
This study presents a process used to assess the general education component of the undergraduate curriculum, focusing particularly on the components of the methodology that provided the data used to suggesting changes in the program. The study was undertaken at an urban institution with an undergraduate population of 6,000, and involved analysis of graduates' transcripts to examine course sequence and compliance with university policy on course sequence enrollment, analysis of syllabi, a course audit questionnaire set to faculty, development of an academic profile of students, and a survey of faculty and staff. The revised curriculum that was the outcome of the study requires a base of 18 undergraduate credits, including English composition, fundamentals of math and/or intermediate algebra, civilization, and first-year experience. A 48-credit distribution component requires that students take 6 credits in each of six areas: natural sciences, social sciences, arts/media, humanities, multicultural/language studies, and quantitative and computer literacy, plus 12 additional credits as electives. The study notes that optimal use was not made of all the data collected, but suggests that as the program progresses only data needed to make necessary program changes will be collected, and that the process will become better understood. Restructuring the General Studies Program at a Public Urban University: Assessment, Evaluation, and Implementation.

Abstract

The general studies curriculum, which had been in existence at the university since 1982, had never been completely assessed. Faculty and administrative constituencies were calling for the program to be revised; others felt no changes were needed. A multi-method design consisting of transcript analyses, faculty and student surveys, objective testing, and analysis of syllabi was constructed. The processes and problems involved in implementing the methodology are discussed. Examples of how the data were presented to the faculty and staff are given. Also presented is discussion of which procedures produced meaningful data, the processes (and problems) of creating a new curriculum, a comparison of the new and old curricula, and the current stage of implementing the new program.
Introduction

Since the mid to late 1970’s, the general education curriculum in colleges and universities across the United States has become an item of concern for higher education faculty and administrative staff. One reason has been attributed to greater competition for students. This resulted from factors such as the last “baby-boom” students having already become of college age, which caused struggles for survival by public and private institutions of higher education that were established to accommodate them, and an influx of more under-prepared students seeking college admission (Kanter, Gamson, and London, 1997). Also noted is the establishment of an “national agenda” for higher education published in higher education periodicals and spoken of at regional and national conferences (Kanter, et.al. 1997). Added to this was an economic slow-down during the 1980’s which resulted in a “drying up” of the flow of Federal and state funds to public institutions. This led to a greater emphasis being placed on accountability for the products of the funds that were given for higher education (Kanter, et.al. 1997), i.e., the institutions were being held accountable for what their graduates knew and could do.

The above phenomena resulted in questions such as “What should an educated person know?” and “What should a person with a college degree know how to do?” These are partially answered by applied and professional degree granting programs that have specific career-based criteria established by accrediting agencies which are used to assess specific knowledge and abilities. But, they do not address what it means to be an “educated” person--a problem that contains elements of institutional politics. However, it has been pointed (Hutchings, Marchese, and Wright, 1991) that focusing on a common core of knowledge often engages faculty in conversations that span disciplines.

Once there is institutional agreement over the goals of a general education curriculum (which is no mean feat itself!) the problems of assessing and evaluating the program arises. The Differential Coursework Methodology (Ratcliff, 1988) utilizes standardized tests and course-taking practices, as revealed in analysis of graduates’ transcripts, to evaluate student learning among the majors offered by an institution. But the generalizability of the results has been questioned (Pike and Phillippi, 1989). The value of tests like ACT’s COMP and ETS’s Academic Profile over institutionally constructed, “home grown”, tests must be determined, as must the utility of administering a standardized test over using proxy measures, such as, student self-reports (Pike and Phillippi, 1989). Other formative and summative methodologies, either by themselves or in combination, such as, portfolios, focus groups, alumni and employer surveys, and classroom assessments, have been developed and utilized by an array of institutions (Hutchings, Marchese, and Wright, 1991) to address the myriad definitions of general education. Plus, there are other components of a good overall assessment strategy such as assessing the focus of the program, the manageability of the methodology, keeping the process on track, and administrative support (Smith, 1993).

Beyond what is mentioned above, there are special problems associated with urban institutions. Their mission statements typically talk about providing access for under-served populations and serving diverse student populations, but there are disparities within that segment
of institutions, especially in regard to development of programs and facilities, (Kinnick and Ricks, 1990), which reinforces the question of appropriateness of standardized tests.

The current study explicates a process used to assess the general education component of the undergraduate curriculum at an urban university. Emphasis is placed on the components of the methodology that provided data useful for suggesting changes to the program, and the aspects of the process whose data or procedures did not provide viable data.

The institution

The present study was undertaken at an urban institution—urban because we are situated in a community of about 200,000 to 300,000 people in the New York metropolitan area. The undergraduate population hovers around 6,000. Our total population is about 8,000—graduate and undergraduate. This paper discusses what worked and what did not work in our analysis of our general studies curriculum; where we got some useful data, and which parts of the methodology gave us less than useful data. It also describes what we would like to do again, and what we will not do again because, in all likelihood, we will be doing something like this again. It's not a dead issue

One aspect of the project should be noted—there was a deadline of December of 1997 to complete the analysis, a timeline of approximately one year from development to report distribution. The faculty senate wanted the report; the administration wanted the report.

The program that was in existence was comprised of 66 credits:

All college requirements (12 s.h.)
  The Requirement in English Communications (6 s.h.)
  The Requirement in Mathematics (3 s.h.)
  The Requirement in Career Exploration (2 s.h.)
  The Requirement in Computer Usage (1 s.h.)

Core curriculum (12 s.h.)
  Area 1.
    Science (3 s.h.)
    The Science Experience
  Area 2.
    Social Science (3 s.h.)
    Introduction to the Social Sciences
  Area 3.
    Fine, Performing, Creative Arts (3 s.h.)
    The Artistic Experience
  Area 4.
    Humanities (3 s.h.)
    Introduction to the Humanities
Distribution component (30 s.h.)
Area 1 Natural Sciences (6 s.h.)
Area 3. Fine, Performing, Creative Arts (6 s.h.)
Area 4. Humanities (6 s.h.)
Area 5. Communications and Contemporary World (6 s.h.)

Advanced electives (12 s.h.)
200, 300, 400 level courses

Method

Analysis of graduate transcripts

The first component of the analysis looked at graduates’ transcripts by looking backwards at cohorts and analyzing their course sequences. We looked back on seven cohorts from 1990 to 1996. There were two reasons this was performed. The first was to get an idea of the course taking practices within majors to see if clusters of General Studies courses were common within the majors and analyze student performance on some discreet test in accordance with The Differential Coursework Methodology (Ratcliff, 1988).

The second component was to assess compliance with the University policy on course sequence enrollment. The policy states Core Courses and All College Requirement (e.g., composition and math, and introductory natural and social sciences) are to be taken within the first sixty-four credits completed. Because the University is situated in an urban environment, many under-prepared students enroll, as do many who require English as a second language courses. These students were eliminated from the analysis.

Analysis of syllabi

The next phase of the analysis was the analysis of syllabi, which was coordinated by the Dean of Arts and Sciences. Syllabi of faculty teaching General Studies courses were requested by the Dean who then sent them to the chair of a Faculty Senate committee for analysis. The analysis involved each syllabus being scored by three members of the committee—an effort to achieve inter-rater reliability on the general studies content contained in the description(s) of the course requirements. Syllabi were judged for references to critical thinking, writing, reading, oral presentation, computer, and mathematical skills in the tasks required of their students. So if they set it in their goals and objectives and then had that within their homework assignments or in their classroom assignments and the students would be doing these things, they would be getting either a one or a three. So we'd score it as either a zero if there was no reference to it or a three that there was a great deal of reference to these criteria.

Course audit

The course audit was a questionnaire sent to faculty. The instrument contained questions asking the faculty of their agreement with the goals of the general studies curriculum and whether they thought those goals were appropriate and achievable. The respondents were
required to select from five-point scales their degrees of agreement with the statements of the goals.

Academic profile

The desire was to get representative percentages of the “native” students, (those students who started their post-secondary education at our university) who were freshman, sophomores, juniors and seniors to take the test. We offered a $25.00 gift certificate to Barnes and Noble as an incentive to come for the test. Time frames were established and letters sent to students telling them a time had been scheduled for them to come in to take the test. The initial response rate was very poor, even with the incentive (about 25 students responded). Subsequent invitations were sent to all native students on campus; approximately 3000 letters asking students to tell us when they could come for testing—this resulted in a sample of 249 students.

The Academic Profile comes in two forms. A long form, which yields information on each individual student, and a short form, which takes less time to administer but only gives institutional data. This form “cycles” the information among the test booklets so that a sample of test content is given to each student. The samples are later aggregated into an institutional score. The Profile contains an optional writing sample, which we chose to administer. ETS scores the Profile and returns the scores, by class level, obtained on the skills and abilities the instrument tests. The writing sample is generally scored by the institution.

Institutions using the Academic Profile are permitted to select from colleges and universities that have used the Profile, a number of institutions for comparative purposes (those scores are aggregated and comparisons are made to the aggregate scores, not individual institutions). To that end, institutions on the ETS list were selected using information in the IPEDS database, for comparative purposes.

Survey of faculty and staff

A survey questionnaire developed through a joint effort of the Office of the Dean of Arts and Sciences and the Office of Institutional Research. It was mailed in June 1997 to faculty who taught general studies classes in the previous semester. The questionnaire contained five sections. Three sections utilized five-point rating scales (Likert scales), a fourth section scale contained question with three response options, and the last asked questions about respondent characteristics—department, employment status and rank, and general studies courses taught.

Results

Analysis of graduate transcripts

The task of assessing by computer differences among the majors turned out to be a daunting one since many students change their majors during their college career. For example, a student may initially claim a natural science as a major, take an introductory course (or two),
and then change majors to a social science. The student might then apply the introductory major course(s) to the general studies requirement.

It was possible, however, to obtain data about core course and all college requirement (ACR) enrollment activities through computer analysis of transcripts. The records of students who graduated between 1990 and 1996, delineated by class-level (i.e., the first 32 credits counted as their freshman year; 33-64 their sophomore year, etc.) were analyzed to assess the proportion of credits earned within the various general studies areas among the class-levels. The findings demonstrated that in the earlier years students tended to take fewer general studies courses during the first years of their college career. In subsequent years the enrollment policies were more closely adhered to and students were taking more general studies courses. These analyses controlled for the number of students taking remedial and English-as-a-second-language courses.

Analysis of syllabi and course audit

The list of courses and their respective scores on the skills was tabulated. The total score per skill for each syllabus (range of possible scores was 0-9 if the syllabus was read three times—occasionally a syllabus was read more that three times) was entered into one table. (table 1), and percentages of the total possible score, depending on the number of times a syllabus was read, was entered into a second table (table 2).

### Academic profile

The test consisted of two major components. The first, a 36 item multiple choice test; the second a short essay. Scoring of both sections was performed by ETS. A full-scale score was reported for each student, but not a score on each individual general studies skill or ability. A writing level score for each student resulted from the essay. The full-scale score was based on a standardized range of 400-500, with a standardized mean of 450. The institutional subject area scores were aggregated within class levels. These were based on a standardized range of 100-130, with the mean standardized at 115. ETS supplies comparative statistics derived from test results from other institutions that have utilized the instrument. Those results are reported in accordance with the Carnegie Classification conventions: comprehensive colleges and universities, liberal arts colleges, research/doctorate universities, and two-year colleges and technical institutions. Within those categories, data are provided for freshmen, sophomores, and upperclassmen. The descriptive statistics for students were reported along with a 95%
confidence interval so that an estimate of total freshmen, sophomore, junior, and senior scores could be made. ETS advises against comparing scale scores among the separate scales, e.g., not to compare Humanities scores with Social Science scores, but states that comparisons across class levels are appropriate. An example of how a general studies content area, Humanities, was reported, is contained below.

![Figure 7: Humanities](image)

Survey of students

A survey was administered using a randomized block design to a sample of general studies courses during the spring 1997, semester to ascertain the students' impressions of the current general studies program. Three hundred fifteen students completed the questionnaire. The survey questionnaire was made up of five sections. The first asked the students if they thought the program’s goals were relevant and if the goals were achieved. The second section asked about specific goals of specific courses and if the students felt the course achieved the stated goal. The third section asked the students if they agreed with the policies and guidelines of the general studies program. The third section asked the students their opinion of the adequacy of the distribution of general studies credits. The last section asked about overall satisfaction with the program. There were also demographic questions such as total credits earned, total gpa, and academic aspiration of the students. (A copy of the survey instrument is contained in the appendix.)

Results were reported as descriptive statistics (means, standard deviations, medians and modes) of the Likert scales for each item (table 3).

There were also several questions that required categorical responses. Questions such as, "Have you completed the computer as a tool course?" The responses to these questions were reported as SPSS "Frequencies" output.

Survey of faculty and staff

One hundred and eighty-nine questionnaires were mailed, 73 usable responses were received resulting in a response rate of 39% (the questionnaire is contained in the appendix).

The highest level of agreement over what is an appropriate goal is to improve students' ability to communicate clearly. The lowest agreement is with the goal to improve students' ability to ask wisely. In an analogous fashion, the responses to the statement of achievability were reduced and tabulated. The most agreement was obtained over the achievability of offering opportunities to achieve an awareness of social problems and structure.

There was general faculty agreement that remedial reading and writing should be completed before the core courses are taken; there should be continuous involvement in the College's writing program until completion of Fundamentals of Communications II is completed; and, that all general studies courses should require reading and writing. The highest level of agreement was with the policy of requiring reading. The lowest level of agreement was with requiring completion of all ACRs and 35 general studies credits before declaration of a major.

Most respondents felt the 12 credits of core and 12 credits of advanced elective requirements were sufficient. They also felt the 30 credit distribution and 66 total credit requirement were sufficient, and that the three credit math and six credit English requirements were enough.

There was a section overall asking about overall satisfaction with the program. The responses did not reflect strong agreement or disagreement with statement that the program is meeting it goals or needs revision. But there was general agreement that the program was providing a good liberal arts and sciences education and was meeting its goals. There was general disagreement with the statement that the program did not need revision. However neither case reflects a majority opinion.

The last section asked information about the respondents—their employment status, department, years of employment, and the category(ies) of general studies courses taught. Most of the respondents were full professors. The average amount of time at the University was 18 years (median 20; tri-modal at 1 year, 25 years, and 30 years; the distribution was negatively skewed with a 36 year range—minimum 1 year, maximum 37 years); the most highly represented department was English (13 respondents). Half of the respondents have taught an ACR course, 60% had taught core courses, 80% taught distribution courses, 70% taught advanced elective courses.

Administrative analysis
This phase of the study was terminated due to the confounding characteristics of the number of courses listed as general studies area courses and the habit of substituting courses when students change majors. This problem is similar to the one encountered in the transcript analysis.

Discussion

The project produced a great deal of useful information, and several components required more time than was allocated and had to be abandoned. The transcript analysis and the administrative analysis are the instances in which this was the case.

Course audit and analysis of syllabi

The course audit provided some interesting data about how general studies courses were addressing, or failing to address, the University's general studies goals. A problem associated with this phase of the analysis was that a goal may have been addressed in the actual activities of the course, but not presented in the syllabus, or vice versa. For example, a syllabus may not state that students are required to submit a paper that has been created with the use of a computer word-processing program, but the faculty member assigning the project requires the paper to be produced in that fashion. Or, the degree to which critical thinking is required within the context of the class-work and assignments cannot be stated in the body of a syllabus.

Although syllabi have been requested each semester, one hundred percent compliance has been a problem. Plus, adjunct instructors taught about 30% of the general studies classes and reaching them to obtain their syllabi has been a problem historically. A new time frame is being enacted within which the request for syllabi will go to faculty in the beginning of the semester, rather than later. It was felt that issuing the request during the middle of the semester caused faculty to have to reprint syllabi, but in the beginning the copies in-hand. This is compounded by the fact that the University's culture is unaccustomed to assessment. As we move forward with our assessment initiatives, this problem should be eliminated.

Transcript analysis

To do a transcript analysis is a time intensive project necessitating, at some level, individual analyses of paper copies because decisions concerning course applicability are required. Because of this, this component had to be abandoned. Would we do this again if time permitted? We most likely would. Especially utilizing something like the Academic Profile or a "home grown" objective test. Valuable information can be obtained via cluster analysis, discriminant analysis, or other analytic means, be they quantitative or qualitative, to discern the course taking practices within the majors. As a matter of fact, a new general studies curriculum has been proposed incorporating an assessment methodology consisting of an instrument developed "in house".

Academic Profile
There are advantages and disadvantages to using a standardized test of general education. Among the advantages are the ability to compare your students’ results to students from other institutions who have taken the test; you get the product of the expertise of a sophisticated staff of test developers; and, you do not have to score the results. But, the ability to compare your students with those at other institutions results in a time consuming, tedious task, especially in selecting institutions with which to compare yourself. For the present analysis, selecting comparable “sister” institutions from the list provided by ETS required searching the National Center for Education Statistics database of IPEDS (Integrated Post-secondary Education Data Survey) data for qualities that matched our institution’s. For example, Carnegie classification, control, student demographics, educational and general (E. and G.) expenditures, and campus location all had to be considered in the process.

Furthermore, in using a standardized test, you cannot be sure the test has been constructed to weight the various components of general education in the same proportions as your curriculum. For example, the test may place a great deal of emphasis on western civilization in the test of humanities, whereas your curriculum places more emphasis on the international components of world history.

Survey of students

This information can be helpful in understanding the students’ feelings about general education, their impressions of the way the content is being delivered, and their overall satisfaction with the program. Just as freshman surveys can identify changes in incoming students, this type of information can alert you changes in student academic goals.

Survey of faculty and staff

The importance of this is similar to the importance associated with student satisfaction with the program. Through the use of clear statements of program goals and items calling for perceptions of goal attainment can provide an understanding of the effectiveness of the program and timing of necessary program changes. If this survey is performed on a regular basis, major changes should not be called for because the curriculum will continuously be adjusted to conform to the desires of the students and faculty/staff, as per the results of the surveys.

Major problems experienced in carrying out this phase of the analysis had to do with timing and communication, which led to the survey being administered twice and data being sent to more than one place. The survey was initially administered in the latter part of the spring semester, when faculty members were preparing for finals or grading papers. Plus, the initial survey was carried out through the Dean’s office, which may have precipitated reticence to comply on the part of some faculty. It was felt, at the end of the semester, that a better response rate was obtainable by mailing the surveys during the summer to faculty homes with a stamped self-addressed envelope returnable to the Director of Institutional Research. The thought did not occur to the researchers that some faculty might be away and unable to respond, or that others who had previously responded would not respond again, even though they were asked to do so in the cover letter.
Revising the general studies curriculum

In December, 1997, the data were submitted to the Faculty Senate's General Studies Coordinating Committee. It is the purview of this committee to recommend changes to the general studies curriculum. Their charge, at this juncture, was to analyze and prioritize the results. After approximately one year of meetings, with one notable meeting that lasted thirteen hours, a revised general studies program was presented to the Senate, in February, 1999. After minor discussion, the program was voted on and accepted.

The upper levels of the University's administration also had an interest in the curriculum, and before the program could proceed to implementation the Senate and Administration Coordinating Committee (commonly referred to on campus as "SACC") had to approve it, which they finally did in November, 1999.

The requirements of the old and new programs are summarized below:

The Old Program: 66 credits

All College Requirements: 12 Credits
- English Communications - 6 credits
- Math - 3 credits
- Career Dimensions - 2 credits
- Computer as a tool - 1 credit

Core Courses: 12 Credits
- Area 1: Science Experience - 3 credits
- Area 2: Intro. to the Social Sciences - 3 credits
- Area 3: The Artistic Experience - 3 credits
- Area 4: Intro. to the Humanities - 3 credits

Distribution Courses: 30 Credits-- 6 credits in each of the "Areas"
- Area 1 Natural Sciences
- Area 2 Social Sciences
- Area 3 Fine Arts
- Area 4 Humanities
- Area 5A Communications (3 credits)
- Area 5B Contemporary World (3 credits)

Advanced Electives: 12 Credits in 200-400 level Arts and Science courses

The New Program:

All Undergraduate Requirements: 18 credits
- English Composition I & II - 6 credits
- Fundamentals of Math, Int. Algebra, or higher - 3 credits
- CAT (Foundations) - 0 credits
Civilizations I & II -6 credits
First Year Experience -3 credits

No Core Requirements

Distribution Component: 48 credits
6 Areas requiring students to take 6 credits per area and 12 additional credits earned through electives in Areas A-E
Area A Natural Sciences
Area B Social Sciences
  Economics/Poli. Sci. -3 credits.
  Sociology/Psychology -3 credits
Area C Arts & Media
Area D Humanities
Area E Multicultural and Language studies
Area F Quantitative & Computer Literacy

Along with the changes in the course distribution, the new program contains an evaluation component that calls for the establishment of a special committee to oversee the process, the General Studies Outcomes and Evaluation Committee. This committee is made up of one representative from each of the distribution areas, a representative from the Office of the Dean of Arts and Sciences, and the Director of Institutional Research. It is responsible for developing a final outcomes statement; developing, selecting and administering appropriate evaluation measures; analyzing the data; recommending changes to the Program; and refining the evaluation model. Students are to be evaluated on basic skills and competencies using a number of measurement instruments upon entry into the University, and on specific outcomes that have been established by the General Studies Coordinating Committee. Data from a basic skills test that has been in use for several years as a placement test will be part of the process along with a writing sample and a test of critical thinking--the Watson Glaser Test. The evaluation will include alternate forms of these instruments, one of which, to evaluate the basic skills and knowledge, is to be developed by the committee. In this way, both formative and summative measures of cohorts and classes, by assessing cross-sections, will be taken annually.

Analyses of student transcripts, graduate surveys, the University's Master Course list, and faculty and student satisfaction surveys are also included as part of the overall plan.

A set of criteria for all classes in the program to meet has been constructed by another new standing committee on course review. The statement from the program proposal is below:

**CRITERIA FOR GENERAL STUDIES COURSES**

The General Studies Program emphasizes the knowledge, skills, and habits of thought that lead to the development of intellect, creativity, breadth of view, and imagination. All General Studies courses must demonstrate the ways in which they further the goals of the program as they introduce central topics in a
discipline or interdisciplinary program. Each course must include the following:

- **Reading.** Students who can read with comprehension and critical alertness can possess the intellectual freedom and self-reliance necessary for the pursuit of excellence. All courses must assign reading in appropriate texts such as textbooks and journal articles.

- **Writing.** If General Studies is to accomplish anything, it must foster in each course the ability of students to express themselves in writing. Those who can think and write clearly about the ideas presented in General Studies possess the basic tools of education. They can describe ideas, develop them, understand them, and communicate them to others Assignments requiring writing must go beyond in-class examinations.

In addition, each General Studies course must include at least two of the following:

- **Critical thinking/creativity.** Assignments and/or in-class exercises that require students to solve problems or produce creative work using techniques appropriate to the discipline.

- **Information gathering and literacy.** Assignments and/or in-class exercises that require students to demonstrate information literacy skills such as using print, traditional, or on-line resources to gather and analyze information.

- **Quantitative and Computer Literacy.** Assignments and/or in-class exercises that require students to use data presented in tabular, graphical or other quantitative forms in order to evaluate information critically.

Seven other working committees have been established to oversee the creation and implementation of the new program:

- The First Year Experience Committee to develop the First Year Experience course, which is described as "...a seminar based on research or other intellectual themes selected by the instructor. The emphasis is on student participation with the goal of sharpening the students' critical reasoning, written and public speaking skills."

- The Writing Intensive Committee to oversee the writing component of the program.

- The Registration and Advisement Committee to ensure courses are taken in the proper order.
• A committee to oversee two courses, Civilizations I and II, whose goals are to have students "...develop an awareness and understanding of the influence of the past on the present and an appreciation of the achievements of the collective human experience."

• A committee to assist faculty teaching General Studies courses in the development of teaching strategies.

• A Course Review committee to assist in the development of course syllabi and to ensure classes are meeting the General Studies course requirements.

• A Quantitative and Computer Literacy committee to oversee the courses responsible for that component of the program.

The program is scheduled to be enacted in the Fall 2001 semester.

Conclusion

Optimal use was not made of all the data collected. This is partially attributable to the time frame provided to assess the program and to the perceived mixture of purposes of the general studies program. The data, too, varied in purpose. The surveys of students, faculty, and staff helped identify the definition of general education and assisted in formulating policies in the administration of the program. Content tests provided an understanding of the breadth and depth of material learned by students, and transcript analysis can resulted in an awareness of the effectiveness of the program's policies and implementation. Transcript analysis can aid in identifying programs and course-taking practices that do better at delivering the general education curriculum, but this type of analysis can be time and labor intensive. However, utilizing this type of multi-faceted analysis will give a complete picture of the effectiveness of the program, and the satisfaction with it maintained by the faculty and staff. Add to this an administrative analysis comprised of use of funds apportioned to support, monitor, and improve the program and a complete planning and assessment package can be developed.

One aspect not included in the assessment methodology, which was brought up afterwards, is eliminating fear and developing trust on the part of all concerned. The establishment of the Faculty Development Committee is an effort at addressing this issue. A suggestion of keeping the activities public and the rationale for the activities had been voiced and is currently being explored as the implementation progresses. The highly politicized environment created by discussing a general education program is evidenced by the time elapsed from the presentation of the initial research findings to the initiation of the implementation of the program. The duration of one of the meetings itself, 13 hours, demonstrates the weight ascribed
to this topic by the concerned constituencies. The success of the program will be a function not only of the student learning outcomes but by its longevity, as well.

The present assessment was the first iteration of a university-wide evaluation process. Not all of the data were perfect, nor were all of the data used to their utmost. However, as the saying goes "you have to start somewhere". The construction of a revised general studies program, one that includes assessment as an integral part, will provide better data that will be used more fully once the program is enacted. In time, as the program progresses, only data that are needed to make necessary program changes will be collected, and the process will become less threatening to all personnel involved.
