culture of the organization. Thus, this study sought to explore the possibility that men and women may have had different perceptions of the affective culture in this organization. Based on the qualitative findings, we believed that women were more likely than men to perceive the culture as affectively neutral. In other words, women would believe that the expression of emotion was not considered acceptable in this organization and would, therefore, report a lower score on the survey designed to measure affective culture. As a result, the following hypothesis was generated:

H1: Women will have a significantly lower score than men on the perception of affectivity in organizations scale.
Theoretical Framework

This study takes a broader look at Hochschild's (1983) emotion systems theory. It first looks at the action component of emotion systems theory, emotion work. It then goes further and looks at the perceptions held by organizational members regarding the affective culture of the organization. This may be considered the feeling rules component of emotion systems theory. This section provides an overview of both emotion systems theory and organizational culture, in particular the organizational culture associated with the United States Air Force.

Emotion work is a primary component of Hochschild’s emotion systems theory. Hochschild called her work as “emotion systems theory” because it is comprised of “a system composed of individual acts of ‘emotion work’, social ‘feeling rules’, and a great variety of exchanges between people in private and public life” (Hochschild, 1983, p. ix-x). Emotion work is the active attempt to change, in either quality or degree, an emotion held by an individual (Hochschild, 1983). There are two primary types of emotion work—suppression and evocation. Suppression occurs when an individual is trying to eliminate or, at the very least, subdue an emotion that is present. The cognitive focus of this act is “on an undesired feeling which is initially present” (Hochschild, 1979, p. 561). Evocation is just the opposite; it occurs when an individual is trying to draw forth an emotion that is not present. Thus, the cognitive focus of the act is “on a desired feeling which is initially absent” (Hochschild, 1979, p. 561). The second major component of Hochschild’s work is that of “feeling rules” (Hochschild, 1979; 1983). Feeling rules are the “socially shared, albeit often latent (not thought about unless probed at)” (Hochschild, 1979, p. 563) guidelines that govern how we want to try to feel. They guide our expression of emotion and they guide our attempt to internalize the acceptable emotion (as defined by the situational rule). Feeling rules are embedded within the culture framing the interaction.

The term “culture” first made its way into the English language in the 15th century through French from Latin roots (McArthur, 1992). Although culture has a long history among anthropologists and sociologists, the term “organizational culture” is relatively new among management and organizational scholars (Hatch, 1993). It was first used as a synonym for organizational climate in the 1960’s (Hofstede, 1997). Denison (1996) argued convincingly that the difference between organizational culture and organizational climate is actually one of interpretation. Both terms represent the same phenomenon that can be seen as creating and influencing the social context of an organization. Thus, it may be said that organizational culture, in some form, has been studied among organizational scholars for quite some time.

Probably one of the most influential scholars in the field of organizational culture is Schein (Hatch, 1993). His conceptual model of organizational culture forms the foundation of much of the research in this area. Schein (1987) argued that organizational culture has three distinct levels that interact with one another: basic assumptions, values, and artifacts and creations. Basic assumptions are the unseen preconscious beliefs commonly held and taken for granted by organizational members. Values are conscious or espoused beliefs commonly held by organizational members. Artifacts and creations are the visible manifestations of the belief system, such as uniforms or logos.

Because organizations are subsystems of larger social systems, it is important to describe the culture of organizations as they relate to the institutionalized values of the superordinate system (Parsons, 1956). Although the organization presented here is not a formal affiliate of the United States Air Force, its relationship with the Air Force and aerospace industry and its overwhelming number of current or former Air Force personnel as members suggest that the Air Force may be considered the superordinate system for this organization. The Air Force culture, of course, is embedded within the larger culture of the military.

Many would argue that the famous words uttered by General Douglas MacArthur—duty, honor, country—best exemplify the culture of the military (Taylor & Rosenbach, 1996). However, these three words are perhaps more indicative of the conscious values held within the military. The unconscious basic assumptions which truly define the nature of the culture can best be characterized as having a “combat, masculine-warrior” orientation (Dunivin, 1994). While the military incorporates a wide variety of activities, one activity associated with the military defines its very existence—combat. In the prologue to the second edition of his classic treatise on the professional soldier, Janowitz commented that, “the notion of combat—preparation for battle and actual battle—has remained a central military value” (1971, p. xiv) throughout history. The masculine-warrior image is the second element of the military culture. Dunivin (1994, p. 533-534) describes the origin of this image:

As an institution comprised primarily of men, its culture is shaped by men. Soldiering is viewed as a masculine role—the profession of war, defense, and combat is defined by society as men’s work. Thus, a deeply entrenched “cult of masculinity” (with accompanying masculine norms, values, and lifestyles) pervades military culture.

Associated with this underlying combat, masculine-warrior culture is the traditional model of the military. This model “espouses conservative moralistic ideology as reflected in its ethics and customs” (Dunivin, 1994, p.
The traditional model reinforces socialization that complements the masculine norms and values of the underlying military culture. The military typically recruits and rewards those individuals who embody the combat, masculine-warrior ideology. This has resulted in an officer corps that is dominated by white men who perceive themselves as masculine warriors. However, the changing perspectives in American culture have begun to influence the models associated with the military culture.

An alternative model of the military is beginning to challenge the traditional model of military culture. This evolving model, largely in response to social pressure, is marked by more inclusionary beliefs, policies, and practices (Dunivin, 1994). This model is also based on the changing attitude among many military members that the best-qualified person should be selected for assignments, regardless of race, gender, or sexual orientation. Despite the growing influence of the evolving model, the military is still marked by the underlying culture of the combat, masculine-warrior. Thus, conflict and change is inevitable; yet the outcome is not certain. As Dunivin (1994) points out, this uncertainty leads to an enduring culture that embodies both change, with the evolving model, and continuity, with the traditional model.

The Air Force culture

Although the Air Force is the newest of the military services, there is some support that it may embody the traditional model more than the evolving model. In comparison to the other service branches, the Air Force has a higher percentage of non-combat occupations which offer the potential for a higher percentage of female participation (Stoddard, 1993). As the evolving model opens more occupational specialties to women, that percentage will probably increase. Nevertheless, a study conducted by Stoddard (1993) found that:

...the relatively low rates of female participation in the Air Force as compared to its minimal combat roles, cannot be attributed to organizational constraints. This might well be an informal consequence of gender preferences by its leadership (p. 30).

This gender preference among senior Air Force leaders had been made public by then-Air Force Chief of Staff, General Merrill McPeak when he testified before Congress in 1991:

...if ordered to choose between an inferior male pilot and a much better female pilot, he would choose the male. 'I admit it doesn't make much sense, but that's the way I feel about it,' he said. In other words, for General McPeak the issue is not job performance or ability, or even military effectiveness. The existence of female combat pilots would simply offend his sense of proper gender roles (Dunivin, 1994, p. 536-537).

More examples of the gender preferences institutionalized in the Air Force can be seen in symbols found at the elite proving ground of the United States Air Force Academy (USAFA). Academy graduates, in particular, are often considered to be the "professional" soldiers who are responsible for being the bearers of the military culture (Janowitz, 1971). The inscription that greets every individual who approaches USAFA reads, "BRING ME MEN." This is a very clear symbolic message to cadets being indoctrinated into the Air Force culture.

Despite the dominance of the traditional model of military culture, the evolving model of military culture certainly influences the Air Force. As with other branches of the military, external forces for social change have brought more diversity into the Air Force. Women and minorities have been integrated into most specialties within the Air Force, perhaps reluctantly. The strong culture of the Air Force has been influenced by laws and policies that have required the acceptance, or at least broader official tolerance, of minorities, women, and gays. These civilian directives are generally accepted by and eventually assimilated into the Air Force because the service adheres to the Clausewitzian model that the military is at the disposal of the civilian, political leadership of a nation because war is simply an extension of politics, but by other means (Paret, 1986). Thus, when given a directive, even one that conflicts with the very nature of the Air Force culture, the Air Force follows the directive. Only then can the evolving model of organizational culture begin to take a foothold.

Methodology

This was a primarily qualitative study that incorporated a quantitative survey as a triangulation element. The research site for the study was a nonprofit organization associated with aerospace and national defense. The organization is primarily composed of Air Force active duty and reserve component members, veterans, and retirees; however, membership is also drawn from civil service personnel, cadets, and civilian individuals who have never experienced military service, many of whom are affiliated with aerospace industry. The sample from this study was drawn from the professional staff, the Board of Directors, and the senior state leadership.
Four methods of data collection were used (individual interviews, observations, surveys, and document analysis) to provide a measure of validity through data-collection method triangulation (Patton, 1990; Yin, 1994). The survey that served as a data-collection method triangulation element contained a scale developed to measure the perceptions of affectivity-affective neutrality (i.e., the affective culture in the organization) (Parsons, 1951). The items for the scale were drawn from two studies on role expectations and conflict using Parsons’ (1951) affectivity-affective neutrality pattern variable (Podell, 1966; 1967). The original studies focused on marriage and family contexts, so the items were modified for use in an organizational setting for this study. The items were as follows:

<table>
<thead>
<tr>
<th>Item</th>
</tr>
</thead>
<tbody>
<tr>
<td>too much emotional involvement can lead to unrealistic plans.</td>
</tr>
<tr>
<td>a certain amount of emotional detachment is necessary to achieve success.</td>
</tr>
<tr>
<td>I would not be successful if I became too emotional.</td>
</tr>
<tr>
<td>you cannot let sentiment overcome objectivity if you want to be effective.</td>
</tr>
<tr>
<td>decisions regarding issues that affect the organization should not be influenced by sentimental factors.</td>
</tr>
</tbody>
</table>

The five Likert-type items had face validity and had shown reliability in the earlier studies (Podell, 1966; 1967); the Cronbach alpha performed on the data from the present study was .72. This was considered to be a sufficiently strong indicator of reliability for a scale with less than ten items (Cortina, 1993; Spector, 1992). Because this study was exploratory in nature, based on qualitative findings, further efforts to establish validity beyond face validity were not pursued. Certainly, future attempts to establish a more definitive connection between the performance of emotion work and the perceptions of the affective culture among men and women would require further validation of the scale.

The survey was administered to 242 members of the professional staff, the Board of Directors, and the leadership of the states. The sample size for the quantitative component of the study was 153 (119 men, 34 women). The 25 (16 men, 9 women) individuals interviewed for the study were selected from those organizational members who returned the survey. This ensured that a triangulation point was available for all interview participants. Over 800 pages of transcribed interviews and correspondence were content-analyzed using NUD*IST software. “Disinterested” colleagues performed coding and data interpretation verification. In addition, seven scholars with a basic understanding of the theoretical framework, yet unfamiliar with the research site, reviewed the findings and interpretations for consistency. Two staff and two volunteers in the organization also reviewed the final document for accuracy of interpretation.

Finally, a t-test was conducted using the 153 survey respondents to determine if the qualitative differences found between men and women in the performance of emotion work could be supported by the quantitative survey that captured perceptions of the affective culture, or feeling rules, in the organization. Certainly the two comparison groups differed in size (119 men, 34 women). There is debate about the negative implications of unequal group size on simple comparisons of means (Lomax, 1992). However, because a significant difference in variance between the two groups would exacerbate any potential negative implications (Hinkle, Wiersma, & Jurs, 1994), a homogeneity of variance test was performed. There was not a significant difference in the variance of each group (p<.500); thus, further comparison between the two groups was warranted.

**Results**

In the interviews and written documentation, a total of 174 incidents of emotion work were identified out of 605 references to emotion. While women did not necessarily perform the majority of the emotion work actions, they often performed more emotion work than expected based on their representation in the interviewed sample. For example, women represented 36% of the interviewed sample, yet they accounted for 46% of the references to emotion. Also, while men comprised 75% of the volunteers from whom documentation contained emotion work references, their comments accounted for only 57% of the emotion work actions discussed by volunteers. In other words, women seemed to perform more emotion work in this organization, particularly among the volunteer members. It is important to note that women were not well represented in the senior leadership of this organization. In the fifty-year history of the organization, only two women had ever served as a national officer; both as National Secretary. Further, among the staff leadership, only one of the ten senior staff members was female.

The vast majority of the emotion work incidents, 115 of them, were associated with suppression of emotion. Women mentioned approximately 51% of the actions regarding the suppression of emotion. The content
and type of emotion work did not differ substantially between men and women, however. The emotions suppressed were primarily negative affects, including frustration, anger, disappointment, fear, and sadness. One female participant reported her emotion work associated with a critical project:

I was so stressed out by this and it was like [he] didn’t get it. ...[T]he toll it took in stress level...was phenomenal. I was so stressed out...that when I went to my therapist, who I was venting all this stuff to, I just said, “I am so angry, I’m about to hit somebody. I’m afraid I’m going to haul off and slap somebody.”

Women performed an inordinate amount of emotion work, usually suppression, associated with cultural issues in the organization. Several of them referred to the organization as a “white, male, preferably pilot” group or a “Good Ol’ Boy network”. One female volunteer, a pilot, talked about suppressing her anger at an older male volunteer who voiced his opinion that leadership positions should be reserved for (male) pilots. She commented that she suppressed her desired response of, “Well, you know, I have to take my skirt off to put on my flight suit.”

There were also two cases of suppression of positive emotion. One female and one male staff member discussed the suppression of positive affect in relation to holding back praise for the success of others. When discussing interactions with “the field”, the volunteers throughout the United States, Europe, and Asia, a male staff member said, “I have the occasion, the good fortune, once in a while to be with one of these effective groups and it’s a feeling of inspiration and admiration.... And I don’t think it’s necessarily appropriate [to express that] other than in simple ways.” Regarding daily operations on the staff, a female member commented that, “we don’t make a big deal if somebody did a great job. It’s just, ‘I’m proud to be working with you.’ Guess what? We can do this thing again next year.”

Evoking emotions was mentioned 20 times. Not surprisingly, positively valenced affects were most often the elicited emotion. The affects ranged from evoking a simple smile to generating the appearance of being enthusiastic. Women were responsible for 60% of the references to evoking emotions. Once again, the difference between men and women was not in the content or type of emotion work; rather, it was simply the amount of emotion work each performed. One example of evocation of positive affect was mentioned by a female volunteer:

...there are lots of times throughout the meeting where I’m really not interested in what they’re talking about and I tend to try to look like I’m interested in what they’re saying without closing my eyes or doing something...that I think would be inappropriate. I sit there and look like I’m interested in what’s going on.

There was, however, a negative affect evoked for one male volunteer. At the opening ceremony of the organization’s annual convention, a “Roll of Honor” is presented to honor those organizational members who died during the previous year. While another member commented on her genuinely felt sadness during this event, one volunteer talked about how he usually had to evoke sadness because he did not know any of those who had died. He was often able to generate feelings of sadness:

You say it’s sad possibly for those people around him that loved him or respected him or worked with him or whatever. Especially if it’s not somebody that has died because they got old, but somebody that died at a younger age.

A unique type of evocation of emotion appeared in this study. Most researchers have reported two distinct categories of emotion work, suppression and evocation (e.g., Hochschild, 1983; Wharton, 1993). However, several respondents in this study explicitly discussed occasions in which they evoked an emotion in conjunction with suppressing another. Because references to this phenomenon have not been made in other research associated with emotion systems theory, I refer to such occurrences as “veiling”, using one emotion to cover up another. This is similar to the Freudian defense mechanism of reaction formation (Juni, 1997; Newman & Newman, 1995). There were 14 references to veiling emotions. For example, one staff member worked with a major awards program for the organization. She found the awards recipients ungrateful and arrogant. In short, she just didn’t like to be around them. Nevertheless, she swallowed her anger and put on a smile for the duration of her contact with the recipients.

A retired senior officer who had served in Vietnam gave the most poignant example of veiling. He equated emotions to a “monster” that needed to be controlled in order to serve effectively. Describing his experience with combat, this volunteer remarked:

...here their best buddy just got shot down and they saw him being led off. And that night they’re having a party like an Irish wake and they’re saying, “Well, the guy was really stupid because he did something dumb and that’s how it happened.” That’s how you isolate yourself.

This type of veiling is similar to what Ashforth and Humphrey (1995) refer to as “normalizing” emotions. In other words, undesirable emotions are reframed to maintain harmony.

The references to veiling were relatively disproportionate between male and female respondents. Women, who represented 36% of the subjects, reported 43% of the veiling incidents. Interestingly, this was the only category in which men performed a greater percentage of the emotion work. In all but one case, the valence of the emotions
related to veiling was mentioned, negative emotions were always suppressed and positive emotions were always evoked. The final case was a generic reference to veiling that did not specify the emotion.

Finally, subjects made 25 references to generic emotion work or managing emotions. This generic emotion work referred to managing emotions in general, without specific discussions of what type of management was being used (i.e., suppression, evocation, or veiling). Like both the suppression and evocation of emotion, generic emotion work references were disproportionately female (56%). Often these references focused on managing emotions of others, in particular in the context of leaders managing followers. For example, one male participant remarked:

I always used to as a young officer watch the...commander...get up there and tell [us] how great we all are. You know, be the motivator. And as the cynic in me always said, “Isn’t this goofy?” But over time as I learned about the cohesion and saw the cohesion, I realized it’s a very, very important part of the cohesion even if, as a leader, you sound goofy. You know, in front of some of the most cynical you are really, [but] the message is being received.

In summary, the qualitative findings revealed four different types of emotion work—suppression, evocation, veiling, and generic. Overall, the content of the emotion work and the type of emotion involved were fairly consistent between men and women. The key difference was found in the amount of emotion work actually performed. In general, women performed a greater amount of emotion work than men in this organization, especially in reaction to cultural issues. The distribution of emotion work is at Table 1.

Because the women appeared to be performing more emotion work than the men, in particular around cultural issues, the survey responses to affective culture were analyzed. This \( t \)-test was performed simply to determine if women and men had a different perception of the extent to which displays of emotion were accepted in the organization. A significant difference would lend support to the qualitative findings that seemed to show that women performed more emotion work, perhaps because of their perceptions of the organizational feeling rules. A higher score on this scale indicates a perception of a more affective culture; a lower score indicates a more affectively neutral culture. Based on the qualitative findings, one would expect to find that women perceived a more affectively neutral culture in this organization (i.e., they would have a lower score). The mean score for women was 19.7; the mean for men was 21.7. The difference between the male and female scores on the affective culture scale was significant at \( p<.007 \).

Discussion

The quantitative findings supported the qualitative findings in this study. The vast majority of emotion work conducted in this organization was suppression; women performed more emotion work than men; and women were more likely to perceive that the culture of the organization required affective neutrality (i.e., emotional suppression). Thus, the emotion work performed by women in this organization may largely stem from their perceptions of this organization’s Air Force-based “combat, masculine-warrior” culture. Certainly the male dominated culture of the organization and the more pronounced minority status of women in the organization may be a factor in the higher levels of emotion work conducted by women. It is also possible that women are more “in tune” with their feelings as some literature on encoding (expressing) and decoding (interpreting) emotion suggests (Gallois, 1993; McConatha, Lightner, & Deaner, 1994).

Women may also report more instances of suppressing anger than men because of the negative cultural perception associated with women expressing such emotions. Research suggests that behavior associated with assertiveness is viewed more favorably when it is performed by men than when performed by women (Davis, LaRosa, & Foshee, 1992). Comments by male volunteers suggested that they believed women should engage in activities and professions intended to “support” their husbands. There was also a belief that women had not risen to the highest leadership ranks of the organization because those who were otherwise eligible tended to be “too masculine” or “too aggressive”. In other words, they did not fit the cultural model either for women or for organizational leaders. In any case, there is a power differential between men and women in this organization that
suggests a need for the women to manage their stronger negative emotions in order to succeed (Davis et al., 1992; Gallois, 1993).

Dunivin (1988) and Tetreault (1988) argued more than ten years ago that women in the military did not have a critical mass to have a voice for change. While that is probably still true for the active duty military, it is definitely true of this military-influenced organization. Dunivin (1988) noted that women in the Air Force “internalized the male-defined work identity and role” (p. 64). A similar phenomenon may be occurring among the female volunteers. This internalization may have created a kind of dissonance for the women. Two of the four female volunteers discussed the importance of not only maintaining a leadership identity among the male volunteers but also maintaining relationships with the wives of the other leaders. They seem to have recognized that many of the men, at least subconsciously, considered the wives to be the peer group of the female volunteers. But, by becoming active as volunteers, these women were no longer considered peers by the wives of the male volunteers. As a result, the women volunteers “accentuated work roles that were rewarded” and “downplayed devalued gender roles” (Dunivin, 1988, p. 64) in order to fit in.

Contributions to HRD practice

The imbalance in the performance of emotion work by men and women in this organization has several implications for this organization, and perhaps others. This organization has had difficulty promoting women into leadership positions. This may be partly due to the emotion work conducted by women because of their perceptions of the organizational culture. They perceive that their emotional inclinations are not valued and, perhaps, that may translate into a devaluing of them as members of the organization. As indicated earlier, women in the Air Force culture downplay feminine, emotional roles in order to highlight their (perceived) more valued roles associated with masculinity (Dunivin, 1988). In other words, perceptions that encoding and decoding emotions (Gallois, 1993; McConatha et al., 1994) are not valued skills may lead some women to suppress what may be key to their ability to perform in leadership positions.

Not only is it possible that emotion work and the perceptions of affective culture would inhibit women from seeking and/or achieving the highest levels of leadership, it is also possible that emotion work has other influences on leadership factors in the organization. Damasio (1994) highlights the critical importance of emotion in cognitively based leadership functions such as decision-making. Not only do leaders need access to their own emotions, but they also need access to the thoughts and feelings of those involved in the decision. However, if those individuals perform emotion work to hide what they perceive as inappropriate emotions, leaders’ decisions will not be as effective as they could be.

In addition, a culture that devalues the expression of emotion may disrupt the ability to recruit new members, especially female members. The lack of women in leadership positions, the perceptions about emotion, and findings from more comprehensive studies on gender issues in this organization (see Callahan, 1999) suggest that the culture may not be accepting of women. Thus, both male and female members who subscribe to the “evolving” (Dunivin, 1994) model of culture may grow weary of a culture hostile to women and choose to suspend active involvement in the organization. By failing to include a large segment of society that is increasingly represented in the organization’s largest constituency base, the Air Force, this organization may distance itself from the very people it was created to serve. Finally, members may find it difficult to educate a more enlightened public about the importance of air power, a key organizational mission, if they are out of step with the larger culture.

MacArthur’s stirring words of “duty, honor, country” may indeed serve as a “rallying point” for military members, in particular when they are engaged in combat. However, the implication of a “combat, masculine-warrior” culture connected to these words may not be effective in the daily operations of an organization affiliated with the military culture. If the organization does not attend to the management of emotional experience and expression conducted by its members, emotion work may contribute to the demise of this organization that is firmly rooted in the core values of “duty, honor, country.”

Mature Behavior in Organizations: Indications of Growth and Learning in the Workplace

Dorothy Marcic
John Maslyn
Debbie L. Waddell
Vanderbilt University

If emotional and cognitive maturity is understood and acknowledged in organizational interactions, then the chances are increased that participants can meet the complex needs of today's organizations. This paper presents a four-stage model of development and links it to organizational learning.

Keywords: Behavioral Indicators, Workplace Learning, Organizational Learning

Some experts believe the only sustainable advantage an organization will have in the future is its ability to learn faster than its competitors (Kapp 1999). Such competitive advantage can be achieved by transforming the organization into a learning organization, providing a stimulating climate for seeking new approaches to perform work. In fact, organizational learning can be developing new knowledge and changing behavior to improve future performance (Barker & Camarata, 1998).

Organizations which have a continuous and enhanced capacity to learn, who acknowledge their human capital, were found by Mariotti (1999) and Kapp (1999) to have an average 17 percent increase in productivity. Part of this can include an increased awareness of developmental growth among members coupled with a relation-based environment.

The purpose of this paper is to develop a model for developmental growth of individuals in organizations and to understand its implication for creating a healthy organization, a high-performing system.

Background on learning organizations

Despite its importance, not all organizations have been able to transform themselves and achieve the characteristics of high-performance systems or learning organizations (Quinn, 1996; Cooper & Schrabraq, 1998; Rashford & Coghlan, 1994). The learning organization does not just happen; conditions must be developed and nurtured for change to occur. Senge (1999) maintains that most change initiatives fail because organizations do not foresee the obstacles that arise naturally wherever growth and learning take place. As organizations mature, do leaders allow employees to mature as they use their successful and unsuccessful experiences as learning opportunities? Do obstacles such as immaturity distort and filter information, thus reducing learning? If maturity (and its lack) is acknowledged in organizational interactions, then participants have a greater chance to meet the complex needs of today's organizations.

Conditions in modern organizations sometimes work against the development of maturity. As more information is presented ever more quickly, with chaotic and unpredictable changes, employees find that they must approach work differently. Downsizing, flattening hierarchy, increased competition, globalization, and intensified technology can leave workers with a possible sense of powerlessness and insecurity (Hirschorn, 1999). As a result, employees themselves exhibit behavior inconsistent with organizational learning. For example, Lancaster (1998) and Argyris (1998) found that employees often exhibit immature behavior when threatened or embarrassed (e.g. defensiveness), and this impedes organizations from reaching optimal levels. Such immature behavior may be the result of both personal and organizational factors and may manifest itself on the organizational culture in ways that causes alienation of workers, disenchantment of customers, and encourages individuals to move away from their espoused values (Marcic, 1997). To develop the characteristics of a successful learning organization, workers need to have the emotional development to increase their learning potential as they interact with others, and respond to the continuous changing environment of a learning organization.

Creating a learning environment ought not to be difficult, as research shows individuals come fully equipped with insatiable drive to explore and experiment (Roth & Kleiner, 1995; Erikson, 1982).
Unfortunately, many organizations are oriented predominantly toward controlling rather than cultivating employees' natural curiosity and impulse to learn (Senge, 1999). Many of these employee-organization relationships are based primarily on rational choice theory where each transaction between parties is based on "I will do this for that," effort is exchanged for a known, specific outcome of equal value (Barker & Camarata, 1998). The choice is primarily economic. Employees' focus on behaviors derived from specific duties and tasks assigned to their jobs. By acknowledging maturity levels of participants within organizational relationships, it can encourage individuals to operate from Blau's (1964) social exchange theory. Instead of acting out of economic calculation, individuals benefit one another on the basis of concern for the other's welfare. Blau (1964) asserts that in terms of performance and/or attitudes individuals generally excel when employees base their relationships less on economic or quid-pro-quo transactional basis (more short term) and more on a focus of personal connection with the leader and/or organization (more long term). This supports the conceptualization that higher level of growth and maturity leads to higher levels of productivity and an enhanced learning environment.

This all-encompassing social exchange and developmental growth foundation could be useful in developing organizational learning. An organization can build effective relationships with employees if certain conditions are met of support towards individual maturity or emotional growth embedded in an employee's work life.

Integrating employees and organizations for learning

Gherardi (1999) defines the culture of learning organizations as being action orientated, geared toward creating a type of organization in which learning is maximized through interaction within the environment. In reality, the culture requires individuals to learn and transfer the knowledge acquired from participants to modify structures within the organization, and that learning leads to an improvement in performance (Gherardi, 1999). In change efforts, participants become fixated on the process of change itself, and often fail to recognize the importance of the human elements, including learning capabilities within the employees (Birkner & Birkner, 1999). Focusing solely on the mechanics of the change process, rather than the people and their needs, can overwhelm even positive and strong individual characteristics (Figure 1). This over-emphasis on organizational structure can prevent and/or discourage individual development and organizational learning. In the learning organization culture, both individual needs and organizational structures need to be in balance to carry out what has been learned, and thus expand learning capabilities and capacity (Fisher & Fisher, 1998; Birkner & Birkner, 1999).

![Figure 1: Imbalance of Organizational Structure and Individual Characteristics](image)

It has been suggested that increasing an individual's psychological development puts an organization on a firm foundation of strong character, i.e., ethics, integrity, and honor (Marcic, 1997), which will enable its members to contribute to the organization's learning. It is possible that aggregate employee maturity is a critical factor in the achievement and performance of an organization as a learning organization. As individuals mature they increase their capacity to learn, think, and create. They recognize that they can learn moment by moment, which can turn into wisdom—not just information or knowledge (Johnson, 1999).
**Theoretical framework for developmental stages**

The first step in evaluating and addressing the impact of employee maturity level on the development and maintenance of a learning organization is to assess an employee's developmental level within the organizational culture. Though much research has been done on developmental stages of organizations (Miller, 1989; Quinn, 1998; Kimberely & Miles, 1981), it has focused on the cycles of the organization themselves, rather than individual members. There is, however, some recognition that organizational learning includes a psychosocial dimension, and that the learning behavior of individuals within groups is significant. Salner (1999) emphasizes the need for individuals to change their cognitive maps, that is, their habitual ways of understanding organizational situations. This research will look, developmentally, at the cognitive-behavioral properties of individuals and their potential to be a skilled contributor to organizational learning as they interact with the organization.

Drawing from the work of Fowler (1981) and Erikson (1982), the 4-stage model presented below (Figure 2) has been developed to provide a developmental framework to assess individuals' level of cognitive and emotional maturity as it relates to organizational behavior. As individuals interact within the organization, behaviors are demonstrated through the following four stages: Egocentric, Protective, Compliant and Dynamism. Each stage is present in some form throughout an individual's experience in the organization, but reaches its own dilemma at a specific time as organizational interaction occurs.

**Figure 2: Cognitive and Emotional Maturity as a Result of Individual-Organizational Interaction**

**Egocentric Stage** – Individuals in the egocentric stage are more dependent on the actions of others, have limited ability to differentiate their own perspective and are acutely submissive to those in authority positions. This stage represents a general encounter between the individual's maturing ego and the social world. Members look for consistency, predictability, and reliability in the leaders' actions. A sense of trust is developed in their leaders, and workers show it in their behavior. They learn to trust themselves. As they develop confidence in their abilities, they also develop a faith in the organization and its leaders. During this time when leaders feel anxious, the worker will feel anxious; if the leader feels calm, the worker feels calm. These interactions in turn influence later attitudes. If the worker can develop a favorable balance of trust over mistrust, he/she will develop a core ego strength in this stage or a sense of hope. Hope enables the worker to move forward and enthusiastically confront organizational events despite current and past frustrations.

**Protective Stage** – The protective stage represents behaviors that are defensive in nature. Individuals see the world in a linear and predictable way, and are often extremely competitive due to a perceived mistreatment by others. Cognitively, they are unable to detect and correct errors in judgement. However, when this happens, leaders do not permit the individuals to enjoy their independence. Instead they train the workers to behave in the socially acceptable way defined by the organization. The battle during this time is between the worker's autonomy and the organization's regulations. When workers insist on correcting a problem in the workplace, leaders will try to regulate their choices or behavior. In this stage individuals begin exercising their will, and developing their sense of autonomy within the system. They want to be independent and learn the organization's culture and values on their own. They insist on making their own decisions, even if it means exercising their right to make a mistake. They
begin to defy external control. Individuals are also very aware of social expectations and pressures. There is a fear of not looking good in others’ eyes. The fear encourages doubt in their abilities and the realization that one is not so powerful after all; that others can control one perform actions much better. It is through the hope developed in the prior stage that workers can learn to adjust to social regulations without losing too much of their initial sense of autonomy. During this stage the leader’s role is two-fold. First, without crushing his/her independence, the leader assists the worker as the worker learns accepted organizational behavior. Second, the leader should not break the worker if they show oppositional behavior; or ridicule if they take the initiative to do things on their own. An objective in this stage is to develop the determination to exercise free choice as well as self-restraint. The worker is the one in charge, not the external powers.

Compliant Stage – In the compliant stage power is relinquished to external parties, which resides in the leadership of the organization. There is a fear of being assertive because of losing one’s place in the social structure of the organization. This stage may become a permanent place of equilibrium for those individuals whose sense of powerlessness continues to manifest itself in the organizational culture. The danger in this stage is an excessive feeling of inadequacy and inferiority. The compliant stage tends to be a period of calm and stability. However, this is a decisive stage for growth in which individuals master important cognitive and social skills. Individuals begin eagerly learning the useful skills and tools of the larger culture and conform their individual behaviors to the organization. During this time, learning is often informal, and comes from more experienced workers. Workers enter training programs and are asked to master more skills. They learn to do more meaningful work and develop strengths of steady attention and persevering diligence. They are also learning to work and interact with their peers. The successful resolution of this stage leads to a strength Erikson calls competence, the free exercise of intelligence and skill in the completion of tasks, unimpaired by excessive feelings of inferiority.

Dynamism Stage – Individuals in the dynamism stage must withstand a certain amount of frustration. Individuals in this stage can begin to indulge themselves as if they were the one and only individual in the process. This stage is the highest level of development. Creativity, collaboration, listening, sharing resources and rewards within the organizational culture characterize it. Individuals begin to examine the norms and make choices using their judgement. They are able to communicate and share their beliefs while listening and taking into account other’s thoughts. This stage is rare because it is a unique way individuals relinquish their power for the sake of a greater purpose. They have a special wisdom that unifies and transforms their environment. They become concerned with developing the next group leaders. They enter into what Erikson calls generativity which refers to the production of things and ideas through work. They teach and guide others by working with individuals to help create a better organization. There is a sense of order to one’s place in the organization, and the acceptance of that place. Integrity is developed that says, “Yes, I make mistakes, but given who I am at the time and the circumstances, the mistakes are inevitable.”

Implications for HRD

As individuals interact within the organization, they respond based partly on their level of cognitive and emotional maturity. Erikson (1982) believes people obey their own inner laws of development, and creates a succession of possibilities based on their own, as well as others developmental levels. For example, at the protective stage, when maturation occurs, it usher in a sense of autonomy where individuals can behave independently and make decisions based on their abilities for the good of the company. At the compliant stage, maturation prompts a new interest in discovery, along with capacities for curiosity and new ideas encouraging learning among work groups.

At the same time, the culture of the organization can evolve such that it invites and meets this inner, maturational succession of potentialities. For example, when the individual at the egocentric stage demonstrates a new degree of self-control, change agents in the organization may consider the individual ready for new skills training. However, the result is sometimes a battle of wills, between the worker and the organizational society, which creates a crisis at that particular period. It can be that the organization is at a lower level of growth than the individual matures to. So whereas managers are exerting tight control, which tends to produce immature behaviors, a particular employee may be searching for more autonomy and growth—finding this environment unsuitable for maturation.

Therefore, there may be lack of fit, either with an immature employee who is put in an empowerment program and begins to feel frustrated and over-whelmed, or the situation where a mature employee is in a rigid top-down command-control environment and starts to suffocate from lack of independence and opportunities for growth.

Our purpose is to continue to try and understand more about these developmental stages and how they affect learning in organizations.
Summary

This paper has presented research in progress to determine how an individual's interactions, work behavior, and attitudes are associated with various stages of emotional development or maturity. Acknowledging how workers move through these stages toward maturity can be an indicator of a successful learning organization. Using this model to provide a framework for measuring individual development will enable organizations to evaluate this critical element and work to develop their human capital into a strong relation-based group of employees, which in turn will promote a successful learning environment.

Sensation-Seeking Behaviors: Predictors of Job Performance?

Thomas G. Reio, Jr.
University of Maryland, College Park

Christopher R. Hardy
INNOLOG, Inc.

Although sensation seeking has been found to have important relationships with job satisfaction and cognitive performance, limited information exists about its possible relation to workplace learning and job performance. Four service-industry companies were sampled (N = 233), and path-analytic techniques were employed to demonstrate that sensation-seeking behaviors can negatively influence workplace learning and technical and interpersonal job performance, as well as job satisfaction. Implications for human resource professionals are considered.

Keywords: Sensation seeking, Job performance, Socialization processes

Various researchers have found the sensation-seeking construct to be meaningfully related to social relationships (Cappella and Green, 1984), openness to change (Bjork-Akesson, 1990), “burn out” (Meier and Schmeck, 1985), life stress (Zuckerman, 1994), job satisfaction and employee intention to quit (van den Berg and Feij, 1991), vocational interests (Zuckerman, 1994), occupational risk taking (Musolino and Hershenson, 1977), and need achievement and cognitive performance (Scroth and Lund, 1993). Zuckerman (1994) called sensation seeking “a trait defined by the seeking of varied, novel, complex, and intense sensations and experiences, and the willingness to take physical, social, legal, and financial risks for the sake of such experience” (p. 27). Thus, an individual possessing a high level of this personality trait would be expected to have a higher need to seek stimulation and novelty, experience different things, and take physical and social risks, all for the sake of maintaining an optimal level of stimulation and arousal. Conversely, a person having a low level of sensation seeking would be expected to have a lower threshold for optimal stimulation and arousal, resulting in less need to undertake risks and experience novel situations.

Sensation seeking has been examined empirically in the psychological and business literature in many absorbing ways, with extremely relevant results to academicians and practitioners alike. However, almost no exploration of its significance to the field of HRD has been undertaken. Knowledge of any relationship between sensation seeking and the workplace learning process and/or job performance could be especially valuable to anyone interested in facilitating learning and enhancing optimal performance.

Review of the Related Literature

In social situations, high sensation seekers excel as they tend to dominate conversation and engage in a great deal of social disclosure, even with strangers (Franken, Gibson, and Mohan, 1990). Thornton, Ryckman, and Gold (1981) found that high sensation seekers tend to select topics of discussion other than those on which they think there will be agreement. The researchers attributed this behavior to the value high sensation seekers place on conflict and differences as positive sources of arousal. In their study of nonverbal behaviors, Cappella and Green (1984) discovered that high sensation seekers were more affiliative in their nonverbal behaviors, such as posture and eye gaze, and emotionally expressive (e.g., more smiles and laughter) because of their propensity toward being more spontaneous and open to novel surroundings and contexts. In essence, high sensation seekers seem to thrive on social contact because of its potential for arousal and to express their desire for social relations through affiliative behaviors.

In a classroom context, Bjork-Akesson (1990) detected a relationship among adolescents between high sensation seeking (using an expanded version of Zuckerman’s construct) and openness to varying learning contexts and group activities. She stressed that because high sensation seekers have a higher threshold for stimulation and
contribute empirical support to theoretical possibilities regarding the relationship between sensation seeking and the

how sensation-seeking behaviors might influence the ultimate measures of workplace learning, i.e., technical and
Investigations into occupational risk taking indicate that individuals in risky occupations, such as air traffic
controllers, paratroopers, test pilots, firemen, and policemen are more likely to be high sensation seekers (Musolino
and Hershenson, 1977). Further, Zuckerman (1994) reported on correlational relationships between his Sensation
Seeking Scale (SSS, a well-studied operationalization of the sensation-seeking construct) and vocational interest
using the Strong Campbell Interest Inventory. The SSS was found to be positively related to the interest scales from
the "helping professions" (e.g., psychology, social work, teaching, and the practice of medicine). On the other hand,
interest in business vocations in which routine transactions predominate (e.g., banking, accounting, and purchasing)
were inversely related to the SSS. These relationships make considerable sense: Because high sensation seekers seek
out social interactions and find them to be stimulating and arousing, these individuals would find vocations
associated with the helping professions more satisfactory.
Finally, in an organizational study conducted in the Netherlands, van den Berg and Feij (cf. Zuckerman,
1994) used a Dutch version of the SSS and measures of work stress and job satisfaction to predict employees’ "intent
to leave" their jobs. The investigators learned that while job satisfaction was the strongest predictor of the dependent
variable, sensation seeking directly predicted an employee’s intent to leave as well. The authors concluded that the
relationship between sensation seeking and intent to leave reflected the employees’ need for variation and change,
regardless of their job satisfaction.

Rationale for the Study

Sensation seeking and its related behaviors have relevance in workplace settings because they may be able to predict
cognitive performance, employee stress, job satisfaction, and intent to leave. Yet little research has been undertaken
to determine their significance in organizational contexts beyond the aforementioned van den Berg and Feij study.
For example, little information is available on how sensation seeking affects individual workplace learning, which is
especially vital to employee socialization (Ostroff and Kozlowski, 1992). Nor has there been research investigating
how sensation-seeking behaviors might influence the ultimate measures of workplace learning, i.e., technical and
interpersonal job performance. It is quite conceivable, for instance, that highly sensation-seeking individuals might
not be as motivated to acquire the necessary workplace knowledge, to “learn the ropes” of their jobs, if they find
them to be boring and monotonous. This lack of learning might in turn negatively influence their job performance.
Consequently, what happens when high sensation seekers have monotonous jobs or conversely when low sensation
seekers have highly variable jobs? Anecdotal evidence suggests that they are less likely to “fit” into their
organizations and that they are much more likely to perform poorly as they become highly dissatisfied. Yet there is
no empirical evidence to support this observation.

Therefore, the purpose of this exploratory study was to focus on the sensation-seeking construct and how it
might relate to the learning associated with the workplace socialization process and facets of job performance. The
results could flesh out previously overlooked factors related to workplace learning and job performance, and
contribute empirical support to theoretical possibilities regarding the relationship between sensation seeking and the
workplace learning process. The identification and clarification of these relationships could provide human resource development professionals with useful ideas for facilitating workplace learning and enhancing job performance, absolute musts for a change-oriented organizational climate.

Research Questions

The research questions that guided this exploratory study were as follows:

1. What are the relationships among sensation seeking, workplace learning, and job performance?
2. Does sensation seeking influence workplace learning and job performance?
3. What influence does job satisfaction have on the relationship between sensation seeking and job performance?

Method

Participants The cross-sectional sample consisted of 81 women and 152 men. There were 11 females and 24 males who were 17 to 20 years old, 15 females and 62 males who were 21 to 29 years of age, 23 females and 37 males who were 30 to 39 years old, 23 females and 25 males who were 40 to 49 years old, and 9 females and 4 males who were 50 or older. The mean age of the sample was 32.5 years (SD = 8.8).

Most (86 percent) of the participants were Caucasian, 9 percent were African-American, 3 percent were Hispanic, and slightly more than 1 percent were Asian. Almost 64 percent of the subjects earned less than $30,000 per year; only 22 percent of the participants earned more than $40,000 annually. Approximately 62 percent of the sample had at least some college education. Overall, the typical participant was a male Caucasian under the age of 40, with some college education and an annual salary of less than $30,000 per year.

Procedure. Participants were obtained from four well-established, service-industry companies in the Washington, D.C., metropolitan area (N = 233). A battery of tests, of which the instruments examined in this study were a large part, and demographic data were collected at the participants’ places of work, with an overall administration time of roughly 40 minutes. All instruments were paper-and-pencil questionnaires.

Instrumentation. One well-studied, self-report measure of the sensation-seeking construct with four relevant subscales was used in this study. The Sensation Seeking Scale--Form V (Zuckerman, 1979) consists of four 10-item subscales: boredom susceptibility, experience seeking, thrill- and adventure-seeking, and disinhibition. Subjects were asked to indicate whether they “liked” or “disliked” the activity described in each question. Cronbach’s alphas of the subscales were .60, .49, .76, and .67, respectively.

The workplace learning (or “socialization-related learning”) measure used was a modified version of the Workplace Adaptation Questionnaire (WAQ; Morton, 1993). This questionnaire was originally a 19-item introspective instrument. We supplemented the job-knowledge subscale with three additional items suggested by Morton’s factor-analytic work to add more technically oriented questions to the instrument. For each question, participants were asked to rate their level of agreement ranging from 1 = strongly disagree to 5 = strongly agree. The first three subscales are concerned with assessing the socialization or learning process at work: establishing relationships (five items), acculturation (five items), and job knowledge (eight items), with corresponding alphas of .85, .86, and .96. The last subscale, satisfaction with learning experiences, is a quite different construct and is not included in the total instrument score. We used this four-item subscale as our operationalization of a kind of employee job satisfaction, that is, learning satisfaction. The internal consistency of the subscale was .81.

Last, the job performance instrument consisted of three two-item subscales (six 10-point Likert items overall). The three subscales assessed overall, technical, and interpersonal job performance. Internal consistencies were .66, .71, and .71, respectively.
Results

After examining the means and standard deviations for each of the measures (see Table 1), all of the research variables were intercorrelated and examined for interesting and meaningful relationships. Table 2 presents the total scale correlations.

Correlations between the variables and their respective standard deviations were entered into a structural modeling statistical package, EQS 5.4 for the Macintosh, and an a priori determined theoretical model (see Figure 1) was tested for statistical fit with the model.

Conventional fit indexes indicated that the theoretical model fit the data adequately; therefore, the data did not disconfirm the model (Comparative Fit Index = .90; Bollen Fit Index = .90; and McDonald Fit Index = .96. Values of .90 or greater are desirable. See Kline [1998] for an excellent discussion of the various fit indices.) All but one of the paths were at least statistically significant at the $p < .05$ level, most were significant at the $p < .01$ level. The satisfaction-with-learning-experiences to technical-job-performance path lacked statistical significance, yet we considered this result to be completely plausible when considering the composition of the learning satisfaction subscale. For instance, question 22, "I am satisfied with the support I have received on the job," does not seem to be as closely associated with technical job performance as it is with interpersonal job performance, especially considering our sample of service workers. Perhaps with technically oriented positions such as computer technicians, technical support would be perceived to be more valuable and thus technical job performance would be influenced more significantly. We recommend modifying the subscale to accommodate these observations.

Essentially, our path model lends empirical support to the notion that sensation seeking has a direct negative influence on socialization-related learning and satisfaction with learning experiences, and an indirect, positive effect on technical and interpersonal job performance, mediated alternatively through the socialization-related-learning and learning-satisfaction variables.

Discussion

Sensation seeking was explored as it related to socialization-related learning, job satisfaction, and technical and interpersonal job performance. As expected, sensation seeking had a direct and significant negative influence on the learning associated with the socialization process as well as on satisfaction with learning experiences (our operationalization of job satisfaction). This is in partial support of the van den Berg and Feij study conducted in the Netherlands. The negative relationship between sensation seeking and socialization-related learning was anticipated because when learning the nuances of one's position and the norms, values, and procedures of an organization, a certain amount of conformity is necessary. Certainly, high sensation seekers would not be as likely to prosper in typical service-oriented organizational situations demanding considerable structure and long-term conformity due to their constant need for stimulation. Indeed, the nature of any job would seem to mandate at least some constraint from one's supervisor, for instance, which would likely contribute to lower levels of job satisfaction for the high sensation seeker, and a resulting decline in their job performance. This assertion is supported by our theoretical model. In addition, high sensation-seeking individuals, while adept at handling novel contexts, would not as likely be stimulated and aroused sufficiently by such a learning context over the long periods of time necessary to accommodate fully to a position, the management staff, and an organization.

We have presented empirical evidence that the sensation-seeking personality trait has an important influence on the vital socialization process in which employees use various organizational resources, such as coworkers and supervisors, to learn the subtleties of their positions, and which ultimately influences their job performance. With this particular sample of service positions, high sensation seekers would not be as likely to be as well socialized or to fit into the organizations where the study was conducted, a development that would have a
concomitant negative influence on their job performance because organizational policies and expectations would probably not encourage and foster such behaviors. Alternatively, with a sample of police officers, firefighters, and air traffic controllers, we might expect the opposite result: High sensation-seeking behaviors would be encouraged through organizational policies, the fit between the employee and the organization would be more assured, and job performance would be positively affected. Undoubtedly, more research is needed to investigate this possibility.

Human resource professionals should use this information carefully. Although a measure such as the Sensation Seeking Scale might be a predictor of organizational fit, job satisfaction, and job performance, these results are far too preliminary to advocate using this measure as a primary criterion for job selection. Far more interesting is the notion that this information could be used to help professionals facilitate and manage organizational learning, job performance, and employee retention.

Analysis of complex action learning documents produced as course requirements in universities on three separate continents strengthens the credibility of relationship theories of mind and enactment theories of transformational learning. Words as data accompanying acts in real work settings, together with verbalized reflections upon these acts, weave a net to catch both organizational and individual meanings.

Keywords: Action Learning, Relational Thinking, Enactment of Learning

A number of qualitative studies have discovered a preponderance of positive outcomes for individuals who engage in action learning (Dilworth & Willis, 1997; Willis, Deans & Jones, 1998; Botham, 1997). With somewhat greater difficulty, researchers also seek to show positive impacts of action learning on organizational processes and outcomes (e.g., ARL™Inquiry, 1997). Action learning does not lend itself easily to results-oriented evaluation, but there is no longer any question that "change happens." The challenge for the researcher is to devise refinements in the ways change phenomena are described, for a better understanding of what is happening as it happens as well as what the wider implications may be.

Purposes of this study are 1) to capture data that suggest relational thinking presumed to be occurring at intersections between person and environments, and 2) to identify relationships, if any, between verbalized emotional changes and cognitive processing. The approach taken is qualitative, systemic, and psychological in orientation, using in particular a general system theory of Emotional Cognitive Structuring (ECS) that is relatively obscure and that has not entered the mainstream of HRD research. It acts in the service of personality development. While HRD has lately been drawn to a brand of social economic theory that seems largely supportive of performance technology, social psychology and personality theories relevant to adult learners seem to have waned in influence and may be in need of reconsideration to infuse new thought in the field.

An "intersection" of relational importance is a conceptual convenience, defined as the point in written reports from the U.K., Australia, and the U.S. where the action learner appears to cross boundaries either affectively or intellectually toward or away from any of three specific environments that are central in the reporting: the client organization (which may be the student’s own work site), the action learning set, and the “intrapersonal space” in which the student struggles to internalize what is being learned. Relational thinking is defined as involving two or more relata ("both-and" matters of interest) and appears boundaryless in the sense that affect, intellect, and environments are not segregated. What we see at intersections may tell us something about how real or artificial it is to imagine that assessment of the impact of action learning on organizations can be made separately from the assessment of its impact on individuals.

Theoretical Framework

Relational thinking in its simplest form, considering two or more relata simultaneously, is axiomatic in general systems theory (GST). It has now become popularly symbolized as "systems thinking." A psychological example of relational thinking is embodied in William Gray’s theory of Emotional Cognitive Structuring (1973, 1975). Gray, a practicing psychiatrist and close friend of GST founder Ludwig von Bertalanffy, insisted that what we call thinking is a system, in which cognitions are always accompanied by emotional correlates that are further differentiated or "nuanced" over time to lay the basis for restructuring of what we think. The theory may have unexamined relevance to the notion of "emotional intelligence," (Goleman, 1997), which is represented as developmental in nature.

Another possible application is the recognition of individualism as an emotional-cognitive system nurturant that, rather than operating as a system antagonist, is essential to the forming of action learning communities.

In Gray’s view, emotion is the “coder” or organizer of cognitive fragments. The fragments are “that which is organized.” A cognition without emotion is not a thought and is easily recognizable by its “dead-endedness,” Gray explained, for a cognition has no interest in going beyond itself (1975, I-5). It is his conception of emotion and cognitive elements as required parts of a “double helix” for thought production that is most pertinent to this study. It encourages the search for specific emotional coding that seems to engender thought in the action learning process.

Fundamental assumptions on which this study rests are that human brains work by integrated, relational processes rather than by chained or split-half processes, and that organizational “brains” work much the same way no matter how it may appear to outside observers. The theory that a “collective mind” exists in organizations is entertained at least provisionally by many organizational theorists, and Kirley (1999) has recently taken long steps through painstaking analogical discourse toward supporting the theory.

For the individual brain, learning is therefore assumed to be relational, and transformational to the extent that the learner recognizes emotionally nuanced events that “change everything.” Learning for the collective mind of the organization is also assumed to be relational, and transformational to the extent that the whole organization or any critical mass within it “feels different.” It is further assumed that the whole-brained organization will itself need to be consciously engaged in emotional cognitive structuring if it is to capitalize on human thought and learning. This structuring is unlikely to be susceptible to knowledge management, if its locus is a psychological or mind process. A final important assumption is that the words people use to describe their experiences in action learning in the context of actions taken can serve to illuminate both organizational and individual meanings either derived from the process or left unchanged by it. Enactment of learning that fully engages thought (not learning by doing) should provide optimal opportunity for transformation of individual and organization.

Problem Statement and Direction of Inquiry

Organizations can be said to “think” if the cognition is coded by emotion and is relational. If an organization thinks, it must be solely because individuals within it think, and do so in mutual, relational ways. Action learning is meant to change individual and organizational thought about self, others, and environments, as action and reflection proceed simultaneously.

Graduate students in several universities discover what action learning is by enacting their learning as part or all of their academic credentialing. At the Revans Centre in the U.K., graduate theses and dissertations literally determine success or failure in the achievement of a “degree by action learning.” They entail three kinds of investigation and reporting, framed by these questions: 1) What did I achieve? 2) What did I learn? and 3) How might I apply my experiences in the future? In essence, student reports are inquiries into their own inquiry processes, which have included action research initiatives in their own or a client organization, collaborative inquiry in action learning sets, and independent reading, workshops and tutorials. In every case, the organizational environment is uppermost in student’s minds, and the “what did I” and “how might I” questions are answered with difficulty because they require a much deeper level of relational thinking and analysis.

The University of Ballarat in Australia uses a different combination of structures and processes, seeking similar outcomes. After preparatory workshops, candidates for the Master of Business Management degree (MBM) must negotiate an operational contract with a client, then construct an associated learning contract with a project supervisor and an action learning set at the university. The degree is not earned until the work with the client, the work with the set, and the inner work of learning have been reported upon.

In the U.S., reports already sorted into a database shared by Georgia State University and Virginia Commonwealth University contain similar process and personal learning information, as well as comments on the organization’s acceptance of the findings from the action learning. These are not reports of thesis length, but have many of the same features, including reflections on personal learning and on the action learning process. The three sets of source materials have all been collected in English-speaking nations, and therefore are expected to capture only evidence of relational thinking as it has occurred in these language-linked nations. Anonymity of entries in the U.S. data base is contractually preserved, and though the theses from other countries are open records, the author’s names and thesis page numbers have not been used in this article because of sensitivity to the personal nature of the material.
Research Protocol

The research examined texts that include six completed theses from the Revans Centre, one comprehensive report from the University of Ballarat, and sorted text data from the shared data base in the U.S. As is customary in qualitative research, definitive hypotheses were avoided to allow for emergent design as data was progressively examined and sorted. These were the major questions of interest, all keyed either to relational thinking and/or to emotional cognitive structuring. They are meant to help illuminate the research dialogue over personal vs. organizational impact of action learning and the reasonableness of making greater use of action learning as part of the HRD organizational change arsenal. "Environments" refers to the client organization, the action learning set, and the "intrapersonal space" of the learner.

1) Does data available suggest that action learners typically have two or more environments (as defined above) in mind during the action learning process or do learners maintain a singular focus?
2) What is the nature of the evidence in the data that relational thinking is or is not occurring? Are there clues to environmental boundarylessness present in the words, the acts, or both? Are environments depicted as alien from one another? Does there seem to be a lack of sharp demarcation between personal learning and organizational learning? Do learners believe that both are occurring simultaneously?
3) Do action learners report their learning as primarily affective, primarily cognitive, or as a mix that can be understood by researchers as emotional cognitive structuring? Does emotion seem to "code" cognition so that thinking/learning about self, others, and environments can be seen to have at least as high a priority as problem-solving?
4) Does thinking appear to become more systemic? Do learners tend to see organizations as more systemic than they initially realized?

Because a major block of data has already been sorted by means of NUD-IST software, coding and card sort were thought sufficient for examining the remaining documents.

Findings, Interpretations, and Conclusions: Five Cases

Reporting of learning and change at the personal level, because of its potency, typically obscures the reporting of what the organization may have learned from person(s) in an action learning set. However, re-examining students' comments about their personal learning, particularly when juxtaposed with those passages where they are discussing either organization or action learning set activity, also shows that organizational learning is occurring.

Case One: Australian Report/Thesis

One example from a pair of text segments is drawn from the only Australian document examined. The first segment seems person-centered, but when analyzed with another entry, the segments together show organizational impact. The student undertook a Volunteer Enhancement Project to develop a strategic plan for attracting volunteers to staff the Ballarat Begonia Festival, to create a social program to keep them interested throughout the year, and to design a program of recognition and future career support. Reporting her actions, she says she was conscious of "rocking the boat" and taking personal risk as she moved forward with what the organization at first suspected was simply a project that met her needs. Initially they did not see "what was in it for them," and so she altered her strategies:

I devised new solutions (changing the survey to focus groups, reporting directly to the Committee, sharing my thoughts and actions with the volunteer sub-committee, accepting the culture of the Festival management...)

Here, personal learning is apparent. She learns to "accept" rather than confront an organizational culture. She challenges her own thinking and revises actions. Later, she knows that what resulted from her project "has become a part of the fabric of the Ballarat Begonia Festival, a major tourist drawcard and contributor to the thriving community of the Ballarat region." Clearly the whole organization learned, and will do things differently in the future. Because she learned personally and reframed her own organizational effort, the involvement of
volunteers in planning for a yearly tourist event that has a major economic impact on Ballarat and the region was institutionalized.

What is also striking in this case is a series of Johari windows depicting the evolution of openness and collaboration of the action learner with her client organization, her professor, and her university action learning set. The client organization series is of most interest here. At first, the window panes representing the open arena and the façade were very small. Although she "knew" the festival committee from her earlier work as a volunteer, she had had no opportunity to provide personal or working information about her project to the committee as a whole. In the very large pane called blind spot, she admits she did not "pick up on" reasons why her project was thought questionable and her methods unacceptable. The largest pane of all -- unknown-- is worth quoting also because it is redolent with emotion. In March she says:

I did not know they would object to my proposed methodologies for gathering information from the volunteers. I didn't know that people I thought had been my friends and allies would question my motivations for the project. I didn't know how I would react to that.

By November, the unknown pane had shrunk to a simple and accepted fact: "The political nature of the committee leaves some unknowns remaining." In the interim, the emotional shocks she had encountered led to understanding that her real client was not an individual leader, but a committee of 10, a realization which then led to meeting with the whole committee to reach compromise.

At least tentatively, this appears to be a case of emotional cognitive structuring, over time, enabling personality development. But the finding least open to challenge in this case is that personal impact of learning shaded over into organizational learning and change.

Case Two: U.K. Thesis One

A professional trainer in the U.K. was providing management development opportunities for doctors in a National Health Services Trust. Engaged also in a master's program in action learning at the Revans Centre for Action Learning and Research, University of Salford, she soon found herself "questioning not only the efficacy of my efforts but the core of my approach to my work."

Though I had kept abreast of changes in my profession and had progressed from "chalk and talk" as an Army instructor to more participative approaches, to "learning contracts," and had recently written a training and development strategy document in which we aspired to become a "learning organization," I had professionally, changed very little from my early years. Although...I "heard the words, I read the books, I debated the issues and at times thought I was genuinely involved," it was at this point that I understood that Action Learning offered opportunities for personal development that I could not only profit from personally but which I had a duty to exploit professionally. I turned to Revan's work to develop a personal understanding of Action Learning.

Ironically, just as she saw how action learning could help the managers she was working with and as she herself was "waking up to the power of learning in this way," this trainer saw that her professional world was turning "in a different direction entirely" toward competency-based training design. With her new insights, she concluded that These [approaches] seem to focus on external representations of ability without acknowledging the linkages between these and inner motivators...I have arrived at my reservations about competence approaches by way of two fundamental issues, context and ethics....Why has Action Learning been much more efficacious in my personal development than other developmental activities in which I have engaged?...The primary difference between this and other forms of learning lies in making explicit the attention which needs to be given to personal growth [as] a focus and not simply a by-product of learning.

She noted that the process had involved "upheaval of my innermost thoughts and feelings and recognizing linkages between these and the way in which I manage the tasks I perform."

Using this example may seem to be a deliberate ideological barrage to help make a case for action learning, implying that if one seasoned trainer "sees the light," then so should we all. But that is not the purpose of quoting this scholar-practitioner at length. Her story stands on its own as a clear description of transformational learning, which is for Mezirow "centrally concerned with the structure and process of construal, validity testing, and reorganization of meaning..." (1991, p. 7). Furthermore, it is obvious throughout the text that she has several environments in mind simultaneously, linking relata from each environment with relata from others. It is relational thinking she displays. Her profession begins to seem less systemic than she thought it was, and she discovers it to
be a profession far less comfortable with emotion than she now believes it needs to be. She uses the term "feelings" instead of the word emotion, but what she writes is emotionally charged, produces new insights, and serves throughout her discourse as an exemplum of progressive emotional cognitive structuring. Differentiations of feeling (nuances) attach to newly appropriate (coded) bundles of cognitive fragments, as Gray would view the process. The connection between impact on her and impact on the organization through action learning is unclear. Although in the midst of her degree program she was downsized from her job, it appears circumstantially to be unrelated to action learning or what use she might have made of it in the health care setting. At first angry about the "redundancy," she began to think excitedly about doing independent consulting.

Case Three: U.K. Thesis Two

A speech and language therapist sought to help her organization expand and institutionalize the use of flex-time in providing health care. Other professionals in the group were chiropodists and physical therapists. She was aware that, although the personnel manager had given lip service to support her research mission, he neither aided her efforts nor took actions himself on the data she gathered. She had what she thought was a workable strategy: to further codify flex-time rules in her own department where there was a favorable climate, and then to inventory other groups so see whether there was support for flex-time in other areas of the organization. She felt that if she could help change the "internal mappings" so that other professionals perceived the advantages of new employment rules, then she would have succeeded in changing the organization's theory-in-use. If that occurred, she would be able to say that the organization "learned."

She wondered how direct the links are between learning and change, and during the project came to the conclusion that "Real and permanent changes in behavior must and can only come about when personal constructs are altered by the learning process." She could testify to the truth of this from her own experience in earning a degree by action learning. Nevertheless, she went through a lengthy process of trying to find other ways to test the reliability of her premise. She could ask subordinates, a spouse, other set members, or even an outside observer to determine whether she personally had learned and changed. But this still left possibilities for distortion. So in the end she decided that she had to trust herself. It was "reasonable to assume that learning would give rise to change, that the changes were attributable to action learning, and that someone would be able to observe these changes."

Reflection on the new information generated by my actions...enabled me to repeatedly reassess and adjust my internally held models of the organization, my colleagues, and people and change in general...I believe I learned to increase my effectiveness in a changing world by recognizing the need for continual development (restructuring of myself)...resulting in altered constructs; changes in behavior are the end product.

She felt that the action learning set helped by "pushing me over the boundary between my current thinking and the acquisition of new ideas."

The refusal of action learning to be neatly separated into a management development module, its propensity for overflowing out of a given project and into every aspect of work and personal life, demonstrated to me a major difference between learning and training. Like learning to drive, she added, you have to do action learning, and you alter surroundings by "passing through" them. In her flow diagram of the process, this passing through is shown as learning made explicit through reflection.

She does not overestimate the impact of her work on the organization, given the fact that the physical therapists and the personnel director shared the perception that strict nine to five hours were more professional and were unrelated to the professional recruitment problem the organization was experiencing. But she did establish new procedures in her own department and also found strong support for similar changes among the chiropodists. While personal impacts of action learning did not map over the whole territory of the organization, they seem to have bled out over large segments of it, and certainly into the lives of those with whom she worked most closely.

In this example there are explicit references to relational, boundaryless thinking and to emotional cognitive structuring in the way her thinking evolved. She does not say that emotions led directly to insights that fuel new thinking, but the "restructuring of self" idea carries that implication.

Case Four: U.K. Thesis Three
In this example, limited text is sufficiently revealing. A director of mental health service development for a National Health Trust region discovered that "managing without shoes" is a confusing but heady experience. He was challenged to develop new forms and venues for mental health service delivery in partnership with users of such services. For him, becoming less of a bureaucrat and more of an entrepreneur was a professional sea change:

I thought I involved people who use our services when I was a service manager, but the experience of developing this project [the creation of an innovative, multi-purpose Creative Learning Center] confirmed to me that this is not the case. They would often be consulted after a decision had been made.

As he devised new ways to work with these consumers, his respect for them grew. He called it learning the art of managing without shoes not only because he was asked to remove his shoes at his first meeting with them, but also because he came to see this as a metaphor "that reflects how uncomfortable and vulnerable I have felt as I encountered a range of new experiences." He will continue to build other partnerships as the project progresses toward implementation.

The person-centered approach to patient care makes deliberate use of a social model, rather than a medical one. This represents an organizational sea change for a national health care entity that is still in the throes of decentralization and reorientation toward the communities served. The executive director of the Trust who chose the new development officer sees the transformation of his subordinate this way:

S. is now clearly the same person with the same values and drive and with an intense commitment. However, he has learned to risk himself in a context which has few of the familiar handholds and which is rich in its novelty and uncertainty. He has done this is a way which has become increasingly self-confident and self-aware. He has become more reflective, but in doing so, has learned to use his reflection to digest and integrate his experiences and move forward. It is a creative and enabling process. The effect of this is that his enthusiasm and drive is now addressed not just to achieving objectives, but also to engaging others and to grappling with concepts and ideas....I have always valued S. and his contribution, but I have been fascinated by the way his vision and style have opened and skills developed.

In an interview I conducted with S. after his submission of thesis, he bluntly acknowledged that he had been forced by his job circumstances to change, that the action learning had helped him accomplish this, and that being a changed man is transformative in more ways that he had ever thought possible. He spends a lot of time just "hearing what people say." To conclude that he has no effect on the organization that sponsored his action learning or on the community in which he now spends much of his time would be disingenuous. That he has had to engage in relational thinking and has used his own uncomfortable emotions to restructure his thinking is also a justifiable conclusion.

Case Five: U.S. Reflection Paper

The fifth and last example is from a reflection paper written by a student in the U.S. after an intensive summer experience with action learning in the U.K. The student was one of 30 from different countries who were sorted by diversity into five action learning sets of six people each, and assigned to work with managers from two hospitals in the Manchester area that were facing the difficulties of a merger. Data from this event make up a large part of the shared U.S. data base on action learning and some of the findings have been reported earlier (Dilworth & Willis, 1997; Willis & Dilworth, 1998). Each set worked with their assigned manager as a team, having periodic consultations with the manager during the two-week intervention.

This was a different structure for action learning than was provided in any of the previous examples, where each thesis writer worked independently with the client group and then touched bases with a university-based action learning set to share concerns and gain new insights about their work. The U.S. author describes the process her set used to learn about the client manager's problem in this way:

We delved into many different perspectives concentrating on the internal and external customers, politics, budgets, cultures (formal and informal), traditions, communication strategies, technology, reward structures, and the mission and value statements of the hospitals...We found that "reading between the lines" was a necessity, even though hospital representatives were honest and straightforward. We...[looked] for implications and values that may not have been evident to those involved....

The problem focus as it was presented to us was laden with systemic disconnects. We decided to break it down to foundational, relational segments, and asked questions relating to these disconnects...It was stressful because we each saw and heard different things even though we
were all at the same meetings... Our "filters" were on and colored our line of reasoning, which was good because we had multiple perspectives. The stress was the result of debating and challenging issues that had meaning for us.

The narrator then speaks of "overreacting" to an offhand comment by one of the set members that appeared to be disrespectful of other members of the group and their efforts. Because she was "not confrontational" by nature, it was "difficult" for her to say "what I thought on the spot," but she did so and this was clearly a defining moment for her, discussed at length in her paper. Subsequent comments included these which are especially relevant to this study:

It was interesting to participate and observe the things that changed and the things that seemed to remain constant... I thought about what I brought to the set... My worry was that I didn't see my own strengths and weaknesses clearly... There wasn't a lot of time to take a challenge and reframe one's perspective, or "unfreeze." It takes a person a long time to develop perspectives... I think there were quite a few of us that pushed our boundaries. Collectively we pushed through some difficult times. I think we gave a quality analysis and provided fresh questions.

This example of a reflection paper that did not attempt either length or the detailed follow-up of the two-week intervention does not and cannot be expected to reflect the same richness and contextual detail that a two-year engagement with action learning and thesis writing must. However, there are clear indications from the set member quoted that the set engaged in relational thinking, adjusted and nuanced emotions that subsequently organized or coded cognitive fragments floating in the set, as voiced by multiple perspectives. The primary "environments" in this case appear to be other "intrapersonal spaces," at least for this participant. The environment of the client organization ran second. In essence, the set delivered a product—a quality analysis and some fresh questions. There is no indication from this writer that the organization learned or was transformed in any way (though other reports in the data base do give such indications). Finding items in written materials that can be assessed in terms of organizational change in thinking and learning seems to be partly conditioned by duration of contact with action learning that the writers have—not necessarily in clock hours but through a passage of time. But finding such items may also be conditioned by the significance episodes have for a particular learner at the point of writing about experiences. Perhaps when emotions are in what Gray calls "global" or "primary color" mode, and not yet differentiated, the cognitive fragments they code are more intrapersonal than organizational.

Recommendations for HRD

Though the examples are limited, they may taken together provide incentive for further investigation along the lines laid out in this research. It is almost impossible to read such narratives separated in time, by culture, and by distance, yet finding the same elements over and over, and not become convinced that action learning is a strategic force for human resource development. There is also evidence that the writers quoted here, in all likelihood unknown to each other and never having worked together, experience much the same sort of restructuring of what they think and what they subsequently act upon once they engage in action learning. Relational, systemic thinking and emotional coding appear to be demanded by action learning, and it may be that these imperatives override many cultural differences. It may even be the case that non-western cultures more easily use these non-linear kinds of processes than westerners do. Research possibilities seem endless, and this is admittedly a very small beginning.

In regard to the four questions of interest, there does appear to be support for believing that action learners rarely if ever maintain a unitary focus. They are not "hung up" on any of the three environments exclusively. Relational thinking is, if not engendered by the process at least compatible with it. Students begin to look for systemic connections both in the client organization and the set, and generally in themselves as well. The "alien" appearance of environments (self, others, client organizations) tends to fade as interactions occur and expand. Learners are aware of this, although they still tend to mark off areas of personal learning from areas of organizational learning. One possibility that occurs to me as a result of this study is that students should be guided themselves to seek out juxtapositions of self/organization change, adding a specific section on organizational learning to their theses and project reports. It may be that students tend to discount the learning of the organization because what they have learned themselves is so remarkable.

Feeling statements are made; students are aware of their own and others' emotions in the course of the work. They reflect and organize and refine their view of what occurs and the role they play in it. At least metaphorically, emotional cognitive structuring seems to be happening and for some it is transformational.

There are specific initiatives that this study indicates HRD should be taking, enumerated as needs or directions below:

- **HRD needs to find ways to factor emotion into organizational and individual learning.**
The role of emotion in human resource development is insufficiently addressed in the research and practice literature in the field. Except for certain types of OD interventions, the relationship between emotion and cognition does not seem to be a comfortable arena for discussion. It is like working with one half of a double helix. In Johari window terms, it may be a crucial "blind spot" in HRD reckoning to leave the emotion in learning to chance or to suppress it in favor of observable performance. If organizations continue to seal off the emotional development of persons from the work environment, giving "feeling" a nod in terms of the rituals and celebrations of culture but not in terms of personality development and growing psychological efficacy, then new cognitive structure may not appear as rapidly as needed.

Gray asked that we aim for "new neuronal networks" [dendrite branching and relational brain activity], which he believed new emotional cognitive structuring (ECS) to be. A person cannot learn without producing change in neuronal networks. The goal for Gray is the self-organization of personality, progressing from simple to higher order affects, which in turn (as one thesis writer said) changes thinking and has enormous influence on how tasks are performed.

- **HRD needs to take action learning more seriously and honor it distinctiveness.**
  
  Action learners with very little practice seem remarkably adept at finding and sorting their emotional nuances into appropriate "bins" or schemas. First, however, they need to be made aware that this can and should happen if they are interested in personal development and confidence/capacity building. They may even need to consider the possibility that what they think is organized by their emotional coding, and that it is handicapping to believe otherwise. Conceding that emotion has a role and giving it legitimacy through action learning is a quick start, if not a quick fix. Relational thinking and emotional integrating, while a long term proposition for individual and organization alike, cannot even begin unless there is a way to make an initial investment.

- **Even as HRD practitioners come to realize that culture makes a difference in how we proceed, there is a growing need to understand that emotion and thought are common to all cultures.**
  
  It may be that emotion codes differently for different people, but that it really does code how we act and think may be an insight we are in danger of losing in our struggle to find "mechanisms" to use cross-culturally.

- **Systems thinking, now become almost a mantra of organizational learning theorists, needs to be recognized by HRD as a deeply personal and relational matter.**
  
  It is multi-directional, permutational, and not a "flow-chart of the mind." Thinking happens in persons as well as organizations and does not proceed either in straight lines or inside lines. It does not emerge by cookie-cutter but idiosyncratically.

- **Finally, HRD may do well to take a deeper interest in the nature of and conflicts in its own philosophies and its own paths to perspective transformation.**
  
  We can hardly encourage others to differentiate and change and learn if we cannot do the same for ourselves.

Employee Strategies in Organizing Action Learning Programs

Rob F. Poell
Ferd J. Van der Krogt
University of Nijmegen, The Netherlands

Existing action learning approaches pay relatively little attention to the strategies of employees (compared to those of learning coaches) and tend to ignore the impact of different work contexts on learning. This study addresses the various ways in which employees organize their own action learning programs in different work contexts. A theoretical framework for the organization of action learning projects is presented, which introduces core activities to be undertaken in an orientation, learning, and continuation phase. Four learning-project cases from different work contexts are analyzed using this framework. It is concluded that employees have their own strategies to organize action learning programs. Moreover, there are several ways in which they organize these learning projects. The work context is found to be an important factor to explain differences among learning programs.

Keywords: Action Learning, Employee Directed Learning, Organizational Learning

Action learning is widely regarded as an effective HRD intervention (Inglis, 1994; McGill & Beaty, 1992). Yorks, O'Neil & Marsick (1999, p. 3) define action learning as "an approach to working with and developing people that uses work on an actual project or problem as the way to learn. Participants work in small groups to take action to solve their problem and learn how to learn from that action. Often a learning coach works with the group in order to help the members learn how to balance their work with the learning from that work."

This definition emphasizes learning by solving real-life work problems in groups. Although an action learning approach seems suited for all kinds of employees, it is often associated with management learning and development (Mumford, 1997; Revans, 1980; Watkins & Brooks, 1994). This raises the question whether employees cannot also learn by solving real-life work problems in groups. Moreover, the definition stresses the role of a learning coach in helping group members learn from their work. This raises the question whether employees cannot also organize group learning by themselves, without the help of a coach.

O'Neil & Dilworth (1999, p. 20) list a number of considerations that have to be addressed in designing action learning programs:
- Work on a familiar or unfamiliar problem?
- Learn in a familiar or unfamiliar setting?
- Define an individual or a group project?
- How to choose participants?
- How much time investment is feasible?
- Should learning content be provided, and if so, what and how?

These basic design issues are important ones to cover, because the answer to the questions will impact the specific type of action learning program that is organized. The HRD profession knows a lot about the strategies that course designers should employ in order to make training programs effective. However, when it comes to more informal ways of learning on the job, effective strategies of employees (and their managers) require much more emphasis. Unfortunately, HRD knowledge in this domain is still quite limited.

Theoretical Framework
Poell & Van der Krogt (in press) present an approach to organizing work-related learning programs, which puts employee strategies at the focus of attention. All employees are considered to be every-day learners, though to a large extent unconsciously, in that they find ways to deal with the problems they face in doing and improving their work. For example, they seek support from colleagues or team leaders, they experiment, they call upon experts, or they engage in trial-and-error problem solving.
Employees can consciously make their learning and work improvement efforts more explicit and systematic by defining it in terms of a learning project, individually or group based. Poell (1998) demonstrated that employees may or may not need support from a learning coach in organizing their learning project. One reason why they would choose not to call upon advisers or managers for assistance is that their strategies to organize learning projects may differ significantly, as Poell, Van der Krogt and Wildemeersch (1999) have shown.

On the basis of these viewpoints, Poell & Van der Krogt (in press) present a method of organizing action learning programs that seek to combine elements of every-day learning, individual self-directed learning, group learning, and facilitator-directed learning activities. The method comprises three main phases: orientation, learning, and continuation. The orientation phase enables employees to make the transition from every-day learning to the action learning program, whilst the continuation phase serves to incorporate lessons learned during the core phase in their every-day learning efforts within the organization.

**Orientation Phase.** This first phase brings employees from an initial idea of learning something new to a group learning contract. There are four essential activities during the first phase: mobilizing the participants, analyzing the learning theme, putting the learning program into context, and making a learning contract.

**Mobilizing the Participants.** Individual members and the participants as a group reflect on their learning needs and how their participation in a learning project could contribute to fulfilling these needs. Group members make arrangements regarding their own tasks and support needed from others.

**Analyzing the Learning Theme.** Participants analyze their work problems and the developments in the organization that have led to these problems. The analysis results in a broad program of learning activities to be undertaken and the learning objectives to be met.

**Putting the Learning Program into Context.** As the learning program will not take place in a vacuum, the opportunities offered by the existing learning system have to be taken into account. Which elements in the current learning facilities can be used, and what additions to it need to be made during the project? Gaining commitment and facilities from significant actors around the learning project is a crucial activity here.

**Making a Learning Contract.** The outcome of all these activities is a (psychological) learning contract, which contains an agreement about the commitment of those concerned, the content and organization of the learning project, and its relationship to the existing learning system. The contract is an explicit expression of the ideas and possibilities of the employees, managers, and coaches involved in the learning program.

**Learning Phase.** This second, and core, phase ranges from the finalization of the learning contract to the attainment of learning outcomes. This is where the actual learning program is created and performed, supported by processes of coordination and guidance. At the same time the learning program is optimized, constantly tuned to changing viewpoints regarding learning and work in those involved, and continually geared to the relevant developments in the work.

**Creating the Learning Program.** The agreements and ideas from the orientation phase are now put into practice. Three core activities are performed at this stage. 1) **Learning in Learning Situations.** Participants engage in learning activities together, reflect upon their progress, and thus develop their expertise and action repertoire. Some examples of possible learning activities include work experiments, giving each other feedback, playing a simulation game, discussing new ideas, participating in on-the-job training. 2) **Learning-Program Coordination.** The learning project comprises various different activities, which have to be coordinated in order to make up a coherent program. Participants extract lessons from previous activities and translate them into the next activity to be undertaken within the program as a whole. 3) **Learning-Program Guidance.** Individual set members and the group as a whole usually need guidance to help them create a meaningful learning program. This activity encompasses making participants aware of available options within the learning project, painting scenarios for these various alternatives, and helping members to make the best choice from possible activities.

**Optimizing the Learning Program.** The ongoing optimization process is closely related to program creation and runs concurrently with it. It addresses three central issues. 1) **Tuning to Learning Views.** Throughout the project, participants ask themselves whether the learning program is still consistent with their views on what they should learn and how it should be learned. Discrepancies are discussed and, if possible, resolved by adapting the learning activities to these views. 2) **Tuning to Work Views.** Similarly, set members reflect on the question to what extent the learning program is still tuned to their views of an optimal work organization and content. If needed, other types of
learning activities are added. 3) Relevance for Work. Participants make sure that their learning activities contribute to solving their work problems. Should this not be the case, then work developments are reanalyzed. If unforeseen work problems arise during the project, learning activities are redirected in order to tackle them as part of the program.

**Continuation Phase.** This third and final phase takes employees from the initial learning outcomes to a lasting effect. On the basis of the lessons learned during the program, employees are enabled to resume their individual every-day learning paths: These lessons are also translated to the organizational level in order to improve the corporate learning system.

**Resuming Individual Learning Paths.** Set members are encouraged to build upon their initial learning outcomes. They alter their personal development plan in order to incorporate and expand the lessons learned during the learning project, both in terms of what they have learned and how they have learned it. Subsequent every-day learning and work improvement activities of the participants are impacted by these reflections.

**Improving the Organizational Learning System.** The organization can also learn from the experiences gained during the learning project. This can be achieved by participants communicating and collaborating with other people in the corporate learning system, for example, by having them as a member or coach in a new learning set. Another possibility is to systematize the learning materials that came out of the project. Finally, the implicit knowledge that members have gained about organizing and optimizing the learning program can be made explicit through interviews, surveys, a project journal, or minutes of set meetings.

**Problem Statement and Research Questions**

There is some empirical research to indicate that action learning programs can be organized in various different ways. Poell, Van der Krogt and Wildemeersch (1999) used four theoretical types of learning projects in order to study the differences among sixteen learning-project cases. Three clusters of learning projects emerged, which were labeled as: 'Extended Training', 'Directed Reflection', and 'Reflective Innovation'. Apparently, employees have several options in organizing their own learning programs.

Furthermore, the work context seems to be an important condition under which learning is organized (Torraco, 1999). Van der Krogt (1998) investigated the relationship between corporate learning systems and the organization of work. He found that certain types of corporate learning systems are more likely to be found in corresponding work systems. A contractual or 'liberal' learning system is related to individual work, whereas a regulated or 'vertical' learning system is more likely to occur in task work. An egalitarian or 'horizontal' learning system is connected to group work, whilst an innovative or 'external' learning system is characteristic of professional work (cf. Table 1; Mintzberg, 1979). Poell, Van der Krogt and Wildemeersch (1999) also concluded that certain types of learning projects are more likely to be found in certain work types. In short, the work context appears to be a crucial factor in explaining which type of learning project employees will organize. We will use the expected relationships between work and learning to interpret and typify the action learning programs described in this study.

The present study intends to demonstrate the various ways in which employees organize action learning programs related to their work context. Working on the basis of the action learning method described above, it aims to develop a number of different ways in which employees, managers and learning coaches can systematize the every-day learning and work improvement efforts of employees.

The following research questions will be investigated:

1. Which activities are undertaken in the orientation, learning and continuation phases of action learning programs? And which ones of those activities are conducted by employees?
2. Are there any differences in the way action learning programs are organized? And, if yes, are these related to the work context (as presented in Table 1)?

Methodology

A secondary analysis of existing learning-project material was performed, including interview summaries and learning-project documents (Poell, 1998). Four cases of work-related learning projects conducted by employees were selected on the basis of different work types in which they were carried out. Four different work types - task, individual, professional and group work - were included in order to maximize the possible variation in learning programs (in view of our second research question). Poell (1998) gives a more elaborate account of the methodology used to study these cases.

Interview summaries corrected by interviewees were used to describe the activities of employees, managers and learning coaches in the various sub-categories of the orientation, learning, and continuation phases of each learning project. An effort was made to increase inter-rater reliability by having two researchers discuss the learning-project descriptions for consistency. Cases were re-analyzed with a focus on employee strategies in preparing, performing and concluding their learning project (in view of our first research question).

Results

Case A. This learning project takes place in an organization referred to as 'Factory', which is characterized by task work. The learning program is conducted by process operators who aim at making the work processes more transparent.

Orientation Phase. Management takes the initiative to start an improvement team, because material wastage is perceived to be excessive. Earlier attempts by management to deal with this problem in a top-down fashion were not successful. A team leader is appointed, who invites a facilitator and seven operators from all five shifts to join on a voluntary basis. The team adopts the problem statement and objectives of their management and decides to focus on clarifying the organization of work processes in the factory. Team members arrange to meet for two hours every week and to work in small groups in between. Commitment from other shift workers is sought by regular two-way communication about improvement activities and other ideas.

Learning Phase. A specific problem-solving method geared to operator use is taken as a guideline to coordinate team learning activities. The facilitator guides the operators through applying this method to their specific problem. Assignments are issued, carried out in subgroups, and evaluated in plenary team sessions. Learning activities include holding a survey among fellow operators, paying a working visit to a similar factory, inviting process experts for a lecture, experimenting with incremental changes to the work process, instructing their own shift members, improvising, and introducing broader changes to shifts. Few optimization efforts are made during the learning project. The problem-solving method is applied in a linear fashion, but it provides ample opportunities for the operators to tune the activities to their own views on work and learning.

Continuation Phase. The operators have gained a lot of experience with a structured problem-solving method, which they can apply in their daily work and in further learning projects. Management has learned that an improvement team brings about more changes and benefits than any of the top-down approaches they have tried before. In that sense, the organizational learning system has been enriched.

Type of Learning Program. This case can be labeled as a well-performed, systematic vertical learning project. The strategy of direct representation of employees in organizing work improvement activities allowed the participants to optimize a regulated learning system.

Case B. This learning project is organized in a night school labeled 'College', which represents individual work. A group of liberal arts teachers carries out a learning program around the theme of "Guiding students who learn independently".

Orientation Phase. School management takes the initiative to have an external advisor hold a learning needs survey among the teachers. Several learning themes emerge from this exercise, one of which is student independent learning. Teachers are asked to join a learning group around this theme on a voluntary basis. A small group starts by discussing the specific outcomes of the survey and translating them into ideas for the learning program. One of the teachers starts having regular meetings with the external advisor in order to inspire the learning set and evaluate its progress. They also use survey results about the college learning facilities and teacher views on their own learning and work situation. School management is very interested in the outcomes of this learning group but leaves it up to the teachers themselves to organize it.
Learning Phase. Coordination of the learning activities rests with the five group members and is largely interest driven. During the project, the external advisor suggests possible learning activities to the group via one member. The teachers start by discussing their own classroom practices on the basis of one of the classes recorded on videotape. In a second meeting, one of the teachers presents his experiences in using the open learning center at a different college. They read and discuss journal articles together. Some group members attend each other’s classes and give feedback to one another. They support each other doing individual classroom experiments with students’ independent learning. Some of the insights gained in the project are used in a newly introduced teaching method. One group session, which turns out to be the final one, is spent listing the consequences of independent student learning to exam regulations. Although the teachers have every freedom to carry on organizing the project, they cannot find a way to make the group activities more concrete and meaningful to their work situation. Hence, the project runs down.

Continuation Phase. Although the project peters out in the end, individual members have experienced new ways of learning together with their colleagues. School management has learned that teachers are willing to organize their own learning projects. Some lessons from the group project have been used for organizational changes. On the other hand, there is also a sense that the project could have produced more concrete output if better arrangements had been made.

Type of Learning Program. This case represents a rather unsystematic liberal learning project, characterized by a lack of coherence in its arrangements among the participants, and a lack of reflection on learning activities as the program is carried out. The group of individual teachers is too loosely organized and does not actively seek opportunities to bring more focus to their joint activities.

Case C. Case C occurs in an organization called ‘Hospital’, where professional work is found. Medical doctors organize a learning project with the specific aim of developing a new medical treatment.

Orientation Phase. A group of medical doctors take the initiative to prepare for the introduction of a new treatment. They invite a nurse and a number of technicians to join the project group. Every individual member’s expertise is needed to make the new treatment a success. The participants study the scarce body of literature about the treatment. They also pay a working visit to a specialized clinic abroad and bring home the material needed to perform the treatment. The hospital management lends financial support to the project group and does not interfere otherwise. The project is considered useful to raise the hospital’s national profile.

Learning Phase. Initially, experimental treatments are performed on sheep. The problems that arise are solved partly by self-study, partly by group evaluation sessions. The treatment is optimized a number of times before it is finally performed on patients. The first results of the new working method are discussed with fellow medics at a special conference and in scientific journals. More experiments gradually lead to standardization of the treatment protocol. Doctors who were not part of the initial project group now learn the new treatment from performing it ‘at the bedside’ with a more experienced colleague. The whole learning program is organized on the basis of continuous adaptation to newly developed insights along the way. However, the participants methodically work their way towards establishing a standardized treatment protocol and use the professional expertise of their fellow medics to this end. After all, they have chosen to work on the cutting edge of medical expertise in their discipline.

Continuation Phase. The participants resume their every-day learning efforts having experienced the benefits of multidisciplinary collaboration during the learning project. Thus, this professional organization has integrated elements of multidisciplinary group learning into its profession-based innovative learning system.

Type of Learning Program. This case can be referred to as a systematic and well-performed external learning project. Besides a strategy of professional innovation, the way in which the doctors develop a new working method displays horizontal characteristics as well, in that they learn constantly from their learning-project experiences and keep adapting the course of the learning program accordingly.

Case D. This learning program takes place in an organizational ‘Consultancy’, characterized by group work. A number of consultants undertake a learning project aimed at applying the concept of the learning organization commercially.

Orientation Phase. The program starts when one of the consultants, after a presentation on ‘The Learning Organization’, is asked by her colleagues to “do something more around this topic”. This is a largely spontaneous initiative. Having established a basic level of commitment, she invites those interested to attend a start-up workshop. She presents some possible ways forward to the members, which are discussed by the group and turned into an optional activity list. All participants decide to work on integrating possible activities into their regular consultancy projects, but this is not really made into a group effort.

Learning Phase. A further plenary meeting is held to discuss the literature on learning organizations and grasp the basic tenets of the concept. Participants also discuss their own viewpoints on the topic and the way they might use it in their own practice. Two of them team up to develop a learning organization questionnaire, which is initially used.
to diagnose their own company. Two others combine forces to reflect on the way in which they have used the concept in a real-life consultancy case. These sub-group activities are next discussed in a plenary session. Individual members are very much in charge of their own learning process and, although they decide to work together in teams for the remainder of the project, in fact the program runs down from this moment on. Most participants report the learning organization concept offers few concrete opportunities for commercial application, even if some of them have succeeded in gaining benefit from their individual activities.

</table>

**CONTINUATION PHASE**
Learning coaches, and managers to pay sufficient attention to these activities. An action-learning project cases were relatively under-addressed. It would also show exactly how important this approach. This would provide answers as to why the orientation, optimization, and continuation phases in some alternative method described in this paper, instead of reinterpreting learning projects conducted without end.

Poell and Van der Krogt (in press) present a number of different models, which can be used to this relevant connections between everyday learning and work improvement efforts and their more systematic learning-organizers in all phases of learning-program creation. Learning coaches and managers should help them organize the losing the intrinsic benefits of informal learning and work improvement efforts. Therefore, employees concerned. However, too much formalization of a learning program may be counter-productive, for there is systematic, throughout the duration of the learning project (which is why optimization should be

Systematically taking into account the everyday learning and work improvement efforts of employees (cf. Table 1). The liberal learning project (case B) and the horizontal learning project (case C), which were performed very systematically, are highly contingent with their contexts of task work and professional work, respectively. The vertical learning project (case A) and the liberal learning project (case D), if conducted less systematically, are also largely contingent with their contexts of individual work and group work, respectively.
