Relationship Features and Adolescents' Experience of Closeness in Relationships with Mothers, Fathers, and Friends.

2001-04-00

Reports - Research (143) -- Speeches/Meeting Papers (150)

Adolescent Attitudes; Adolescent Development; *Adolescents; Age Differences; Attachment Behavior; Comparative Analysis; Emotional Development; Emotional Response; *Fathers; *Friendship; *Intimacy; *Mothers; *Parent Child Relationship; Peer Relationship; Predictor Variables

*Closeness; Relationship Quality

Noting that during adolescence the importance of feeling intimate or close to a relationship partner (mothers, fathers, or friends) increases and that closeness to parents is associated with positive adolescent outcomes, this study examined how features of adolescent relationships are related to adolescents' experience of subjective closeness in relationships with mothers, fathers, and same-sex friends. Participating in the study were 64 seventh graders and 43 tenth graders from a rural school. All participants received parental consent and a stipend of $5.00 for completing a questionnaire regarding relationship features. Five relationship features were assessed: (1) frequency of interaction; (2) diversity of activities; (3) strength of influence; (4) positive and negative emotions; and (5) subjective closeness. Results of regression analyses indicated that relationship features predicted more variability in subjective closeness for tenth graders than for seventh graders, with emotional tone and the quality of interactions appearing to be salient relationship features. Relationship features predicted more variability in relationships with fathers than in relationships with mothers or friends for both age groups. Seventh graders' closeness to fathers was predicted by more frequent interaction with them and a larger diversity of activities. Tenth graders' closeness to fathers was predicted by experiencing positive emotions in the relationship. Seventh graders' closeness to mothers was predicted by greater frequency of interaction. Tenth graders' closeness to mothers was predicted by engaging in more diverse activities with them. Closeness in relationships with friends was predicted by the experience of positive emotions in this relationship for both age groups. (KB)
Introduction

During adolescence increased importance is attached to feeling intimate with or close to a relationship partner (e.g., mother, father, or friend). Intimacy is often thought of as a prototypical feature of adolescents’ friendships (Savin-Williams & Berndt, 1990) whereas the subjective experience of feeling close has long been considered a hallmark of parent-child relationships (Kelley et al., 1983). Moreover, the experience of feeling close to mothers and fathers is associated with outcomes for adolescents in a number of salient domains (e.g., enhanced academic performance, and lower levels of problem behavior and chemical use; Repinski & Zook 2000; Zook & Repinski, 2000). Consequently, it is important to understand the experiences and relationship features that are associated with adolescents’ experience of closeness in relationships with mothers, fathers, and friends.

Some have suggested that the basis for feeling close to a relationship partner during adolescence lies in emotional sharing and the disclosure of personal thoughts and feelings (Buhrmester & Furman 1987). On the other hand, other researchers have proposed that shared activities and time spent together fosters the experience of feeling close to a relationship partner (Camarena, Sarigiani, & Petersen, 1990). In light of these issues, the present study sought to examine how five features of adolescents’ relationships (i.e., frequency of interaction, diversity of activities, strength of influence, the experience of positive emotions, and the experience of negative emotions) are related to adolescents’ experience of subjective closeness in relationships with mothers, fathers, and same-sex friends. We sought to address two questions: First, are there grade differences in associations between the relationship features and subjective closeness? Second, are there relationship partner differences in associations between the relationship features and subjective closeness?

Method

Participants

- 64 seventh grade adolescents (35 male, 29 female) from a rural school
- 43 tenth grade adolescents (15 male, 28 female) from a rural school

Procedure

- All participants received parental consent and were given a stipend of $5.00.
- Self-report questionnaires regarding relationship features with mothers, fathers, and same-sex best friends were collected from seventh- and tenth- grade adolescents.

Measures

- Frequency of Interaction was assessed using adolescents’ reports of the average amount of time per day spent alone with each relationship partner during the past week.
Diversity of Activities was measured using adolescents' reports of whether or not they did 36 common activities (e.g. "Played sports" and "Did laundry") alone with each relationship partner during the past week.

Strength of Influence was assessed with adolescents' ratings (on a 5-point Likert scale) of the degree to which each relationship partner influenced 45 domains of their lives (e.g. "My beliefs and morals" and "What I do in my free time").

The Experience of Positive and Negative Emotions with each relationship partner was measured using adolescents' reports on the frequency during the past week with which they experienced six positive emotions (e.g. "satisfied" and "excited") and 13 negative emotions (e.g. "frustrated" and "disappointed") on a scale of 1 (never or almost never) to 5 (almost always).

Subjective Closeness was assessed by summing adolescents' responses to two questions regarding their feelings of closeness to each relationship partner on a scale of 1 (not close at all) to 5 (very close):
- Compared to all your other relationships (friends, siblings, etc.), how would you describe your relationships with your mother?
- Compared to what you know about other teenagers' relationships with their mothers, how would you describe your relationship with your mother?

Results

Plan of Analysis

Descriptive statistics for the study variables are reported in Table 1. Bivariate correlations between relationship features and adolescents' reports of subjective closeness, by relationship partner (i.e., mother, father, friend) and by grade, are reported in Table 2. The relationship features that were found to correlate significantly with reports of subjective closeness were then entered into regression equations, by relationship partner and by grade, with subjective closeness as the criterion variable (see Table 3).

Correlates of Subjective Closeness (See Table 2)

Seventh-graders' reports

- Subjective closeness in relationships with mothers was positively correlated with frequency of interactions with mothers ($r = .37, p \leq .01$), the experience of positive emotions in relationships with mothers ($r = .28, p \leq .05$), and negatively correlated with the experience of negative emotions in relationships with mothers ($r = -.30, p \leq .05$).

- Subjective closeness in relationships with fathers was positively correlated with frequency of interaction with fathers ($r = .50, p \leq .01$), diversity of activities with fathers ($r = .52, p \leq .01$), as well as strength of influence of fathers ($r = .55, p \leq .01$). Further, subjective closeness was positively correlated with the experience of positive emotions in relationships with fathers ($r = .50, p \leq .01$), and negatively correlated with the experience of negative emotions in relationships with fathers ($r = -.48, p \leq .01$).
Subjective closeness in relationships with friends was positively correlated with diversity of activities with friends ($r = .25, p \leq .05$), strength of influence of friends ($r = .33, p \leq .05$), and the experience of positive emotions in relationships with friends ($r = .35, p \leq .01$).

Tenth-graders' reports

Subjective closeness was positively correlated with frequency of interactions with mothers ($r = .35, p \leq .05$), diversity of activities with mothers ($r = .60, p \leq .01$), as well as strength of influence of mothers ($r = .50, p \leq .01$). Further, subjective closeness was positively correlated with the experience of positive emotions in relationships with mothers ($r = .56, p \leq .01$) and negatively correlated with the experience of negative emotions in relationships with mothers ($r = -.39, p \leq .01$).

Subjective closeness was positively correlated with frequency of interactions with fathers ($r = .53, p \leq .01$), diversity of activities with fathers ($r = .70, p \leq .01$), as well as strength of influence of fathers ($r = .59, p \leq .01$). In addition, subjective closeness was positively correlated with the experience of positive emotions in relationships with fathers ($r = .75, p \leq .01$) and negatively correlated with the experience of negative emotions in relationships with fathers ($r = -.48, p \leq .01$).

Subjective closeness was positively correlated with frequency of interactions with friends ($r = .35, p \leq .05$), diversity of activities with friends ($r = .48, p \leq .01$), as well as strength of influence of friends ($r = .40, p \leq .01$). In addition, subjective closeness was positively correlated with the experience of positive emotions in relationships with friends ($r = .49, p \leq .01$).

Regression Results Predicting Subjective Closeness (See Table 3)

Seventh-graders' reports

Features of relationships with mothers predicted 18% (adjusted $R^2$) of the variance in adolescents' reports of subjective closeness ($F (3,59) = 5.50, p \leq .01$).

- Frequency of interaction with mothers made a significant ($\beta = .32, p \leq .01$) contribution to this prediction.

Features of relationships with fathers predicted 41% (adjusted $R^2$) of the variance in adolescents' reports of subjective closeness ($F (5,46) = 8.13, p \leq .001$).

- At the level of a statistically significant trend, frequency of interaction ($\beta = .25, p \leq .10$) and diversity of activities ($\beta = .24, p \leq .10$) made contributions to this prediction.

Features of relationships with friends predicted 11% (adjusted $R^2$) of the variance in adolescents' reports of subjective closeness ($F (3,54) = 3.35, p \leq .05$).

- At the level of a statistically significant trend, the experience of positive emotions in relationships with friends ($\beta = .23, p \leq .10$) made a contribution to this prediction.
Tenth-graders' reports

- Features of relationships with mothers predicted 36% (adjusted $R^2$) of the variance in adolescents' reports of subjective closeness ($F(5,35) = 5.43, p \leq .001$).
  - Diversity of activities ($\beta = .34, p \leq .05$) with mothers made a significant contribution to this prediction.

- Features of relationships with fathers predicted 67% (adjusted $R^2$) of the variance in adolescents' reports of subjective closeness ($F(5,32) = 15.67, p \leq .001$).
  - The experience of positive emotions in relationships with fathers ($\beta = .48, p \leq .001$) emerged as a highly significant predictor.

- Features of relationships with friends predicted 29% (adjusted $R^2$) of the variance in adolescents' reports of subjective closeness ($F(4,35) = 4.93, p \leq .01$).
  - The experience of positive emotions in relationships with friends ($\beta = .31, p \leq .05$) made a significant contribution to this prediction.

**Discussion**

Are there grade differences in associations between the relationship features and subjective closeness?

- Relationship features predicted more variability in subjective closeness for adolescents in tenth grade. The emotional tone and the quality of interactions in older adolescents' relationships appear to be salient relationship features. In contrast, other relationship features not assessed in the current study predict the experience of closeness for seventh graders. This difference may be due to the increasingly differentiated nature of social relationships as adolescents mature (Collins & Repinski, 1994).

Are there relationship partner differences in associations between the relationship features and subjective closeness?

- Relationship features predicted more variability in relationships with fathers than in relationships with mothers or friends for both seventh- and tenth-graders.

**Fathers**

- Grade differences were evident in the predictors of adolescents' reports of subjective closeness in relationships with fathers.
  - Seventh graders' reports of more frequent interaction with fathers and a larger diversity of activities with fathers predicted subjective closeness.
  - Tenth graders' reports of subjective closeness in relationships with fathers were predicted by the experience of positive emotions in this relationship.
Mothers

- Adolescents’ reports of subjective closeness in relationships with mothers were predicted by the interactional features of the relationship.

- Seventh graders’ reports of subjective closeness were predicted by greater frequency of interaction.

- Tenth graders’ reports of subjective closeness were predicted by adolescents’ reports of engaging in more diverse activities alone with mothers.

Friends

- Reports of subjective closeness in relationships with friends was predicted by adolescents’ reports of the experience of positive emotions in this relationship for both seventh- and tenth-graders.

I. DOCUMENT IDENTIFICATION:

Title: Relationship Features and Adolescents' Experience of Closeness in Relationships with Mothers, Fathers, and Friends

Author(s): D. Repinski & J. B. Zook

Corporate Source: 

Publication Date: April 2001

II. REPRODUCTION RELEASE:

In order to disseminate as widely as possible timely and significant materials of interest to the educational community, documents announced in the monthly abstract journal of the ERIC system, Resources in Education (RIE), are usually made available to users in microfiche, reproduced paper copy, and electronic media, and sold through the ERIC Document Reproduction Service (EDRS). Credit is given to the source of each document, and, if reproduction release is granted, one of the following notices is affixed to the document.

If permission is granted to reproduce and disseminate the identified document, please CHECK ONE of the following three options and sign at the bottom of the page.

The sample sticker shown below will be affixed to all Level 1 documents

PERMISSION TO REPRODUCE AND DISSEMINATE THIS MATERIAL HAS BEEN GRANTED BY

Sample

TO THE EDUCATIONAL RESOURCES INFORMATION CENTER (ERIC)

Level 1

Check here for Level 1 release, permitting reproduction and dissemination in microfiche or other ERIC archival media (e.g., electronic) and paper copy.

The sample sticker shown below will be affixed to all Level 2A documents

PERMISSION TO REPRODUCE AND DISSEMINATE THIS MATERIAL IN MICROFICHE, AND IN ELECTRONIC MEDIA FOR ERIC COLLECTION SUBSCRIBERS ONLY, HAS BEEN GRANTED BY

Sample

TO THE EDUCATIONAL RESOURCES INFORMATION CENTER (ERIC)

Level 2A

Check here for Level 2A release, permitting reproduction and dissemination in microfiche and in electronic media for ERIC archival collection subscribers only.

The sample sticker shown below will be affixed to all Level 2B documents

PERMISSION TO REPRODUCE AND DISSEMINATE THIS MATERIAL IN MICROFICHE ONLY HAS BEEN GRANTED BY

Sample

TO THE EDUCATIONAL RESOURCES INFORMATION CENTER (ERIC)

Level 2B

Check here for Level 2B release, permitting reproduction and dissemination in microfiche only.

Documents will be processed as indicated provided reproduction quality permits.

If permission to reproduce is granted, but no box is checked, documents will be processed at Level 1.

I hereby grant to the Educational Resources Information Center (ERIC) nonexclusive permission to reproduce and disseminate this document as indicated above. Reproduction from the ERIC microfiche or electronic media by persons other than ERIC employees and its system contractors requires permission from the copyright holder. Exception is made for non-profit reproduction by libraries and other service agencies to satisfy information needs of educators in response to discrete inquiries.

April 17, 2001

Dear Colleague:

It has come to our attention that you will be giving a presentation at the 2001 Biennial Meeting of the Society for Research in Child Development to be held in Minneapolis, Minnesota, on April 19-22, 2001. We would like you to consider submitting your presentation, or any other recently written education-related papers or reports, for possible inclusion in the ERIC database.

As you may know, ERIC (the Educational Resources Information Center) is a federally sponsored information system for the field of education. Its main product is the ERIC database, the world's largest source of education information. The Clearinghouse on Elementary and Early Childhood Education is one of 16 subject-specialized clearinghouses making up the ERIC system. We collect and disseminate information relating to all aspects of children's development, care, and education.

Your paper should be at least 8 pages long and not published elsewhere at the time of submission. Announcement in ERIC does not prevent you from publishing your paper elsewhere because you still retain copyright. The reproduction release is simply a tracking device for us to know the level of availability you want for your material. Your paper will be reviewed, and we will let you know within 6 weeks if it has been accepted.

Please sign the reproduction release on the back of this letter and return it with an abstract and two copies of your presentation to Booth #20, or mail it to ERIC/EECE. If you have any questions, please contact me by phone at (217) 333-1386 or by email at ksmith5@uiuc.edu. I look forward to receiving your paper.

Best wishes,

Karen E. Smith
Assistant Director
