This document contains 127 papers and innovative sessions and three poster sessions presented at a conference on human resource development (HRD). A program overview, author index, keyword index, and a CD-ROM version of the document are also included. The papers are grouped by the conference's 44 symposiums, which were devoted to the following topics: action learning; integrating university and corporate learning with work; HRD in Asia; distance learning; HRD in Latin America; trust in organizations; global team development; coaching and knowledge transfer; ethics and integrity in HRD; organization values; issues in evaluation; global knowledge transfer issues; leadership development; transfer of learning; HRD theory;
organizational development; the role of HRD in women's career development; knowledge management and human capital; organizational change; university programs; theory building; human resource management issues; workplace learning; managerial performance issues; improving learning with technology; professional development; informal learning; emotions and behavior in the workplace; evaluation in HRD; organizational enhancement; workplace learning issues; managing the HRD function; career development issues; research issues in HRD; adult learning; learning organizations; measurement and research tools; assessment and evaluation modeling; issues in training; workplace issues in human resources; executive and management development; HRD and small manufacturers; motivation for improving performance; and redefining HRD. Most papers include substantial bibliographies. (MN)

### From the Editor

Call for Papers – AHRD 2002 Conference  
AHRD 2001 Conference Overview

### Conference Papers

#### Symposium 1: Action Learning

**Action Learning: Case Studies of Most Valued Learning and Application**

*Suzanne D. Butterfield*

1-1

**Mapping Group Dynamics in an Action Learning Experience: The Global Team Process Questionnaire (GTPQ)**

*Robert L. Dilworth*

1-2

**Comparing the Learner's and Educator's Perspective on Conditions that Foster Transformative Learning in Action Learning Programs**

*Judy O'Neill and Sharon Lamm*

1-3

#### Symposium 2: Integrating University and Corporate Learning with Work

**Workplace Application of HRD Concepts as Perceived by Non-Traditional Adult Students and their Workplace Supervisors**

*Kit Brooks, Dale E. Thompson, and Elizabeth S. Lizarraga*

2-1

**Tactical Management of Power: The Practical Work of Negotiating Stakeholder Interests in Planning Education Programs in A Corporate Context**

*Christie Knittel Mabry and Arthur L. Wilson*

2-2

**Understanding the Experience of College Graduates During their First Year of Employment**

*Janet L. Polach*

2-3

#### Symposium 3: HRD in Asia

**The Experience of HRD Professionals Participating in Continuing Professional Development in Taiwan**

*Yu-Shu (Jason) Chen*

3-1

**What Is It Like to Be A Taiwanese HR Practitioner Performing HRD Tasks?**

*Ya-Hui (Bella) Lien and Gary N. McLean*

3-2

**A Study of Human Resource Development in Indigenous Firms and Multi-National Corporations in East and Southeast Asia**

*Kenneth R. Bartlett, John J. Lawler, Johnseok Bae, Shyh-Jer Chen, and Tai Wai David Wan*

3-3

#### Symposium 4: Distance Learning

**An Exploration of Perceived Differences in Teaching Roles Between On-Site and On-Line Instruction**

*James J. Kirk*

4-1

**Factors Affecting Student Completion in a Distance Learning Mediated HRD Baccalaureate Program**

*Hui-Chin Chu and Barbara E. Hinton*

4-2

**Experiences of Web-Based Instruction Among African-American Students Enrolled in Training and Development Graduate Courses**

*Saundra Wall Williams*

4-3
Symposium 5: HRD in Latin America
Looking at the Literature on Workplace Democracy in Latin America: Factors in Favor and Against it ............................ 5-1
Max U. Montesino

Toward a New HRD Organization Model .................................................................................................................. 5-2
Jules K. Beck

Differences in Priority For Competencies Trained Between U.S. and Mexican Trainers .............................................. 5-3
Larry M. Dooley, Kenneth E. Paprock, In-Sun Shim, and Elsa Gonzalez Y Gonzalez

Symposium 6: Trust in Organizations
Organizational Trust: An Orientation for the HRD Practitioner .................................................................................. 6-1
Christina L. Lafferty and Brad D. Lafferty

A Conceptualization of Interpersonal Trust in the Workplace ...................................................................................... 6-2
Sandra L. Williams

Organizational Trust and Attachment to an Immediate Leader: A Pilot Study ............................................................. 6-3
Colleen E. Duffy, Christina L. Lafferty, and Brad D. Lafferty

The Importance of Individualism and Collectivism as they relate to Interpersonal Trust ........................................... 6-4
Ghazala Ovaice

Innovative Session 1
Performance on Multiple Levels: Seeing the Forest and the Trees ............................................................................ 1-1
Susan Reynolds Fisher, Darren Short, and Catherine M. Sleezer

Symposium 7: Global Team Development
Virtual Executives: A Paradox with Implications for Development ............................................................................. 7-1
Andrea Hornett

Team Development and Group Processes of Virtual Learning Teams ............................................................................. 7-2
Scott D. Johnson, Jared V. Berrett, Chanidprapa Suriya, Seung Won Yoon, and Jason La Fleur

Developing a Consulting Tool to Measure Process Change on Global Teams: The Global Team Process Questionnaire .................................................................................................................. 7-3
John W. Bing

Symposium 8: Coaching and Knowledge Transfer
The Role of the Learning Coach in Action Learning .................................................................................................. 8-1
Judy O'Neil

The Impact of the Dimensions of the Learning Organization on the Transfer of Tacit Knowledge Process and Performance Improvement ................................................................. 8-2
Miguel Hernandez

The Relationship between Distance Coaching and the Transfer of Training ............................................................... 8-3
Libin Wang and Tim L. Wending

Symposium 9: Ethics and Integrity in HRD
Redefining Human Resource Development: An Integration of the Learning, Performance, and Spirituality of Work Perspectives ........................................................................................................... 9-1
Reid A. Bates, Timothy G. Hatcher, Elwood F. Holton III, and Neal Chałofsky

Codes of Ethics and Enforcement of Ethical Conduct: A Review of other Organizations and Implications for AHRD ......................................................................................................................................... 9-2
Janet Z. Burns, Darlene Russ-Eft, and Howell F. Wright

The Role of Codes of Ethics in the Future of Human Resource Development .......................................................... 9-3
Wendy E. A. Ruona and A. Carol Rusaw
Symposium 10: Organization Values
Understanding the Work Beliefs of Nonprofit Executives through Organizational Stories .......... 10-1
Ava S. Wilensky and Carol D. Hansen
Work-Related Values of Managers and Subordinates in Manufacturing Companies in Germany, Georgia, Kazakhstan, the Kyrgyz Republic, Russia, and the U.S. 10-2
K. Peter Kuchinke and Alexander Arichvili
Valuing the Employment Brand: Attracting Talent That Fits 10-3
Diane M. Bergeron

Symposium 11: Issues in Evaluation
Evaluation of the Method of Modeling: A Case Study of the Finnish Steel Industry .......... 11-1
Ville Nurmi
Doris B. Collins
Redefining Performance: Productivity and Return on Investment in Physical Therapy .......... 11-3
Scott S. Harp

Symposium 12: Global Knowledge Transfer Issues
Indigenizing Knowledge Transfer .......... 12-1
Gary N. McLean
Baiyin Yang and De Zhang
Enhancing Commitment and Overcoming the Knowing-Doing Gap: A Case Study at the Technikon Northern Gauteng (TNG) in South Africa .......... 12-3
Hilda Martens and Jan Verhagen

Innovative Session 2
Barbara J. Daley, Vivian W. Mott, Ruth Craven, and Judith M. Ottoson

Symposium 13: Leadership Development
Organizational Performance: The Future Focus of Leadership Development Programs .......... 13-1
Doris B. Collins
Hidden Dimension of Leadership Success: Implications for Building Effective Leaders 13-2
Anne Elizabeth Khoury
A Study of Leadership Roles, Styles, Delegation and Qualities of Indian CEO’s .......... 13-3
T. V. Rao, Raju Rao, and Soumya Dixit

Symposium 14: Transfer of Learning
The Influence of the Implementation of a Transfer Management Intervention on Transfer of Training .......... 14-1
Patricia R. Saylor and Marijke T. Kehrhahn
Learning Strategies: A Key to Training Effectiveness 14-2
Paula Willyard and Gary J. Conti
An Examination of Learning Transfer System Characteristics Across Organizational Settings .......... 14-3
Elwood F. Holton III, Hsin-Chih Chen, and Sharon S. Naquin
Symposium 15: HRD Theory
Wendy E.A. Ruona
Theorising Human Resource Development ................................................................. 15-2
Jim McGoldrick, Jim Stewart, and Sandra Watson
Human Resource Development as a Factor in the Inevitable Move to Globalization ................. 15-3
Gary N. McLean

Symposium 16: Organization Development
A Study of Gender Management Preferences as Related to Predicted Organizational Management Paradigms for the Twenty-First Century .......................................................... 16-1
Cathy Bolton McCullough
Considering OD Theories from the Theoretical Foundations of HRD and Performance Improvement ...... 16-2
Thomas J. Chermack and Susan A. Lynham
Organization Development: An Examination of Definitions and Dependent Variables .............. 16-3
T. Marshall Egan

Symposium 17: Role of HRD in Women’s Career Development
Career Goals of Non-Managerial Women: An Adaptive Approach ...................................... 17-1
Linda M. Hite and Kimberly S. McDonald
The Career Life Cycle and Mentoring: The Opportunity for Reflection as an Outcome for Mentors ...... 17-2
Ellen J. Mullen, Betty E. Steffy, and John Van Ast
Functions Performed by Mentors that Assist in the Career Development of Women Managers .......... 17-3
Rose Mary Wentling

Symposium 18: Knowledge Management and Human Capital
Analyzing and Solving Difficulties Experienced in Knowledge Management: The Case of a Knowledge Intensive Organization ........................................... 18-1
Simone J. van Zolingen, Jan N. Streumer, and Maaike Stooker
Joanne Provo
Human Capital, HRD and the Knowledge Organization .......................................................... 18-3
Oscar A. Aliaga

Symposium 19: Organizational Change
Instituting Organizational Change through Cascade Training: Implications for HRD Research .... 19-1
Ronald L. Jacobs, Darlene Russ-Eft, and Suhail Zidan
Shock to the System: Analyzing Organizational Change Using the Construct of Awareness Development .................................................. 19-2
Martin B. Kormanik and Annette K. Sturdevant
Connotative Meanings of a Change Agenda ........................................................................... 19-3
S. Ramnarayan

Innovative Session 3
Mobilizing Illegitimate Movers: A Model for Transcending the Constraints of Potential ............ 1-3
Joseph E. Sanders III and Gary D. Geroy

Volume 2

AHRD 2001 Conference Overview

Conference Papers

Symposium 20: University Programs
Institutional and Curricular Characteristics of Leading Graduate HRD Programs in the U.S. .......... 20-1
K. Peter Kuchinke
Assessment of a Graduate Program in Human Resource Development: Perceptions of Key Stakeholders . 20-2
Julie A. Furst-Bowe and Joseph Benkowski
Predicting Academic Performance in Management Education: An Empirical Investigation of MBA Success ........................................................................................................... 20-3
Baiyin Yang and Xiaoping Rosa Lu

Symposium 21: Theory Building
A Multilevel Theory of Organizational Performance: Seeing the Forest and the Trees ....................... 21-1
Susan Reynolds Fisher
Is Knowledge in the Head or in the World? ........................................................................................................ 21-2
Richard J. Torraco
A Performance Perspective Synthesizing Intellectual Capital, Knowledge Management and Organizational Learning ........................................................................................................... 21-3
Carson R. Arnett

Work and Family Conflict: A Review of the Theory and Literature ......................................................... 22-1
Susan R. Madsen
Behind the Badge: Implications for Employee Assistance Programs in Law Enforcement ..................... 22-2
Lynn Atkinson-Tovar and Kathleen Kiernan
Employee Expectations, Characteristics, and Perceived Goal-Attainment of Tuition Assistance Program Participants ........................................................................................................... 22-3
Ronald L. Jacobs, Mark Skillings, and Angela Yu

Symposium 23: Workplace Learning
Beyond School-to-Work Initiatives: Does HRD Have a Role? ................................................................. 23-1
Gene L. Roth and Laurel Jeris
The Concept of Common Sense in Workplace Learning: A Qualitative Study ........................................... 23-2
Robert W. Rowden
Job Analysis for Training: Examining the Holistic Nature of Work Requirements .................................. 23-3
Donna H. Redmann, Judith J. Lambrecht, and Wanda L. Stitt-Gohdes

Symposium 24: Managerial Performance Issues
Managerial Skills Requirements: Evidence from the Scottish Visitor Attraction Industry ...................... 24-1
Sandra Watson and Martin McCracken
An International Assignment and Managerial Performance: Job-related Variables Relative to Effective Performance of Japanese Expatriates ........................................................................ 24-2
Kiyoe Harada
Modeling the Impact of Managerial Behavior in a Store Environment ....................................................... 24-3
Allan H. Church
Symposium 25: Improving Learning with Technology
The Benefits, Challenges, and Implications of Teleworking: A Literature Review
Susan R. Madsen
A Study of e-Learning Practices in Selected Fortune 100 Companies
Danielle Strazzo and Tim L. Wending
Human Resource Development for International Technology Transfer within Multinational Enterprises in Singapore
AAhad M. Osman-Gani

Innovative Session 4
Increasing Capacity to Learn in the Learning Organization
Neal Chaloftsky

Innovative Session 5
Layers of Learning: Promoting Performance Improvement and Action Learning in Higher Education
Diane Foucar-Szocki, Randy Mitchell, Rick Larson, Laurie Harris, and Nancy Sherman

Symposium 26: Professional Development
An Inquiry into the Continuing Professional Education of Information Technology Workers
David D. Branigan
The Relationship between Professional Learning and Continuing Professional Development in the UK: the Implications for a Research Design
Jean Woodall and Stephen Gourlay
A Comparative Analysis of Problem-based Approaches to Professional Development
Margaret C. Lohman

Symposium 27: Informal Learning
Workplace Learning Reviewed: Confronting the Rhetoric with Empirical Research
Rob F. Poell and Ferd J. Van der Krogt
A Study of Informal Learning in the Context of Decision-Making
Andy R. Walker and Victoria I. Marsick
Learning Beliefs and Strategies of Female Entrepreneurs: The Importance of Relational Context in Informal and Incidental Learning
H. Elizabeth Coyle and Andrea D. Ellinger

Symposium 28: Emotions and Behavior in the Workplace
Analyzing Training from an Emotions Perspective
Darren C. Short
The Planned and Unintended Emotions Generated by a Corporate Change Programme: Managing the Gaps and their Implications for HRD Practice
Sharon Turnbull
Conceptualizations of Emotional Behavior in Organizational Contexts: A Framework for Understanding the Implications of HRD Research and Practice
Jamie L. Callahan and Eric E. McCollum
Symposium 29: Evaluation in HRD
Utilization of Corporate University Training Program Evaluation ........................................... 29-1
Christopher F. Bober
Organizational Readiness for Learning and Evaluation ................................................................. 29-2
Hallie S. Preskill, Brenda Martinez-Papponi, and Rosalie T. Torres
Three Perspectives of Training Evaluation Based on Organizational Needs .............................. 29-3
Eul-Kyoo Bae and Ronald L. Jacobs

Symposium 30: Organizational Enhancement
Motivation to Improve Work Through Learning in Human Resource Development .................. 30-1
Sharon Naquin and Elwood F. Holton III
Improving Performance through HRD: Towards a Multi-Level Model .................................... 30-2
A. A. M. (Ida) Wognum
Exploring Organization Commitment in a Non-Profit Service Organization .............................. 30-3
Constantine Kontoghiorghes and Nancy Bryant
Innovative Human Resource Practices and Organizational Commitment: An Empirical Investigation .... 30-4
Tanuja Agarwala

Innovative Session 6
A Model for Linking Organizational Culture and Performance ..................................................... 1-6
Cathy Bolton McCullough

Symposium 31: Workplace Learning Issues
The Impact of Self-Management on Training Participation ......................................................... 31-1
Jasper van Loo, Andries de Grip, and Jo G. L. Thijssen
Corporate Training as an Organization Subsystem ....................................................................... 31-2
Monica M. Tuttle
The Relationship between Workplace Training and Organizational Commitment in Australian Organizational Settings: A Preliminary Analysis ......................................................... 31-3
Adela McMurray and Rae Dorai

Symposium 32: Managing the HRD Function
The Relationship between Factors Impacted by the Current Economic Crisis and Human Resource Development Roles and Functions in Thailand ................................................................. 32-1
Chiraprapha Tan Akaraborworn and Gary N. McLean
Testing the Appropriateness of the Gap Service-Management Model to the HRD Function in Organizations ................................................................................................................. 32-2
Shrine L. Mafi, Ronald L. Jacobs, and David A. Collier
A Study of HRD Concepts, Structure of HRD Departments and HRD Practices in India ............ 32-3
T. V. Rao and Raju Rao

Symposium 33: Career Development Issues
Career Development: What is its Role in Human Resource Development? ............................. 33-1
Mary Allyn Boudreaux
Free Agent Learners: The New Career Model and its Impact on HRD ....................................... 33-2
Darren Short and Rose Opengart
Career Development through informal Learning: A Review of the Literature ............................. 33-3
Toni Powell, Betty Hubschman, and Madeleine Doran
### Symposium 34: Research Issues in HRD

The Influence of Theories of Action on Action Research Initiatives: One Dying Division's Case .......................... 34-1  
*Linda Neavel Dickens*

Women's Ways of Knowing: A Conceptual Framework for HRD Research ......................................................... 34-2  
*Yvonne M. Johnson*

*Heather A. Williams*

### Symposium 35: The Adult Learner

Bridging the Gap between Adult Education and Educational Psychology: Some Important Findings ........... 35-1  
*Bryan W. Smith*

Mary Parker Follett: Philosopher of Human Resource Development ................................................................. 35-2  
*Leslie DeLaPena Wheelock and Jamie L. Callahan*

The Human Resource Development Network as a Means for Adult Learning ....................................................... 35-3  
*Susan A. Huhta and John A Niemi*

### Symposium 36: Learning Organization

Perception of Learning Culture and Concerns about the Innovation on Use of Innovation: A Question of Level of Analysis ....................................................................................................................... 36-1  
*Rebecca F. Sta. Maria and Karen E. Watkins*

"Shared Vision": Are We at Risk of Creating Monochromatic Organizations? .................................................... 36-2  
*Verna J. Willis*

Critical Reflective Working Behaviour: A Survey Research ................................................................................... 36-3  
*Marianne van Woerkom, Wim J. Nijhof, and Loek F.M. Nieuwenhuis*

### Innovative Session 7

Construction of an Action-Research Project about an Organizational Change Process in a Bureaucratic Organization .......................................................................................................................... 1-7  
*Hilda Martens*

### Symposium 37: Measurement and Research Tools

An Examination of the Multiple Intelligences Developmental Assessment Scales (MIDAS) ............................. 37-1  
*Albert K. Wiswell, Christopher R. Hardy, and Thomas G. Reio, Jr.*

Evaluating Corporate Quality of Life Programs: Utilizing the Balanced Scorecard Model in Conjunction with Quasi-Experimental Design .................................................................................. 37-2  
*Wendy J. Casper and Ann L. Landy*

Validating a Tool to Measure Customer Service Competencies ........................................................................ 37-3  
*Darlene Russ-Eft, Caryl Berrey, Ruth Pangilinan, and Regina Atwood*

### Symposium 38: Assessment and Evaluation Modeling

Training Assessment among Kenyan Smallholder Entrepreneur ........................................................................ 38-1  
*George G. Shibanda, Janymah Ingado, and Bernard Nassumba*

Business-Focused Evaluation: A New Collaborative Model ................................................................................. 38-2  
*Valerie Stead*

Challenges in Measuring and Evaluating Diversity Efforts in HRD ..................................................................... 38-3  
*T. Marshall Egan*
Symposium 39: Issues in Training
Improving Customer Service Training in Korea ................................................. 39-1
Namhee Kim
Organizational Culture and Training Effectiveness ............................................. 39-2
Kay J. Bunch
The Intersection of Training and Careers: An Examination of Trends of Vocational and Professional Certification and a Call for Future Research ........................................ 39-3
Shani D. Carter

Symposium 40: Workplace Issues in Human Resources
The Effect of Organizational Structure on Single-Source and Multiple-Source Performance Appraisal Processes: Implications for HRD ............................................. 40-1
Karen K. Yarrish and Judith A. Kolb
An Exploratory Examination of the Literature on Age and HRD Policy Development ............................................. 40-2
Tonette S. Rocco, David Stein, and Chan Lee

Symposium 41: Executive and Management Development
The Role of the Chief Learning Officer: Implications for Human Resource Development Theory and Practice ............................................. 41-1
Robin Lackey
Anticipating Management Development Needs ............................................. 41-2
Jonathan Winterton
Simulation Enhanced Learning: Case Studies in Leadership Development ............................................. 41-3
Claudia C. Hill and Steve W. Semler

Innovative Session 8
The Theory Challenge Facing Human Resource Development ..................................... 1-8
Richard A. Swanson

Symposium 42: HRD and Small Manufacturers
Toward a Model of Technical Assistance for Small Manufacturers: The Role of Performance Technology ............................................. 42-1
Dale C. Brandenburg
Understanding Technology Diffusion in Northeast Oklahoma Small-to-Medium Sized Manufacturers ............................................. 42-2
Brenda Solomon
William R. Venable

Symposium 43: Motivation for Improving Performance
The Effects of Personality, Affectivity, and Work Commitment on Motivation to Improve Work Through Learning ............................................. 43-1
Sharon S. Naquin and Elwood F. Holton III
The Relationship between Work Environment and Employees' Self-Directed Learning Readiness in Korean Companies ............................................. 43-2
Ji-Hye Park
Predicting Motivation to Learn and Motivation to Transfer in a Service Organization ............................................. 43-3
Constantine Kontogiorghes
Symposium 44: Redefining HRD
If We Can't Define HRD in One Country, How Can We Define it in an International Context? .......................... 44-1
Gary N. McLean and Laird McLean

A Refusal to Define HRD ......................................................................................................................... 44-2
Monica Lee

HRD: The Power of Definitions ................................................................................................................ 44-3
John Walton

Posters
Developing the Employment Brand: Targeting MBA Campus Hires ................................................ P-1
Diane M. Bergeron

Learning-Action Strategies of Project Managers in a Collaborative Learning Program: An Action
Research Project into the Learning Activities of Project Managers ......................................................... P-2
Rachelle Pluijmen

Trainer Certification: Conducting Research in the Real World .............................................................. P-3
Marilynn N. Butler

From the Editor

I am pleased to welcome you to Tulsa and to this year’s Conference of the Academy of Human Resource Development! With great satisfaction, I proudly offer you the AHRD 2001 Conference Proceedings. It reflects the excellent work of all scholars and professionals who continue to contribute to the development of the profession.

As in the past, this year’s Proceedings represent a wide variety of topics in many areas in the over 140 papers presented at this Conference. Also, we continue to be fortunate with the commitment from scholars from over the world—all five continents are represented in the Conference! These two facts certainly ensure stimulation and inspiration to our dialogue and debate.

I wish you a productive and enriching participation in this Conference, and I hope these Proceedings achieve the goal of disseminating the emerging work of the many professionals that have come to the Conference.

Using the Proceedings

1. This year’s proceedings are divided in two volumes, following the Conference program. Volume 1 covers all symposia through Friday. Volume 2 covers the remaining days.

2. The Table of Contents provided at the beginning of each volume covers the contents for both volumes. And so do the Author Index and Keyword Index included at the end of each volume.

3. A Program Overview is also included in both volumes. The full version of the Conference Program is printed as a separate document.

4. Papers are grouped by symposium number. The symposium number has been used for referencing the Author and Keyword indices.

5. As in recent years, we have also a CD-Rom version of the Proceedings available to all Conference participants. Instructions to use the CD-Rom are provided in the same CD.

I want to thank Toby Egan, Sonja Irlbeck, Janet Polach, Lisa Weinberger, and Richard Herling from the University of Minnesota for their help in making the Proceedings look professional and consistent. But my special thanks go to all authors, for contributing their papers. Enjoy these outstanding papers and your stay in Tulsa!

Oscar A. Aliaga
University of Minnesota
Editor
Dear HRD Professional:

The Academy of Human Resource Development strives toward a vision of "Leading the Human Resource Development Profession Through Research." A key component in achieving this vision is our annual research conference, which convenes scholars, students and reflective practitioners from business, government, non-profits, the military, and the academic sector to discuss research and forge relationships that foster cooperation and collaboration. As the world grows increasingly smaller, we are particularly interested in extending that cooperation and collaboration to the international community. Accordingly, we extend a special invitation to international scholars, students and reflective practitioners to submit manuscripts and attend the conference.

We urge every HRD scholar and professional to give the call for papers the widest possible dissemination. In addition to giving the hard copy of the call for papers to an interested associate, you may refer those interested to the EVENTS AND CONFERENCES section of the AHRD website www.ahrd.org or ask them to contact the AHRD office.

We are also interested in expanding the number and quality of the innovative and poster sessions and, towards that end, have provided additional information on various formats, submission requirements and acceptance criteria as part of this call for papers. Finally, in an effort to expand and refresh our preconference offerings, we have gone to a proposal format for those sessions, also. We urge you to be creative and innovative in putting together either half-day or full-day sessions that would attract the interest of the HRD research and reflective practitioner community.

We look forward to receiving a wide variety of submissions and proposals from the worldwide community of HRD scholars, students and reflective practitioners and making this Tenth annual research conference the best we have ever had.

Thank you for sharing our vision, and I look forward to seeing you in Honolulu, Hawaii, February 27 - March 3, 2002.

Best Regards,

Gary N. McLean

Academy of Human Resource Development
Local Host Organization

Pacific Resources for Education and Learning (PREL): www.prel.org

Pacific Resources for Education and Learning (PREL) is a nonprofit corporation that serves the U.S. in the Pacific region. PREL helps Pacific schools improve educational outcomes for children, youth, and adults by providing research, development opportunities, training, technical assistance, group facilitation, information resource activities, dissemination, and evaluation services.

Conference City

Honolulu, Hawaii, the capital city, has much to offer with respect to museums, restaurants, activities, shopping and recreation. You can choose culture, sports, nature or the beach during the day and then a quiet dinner at one of the many fine local restaurants or sample the nightlife along Waikiki beach. However you choose, Honolulu is your ultimate vacation or business destination.

The Academy of HRD, an international organization having the mission of encouraging the systematic study of human resource development theories, processes, and practices, encourages you to submit manuscripts for the 2002 International Research Conference.

- All scholars interested in HRD are invited to submit manuscripts for consideration. The conference is attended by researchers and students from the areas of HRD, business, psychology, education, economics, sociology, technology, and communication. In addition, HRD researchers and reflective practitioners from business, industry, and government participate fully in the conference.
- Manuscripts may be submitted in four categories: Research and Theory Symposium, Innovative Session, Poster and Research in Progress. All Research and Theory and Poster Manuscripts will be blind reviewed and should be of new unpublished research. Research in Progress manuscripts will be blind reviewed, but will not be published in the proceedings. Manuscripts accepted for the conference program will be published in the conference proceedings and may be published elsewhere following the conference.
- At least one author for each submission must register by January 7, 2002 for the submission to be scheduled for the program.

<tr>
<td>Full manuscripts (14-22 pages) are required. Submissions should be new and unpublished. Research papers, as appropriate to the methodology used, should contain the following elements:</td>
<td>Innovative session proposals may be of variable length (maximum 22 pages). An innovative session is designed to present new and innovative HRD work through creative, interactive presentation formats that do not fit within the regular research and theory symposium process. The following criteria MUST be addressed in the proposal:</td>
<td>Manuscripts (up to 12 pages including the poster miniatures) are required. Visual representations of the posters can enhance the clarity of the research and help us view the field of HRD in new and different ways. Posters are not a substitute for a scholarly paper. Posters will remain up throughout the conference, and a session will be scheduled to allow interaction between the author(s) and conference participants. The following criteria MUST be addressed in the manuscript:</td>

Research and Theory or Poster Submission Requirements

Full Manuscripts are required for consideration and manuscripts must meet the following criteria:

1) **CLEARLY MARK THE PAPER'S CATEGORY ON BOTH THE COVER SHEET AND IN THE TITLE:** Research and Theory, Innovative, Poster or Research in Progress

2) Must not exceed the page limits specified. Page limits include everything except the cover sheet (body of paper, figures, tables and references). Manuscripts that exceed the page limits will be returned. **FINAL PAPERS WILL BE LIMITED TO EIGHT PAGES WITH 10 POINT, SINGLE SPACED TYPE, INCLUDING REFERENCES, FIGURES AND TABLES.**

3) Blind review ready
   a. Cover sheet contains the following information for each author, abstract, three descriptive keywords and primary research methodology
      - Full Name
      - Complete Address
      - Work phone
      - Fax
      - Email
   b. No author identification in body, header or footer of manuscript

4) Specific Requirements:
   a) First manuscript page contains abstract, three descriptive keywords and primary research methodology immediately below title
   b) 12 point type
   c) Double spaced
   d) 1" margins all around
   e) Pages numbered

6) All communication with authors will be via Email. Manuscript submissions MUST INCLUDE AN E-MAIL ADDRESS FOR ALL AUTHORS.

7) All deadlines are firm. Exceptions will be made only for true emergencies or extraordinary circumstances.

8) All final manuscripts not forwarded by Email must include a disk copy in MS Word 6.0 (or later) format on an IBM formatted disk. If the manuscript is not in MS Word, the email should specify the word processing format.

9) Scheduling of sessions: Individuals are expected to participate at the time scheduled by the Program Committee. If there are special time constraints, please note them on the manuscript Cover Sheet. The Program Committee will consider such constraints when assembling the schedule, but makes no guarantee that authors will be scheduled according to these requests.

**Submission Deadlines**

1. Manuscripts: Monday, October 8, 2001
2. Decision Notification: Monday, December 3, 2001
3. Final Papers Due to Proceedings Editor: January 7, 2002

**Submission Addresses**

Email manuscript submission is expected. If you have trouble submitting the manuscript via email, contact the AHRD office and we will work with you. Do not send duplicate manuscripts.

If you need the mailing or physical address of AHRD, you can find it on the website under the ABOUT section or refer to page 2 of this document.
The Academy encourages you to submit **Innovative Session Proposals** for the 2002 International Research Conference.

- Innovative proposals use creative or alternative presentation techniques, address new or emerging topics or combine these two requirements.
- The formats described below are offered as suggestions only. The intent of these examples is to be useful to those considering alternatives to the standard paper and symposium session formats. Preference will be given to proposals with a research or theoretical basis.

**Debate.** The debate format can be an effective way to present two opposing views about a topic. One structure for a debate is to have a moderator and two, two-person teams. The debate begins with the moderator stating a position. One team then presents arguments that affirm the proposition and the other team presents arguments against the proposition. Each team member has a fixed amount of time (e.g., 10 minutes) to present arguments. Time for rebuttal can be incorporated into the session and/or a discussant can sum up the main points of the session. When submitting a debate proposal, be sure to include a statement of the proposition to be debated and descriptions of the major points likely to be argued by each side.

**Panel Discussion.** In a panel discussion, the chairperson plays a very active role, serving as a moderator who asks questions of the panelists and ensures that all panelists (three to six people) have the opportunity to speak. Diversity among panelists is important to the success of the session. Furthermore, all panel discussion members must recognize the need for advance preparation. Panelists and chair do not prepare papers. They make brief introductory remarks before engaging in ad hoc give and take for which they may have prepared themselves but which cannot be predicted or entirely controlled. (A chair skilled in discussion management is essential.) Panel discussions should generate spontaneous interaction among participants and between participants and the audience. A panel discussion proposal should describe the questions that will be addressed by the panel, the underlying issues or themes to be discussed, and the structure or format of the session.

**Practitioner Forum.** A Practitioner Forum provides an opportunity for HRD professionals to discuss challenges in the work environment and innovative solutions that are linked to HRD research issues. Each forum is devoted to a single topic. A chair introduces the session, three or four presenters take approximately 10 minutes each to discuss applied research and practice issues, and audience members spend the remaining time interacting with presenters and each other, offering their own ideas about applied research and practice. Practitioner Forum topics are welcome on any "cutting edge" topic. Special effort should be made to link theory and practice.

**OTHER CREATIVE FORMATS ARE STRONGLY ENCOURAGED**

**Requirements for Innovative Session Proposals**

1. The proposal is clearly marked – **INNOVATIVE SESSION** – on the cover sheet and in the title.
2. The proposal contains a theoretical framework.
3. The proposal contains an agenda.
4. The proposal is blind review ready.
5. The proposal will meet the same requirements as #4-10 in Research and Theory submissions as outlined on page 4.
Call for Preconference Proposals

Honolulu, Hawaii, USA
February 27, 2002 - March 3, 2002
Hosted by Pacific Resources for Education and Learning

The Academy of Human Resource Development, an international organization having the mission of encouraging the systematic study of human resource development theories, processes, and practices, encourages submission of Preconference Proposals for the 2002 International Research Conference. The audience includes HRD students, both junior and senior faculty researchers, and practitioners within and outside the research community.

The AHRD Conference Planning Committee seeks dynamic learning experiences that would be of significant interest to HRD researchers and reflective practitioners. Preconference sessions may be problem oriented, be professional-development oriented, focus on knowledge transmission, address recent methodological and substantive developments in HRD research or serve as organizing sessions for special interest groups exploring an HRD related subtopic in depth. AHRD welcomes sessions that extend beyond traditional research paradigms and methods. AHRD especially encourages offerings that merge research and practice.

- AHRD solicits proposals for full-day preconference sessions that will run before the Annual Conference.
- AHRD solicits proposals for half-day seminars (4-hour) that will run before the Annual Conference.

Preconference Proposal Requirements

1. Proposals are required to contain the following elements:
   a. Title
   b. Committee or Panel Members
   c. Purpose including a statement about how the session advances the mission and vision of the Academy
   d. Constituency or target audience
   e. Specific goals
   f. Draft agenda

2. Preconference proposals will not be blind reviewed but will be judged on their contribution to advancing the vision of the Academy.

3. An example proposal can be found on the AHRD website <www.ahrd.org> under EVENTS AND CONFERENCES.

4. No budgets are allocated by AHRD for preconferences, except for refreshment breaks.

5. All preconference attendees are expected to pay the fee including invited speakers.

6. No preconference is guaranteed approval from one year to the next.

Submission Requirements

1. Cover sheet should contain full identification and contact information for All organizing committee members.
2. All communication will be via Email.
3. Submissions MUST INCLUDE AN E-MAIL ADDRESS FOR ALL ORGANIZERS, if possible, but at least one CONTACT who will then receive all communications.
4. All deadlines are firm. Exceptions will be made only for true emergencies or extraordinary circumstances.

Submission Deadlines

1. Preconference Proposals: September 1, 2001
2. Decision Notification: November 15, 2001

### Academy of Human Resource Development

#### VISION
To Lead the Human Resource Development Profession through Research

#### MISSION
The Academy was formed to encourage systematic study of human resource development theories, processes, and practices, to disseminate information about HRD, to encourage the application of HRD research findings, and to provide opportunities for social interaction among individuals with scholarly and professional interests in HRD from multiple disciplines and from across the globe.

#### PUBLICATIONS
AHRD in cooperation with our publishing partners, provides a full range of scholarly and professional publications:
- *Human Resource Development Quarterly*, our research journal
- *Human Resource Development International*, our new international journal
- *Advances in Developing Human Resources*, a quarterly monograph series
- *AHRD Standards on Ethics and Integrity* in Human Resource Development
- *Human Resource Development Research Handbook*, a book for both researchers and practitioners
- Blind Refereed Annual Conference Proceedings published annually in conjunction with the annual research conference

#### MEMBERSHIP
AHRD membership includes the following:

1. Being a member of the only global organization dedicated to advancing the HRD profession through research
2. Subscription to all four AHRD sponsored scholarly journals:
   - Human Resource Development Quarterly
   - Human Resource Development International
   - Advances in Developing Human Resources
   - Human Resource Development Review
3. Copy of AHRD Standards on Ethics and Integrity
4. Subscription to the Forum, the Academy newsletter
5. Subscription to the Academy Listserv, for timely professional and career information annual
6. Discount on annual conference participation
7. Research conference with full proceedings of research papers (1200+) pages
8. Research partnering, funding, and publishing opportunities

#### ANNUAL RESEARCH CONFERENCE
AHRD holds an annual research conference in the early spring of each year. Pacific Resources for Learning and Education will host the 2002 conference in Honolulu, Hawaii, USA. Kitty Kautzer will chair the 2002 conference host committee.

#### AWARDS PROGRAM
AHRD recognizes professional excellence in the HRD profession through its awards program, including:
- HRD Scholar Hall of Fame
- Outstanding HRD Scholar Award
- Richard A. Swanson Research Excellence Award
- Outstanding Human Resource Development International Article
- Malcolm S. Knowles Dissertation Award
- HRD Book of the Year Award
- AHRD Outstanding Academic Program
- "Cutting Edge" Top Ten Conference Proceedings Papers

CONFERENCE PAPERS
Action Learning: Case Studies of Most Valued Learning and Application

Suzanne D. Butterfield
Brenau University

The purpose of this qualitative study was to document what action learners believed to be their most valued learning and application. Longitudinal data were collected from document analysis and first-line consulting managers who participated in an action learning experience. The most prevalent learning and application focused on provocative questioning to solve problems, coach and counsel for performance improvement, and accomplish work in general.

Keywords: Action Learning, Transfer of Learning, Management Development

Concern about the transfer of formal training among HRD professionals is not new. In 1988, Baldwin and Ford reported that not more than 10% of training expenditures result in transfer of training to the job. Since then, several reports have been published regarding the demise of training transfer even as formal organizational training budgets have increased (Gordon, 1998). One way to promote learning and its application is to incorporate elements of actual work experiences into the learning experience. Action learning does this while simultaneously developing fundamental thinking and learning strategies that can be employed as a natural way to conduct oneself, not just in one specific effort.

Several problems arise, however, in an action learning experience. The first is its learning and application are difficult to observe and measure. The second is that human resource developers cannot predetermine or control new thinking strategies, so learning objectives are difficult to identify and design into the training. Extensive time and effort might elapse before linkage is realized among action learning and individual, group, and organizational development. As a result, action learning may be easily discounted even though it has been seen as a bridge to link learning, professional development, systems thinking, and performance outcomes.

Theoretical Framework

Action Learning. The theoretical framework for this study is action learning as proferred by Reginald Revans (1981, 1982). This was chosen as the theoretical framework for this study instead of other models because it is considered seminal work in the field. Revans proposed that learning is a function of conventional knowledge, insightful questioning, and experimentation. The basis for his propositions is that people learn best while trying to resolve an unfamiliar, intractable problem; and that people learn best while interacting with co-learners. Learning occurs from direct engagement upon the learner's existing problem versus being directed by others to participate in training or receiving instruction about some distant construct. Other educators have reiterated that adults are more interested and motivated to learn about something to which they can relate and about which they can do something (Marsick, 1987; Marsick, 1991) --hence, the learner's problem rooted in the workplace.

Furthermore, learning occurs collaboratively in a learning group that meets on a regular basis over an extended period of time. Co-learners bring a range of insight and experience to problem resolution, individual introspection, individual learning, and social construction of meaning and knowledge. What makes action learning unique is its reliance on questioning insight. Insightful questions are those questions, of self and to others, that reexamine underlying assumptions, creativity, breakthrough thinking, and experimentation.

Other types of learning that have been identified from an action learning experience are systems thinking (global operations perspective), processing (conflict management, building trust, teamwork), and communication skills (ARL™, 1996). Marsick (1987) found that an action learning experience impacted action learners' abilities to expand their perspectives and frames of reference, to redefine problems, actively experiment, and critically reflect. Systems thinking (global operations perspective), processing (conflict management, building trust, teamwork), and communication skills have been significant outcomes from such an experience (ARL™, 1996). An action learning experience can impact learners' abilities to expand their perspectives and frames of reference, to redefine problems, actively experiment, and critically reflect (Marsick, 1987). Butterfield, Gold, and Willis (1998) found that action
learning had to become "a way of personal way to life—almost a value before it could be effectively translated to the workplace according to a majority of the participants" (p. 495). These results showed a "new awareness of the impact of reactions and interaction, assumptions, ethics, and the liberation from canned or programmed viewpoints and problem solving (p. 494). These same participants believed that they could immediately create informal action learning environments within their work groups without having the structure of a formalized action learning group process. These studies have generally shown that action learning is a learning strategy that can be used when rapid changes in the organization adversely affect the applicability of and the learning from traditional training with predefined outcomes. Action learners are more likely to develop the personal strength and thinking strategies to continuously question their own and others' perspectives and what they think they know. This results in continuous, self-directed informal learning.

Qualitative Case Study Methodology

A qualitative case study is an appropriate methodology to study what individuals learn in action learning and how they apply this learning (Balog, 1995; Stake, 1994; Yin, 1989). This better captures the participants' perceptions as they are constructed over time in their own and in rapidly changing environments. The case study methodology allowed these participants to surface issues important to them—it was exploratory and emergent in nature (Lincoln & Guba, 1985). The research questions in this study were:

1. What do action learners believe to be their most valuable learning in an action learning experience and why was this important to them?
2. Across cases, what appears to be the most prevalent learning and application as a result of the action learning experiences?

Sample. This was a purposive sample composed of first-line managers drawn from multiple action learning groups. Each participant was a case. The participants worked for the same employer—a multinational professional services firm rooted in providing tax, accounting, and management consulting services. The firm delivers a variety of services to clients to solve critical problems by implementing highly valued changes in their business strategies and operations. The participants had been in their current positions less than two years, although most of them had several years of consulting experience. They typically provided advisory or system implementation services to clients external to their own organizations. When first promoted, these managers typically manage consultants or senior consultants on a project; however, they may also perform in individual contributor roles.

The action learning groups were part of a management development program—the purpose of which was to improve management and project performance, management retention, and client relationships. This specific study was initially undertaken to determine the effectiveness of using action learning as a management development intervention. The program started with a two-day kickoff which communicated that the participants were going to learn through a problem challenge, define their role in creating value, build capacity for managerial judgment, and improve tactical leadership skills while they worked toward personal development goals. The kickoff commenced with executive presentations about leadership. The program leader then conducted general team building exercises, orientation to action learning as the developmental methodology, and mock action learning groups with company executives acting as problem owners.

Each action learning group had a learning coach, at least five colearmers, with each colearmers having a different background, developmental goals, problems, and client engagements. The groups met separately once a month for an entire day during the next three consecutive months. Each participant had dedicated airtime within which he or she presented the problem and the action already taken to resolve it. Colearmers engaged in questioning to help the problem owner think about the problem differently and make progress toward problem resolution. Providing advice to the problem owner was discouraged. At the end of the third workshop, each group presented their findings and learnings to a group of company executives. Executive presentations of this type are considered to enhance participants' learning (Dilworth & Willis, 1997).

Data Collection and Analysis. The principal method of data collection in this study was audio taped telephone interviews with the participants and with the management development program leader. Telephone interviews were the best and most expeditious method of collecting data because the participants worked at client sites throughout the United States. There were 22 participants selected for the study. These 22 attended the kickoff and at least two of the workshops. Approximately four months after the end of the program, data were collected from 17 of the 22. The interviews focused on the individual's learning and its application in the workplace and the
workshop. I analyzed interview transcripts for key ideas, critical incidents, key participant comments, discrepancies in responses, and reactions to questions that related to learning and application. I noted patterns or themes within each case and identified codes to represent them. These were categorized, defined, and labeled with properties and dimensions of frequency, degree, or intensity. The constant comparative analysis was used to search for statements or other indications of recurring behavior or events related to the research issues (Strauss & Corbin, 1994). I then generalized patterns across cases. One year after the first interview, I conducted a follow-up telephone interview with 10 of the 17. These 10 are later referred to as the "core" participants. The purpose of these interviews was to investigate what the participants believed to be key learning from their action learning experience after a longer period of time and how they had used action learning or other acquired knowledge. These interviews provided the opportunity to study the sustainability of action learning and its application. After these interviews, I conducted another transcript data analysis.

I also reviewed several documents relating to the company and the action learning module of the program. These documents included web site material; correspondence from the program leader to executive management regarding the program, research, results, action learning orientation material, and post-program feedback from the participants' and directors about the participants' behaviors and results. Three research associates examined some of the interview transcripts to provide independent analysis as a cross check to my own findings. Consequently, this study's internal validity was substantiated by the use of multiple methods of data collection such as questionnaires from a pilot study, interviews of participants and key informants, document review, the directly-related previous research in action learning, and the associates' analyses to develop "converging lines of inquiry" (Yin, 1989, p. 97) for triangulation purposes.

Limitations. One potential limitation that I, as the human-as-instrument, was continually concerned about was the influence of my own experience and expertise. The research associates provided a cross-check to my findings. To overcome the potential limitation of the small number of participants in this study, I compared their data to the data from my original research in which two other research associates also coded and analyzed the data. Another limitation was that these were telephone interviews. Face-to-face interviews might produce richer results if the researcher could address perceived discrepancies between verbal and non-verbal responses. In this case, I rechecked responses when I noticed changes in the participant's voice. I also reviewed the data more carefully when I listened to the audio tape after the interview if I noticed hesitancy or change of the participant's tone of voice or pattern of speech. To overcome the potential limitation of the self-report, I triangulated the data across cases and document review of data from participants' surveys immediately after the program and survey data from their managers.

Results and findings

In the first interviews, all of the participants were able to explicate what they did or did not learn. At the beginning of the reinterviews of the core group, most of the participants could not recall the action learning process. It appeared that the participants thought of action learning only as a formal group process they were meant to experience in the workshop—a technique. Consequently, they initially believed they either had not learned or had not applied the process. At some point during their reinterviews, all of the core group participants eventually identified either what they had learned or applied, or both as a result of their action learning experiences.

Questioning. The most prevalent learning occurred in how to engage in thought-provoking questioning—100% of the core group and 94% of all participants. The most valued learning of questioning was also the construct most applied. Almost all of the participants either learned or reinforced various skill levels of questioning. Half of the core group members (and nearly half of all participants) recognized that they had improved or reinforced their questioning skills. Others stated that the action learning process helped them improve the effectiveness of their questioning by prompting them to be more intentional, systematic, cogent, or generally more competent. Some of them felt that the questioning helped them determine solutions more quickly than if they had not engaged in it. Several participants cited the specific questions they learned or used to question others or themselves. The most cited questions were practiced in the action learning groups. Most of these questions are also fully anchored to action learning in the existing related literature. They were: "What would happen (if you tried...?)" "Now what?" "So what?" "Who cares and why do they care?" "What is getting in my way (of solving the problem)?" "Have you thought about...?" Generally, the participants felt the action learning questioning strategy was a way for them to think about their situations differently. They were not supposed to ask closed-ended questions. Instead they were
expected to ask "the questions that went beyond the yes and no." The participants interpreted the purpose of the questions as helping them to "generate their own ideas."

The participants viewed action learning predominantly as a questioning technique. Three of the participants from the core group, however, described, either directly or indirectly, action learning as a way of thinking instead of being just a technique. All of the participants who indicated they learned new questioning approaches (16 of 17) engaged in it in the workplace less formally and more spontaneously than in the learning group. They tended to use questioning in their team or client committee meetings or in one-on-one settings. No participants indicated use of it in the formal sense of having designated airtime for questioning of the problem owner, reflection to think about what transpired during the questioning, or discussion of what was learned. Half of the core group participants indicated they engaged in questioning more cogently, systematically, or intentionally. The following is a discussion of how they reported using questioning.

**Problem Solving.** The most prevalent use of the questioning was to solve problems. The entire core group and nearly all 17 of the participants reported they used questioning to solve problems. This is not surprising because in action learning the problem is intentionally the mechanism by which learning occurs. Having a problem was a condition of participation in the management development program. Most of the participants, whether in a leadership or individual contributor role, felt they could engage in questioning with their team members to solve problems. Some recognized that using questioning helped them get through the emotions of a situation to directly address the root causes of problems. Two of the participants reported they probably would have resolved problems with others using their traditional methods; however, they recognized that the people with whom they were working seemed to enjoy the process more with the questioning approach. Five of the core group members engaged the client in questioning. Of these, three used it to enable the client to solve their own problems. The participants, however, appeared to be selective about when they engaged in questioning with the client. Some were concerned about the client's perceived value of their (expert) service if they performed in a less directive manner. All of them used it to investigate client expectations, perspectives, and project-specific information.

**Coaching and Counseling for Performance Improvement.** Almost three quarters of both the core and the total group indicated that using supportive questioning was more effective, collaborative, and developmental than providing advice or answers to improve subordinates' work performance. Two participants realized the value of using questioning to keep responsibility for solving a problem with the team member working an issue. Related to this, a few of the participants recounted a sense of personal relief that the questioning freed them from always having to have just the right answer in a given situation. Three participants had opportunities to counsel poor performers in their work groups during the year between interviews. Two of them felt they experienced better results by integrating a questioning approach in the discussion.

**Accomplishing Work.** Approximately three quarters of the participants in the core and the total group indicated they used varying degrees of thought-provoking questions specifically to accomplish work. They reported they used questions primarily to 1) define project scope of work and related staff roles, 2) define and investigate environmental influences affecting project execution; solicit stakeholders' or team members' expectations, perspectives, or motives; or 3) assess risk. Some of these participants expressed concern about using the questioning with individuals who were not familiar with the process. Four participants indicated they learned to enable team members to solve their own problems and grow professionally. They learned that they could achieve this through questioning.

**Self-Questioning.** Well over half of both the core and total groups engaged in questioning themselves for various purposes, most of which fall under the category of "thinking through the process." More specifically, they engaged in self-questioning to identify key project stakeholders, needed or potential actions and related steps, and project goals. A few of the participants questioned themselves to determine how they were performing some action or in evaluating their own or others' experiences in both work and non-work situations. Few participants reported that they consciously engaged in self-questioning to discover their assumptions, preexisting theories, and feelings about their situations. The majority of the participants did not appear to engage in self-questioning to identify their assumptions or in questioning others about their assumptions or espoused theories. This would have been more representative of insightful questioning, a step beyond the prevailing thought-provoking questioning. This fact uncovers a large "personal growth area" which might be addressed by action learning designers and researchers in the future.
In general, there did not appear to be consistent application of the questioning over time. Five of the core group members admitted to or indicated varying degrees of relapse. Several contextual reasons were indicated for this relapse (i.e., compressed project schedules, time pressures, inordinate amount of work, mindset or expectations to be the expert, the role of expert/individual contributor instead of as a group or project leader, lack of management support and reinforcement, lack of consistent internal management and lack of consistent management with knowledge of action learning principles, lack of a safe group in which to engage in mutual learning, and the judging environment of the firm wherein they did not want to appear to be anything other than an expert).

From the document review, I found that the program leader reported generally positive results from the management development program. At the end of the program, program participants, on the average, said the program met their expectations (35%—more than expected, 60%—close to meeting expectations). The program participants who had been managers for less than six months experienced the most broadening or changing of their understanding about their perception of a managerial role. Eighty-five per cent of the total number of program participants reported that their understanding of their potential impact on business in a managerial role was broadened during the program and 35% in a highly significant way. Most of them thought the learning format helped them develop "translate that thinking into action." The workshop helped them to think differently about learning and relating it to experience. The results of this review indicated that many of the total number of program participants' expectations were met or exceeded in a number of ways. The first was obviously in the area of problem solving. Almost three quarters of them needed development in the area of identifying, discussing, and resolving problems, and they achieved it. The next two most needed areas for development with the highest achievement level were handling issues with teams and clients and preparing others to be successful. The fourth most needed area for development with high achievement noted was in preparing others to be successful. In general, the results generated within the organization were consistent with the findings derived from the interviews. Most of the participants made improvements in their tactical leadership and project execution skills. A few of them developed a holistic and enabling paradigm of thinking rooted in challenging themselves and supportively questioning others. Furthermore, the participants and their managers acknowledged the environmental constructs of time pressures and client intolerance as limitations to learning and application. Finally, the results of this study were consistent with a pilot study (Butterfield et al., 1998). The participants in both studies generally experienced that:

1. The process of action learning, primarily questioning, is a powerful way to solve problems—accomplish work.
2. Action learners can immediately apply the principles of action learning informally—more one-on-one instead of the formal group process.
3. Focus on immediate results, expertise, and experience inhibits learning and its application.
4. Action learners can internalize questioning as a value—a personal and holistic way of thinking.

Summary of the findings. The predominant learning and use of action learning by the participants in this study was the practice of provocative (thought provoking) questioning. Approximately one-fourth of all participants proceeded to the depth of insightful questioning. Some participants did ask themselves and each other questions designed to clarify, examine, probe, discriminate, interpret and integrate elements of the situation, but others were somewhat less able to do so. It was difficult and mostly uncomfortable for the participants to make and sustain the switch from providing advice and counsel to insightful questioning. Most of the participants continued to rely on experience or expertise (their own or others' expectations) to some extent. Many of them engaged in questioning of a suggestive nature that appeared to be another way of recommending something from the questioner's experience. I especially interpreted such questions such as being of the "leading" kind. These often appeared to be veiled suggestions and cues to the answer that the questioner wanted considered. These types of questions and reliance on others' experience can act as barriers to learning, to generating one's own solutions, and to generating solutions grounded in the context from which the problem arises. By engaging in at least the level of provocative questioning, many of the participants expanded their perspectives, redefined problems, actively experimented, reflected and either resolved or made progress toward resolution of their problems. For some of the participants, the shift to asking insightful questions seemed to be hampered by the use of the familiar problem instead of the unfamiliar problem, unquestioned reliance on experience and expertise, or the expert role mindset. The facilitative-oriented managers (process consultants) may have a built-in advantage. They tended to engage in what seemed to resemble insightful questioning to induce others and themselves to think differently about their situations. It may be that their mindsets and expertise are grounded in consulting process rather than in subject matter. They typically perform their work without having specific expertise in the content of the client's problem.
Conclusions, recommendations, and implications for HRD research and practice

There appears to be two levels of questioning that can help the action learner view a dilemma differently. One level is the provocative question, the most predominant learning and application. The provocative question appears to induce people to adapt something known from their or others' experience to a current problem. The risk is making current decisions and solving current problems with assumptions rooted in a non-relevant context or with obsolete or limited information. Action learners can use provocative questioning to make some progress toward solving work and personal problems. They can also use questioning to coach, enable, and counsel others in their own and client organizations. By doing so, they can discover multiple ways of making progress on their problems. This type of questioning, however, does not induce individuals to identify their assumptions or preexisting personal theories that influence their ability to view their situations in different or new ways. The provocative question appears to limit the response to what is already known—it provides boundaries within which to answer the dilemma at hand.

The second level, the insightful question, allows action learners to experience more qualitative results because they tend to access and explore their own cognitive processes and assumptions and then evaluate the conditions of the relevant context. This type of questioning is more representative of systems thinking than the provocative question because the learner can examine diverse elements (and their interdependence) of the relevant context in more inclusive ways. They can subsequently derive entirely new solutions rooted in the problem's unique context in a real-time manner, considering the people and conditions of the relevant context instead of the people and conditions of a context not associated with the current problem. Insightful questions can result in action learners generating their own solutions instead of transferring cues from others or other experiences. Such action learners can recognize that individuals within the context have diverse ideas or perspectives about the relevant problem that could influence the course of action or provide a starting point from which to engage in further investigation. This leads to more developmental and innovative results than are likely to be derived from the provocative question. From a typical action learning experience, few will learn to engage in insightful questioning (of self and others) to the point that it becomes a natural way of thinking.

After a formal program, action learners tend to informally engage action learning instead of a formal group process with designated airtime. Such engagement can be in one-on-one dialogue, dialogue in meetings, or in very informal spontaneous interactions where they perceive a safe environment. This is very different from the formalized workshop setting where there was a specific process to follow including a finite airtime to discuss the problem, actions taken to date, questions from colearners, and discussion of lessons learned. The change in operationalizing action learning less formally as these participants did should not be construed as relapse or decay. In action learning groups in the United States, colearners typically experience a formal sequential technique that includes questioning. However, Revans, himself, has not prescribed finite and sequential steps for the action learners. He does not espouse learning a sequential technique. He focuses on building capability for the future. Learning and performance (in this case, application) is highly individualized based on the learners' current and future needs, the problem under study, and the relevant contexts. Consequently, the participants learned the technique, but did not apply it. They experienced more meaningful learning that they subsequently applied by translating the results of the technique. This required a longer period of time for cognition and application purposes. Additionally, the program designer (the HR developer) was far removed from the informal learning and application that occurred after the completion of the formal action learning experience.

Finally, learning and application cannot be adequately designed into the experience and appraised by evaluating just one or two of the elements of action learning. The systemic nature of action learning illustrates the intricacy and inter-relatedness of learning, action, accountability, responsibility, and characteristics of the learner, program design, and the context. Evaluating just one or two constructs would not present the full extent of learning or its application.

The conclusions drawn have implications for the theory and practice of action learning. These data add longitudinal insight to the existing research base. These data also highlight that building the capacity for learning needs time to develop; therefore, it is typically not measurable in the short term such as a three-month program. The participants needed more than the three learning group workshops; further support from their managers: and relief from work pressures to focus on, reinforce, and extend their learning. Continued management and HRD involvement need to be designed into the formal action learning experience. This is particularly true when action learners will typically use their learning in an informal and spontaneous fashion instead of a formalized workshop setting—this informal use of action learning is not as visible. The intent of action learning is for the action learner to use an immediate problem as the learning mechanism in the present. However, the long-term focus of action learning is to develop new ways of thinking so that individuals can address future problems in qualitatively different ways. Therefore, time is needed for the HRD practitioner to evaluate the effectiveness of action learning—
effectiveness cannot be validated in the short term. HRD practitioners need to provide safe haven for communities of learning. The safe haven provides opportunities to experiment with and extend new learning, new techniques, new performance strategies, and thought processes without fear of career limitation from executive management, clients, peers, or the self. These communities can focus on learning that is both immediately applicable and strategic.

Mapping Group Dynamics in an Action Learning Experience: The Global Team Process Questionnaire (GTPQ)

Robert L. Dilworth  
Virginia Commonwealth University

Action learning is increasingly used for developing teams, "jump starting" organizational learning, promoting leadership development and transforming an organization's culture. However, there is little research about how action learning is viewed by learners and how the group dynamics within teams dedicated to action learning unfold. Virginia Commonwealth University has given the evaluative area of action learning concentrated address. VCU used a modified version of the Global Team Process Questionnaire to map group dynamics in action learning sets.

Keywords: Action Learning, Evaluation, Higher Education

For the past five years, the Adult Education and Human Resource Development Master's Degree Program at Virginia Commonwealth University (VCU) has been striving to build evaluation techniques specific to the action learning experience. Action learning has become an important part of curriculum design. Dilworth (2000) reported on action learning programs at six universities, including two outside the United States. At VCU, students in the aforementioned Master's Degree Program are encouraged to think deeply about their experience in dealing with a complex, real-world problem that they are asked to solve as part of the capstone course in the program. The students do this as part of an "action learning set" of four to six members. They are asked to keep "learning journals". At the end of their semester-long experience, "students submit an extensive individual report on the action learning process, group dynamics and personal lessons learned" (p. 529).

Why is action learning different than a usual team related undertaking? VCU uses core principles of action learning in its program that are found in varying degrees in most other action learning programs.

The problem to be addressed by the set (or team) is real and in great need of address. It is not fabricated in any way.

1. While it is expected that a solution to the problem can be developed and acted upon, the larger yield is learning itself. The real problem becomes the fulcrum on which critically reflective learning processes occur. The goal from a human resource development standpoint is to develop people who are capable of leading, problem solving, working effectively in teams, and thinking critically in building the long-term strategic capabilities of the organization.

2. Action learning must lead to action (Marquardt, 1999). "Merely producing reports and recommendations for someone else to implement results in diminished commitment, effectiveness, and learning..." (p. 33)

3. Emphasis is on questioning inquiry (the "Q" in the parlance of Reg Revans) as opposed to excessive dependency on "P", standing for programmed instruction (Revans, 1983, p. 11). Revans argues that in a rapidly changing environment we should begin with the "Q" (what is happening, what ought to be happening, and how do you make it happen?).

4. The set has no assigned leader and customarily operates as a self-directed work team with responsibilities shared.

5. Emphasis can be on moving learners away from what they already know, assigning them to work on problems that no one in the set has any great familiarity with. This can lead to fresh questions (the "Q" factor) and a re-examination of basic underlying assumptions. In this format, members of the action learning set are usually assigned a common problem to deal with. In other approaches, the individual set members may have individual problems they work on that are taken from their respective workplaces. In the latter case, the problem will probably only be familiar to the set member studying that issue (unless an entire natural team is committed to problem solution), thus creating an environment conducive to questioning inquiry.

Problem Statement

There needs to be greater attention given to the evaluation of learning that is taking place, as well as group dynamics, in an action learning experience. This is not an area that is well covered, in part because the focus can center on task accomplishment versus learning. Action learning also has many variations in application, and determining how best to evaluate group dynamics and learning across action learning experiences can be problematic.

Theoretical Construct

Action learning traces its origins to action research and Kurt Lewin (Weisbord, 1987).

Lewin intended his enhanced problem solving model to preserve democratic values, build commitment to act, and motivate learning—all at once. Indeed some people have renamed the process action learning to more accurately indicate its nature (p. 87).

The work of Reg Revans over the years has given primary shape to action learning, including refinement of the dimensions inherent in the process (Revans, 1983, 1982, 1980). Those dimensions are highlighted in the introduction to this paper.

Action learning is increasingly finding its way into corporations, often as part of their corporate university. Rather than simply send high potential managers to external executive education programs, these organizations are developing focused large-scale customized action learning programs with measurable results. (Meister, 1998, p. 15) The Global Team Process Questionnaire (GTPQ) was created by ITAP International of Princeton, New Jersey, an organization doing wide-ranging consultancy with corporations world-wide. The fact that the GTPQ is indexed to the global arena makes it doubly attractive as a vehicle for evaluating group dynamics in an action learning set, since sets can often have multi-cultural content. This is certainly true of corporations today, and it can also be true of the university setting. For example, the Adult Education and Human Resource Development Master's Degree Program of VCU partnered with the University of Salford in England in 1996 in organizing an action learning program for US, Canadian and Australian students. (Dilworth, 1996, 1997, 1998, 2000). Further, students in the VCU program in recent years have come from 17 nations.

The GTPQ is a well-established instrument in terms of wide application since its inception in 1993. It has been used extensively (over 30 administrations with global teams), with pharmaceutical companies as well as in the chemical, consumer products and information technology industries (Bing, 2000). Thoroughly tested in a variety of environments, specifically by peer reviews at the end of the process, results have shown that the team with the best level of process (as indicated by the GTPQ) was also rated as producing the highest quality results. The GTPQ is a diagnostic tool which measures process changes over time on global and distance teams. It has also been used for intact, local teams.

Research Questions

The research questions all stem from one overriding proposition, namely that you can evaluate group dynamics and learning processes in action learning sets. Evaluation of group dynamics in teams is not new. What is new is an attempt to map group dynamics and effectiveness of the learning process within an action learning experience in juxtaposition. The specific research questions are:

1. Can a modified version of the GTPQ be used in an academic setting to map group dynamics and effectiveness of learning in an action learning experience?
2. What can administration of the GTPQ tell us about the internal dynamics of an action learning set?
3. What barriers occur in an action learning experience that can stand in the way of the learning process?
4. What positives and negatives do the participants in the action learning experience ascribe to action learning?

Methodology and Research Design

In partnership with ITAP International, the GTPQ was modified to fit the academic setting and obtain information specific to the action learning experience. Most changes to baseline questions were minor (e.g., reference to class versus corporate setting).

The following specific questions were asked in the modified questionnaire. Where a slight adjustment has been made to fit the classroom setting, one asterisk appears. When the question is unique to the particular
experiment in evaluating action learning, a pound sign appears. All other questions listed are baseline questions used without modification. Respondents use a six level Likert Scale in assigning a value (favorable to unfavorable). In some questions, "6" is high and in other cases, "1" is high.

1. Within your team, please characterize the distribution of work among team members over the recent past (equal to unequal).
2. Have your skills and capabilities increased through participation in your team?
3. Do you have time for work on your team's activities?
4. Is the agenda of your team clear? (Clear vs. unclear)
5. Are the roles of the team members clear? (Clear vs. unclear)
6. How effective is the work of your team? (Effective vs. ineffective)
7. (*) Have you had the opportunity to inform others in the class of the work of your team? (No opportunity or need vs. provided a presentation to another group)
8. (*) Have you had the opportunity to learn of comments on your work team from others in the class (No vs. quite a bit)
9. (*) How do you rank the importance of your team to your own future career success? (Of central importance vs. of little or no importance)
10. (*) Is your future career success likely to be positively affected by the team's work? (My future career success will remain unchanged or degraded, to there is likely to be a positive benefit to my future career success)
11. Group communications (Excellent to poor)
12. Describe the level of trust on this team. (Strong to weak)
13. (#) Describe the level of support provided by client(s). (Highly supportive to not supportive)
14. (#) The degree of learning occurring in this course experience vs. other courses you have taken. (Much higher to much less)
15. (#) The extent to which you find this experience challenging vs. other learning experiences in an academic setting. (Much less challenging to much more challenging)
16. (#) How did you find operating in a virtual team environment (i.e., much of the interaction by Internet and telephone vs. a collocated team at a single site? [One action learning set dealt with a client team over 1,000 miles away]
17. Identify a barrier that stands in the way of your team's work.
   a) With respect to your contributions.
   b) With respect to internal team productivity.
   c) With respect to factors, outside the team's control. [These required open-ended response vs. Likert Scaling]
18. (#) List four positives and four negatives in priority order of your experience with action learning thus far. [Students provided open-ended entries]

Two action learning sets were involved in this experiment. One set of five consisted of four females and one male. The other set had three female members and one male member. Administration of the Honey-Mumford Learning Style Questionnaire (LSQ) helped determine the set to which a given student would be assigned. An effort was made to mix learning styles and backgrounds in arriving at action learning set composition.

The larger team was involved with a major examination of how professional development programs needed to be designed and promoted for 500 faculty and staff at a large local community college. The other team dealt with a major project for the corporate university of a major company based in the Mid-West. Their study centered on evaluating how to measure delivery of learning programs. They had on-site visits at the beginning and end of the project (February and April 2000), handling research and interaction with the client team via virtual means in the interval between visits.

Adding to the value of this experiment was the fact that earlier evaluation processes were left in place as the GTPQ was administered. Students kept their learning journals, served as a focus group in discussing their experience as it developed during the semester, submitted a 15 to 20 page end-of-semester essay providing an assessment of the action learning process and group dynamics, and submitted a five to seven page end-of-semester essay on their personal learning. Their personal learning was pegged to critical incidents criteria. (Dilworth, 1998)

The GTPQ was administered twice during the semester. The first administration was done after the team had been through a month of intensive effort and had a chance to develop some group cohesion. That became the baseline index. Three months later, the second administration occurred as the projects drew to a close. It was therefore possible to compare baseline results with the second administration of the GTPQ, do a gap analysis and map trends. This could in-turn be compared with the other evaluative processes used. Following each
administration, ITAP International determined qualitative results via computer analysis and recorded qualitative results.

The action learning sets were given a composite/matrix profile of the overall team averages and range for each question asked, together with individual team member scores for each question. Since all completed their questionnaires independently, there was no way of identifying who was responsible for a given score. The results showed relative alignment in some cases (all scores close to the same) and areas where there were significant perceptual disagreements within the set. This created a basis for meaningful discussions within the set in reviewing and "fine tuning" the group dynamics. It served to open up discussion in areas that might otherwise have been undiscussable.

Each action learning set saw the complete results of the other team as well as their own. Each set then served as a set of "consultants" to the other team in helping them sort through the findings, in determining what they meant and how the team needed to address the findings.

What limitations were there to the research? As with any such investigation, the mix of participants can heavily influence results, no matter how good the methodology or basic learning design (in this case action learning). However, the care in administration of the GTPQ and the forms of triangulation present (e.g., comparing narrative student comments in their essays to GTPQ results) did serve to create a means of interpreting the significance of the results.

Results and Findings

1. Qualitative comparison of GTPQ results with other evaluative reference points (essays) suggest strong congruence, and that is reasonably to be expected. Both record the same experience.
2. Team 2 started with a relatively low profile in terms of performance based on the GTPQ. It then surged based on results of the second GTPQ. Team 1 had a much stronger initial profile. It then slipped back somewhat based on the second administration of the GTPQ, but retained rather high marks across the board. When the second administration of the GTPQ is compared with the first for each team, it reveals the following trends across the question categories (Likert-based items).

<table>
<thead>
<tr>
<th>Improved</th>
<th>Diminished</th>
<th>Unchanged</th>
</tr>
</thead>
<tbody>
<tr>
<td>Team 1</td>
<td>04</td>
<td>11</td>
</tr>
<tr>
<td>Team 2</td>
<td>14</td>
<td>01</td>
</tr>
</tbody>
</table>

1. GTPQ results for both administrations reveal very strong positive ratings for both teams in the following categories:
   a. Work distribution.
   b. Use of time.
   c. Team agenda clear.
   d. Team member roles clear.
   e. Team effectiveness.
   f. Opportunity to inform others.
   g. Opportunity to learn from others.
   h. Future career success positively affected.
   i. Trust.
   j. Learning in the academic course vs. others.
   k. Experience challenging vs. other classroom experiences.
2. The high quantitative results on the GTPQ are mirrored in the quantitative results generated by the usual faculty evaluation form used at the university to assess quality of instruction and the learning experience. Results were uniformly at a median level of 5 (on a Likert Scale, with 5 as the maximum rating). Student essays also reflect the very positive student evaluation of the experience.
3. When set profiles were examined they identified some disparities of view within a set/team. Deviations of two or more Likert ratings between set members in a given area demonstrated to the set that there were some potential problem points in group process. One example of this was when four of five members of a set rated quality of communications to be excellent, while one member rated this area low. Another area of divergence noted was related to time. Four found adequate time to work on the project and one did not. Such differences are important to know. They provide a basis for intervention strategies within the set itself to alleviate concerns and improve group process.
While students placed high value on the learning, they also cited barriers to the team's work. They were invariably time related. Some verbatim student comments were:

a. Family time is reduced.
b. Time: Balancing work and this project because of the time spent on the project. I feel as though I almost need to be "on leave" from work in order to do extensive research, meet with the client, prepare presentations, etc.
c. Trying to meet at a convenient place and time for all members (not a very big barrier though!)
d. Attendance and punctuality has marginally interfered with productivity, but may have undermined group process (e.g., communication and cohensiveness...).

What is shown below is a representative sampling of student comments re: the most positive and negative aspects of the action learning experience (Number 1 in the priority order, of four asked for)

Positives
- Good team cohesiveness
- People from different areas and backgrounds working together
- More camaraderie than traditional courses
- Group interaction
- Working with the team and coming from a variety of experience
- Communicating within loop—sharing concepts with all for new ideas
- It's good (to a degree) that we are unfamiliar with the client organization—fresh perspective
- Developing friendships with team members

Negatives
- Confusion as to which group member should answer questions when asked by the client
- Decision making can be a long process
- Difficult to coordinate logistics
- Stress
- Must rely on all members, i.e., have to wait when one or more are late
- Overwhelming, easy to lose confidence in project
- Having to coordinate with all even with minor issues
- The client didn't seem to embrace, by way of deep introspection, action learning
- Difficulty getting a real grasp on what is expected of our team (deliverables)

Conclusions and Recommendations

1. To use the GTPQ effectively requires that the team have time to form and coalesce before administration of the instrument. In an earlier pilot test by the researcher, the teams involved did not spend extended time together. Therefore, team members did not feel any real vesting in team performance. Further, there was no single project focus as was true in this action learning experience. In the action learning experience, the project work was tightly bounded by time. How well the group did played an important part in determining the individual student grades.

2. When used in situations such as the action learning experience, where the work tempo is intensive and success of the team depends on good group dynamics, the GTPQ seems a very powerful tool. It also provides a basis for the team to target on specific areas that can interrupt or impede team effectiveness. That allows the team itself to deal with such problems. Since problems have been made evident by the team members, themselves, through anonymous completion of the GTPQ, the issues are made authentic and legitimate. It is worth noting that when results are excellent, good performance can end up being further bolstered (reciprocal causation). If an external facilitator, on the other hand, were to identify problems to the group based on observations of group activity, that would not tend to carry as much weight. It would be group process as seen through the eyes of someone not a continuous part of that process, rather than the inner conscience of the group.

3. When the GTPQ is slightly modified and wedded to the action learning experience through use of some open-ended questions, it can be doubly useful in an action learning context. The members of the action learning set receive not only quantitative feedback in this case, but qualitative as well. What this suggests is that the GTPQ can be made even more effective and useful by including questions customized to the context involved. This can be especially useful in dealing with cross-cultural situations where an understanding of cultural nuance can be important.
4. To an indeterminate extent, the GTPQ itself served as an effective intervention, in that its administration caused members of the action learning sets to consider a number of areas that are critical to the effectiveness of any group/team (e.g., clarity of team member roles and the level of trust within the team).

5. Use of the GTPQ in this instance, since it was used in tandem with several other evaluative sources (i.e., two essays, professor observation, class as focus group and the usual faculty/course evaluation at the university), provided a means of triangulating the results.

6. In responding to those question areas unique to the classroom version of the GTPQ, students rated the action learning experience more challenging and of higher learning value than other university courses they had taken. In terms of challenge, one set assigned an average value of 5.4. The other set averaged 4.5 (with a Likert Scale rating of six being the maximum in this instance). In terms of learning compared with other courses, one set assigned an average value of 2 and the other 1.75 (the best Likert Scale rating being 1 in this case).

How this Research Contributes New Knowledge in HRD

1. It shows how a proven survey instrument can be further strengthened through customization and the addition of a qualitative component to go with the quantitative one.

2. The GTPQ seems to have particular utility in an action learning experience because it promotes critical reflection at both individual and group levels, allowing the group itself to determine how best to self-facilitate progress. It can also give an external facilitator a legitimate basis for helping a group work through its self-determined problem areas.

3. As the use of self-directed work teams broadens, with the need to have them truly self-direct their activities, an instrument like the GTPQ can be of great value. As indicated earlier, it can be of particular benefit in identifying areas of possible culture clash when cross-cultural teams are being used. Since some cultures are reluctant to discuss problems openly, this can be a means of getting areas of concern into the open for discussion.

Comparing the Learner's and Educator's Perspective on Conditions that Foster Transformative Learning in Action Learning Programs

Judy O'Neil
Partners for the Learning Organization

Sharon Lamm
Inside<->Out Learning

This paper looks at the results of two action learning studies to compare the learner/participant perspective with the educator/learning coach perspective on what individual, program and organizational conditions foster transformative learning. The results show some agreement in the individual context; significant agreement in the program context; and little agreement in the organizational context, along with two areas of interest for Mezirow's work on transformative learning.

Keywords: Action Learning, Transformative Learning, Rational Discourse

Problem Statement

Action learning is said to help bring about transformative learning (Dilworth, 1996; O'Neil & Marsick, 1994; Pedler, 1996). Research has been done from the learner/participant perspective that describes what they experienced that brought about transformative learning (Lamm, 2000; Weinstein, 1995). Research has also been done that tells us what educators/learning coaches do to try to help bring about transformative learning (O'Neil, 1999). What we don't know is how the learning conditions that learners describe as fostering transformative learning compare with those conditions that learning coaches said they created to foster such learning. In other words, do learning coaches who espouse helping learners engage in critical reflection to lead towards transformative learning actually create situations that, from a learner’s viewpoint, foster transformative learning? By having a better understanding of this phenomenon, human resource managers can improve the design of action learning programs and learning coaches can improve their practice.

Theoretical Framework

The concept of action learning originated with the work of Reg Revans in England in the 1940s (1989). We generally defined action learning as follows:

"An approach to working with and developing people that uses work on an actual project or problem as the way to learn. Participants work in small groups to take action to solve their problem and learn how to learn from that action. Often a learning coach works with the group in order to help the members learn how to balance their work with the learning from that work" (Yorks, O'Neil & Marsick, 1999, p. 3).

Through an analysis of the different ways in which action learning is being practiced, O'Neil (1999) identified four 'schools' of action learning practice: the scientific school, the tacit school, the experiential school, and the critical reflection school. These 'schools' are based on the way in which practitioners view learning takes place in action learning. The school that is most pertinent to this paper is the critical reflection school. In the critical reflection school, practitioners believe participants need to go beyond problem solving to problem posing, and reflection on the basic premises that underlie their thinking. Mezirow (1991) refers to this kind of reflection as critical reflection. The explicit intention of fostering critical reflection is the primary differentiator of this school from the other schools.

Learning coaches who advocate the critical reflection school believe learning takes place through critical reflection and in their practice try to create situations in which this type of reflection would take place. The goals of this school are personal and organizational transformation (Yorks, O'Neil & Marsick, 1999).

For the purpose of this paper, we use an adapted version of Mezirow's (1995) definition: Learning becomes transformative when a distorted, inauthentic, or otherwise unjustified assumption is replaced by a new or transformative point of view (meaning scheme) or habit of mind (meaning perspective) resulting in a more differentiated, complex, inclusive, reflective meaning structure as a guide to action (Lamm, 2000, pp. 222-223).

Copyright © 2001 Judy O'Neil and Sharon Lamm
Research Questions

1. Do the situations/conditions that learning coaches create with the intention of leading to transformative learning actually enable transformative learning from the perspective of participants?
2. Are there situations/conditions that learning coaches create with the intention of leading to transformative learning that participants don't identify?
3. Are there situations/conditions participants say bring about transformative learning that learning coaches don't explicitly identify?

Methodology

This study compares the results of two dissertation research studies—one that looked at transformative learning in action learning through the eyes of learners/participants and one that looked at action learning through the eyes of learning coaches (Lamm, 2000; O'Neil, 1999). The comparison was done via a content analysis (Weber, 1990) of the findings from both dissertations. The two researchers did the content analysis of the findings independently and the results were compared to help promote inter-rater reliability (Miles & Huberman, 1994).

The dissertation that looked at transformative learning (Lamm, 2000) from the learners' eyes addressed whether and how leaders who participated in an action learning program experienced transformative learning, and which if any leadership behaviors were most likely influenced through participation in the program. This dissertation was a qualitative case study in one global corporate organization. The research sample included 24 learners, 24 co-workers who work with them, one key executive, and three action learning coaches. A number of data collection methods were used including: document analysis, pre-interview forms, learner, executive and learning coach interviews, learner leadership reflection forms, co-worker critical incident questionnaires, and Burke's (1992) self and co-worker leadership assessment inventory (LAI).

Transformative learning occurred in the areas of self-understanding, inclusiveness and reflective action. Also human qualities in leadership were enhanced, namely, empathy, humility, tolerance and patience. A model for cumulative transformations was developed. A complex interaction of individual, program and organizational conditions fostered a cumulative transformation process of multiple new awarenesses, verification/support, and practice. The after-program conditions were as important as stimuli that triggered transformative learning.

The dissertation that looked at transformative learning through the learning coaches' eyes (O'Neil, 1999) addressed what action learning coaches do and why they do it and what they think is distinctive about their role in helping individuals learn from their experience. This dissertation was a modified phenomenological study of 23 learning coaches in the US, UK and Sweden. It used a variety of qualitative research techniques including "Self Q" interviews (Bougan, 1983), semi-structured interviews, and observations. The focus from the dissertation for this paper is on the view of those learning coaches who espoused helping learners engage in critical reflection towards transformative learning.

Key findings pertinent to this paper are that learning coaches who have a theoretical underpinning of how learning takes place in action learning and an internal, metaphorical view of their practice are more likely to have their espoused theory of practice match their theory-in-use. Second, learning coach interventions that are unique to action learning focus on creating situations which would promote and support learning, particularly learning that leads to critical reflection and possibly transformative learning.

The limitations that need to be acknowledged in looking at the findings from this study include the following:
- only the findings of those learning coaches who espoused using critical reflection to create transformative learning—a total of 8 out of 23—were used for the content analysis
- the study of learners was confined to one organization within one action learning program, while the learning coaches worked across a wide spectrum of academic and corporate organizations and action learning programs.
- learning coaches who did not work in the program studied by Lamm were included in O'Neil's learning coach sample.
- the original purpose of Lamm and O'Neil's study was not to compare learner and learning coach perspectives.
Results and Interpretations

There are a number of similarities in what the learners think are conditions that support their transformative learning and what situations learning coaches create to enable transformative learning. There are also some situations emphasized by the learning coaches that are not explicitly discussed by the learners and some important to the learners not addressed by learning coaches. The results are presented from the learner perspective and use the terminology from each separate study in describing the situations and conditions discussed. Results are discussed for each of the research questions and are followed by interpretation of these results.

Table 1. Research Question 1: Do the situations/conditions that learning coaches create with the intention of leading to transformative learning actually enable transformative learning from the perspective of participants?

Although there is agreement in several areas, some agreement is stronger based on the number of learners and learning coaches who agreed. These stronger agreements are discussed below.

**Individual Contextual Conditions**

The key match in learner and learning coach perspectives within the individual context category is the importance of the learner having little to no experience in a learning area. All 22 of Lamm’s learners discussed this condition. This condition was supported by the program design of having unfamiliar problems in unfamiliar contexts with non-expert participants on project teams. These design criteria were expressed as a basic part of action learning by almost all coaches in O’Neil’s study including those not in the critical reflection school. This feeling of “not knowing” often fostered learners in trying on new points of view which Lamm (2000) defined as a new awareness. Prior to trying on this new point of view was what appeared to be a disorienting dilemma where learners realized that the way they originally viewed a situation/perspective might not be accurate or the best interpretation. Table 1a displays an example of this match:

**Table 1a. Little or No Experience in a Learning Area**

<td><em>(Before the program) I had a limited cross-function view...I was not aware how people working in other parts of the world looked upon us as a company...during the program, I realized other people looked upon things differently. (Back)</em></td>
<td>You might have in-company programmes where projects are undertaken in unfamiliar departments. ... I'm in with the Reg (Revans) system here you know—beware of the experts. Beware of those who know, who’ve always got an answer. (Wendy)*</td>
</tr>
</tbody>
</table>

**Program Contextual Conditions**

The first agreement in this area is continual action and reflection. All 22 of Lamm’s learners and the 8 learning coaches in the critical reflection school in O’Neil’s study described action and reflection as fostering transformative learning. The learners said that their learning coaches played a key role in this balance and the balance is considered an integral part of the ARL™ process. The coaches discussed using reflection—in Mezirow’s language (1991) some described process reflection or content reflection—but always oriented towards creating situations for learning. These learning coaches also stressed the use of critical reflection to which the learners did not explicitly refer. This lack of reference to critical reflection may have been because the learners lacked the appropriate terminology; there was a lack of probing for critical reflection; or an issue involving adult development levels that will be discussed more in the conclusions section of the paper.

**Table 1b. Continual Action and Reflection**

<td>Because a lot of courses...they pass by, but this I think stuck in our minds...In this case it was repeatedly coming back to the same over emphasizing it...Did we do things right? What shall we do better? Making us almost angry how much...reflection...but if we hadn’t done like that, it might have been that I wouldn’t have remembered it. (Back)</td>
<td>But I'd certainly stay after and ask questions like questions you might agree to reflect and listen to. ... How do you understand that Jean is interpreting our situation? Could you interpret it any differently? Alternative interpretations come to light that would drive people into more deep, you know, thinking about some things. I might do that sort of thing. (Pete)*</td>
</tr>
</tbody>
</table>

The continual action and reflection is linked to the program condition of intensity, duration and frequency. As illustrated by Back in Table 1b, all subjects considered for this paper named this as an important condition in fostering transformative learning. Action learning programs have a variety of designs. When program sessions are spread over time, learners can try out new behaviors back in their lives, project work continues between program sessions and learning coaches are better able to create conditions to allow learning to happen. The action and...
reflection balance is continuous throughout the program, which assists learners in making new behaviors that work as a habit.

So the second area of substantial agreement is the intensity, duration and frequency of the program. All 22 of Lamm's learners and the 8 learning coaches in the critical reflection school in O'Neil's study discussed this phenomenon. The learners discussed how they could not escape the intensity of the program, with common mention of long hours and fatigue, but agreement about the value of a program of this duration. The coaches also discussed the issue from the opposite perspective. They expressed concern about the need to have sufficient time to effectively help people to engage in learning that could result in transformative learning. This difference in perspective can be attributed to the fact the coaches were engaged in a variety of program models—not all of which had the amounts of time they felt were sufficient for their work.

<td>That's one of the good things this program has...It takes almost a year, so I mean, you get reminded. You get a new shot every three months...you get a chance to do something about what you learned, and implement it...One of the things we regret is that it has stopped. (Mike)</td>
<td>There's a mixed dilemma (with short programs) because if you wait until they really need it, it's the end of the program...My sense it it's not ideal in terms of timing. (Hillary)</td>
</tr>
</tbody>
</table>

The final area in Program Contextual Conditions is an open and trusting environment. Again, all subjects being considered for this paper in both studies agreed on this condition. The learners defined it as one where they felt safe to be honest and vulnerable and supported in their learning. Five of the learners specifically linked the learning coaches to creating an open and trusting environment. The coaches discussed norms such as confidentiality and setting boundaries between the action learning group and the organization and used words like collaborative, a "context of grace", ethics and humane in characterizing the kind of environment they were trying to create. The kind of environment described by both the learners and coaches alike has a lot of resemblance to Mezirow's conditions of rational discourse (1991), which will be discussed more in the conclusions of the paper.

<td>No match</td>
<td>Learning coach 'role metaphor' to say nothing and be invisible</td>
</tr>
</tbody>
</table>
Of the two Program Contextual Conditions explicitly identified by coaches and not learners, the most critical is the use of questions. Questions, or 'questioning insight', have always been considered a fundamental part of action learning (Revans, 1989; Weinstein, 1995). Learners also did not explicitly identify learning coaches as instrumental in their transformative learning. These non-matches could be attributed to the fact that both questions and coaches are such an integral part of the action learning process they became 'invisible'. The earlier quote by Back alludes to questions being asked repeatedly during the reflection process and in O'Neil’s findings many of the learning coaches tried to attain the role of “saying nothing and being invisible”.

Table 3. Research Question 3: Are there Situations/Conditions Participants Say Bring About Transformative Learning that Learning Coaches don’t Explicitly Identify?

<td>No match</td>
</tr>
</tbody>
</table>

There was one Program Contextual Condition and three Organizational Contextual Conditions that learners identified as helping to foster transformative learning while learning coaches did not. The program condition mentioned by 11 learners was how Informal time such as drinking at the bar, eating, and traveling together fostered transformative learning. As one learner said, “you would have to be deaf, dumb and blind not to pick up something after spending so much time together – eating and traveling together.” This finding confirms literature on the importance of informal learning (Marsick & Watkins, 1992). Learning coaches may not have mentioned informal time as a condition because, while it is part of the program design, it is not an activity that coaches purposefully engage in.

The Organizational Contextual Conditions described by learners as important in fostering transformative learning but not by learning coaches were Supportive organizational context, Job change around the time of the program, and Supportive boss/co-workers. These organizational conditions were often mentioned as important in continuing to apply new behaviors and try on new points of view back in the workplace. There are a few possible explanations for the learner/learning coach discrepancy around Organizational Contextual Conditions. First, as described in the limitation section above, learning coaches were from varied backgrounds and worked across several organizations, while the learners were within one organization. Second, a learning coach’s view is often more within the context of the program since their role is within an action learning program.

Conclusions and Recommendations

There is a significant amount of agreement between the two studies on the conditions that can help to enable transformative learning. Both the major areas of agreement in the individual and program context, and the main area of disagreement, the organizational context, can be attributed to a number of reasons as discussed in the preceding section.

There are two areas of results from this study, however, that have a particular relationship to Mezirow’s work on transformative learning. The first is in the finding of the agreement of a need for an open and trusting environment and the second is the issue of the coaches advocating the use of critical reflection to enable transformative learning versus the learners not explicitly identifying critical reflection as a part of their transformative process.

The finding of the need for an open and trusting environment would appear to confirm Mezirow’s ideal conditions where learners are able to feel safe to share openly (1991).
"Under these optimal conditions, participants will:

- have accurate and complete information
- be free from coercion and distorting self-deception
- be able to weigh evidence and assess arguments objectively
- be open to alternative perspectives
- be able to become critically reflective upon presuppositions and their consequences
- have equal opportunity to participate (including the chance to challenge, question, refute, and reflect and to hear others do the same), and
- be able to accept an informed, objective, and rational consensus a legitimate test of validity" (po. 77-78).

For example, Mezirow talks about an environment in which learners are free from coercion and open to alternative perspectives. One learner said, “I felt secure in the program. ... if I felt insecure, I think that would have blocked me from learning experiences”. A learning coach described an intervention, “And my intervention seemed to create some sort of atmosphere which almost helped heal the thing”. Both described action learning programs that seemed to create these ideal conditions.

Addressing the second issue, Mezirow theorizes that critical reflection is needed for transformative learning (1991). The learning coaches from the critical reflection school would agree with him. Why then didn’t the learners, who experienced transformative learning, identify critical reflection as one of the conditions? Two reasons were discussed earlier—the learners did not have the language to describe what could be interpreted as critical reflection or the research didn’t probe for critical reflection. Another view might be that these learners didn’t experience critical reflection. Fisher and Torbert (1995) theorize that critical reflection and transformative learning can only take place with people who are at a high developmental level. Perhaps people who are at different developmental levels experience transformative learning differently. Mezirow and Lamm (1997) agreed that absent chance occurrence of a traumatic event, cumulative transformations seem most likely fostered in an action learning program. In this case the learners might have experienced a series of single loop learning cycles that resulted in a cumulative transformative learning experience (Lamm, 2000). So while learning coaches may be trying to create situations for critical reflection, many learners may be in “over their heads” (Kegan, 1994) from a developmental perspective.

More research is necessary to examine the issue of how the developmental level of learners may impact their transformative learning experience. A study could be set up with the specific objective of comparing learning coach and learner perspectives. The conditions suggested in this paper could be used to test whether similar conditions are found in other contexts while at the same time allowing for new emerging conditions. Perhaps using a methodology like mixed focus groups of learning coaches and learners could foster a live dialog around such condition comparisons. Such research could also identify possible explanations for discrepancies in learning coach and learner viewpoints.

How this Research Contributes to New Knowledge in HRD

This paper presents a unique look at research that combines findings from two exiting studies to produce a new set of findings. These findings add to the theory base of both action learning and transformative learning, as well as provide knowledge useful to learning coach practitioners. Finally, the paper opens new avenues for research, particularly in the area of transformative learning.

Workplace Application of HRD Concepts as Perceived by Non-Traditional Adult Students and their Workplace Supervisors

Kit Brooks
Dale E. Thompson
Elizabeth S. Lizárraga
University of Arkansas, Fayetteville

This study examines non-traditional students' transfer concepts taught in an accelerated undergraduate HRD degree program. It focused on students' application of learned skills and concepts. Students and their workplace supervisors were interviewed over the telephone regarding the evidence of application of learning within the workplace. Results seemed to substantiate the application of skills and concepts learned in the HRD program was transferred to the workplace, and the organization and the individual benefited by the skills and concepts learned.

Keywords: Transfer, Evaluation, Qualitative

This study explores student and supervisor perceptions of application within the workplace of skills and concepts learned in an accelerated undergraduate Human Resource Development (HRD) degree program. In 1999, a total of 62.5 billion dollars was spent on training in the U.S. (Training, 1999). Recent studies suggest that actual transfer of new skills and knowledge back to the job as a result of training ranges from 10 to 30% (Brinkerhoff & Gill, 1994; Brinkerhoff & Montesino, 1995; Tannenbaum & Yukl, 1992; Baldwin & Ford, 1988; Broad & Newstrom, 1992). “The focus on performance and its requirement for transfer of learning, means that a shift in perspective is necessary...” (Phillips & Broad, 1997, p.3). This shift in perspective has resulted in top managers demanding evidence that their training investment has paid off or contributed to increased performance outcomes.

Transfer of Learning

“Transfer of learning is the effective and continuing application by learners – to their performance of jobs or other individual, organizational, or community responsibilities – of knowledge and skills gained in learning activities “ (Phillips & Broad, 1997, p.2). Baldwin & Ford (1988) suggest that transfer requires learned behavior to be generalized to the job context and maintained over a period of time. Factors that affect the learning outcomes include design of learning program, characteristics of the learner, and work-environment characteristics. Figure 1 illustrates Baldwin and Fords model of the transfer process (1988).

Figure 1: Baldwin & Ford’s Model of the Transfer Process

Copyright © 2001 Kit Brooks, Dale E. Thompson, Elizabeth S. Lizárraga
The application of skills learned through training and education and its impact on workplace performance is important to consider given the vast amount of dollars invested in these interventions and the performance expectations associated with training and education. The incorporation of learning principles, the sequencing of learning material, and job relevance of learning content are the learning input factors that affect the learning outcomes. Work-environment characteristics that affect learning outcomes include supervisory or peer support as well as constraints and opportunities to perform learned behaviors on the job. Learner characteristics that influence learning outcomes include ability, personality, and motivation.

Evaluation of Learning

Evaluation is a method of gathering data to determine if learning activities have value (Broad, 1997). Kirkpatrick's (1994) model measures the value of four separate learning domains. The four levels or domains include: (a) Level I - Reaction: measures how learners feel about learning/training, (b) Level II - Learning: evaluates what was learned and retained from the learning experience, (c) Level III - Behavior /Application: evaluates the degree to which learners apply what was learned on the job, and (d) Level IV - Results: evaluates the impact that transfer of learning has on the business.

Phillips and Broad (1997) suggest that while providers of learning have typically evaluated participants' reaction to learning, fewer have measured the knowledge and skill gains at the end of the learning event. This practice of low-level evaluation has contributed to the scramble for these providers to find evidence of transfer of learning and improved performance in the current management climate of improving performance while cutting costs and demonstrating return-on-investment (Phillips & Board, 1997).

This focus on performance improvement can be traced in part to the dismal results that business and industry have garnered from the exorbitant amount of money that was allocated in training over the past decade. According to Dixon (1992), three factors are driving organizations to become more productive and intensify the organizational emphasis on learning. These forces include the changing nature of work, the competitive challenges associated with the global economy, and the increasing pace and unpredictable nature of change. Zuboff (1988) posits that information technology has altered the basic assumptions regarding work and learning.

The informed organization is a learning institution, and one of its principal purposes is the expansion of knowledge—not knowledge for its own sake (as in academic pursuit), but knowledge that comes to reside at the core of what it means to be productive. Learning is no longer a separate activity that occurs either before one enters the workplace or in remote classroom settings. Nor is it an activity preserved for managerial groups. The behaviors that define learning and the behaviors that define being productive are one and the same. Learning is not something that requires time out from being engaged in productive activity; learning is the heart of productivity. To put it simply, learning is the new form of labor (p. 395).

The emphasis on evaluating results of learning has strong implications for HRD professionals who by the nature of their positions are typically charged with managing learning within organizations.

Background

A baccalaureate degree in vocational education with a major in Human Resource Development for adults in the workforce was developed at the College of Education, University of Arkansas, in the Department of Vocational and Adult Education. Requiring 125 credit hours, the program allows students with significant workplace experience to receive up to 33 credit hours for experiential learning. HRD courses and internships provide the upper division courses required for degree completion. Students must meet the 56-hour general studies requirements of the University, courses that can be taken in a two-year postsecondary setting. Credit granted through documented prior work is accomplished through composite-portfolio documentation following a standardized format and Academic Standards as suggested by the Council for Adult and Experiential Learning (CAEL). Applicants will be required to develop a composite-portfolio through which they petition for and are awarded academic credit toward an undergraduate degree in Vocational Education.

Courses include (a) skills and strategies in professional development, (b) strategic planning and development, (c) leadership, (d) team building, (e) research and evaluation, (f) communication, (g) adult learning, and (h) skills in instruction and facilitation.

The HRD program component was introduced in Fall 1996 and was offered to a group of approximately 40 students via compressed video distance education at four sites on Friday evenings and Saturdays. The courses were offered in an accelerated format, meeting 9 weeks instead of the standard 15 weeks. Currently, there are five different groups of students involved in the program at nine different sites throughout the state.
Purpose of the Study

Spender (1992) posits that firms are engaged in two processes: knowledge creation and knowledge application. Demsetz's (1991) suggests that the efficiency in the acquisition of knowledge requires that individuals specialize in specific areas of knowledge, while application of knowledge to produce good and services requires the bringing together of many areas of specialized knowledge. Reich (1987) posits that the learning process is central to continuous organizational improvement and enhanced performance and that all learning in an organization must necessarily occur though individuals. This study proposes to move beyond the traditional Level III evaluation of student application of learned HRD concepts. The purpose of this study is to explore student and supervisor perceptions regarding application within the workplace of skills and concepts learned in the HRD program. The research design is focused on identifying the Level IV impact upon their organizations.

Methods

This study used qualitative methods as the primary research design. A fundamental characteristic of qualitative research is its in-depth exploration of a phenomenon and its context (Densin & Lincoln, 1994; Fryer, 1991; Patton, 1990). Telephone interviews were conducted with each student and their workplace supervisor from the sample. A structured, open-ended interview guide was used for each telephone interview. The interview guide consisted of questions that explored student and supervisor perceptions regarding application of concepts and skills learned in the HRD program. Interview questions included:

Student Interview Guide

1. The concepts / skills that were taught in the HRD program included: communication, leadership, principles of adult learning, instruction and facilitation, needs assessment / research, team building, and professional development. Describe how have you applied the concepts that were presented in the HRD program.
2. How has your organization benefited by your participation in the HRD program?
3. How has the HRD program benefited you personally?
4. How has the HRD program benefited you professionally?

Supervisor Interview Guide

1. The concepts / skills that were taught in the HRD program included: communication, leadership, principles of adult learning, instruction and facilitation, needs assessment / research, team building, and professional development. Describe how [name of student] has applied these concepts on the job.
2. How has your organization benefited by [name of student] participation in the HRD program?
3. How has the HRD program benefited [name of student] personally?
4. How has the HRD program benefited [name of student] professionally?

Both student and supervisor interviews were tape recorded with participant consent. Numerical codes were assigned to each interview to protect anonymity of the participants during data analysis. All interviews were subsequently transcribed and analyzed using a computer-based qualitative data analysis program. Because this was a descriptive and exploratory study, the data were analyzed for patterns.

In accordance with qualitative methods, research participants were selected using purposeful sampling. Patton (1990) suggested that the power of purposeful sampling methodology is selecting information-rich cases for the purpose of learning a great deal about issues of central importance to the research. Criterion-based purposeful sampling was used to select individual participants. To be included in the study, the participants had to meet the following requirements: (a) student participants were from the first and second program cohort, (b) student participants had completed all the HRD courses, (c) student participants had the same workplace supervisor throughout the program, (d) student participants consented to be interviewed, and (e) students consented to having their supervisor interviewed. Workplace supervisors were selected if (a) they consented to participate in the interview, and (b) if they had supervised a student throughout the program. Eighteen students and their supervisors met all of the criteria. Participants represented the following fields: banking, health care, manufacturing, public utilities, and post-secondary education. Participants represented both supervisory and non-supervisory positions.
Data Analysis

Because the primary focus of this study is the application of concepts and skills that were transferred from classroom to workplace, participants' responses were analyzed and subsequently coded to identify patterns in the data that described evidence of knowledge transfer. HRD course concepts and skills focused on communication, needs assessment, leadership, professional development, adult learning principles, instruction and facilitation. Data from each interview were coded to identify evidence of application in the workplace of these skills and concepts. Each student and supervisor response has been coded to provide an audit trail that describes the context of the comments. Miles and Huberman (1994) describe an audit trail as a method of logging and describing our procedures and data clearly enough so that others can understand them, reconstruct them, and scrutinize them. The trustworthiness of the study is contingent upon the audit trail being (a) complete, (b) comprehensible, and (c) systematically related to methodological approaches (Lincoln & Guba, 1985).

Results

In this study students and their supervisors were asked to indicate how skills learned in the HRD program were applied within their workplace. This section summarizes the participants' descriptions and examples of the transfer of skills and concepts from the classroom to the workplace. The skills and concepts described by participants include communication, leadership, adult learning principles, instruction and facilitation, evaluation/research, teambuilding, and professional development.

Application of Communication Skills

Students reported that their improved speaking skills had significant impact within their workplace. They reported being more comfortable speaking in front of groups. Due to their improved listening skills, they indicated an increased ability to understand co-workers and their problems. This enabled them to respond more appropriately to what was communicated by others. The students also reported that their non-verbal skills had been developed during the program. This has also improved their ability to better “read” people and respond appropriately. Generally, students reported that being more focused on the communication process and using the skills and strategies presented in the HRD program has increased their effectiveness at work.

The supervisors indicated that the students that had completed that HRD program exhibited increased confidence when communicating to co-workers and clients, and a better understanding of communication methods, and increased ease and ability to disseminate information throughout the organization.

Application of Leadership and Teambuilding Skills

Students perceived that they were better managers because their “people skills” had improved. This was described as being able to provide a more productive environment for their co-workers due to the skills learned in the leadership HRD program.

Supervisors described leadership changes that included improved organization skills, the ability to motivate, lead teams, and delegate tasks. They also observed improvement in decision making, coordinating others, planning and facilitating meetings, and mentoring others.

Application of Adult Learning Principles

Students reported applying principles of adult learning in various ways. Examples of these applications included using professional presentation methods when delivering information to co-workers and clients. Students commented on using the techniques that facilitate learning during staff and company meetings and when dealing with external clients. Students indicated that understanding the different learning styles impacted formal and informal communication processes.

Supervisors indicated that students had gained the ability to establish / revise internal training programs that reflected effective adult learning principles. Students not only managed the training programs, but also expanded their roles as facilitators. Supervisors also reported that students demonstrated the relevance of adult learning theory to functional management skills.
Application of Facilitation and Instruction Skills

Many students reported using facilitation and instruction skills learned in the HRD program by assessing and altering their current training programs and developing new programs. Some students developed curriculum and manuals to facilitate learning. Others altered the employee evaluation process within their workplaces.

Supervisors commented on the students' ability to suggest and design alternative training programs while streamlining various processes. They also commented on students' ability to identify resources to facilitate workplace learning.

Application of Research and Evaluation Skills

Students felt that their increased research and evaluation skills helped them assess various organizational needs and design effective methods to evaluate the success of programs implemented to address the identified needs.

Supervisors indicated that students made databased suggestions and decisions regarding organizational policies and procedures. Examples of this included designing performance-based job descriptions and multi-rater evaluation processes.

Application of Professional Development Concepts

Students reported that they continue to assess themselves and their competencies as their roles change within the workplace. Many continue pursuing formal and informal professional development activities in order to reach their professional demands and goals. Many reported routinely reading professional journals and participating in professional associations as a means of continuous self-improvement.

Supervisors indicated increased professionalism among the students from the HRD program, as well as the ability to identify and locate appropriate professional resources that benefited the organization.

Limitations of the Study

This study contributes to the knowledge base in HRD by demonstrating that multiple perspectives can provide powerful data regarding a phenomenon under investigation. This methodology allows the researcher to validate and contrast diverse perspectives regarding identical concepts. And finally, it goes beyond program evaluation that examines singular perspectives at the reaction level. While the results of the research are significant, the study's limitations should be considered. Specifically, this study relied primarily on self-reported information. There was no observation of reported information that would further strengthen the data.

Conclusions and Recommendations for Further Study

Aside from affirming that transfer of learning from the classroom to the workplace did occur, the underlying theme that emerged from this study seemed to suggest that the individual and the organization benefited by this ability to transfer knowledge and skills from the learning environment back to the working environment. While both supervisors and students responded to specific questions, they indicated that students were better employees as a result of attending the HRD program. Students reported feeling more qualified and confident while supervisors reported observing enhanced leadership qualities among students.

This study indicates that not only did transfer of knowledge occur, but also the application of the knowledge required synthesis of different types of knowledge. It reasonable to assume that there is a causal linkage between learning, transfer, and individual and organizational benefit. The results of this study indicates that students developed cognitively, behaviorally, and affectively as a result of learning HRD concepts and then applying these skills to the workplace.

While students and supervisors often used different words and examples to describe their perceptions of how learning transferred and was applied within the workplace, patterns across the data from both populations confirm that transfer of learning did occur. However, there is a need for further study to better understand the relationship between learning and transfer. For example, we did not investigate the conditions that the literature indicates affect transfer of learning within the workplace, nor did we examine the factors associated with the learning environment of the HRD program that may have affected transfer. A study that examines various types of support and opportunities for students to try out their newly learned skills is indicated. It would also be interesting to explore the motivational aspects of transfer of learning as well as the cognitive and environmental factors that
influence this phenomenon. Exploring the impact of the methods used to teach coursework in the HRD program and socialization processes would also be advisable.

Fryer, D. (1991). Qualitative methods in occupational psychology: Reflections upon why they are so useful but so little used. The Occupational Psychologist, 14. (Special Issue on Qualitative methods), 3-6.

The purpose of this study was to investigate how adult educators negotiate power and interests in program planning for training and development in a corporate setting. The research methodology was a descriptive qualitative study of typical program planning practices of adult educators in a multi-national corporation. The chief finding was that planners' "practical" strategic action for negotiating interests and power varied according to specific situations and how planners perceived the involvement of various stakeholders.

Keywords: Power, Negotiation, Stakeholders

Problem Statement

Much of the educational program planning literature proposes an ideal, rational model for how educational programs should get planned in organizations (e.g., Apps, 1979; Boone, 1985; Boyle, 1981; Brinkerhoff & Gill, 1994; Broad & Newstrom, 1992; Knowles, 1980; Sork & Buskey, 1986; Sork & Caffarella, 1989). Research has demonstrated, however, that the actual practice of planning and implementing educational programs differs significantly from these rational models (Cervero & Wilson, 1994, 1996, 1998; Sork, 1996, 2000).

Indeed, education planning in business and industry always occurs in specific settings – settings which are marked by a variety of stakeholder needs and interests as well as organizational opportunities and restraints. To this end, Cervero and Wilson (1994, 1996, and 1998) contend that planning is essentially a social and political activity in which people negotiate with each other to determine the eventual output of an education program. They write that "putting practice into its social context inextricably links planners' actions to the complex world of power relationships and interests" (1994, p. 28).

As a result, research in the past decade has begun to focus attention on what Sork (1996, 2000) refers to as the socio-political and ethical dimensions of program planning. Cervero and Wilson (1994, 1996, & 1998) argue that program planning must be understood as a social activity in which adult educators negotiate personal and organizational interests within relationships of power. Their research has demonstrated that stakeholder interests are causally related to which programs get planned. A number of investigations have demonstrated the centrality of negotiating power and interests in educational program planning (e.g., Mills, Cervero, Langone, & Wilson, 1995; Rees, Cervero, Moshi, & Wilson, 1997; Sessions & Cervero, 1999). From this work we can say with some confidence that we know what adult educators do.

Although the case studies in Cervero and Wilson (1994, 1996) and other studies offer some important insights, we know relatively less, however, about how HRD practitioners actually negotiate multiple and often conflicting interests in practice. Therein lies the problem that is central to this study – to uncover the specific tactics that HRD practitioners use to manage power in order to negotiate stakeholder interests in the highly political organizational terrains in which they work.

Theoretical Framework

Much of the discussion in adult as well as business education program planning literature has focused on the technical aspects of program planning (e.g., Apps, 1979; Boone, 1985; Boyle, 1981; Brinkerhoff & Gill, 1994; Broad & Newstrom, 1992; Knowles, 1980; Sork & Buskey, 1986; Sork & Caffarella, 1989) to the detriment of the
context oriented or socio-political aspects. Indeed, the literature on negotiation has long been heavily prescriptive
with little empirical evidence to show how people actually negotiate in practice. Forester (1999) and Lax and
Sebenius (1986) straddle both the prescriptive and the empirical as they offer up their own views about what
negotiation should look like ideally, along with evidence of how it occurs in practice. Elgstrom and Riis (1992)
offer another way to understand negotiation through their discussion of substantive and meta-negotiations. Cervero
and Wilson’s (1998) and Umble’s (1998) empirical analyses of the substantive and meta-negotiations that occurred
in several case studies add strength to this perspective.

Yang’s (1996) extensive analysis of the literature on power and interests lends yet another dimension to
understanding negotiation. Yang (1996) and Yang, Cervero, Valentine, and Benson (1998) developed a model to
help understand how planners negotiate power and interests in program planning for adult education. In developing
the Power and Influence Tactics Scale (POINTS), Yang outlines seven general strategies: 1) reasoning; 2)
consulting; 3) appealing; 4) networking; 5) bargaining; 6) pressuring; and 7) counteracting. Yang’s analysis has
helped to move the conversation from what planners do (negotiate) to the important strategic question of how they
negotiate. Even with these broad strategic categories, however, we know comparatively less about how planners
actually use negotiating tactics in practice.

Giddens’ (1979) notion of the differences between practical and discursive consciousness proved helpful in
exploring the practical terrain of actual planning. Discursive consciousness refers to the mode of cognition in which
social actors are able to explicitly detail knowledge about the social systems in which they participate. This is the
type of knowledge revealed by Yang’s POINTS inventory. Practical consciousness, which Giddens defines as the
“tacit stocks of knowledge which actors draw upon in the constitution of social activity” (p. 5), is the mode in which
actors adeptly navigate their worlds on a daily basis but are, nonetheless, typically less able to articulate. That is,
they are effectively able to draw upon such tacit stocks of knowledge and practice without being able to say how
they do it. Following on Giddens, it is our contention that much significant, but as of yet unarticulated, knowledge
about planning exists at this level of cognition.

To this end, the research has shown the following. First, program planning in adult education is an
2000). Second, and because of this, planners negotiate power and interests as they manage the political landscapes
negotiate power and interests through simultaneously employing both substantive (where they act within the web of
existing power relations to construct the program’s purpose) and meta-negotiations (where they act on the power
relations themselves – thereby either strengthening or weakening those macro-level boundaries) (Cervero & Wilson,
have a better understanding of what these tactics look like. How such tactics (and others) are actually employed
while negotiating power and interests in planning practice was the focus of this study.

Purpose of Study

The purpose of this study was to investigate how adult educators negotiate power and interests in program planning
for training and development in a corporate setting. This study is significant because it sought to investigate what
successful program planners actually know and do by examining the actual tactics and strategies used by HRD
practitioners. Understanding the practical negotiation strategies employed by adult educators could be instrumental
in improving program planning practice.

Methodology

The research methodology was a descriptive qualitative study of typical program planning practices of adult
educators in a large, multi-national corporation which is referred to as the Warde Financial Corporation. A
qualitative methodology was selected for three key reasons. The first was that the purpose of this study was to
describe and analyze the social processes of program planning practice. Qualitative analyses are considered to be
especially well suited for investigations of social phenomena that are descriptive, interpretive, or analytical (Yin,
1994). Second was the exploratory nature of this research. The prime author and lead researcher for this study,
Christie Mabry, was not only concerned with what planners do in negotiating power and interests, but how and why
they do it. Thus, these kinds of questions were best understood through thick descriptions and inductive analysis.
The third reason was because of the “bounded” nature of this particular system. A bounded system is any particular
system – be it an individual, an event, a situation, a program, or a phenomenon – over which the researcher has little
or no control, and which is not easily separated from its context. Thus, the specific negotiation strategies of adult
educators in the “Warde Corporation” are context specific, and hence idiosyncratic, to this company (Mills, 1993; Merriam & Simpson, 1995).

To this end, this study was what Merriam and Simpson (1995) call a combination of a descriptive and an interpretive qualitative study. The researchers sought to develop categories to conceptually illustrate, support, or to challenge theoretical assumptions. In doing so, the intention was to get a better understanding of the largely tacit and practical strategies that occur along this socio-political dimension.

The specific units of analysis were fourteen adult educators who worked in sites that spanned the boundaries of three different Warde Financial Corporation companies. The rationale behind this proposed selection of multiple sites within the Warde “system” was to partially account for the diversity of contexts that could be found within the different divisions within the greater Warde Financial Corporation. It was important to attempt to achieve some measure of context diversity to more closely replicate a “typical” sample of program planning practice.

Nonprobabilistic, or purposeful, was the sampling methodology utilized in this study. More specifically, a typical case sample was the type of purposeful sampling employed in this study. Typical case purposeful samples reflect typical people in typical planning phenomena. As such, the selection criteria for adult educators for this study included the following characteristics: adult educators who possessed a minimum of three years experience in planning programs for adult education; adult educators who possessed a minimum of two years of experience with the Warde Financial Corporation; adult educators who represented varying sizes of Warde Financial Corporation businesses; adult educators who represented the Warde Financial Corporation Corporate office; adult educators who were located in differing geographic areas and field office locations; adult educators who had planned a new or major program within the last twelve months, or who were in the process of planning a new or major program.

Specifically, these sampling criteria ensured that the adult educators who were studied had a history of program planning experience from which to call upon and experience negotiating the organizational context at the Warde Financial Corporation. It was also very important that various Warde Financial Corporation businesses/sites were studied to account for some of the distinct differences that existed based on company size, geographic location, the nature of the specific business-type, leadership philosophy and practice, corporate culture, and field versus home office dynamics. Finally, it was important that the researcher was relatively unfamiliar with the particular business dynamics (the specific people, micro-politics, etc.) present in each of the businesses studied.

This study was set up such that the researcher would have multiple contacts with each subject. These contacts included a twenty to thirty minute preliminary telephone conversation, a one and a half-hour in-depth face-to-face interview, and a follow-up telephone call to clarify any questions or issues which emerged during the analysis of the data.

Of this group of fourteen adult educators, three were Directors of Education at their sites, and had somewhat different perspectives based upon their vantage points as education leaders. Goetz and LeCompte (1984) would describe these three directors as key informants. The other eleven subjects were staff trainers and program managers. As such, program planning for adult education comprised a huge percentage of their daily jobs. Indeed, in that most of them were individual contributors in the organization (i.e., they did not manage other people), their success in program planning rested on their abilities to demonstrate considerable negotiation skills in organizations where they did not possess a lot of positional power. As such, they provided a very compelling perspective on negotiations strategies that were utilized in practice.

In addition to the multiple contacts with these two levels of adult educators at three different sites, critical incident technique was also employed (Brookfield, 1986). The participants completed and returned a one to two page critical incident piece where they reflected upon a program that was particularly meaningful to them as an either extraordinarily positive or negative experience in program planning. This incident then, formed the basis of the one and a half-hour face-to-face discussion.

In addition, document analysis was employed as another way to gain methodological plurality. The documents reviewed included plans of work, project reports, memos and correspondence, notes, program files, organizational charts, program materials, and any other program-related information that might have proven helpful in understanding both the program planning process as well as the program planning goals vis-à-vis the end results.

Triangulation, as defined by Mathison (1988) as the attempt to aid in the construction of plausible explanations and fuller understandings of the phenomena being studied, was achieved by utilizing more than one data source, by pursuing multiple contacts, through use of the critical incident technique, and through document analysis.

Data analysis incorporated the constant comparative method as well as content analysis. Content analysis was employed in examining the field notes, program planning documents, correspondence, notes, memorandum,
course materials, evaluations, and organizational charges. These documents were examined to compare the programs reported to what actually occurred (Patton, 1990). Given that the purpose of this study was to understand the negotiation strategies employed by adult educators on the level of practical consciousness, these two techniques were well suited because they involved inductive analysis and category building from the raw data of interviews and documents.

An important potential limitation of this study was that the researcher had been employed as a Director of Adult Education with a sister division of the Warde Financial Corporation through the data collection period of this study. To this end, the researcher may have unintentionally influenced some of the subject's responses to the interview questions. In addition, and because of the researcher's extensive knowledge of the corporate culture of the Warde Financial Corporation, the researcher might have also arrived at incorrect inferences about negotiation strategies.

This same potential limitation could also have been viewed as a significant research strength. This is so because the researcher had a high amount of internal credibility within the Warde Financial Corporation, credibility that may have helped to elicit more honest and potentially more accurate descriptions of negotiation strategies employed in practice. In addition, the Warde Corporation possessed a very strong cultural identity (an identity that was mostly derived from the Warde Chairman) that spanned all of the businesses. This broad identity could, perhaps, best be described as a “meta-culture.” As such, and because of the researcher's deep familiarity with this meta-culture (norms, language, history, symbols, etc.), valuable time was not lost during the interview process describing elements of this culture, and hence the information and analysis went much deeper than would have been the case with a researcher from outside of the organization.

Findings

While Yang’s “discursive” strategies were evident, the chief finding was that the “practical” strategic action of negotiation varied according to the specific situation. The planners' tactics for negotiating power and interests reflected the following phenomenon: 1) the tactics employed depended on the planners' perceptions of the stakeholders in terms of how much power the stakeholder could exercise in the situation; 2) the planners' perceptions of stakeholder power were arrayable into five separate categories along a continuum of desired stakeholder involvement (i.e., planners' perception of various stakeholder involvement ranged from "not involved" with the program on one end of the continuum to "very involved" in the program planning process on the other end); 3) the specific tactics (of which seventeen were evident in this study), then, varied according to which category the planners perceived the stakeholders to represent (see Figure 1).

In other words, the specific negotiation tactics that the planners employed depended upon what sort of involvement they wanted from each stakeholder. For example, if the planner wanted little involvement from the stakeholder (perhaps because this stakeholder could have slowed them down or possibly have hurt their efforts), their tactics might have included some form of circumvention. On the other hand (and on the other end of the stakeholder involvement spectrum), if the planner wanted the stakeholder to become personally involved in the program (perhaps as a subject matter expert), then the tactics employed might have included a direct appeal to the stakeholders' ego. The tactics employed, then (almost all at a practical level of consciousness) were done so to elicit certain behaviors from various stakeholders involved in the planning process.

In addition, the planners in this study manifested their own power by both maintaining as well as by transforming relationships of power through employing both substantive as well as meta-negotiations (Cervero & Wilson, 1998; Elgstrom & Riis, 1992; Umble, 1998). In almost every case, the planners had strongly held notions of not only what needed to be done, but also how it should be done.

They then used these tactical strategies (as outlined in Figure 1) to negotiate power and interests — practically, not discursively — among the key stakeholders in their organizations to accomplish their objectives by either maintaining or transforming relationships of power. Indeed, these substantive and meta-negotiations strategies were often used simultaneously. Cervero and Wilson (1998) write about these phenomena:

Thus, substantive and meta-negotiations are simultaneously interwoven in daily practice...Using the metaphor of the planning table, we have shown how adult educators are always simultaneously negotiating about the important features of educational programs (substantive negotiations) and about the political relationship of those who are included and excluded from such negotiations (meta-negotiations). (p. 20)

In other words, the planners employed both substantive as well as meta-negotiations strategies to, essentially, alter the relationships of power to make it more productive for them.

Essentially, placing someone in the “low involvement” category was akin to either keeping them in the dark altogether, or at least ensuring that the stakeholder had the least level of participation as possible. Stakeholders

</table>

** "N & I" tactics indicates negotiation and influence tactics
in this category were often ones who possessed enough power to potentially hurt the program planning efforts. Indeed, a surprising number of the planner’s managers fell into this category. Their tactics included: “flying under the radar screen” or keeping a low program profile to avoid unwanted attention, sharing the smallest amount of information (i.e., not sharing all of the “hairy details”) possible and designing alone or with as few people as possible, setting the situation up for success, and by avoiding people and “apologizing later versus asking for permission.” Given that the planners in this category did not seek to alter the fundamental relationships of power (meta-negotiations), their negotiations tactics were more substantive in nature.

Moving along the involvement axis, “general program awareness” was where the planner wanted the stakeholder to be aware of the program and to hear good things about it. The only level of involvement that the stakeholders in the general program awareness category needed was to be generally aware, in a positive way, about the program. Good program public relations seemed to be a key success factor for many of the programs. Thus, it was important to many of the planners that the “word on the street” be positive. When planners wanted stakeholders to be generally aware in a positive way about the program (general program awareness), their tactics included: forming committees to “evangelize” to their peers in their respective departments (meta-negotiations), using organizational communication and marketing tools (substantive negotiations), and “getting to mass” by running a successful pilot program which generated enthusiasm in the organization (substantive negotiations).

Stakeholders in the “buy-in” category were expected to be moderately involved with the program. This moderate involvement included understanding the program, and buying in to its objectives. Understanding and buy-in were key factors in ensuring that these stakeholders could speak to the merits of the program if they needed to, as well as could defend any specific programming actions. Again, many of the managers of the planners fell into this category. These managers were often not involved with the programs on a daily basis, but needed to be aware of them if the situation called for them to explain why certain programming decisions were made. “Buy-in” category stakeholder involvement included the following tactics: consulting with and seeking critical feedback from key stakeholders (substantive negotiations), making the buy-in process more convenient by walking people through the program (substantive negotiations), proactively seeking out and sharing positive feedback (meta-negotiations), and employing a “one-up” strategy where planners had more powerful people in the organization marshal support from people who were even more powerful than them (meta-negotiations).

The “mobilizing resources” category included the stakeholder mobilizing resources for the program such as money, people, time, etc. This was a much more significant level of involvement on the part of key stakeholder. As such, the negotiation tactics intensified. When planners wanted the stakeholders to mobilize significant resources for their programs in this category, the tactics included: employing a “one-down” strategy in which high level people influenced lower level people to mobilize resources (meta-negotiations), and through making the “business case” for a program idea (ideas which the planners had, more often than not, intuitively arrived at but they needed to validate for key stakeholders) through providing data, anecdotes, stories, etc., (substantive negotiations), and by understanding and pushing stakeholders “hot buttons” (meta-negotiations).

The “high personal involvement” category constituted the most intense level of personal involvement on the part of the stakeholder. As a result, all of the negotiations strategies sought to transform relationships of power through meta-negotiations. Stakeholders in this category were expected to get personally involved in the program through expending their own time or expertise. For example, high personal involvement stakeholders often helped develop key content modules for programs and often facilitated these modules. Key tactics employed to generate this level of program involvement included: appealing to their egos / subject matter expertise, engaging in some form of exchange or horse-trading and articulating the W.I.F.M. (what’s in this for me) for each stakeholder, and by applying subtle pressure (a.k.a. "the velvet hammer").

Implications for Future Research

Perhaps the most pressing implication for future research centers around the ethics of program planning. When planners are faced with multiple and often conflicting interests, whose needs should they serve? Clearly, the organizations for which they work will almost always demand that the needs of those with the most power be served first. In response to this question, Cervero and Wilson (1994 & 1996) advocate that planners should employ a substantively democratic planning process in which the needs of all affected stakeholders should be considered. In reality, however, how do planners make those difficult decisions in the politically intricate settings in which they work?

A second and major implication for future research has to do with the replicability of this study in other kinds of organizations. These negotiation tactics were effective within the context of the Warde Financial
Corporations – a large, mature, financial services corporation with a very deeply embedded set of corporate norms. However, it is unknown whether or not they would be effective within a smaller manufacturing firm or a high-tech firm, to name just a few examples.

A third implication for future research centers around the use of covert practices within organizations. Since this study reflected the use of a number of covert practices (flying under the radar screen, avoiding people, getting more powerful stakeholders to appeal to less powerful ones), it would be interesting to explore the theory and the practice behind the use of covert practices in organizations so to make connections with adult education program planning practices.

Contributions to New Knowledge in HRD

As has been well documented, the scope and impact of adult education activities upon individuals and upon the communities in which they live is both wide and deep. However, adult educators in their roles as HRD practitioners, as a whole, continue to occupy a somewhat marginalized place in the organizations in which they do their work in that they typically do not possess large quantities of organizational power. With the exception of educational institutions, most adult education activity occurs on the periphery of organizations and is typically not the central product or focus of these organizations. As such, adult educators walk a precarious line as they attempt to do high quality work that is not only desirable and acceptable to the organizations which pay their salaries, but is congruent with their personal values and visions of “what could be” as well. Indeed, the tension created in the attempt to reconcile these factors constitutes a key dilemma for most adult educators.

A potentially key contribution of this research to new knowledge in HRD, then, is that it suggests a number of specific tactics which planners and HRD practitioners can employ to, essentially, reconstruct these relationships of power so that they can be more effective in planning educational programs in their respective organizations. In doing so, this study affirms Isaac’s (1987 & 1992) definition of power as “the capacities to act possessed by social agents by virtue of the enduring relations in which they participate” (1992, p. 27). As such, the planners in this study used their “powers to act” to reconstruct existing power relationships through both substantive and meta-negotiations to make their respective planning situations more productive for them.

Adult educators and HRD practitioners often vie for seats at what Cervero and Wilson (1994a, 1994b, 1996, 1997) refer to as the metaphorical as well as literal organizational “planning table” – a table from which they are often distanced due to their lack of relative organizational power. The potentiality, then, for adult educators and HRD practitioners to replicate some of these tactics so to reconstruct power relationships is tantalizing indeed. Indeed, adult educators might not only find that their seats at this metaphorical planning table are more powerful and productive ones, but they also may find that these more powerful seats allow them the space and the leverage to do the kinds of work that is most congruent with their own personal values.

Understanding the Experience of College Graduates during Their First Year of Employment

Janet L. Polach
University of Minnesota

Understanding the experience of graduates during their first year of employment improves college recruitment practices, as well as organizational socialization processes. This study recorded the experiences of eight college graduates, who were employed by a major manufacturer headquartered in the Midwest. Two unstructured interviews were conducted with each participant to gain insight and understanding of their first year experience. Nine themes were identified and are discussed. Recommendations are offered and research implications are discussed.

Key words: College graduates, First year of employment, Organizational socialization

The transition from college to first job after graduation is significant. The literature is ripe with strategies and tips for assisting college graduates in landing their first perfect job. Further, studies have been done describing the challenges organizations face in attracting and hiring college graduates, and graduates' expectations for their first employer (Bewayo, 1990; Corley, 1999; Losyk, 1997; Montana & Leneghan, 1999). Authors have also articulated strategies to assist students, and their new organization, in better managing the transition by offering ways to ease the transition for both (Asher, 1999; Holton, 1999). The literature is far more limited, however, in describing the work experience once graduates have actually begun working. While some have surveyed graduates on the socialization process they experienced becoming familiar with their new employer during their first year of employment (Gardner & Lambert, 1993; Holton, 1995; Nicholson & Arnold, 1991; Richards, 1984), few have captured the feelings, frustrations, and challenges of the experiences from the individual's perspective.

What is the first job experience like for them? What do these young people feel during their first year of employment? What challenges do they encounter in adapting to not only their selected organization, but in many cases their new city and their new home? How do they make friends when they have moved to a new community where they know virtually no one? My research explored these questions.

Significance to HRD

Understanding the first year experience of college graduates is critical to the organizations hiring them. Human resources managers can gain insight into their perspectives of reality versus expectations that may have been discussed during the recruiting process. Human Resource Development (HRD) professionals need to understand this group of employees in order to provide them with the development and coaching needed to be successful in their selected organizations, both immediately and over their longer term employment. Additionally, a study that examines the experiences of newly hired college graduate offers potential insights to the company's process for orienting new employees to its culture, norms and practices. Holton (1995) called this process "organizational entry" and suggested that its responsibility rests clearly with HRD. While the results of this study cannot be generalized or transferred to another organization, understanding the experience of this particular group of first year college graduates provides valuable knowledge and perspective about the organizational entry. This knowledge provides opportunities for improving or modifying practices within the organization around college recruiting, onboarding orientation, and employee development.

College Graduates and the First Year Work Experience

This research adds to what others have already discovered about the first year work experience. Rayer (1998) articulated the difficulty new graduates faced in adjusting to their new role of employee and their frustration in learning the underlying cultural norms and unwritten rules of their new organization. Holton (1995) found that while the first year experience was positive and productive for some graduates in their first jobs, it was difficult,
stressful and less successful than desired for others. Gardner and Lambert (1993) reported a considerable difference between their pre-work expectations and the experiences on the job, being less challenged, using few skills, having less autonomy, and receiving less feedback than expected. Others conducting similar studies include Richards (1984) and Nicholson and Arnold (1991). To add further understanding to this area, the following question was pursued: What is it like working in a large corporate environment as your first job following college graduation?

Method

Individuals participating in my study were working in software engineering jobs, performing tasks such as requirements definition, software design, and testing for new products or enhancements on existing products. They all worked within a single division of a large manufacturer headquartered in the Midwest. All had been employed with the company for roughly eight to ten months when I first interviewed them. They were hired directly from college and ranged in age from 22 to 25 years old. Using a structured interview guide, eight individuals were interviewed. The interview began by asking each individual why they had selected their organization, and then they were asked to describe their experience.

Each interview was transcribed, read and reread to identify key ideas about their experiences. Individual key ideas were compared to identify themes that were central or common to the overall experience. Each theme was named and described. Nine themes emerged. Once each theme had been named and fully described, the researcher returned to the participants to review them. During the second interview, participants provided additional perspective, correction and further insight into the experience. Many were surprised that, while they had not necessarily articulated one aspect (one identified theme) of the experience during their own interview, it was indeed part of their first year experience. The nine themes identified are grouped into three major categories: work environment, friendship, and performance.

Findings—Work Environment

Un-stressful and Easy-going Work Environment

Participants described a work environment that they enjoyed and found very comfortable. It is easy-going and unstructured. They were expecting to work with highly stressed people and being stressed themselves, working under tight deadlines, and being carefully monitored and managed by someone else, most likely their supervisor. They were relieved to discover that none of these characteristics were true about their work environment or the company they had joined. Participants described the reasonableness of the environment. “You have a good pace, good expectations here. You actually have deadlines, but nobody's pounding us over the head because we need to get things done, at least not in my group.” This was a surprise to them. They had expected work to be highly controlled, being required to punch a clock or being watched constantly, particularly about the hours they worked; they didn’t expect to be able to set their own work schedules or go rollerblading during lunchtime.

The Literature Perspective on Easy-going Work Environment. Raines (1997) devoted an entire chapter to describing Generation X’s preferred work environment—their desire to work in a flexible, low stress environment. The environment that the participants in this study work in fit all her criteria: casual and friendly, clean and orderly, up-to-date technology, collegial, a place to learn, high level of freedom, and functional. Losyk (1997) and Montana and Leneghan (1999), who have also queried Generation Xers on expectations of their employers, have concluded that they prefer a work environment that offers a great deal of freedom to work with minimal supervision. Losyk added, however, that while graduates are fearful of being micro-managed, they want guidelines and access to management should they have questions or need direction.

Frustration with Much to Learn and No Structure to Follow

Participants discovered that there was a lot to learn in their new job and about their new company. This particular organization does not offer a formal training program for its college graduates, but rather urges them to learn through informal means about the business, its products and industry, and the tools they will be using to do their job. This learning is very unstructured, and lasts roughly three months. Participants were encouraged to ask questions of longer term employees, read old textbooks, attend a myriad of classes offered by the organization, and “play” with the technology to discover how it works. Very little structure was provided during this initial learning period, and minimal work was expected to be produced. The unstructured environment, where there was a great to
deal learn about how things were done, and yet very little formal guidance was given about how to navigate through it was both surprising and unsettling to the participants I interviewed. They were surprised that a company as large as theirs did not have a structured way to show new graduates how and where to focus their efforts. Their frustration in the maze of information was further confounded in other areas, as well. From their perspective, the company gave them little guidance in navigating through non-work related tasks, such as finding apartments, working through benefit options, or finding how to participate in the company’s intramural golf league. Yet, while this was frustrating, they expressed a great deal of satisfaction once they had navigated through yet another unknown challenge.

The Literature Perspective on Learning Work and Non-work Related Practices. While participants generally enjoyed the unstructured work environment, they found the lack of structure difficult when they needed to learn how to do something or gain organizational information. The process of adapting to the new organization is referred to in the literature as organizational socialization, the process by which individuals acquire the tasks, social knowledge, and behaviors needed to successfully participate as a member of their new organization (van Maanen & Schein, 1979). Related research supports Generation X’s preference for a highly unstructured, flexible work environments (Losyk, 1997; Montana & Leneghan, 1999; Raines, 1997), yet, the unstructured environment under which my participants were initially socialized caused frustration, stress, and confusion. Asher (1999) provided some explanation for this paradox by highlighting the differences between the limited structure in many corporate settings with the highly structured learning environment of colleges that use syllabus-driven learning outcomes and concrete measures derived from term papers and exams. The dramatic contrast of the two environments shows how easily new graduates can feel confused or off track in their new work environment.

Findings—Friendship

Different Than School To Make Friends

Participants described spending a lot of time getting to know people. Their actions were deliberate and focused, enabling them to meet friends. They observed very quickly that people interacted differently at work than they had at school. “Everybody kind of stays in their cube and does their thing,” said one individual. “It's really tough to describe because it's not really overt, [there isn’t] a lot of chatting and going back and forth,” said another. Participants described their surprise and even sadness at realizing how much younger they were than most of their co-workers, “at first, it seemed like everybody was twice as old as me.” When I asked why this mattered, one explained simply, “You just like to hang out with people like you.” Despite the reality of a different social environment, participants described taking a proactive and productive manner for learning to fit in and establishing friendships. Friendships happened; they discovered, through a series of informal, unplanned events.

The Literature Perspective on the Difference in Making Friends in the Workplace. “The workplace is an important locus of friendship formation,” asserted Fehr (1996, p. 46). Work tasks often require friendly cooperation and collaboration, and the physical proximity of co-workers in cubicles allows for frequent interchange of ideas that are work related, and non-work related, and similarity of backgrounds and work departments all promote workplace friendship formation. Further, friendships, she stated, are more likely to occur from one’s own personal network, being introduced to a friend of a friend. So it is not uncommon, as the participants in this study described, for acquaintances that are introduced in the work setting to introduce work friends to other members of their social network. Carbery and Buhrmester (1998) interviewed 180 undergraduate and recently employed graduates, who were single, married with no children, or married with children on the social provision friends, partners or parents provided. Social provisions included such things as companionship, intimate disclosure, affection, nurturance, emotional support, and guidance. “Subjects in the single phase reported friends as the single most frequent providers of companionship and intimate disclosure,” (p. 401) they found. As new workers, they have left their college relationships behind; for this group of participants, they left their friends literally behind in other cities, and must now build their new support structure and network primarily through their contacts at work.

Friendship is Critical to Feeling Settled and Belonging

Participants described friendship and friendship making as a key component of their first year experience. They described actively seeking others out, and inviting new comers into their group of friends to help others in the settling process. Friendship is critical to this group. They talked about it a great deal during both interviews. When
asked why friendship was so critical, one individual responded, “It provides a sense of belonging, for one thing. Fun. Lack of boredom. With friends you experience new things, experience things in life. You share things with your friends.” Many talked about friendship making as a journey. All deeply rely on their friends for support, encouragement, and companionship. I asked one individual what the friendship support structure provided. He said, “It’s a sounding board, pretty much. Work related, life related. Have people to share your experiences with and gain commonality. You understand each other and that allows you the opportunity to help other people. So I think that it’s kind of give and take.”

The Literature Perspective on Friends and Belonging. Several research studies support this theme of friendship and the belonging it brings to young adults. Rose (1985), for example, interviewed 90 undergraduates and recently hired graduates, asking them what their friends do for and with one another. She discovered eight functions of their friendships: acceptance, help, loyalty, availability, recognition, intimacy, and companionship. Additionally, she discovered nine methods for formation and maintenance of friendships: physical proximity, demonstration of concern, willingness to make sacrifices, length of contact, sharing of ideas, commonality of interests, initiation of affection, sexual interests, and unwillingness to form friendships. Clearly, friendships are critically important to young adults. The Carbery and Buhrmester (1998) study referred to earlier, supports this need as well. They found that the reliance on friends to satisfy social needs is greatest during the single phase in early adulthood, and is reduced significantly during marital and parenthood stages that occur later in life. They reported, “subjects in the single phase reported friends as the single most frequent providers of companionship and intimate disclosure,” (p. 401).

Moved to Find a Better Sense of Belonging

Nearly all participants moved during their first year. They moved to a place they described as being better for them. They moved to be in a neighborhood or area that housed more people like themselves. They liked the action in a particularly younger part of the metropolitan area: it was diverse, close to everything, and attracts people like themselves. Moving lead to them feeling even more connected to their new city. They expressed frustration that the company provided no insights into where college graduates might prefer living, and which communities to avoid. This researcher was unable to uncover research studies related to this theme. However, perhaps it isn’t as significant as those of us who have been settled in one place for years may question. Said one, when I asked why everyone moved, “We just move. In college we lived somewhere different every year. So if we don’t like where we’re living, we just find somewhere else.”

Findings—Performance

Unsure of Own Performance Due to Lack of Feedback

The first theme in the performance area is the uncertainty the participants they felt because they received little structured feedback from their immediate supervisor. Receiving frequent, job-relevant feedback was a clear expectation of the college graduates I interviewed. Said one, “My year one is coming up, but you know, not once has my manager said one thing to me about my performance, negative or positive.” Participants in my study had high expectations for receiving frequent and ongoing feedback from their boss. They easily described why they had this expectation—well-established feedback systems were followed in every class in college and in high school. One individual articulated the experience, “in school, you receive frequent and immediate feedback. You are assigned homework and receive a grade. You take a test and receive a score. Grades provide a periodic measure of how you are progressing on a topic. This is true for both high school and college.” Not all individuals reported a lack of feedback. A few of the participants described their experience as just the opposite. They received focused, specific feedback and frequent interaction with their manager. Said one, “Everybody has been really helpful in helping me come up with my goals, helping me gain understanding in what it is that I want to do.” They knew where their performance was satisfactory, and they knew where they should concentrate their efforts.

The Literature Perspective on Feedback Expectations. Many who have conducted studies on the first year experience following college graduation have not specifically reported the need for frequent, job-specific manager feedback (Gardner & Lambert, 1993; Holton, 1995; Montana & Lenaghan, 1999; Nicholson & Arnold, 1991). These studies focused on the degree of employee satisfaction or organizational commitment that occurred during the graduate’s first year of employment. Others, however, have identified this need. Rayer (1998), for example,
reported the experience of seven college graduates during their first three months of employment following graduation by asking them to record their work experience through daily journaling. Her participants reported a similar frustration and sense of uncertainty because they did not receive regular feedback from their supervisor. Additionally, Holton and Russell (1999) reported a strong predictor between the graduate's experience in institutional preparation, informal training, introduction to other people in the organization, and their initial feedback seeking behavior to the attachment they felt with their organization one year after beginning employment.

Guilt of not Producing

The division within which I interviewed hires 20 to 25 undergraduates a year. When hired, new graduates are generally knowledgeable about the division in which they will be working, but not about their specific job responsibilities. The company does not offer a structured training program. Rather, it expects new hire graduates to spend their first few months learning—getting acquainted with company’s processes, procedures and products, learning the software and hardware environment, and discovering about particular projects that are underway. This approach offers freedom and flexibility. Individuals in my study chose this company over others that offered more highly structured new graduate training programs, such as the Big Five consulting firms, or regimented rotational programs. While they knew their initial learning would be informal, they found it confusing and unsettling. Many participants described their first few months of employment as slow, and they spent a lot of time learning. This felt uncomfortable. While they knew they would not be entering into a structured training program, they were surprised that there was virtually no structure to guide their learning. Said one, “What did I do every day? Try to figure out what I was supposed to do which I found out was nothing. It's sort of weird, you know.”

The Literature Perspective on not Being Productive. This theme is difficult to find in the literature. In the studies noted earlier on college graduates during their first year of work (Gardner & Lambert, 1993; Holton, 1995; Holton & Russell, 1999; Montana & Lenaghan, 1999; Nicholson & Arnold, 1991; Rayer, 1998), this particular theme is not identified. Other literature, however, hints at this theme. Holton (1999) wrote an article intended to assist new graduates settle into their new organization quickly. He urged new graduates to focus first year goals on more than just productivity. He asserted that while productivity goals are important and reasonable, knowledge and skill development must also be one's focus. Graduates must also spend time learning to fit in and gaining acceptance and respect from co-workers, he suggested.

Gratification Finally to Contribute

All participants described eventually moving from the learning mode to actually producing the work they thought they were hired to produce. It happened gradually. Most described getting to a certain point in the year where the pieces that they had been learning and the few work tasks they had been given to do started to make sense. Two key feelings were expressed: relief to finally be doing something meaningful, and elation with the results they had produced. Many said it took several months to get to a point where they felt they finally had contributed something meaningful to their organization. Participants described satisfaction and personal reassurance that they would actually be working, not just reading materials during their tenure with the company. Said one individual, “after six months, I started to really accomplish some things that I can be proud of and I feel like I've come a long way in that year.... I'm starting to earn that paycheck.” Some described it coming, not all at once, but gradually over time. I was unable to find any published research or anecdotes related to this theme of college graduate's need to contribute during their first year.

Personal Satisfaction and Growth in the Overall Experience

The final theme sums up the year's experience: it has been positive, productive, and participants have grown a great deal during the year. “I've actually liked it more than I thought I would,” said one individual. “I'm liking it more though as I stay with it,” said yet another. During the year they discovered the world of work. Said one, “I've learned what it's like to make a living.” However, many described the work as not being as challenging as they had expected. Participants described a great deal of satisfaction with themselves during the year. They were surprised at how enjoyable and satisfying their accomplishments were. They described growing a great deal during the year: managing their own apartment and finances, moving to a new city, contributing and being sought out for advice, gaining insights into what it's like to work day-to-day. One individual summed it up as follows, “Overall, [the year] has opened my eyes to what the real world is, as well as giving me a chance to contribute.”
The Literature Perspective on First Year Satisfaction. This theme, satisfaction in the overall experience, has been researched in a number of studies looking at college graduates during their first year of employment. Holton (1995) surveyed 378 college graduates during their first year of employment, and found a wide range of relative satisfaction with the overall experience in many college graduates. He reported a mean of 4.05 (on a scale of 5) suggesting that many participants experienced a highly satisfying experience. He pointed out, however, that the standard deviation in the sample of .71 suggested that many respondents had unsatisfying experiences, as well.

Discussion

This study offers a number of insights into the college graduates’ experience. While the results are not generalizable to any population, they offer awareness to those who work with and employ college graduates. Some of the insights I gained from the research are discussed below.

I entered this study thinking I had a good understanding of their first year experience, my research revealed that there are many aspects of their experience with which I was unaware. For example, I had never realized the criticality of friendships during this period in their lives, nor did I realize that the source of their friendships came primarily from their workplace. I overlooked this aspect, perhaps, because I married immediately after graduation and had a different perspective about workforce friendships than the mostly single graduates that I interviewed. (See Carbery and Buhrmester (1998) for related research.)

I was also struck by their struggle to figure things out and for sources of reliable information in their new organization. The individuals in my study were bright, articulate, and academically accomplished. Generation X literature cited in this study (Hornblower, 1997; Losyk, 1997; Macalister, 1994) clearly stated that young adults demand freedom and flexibility and reject a good deal of structure. Yet, when the organization provided them with just that, they were frustrated, confused, and surprised that a company as large and as successful as theirs did not offer a more formal socialization process.

In reflecting on the experience of conducting this study, I am very satisfied with the methodology I selected for this study. Like many United States’ academicians, I was educated to appreciate quantitative research approaches. The hermeneutic phenomenology approach I used did not reveal statistics or trends, but, rather, it allowed me to hear, perhaps for the first time, the stories and the experiences that occurred beyond the statistics and the quantitative studies that have been reported in the past. The results produced two new themes—guilt at not producing and moving to find a better sense of belonging—themes that I was unable to find previously documented in studies relating to college graduates. Additionally, my study yielded insights and depth of the experience that were not necessarily captured in other college graduate studies. For these reasons, I have concluded that there is a necessity for using both quantitative and qualitative research to understand more fully an organizational issue, an issue such as the first year experience following graduation.

The themes in this study were described earlier. While each stands on its own, when they are looked at in total, they offer additional perspective in describing the first year experience. Three cross-theme reflections are offered: (a) Many (Asher, 1999; Gardner & Lambert, 1993; Holton, 1995; Nicholson & Arnold, 1991; Rayer, 1998) have described the transition from college to work as significant. Yet, speaking with individuals from my study, they don’t describe it as significant. Rather they see their first job as the next step in their life’s journey. The year was full of transition: many were living in a new community, all held their first fulltime, long term job, all were developing new friendships, and were adjusting to the reality of spending most of their day working, rather than doing other activities they enjoyed. (b) The most significant insight for this researcher was the criticality of friendships. As I was reading and rereading the transcripts, I was struck how often they talked about the social environment, making friends, and how different work life was from school life. They weren’t describing these discoveries as necessarily bad, just different. When I tried to understand this more fully, participants frequently described the highly social environment of campus life. The Carbery and Buhrmester (1998) study on friendship making in young adulthood affirmed the participants’ need and desire for friendships at this point in their lives. “Friendships reach their peak of functional significance in the network during the single phase of young adulthood” (p. 405). (c) The organization’s willingness to give new hires a long time to “learn the ropes” has business merit. It gives new graduates time to adjust and conform to organizational practices before being relied on to deliver to deadlines on critical projects. Yet, it was clear that graduates were uncomfortable with the non-producing phase of their employment. They came to the organization ready to design requirements, code programs and test features. They did not expect to spend their first few months learning about a myriad of seemingly unrelated topics, particularly when the learning followed little or no structure.
Recommendations

This study provides a number of possible recommendations to the organization that employs the participants in this study. It also offers a perspective for soon-to-be college graduates to consider. It also identifies opportunities for further research.

Recommendations to the Organization

As the individuals whom I interviewed were not statistically selected, results from this study cannot be generalized to any group. However, the insights gained from this study should be carefully considered by the organization that employs the participants. The organization may benefit by examining these findings in conjunction with insights gained through other means, such as exit interviews or employee opinion surveys, to determine whether the recommendations offered below are plausible. I suggest the following: (a) Establish peer mentors. The organization currently assigns an experienced engineer to every new graduate engineer. This practice is not uncommon, and mentors tend to focus on career development issues. Graduates during their first few months of employment, however, tend to focus less on long-term career development issues and more on not making themselves look foolish and just figuring things out. (b) Facilitate friendship making. Those I interviewed expressed frustration that the organization spends a great deal of effort courting interns, their future new graduates, but does nothing to connect new hires to each other once they become fulltime employees. Assistance in friendship making could be inexpensive and could be managed by former graduates themselves, a picnic or dinner in the middle of the summer could not only facilitate young people meeting each other, but it could also reinforce to new hires that they had selected the right organization. (c) Provide a learning framework. Participants were not looking for a great deal of learning structure; many said they were simply looking for a picture of how things fit together. A first year learning framework could be a simple list posted on the company’s intranet identifying learning outcomes at various points throughout the year, or it could be a packet of electronic information that provides reference information in a number of areas. It should include areas of focus during the first month, three months, six months, and year and identify learning outcomes for each timeframe. Additionally, the framework could include contact information and reference points for professional affiliations, as well as non-work related information. (d) Engage college new hires. Organizational members, not just an employee’s manager, would be well advised to be aware of new graduates and assist them in little ways with their transition. Simple interest and conversation can help them with their transition.

Recommendations to Future Graduates

This study also provides information about the first job experience that may be helpful to future graduates. For example, this study points to the fact that there is a great deal to learn in a new organization; and much of what needs to be learned is not written down. This is very different from college, where every step in the learning process is clearly laid out. Additionally, the study discussed that the composition of the workplace is very different from the environments to which college students are accustomed. Participants in this study came to realize that not all employees wanted to be friends. Finally, many participants discussed the lack of feedback they received. Graduates so often focus their job search on impressing potential employers. After conducting this study, I would encourage soon-to-be graduates to continue to focus their job searches, but also to interview friends who are now full-time employees to discover their experiences.

Opportunities for Further Research

This study invites additional research. Any of the nine themes could be researched more fully. For example, research could be explored on the friendship themes to determine whether they are consistent in many college graduates or unique to the eight I interviewed. Additionally, data could be collected from the participants’ managers to ascertain whether they believe they are providing their new hires with adequate feedback. Research could also be conducted on the themes that offered little if any related research. While all of these research possibilities are compelling, I suggest pursuing the same study in another organization, an organization that has a strong, yet different culture. Partnering with an organization that employs highly standardized training programs and predictable work progression, such as a large consulting firm or even the U.S. Marine Corps, might provide contrast to the themes that emerged from this particular study.
Summary

This article reviewed the study I conducted on understanding the experience of college graduates during their first year of employment. It articulated the research method I followed and provided a brief review of the nine themes that were discovered. It discussed a number of insights I gained from the research. These insights included personal reflections from the researcher, perspectives on the value of qualitative research as they relate to the first year employment experience, and consideration of the cross-theme perspectives on the entirety of the first year work experience. I then discussed recommendations to the organization that hired the participants in my study, and recommendations to future graduates. Finally, I concluded the paper by describing opportunities for future research.

The Experiences of HRD Professionals Participating in Continuing Professional Development in Taiwan

Yu-Shu (Jason) Chen
University of Minnesota

The purpose of this study is to describe and interpret the experiences of Taiwanese human resource development (HRD) professionals participating in continuing professional development (CPD). Using hermeneutic phenomenology as a methodology, the researcher conducted face-to-face conversational interviews with 14 volunteer participants. Three major themes emerged from thematic analysis: (a) "I felt changes," (b) "I felt a drive for learning and development," and (c) "I felt CPD was part of my working life."

Keywords: HRD Professionals, Continuing Professional Development, Taiwan

Taiwanese economic development has caused a transition in the economic structure from labor-intensive industries to capital- and technology-intensive industries (Lee, 1995). To maintain a competitive advantage, and to develop Taiwan as an Asia-Pacific Regional Operations Center and as a Technology Island, both the Taiwanese government and private enterprise pay increasing attention to developing corporate human resources. In Taiwan, the role of human resource development (HRD) is much more important than ever. As McLagan (1989a) noted, HRD professionals assume increased responsibility to “integrated use of training and development, organization development, and career development to improve individual, group, and organizational effectiveness” (p. 7). Due to the accelerating pace of economic, social, and technology change, and to ensure the smooth execution of their professional duties, most Taiwanese HRD professionals are aware of the importance of maintaining, broadening, or raising their competencies through continuing professional development (CPD). In the modern Taiwanese workplace, it is essential for HRD professionals to participate in CPD; it has become an important part of their working lives. This hermeneutic phenomenological study was conducted to gain a deeper understanding of the nature and meaning of the lived experience of Taiwanese HRD professionals participating in CPD.

Problem Statement

Recently, human resource development in Taiwan has received much attention and recognition for its value from the business sector, academia, and the government (Chen, 1997). During the 1990’s, many studies were conducted that were related to Taiwanese HRD (Kuo & McLean, 1999). However, most of them were positivistic, and none focused on HRD professionals' continuing learning and development. Since little was known about Taiwanese HRD professionals participating in CPD, the purpose of this study was to explore, describe, and interpret the experiences of Taiwanese HRD professionals participating in continuing professional development. It attempts to explicate and understand the structures of meanings of this unique experience. As a researcher, I was interested in textual reflection on the lived experiences, with the intent to increase our understanding of HRD professionals’ CPD. This study uncovered the meaning of those lived experiences to HRD professionals and the nature of these phenomena.

Theoretical Framework

No preconceived notions, theories, or frameworks guide researchers as they conduct phenomenological research (Creswell, 1994). This section addresses some models and concepts for CPD; in order to study the essential structures of the lived experience, it brackets the researcher’s beliefs, prejudices or prejudices.

What Is CPD?

Continuing professional development is often used interchangeably with the terms “professional development” or “continuing professional education.” There are several definitions of CPD; it is helpful to review
those important definitions to clarify the thoughts about what CPD means. Chalofsky and Lincoln (1983) define professional development as "a process of keeping current in the state of the art, keeping competent in the state of practice, and keeping open to new theories, techniques, and values. It is related to present and near-future positions and usually based on work objectives" (p. 21). Chalofsky (1990) emphasizes that CPD is a continuing process, especially in the HRD field where new theories, techniques, and approaches constantly emerge. McCullough (1987) defines professional development as "the process by which individuals increase their understanding and knowledge, and/or improve their skills and abilities, to perform better in their current positions or to prepare themselves for a position to which they can realistically aspire in the near future" (p. 37). The American Society for Training and Development (ASTD) defines professional development as "the ongoing growth of knowledge, skill, and values through deliberate learning efforts to enable individuals to more competently perform their professional roles, support their organization's objectives, and contribute to the evolution of the profession" (McLagan, 1989b, p. 57). Woodward (1996) states that "the term CPD describes learning activities that are undertaken throughout working life and are intended to enhance individual and organizational performance in professional and managerial spheres" (p. 1). According to the above definitions, two key features about CPD are identified: (a) CPD is a continuing learning and developing process by which professionals maintain, broaden, or raise their knowledge, expertise, or competencies through their working lives; and (b) the purpose of CPD is to improve individual, organizational performance, or both.

Models Related to CPD

As Nadler (1981) noted, "the value of a model is that it enables us to communicate ideas" (p. 73). No single model is meant to represent all facets of the field; rather, each model presents its author's concept from that person's perspective, and makes a unique contribution to the professional field of HRD. Two CPD models merit more complete description and analysis.

Nadler's Model for Professional Development. Nadler (1981) constructs a model that is essentially directed at practitioners who are internal to an organization. His model for professional development is based on the following assumptions: "(a) the core of the field of HRD is in learning; (b) an HRD practitioner must know more than learning; (c) most HRD practitioners entered the field through other routes; and (d) the field of HRD is changing" (p. 74). Nadler (1981) identifies HRD practitioners by looking at three variables: activities, categories, and levels.

1. Activities: The three major roles of HRD professionals and their major activities are learning specialist, human resource administrator, and organization consultant.

2. Categories: There are three categories for HRD practitioners. Category 1 is professionally identified. In this category, professionals are cosmopolitans who take their leadership from HRD professional organizations. Category 2 is organizationally identified; its practitioners are those who work for an organization and have been temporarily assigned to HRD functions. Category 3 is comprised of collateral duties; it consists of those people who do not spend full time in HRD but are involved in HRD operations.

3. Levels: Three different levels of competency are labeled as basic, middle, and advanced. However, Nadler has not made clear distinctions among these levels.

This model can assist HRD practitioners to understand themselves and their organizations. As Nadler (1981) noted, using this model, practitioners could identify what they want from the job and from the HRD field. "The model allows practitioners to identify where they are now, and where they might go in the future. It helps them clarify their own growth needs" (pp. 83-84).

Chalofsky's Professional Self-Development Model. Chalofsky's model is a fairly simple process that is based on the premise that "HRD professionals can have a great measure of control over their own growth" (Chalofsky, 1990, p. 13.5). The model consists of eight linear steps in the circle and one step is common to all in the center. Step 1 is to identify what professionals do. Professionals may need to construct a list of their tasks and make sure that their lists are proactive and consider what they should be doing now and what they may do in the future. Step 2 involves prioritizing the list of tasks, since professionals might not be able to work on everything at once. Step 3 asks what knowledge and skills are required to perform a particular task, and requires that professionals think about what the results of a task should be, then think about what they need to know to reach those results. Step 4 is to assess level of proficiency against the list of competencies. Professionals must identify the gaps and then go to step 5 to specify learning objectives that are based on that assessment. Step 6 is to develop the CPD plan, including learning objectives, learning strategies, and evaluation plans. Step 7 and step 8 involve actual performance and performance assessment to determine the level of proficiency on the task. Significantly, evaluation and feedback
occur at every step to ensure consistency and organizational support (Chalofsky, 1990).

Research Question

"Phenomenology always asks the question of what is the nature or meaning of something" (van Manen, 1997, p. 184). In this study, I will attempt to describe and interpret the nature and meaning of the lived experience of Taiwanese HRD professionals’ CPD participation. The central research question is: “What is the lived experience of Taiwanese HRD professionals participating in their continuing professional development?”

Methodology

Hermeneutic phenomenology, the research methodology in this study, is a human science that attempts to achieve awareness of different ways of thinking and acting in search of new possibilities of looking at life. It is the systematic approach used to uncover and describe the structure, the internal meaning structures of lived experiences (van Manen, 1997). Hermeneutic phenomenology attempts to gain a deeper understanding of the nature of our everyday experiences and to describe such meanings to a certain degree of depth and breadth. It matches the research purposes of this study, which is to attempt to explore Taiwanese HRD professionals’ experiences of participating in CPD and to explicate the meaning of these phenomena.

Hermeneutic Phenomenological Interview

Hermeneutic phenomenology, an interview has a unique potential for obtaining access to and describing the lived experience. The interview is a conversation about the human life world that is transformed into texts to be interpreted (Kvale, 1996). In this study, I developed research texts through face-to-face conversational interviews. I used open-ended questions; there were no strictly pre-formulated interview questions in order to allow study participants to tell their own stories using their own words. Each participant was interviewed twice in order to obtain a rich understanding of his or her lived experiences; each interview lasted 60 to 90 minutes. All interviews were conducted in Mandarin Chinese or Taiwanese, although some participants used some English words. All interviews were tape recorded, with the participants’ consent. All interview data were first transcribed verbatim into Chinese—with the exception of English words—and the Chinese transcripts were used to do thematic analysis. All transcribed texts were translated into English only after the thematic analysis was finished in order to maintain fidelity to the participants’ original descriptions without language-based distortion or cosmetic revisions.

In the first interviews, I gathered information about study participants’ backgrounds and attempted to extract as much description about their lived experiences of CPD participation as each participant was willing to share. In the second interviews, we clarified misunderstandings that I might have had about the descriptions and the meanings of their experiences from the previous interviews. Participants were asked to review the emerged themes and engage in deeper description in order to determine the deeper meanings or themes inherent in these experiences. Researcher and participants intersubjectively interpreted a draft of themes through hermeneutic conversation or collaborative discussions. Emerged themes were examined, articulated, re-interpreted, omitted, added, or reformulated to achieve the intersubjective agreement that was the means of validation for this study (van Manen, 1997).

Participants

I invited volunteer participants from a pool of contacts among members of the Human Resource Development Association of Republic of China (HRDA, ROC), one of the largest HRD professional associations in Taiwan. Fourteen HRD professionals participated in this study. They represented a mix of individual and corporate backgrounds, with positions that ranged from specialist to director, and job titles that included HRD/HR specialist, HRD/HR senior specialist, training/business consultant, HR section assistant manager, personnel manager, HR manager, training manager, and administrative division director. Study participants had varying lengths of HRD work experience from 3 to 25 years. In order to protect his or her identity, I used an English pseudonym for each participant in this study.

Thematic Analysis

The purpose of phenomenological reflection is to understand the meanings of the human phenomenon. To
grasp the structure of meanings in texts, it is useful to describe the experience in terms of themes (van Manen, 1997). Such “theme analysis” refers to “the process of recovering the theme or themes that are embodied and dramatized in the evolving meanings and imagery of the work” (van Manen, 1997, p. 78). van Manen (1997) proposed three approaches to uncover or isolate themes: wholistic, selective, and detailed. The textual analysis in this study combined the wholistic and selective approaches to uncover thematic aspects of a phenomenon in the developed texts; the two approaches were used interchangeably. Using the wholistic approach, I attended to the developed text as a whole and attempted to find out “what sententious phrase may capture the fundamental meaning or main significance of the text as a whole” (van Manen, 1997, p. 93). I listened to the tapes and read the transcripts multiple times as I attempted to find the general meaning in each transcript. Using the selective approach, I read and re-read individual texts several times as I attempted to ascertain “what statement(s) or phase(s) seem particularly essential or revealing about the phenomenon or experience being described” (van Manen, 1997, p. 93). By using the wholistic and selective approaches to text analysis continuously and interchangeably, several significant themes emerged.

Results and Findings

Three major themes—each of which expressed an essential aspect of the Taiwanese HRD professionals’ CPD experiences—were identified and explored in this study. Each theme consisted of several sub-themes that deeply explored those lived experiences. Due to the interrelationship of Taiwanese HRD professionals’ lived experiences, some themes were strongly connected.

Theme 1: “I Felt Changes”

The single-syllable, six-letter word “change” is the central thought for the first theme in this study. In the modern Taiwanese business world, no matter where HRD professionals turn, change is the only constant. HRD professionals’ survival depends on how well they react to on-going changes. Three sub-themes describe how the participants feel about changes in the workplace while they participated in CPD.

“I Felt Changes in the Business Environment”. The Taiwanese business environment recently has undergone fundamental changes. The subsequent increase in competition is clearly apparent, as HRD professionals experience organizational changes related to the rapid change in business. Gary is an HR manager at a large-scale electrical company. Like many Taiwanese companies, Gary’s company went through a significant transformation, as it became technology-intensive. The company was reengineered several times, which changed Gary’s job content, and required that he developed his new professional expertise and knowledge by taking extension courses. He described:

I have been working at the HR division at this company since I graduated from the university. In the 1980’s, with the changes of Taiwan’s business environment, our company had to conduct reengineering. As an HR staff, the project of reengineering was a big challenge for me. From 1985 to 1986, our company laid off half as many as our employees. In 1985, we had 3700 employees. After the reengineering, only 1500 remained. It was a huge transformation for our company transferring from labor-intensive to technology-intensive. Although the number of employees decreased, our productivity still had to increase.... The reengineering resulted in a big change in my company. The changes gave me a lot of pressure. I felt my previous learning from the university was not enough. I had a strong desire to go back to school again to collect more information to help our company development. Therefore, I went to take some extension courses at several universities.

“I Felt Changes in the HRD Field”. HRD is an emerging and dynamic field that is undergoing transformational change from outside pressures on enterprises as well as from new developments in learning, organization, and career theories and methods (Rothwell & Sredl, 1992). New knowledge and approaches emerge constantly as cutting edge knowledge changed from one wave to another. When they recalled their experiences of CPD, many participants were impressed by the dynamic changes in the HRD field. Ingrid, an HRD senior specialist with a master’s degree, mentioned that there are many new things in the HRD field, and to know those new theories and approaches, she continues to participate in CPD. She said:

In the HRD field, leading knowledge changes often. Several years ago, “competency” was popular. Before that, we only knew “job analysis” and “job evaluation.” When “competency” emerged, we started to learn what “competency-based” means.... Because of my job needs, I have to learn leading knowledge in the
HRD field. Recently I went to learn of “knowledge management,” which is the most popular leading knowledge now. What is knowledge management? How can we put it into action? Looking from the business perspective, the rules of the game are changed almost every 5 to 6 years. The rules of the game in HRD are also changed.

"I Felt Changes in My Career". Labor market analysts estimate that each year in America, one-third of all job roles are in transition, one-third of technical skills turn obsolescent, and one-third of workers leave their jobs (Charland, 1997). The labor market in Taiwan is also changing dramatically. The volatile working environment and the need for lifelong learning produce careers for modern Taiwanese that look quite different from those more traditional careers of previous generations. Most workers will go through several major job changes during their lifetimes (Bard, 1987). Similarly, career paths in HRD are as diverse and individualized as the backgrounds of HRD practitioners and as constantly changing as the field. A wide variety of career-related transitions are common occurrences for HRD professionals; as they recalled their CPD, many participants recognized the transition-based experiences in their careers. Mary, an HR section assistant manager, felt that focus of her CPD changed with her career stages; at different career stages, she needed different levels of CPD and information. She stated:

When I was a corporate training specialist, I took courses related to training. Because I was in charge of training affairs, I took those courses. Now, I am in a different career stage. I am a HR assistant section manager. I needed to enhance my HR competencies. I searched for courses related to HR and I took courses that I need at my present stage…. What information I need to collect and what courses I need to take have much to do with my career stages. Definitely, the focus of my learning was different in different career periods.

Theme 2: "I Felt a Drive for Learning and Development"

HRD professionals are busy; most of them work at least 8 hours a day. Then, as is true for most workers, HRD professionals also spend many hours attending to family and community issues and to other concerns. With such tight daily schedules, why do HRD professionals still enroll in formal learning classes, engage in independent learning activities, and establish their professional networks? One major reason for such involvement is the drives for learning. When they reflected on their CPD experiences, HRD professionals clearly recognized some drives that push them to participate in learning and development activities.

"I Was Preparing for My Future". Too many uncertainties exit in today’s constantly changing business environment. A modern professional’s career path is no longer linear and stable; rather, it is marked by frequent and often complex changes in both responsibilities and directions (Scanlan, 1985). Many of my participants were interested in participating in CPD to get better jobs; the “I was preparing for my future” drive pervaded those interviews. Neil, a 52 years old consultant with 15 years’ work experience, spoke of his CPD experiences as it related to consulting certificates. When he prepared to enter the consulting field, he went to the China Productivity Center (CPC) to take two certificate programs. He recalled his experience:

I took two series of certificate courses at CPC; one is for consultants and the other for advanced consultants. CPC is regarded as the cradle of consultants in Taiwan. They have good programs and instructors for training consultants…. The program for fostering consultants lasted two years, took more than 400 hours and cost me NT$75,000. The other program for fostering advanced consultants took more than 300 hours and cost me NT$30,000…. At that time, I prepared myself to be a consultant; I needed to know what consultants do and what competencies a consultant should have. Therefore, I was interested in CPC’s certificate courses. My main purpose was to get the consultant certificates, which were useful for my consulting career.

"I Desired to Keep Myself Active". Learning drives emerge as a result of either intrinsic or extrinsic factors; extrinsic factors consist of external incentives or pressures, while intrinsic factors are composed of a series of inner pressures or rational decisions which create a desire to learn (Rogers, 1996). An intrinsic drive for learning does not arise from specific objectives; rather, it arises from self-discipline. CPD participation is not done for the sake of specific knowledge; rather, it is done because of the belief that learning maintains or strengthens mental processes (Houle, 1984). Many participants reflected on the internal drive that maintained their desires to keep active or the knowledge that continuing learning activities kept them active. They believe in the old axiom, “If I rest, I will rust.” This sub-theme revealed a nature of learning that is reminiscent of Houle’s (1961) activity-oriented learners who participate in learning activities primarily for the sake of the activity itself. Dorothy is a 47 years old
director who passed the graduate institute entrance examination after she took several academic credit courses. Dorothy enjoys learning with her young classmates, who keep her active. She described:

I did feel excited when taking academic credit courses at Sun Yat-Sen University. I felt as if I went back to my college days again [smiles]…. Continuing learning keeps me young and active [laughs]. I felt I could keep abreast of the times. The feeling is very nice…. Most of my classmates are much younger than I. I liked to study with young and active people. I don’t like to waste my time gossiping. It is nice to keep a young and active heart to study.

"I Desired to Know More". Learning is a natural activity for human beings. It is the continual process of adapting to various changes that we confront, such as changes in our social and cultural contexts, in our own workplace, and in our own personal growth and development (Rogers, 1996). We all have learning desires. Some learning desires are very pressing and arise from or are reinforced by urgent matters; however, some learning desires lie dormant, overlaid by more immediate concerns, and await either a suitable learning opportunity or an increased sense of need to come to life. For many people, these desires for more learning have been buried by other experiences; nevertheless, they still exist and can be awakened in appropriate circumstances (Rogers, 1996). Amy is an HR specialist working in an American-owned company. After working several years in the HRD field, Amy felt she only sees the HRD/HR “trees” rather than the “forest.” The drive to know the whole picture of HRD/HR pushes her to take some courses. She expressed:

In the past, I only focused on a single task on my job. For example, when my boss said we had to do this, then I concentrated on this task. Next time my boss said we have to do that; then I concentrated on that task. However, the tasks are “trees”; I did not see the “forest”…. I desired to know the whole picture of HR. I also want to know which parts of HR suit for me for specialization. Therefore, I took some courses from the HRDA, ROC and Sun Yat-Sen University.

"I Felt Self-Actualization". Humanists consider learning from the perspective of the human potential for growth. They see learning as the main process by which to meet the compulsion of inner drives rather than to respond to stimuli (Rogers, 1996). To a certain extent, study participants were active in continuing learning and development for self-growth and self-challenge. They attempted to prove their abilities or pursue self-actualization through CPD. The strong drive that pushed Ingrid to participate in CPD was her desire to be in the leading place in the HRD field; she did not care about the job title or salary. Ingrid seemed to be pursuing the highest level of Maslow’s (1968) hierarchy of needs, which consists of a need to create, to appreciate, to know, and to understand. She firmly stated:

I have a thought that I must be in the leading place in the HR or HRD field. This is my goal of CPD. If achieving this goal, I will feel very happy and proud of myself. In fact, I did not care about my job title. It is not really important for me…. Everyone runs his or her own brand in this competitive business environment and I am not an exception. I hope I could be a benchmark in every wave of change. This is what I want.

Theme 3: “I Felt CPD Was Part of My Working Life”

HRD professionals’ working lives are as diverse as the organizations and positions they represent. Study participants came from a mixture of individual and corporate backgrounds; naturally, each participant faced different challenges in their working lives. Even similar experiences may mean different things to different people; however, several essential attributes can be mentioned. In this section, two sub-themes explore CPD that is related to HRD professionals’ working lives.

"I Learned While Working". There is growing consensus that experience forms the basis of many learning activities (Rogers, 1996). My participants thought of experience as the best approach to CPD in their working lives. As they reflected on their CPD experiences, participants described many important learning experiences they acquired at work. Participants believed if they performed specific activities instead of listening to instructors talk, they would be able to return to work with some practical skills. These HRD professionals did learn from experience and many study participants expressed firm convictions about the effectiveness of learning from experience. John, a senior HR specialist, stated:

I developed many projects with which I was unfamiliar. However, I have to try. For some projects, even my boss did not have related experience. He cannot give me effective direction. Developing projects were different from daily routines. It was not easy to find out ready-made resources…. For example, I once
developed an “assessment center project.” I could not find out related resources from my company. Therefore, I read books, searched on the Web, and consulted experienced predecessors. A large proportion of my learning is from working. It was the most effective one. When taking a course, I felt there is a gap between the theory and practice. By working, I could find out the solution and have some outcomes. Working was an important learning process.

“I Perceived Organizational Cultures Influenced My CPD”. Whether or not we are aware of it, culture is all around us. When we travel to a different country, we may be struck by unique buildings, customs, or behavioral patterns. In the world of work, companies also have cultures. Organizational culture is not limited to what is written in a formal statement; it is ingrained in the behavior of every person in the organization. As they worked in different companies, participants felt different corporate cultures. Some cultures were learning supportive and others are not; corporate cultures could help participants or choke their CPD. Emma, a senior HR specialist, works in an electronic company with a pro-learning culture. She said:

Lifelong learning is one aspect of our expected corporate culture which was listed on our business philosophy [shows me their business philosophy on the company profile]. Our company strongly encourages employees to be lifelong learners.... Our company adapted the job rotation system. We hope our employees can develop diverse competencies rather than just focusing on one field.... In addition to our annual training plan, we can apply for taking courses outside. As long as the course is related to one’s job and the cost is within the training budget, the application is always approved. Our company did encourage employees to learn and develop themselves.

Unlike the situation in Emma’s company, the corporate culture in Dorothy’s company did not support continuing learning and development. She felt frustrated by her boss’s negative attitude against her CPD participation. Dorothy described:

In the past, I often requested taking courses or attending seminars to develop myself. One day, my boss told me in an ironic and unhappy tone: “You seem to have taken many courses haven’t you?” I dare not take any course this year.... Learning resources are limited in our company. I have to let other employees have opportunities to use them. In the past, I did use little more than others.... Our company lacked a leaning climate. Sometimes I dare not even apply for taking courses outside even if the course is very important.

Conclusion

In the modern Taiwanese workplace, it is essential and necessary that HRD professionals participate in CPD. This study explores, describes, and interprets the experiences of Taiwanese HRD professionals participating in CPD. The findings of this study provide a deeper insight into the structure of meanings of this unique experience. Listening to the voices of my participants helps us to have a sense of how Taiwanese HRD professionals perceive their CPD. Learning from these selected participants’ experiences helps us to rethink the meaning of CPD participation in their working lives of modern Taiwanese HRD professionals. Hopefully, this research will prompt further research to enrich understanding about Taiwanese HRD professionals.

Study Contributions to HRD

This hermeneutic phenomenological study contributed to new knowledge in HRD by providing a deep description and interpretation of HRD professionals’ CPD experiences. This study provides a richer and deeper understanding of this lived experience as well as offers an intersubjective interpretation of this experience. This study adds the possibility of plausible insights that bring us in more direct contact with HRD professionals’ CPD activities. It is important to understand these phenomena. Increased understanding of their lived experiences will directly contribute to those Taiwanese HRD professionals who rely on CPD to update their competencies and expertise. The study also provides valuable insights for adult educators, HRD/HR managers, and other individuals who are interested in fostering and developing HRD professionals.

What is it Like to be a Taiwanese HR Practitioner Performing HRD Tasks?

Ya-Hui (Bella) Lien
National Chung Cheng University, Chia-Yi, Taiwan

Gary N. McLean
University of Minnesota

This interpretive study describes the lived experiences of Taiwanese Human Resource (HR) practitioners who are performing Human Resource Development (HRD) tasks. Using hermeneutic phenomenology as the methodology, seven participants were interviewed about their daily work experiences as HR practitioners. Three major themes emerged about HRD in the Taiwanese work culture: (a) HRD is one aspect of HRM, (b) HRD is equated with training in Taiwan, and (c) HRD success relies on the visions and support of top management.

Keywords: Global HRD, Taiwan HRD, HRD Tasks

As will be seen from the brief literature review presented below, Human Resource Development (HRD) has neither a standard definition nor roles that are universally accepted. In fact, as the contexts in which HRD is done change, the understanding of HRD in those contexts change. One significant context is the country in which HRD is performed. In this research, the meaning of HRD for seven practitioners in Taiwan is explored.

Human Resource Development (HRD) is a relatively new area of professional practice and academic study, even in the United States (Jacobs, 1990). DeSimone and Harris (1998) indicated that "human resource development is a relatively new term, but not a new concept" (p. 3). In Taiwan, it is even more recent.

In order to contribute to improved organizational effectiveness and success, HRD in the United States is a discipline charged with the development of people, processes, and organizations (Wimbiscus, 1995). According to Ruona (2000), scholars in the United States have different points of view about HRD as a profession. Even core beliefs are different due to different value systems. With such differences existing within a country, it should not be surprising to find that different definitions of the HRD profession will exist in other countries (Gilley & Eggland, 1989; McLean, 1999).

In the United States, Nadler (1983) defined HRD as "organized learning experiences, in a given period of time, to bring about the possibility of performance change or general growth for the individual within an organization" (p. 9). Swanson (2000) indicated that "HRD is a process of developing and unleashing human expertise through organization development (OD) and personnel training and development (T&D) for the purpose of improving performance" (p. 8-2). Watkins and Marsick (1997) suggested that HRD practitioners should broaden the concept of HRD. From an adult education perspective, Watkins (1989) suggested that

Human resource development is the field of study and practice responsible for the fostering of a long term, work-related learning capacity at the individual, group, and organizational levels. As such, it includes—but is not limited to—training, career development, and organizational development. (p. 427)

Mclagan (1989) suggested that the fundamental HRD roles are administrator, evaluator, HRD manager, HRD materials developer, individual career development advisor, instructor or facilitator, marketer, needs analyst, organizational change agent, program designer, and researcher. Marquardt and Engel (1993) argued that HRD should focus on needs that relate to the global workplace. They argued that HRD practitioners should have interpersonal and cultural competencies, including "developing a learning climate, designing training programs, transmitting information and experience, assessing results, providing career counseling, creating organizational change, and adapting learning materials..." (p. 63).

In Taiwan, in contrast, there is limited information about how HRD is defined and its roles. According to Kuo and McLean (1999), "Taiwan's economic success supports the idea that developing human resources through education has an important bearing on economic growth" (p. 444). Developing human resources starts with managing human resources. Managing human resources as a strategy has a significant impact on Taiwan's economic development. Human Resource Management (HRM) has been taught in business administration departments for a
long time. Most HRM textbooks are focused on the administrative matters of HRM activities with little emphasis on what would be included in the United States as HRD. Although activities in HRD and HRM do have some overlap, in Taiwanese business settings, Human Resource Management (HRM) is considered to be far more significant than HRD. Some scholars (Chang, 1995; Chang, 1999; Jean, 1995) from different perspectives defined HRD functions as a part of HRM. When they discussed human resource development, they focused on career development and task-related development for employees (Chang, 1999). In the 1990s, many Taiwanese scholars studied abroad and returned to Taiwan to convey, broaden, and differentiate human resource management and development concepts (Chen, 1995; Jean, 1995; Lin, 1991; Lin, 1996). Within the country’s higher education community, the relatively new concept of HRD is becoming an increasingly important subject. This is especially true due to the number of studies related to Taiwan and HRD that accumulated during the 1990s (Kuo & McLean, 1999). In spite of this growth in usage, however, the components have not been defined in the literature, and it is not clear if the users of the term in practice clearly differentiate it from HRM. That is, one of the motives for this study. From this lack of careful distinction among fields in Taiwan, some confusion still exists, and HRM, HRD, personnel, training, and even industrial relations (IR) are often used as synonyms in Taiwan. Within this confusing context of terms, the question that emerged for research was, What is it like to be a Taiwanese HR practitioner performing HRD tasks?

Research Questions

Determining the meaning of HRD in Taiwan for a small group of HR practitioners was one of the focuses of this study. Since HR remains the primary term in Taiwan, the researchers decided to focus only on HR practitioners who might perform HRD activities, however they define them. At present, there are no studies identified that address the experiences of Taiwanese HR practitioners. The major research question for this study was: "What is it like to be a Taiwanese HR practitioner performing HRD tasks?" The following specific questions were posed in the interviews as beginning points in the guided conversations with the participants.

1. What roles do the identified HR practitioners fulfill in Taiwan?
2. What functions and definitions of HRD do these Taiwanese HR practitioners use in a business setting?
3. What is the essential meaning of HRD for these Taiwanese HR practitioners?
4. How do these HR practitioners feel about their work?

Each of these questions was selected as they represented a major component of previous research that has emerged from research in other countries, primarily the United States. While it would be preferable to have these questions emerge from the research in Taiwan, this study was exploratory exactly because the desired research in Taiwan has not been identified, if it exists. Further, while these questions were asked to begin the conversations, as van Manen (1998) specified, the researcher's role in phenomenology is to have a conversation with the interviewees. Thus, questions were used to probe for the interviewees' experiences as HR practitioners performing HRD activities.

Methodology

According to Marsick (1990), qualitative research is useful when research attempts to (a) build new theory rather than imposing existing frameworks on existing data, and (b) explore uncharted territory. In order to explore the complexity of the relatively unexplored concept of Human Resource Development in the Taiwanese workplace, a qualitative study seemed appropriate as a means of conveying the participants' experiences.

The purpose of this study was to establish shared understanding among seven Taiwanese HR practitioners about their lived experiences in performing what they identify as HRD tasks. Hansen (1998) advised telling the story from the viewpoint of informants and using their vocabulary and definitions in the form of raw quotes as the basis of emergent theory. Given the inadequacy of existing frameworks in Taiwan, this study attempts to explore and understand only these Taiwanese HR practitioners' experiences first. In addition, it also adds to the growing body of knowledge in international HRD.

Seven Taiwanese HRD practitioners participated in semi-structured interviews. The study used hermeneutic phenomenology as the research methodology through which to understand the inherent phenomena (phenomenology)—the ambiguous role and concept of HRD in Taiwan—and to interpret the lived experiences (hermeneutics) of Taiwanese HR practitioners who claimed to perform HRD activities (Hultgren, 1989). The interviews were transcribed verbatim, and the text was analyzed by repeated readings, identifying themes that emerged with the use of a highlighter and codes placed in the margin of the transcripts. The text analysis was based on the principle of hermeneutic cycle (van Manen, 1998). First, the researchers read the verbatim transcripts many times until the themes emerged. Second, the findings were shared with the participants to obtain intersubjectivity and to determine whether mutual understanding of their experiences had been identified. Third, the
themes were modified if the participants did not agree that the themes identified accurately reflected their shared experiences.

Study Participants

The interview subjects were seven Taiwanese HR practitioners who ranged in age from 27 to 50+ years. Although all of the practitioners claimed to be involved in HRD activities, they all considered themselves to be HR practitioners rather than HRD practitioners. By title, the seven participants were a training supervisor, an HR manager, two independent HR consultants (who used to be internal HR consultants), an independent OD consultant, an HR supervisor (Human Resource Division), and an HRD professor (Industrial Relations Department). The study participants were purposefully selected by using the snowball technique (Patton, 1990). A more detailed description of the participants is included in Table 1, below.

Findings

The text analysis produced three major themes: (a) HRD is one aspect of HRM, (b) HRD is equated with training in Taiwan, and (c) HRD success relies on the vision and support of top management.

HRD Is One Aspect of HRM

HRD is a relatively new term in Taiwan. As HR is currently a trend in Taiwan, most Taiwanese companies, according to the participants, have changed the name, Personnel Department, to Human Resource Department. Basically, most companies, however, have not extended the functions of human resources; their activities still focus on functions such as compensation, benefits, and labor law issues. One participant stated that HRD includes training, CD, and OD activities. He pointed out that HRD as a discipline is too weak to develop in Taiwan because most HRD activities, compared with HRM activities, are more difficult to measure and to get business results immediately. Therefore, most of the time, HRD does not get the attention of management. As one participant said:

In Taiwanese organizations, the so-called HRD practitioners still deal with low-end matters. Instructional design or teacher planning is just a small portion of their daily work. We spend a lot of time on administrative work. HRD in Taiwan is just part of the HRM function. I don’t think they pay much attention to HRD here. Most of the time, the so-called HRD practitioners deal with compensation, how to count fringe benefits, and labor law issues. Another participant said:

HRD is supposed to have the big picture of how to develop human capability; HRD is supposed to help people develop their competencies; HRD is supposed to include activities related to learning, teaching, and evaluating. Unfortunately, all we can do now is HRM activities. HRD tasks are a small portion of daily
work; we do not have enough people and time to develop and do all the HRD tasks. Hey, I am a training specialist; what I do is collect the training needs of employees and send them out for training. In addition, can you believe that in our department (HR), I need to take care of benefits stuff?

Another participant said:

In the past, Taiwanese enterprise business was not like we have now. Foreign-owned companies try to find local people to deal with personnel matters. Translators in the military are hired to transform HR policy and know-how from the foreign-owned company to the local subsidiary company. Little by little, personnel administration as part of HR management was developed in Taiwan. As I remember, HRD was just as a small portion of the HR function in the company at that time. HRD focuses on the future; we need to think about “now.” There were a lot of personnel administration matters to deal with, such as compensation, labor laws, legislation, and labor relations related issues. It is daily, routine work... In the 1970s and 1980s, all the business administration graduates, if they were interested in personnel matters, focused on entire administration techniques of HR. It was not necessary for them to know what HRD really is. No wander, HRD since then has been just one aspect of HRM.

From my point of view, HRD should be management development (MD); it should include a good succession plan for employees and the business. My past company does have such a plan to match employee interests and company needs. I think that is part of HRD. But most companies focus on low-end personnel matters; HRD may not be a first concern of their daily work.

In Taiwan, the participants observed that most of the time organizations do not appreciate HRD as a separate profession and do not distinguish HRD activities from HRM. Thus, the best strategy for HRD practitioners at this moment is to rely on HRM-related professional associations, while participating in HRD activities with an HRD philosophy. Unlike many studies in the U. S. (Cummings & Worley, 1993; McLagan, 1989; McLagan, 1996; Willis, 1996) that highlighted one of the traditional HRD roles as change agent, Taiwan’s HRD practitioners barely recognized their role as change agents within organizations. For example, the OD functions of HRD are not significant at this moment in Taiwan’s HRD activities, all according to the participants.

HRD is Equated with Training in Taiwan

According to DeSimone and Harris (1998), instructional design, teacher planning, and performance technology are each areas of HRD. HRD practitioners in Taiwan are referred to as training specialists, since a large part of their responsibility is to deliver training. Does HRD in Taiwan include performance technology or teaching planning or evaluation? The answer is both yes and no. According to the participants, Taiwanese organizations do not see a broad scope of activities associated with HRD or even training and development; they just see training. The purpose of training is to solve current problems. Development may not be as urgent as other business functions. Sometimes, Taiwanese organization may do simple evaluation along with the training, but it is just because “everybody does,” not necessarily for developmental purposes.

Watkins and Marsick (1992) explained that the learning perspective involves “facilitating or monitoring all types of learning in the workplace, including formal, informal and incidental learning, implying at least that human resource developers should be responsible for enhancing the organization’s learning system” (p. 118). In Taiwan, if companies are large enough, they may have a training center—separate from the HR department—to deal with all aspects of training, including some elements of teacher planning and performance technology. If companies are small, they generally buy ready-made materials and ask their HR Specialist to deliver the training. Sometimes, they do not even do an evaluation. They just deliver the training that they think is useful. This finding is similar to Walton’s (1999) conclusion that, in some literature, HRD and training and development are interchangeable notions.

One participant, who is an HR supervisor, noted:

The thing that I deal with most is to call the labor bureau and ask what benefits our employees can get. There’s a lot of law that we need to follow, a lot of paper that we need to fill out. I’ve been thinking about planning some training activities for our employees, but it seems that it is not our company’s first priority. If we really need a training program, my boss just sends people out or buys a training program and asks us to deliver it. I am more interested in planning and developing a training material, which fits the employees, but first of all, I don’t have time; second, my boss doesn’t see it as necessary.

I don’t think so-called OD can survive in Taiwanese organizations. Training may be more visible. I believe my boss thinks so-called HRD is training, nothing else. However, organizational change is not what we need to consider; that kind of issue belongs to top management.

Training is considered by the participants to be an HRD activity. Although HRD is not limited to T&D, one participant kept referring to HRD as training when asked about his daily HRD tasks. He said:
Training is an important part of HR. We really care about the training. Training and development are the most important parts of our business strategy... In addition to me, I have two colleagues, and they help me to design training classes.

HRD Success Relies on the Vision and Support of Top Management

As with many organizational activities in Taiwan, without top management commitment, many HR activities barely succeed. Thus, on the one hand, if the leader of the company has a clear vision and supports training and other HRD-related activities, HR practitioners are able to do more meaningful work. On the other hand, some leaders who lack a vision of HRD as a profession seek only their company's immediate financial results instead of long-term business results. With this management philosophy in mind, HRD practitioners in Taiwan do have some strategies to re-educate top managers. One participant explained:

I really appreciate my boss, who supports my training program. Even when he asks me about the results [of training on performance], and I cannot give him an answer, he still lets me do it. And it pushes me to think about performance as a result of the training. As an HR practitioner, I think the boss' appreciation and support are very important. If they (boss) have vision, I will enjoy working in the HR department, and I can do lots of HRD activities. Otherwise, I don't think that I can happily work as a training specialist.

Another participant said:

HRD practitioners in Taiwan had better take the HRM position and work it as their strategic plan. Because we don't have enough HRD people, we need to wait and cultivate our own HRD people who share the same vision and shift the paradigm. I think it is not important to be called HRD practitioners or HR practitioners as long as we practice HRD tasks.

Still another participant said:

The mind of top management is what really matters. I seize every opportunity to educate my boss on how important HRD is and try to give him the whole picture of what HRD is. I hope someday my boss can listen to me and realize that the HRD function is different than HRM activities. Then I can deal with real HRD activities, such as developing a career development plan for employees in which I have more things to do..., or, officially, I can perform HRD tasks without any confrontation or conflict with my boss.

Conclusions and Recommendations

Given the nature of the research methodology, it can be concluded from this study that, for the seven Taiwanese HR practitioners involved in this study, (a) HRD is one aspect of HRM, (b) HRD is equated with training, and (c) HRD success relies on the vision and support of top management. It also appears from the participants' observations that there will be more opportunities for development in HRD-related areas in the future. These Taiwanese HR practitioners, at least, do not perform many HRD activities, such as training planning and development, career development, organization development, and performance technology. And most of the time, when these HRD tasks are performed, they are not the focus of their job due to external constraints. All they practice are parts of training activities, parts of performance technology, and parts of organizational interventions, depending on the business tasks in which they are involved.

It is interesting to observe that the three themes are not completely parallel to the research questions posed at the beginning of this paper. One of the observations from this study, also experienced in other interview studies conducted in Taiwan, is that the interviewees were often not direct in responding to questions. Thus, while probing questions were asked during the conversations relative to the four research questions, the interviewees often responded in indirect ways to the questions. This raises interesting questions about doing qualitative research in this context. For example, one participant mentioned that it does not matter what people call them; at this moment, the most important thing for HR is to educate business and society to appreciate HRD as a discipline.

In the future, it will be very helpful to extend the findings of this study. It would be extremely helpful to replicate this study by interviewing those who identify themselves as HRD practitioners, or those who identify themselves in some aspect of what some see as HRD, i.e., organization development practitioners, performance technologists, career counselors, and so on. As this database grows, it will also be helpful to begin to move towards quantitative measures of the broad field of Human Resources and its sub-components, so that the field can be mapped more fully for Taiwan.
Contributions of Research to HRD

This study contributes to the body of knowledge in HRD by providing a deeper understanding of a select group of Taiwanese HR practitioners and their HRD practices. In addition, through a deeper understanding of Taiwanese HR practitioners, this study also provides additional information about theory and practice in Taiwan, adding to the growing database of countries for which such information is becoming available. Further, this study serves as a foundation on which to build theory in Taiwan, which is of interest to Taiwanese HR practitioners, researchers, and educators, as well as international HRD researchers, to help them also reflect on HRD in Taiwan.

The growing significance of international corporations and the search for optimal management practices within these organizations has resulted in major impacts to the field of human resource development (HRD). As noted by Schuler, Dowling, and De Cieri, (1993) the globalization of business is making it more important than ever to understand how multinational organizations can operate more effectively and efficiently. The HRD function is emerging as a critical competitive factor in the success of international organizations that warrants further investigation (Baumgarten, 1995).

Problem Statement

The vast majority of international HRD literature focuses on the policies, programs, and practices associated with preparing employees for current and future international assignments (Landis & Bhagat, 1996). However, noticeably lacking from the international HRD literature is an examination of the training and development of non-managerial host-country nationals (HCNs) employed in multi national corporations (MNCs) compared to those Host country nationals employed by indigenous firms, also referred to as locally owned corporations (LOCs).

Literature Review

The role of international HRD has traditionally been limited to selecting, training, and supporting expatriates rather than focusing on serving the global employee population of the entire organization (Pucik, 1997). A shift is occurring within MNCs as the vital role of host country nationals in the operation of multinationals is increasingly recognized (Baumgarten, 1995). The increased reliance of host country nationals coincides with the continued high costs of expatriate employees as compared to the employment of citizens from the host country (Townsend, Scott, & Markham, 1990). Other advantages offered by host country nationals include the ability to speak the native language, and their familiarity of local business norms and practices (Barratt, 1995). Not surprisingly, many MNCs...
are increasingly selecting managers and other top executives from the host county (Hayden, 1990).

For many years a stereotypical view persisted that characterized host country employees as being unsophisticated, untrained, and technically incapable as compared to expatriates (Mendenhall, Punnett & Ricks, 1995). As a result, expatriate employees were selected for a variety of overseas job assignments with very little thought given to the HRD needs of entry level HCN employees with which the expatriate would work. Expatriate managers have often failed to emphasize HRD for the non-managerial HCN workforce reflective of their focus to the short duration (usually less than three years) of their overseas assignment.

Increasing concern at the number of expatriate failures, as measured by early return, together with the rising costs of salaries, benefits, and travel expenses has seen MNCs attempting to circumvent the expatriate problem by recruiting and training host country nationals (Bhagat & Prien, 1996). Wes (1998) suggests that managers adopt a process of “localization” by using HRD practices to develop host country nationals to replace expatriate staff. Vance, Wholihan, and Paderon (1993), suggest that well trained host country nationals can assist expatriates in succeeding in their assignment and avoid certain costly mistakes that might seriously undermine the success of the foreign assignment. It has also been said that multi national corporations have an ethical responsibility in providing training and development for the host country workforce (Vance & Paderon, 1993). Providing HRD for the host country workforce reflects a long-term developmental approach to the global workforce and reduces existing stereotypes that multi nationals exploit cheap labor. It also supports the notion that a long-term investment perspective is required for building truly global organizations.

Research Hypotheses

Within the last two decades countries in the Southeast Asia have experienced much global business activity capitalizing on the competitive advantage represented in their human resources. Studies by the World Bank highlight that pre-existing education priorities for the nation may be the single most important element in any national or firm level HRD strategy (Asia Development Bank, 1991). Because both MNC and locally owned companies utilize the host country workforce, it is thought that the percentage of HCN workforce receiving training would be the same for LOC and MNCs.

Hypothesis 1: The percent of the HCN workforce receiving training in the past year will not be significantly different for host country nationals in U.S., Japanese, and European MNCs compared to locally owned firms in Singapore, South Korea, Taiwan, and Thailand.

U.S. companies operating internationally are said to invest less in HRD as they transfer their short-term financial performance approach to management often resulting in HRD for host country nationals taking a back seat (Russ-Eft, Presskill, & Sleezer, 1998). Meanwhile, Japanese firms are often cited as investing heavily in HRD to reflect their values towards training and development (Lindberg, 1991). Locally owned corporations are general thought to adopt a long-term developmental approach to their human resources whereas MNCs have tended to focus on the competitive advantage represented by an abundant and cheap labor force.

Hypothesis 2: Locally owned firms are more likely than MNCs to engage in HAD activities with a long-term focus on HCN development.

Hypothesis 3: MNCs will be more likely than locally owned finns to engage in short-term training activities.

In additional to the transferability or local adaptation of HRD policies, various organizational structural and performance variables may also influence the amount and type of HRD provided for host country nationals. The existence of a centralized human resource department has been shown to relate positively to formal HRM standards. Extending this argument, it could be suggested that HR professionals within a centralized HRM department would be more likely to support the provision of both short-term training and long-term HRD for host country nationals as it increases the role and visibility of HRM within the organization and because it reflects practices consistent with modern effective HRM.

Hypothesis 4: Firms with a centralized HRM department are more likely to engage both in short-term training and HRD activities with a long-term focus on HCN development.
The size of the firm and number of years of operation in the host country are also expected to influence HRD for host country nationals. Existing research confirms that larger firms provide more training (Osterman, 1995). It was also thought that firms in operation for a number of years may have determined the amount and type of training and development needed to ensure that local employees possess the required knowledge, skills, and abilities.

**Hypothesis 5:** Larger firms are more likely to engage in HRD activities with a long-term focus on HCN development and also more likely to engage in short-term training.

**Hypothesis 6:** The length of operation in a host country will increase the likelihood of a firm engaging in both short-term training and long-term HRD activities.

Firm performance, turnover, and the number of employees recruited at entry level are also expected to influence HRD. Higher performing firms are likely to have the resources necessary to undertake training and HRD activities. The voluntary turnover rate was included as high turnover among host country nationals may result in reluctance for training and development investments. Previous research has identified increased training and development in firms with low turnover (Lynch & Black, 1998). The number of employees recruited at entry level may increase the amount of training required to ensure that all employees have the required job skills despite potential shortcomings resulting from their formal education.

**Hypothesis 7:** Firms with greater levels of organizational performance are more likely to engage in HRD activities with a long-term focus on HCN development and also more likely to engage in short-term training.

**Hypothesis 8:** Firms with high voluntary turnover rates are less likely to engage in HRD activities with a long-term focus on HCN development and also less likely to engage in short-term training.

**Hypothesis 9:** Firms that recruit a high proportion of host country nationals at the entry level are more likely to engage in HRD activities with a long-term focus on HCN development and also more likely to engage in short-term training.

**Method**

**Data and Procedures.** A survey questionnaire was developed as part of a larger comparative study of HRM systems in South Korea, Taiwan, Thailand, and Singapore. The questions focused only on non-managerial employees in narrowly defined categories of similar jobs. The questionnaire was translated into Korean, Chinese, and Thai, with back translation to assure validity of the items; the survey instrument used in Singapore was administered in English. The instruments were mailed to individuals with principal responsibility for HRM in a random sample of both MNCs and LOCs who were identified in business directories of major companies in each country. A total of 402 organizations were included in the analysis with return rates for each country being in the 25% to 30% range, which is typical for international HRD studies (Tregaskis, 1998).

**Variables.** All of the variables included in this study were derived from items on the questionnaire. The dependent variables for this study included a scale of training practices for host country nationals and a scale of more long-term HRD practices for host country nationals. Items in the training scale reflected a short-term, job related approach to developing human capital within the firm. Responses were scored along a six-point Likert-type scale with the end points reading 1 = very inaccurate, 6 = very accurate. These items were based on those used by Snell and Dean (1992). The scale consisted of four items and the reliability of this scale was within acceptable limits (α=.67). The four-item HRD scale included items to reflect a long-term and broader perspective to improving employee skills. The reliability coefficient for the HRD scale was on the low side, but certainly acceptable for an exploratory study (α=.62). Two other dependent variables in the study (percent of employees receiving training and hours spent in training) were single item questions asking for specific numbers from the respondents.

As for the independent variables, host country and country of origin were measured by dummy variables. The reference category was U.S. multi-national firms with dummy variables indicating if the firm was a Thai, Taiwanese, South Korean, or Singaporean indigenous firm or the affiliate of a Japanese, or European multi national. These variables were used to test Hypotheses 1-3. A dummy variable indicated if the firm had a centralized HR department was used to test Hypothesis 4. Respondents were also asked the number of individuals currently
employed by the firm (Hypothesis 5), which was converted to its logarithmic value, and the number of years the firm had operating in the host country (Hypothesis 6), also converted to its logarithm. An organizational effectiveness scale, based on the work of Khandwalla (1977), was used to test Hypothesis 7. Only the items relating to firm financial performance were used from this scale; the scales reliability was high (α=.81). Finally, two questions asked the voluntary turnover rate (Hypothesis 8) and percentage of employees recruited at the entry level (Hypothesis 9). Means and standard deviations appear in Table 1.

Results

As the regression results show in Table 2 each column corresponds to a separate dependent variable and standardized regression coefficients and t-statistics are reported for each independent variable. All four equations are statistically significant.

Hypothesis 1 relates to differences in the percent of non-managerial host country nationals trained by multinationals and indigenous firms. Dummy variables representing the firm's country of origin are used to test this hypothesis. Thus "Japan" and "Europe" indicate that the company is the subsidiary of a Japanese or European-based MNC, regardless of host country. "Korea," "Singapore," "Thailand," and "Taiwan" indicate the firm is locally owned and situated in the indicated country. The excluded (reference) category represents subsidiaries of U.S.-based MNCs. The addition of the country of origin dummy variables to the regression equation in which percent of host country nationals trained is the dependent variable significantly improves the fit of the model (F₆,₄₀₂ = 7.43, p < .001), which would tend to result in a rejection of Hypothesis 1. That is, there are systematic differences by country of origin with regard to the proportion of employees trained. In contrast, however, the country of origin dummy variables exert no statistically significant effect on the average time spent on training (F₆,₃₈₁ = .695, ns), so given that a firm provides training, the typical duration of the training experience does not vary by the cultural context of the country of origin nor does it differ between MNC subsidiaries and indigenous firms.

***p < .01  **p < .05  *p < .10

Hypotheses 2 and 3 are assessed by the country of origin dummy variables in the HRD and training scale equations, as these two scales represent the nature and qualities of the HRD and training efforts, rather than intensity or breadth. To test these hypotheses, we include only the dummy variables that indicate locally owned companies, since we investigate the issue as to whether the indigenous firms differ from MNC subsidiaries and, if so, in which countries. The country dummy variables for the training scale are not, as a set, statistically significant ($F_{4,408} = 1.015$, ns), though they are in the case of the HRD scale ($F_{4,408} = 4.467$, $p < .01$). The former results would lead to a rejection of Hypothesis 2, whereas the latter results would be supportive of Hypothesis 3. Yet, the impact in the latter case is limited to indigenous Thai and Taiwanese firms, which are significantly more likely to pursue long-term development activities than MNC subsidiaries; indigenous firms in the other two countries in the study are not significantly different from MNC subsidiaries on this dimension. Thus, the effect is fairly weak.

Other variables exerting a significant effect on percent host country nationals trained include organizational performance (positive), percent recruited at the entry level (positive), and organizational size (positive). These effects are consistent with Hypotheses 7, 9, and 5 respectively. In the case of average training time, organizational performance exerts a positive significant effect consistent with Hypothesis 7. The organizational size and presence of a centralized HR department exert significant positive effect as well and these are consistent with Hypotheses 4 and 5 respectively. Other variables are not significant at the .05 probability level.

Organizational variables have effects on the training scale. Organizational performance, the presence of a centralized HR department, and organizational size had positive and statistically significant effects on the training scale, thus supporting Hypotheses 7, 4, and 5 respectively. Voluntary turnover is negatively related to the training scale, which is consistent with Hypothesis 8. Few organizational variables effects on the HRD scale. The only strongly significant variable is organizational performance, which is positive and thus consistent with Hypothesis 7. The presence of a centralized HR department is also positively related to the HRD scale (as is consistent with Hypothesis 4), though this is only significant at the .10 level.
Conclusions

This paper has explored the role of national origin of firms in attempting to explain the amount of training and development offered to non-management employees in large multi-national and locally owned corporations in four selected Southeast Asian countries. The results suggested a variety of other variables might also affect the amount of HRD opportunities afforded to HNCs. Although various control variables in our analysis performed as expected, our principal hypotheses, relating to differences in training and development as a function of country of origin, were not strongly supported. This, in fact, indicates that a convergence effect may be at work here; that is, companies make decisions based on economic and organizational structural variables rather than national cultural and other influences. This bears further inquiry and model refinement.

This study contributes new knowledge to international HRD in that there is currently a shortage of empirical work existing to explain the differences in the level and types of HRD activities for host country nationals in MNCs. The findings of this research challenge many commonly held beliefs about international HRD. Specifically, despite all firms depending on existing local education systems to provide employees it appears as though the country of origin does influence the percent of the HCN workforce receiving training. The oft cited over investment on long-term HRD by Japanese firms and under investment by U.S. multi-nationals was not supported in this study. Results showed that U.S. multi-national corporations were training a larger percent of their HCN workforce as compared to Japanese multi nationals. The results of this study support the idea that indigenous firms recognize the value of training and developing their human resources. The results also highlight the influences on short-term training and longer-term HRD activities from a range of organizational structure, strategy, and policy variables which would seem to support existing research that finds the variable most related to participation in HRD is organizational commitment to training and policies and regulations that facilitate attendance at training events (Tharenou, 1997). However, much additional research is required to understand possible barriers to the implementation of widespread HRD initiatives for host country nationals employed in multi national organizations. Ideally such future studies would be cross-cultural, employ diverse research methods, and use longitudinal designs to address the influence of variables other than national and organizational culture as has been discussed above.

An Exploration of Perceived Differences in Teaching Roles between On-Site and On-line Instruction

James J. Kirk
Western Carolina University

This investigation explored perceived changes in nine traditional teaching roles as experienced by 144 on-line instructors at selected institutions across the United States. Respondents were asked to compare the roles in terms of on-site versus their on-line teaching experiences. Significant differences were found with respect to role importance, role difficulty, role changeability, role satisfaction, and time required to perform the roles. The findings hold implications for those who recruit, hire, train, and supervise on-line instructors.

Keywords: Distance Learning, On-line Instruction, On-site Instruction

The rapid growth of the World-Wide-Web, is changing how people learn (Green, 1996). For example, in 1999 state colleges in Colorado reported enrollment growth in on-line courses to be up 117% over the previous year (Scanlon, 1999). Furthermore, it is estimated that in the near future 25% of all community college students will acquire part of their education via the Internet and that community colleges will compete nationally/internationally for students via distance learning technologies (Morrison, 1995). In recent months such organizations as the Metropolitan Life Insurance Co., (Swanson & Khirallah, 2000) and the United States Veterans Administration (Khirallah, 2000) announced plans to dramatically increase their on-line training offerings.

The rapid expansion of on-line courses has generated numerous studies on web-based instruction. To date many of these studies have focused on learning outputs (Russell, 1997; Johnson, Aragon, Palma-Rivas, Shalk, & Bilsbury, 1999). The advent of web-based-instruction has also renewed lively discussion on educational theory and practice. According to Wilson (2000), “A major debate has surfaced about the basis of teaching and learning in an on-line environment. Of the current theories that support on-line teaching and learning, behaviorism has historically had the greatest impact.” Individuals in both theoretical camps (i.e., behaviorist and constructivist) hold opposing notions about the appropriate roles of instructors (e.g., sage on the stage versus the guide on the side). Both behaviorist and constructivist want to bring their preferred teaching roles to their on-line instruction.

Rutherford (1977) contends many instructors have concerns about on-line teaching and are reluctant to embrace its technologies. One of their greatest concerns is the impact of technology on their teaching roles (Monaghan, 1995). While some authors have written about the teaching roles of on-line instructors (Berge, 2000; McMann, 1994; Damey & Martha, 1999), few studies have focused on how the on-line teaching environment impacts the traditional roles teachers perform in face-to-face classrooms or how instructors feel about how web technology has affected their traditional teaching roles. Therefore, this investigation sought to explore changes in traditional teaching roles experienced by on-line instructors and their satisfaction with such changes. The findings hold implications for those who recruit, hire, train, and supervise on-line instructors.

Related Literature

Educators, such as teachers and trainers, take on a number of roles in their classrooms. According to Webster (1990) a role is defined as a character assigned or assumed; a function. Various authors discuss their ideas of these functions or roles that instructors employ within the context of the traditional classroom setting. It has been suggested that traditional classrooms are based on an instructor paradigm (Torode, 1997; ERIC Digest, 1992), in which the instructor is a role model or example to which students aspire. Teachers and trainers play the role of expert, “the sage on the stage” (Young, 1997; Downe, 1997). In this role, the instructor displays skills or knowledge based on experience, education, or training. Instructors are also lecturers or presenters of this expert knowledge (Swift & Wilson, 1997; Young, 1997; Bauer, 1998; Harris, 1992), delivering the information gathered from research, reading, and experience. Traditionally, teachers play the role of authoritarian (Whitman, 1999) or disciplinarian (Meyen & Lian, 1997; Downe). Other roles include those of course designer (Harris; Young, 1997)

Copyright © 2001 James Kirk
and discussion moderator or questioner (Harris; Downe; Young). Traditional instructors are also evaluators or critics (Braxton-Brown & Keenan, 1991; Harris; Young) of a learner's work, deciding just how well students master the subject.

Through the growth and acceptance of technology, distance education has emerged and therefore reshapes the roles and functions played by educators. Distance education is defined as any learning that takes place without the physical presence of the instructor with the learner (Boles & Sunoo, 1997). Now, raising even more questions as to the roles and functions of instructors is the appearance of the Internet and World-Wide-Web as a new mode of distance teaching. Even though its use is not currently widespread, the Internet delivers training that is expected to increase dramatically (Bassi, 1997). Higher education and corporations are beginning to take advantage of the Internet as the newest form of distance education. Although there is a body of knowledge on distance education, online instruction was not an option when this literature was written. Until more research can be done on teaching online, distance education offers some direction as to the roles of these instructors and how they have changed from the traditional classroom. Therefore, it is useful to view on-line instruction as a distance education option. Most of the research on distance education has not looked directly at the effects it has on instructors and the roles they play. These studies do not classify roles of distance instructors; they do, however, make inferences based on students’ needs and opinions.

Several authors have commented on the roles that distance instructors play and the ways in which they have changed from traditional teaching roles (Berge, 2000; Danney & Martha, 1999; McMann, 1994). Distance/on-line educating shifts the focus from the instructor being the “sage on the stage” to being the “guide on the side” (Young, 1997). Instructors are now helping the students to learn how to analyze information and have more control over their own learning. Trainers and teachers are no longer focusing on what they can teach but on playing the role of facilitator in the learning process (Swift & Wilson, 1997; Moore, 1997; Meyen & Lian, 1997; Doyle, 1991). Through distance/on-line teaching, instructors become mentors or counselors (Downe, 1997; Whitman, 1999; Torode, 1997; Simonson, 1993; Rangercroft, 1998; Care, 1995). Students frequently feel isolated from instructors and other students in on-line courses. Counseling these students motivates them to participate, and it promotes their confidence. Mentoring also reduces students’ fear, and it reduces the sense of teacher as authoritarian, which allows the learner to be in control.

In addition to counselor, other key roles emerge from the growing need for students to do well and feel a part of the learning environment. The distance/on-line teacher must become a communicator (Meyen et al.; Thach, 1993, Simonson). In some distance education there is no nonverbal communication, no body language to read, and no face to face contact. This means that solid communication is imperative to the students’ success. Emails and materials such as syllabi must be clear and effective. The instructor must personalize communication through email, phone, or fax. Instructors need to ensure lines of communication are always open. They also need to provide constant feedback. Teaching through distance education means more hours of preparing instruction and materials than in traditional classrooms. Instructors play a more emphasized role of instructional designer (Meyen et al.; Bauer, 1998; Kubala, 1998, Simonson; Swift et al.). Their work is done up front, and there is no room for “winging it.” All materials and course preparation must be completed before the first class even begins. Instructors must decide what content to post, work with technicians and other professors to prepare multimedia presentations, and make sure that all lessons encourage student involvement and interaction.

The web continues the long debate between the Objectivist and Constructivist approach to teaching. Under the constructivist model, students are the active processors of information; they are self-directed in their learning. Students have their own questions, and through the use of the Internet, they are able to find their own answers and discover new information through exploration. The instructor plays the role of learning facilitator. The Objectivist model is based on learning objectives set by the instructor. This is a subject-centered approach with definite right and wrong answers. Teachers who use this approach highly manage their instruction. In this, their role is to control the learning environment. The Objectivists use the web for more specific learning activities, exercises, and quizzes. (Fox, no date; Koyanagi, no date).

There are mixed reviews as to distance educators' attitudes and satisfaction pertaining to changes in their teaching roles (Thach, 1993). Some instructors find teaching on-line to be a positive experience (Moore, 1997; Meyen & Lian, 1997). Some instructors see the need and opportunity for on-line teaching. They also see the Internet as a great opportunity for faculty who live in remote areas to have this kind of access. Some even believe that teaching may become more efficient and that these new roles will leave them with more time to do the things they do best (Young, 1997). Although there are those who are pleased with these changing roles and technologies, there is more literature on the frustration and lack of excitement towards these new roles. According to a survey done on the faculty of Florida Gulf Coast University, over half do not believe that more Internet classes should be offered nor do they see the Internet as an effective alternative to traditional instruction (McKimmon, 1998).
Trainers and professors alike worry that on-line learning may be stealing their control and ownership of their courses, and many worry that their jobs will become unstable and that they could be replaced (McKimmon). Teaching is now occurring at home or at an office, and some teachers find it challenging to balance flexibility with some form of a set schedule. Others are just frustrated and resistant to making the move to on-line learning due to role ambiguity (Ulrich, 1998). Instructors know their role is changing. But they do not know exactly how, and they are not being trained to take on such roles. Due to all these frustrations as well as the amount of time for preparation, many instructors feel inadequately prepared and inadequately compensated (Pool, 1996).

Research Questions

For the purpose of this study, three research questions were posed. They included:

1. Are there significant differences in on-line instructors’ perceived changes in traditional teaching roles?
2. Is there a significant difference in on-line instructors’ satisfaction with on-site versus on-line teaching experiences?
3. What new roles do on-line instructors assume when teaching on-line?

Methodology:

The World-Wide-Web was the sole source of respondents for this survey. Initially, a general search for On-Line Courses was performed using search engines such as Yahoo, MetaCrawler, etc. This resulted in many direct links to courses, as well as directory sites, such as The World Lecture Hall (http://www.utexas.edu/world/lecture) and The Distance Learning Resource Network (http://www.wested.org/tie/dlm/CollegeDistanceEd.html). Once specific courses and instructors were found, additional on-line courses taught at the same institution were added to the sample pool. A total of 565 cover letters and surveys were e-mailed to on-line instructors. The survey was included in the text of the e-mail message and also attached as a Word document. Respondents were given instructions on how to return the questionnaire. Options included e-mail, fax, or the U.S. postal service. Fax and U.S. mail return options were offered to respondents desiring complete anonymity. One hundred forty-four (144) usable surveys were returned (25.48% response rate). Some instructors who e-mailed back comments stating that they did not have the time to complete the 65-item questionnaire. Items on the questionnaire related to personal/occupational information, satisfaction with instructor roles, and perceived changes in teaching roles.

Data from the questionnaires was entered into a statistical database from which descriptive and comparative statistics were generated. Descriptive statistics included frequency counts, percentages, and means scores for the selected variables. Comparative statistics included the results of Chi Square tests and an Independent T Test. The probability level for determining statistical significance was p = .05.

Results

Respondents had a mean age of 52.44 years. Forty-nine (34%) were female and 95 (66%) were male. On average they had taught for 18.92 (SD=10.8) years and on-line for 2.23 (SD=4.31) years. Their main reasons for teaching on-line were to reach more students (38.2%), personal interest/challenge (20.1%), required to (12.5%), job flexibility (8.3%), professional development (6.9%), and to keep up with technology (6.3%). They had received an average of 15.06 (SD=32.51) hours of training on teaching on-line.

The Chi Square Test used to answer question one ((i.e., Are there significant differences in on-line instructors’ perceived changes in traditional teaching roles?) reveal several differences (see Tables One-Six). Seven traditional teaching roles showed significant differences with respect to time consumption and challenge, five with respect to role importance, four with respect to role changeability, and three in terms of role satisfaction. The role displaying the greatest number of significant differences was that of Instructional Designer (5 significant differences). With four differences, Evaluator and Role Model had the next highest number of significant differences. Only one significant difference was discerned with respect to the role Information Presenter.

The Two-Tailed Independent T Test used to test for a significant difference in on-line instructors’ satisfaction with on-site versus on-line teaching experiences (question two) revealed no significant difference (t=1.89, df=143, p=.06). On a five-point likert-type scale, respondents’ means score for satisfaction with their overall classroom teaching experiences was 4.72 (SD=4.24) and their on-line teaching experiences was 4.05 (SD=.95).
As for question three, (i.e., What new roles do on-line instructors assume when teaching on-line?) only one new role was identified by a large number of respondents. Forty-seven of the respondents named computer technology consultant as a new role they had taken on as on-line instructors. They reported that students turned to them for technology assistance.

Conclusions

Several conclusions may be drawn from the results of this exploratory study. It appears that some on-line instructors perceive many changes in the traditional roles that they perform in face-to-face instruction. The major changes appear to be related to time requirement and challenges associated with performing traditional teaching roles. For example, 85.4% of the respondents found the role of Instructional Designer more time consuming with on-line
teaching. Sixty-six percent (66%) found the role Discussion Monitor and 55% found the role Evaluator more time consuming. Approximately seventy-four percent (73.6%) of the respondents found the role Instructional Designer more challenging. Fifty-nine percent (59%) found the role of Discussion Monitor and 55% found the role Information Presenter more challenging. Other notable changes in roles occurred with respect to role importance and changeability. For example, 50% of the respondents perceived the role of Discussion Monitor as being more important and 46.5% of the respondents view the role of Instructional Designer as being more changeable (i.e., more dynamic or fluid).

Another conclusion derived from the study is that some on-line instructors are not generally significantly more or less satisfied with their on-line teaching experiences than they are with their “regular” on-site teaching. However, an inspection of perceived satisfaction changes with respect to specific roles, revealed that 35.4% of the respondents experienced increased satisfaction with the role of Instructional Designer. This is the same role that 85.4% of the respondents found more time consuming and 73.6 found more challenging. It would appear that a large number of the instructors took on the challenge of designing instruction for the web and found it more satisfying than their on-site instructional design efforts. The roles of Role Model and Mentor had the greatest number of instructors (28.5% and 25% respectively) indicating they viewed their on-line performance of the roles as being “less satisfying.”

Finally, it appears that many on-line instructors performed the same roles in their on-line instruction as they do in their face-to-face teaching. When asked to identify the new roles they had taken on as on-line instructors, only one new role reported-technology consultant. Comments from respondents suggested that the on-line instructors were using new “methods” to perform traditional teaching roles and that their on-line students looked to them for assistance with computer technology.
Discussion

The results of this investigation tend to support the findings of other writers. For example, the finding that seven traditional teaching roles showed significant differences with respect to time consumption and challenge corresponds with the research of Ullrich (1998) and Pool (1996). Furthermore, the finding that the role of Instructional Designer undertook the greatest number of significant changes is consistent with the findings by several researchers (Meyen et al.; Bauer, 1998; Kubala, 1998, Simonson; Swift et al.) who speak of the more emphasized role of instructional designer among on-line instructors. The small amount of training instructors received in preparation for teaching on-line is also consistent with comments from Pool (1996). Nevertheless, additional research into the methods being used by instructors to perform traditional roles is needed. Some of the methods changes appear to be overt and were hinted at in respondents' comments. Other more subtle changes were not touched upon by the results of this study.

The results of this study hold implications for those who recruit, hire, train, and supervise on-line instructors. For example, some of the instructor's reasons for teaching courses on-line might be mentioned by recruiters as potential benefits (i.e., reach more students, personal interest/challenge, job flexibility, professional development, and keep up with technology) to prospective instructors. Given the fact that on-line instruction heavily relies on instructor written communication and technology skills (Meyen et al.; Thach, 1993, Simonson), it is important that recruiters screen potential hires in terms of their expertise in these areas. Respondents in the study indicated that many of their traditional roles became more challenging due to the need to be more "guiding," "directing," and "explicit" in their communications with students. Instructors also indicated that many of the roles were made more challenging by the technology.

The results that respondents in the study only received 15.06 hours of training in preparation to teach on-line suggest that on-line instructors are not being adequately prepared for their new on-line teaching assignments. It is likely that additional training is needed and that some of the additional training might be well spent on the design of web-based courses and materials. Additional training should also be given in preparing instructors to perform the role of "technology consultant." The additional time required to prepare (i.e., design) on-line courses and materials should be taken into consideration by supervisors in terms of teaching loads (i.e., the number of courses an instructor is required to teach) and/or compensation. Furthermore, evaluation instruments used by students to evaluate on-line instructors may need to be revised to include new teaching methods and strategies being used to perform traditional teaching roles as well new emerging roles.

Factors Affecting Student Completion in a Distance Learning Mediated HRD Baccalaureate Program

Hui-Chin Chu  
Shu-Te Technical University

Barbara E. Hinton  
University of Arkansas

This study analyzed factors affecting degree completion of the nontraditional adult students in a distance learning mediated, degree-completion HRD program. Demographics, number of technical and general education hours transferred, work-related and family-related variables were examined to determine those factors most likely to predict program completion.

Keywords: Distance Learning, Working Adults, HRD Baccalaureate Degree

Many American businesses have restructured to meet the demands of a global economy in order to compete with businesses in other countries. Because of that, American workers face a new challenge in having to upgrade continually their knowledge and skills, or in learning new skills in order to remain competitive and increase their earning power (Dubois, 1996). These demands require the American workforce to be more educated to function in a global community. For this reason, more and more working adults (nontraditional students) seek higher educational opportunities for upgrading the skills and knowledge needed in business today. The absence of an earned bachelor's degree limits opportunities for working adults to graduate education and access to higher positions and career advancement (Chu, Martinez, & Hinton, 1999).

Theoretical Framework

The growth of nontraditional students enrolling in higher education reflects the changing demographics of university and college student populations. Over one third of the students now enrolled in U. S. colleges are more than 35 years old. Between 1983 and 1993, enrollment increased about 15 percent, from 12.5 million to 14.3 million. Much of this growth was in part-time and female enrollment. The number of older students has been growing more rapidly than the number of younger students. Between 1980 and 1990, the enrollment of students under age 25 increased by 3 percent while the enrollment of persons 25 and over rose by 34 percent. From 1990 to 2000, National Center for Education Statistics (NCES) projects a rise of 12 percent in enrollments of persons over 25 and an increase of 13 percent in the number under 25. Nontraditional students can be defined as having multiple roles such as parent, employee, student and so on. Nontraditional students are also defined as being over twenty-four years of age or returning to school after a break in their education (Hirschorn, 1988). They are often married, work, and have children, so returning to school means making a significant change in their life style.

The growth of nontraditional adult student enrollment in higher education demands a different and more flexible delivery system in order to meet the students' need. Distance education is one method that higher education institutions are turning to help meet the special needs of the nontraditional adult student. Distance education is any instructional activity in which the instructor and the learner are separated by space or time (Keegan, 1986). It also provides powerful tools for locating, synthesizing, and creating resources in digital schools without walls to both instructors and learners (Ludlow & Duff, 1998). It is seen as a promising mechanism for improving access to education by increasing the size of service areas (Jacobsen, 1994). It reaches nontraditional learners who cannot afford the time and expense (Ehrmann, 1990). It also enhances the quality of education through multimedia and interactive instruction. In addition, it controls costs by increasing enrollments without additional capital investments (Blumenstyk, 1994).

Distance learning is compatible with the characteristics and needs of the adult learner. By being able to maintain their current job while attending school, nontraditional adult distance learners are able to continue to gain

Copyright © 2001 Hui-Chin Chu and Barbara E. Hinton
in work experience while simultaneously pursuing educational goals. Continued work experience enriches the learning process for the individual. The individual's experiential contribution can also enhance the learning process for the other students as well.

While the literature speaks extensively to the characteristics and needs of adult learners, there is a need for research on the impact of distance learning on adult student degree completion. What, if any, is the impact of the demographics of adult learners, work-related variables, and family, or employer support on the graduation rates of these students? Does access to a degree completion program insure student success? It was these questions that sparked this study.

Research Questions

The key question in the study was the following: What are the factors affecting degree completion of nontraditional students in a distance learning mediated, HRD bachelor degree-completion program? This study was guided by research questions that asked, Is there a difference between students who have graduated or are on-track to graduate and those who are not graduating in terms of the number of credit hours of general education and the number of credit hours of technical requirements earned prior to program entry, selected demographic factors, selected work-related factors, family-support factors, and employer-support factors? The study also sought to determine what combination of factors best predicts student graduation?

Methodology

The population of the study was all adult (nontraditional) learners in a distance learning B.S. Ed. HRD degree completion program option. There were three cohorts distributed in ten different sites. The total population of students was 111 with the sample being the 106 students responding to the survey. Cohort one and cohort two, which were launched in 1996 and 1997, have finished their academic work in the HRD distance-learning program. Cohort three, which was launched in 1998, was scheduled to finish their course work with the HRD degree completion program in Spring 2000. The sample was divided into two groups: (a) students who have graduated or were on-track to graduate within four years and (b) students who are not graduating.

The Survey Instrument

A survey questionnaire, HRD Student Enrollment Survey, was used to collect data to answer the research questions in the present study. A five-point Likert-type scale was adopted for the attitudes that the respondents possessed toward family support and employer support. The survey had three sections. The first section elicited personal information such as name, address, site, cohort, age, gender, ethnicity, prior credit hours gained, and associate degree completion status. The second section gathered information about work experience including number of years of work experience, type of work, and kind of organization. The third section contained questions about family support and employer support. Family support included verbal encouragement, financial support, child care assistance, help with responsibilities at home, and transportation. Employer support included verbal encouragement, tuition reimbursement, and time off from work to attend classes.

Data Analysis

A series of descriptive analyses was conducted before an inferential statistical test for each research question. Descriptive statistics reported frequencies (n) and percentages (%) of respondents who have graduated or are on-track to graduate and those who are not graduating based on demographic data, work-related data, and the sub-items of family support and employer support collected from the survey.

Inferential statistical tests (t-test, Chi-square, and Logistic Regression) were performed to test the seven research questions. To compare if there was a difference between two group means, a t-test was used. Pearson's chi-square was used to determine if there was a difference between two group percentages. The significance level (α-level) for accepting or rejecting all hypotheses was set at .05 (Wiersma, 1991). Logistic regression analysis, which was conducted to determine if the selected variables in combination could predict whether students graduate or not.
Findings

The following is summary of both descriptive data and inferential statistical findings:

**Demographics**

The majority of the participants were female, who consisted of 68.9 percent of the total respondents, while the male participants consisted of 31.1 percent. The majority (72.6%) of the participants in this program was between the ages of 31 - 50. The two largest groups in this study were 31-40 years (36.8%) and 41-50 years old (35.8%). Of the 106 respondents, 77 fell into these two categories. Only fourteen (13.2%) of the respondents were younger than 30 years old. Twelve (11.3%) of the respondents were between 51 - 60 years old. There were no students younger than 22 or older than 61. The majority of the respondents were White (86%). Thirteen (12.3%) of the respondents were black. Other ethnicity groups included one American Indian, one Asian, and one Hispanic student. The majority of the respondents (83%) lived within 25 miles of the class location. The largest group (61.3%) lived within 10 miles from the classroom while only eight respondents (7.5%) needed to drive more than 50 miles to attend the classes. A majority (54.7%) of the students entered this degree completion program with an associate degree. The majority of the respondents (79%) had between 11 - 30 years of work experience. The largest group (31.1%) had between 21 - 30 years of work experience. Forty-five (42.5%) of the respondents described their work as being in management, and 16 (15.1%) of the respondents described their work as supervisory. Forty-three (40.6%) described their positions as being non-supervisory in nature. The results show that the largest percentage of the respondents (33%) worked in an educational setting. The second largest type of organization was manufacturing (21%) followed by health (12.3%), government agency and service industry (10%), and transportation (7%). The remaining students fell into the category of others.

A majority of the respondents (62.3%) worked in their present jobs for 5 years or less. Eighty-two percent of the respondents worked in their present jobs for 10 years or less. The largest group (38.7%) of the respondents worked in their present jobs within 2-5 years. The second largest group (23.6%) worked in their present jobs for less than one year. The third largest group (19.8%) worked in their present jobs within 6 - 10 years. Those who worked in their jobs for more than 10 years comprised only 17.3% of the respondents with 7% having worked between 11-15 years and 5.7% more than fifteen years. This item also showed only one respondent working on the present job for more than 21 years.

The largest group of the respondents (39.6%) worked for medium sized companies and organizations with 100 to 500 employees. The second largest group (20.8%) fell into the first category, which was organizations with less than 50 employees, followed by 501 to 1000 employees (11.3%), 1000 and above employees (9.4%), 1001 to 5000 employees (8.5%), below 100 employees (5.7%), and 5001 to 10000 employees (1.9%).

In summary, by using modes as a guideline, a typical survey participant is described generally as follows: A 31 to 40 year-old white female, who has earned an associate degree with 18 general credit hours and 33 technical credit hours brought into the program. She works in an educational organization with 100 to 500 employees. She has worked in the present management position for 2 to 5 years.

**Analysis of Previous Hours Taken, Demographics, Work-Related, Family Support and Employer Support Factors**

Results of the analyses indicated that there is a significant difference between students who have graduated or are on-track to graduate and those who are not graduating in terms of the number of credit hours of general education requirements earned prior to program entry, (4.066 with a probability of .000); number of technical credit hours earned prior to program entry, (t-value of 2.932 with a probability .004), in terms of an associate degree earned prior to program entry ($X^2$ value was 3.958 with a p-value of .047) and in terms of family support (t-value of t 2.083 with a p-value of .040). Individual factors which were not found to be significant included: gender, age, ethnicity, distance to attend classes, type of work, type of organization, total number of years of work experience, number of years in present jobs, number of employees in the organization, and employer support.

The study sought to determine in combination what demographic variables, work-related variables, general and technical credit hours earned prior to program entry, and family and employer support best predicts students' graduation. Logistic regression was conducted to estimate how well the selected variables could predict graduation to occur. The purpose of the logistic regression analysis was to predict the probability of graduation by using all the variables. The variables included: (a) gender, (b) age, (c) ethnicity, (d) the number of general credit hours earned prior to the program entry, (e) the number of technical credit hours earned prior to the program entry, (f) an associate degree earned prior to the program entry, (g) the number of years of work experience, (h) the type of work,
(i) the type of organization, (j) the number of years in present job, (k) the number of employees in the organization, 
(l) family support, (m) employer support, and (n) the distance to attend classes.

In logistic regression analysis, the greater the Wald value, the greater the probability is of an event to occur. 
The number of the general credit hours earned prior to program entry (Wald value = 11.0380 with a significance of 
.0009) played an important role in the graduation of the respondents. From Table 1, a direct estimation of the 
probability of an event occurring can be made by computing the $B$ (effect coefficient), $X$ (the independent variable), 
and $e$ (the base of the natural logarithms, approximately 2.718) using the formula: 
$\text{Prob (event)} = \frac{1}{1+e^{-Z}}$, where 
$Z = B_0 + B_1X_1 + B_2X_2 + B_3X_3 + \ldots$. The probability of the event not occurring is estimated as $\text{Prob (no event)} = 1-$ 
$\text{Prob (event)}$. Based on this estimate, predictions of the probability to graduate can be made. The event is predicted 
to not occur if the estimated probability of the event is less than 0.5. The event is predicted to occur if the estimated 
probability of the event is greater than 0.5 (Table 1).

The number of technical credit hours earned prior to the program entry was significantly related to the 
graduation with the Wald value 4.0591 and a significance of .0439; the number of general studies hours previously 
completed had a Wald value 11.0380 and a significance of .0009. Employer support was also significantly related to 
the graduation with the Wald value of 4.9612 with a significance of .0259. One can conclude that the combination of 
these three variables best predicts student graduation.

The results seemed contradictory with the t-test results of employer supportive individually (significance 
level of .175), which showed no significant difference on students' graduation. Thus, some variables might not make 
a significant difference when they are tested alone, but they become significant when they are combined with other 
variables. One can conclude that when general credit hours earned prior to program entry, technical credit hours 
earned prior to program entry, and employer support were combined, there is a significant difference made in 
student graduation in terms of the combination of these three variables.

Another way to assess how well the logistic regression model fits is to compare the predictions to the 
observed outcomes (Figure 1). From the table in Figure 1, 38 respondents who are not graduating were correctly 
predicted by the model. Similarly, 32 respondents who have graduated were correctly predicted. A total of 23 
respondents were misclassified in this model - 11 respondents are not graduating and 13 respondents have
graduated. With the respondents who have graduated, 71.11% were correctly classified. Of the respondents who are not graduating, 77.55% were correctly classified. Overall, 74.47% of the 94 respondents were correctly classified.

</tr>
</tbody>
</table>

Since the results showed that general credit hours, technical credit hours earned prior to program entry, and employer support were the best combination for predicting student graduation, another logistic regression was tested based on these three items only. The results (Table 2) showed that all the three variables were significant. The Wald of general credit hours was 13.77 with a significance of .0002. Technical credit hours had a Wald of 8.67 with a significance of .0032. Employer support had a Wald of 4.51 with a significance of .0337. The results gave a confirmation that these three variables were the best combination for prediction of student graduation.

</tr>
</tbody>
</table>

Goodness of fit test results (Figure 2) showed that with these three variables, 38 non-graduates were correctly predicted. Similarly, thirty-eight graduates were also correctly predicted. A total of 30 respondents were misclassified in this model — 17 respondents are not graduating and 13 respondents have graduated or are on-track to graduate. With the respondents who have graduated, 74.51% were correctly classified. Of the respondents who are not graduating, 69.09% were correctly classified. Overall, 71.70% of the 106 respondents were correctly classified. This model predicted students who have graduated better than the previous model with all the factors (74.51% vs. 71.11%). The overall prediction rate was also higher than the previous model, which was 71.70% out of 106 respondents compared to 74.47% out of 96 respondents. This means that 76 respondents were correctly classified in this model compared to 71 respondents that were correctly classified in the previous model.

Discussion

The following discussion is limited to those factors found to be associated with program completion. Factors not found to be associated with graduation are not discussed because of space constraints.
General Education Credit Hours

The study revealed that the number of general credit hours earned prior to program entry did affect the degree completion between those who have graduated or are on-track to graduate and those who are not graduating. According to the t-test, respondents who earned more general credit hours prior to program entry were more likely to complete their degrees on time. There is no direct literature that supports that the more general credit hours students earned prior to program entry, the more likely they are to graduate. However, literature support the idea that continuous enrollment plays a big role in degree completion (Adelman, 1999). It can be assumed that if students keep enrolling in school, they continue to gain in the number of credit hours earned.

Technical Credit Hours

The study also revealed that the number of technical credit hours earned prior to program entry differed significantly between students who have graduated or are on-track to graduate and those who are not graduating. According to the t-test results, the findings indicated that the more technical credit hours the students earned prior to program entry, the more likely they were to graduate on time. Graduates had significantly more technical credit hours earned prior to program entry.

Again, there is no direct literature related to the relationship between technical credit hours earned prior to program entry with student graduation. One can assume that if the students keep enrolling in school, the more technical credit hours they would have earned. With more technical credit hours earned prior to program entry by the students, the more likely they are to graduate on time.

Family Support

It is not surprising that family support played an important role on degree completion of the participants. Since this distance HRD degree completion program offered classes five hours on Friday evenings and five hours on Saturday mornings, students had to take time from their family or from other responsibilities at home. In addition, homework and assignments also took away from their family. Family factors are personal because they are unique to every individual. It has been confirmed that non-completion in adult students is normally due to personal or financial factors rather than to academic failure (Lucas & Ward, 1985). The test results showed that family support was one of the factors that affected the degree completion of the respondents. One can conclude that graduates had more family support than did non-graduates. However, there is a need for further analysis of family support factors.

Employer Support

There is one factor – employer support – that surprisingly did not affect students on their degree completion when it was tested individually. From one of the previous studies on employer support and academic success by Dinmore (1997), employer support is one of the most powerful motivators for re-entry adult students, particularly if the employers offer their full tuition reimbursement. It seems surprising that the test results did not indicate that employer support was one of the factors affecting degree completion of the respondents, since employer support has been confirmed by the literature as one of the important factors affecting academic success of working adult students. Even though employer support was not significant when it was tested individually, it was significant when it was combined with the other two.

From the test results, the researcher found the factors affecting academic success (degree completion) were highly individualized. Demographic factors such as gender, race, and age seemed to have no effect on student’s degree completion. Since they were working adults, the researcher took working conditions into account as factors such as the number of years of work experience, the type of work, company size, and the type of organizations where they worked. The results showed that those variables did not affect degree completion. What affected degree completion were factors that related to individual students such as the number of general credit hours and technical credit hours they earned prior to program entry, whether they entered the program with or without an associate degree, and whether or not they received family support.

However, employer support was found significant as tested by logistic regression analysis. It was a significant factor affecting student graduation when combined with two other factors – general credit hours earned prior to program entry and technical credit hours earned prior to program entry. Logistic regression was conducted to estimate how well the selected variables could predict graduation to occur. The test results showed that the best
model to predict student graduation was the combination of these three variables, which were general credit hours earned prior to program entry, technical credit hours earned prior to program entry, and employer support. The test results were consistent with the literature that employer support is one of the important factors for working adult students pursuing their educational goals. According to the discussions above, one can conclude that general and technical credit hours earned prior to program entry, an associate degree earned prior to program entry, family support, and employer support were the factors affecting degree completion of the nontraditional students in an HRD degree completion program in distance learning.

How This Research Contributes to New Knowledge in HRD

This study suggests factors that affect the degree completion of nontraditional adult learners in distance education, particularly in the field of Human Resource Development. The findings of this study may help program planners and curriculum developers design support programs and academic enhancement activities that will help students achieve academic success. An important implication for this research is the potential use of the findings to improve students' graduation completion rates. The study also raises some issues that should be investigated further. Several implications and recommendations can be made based upon the study.

Future studies should focus in more detail on family support to see how it affects student graduation rates. Based on the single-factor Likert scale in this study, family support is an important factor for students to graduate on time. Although there were subcategories related to family support, these subcategories did not indicate the degree of importance each had in the overall rating of family support. The respondents were asked to check a subcategory if they had support in this area. However, while one can conclude that any respondent who marked this subcategory had such support, what is missing is the ability to make inferences about those who did not mark a subcategory. One cannot conclude whether they lacked support in this area or whether it was simply not a necessity or concern. For instance, in the area of child care the respondents were not asked if they had any children, or if they had children whether child care was a necessity. The same can be said for financial support or any of the other categories. A more detailed questionnaire or a more comprehensive Likert scale that requires answers from all respondents could then allow for a comparison to be made between students who have graduated and those who are not graduating to see whether the two groups differ significantly or not.

Employer support is also an important factor for students to continuously pursue their educational goals. In the present study, employer support did not make any difference between students who have graduated or are on-track to graduate and those who are not graduating when it was tested individually. The descriptive statistics indicated that the majority of the respondents received rather high support from their employers. Does it imply that employer support might be very encouraging for employees taking classes in their related field, but it might not be the factor enhancing employees to complete degrees? However, the test results of logistic regression analysis pointed out that employer support was a factor affecting student graduation while combined with the other two factors — general credit hours earned prior to program entry, and technical credit hours earned prior to program entry. It became significant when it was tested in the combination with the other two factors. Further studies should focus on the relationship between employer support and student academic success (degree completion) in detail.

Distance education has been considered an adopted child in higher education. Students take courses by distance education because of its convenience and the accessibility. Literature found that there is no difference between distance learners and traditional students on performance, but research studies related to student satisfaction in distance learning seldom can be found. Future studies should also focus on student satisfaction between distance learners and the defined distance learners described in the literature. Comparisons also can be made between distance learners in cohort groups and traditional students; and between distance learners in cohort groups and the nontraditional students in traditional educational settings.

Further Study

An in-depth qualitative study of students and their supervisors in this program has been completed. Results of the 38 interviews examining factors affecting student success as well as other issues such as expectations at the beginning of the program, program challenges, program strengths and benefits, course evaluations and competencies implemented, program outcomes, and program recommendations are being analyzed and will be reported at a later date. Both the quantitative and qualitative studies conducted with this population have been supported by a grant from the U.S. Department of Education, Fund for the Improvement of Postsecondary Education (FIPSE).

Experiences of Web-based Instruction among African-American Students Enrolled in Training and Development Graduate Courses

Saundra Wall Williams
North Carolina State University

The purpose of this study was to describe the online experiences of African-American students participating in web-based training and development graduate program courses. The experiences described in this study give insight as to why African-American students do not participate or continue to participate in web-based courses at the graduate level. The study identified experiences relating to learner-instructor interactions. Conclusions and implications for practice and future research are given.

Keywords: Web-based Instruction, African-American Students, Technology

Historically, cultural, economic, and power-related factors have worked against the success of African-American students in institutions of higher education (Richardson, 1997). The integration of technology may be adding to these factors of African-American student success. Many African-American students are entering higher education without the skills necessary to effectively use the new information technology tools and resources (Resta, 1994; Slater, 1994). Factors such as access, affordability of computer courses, choice of institution, and lack of training have created a “digital divide” in higher education between African-American students and other ethnic groups. The “digital divide”, defined as the gap between the numbers of African-American students and other students who have access to computer technology, has become an issue of concern in all areas of education and training. Although the gap of the “digital divide” is narrowing, currently approximately 15 percent of African-American students have access to or own computers, as compared to 55 percent of students nationally (Carlson, 2000). The longer the “digital divide” continues to exist, the farther behind in technology African-American students will fall.

The delivery of instruction through the World Wide Web continues to grow at an exponential rate. Previous research has examined the differences between face-to-face teaching and online teaching (Russell, 1997), learning style changes in a technology based learning environment (Cohen, 1997) and the instructional design of web-based courses (Braden, 1996). Current studies identify access to technology as one of the key factors in creating the “digital divide” (Carlson, 2000). Yet, research has not expanded beyond access as a factor in enhancing the “digital divide”. Hence, a major question yet to be explored by the field of Human Resource Development (HRD) is: “What experiences account for African-American students not participating in web-based courses?"

According to proponents of computer technology, technology promises inclusion, equality and empowerment. However, based on the research on African-Americans and computers it is less likely that African-American students will be equipped to participate in the information on the Internet. Instead of numerous benefits, for some African-American students the Internet can perpetuate exclusion, inequality, and disenfranchisement (Resta, 1994; Slater, 1994; Richardson, 1997). With a 72 percent rise in the number of distance education programs at colleges and universities, where the primary medium for delivery is the Internet (National Center for Education Statistics, 2000), African-American students may become detoured off the education and training information superhighway. Hence, an investigation of actual online experiences may give some insight as to why African-Americans students do not participate in courses offered via the World Wide Web.

The purpose of this study was to describe the online experiences of African-American students participating in web-based training and development graduate program courses. The experiences described in this study give insight as to why African-American students do not participate or continue to participate in web-based courses at the graduate level.

Conceptual Framework

While conceptual frameworks exist about African-American students within the traditional classrooms (Burlew,
Banks, McAdoo, Azibo, 1992; Justiz, Wilson, Bjork, 1994), far less has been written about African-American students in a web-based learning environment. Researchers (Beckles, 1997; Hoffman & Novak, 1998; Kirk & Shoemaker, 1998) have analyzed barriers to Internet access, but no studies have investigated the experiences of African-American students who have completed web-based courses, specifically at the graduate level.

Several models (Holmberg, 1986; Moore, 1989; Moore, 1996) exist concerning the learner in a technological environment. However, in determining the conceptual framework to undergird this study, Moore's (1996) framework and Hoey, Pettit, and Brawner (1997) were utilized because each focus on the student perceptions in a distance learning environment. These frameworks consist of three components: (1) learner-instructor interaction; (2) learner-learner interaction; (3) learner-content interaction and (4) learner-environment interaction. For the purpose of this study the constructs of learner-instructor, learner-learner, and learner-environment interactions were investigated.

Learner-Instructor Interaction

Moore (1996) describes learner-instructor interaction as a multifaceted interaction. This interaction is between the learner and the instructor where the instructor plans a program of instruction, attempts to motivate students to learn, make presentations, organizes opportunities for learners to acquire relevant skills, evaluates their progress, and provides support and encouragement to the learners.

Learner-Learner Interaction

Learner-learner interaction is seen as the new and challenging component of distance education. Moore (1996) refers to this interaction as "inter-learner interaction between one learner and other learners, alone or in group settings, with or without the real-time presence of an instructor" (p. 22). As determined by Schutte (1997), this dimension is important because it shows that online students actually outperformed students in otherwise identical section of his statistics class by adopting group learning strategies.

Learner-Environment Interaction

Learner-environment interaction is a fourth dimension proposed by Hoey, Pettit, and Brawner (1997). This interaction involves the relationship between the type of technology employed and the physical and virtual environment created. According to these authors, this aspect of learner interaction is important in determining the learner's comfort level with a particular technology, which can play a great role in determining success or failure in a web-based course. This dimension builds on the work of Smith (1997) who introduced the learner-technology interaction.

Research Questions

The purpose of this study was to describe the online experiences of African-American students participating in web-based training and development graduate program. The following research questions guided this study:

1. What experiences do African-American students enrolled in a training and development graduate program report as they relate to participation in their current web-based course?
2. What experiences do African-American students enrolled in a training and development graduate program report as they relate to participation in future web-based courses?

Research Design

In order to determine the experiences reported by African-American students during their participation in web-based training and development graduate courses, this study utilized a qualitative research paradigm. The objective of using the qualitative paradigm was to identify recurrent patterns in the form of categories.

The study was conducted on a predominately white Research I institution in the south. The participants in this study were graduate students who identified themselves as African-American, Black, or biracial (African-American/other) and have completed a web-based course in a training and development program. A total of ninety students have completed web-based courses in the program, where fifteen percent (N = 14) of these students were African-American. Of these fourteen African-American students, five completed the online course and nine withdrew

The data was collected from these students by conducting standardized open-ended interviews via an asynchronous electronic discussion board. In the standardized open-ended interviews, the exact wording and sequencing of questions were determined in advance and all students were asked the same questions in the same order. Utilizing this method of interviewing ensured complete responses from each interview and it increased the comparability of the responses (Patton, 1990). For these participants, the electronic discussion interview technique was appropriate because students who participate in online courses are accustomed to and familiar with communicating using an asynchronous electronic discussion tool. Because the ability to communicate in an online environment is a requirement for participation in all web-based courses in the training and development program, the researcher did not select a more traditional means for interviewing.

These participants were asked open-ended questions in relation to motivation and persistence, interaction with other students, interaction with the instructor, interaction with the environment, and the instructional design of the course. These open-ended questions, explored six general content areas: interactions with instructor, interaction with other students, social and formal interactions, instructional methods, use of time, and motivation.

The data consisted of electronic text from the responses of each individual interview. The electronic text was verbatim directly from the participants; therefore, no transcribing was necessary. The data analysis was conducted as an activity simultaneously with the data collection and data interpretation. As the verbatim data was collected electronically, it was sorted into categories based on the topics of the structured interview guide. The data in the initial categories were re-coded utilizing the schema from Moore (1996) and Hoey, Pettitt, and Brawner (1997).

Findings

The six general content areas explored during this study; interactions with instructor, interaction with other students, social and formal interactions, instructional methods, use of time, and motivation, were analyzed from the perceptions of the African-American students who participated in web-based training and development courses. Due to space limitations, this paper will only report on the findings related to learner–instructor interactions.

The findings from this study will be presented in two areas:

1. Accessibility and responsiveness of the instructor (learner–instructor interaction)
2. Instructor’s expectation of the student (learner–instructor interaction)

Accessibility and Responsiveness of Instructor

Experiences with the accessibility and responsiveness of the instructor during the web-based course emerged throughout each of the interviews. These experiences were represented by statements such as:

- “For one course I was extremely disappointed. There was almost no contact or feedback from the instructors in one course. The format was divided into content instructor and technical instructor. The
technical instructor made a few contacts and gave feedback, but the content instructor responded to nothing, not even phone calls. It was very insulting to have a professor flat out ignore you. For the other course, the feedback has been prompt and consistent. The instructor is extremely accessible and encourages students to utilize his on campus office hours if clarification is needed on class topics."

- "Yes, she constantly stayed in contact via e-mail and provided the students with several options when trying to contact her (phone, fax, and etc.)."
- "There were delays in the beginning of the class that made me feel disconnected."
- "There were periods of time in which we had no interaction with the course instructors. They were inaccessible by email, phone, and face to face interaction."
- The majority of the time the instructor and I could not reach each other via email."
- "The class notes were wonderful, very organized, detailed, and always available on the class web site."
- "I was dissatisfied with the down-time. At one point we were not given an assignment for at least three weeks."
- "I did not receive any feedback on any of the work that I turned in. I feel that this would not have been an issue in a traditional classroom setting where I could talk to that teacher face to face."

The accessibility of the instructor as a benefit or barrier to the student taking another web-based course was asked in each interview. Student responses were:

- "It was definitely a barrier."
- "It definitely has me questioning if I want to enroll in another web-based course."
- "Somewhat of a barrier, I have other life activities to manage. It is difficult when one needs an answer to proceed, and the professor's schedule is unknown. It is a frustrating to have to periodically check my computer, and there is not response."
- "Benefit. More accessible than regular office hours."
- "His responsiveness was a benefit."
- "Since this appears to be the way of the new century, I feel I must develop a new set of skills to be successful in a computer environment, particularly being able to trace the structure of communication lines in web site instructional learning activities (to be able to following the design/structural mapping in order to have responses show appropriately for other students and professor's understanding. Fortunately, I possess keyboarding skills, internet access (purchased my own computer to increase availability of access)."

Instructor's Expectation of Students

A second category that emerged from the data from student - instructor interaction was the instructor's expectation of the students. These experiences were represented by statements such as:

- "The expectations were maybe a little too high considering the nature of the instruction."
- "Given the above concern re: design/response structure of the computer-based course, it was a challenge for a "first-timer"; I lacked experience. The instructor did attempt this concern with an "orientation session"."

The expectations of the instructor as a benefit or barrier to the student taking another web-based course were also asked in each interview. The following statements represent responses to this question.

- "I feel that it was a benefit because I know what is expected from participation in this type of course."
- "This experience can not be used as a barrier, I feel I have no choice when the only way for me to have access to a course is limited to being offered computer-based environment. There is no other option but to take the course, as is "on the Internet"."

Instructor Fostered an Environment of Active Participation of Students

Active participation of students is a major tenet of adult learning and training. This factor emerged as one experience that affects the African-American student in a Web-based course. The following statements represent these experiences.

- "Active participation of students was encouraged by utilizing project based learning. (Group project and case study requiring the student to interact with others in the field)."
- "The instructor was actively involved in participating in the group forums as a part of learning."
- "It was encouraged but didn't necessarily take place."
Conclusions

This study represents only a small step towards a more comprehensive understanding of African-American students and the impact of technology and education. Although the small sample size does not warrant generalizations, it is evident that the experiences of African-American students participating web-based instruction can be affected by their interactions with instructors. It is this authors viewpoint that although African-American students have progressed in terms of education, technology and the implications and factors that go along with it, technology may continue to hinder African-American students in the future from being included in web-based courses.

This study does not show that the findings are unique to African-American students. The experiences reported by African-American students could be experienced by students of other races or ethnic backgrounds. Hence, validation through a comparative study with students of other ethnic and racial groups would go far to enhance the findings.

Implications for Practice and Research

The current study assists in the identification of experiences of African-American students enrolled a web-based course. Identifying such experiences surrounding accessibility, responsiveness, instructor expectations, and active participation, might aid in the design, development, and delivery of online instruction. Because African-American students come to the web-based learning environment with factors stacked against them, successfully completing a course in this medium can be even a more difficult and stressful experience. This information may aid faculty who teach via the Internet by identifying difficulties in web-based courses that may contribute to course completion rates for African-American students.

This study has implications for future research in several areas. First, similar research should be conducted with other web-based courses in different disciplines and different institutions to determine if these experiences found in this study are perceived throughout other African-American students enrolled in web-based courses. Second, research implications may also exist in the design of web-based instruction to serve the needs of all students. Research focusing on faculty and their ability to teach effectively in an online environment is major implication for research. This implication is of extreme importance because of the increasing number of courses being converted from face-to face to online environments, particularly in higher education HRD programs. Finally, this research also has implication for future research in African-American student retention and attrition, and the extent to which technology and the instructor in a web-based environment may add to student retention in online educational programs.

Looking at the Literature on Workplace Democracy in Latin America: Factors in Favor and Against it

Max U. Montesino
Indiana University-Purdue University Fort Wayne

This paper discusses some of the issues related to workplace democracy in Latin America, a clearly neglected area in the field of human resource development. It is the brief summary of a non-exhaustive review of the literature on workplace democracy in the region. The author identifies six of the most salient issues for further research in the area of workplace democracy in Latin America. An ample bibliography on the topic is available upon request.

Keywords: Workplace Democracy, Organizational Decentralization, Latin America

Introduction

Even a brief look at the literature would suggest that the subject of workplace democracy seems to be a neglected area in the study of Latin America. Much has been investigated and published about the transition from authoritarian rule to political democracy in the region, but except for a few studies scattered in several countries, little is usually published about the ways in which that transition, if any, manifests itself in the context of work organizations. The purpose of this paper is to explore this neglected phenomenon in the region through a brief review of the literature.

In the preface of her book on work democratization in Cuba, Linda Fuller (1992) states "I...wonder if people had ever challenged the pervasive absence of democracy at work...I began to question how social thinkers had resolved the striking contradiction between the widespread and passionate support for the idea and practice of democracy in the political realm and the authoritarian and hierarchical arrangements at work, and found that they had not..." This paper is aimed at calling the attention of scholars and practitioners in human resource development to this phenomenon that has been called "workplace democracy," in the context of the Latin American culture at large.

The way one defines "workplace democracy" profoundly influences the manner in which one perceives the phenomenon. Political scientists help to clarify the concept of democracy in the political realm, which in turn helps organizational-behavior scientists to clarify the concept of democracy in the workplace. According to Clegg (1983, p.3), "democracy is often regarded as the process whereby the concentration of political power is dispersed and the quantity of participation in political life is increased." In the context of work organizations, democracy can be defined in similar terms as above. Clegg contends that "employee participation schemes [in decision making] are widely regarded as the means whereby a more equal distribution of power in organizations may be achieved. Such a process would represent a democratization of work" (1983, p.3).

With this non-exhaustive literature review, the author wanted to explore the understanding of the concept of workplace democracy among those who write about the phenomenon in Latin America, as well as the factors that help/hinder workplace democracy experiments in the region. The author accessed several databases at his disposal, such as ERIC, Infotrack, Academic Search Elite, and others. The most relevant source used was the Handbook of Latin American Studies Online (Library of Congress). The oldest item referred to in this paper was published in 1963. The newest ones in 2000. What follows is a brief summary of the findings from the literature review. The author had to follow the eight-page limitation imposed by AHRD. The original document consisted of a body of 30 pages and a reference list of 79 items. The reference list at the end of this paper only covers up to the letter "o" due to space limitations. The rest of it is available upon request.

Looking at the Literature: The Scope of Workplace Democracy

The field of workplace democracy encompasses a wide variety of employee's participation schemes, with the purpose of spreading organizational influence/authority, actual control, and power of different sources among different levels of the
management hierarchy and rank-and-file employees. The field, as stated by Heller (1984, p. xxxv) "stretches from interests and influence of employees at various levels." This wide spectrum of participation schemes makes the participative management and employee involvement, to industrial democracy and self-management...the term is meant to describe a variety of interpersonal and/or structural arrangements which link organizational decision-making to the phenomenon more difficult to understand and complicates its study. Workplace democracy experiments transcend political systems, are rooted on different organizational theories, produce a wide variety of organizational outcomes, and face a myriad of implementation obstacles from country to country.

Different degrees of workplace democratization experiments have been documented all over the world. A comprehensive list of schemes escapes the space limits of this review. Their denominations, scope, depth of involvement, and organizational context varies widely from place to place. A non-exhaustive list of those most studied and published include: project teams, problem solving groups, cross-functional task forces (Cotton, 1993; Katzenbach & Smith, 1993), advisory-consultative committees, co-determination, collective bargaining, work councils, collectives, (Bayat, 1991; Crouch, 1983; Fuller, 1992), representative participation (Cotton, 1993; Poole, 1986), producer's and consumers' cooperatives (ENDA, 1987; McClintock, 1981; Moscoso, 1987; Schneider, 1986; Scurrah & Podesta, 1986), government decentralization projects (Caravedo, 1986; Ickis, De Jesus, & Maru, 1986; Liboreiro, 1986), quality of working life experiments (Cotton, 1993), quality circles (Cotton, 1993; Gaitan, Davila, & Zarruk, 1985; Weis, 1994). Other work democracy experiments include gain-sharing schemes (Cotton, 1993; Orsburn, Moran, Musselwhite, Zenger, 1990; Schuster, 1983), self-directed work teams (Beekum, 1989; Cummings, 1978; Fisher, 1993; Manz & Sims, 1993; Miller, 1975; Orsburn, Moran, Musselwhite, Zenger, 1990; Wellsins, Byham, & Wilson, 1991), worker self-management (Barrera, 1981; Garson, 1977; Sacks, 1983), employee ownership (Cotton, 1993; Scurrah & Podesta, 1986), total quality management (Dean & Evans, 1994; Deming, 1986; Moguel, 1993; Trejos, 1995; Weis, 1994), self-managed indigenous communities (Bedoya, 1987; Putterman, 1984), and multiple forms of neighborhood grass-roots organizations that engage in mutual help for work (ENDA, 1987). The literature cited above includes experiments with workplace democracy in all continents, regardless of the political system in place in each country.

The organizational theories behind the push for workplace democracy vary according to the type of scheme implemented, the degree of employee involvement, and the purpose sought with the participation scheme. The theoretical foundation for the implementation of worker-managed participation schemes can be traced back to the old quest for increasing workers' control in the workplace (Scurrah & Podesta, 1986); while other forms of participation that do not require redistribution of ownership owe their theoretical basis to several contemporary management theories, such as sociotechnical systems (Beekum, 1989; Cummings, 1978; Miller, 1975), leadership substitute theory (Kerr & Jermier, 1978), social learning and cognition (Bandura, 1986; Manz & Sims, 1993; Sims & Lorenzo, 1992), and followership theories (Kelley, 1992; Weis, 1996).

The implementation of a wide range of employee participation schemes at work has been associated with important organizational outcomes all over the world. Some of the outcomes with which they have been associated include: increased employee productivity (Cotton, 1993; Gaitan, Davila, & Zarruk, 1985; Miller, 1975; Wall, Kemp, Jackson, & Clegg, 1986; Weis, 1994), governmental efficiency (Ickis, De Jesus, Maru, 1986), employee commitment (Barrera, 1981; Tarrab & D'Aragon, 1986), production efficiency (Caravedo, 1986; Sacks, 1983), job satisfaction (Cotton, 1993; Tarrab & D'Aragon, 1986; Wall, Kemp, Jackson, & Clegg, 1986), and a difficult-to-measure sense of organizational synergy (Adizes, 1971; Cotton, 1993; Katzenbach & Smith, 1993; Robbins & Finley, 1995; Schaupp, 1978; Scholtes, 1988). All these outcomes are of a positive nature for both the organization and the employees involved.

Obviously, workplace democracy has also been associated with operational problems, failures, and numerous obstacles which are inherent to each participation scheme (see Adizes, 1971; Barrera, 1981; Bedoya, 1987; Cotton, 1993; De Castro, 1988; ENDA, 1987; Gaitan et al., 1985; Katzenbach & Smith, 1993; Kras, 1994; Liboreiro, 1986; McClintock, Podesta, and Scurrah, 1984; Moscoso, 1987; Ortega, 1985; Putterman, 1984; Robbins & Finley, 1995; Schaupp, 1978; Scholtes, 1988; Scurrah & Podesta, 1986; Weis, 1994; and others). In Latin America, participation schemes face serious implementation difficulties derived from the nature of the region's capitalist development (in most cases), state control over the production means (in others), and the lack of a self-management culture in general. For example, De Castro (1988) stresses that several participation schemes have failed in Brazil because of the tutelage model of labor relations, employer control strategies in the workplace, and resistance from unions. Lack of experience with quality circles have posed difficulties to the implementation of that approach in Colombia (Gaitan, Davila, & Zarruk, 1985; Weis, 1994). The "traditional managerial culture" in Mexico, according to Kras (1994), makes the transition to "modern" management (as she sees it) more difficult.

By the same token, self-management experiments in Latin America face several other types of operational difficulties (Bedoya, 1987; ENDA, 1987; Iturraspe, 1986; Liboreiro, 1986; McClintock, Podesta, and Scurrah, 1984; Ortega, 1985; Scurrah & Podesta, 1986). As stated by Moscoso (1987) in his account of the struggle of a workers'
Regardless of size and sectors where they operate, Jorgensen at al. (1986) identified four basic types of work organizations that accompany the implementation of work democracy schemes. Some progress toward greater decentralization and participation may cause them to lose interest in measures of performance, productivity and other effectiveness indicators that are critical to the way of promoting workplace democracy. In many cases, organizational practices such as patronage and nepotism are based on loyalty, sense of duty, and group participation. This collectivistic tendency in the Latin American culture in general, as it extends to the work place, helps the prospects for workplace democracy. The extent to which this cultural asset has been used by work leaders to enhance workplace democracy is not clear.

The drive for political democracy that is sweeping away old authoritarian regimes in Latin America is also a factor in favor of workplace democracy. The transition from authoritarian rule to political democracy in the region has been amply documented in the political science literature (see Malloy & Seligson, 1987; O'Donnell, Schmitter & Whitehead, 1986; among many others). It has taken place during the last 30 years and has produced strengthening of the civic society, electoral reforms, and provided for more accountability in public administration.

Although the forces that prompt changes in the political arena may or may not be the same that foster changes in organizations, changes in the political arena do influence democracy in work organizations. The similarities between political and managerial cultures pointed out before give hope to the belief that as more progress is made in the democratization of politics in the region, more experimentation with workplace democracy can be expected.

As mentioned before, one of the most relevant stumbling blocks to workplace democracy is the high concentration of power in work organizations. This tendency has been suggested in several studies that have included Latin American countries (Fuller, 1992; Hofstede, 1983; Jackofsky et al., 1988; Otalora-Bay, 1986; Ronan & Shenkar, 1985). Hofstede's study (1980) identified as "power distant" several countries in the region. Hofstede defines power distance as the preferred degree of power inequality between two individuals. In countries with high power distance scores, power holders are entitled to privileges, and the social norm is for clear and strong superior-subordinate relationships. In countries with low power distance scores, the norm is for more equality and sharing of power. Weiss (1996, p.191) says that "high power distance societies and members believe the boss is right because he or she is the boss...less powerful members of society accept the unequal distribution of resources and power in society." According to Hofstede (1980), power distance norms are related to the reactions of individuals to the hierarchical power structure and to authority in organizations. The author believes that this is the single most important hindrance to workplace democracy in Latin America.

To be more precise regarding the effects of a weak self-management culture at work in Latin America, let's take a look at the different types of work organizations that are typically found in the region. For the sake of manageability, the work-organization taxonomy developed by Jorgensen, Hafsi, & Kiggundu (1986) will be used for this analysis. Regardless of size and sectors where they operate, Jorgensen et al. (1986) identified four basic types of work organizations in developing countries: (a) government and state-owned enterprises, (b) the entrepreneurial family-owned firm, (c) the industrial cluster, and (d) the multinational subsidiary. The author will add a fifth type: the non-governmental organization-NGO. The NGOs are a type of organizational creature that has spread all over the developing world as governments have failed to provide basic services to the population. Like multinational corporations, NGOs sometimes bridge the transfer of technology and managerial know-how between developed and less developed countries.

Throughout history, "government institutions and state-owned enterprises," have shown a highly hierarchal structure due to, in part, their heritage from the military and the church. According to Jorgensen et al. (1986, p.429), they most of the time "emphasize political survival rather than effectiveness and efficiency." This emphasis sometimes gets in the way of promoting workplace democracy. In many cases, organizational practices such as patronage and nepotism cause them to lose interest in measures of performance, productivity and other effectiveness indicators that usually accompany the implementation of work democracy schemes. Some progress toward greater decentralization and
accountability is observed in the public sector in Latin America lately. This trend has accompanied the transition to democracy taking place in the political realm in the region. The work of some global organizations (such as the technical institutions of the United Nations), regional organizations (such as Organization of American States), and technical-support networks (such as the Latin American Center for Development Administration-CLAD) has helped to encourage this drive toward more decentralization of governments.

"Private businesses" are the most common types of work organizations in Latin America both formal and informal. Again, for the sake of manageability, we will refer to formal business organizations in this paper. Informal businesses tend to show very similar characteristics regarding power orientation in Latin America; but their study in terms of organizational behavior is very limited. Jorgensen et al. (1986) classify formal business organizations in two types: (a) entrepreneurial family-owned, and (b) industrial cluster. These two types of business organizations show different dynamics regarding their proclivity to engage in work democracy schemes. Both types face very unique sets of challenges for decentralizing decision making, due to their origin, size, and structure. The other unique challenge alludes to their varying degrees of access to technology and managerial talent.

In the case of the "entrepreneurial family-owned organization," the entrepreneur is the owner and manager, playing different roles in the community. This type of organization diversifies risk by engaging in several businesses at once, linked by family ties. For that reason, Jorgensen et al. (1986) called it "the octopus." This type of work organization is usually characterized by a lack of management talent. Their cadre of middle managers and front-line supervisors emerges primarily through nepotic practices and is usually developed from within the organization with very little exposure to formal schooling and contemporary management education and technology. Kras (1994) studied this type of organization in Mexico and concluded that the changes in management philosophy and practice have to be drastic, in order for the owners to embrace self-leadership and engage in decentralization, participation, and self-management schemes.

In the "industrial cluster," the control shifts from family funding to professional managers. In Weberian terms, this is where the control of bureaucrats and technocrats takes hold, as documented by Weis (1994) in her study of industrial organizations in Colombia. This type of business organization is typically well equipped in terms of managerial talent. Staffed at the upper and middle management levels by college graduates and other professionals with graduate studies either in their own countries or abroad, they resemble very much their counterparts in developed countries. Following the footsteps of the total-quality-customer-focus approaches in the United States, Europe, and Japan, they pay close attention to the notion of "customer empowerment." The extent to which this interest in customer empowerment is translated into "employee empowerment" is not totally clear. Their size, competitiveness, and interest in efficiency make them the most likely candidate for experimenting with work democracy schemes.

Jorgensen et al. (1986) referred to the "multinational subsidiary" as "the truncated organization" because many of the logistical functions are performed at the parent firm, while the operating core is located in the host country. Studying multinational corporations in the United States, Germany, and Japan, Negandhi (1984) found that global rationalization practices were creating higher levels of centralization in decision-making. According to Brooke (1983), powerful commercial pressures to centralization make the multinational firm an unlikely candidate for industrial democracy. On the other hand, the growing trend for multinational firms to ascribe themselves to what Beamish, Morrison, & Rosenzweig (1997) called "geocentrism" in integrating people from different regions and countries, favors their engagement in participatory schemes. The other force prompting multinational subsidiaries to experiment with organizational decentralization is their symbolically-assigned role as vehicle for technology transfer from the developed to the developing world. Technology transfer includes management technology. Since most of the decentralization schemes that workplace democracy encompasses have been, if not developed from ground zero, then at least perfected in the developed world, multinational subsidiaries are in a very good position to promote it.

"Non-governmental organizations" (NGOs) are very similar to government institutions in their programming and the nature of the services they provide to communities in developing countries. But they are radically different both in terms of their size and structure, and in terms of their willingness to not only decentralize themselves operatively, but also to involve their own client population in their internal decision-making process. They tend to be interested in measures of performance effectiveness to be accountable to donors in the developed world; and, therefore, show some willingness to experiment with participation schemes. Of course, their small size and their ties to donors in the developed world facilitate experimentation with workplace democracy.

Summary of Recommendations For Future Research

The preliminary review of the literature on workplace democracy in Latin America left the author with more questions than answers. The following paragraphs address some of the issues that the author thinks deserve further exploration in
the immediate future. Some of them reflect the need for future research with potential practical applications to the world of work. Others are further questions for exploration of a theoretical nature.

1. There is a need for studying the magnitude of work democracy experiments in the region. For example, what is the relationship between political participation in general and employee participation at work? Does political democracy influence workplace democracy and/or vice-versa? How to explain the fact that organizations (and management practices) seem to remain authoritarian in nature, while societies are undergoing transformations in the direction of political democracy? Since the ultimate aspiration of political democracy is total participation of the members of the society for redistribution of power (that is, the existence of a politically participant citizenry), to what extent does "participant citizenship" express itself in work organizations in Latin America?

2. Researchers in Latin America would benefit from studying workplace democracy regardless of ideological preferences, to capture the full spectrum of possible outcomes of the phenomenon. In his foreword to Volume II of the International Yearbook of Organizational Democracy, Heller (In Wilper and Sorge, 1984, p.xxxv) stated that the term "organizational democracy is not intended to imply an analogy with the concept of parliamentary or political democracy. This means that forms of organizational democracy can exist in places that do not have political democracy, as defined in most Western countries. At the same time, it is compatible with individual ownership of the means of production." This assertion might help to explain the existence of work democracy schemes in different political systems such as those described by Fuller (1992) in Cuba, the formidable advancement of self-directed work teams in major corporations in the United States (Beekum, 1989; Cummings, 1978; Fisher, 1993; Manz & Sims, 1993; Miller, 1975; Orsburn, Moran, Musselwhite, Zenger, 1990; Wellins, Byham, & Wilson, 1991), and some other countries in the middle of the political spectrum around the world (Bayat, 1991).

3. As stated at the beginning of this paper, the way one defines "workplace democracy" will determine what is studied, and what is left out of inquiry. If workplace democracy is defined narrowly within the confines of a particular political world view, the theoretical perspectives and methodological tools provided by that paradigm may well filter the information available that does not fit it. The author believes that the study of workplace democracy in Latin America suffers from this paradigm disease; that is, most of the published literature is confined to investigations of employee participation schemes that involve redistribution of ownership (see Barrera, 1981; Bayat, 1991; Espinosa & Zimbalist, 1978; Fuller, 1992; Iturraspe, 1985; McClintock, 1981; McClintock, Podesta & Scurrah, 1984; Moscoso, 1987; Scurrah & Podesta, 1986; Schneider, 1986; Stephens, 1980). This strong emphasis on studying mostly self-management experiences that imply redistribution of ownership neglects the vast array of experiences that might have been implemented in several places without redistribution of ownership, which go understudied or at least under published, to the best of the author's knowledge. This bias misleads people to believe that only when employees own the business or control the production means is there self-management. Because of this bias, one does not know of other participation schemes that might have been successful, such as the cases that Gaitan et al. (1985) and Weis (1994) documented in Colombia's quality circles and Osland, De Franco, and Osland (1999) refer to elsewhere in the region. Furthermore, in some cases the term "autogestion" [self-management] has been misconstrued to reach the connotation of a bad word ["mala palabra"], as Scurrah & Podesta (1986, p.17) reported in the case of Nicaragua. In regards to this issue it is pertinent to wonder whether the lack of publications about other participation schemes in Latin America (that do not imply redistribution of ownership) is a reflection of the lack of broader-scope studies, or a reflection of the non-existence of these other participation schemes in the region.

4. Given the features of the Latin American managerial culture (not discussed here for lack of space), the process of "learning self-direction" deserves to be studied carefully. As Gaitan et al. (1985) gleaned from the Colombian experiments with quality circles, learning to work in participative schemes does not follow a "predetermined path" (p.45); because the specific tools to apply will vary according to the situation. Regarding this learning process it is pertinent to address several questions: What factors (social, cultural, psychological, etc.) affect people's participation at work in Latin America? What does it take to learn self-management at the level of individuals, organizations, and countries? What are the self-direction hindrances, and ways of addressing them? Practitioners of organizational behavior in Latin America need basic research in these areas to be able to contribute to the democratization of the workplace.

5. Another issue deserving further study is whether regional differences within the same country have any impact on the way people accept and get involved in participatory ventures. For example, as the author collected data for the evaluation of a management development program in an NGO in Ecuador during the summer of 1997, he noticed that managers interviewed in the coastal region (Manabi) were successfully engaged in self-directed management teams, while managers in La Sierra region (Bolivar) were facing serious difficulties in implementing the team management scheme. Similarly, a self-directed management team was operating smoothly in Santa Cruz (Bolivia) while the same scheme faced several implementation difficulties in Tarija, within the same country. By the same token, while in El Salvador and Honduras the same NGO has implemented self-directed work teams, it has not implemented them in the Dominican
Republic. Kras (1994) observed the same trend in her study of Mexican management, as she noticed that the industrial north tends to be more prone to modernizing management practices than the southern part of the country. The question here is: are there cultural characteristics that explain regional differences in the proclivity of people to engage in self-management ventures?

6. Finally, given the push toward greater diversity in U.S. work organizations, it is pertinent to wonder what are the implications of the evolution or lack of evolution of the Latin American managerial culture to favor or limit workplace democracy?

The author hopes that further research will shed light on these and other issues related to decentralization of power and people's participation schemes in work organizations.

How This Research Contributes to New Knowledge in HRD

The ways in which a nation's political culture impacts workplace behavior is another phenomenon scarcely studied around the world and, in particular, in Latin America (Montesino, 2000a). This is one of the most relevant contributions of this literature review to the HRD field. According to Almond and Verba (1963, p.14), "the political culture of a nation is the particular distribution of patterns of orientation toward political objects among the members of the nation." The term managerial culture is used here in the same sense; that is, the set of work practices by managers and employees (two very special kinds of leaders and followers) that are a reflection of philosophical orientations, values, and beliefs about work behavior and the role of the self in the context of the work organization.

Particular preferences for power holding in the region have a tremendous impact on the management development initiatives undertaken. Latin America is not a homogeneous region regarding cultural characteristics and behaviors. But, according to some (Hofstede, 1983; Jackofsky, Slocum, & McQuaid, 1988; Ronan & Shenkar, 1985; Veliz, 1980), among the many commonalities, "power holding" stands out as one the organizational behaviors in which most people from the different regions of Latin America tend to act alike. Several scholars even tend to suggest that the region's political and managerial cultures over-emphasize ways of power holding that get in the way of democratic development (Avila, 1980; Harrison, 1985; Veliz, 1980; Wiarda, 1974). Some researchers (Booth & Seligson, 1984; Farris & Butterfield, 1972; Montesino, 1998; Montesino, 2000a: Montesino, 2000b) seem to be skeptical about this alleged inherent authoritarianism. Others (Todaro, 1974; Tulchin, 1983) challenge that conclusion on methodological grounds. Regardless of what corner of the debate you support, the implications of power orientations at work for HRD are vast.

Toward a New HRD Organization Model

Jules K. Beck
University of Minnesota

Increased economic growth in Asian and European markets, fueled by European incorporation of former state-controlled economies and by development of Asian financial infrastructures, will one day place the Americas at a competitive disadvantage unless a new international organization model emerges that can better harness labor to strengthen the hemispheric economic engine. HRD can lead emergence of such a model while furthering development of an independent workforce, attending to greater needs for self-directed training.

Keywords: Organization Structure, Organization Model, NAFTA Structure

HRD practitioners who are committed to developing and unleashing human potential through both organization development (OD) and through personnel training and development (T & D) might consider uniting the two modalities in a new organizational structure to be the best response to long-term hemispheric political and economic needs. It is argued here that furthering the long-term capability of the Americas to compete on an equal basis with the future European Union and Pacific Rim communities will require a new organization model that can facilitate development of and harness an emerging independent workforce (Beck, 2000).

This call for HRD to develop a new model begins with its most immediate relevance for the Western Hemisphere, but also looks to the future where such a structure will strengthen labor capability wherever OD leads economic and social development. To open the debate, the following review first explores how NAFTA might become a pan-hemispheric economic engine, and then examines how current organization modeling can contribute to development of a new organization structure.

Why the Americas Need a New Organization Model

Agreements between the US, Canada, and Mexico in 1993 formed the North American Free Trade Alliance (NAFTA) in recognition of commerce among the countries and the common desire to stimulate development and economic growth across shared borders. The borders remain closed, however, to the general movement of labor that might accelerate economic development. An objective of the newly elected administration in Mexico is to pressure the US and Canada so that borders are opened much like they are to citizens of the European Union (EU) (Fox, par. 13).

Against a background of individual country laws, customs, and political practices, transnational corporations have established branches, joint ventures, and ownership positions, sometimes interacting with cultures having profoundly different business behaviors. Advances in communication and transportation have widened the portals of international trade, encouraging small and medium-sized businesses to join larger compatriots in the international business sphere.

Recent challenges in Asian financial centers demonstrate the interdependence of economic forces in that marketplace. Equally evident was the relative independence of the US economy from those same financial forces. As the Asian financial community addresses fundamental issues, area development should eventually resume prior growth, restoring Pacific Rim status as a communal economic force, more solidly grounded than before. A similar force will emerge in a unified Europe that includes countries once dominated by state-controlled economies. The EU expansion eastward gained momentum during December, 2000 EU meetings where new membership conditions for a dozen European nations were agreed upon. Swedish Prime Minister Pearson declared, “this is a big day for Europe . . . we are ready for enlargement” (Star Tribune, December 11). An expanded EU capitalist machine will rival the Pacific force as well as that of the Americas for trade supremacy. The Americas might need the unifying force of an enlarged NAFTA to compete on equal terms with the other two communities.

The Americas lack the common currency and history of political diversity that characterize the new

Copyright © 2001 Jules K. Beck
European capitalism. As Europe effectively resolves its current issues, it will continue to make inroads into markets previously dominated by US interests, including the Mercosur counties led by Argentina, Paraguay, and Uruguay. Some fundamental issues in cross-border agreements have been painfully addressed through the first NAFTA agreements, and judicial oversight agreements continue to examine common labor concerns. The greatest barriers to realizing the economic potential of hemispheric development are political and systemic, where national interests continue to thwart benefits of cooperation. Isolated political agreements might overcome some political barriers, but solutions to systemic barriers will require a closer examination of the ways companies do business across hemispheric borders. Some organization model components are better suited to extend current regional cooperative ventures. Identifying and combining some of those components might lead to a hybrid model capable of reconciling marked differences in country economies as well as labor markets subject to different cultural norms and educational systems. Organization systems that can respond to project needs throughout the Americas by accessing expertise wherever it resides will help meet production needs, while hemispheric politics should respond to the same realities that are overcoming Eastern European political intransigence.

Method

This inquiry eschews the common research design where a problem is identified and a problem-solving analysis and solutions presented. Instead, it is designed to create a dialogue based upon principles of *appreciative inquiry* (AI) that rely on generative rather than adaptive learning philosophy (Barrett, par. 5). Zemke (1999) considers AI as an “alternative to problem-oriented models . . . a new approach to OD that focuses on what works rather than what doesn’t” (par. 1-2). AI was proposed by Cooperrider at Case Western Reserve; it is described as an innovative process for organization change that moves from “deficits to positive possibilities” (Schau, 1998, par. 1).

Where adaptive learning focuses on incremental improvement to existing services, products, and markets, generative learning looks to “continuous experimentation, systemic rather than fragmented thinking, and a willingness to think outside the accepted limitations of a problem” (Barrett, par. 6). Lawton (1993) makes a further distinction, between “convergent thinking” and “divergent thinking.” Convergent thinking refers to “incremental modifications” made for improvement. Divergent thinking, on the other hand, refers to the ultimate outcomes of our industry (p. 80). The inquiry question treated here defines movement “toward a new HRD organization model” as an opportunistic outcome rather than the closing of a productivity gap so as to conform to requirements.

The inquiry proceeds with a review of the literature about organization models, with the purpose of identifying model elements that might contribute to worker mobility and effectiveness throughout the hemisphere. Employment should be supported by legal, political, and social institutions that empower rather than constrain, whether knowledge work or manual labor. It is hoped that the inquiry’s discussions will generate further scholarly dialogue around the question. The literature selected for review includes articles that examine popular organization models, first, and then analyses of political, legal, and social conditions that affect NAFTA and international trade.

Assumptions

This inquiry assumes that certain political and economic conditions will prevail, and that some training issues will take on added significance. First, a hemispheric alliance will continue to evolve, providing a coherent market competitor in answer to European and Asian alliances. For example, Mercosur members have shown a willingness to join NAFTA if given the opportunity.

A hybrid organization model will improve upon current organizations in hemispheric commerce that have not furthered the interests of workers who are only now learning how to compete in a new information age. Consistency in training and portability of benefits are critical issues for the hemispheric future, and their provision may also represent an ethical underpinning of the HRD profession. As computer access to hemispheric markets matches opportunities with workers, their access vehicle for employment will depend on cross-cultural credentialing as well as on the structural means workers have of joining an international work force.

Training for a hemispheric workforce increasingly made up of contingent employees will raise new issues for HRD, since traditional corporate in-house training programs have been subject to the same downsizing and reengineering forces that have surfaced as a wide-spread corporate activity. The fluid global marketplace of the foreseeable future will most likely see an increasing reliance on economies of scale that direct more of the financial costs of training and education on to workers. This assumption might be revised where organizations recognize and initiate training programs to satisfy critical international commercial needs. Cross-frontier credentialing might require greater standardization in competency-based training and education system models, patterned after standards
developed in emergent international HRD programs and philosophies. The new organization model must coordinate training and credentialing tasks, perhaps through a NAFTA-style division charged with overseeing hemispheric standards in these areas. A similar group might emerge to define and supervise cross-border benefits and other labor standards. Such groups may combine public and private sponsorship at the same time they offer workers entry to Pan-American job assignments.

Current Organization Models

To help conceptualize a new system to further hemispheric capabilities, this section looks at some organization models that characterize international commerce as well as examining political relationships and legal considerations that would impact a new organization model.

Organization Structure

The following organization models are most likely to contribute to a new structure that maximizes international labor access to work and effectiveness: the matrix, heterarchy, diamond, broker, and MNC subsidiary.

Matrix. The matrix has been a popular model since the 1960s, although it has been attacked in recent years. Bartlett and Ghoshal (1990) argue, however, that the matrix concept remains a valid way to meet organization needs, since the strategic reality for most companies is that “both their business and their environment really were more complex” (p.139). The matrix organization combines elements of both functional and project team organizations, imposing a lateral program management on the traditional hierarchical structure. The advantages of the matrix organization were listed by Cummings and Worley (1993), and included making specialized, functional knowledge available to all projects while providing great flexibility in harnessing human resources. The matrix structure also allows adaptation to environmental changes by altering emphasis according to project or function. The principal drawback to the matrix concept is in its multiple reporting line, a violation of the “unity of command” principle. Most other drawbacks of the model are disadvantages of a political rather than structural nature. Larson and Gobeli (1987) see the matrix concept as a continuum between the traditional functional hierarchy and the project team concept. The matrix organization might be especially suited for the new hemispheric workforce. The vertical “silos” that define the functional side of the matrix organization can also include a “silo” that represents the contingent workforce available to meet individual project needs. The project-centered nature of the matrix structure allows organizations to recruit people with skills needed for specific international projects. While about one-sixth of the domestic US workforce is currently employed in contingent labor, much of which is highly skilled in scarce technical disciplines, corporations are increasingly tapping an international workforce to meet interdependent trade and manufacturing needs.

Heterarchy. Solvell and Zander (1995) propose another organization structure when they examine the dynamic multinational enterprise (MNE). They compare the relationship of the home base corporation to its subsidiaries and define a heterarchical MNE, differing from the limited home-base model where the typical MNE has its core functions and its core manufacturing. The heterarchical model has many centers of different kinds to better deal with the increasingly complex international marketplace. Solvell and Zander believe that advantages in the heterarchical MNE include both low-cost or skilled labor provided in the host country as well as access to advanced research institutions. They compare models proposed over the years, such as the geocentric firm, the multifocal firm, the diversified multinational corporation, the transnational firm, the horizontal firm, and the heterarchical MNE, and find a common theme among them where the MNE builds more complex organizational structures and management processes that can combine global integration with location differentiation. The heterarchical model has different kinds of centers: traditional headquarters functions are geographically dispersed where any subsidiary can generate new knowledge. Each center assumes its own leading role in the creation of new technologies. Hence, a business segment may have a different home base than headquarters, and changes may occur anywhere among different units. A foundational concept of the heterarchical model is that information about the whole is stored in each part of the organization. By joining location with particular demand characteristics and allowing functional activities to be carried out anywhere in the world, the heterarchical model “accentuates the trade-off between the geographical demand and functional dimensions that would represent shifts in the traditional matrix structure.” (1995). Solvell and Zander raise important questions for HRD, including a central issue of how a heterarchical firm can build a corporate culture strong enough to overshadow the complexity of national cultures.
Core activities, including decision-making, R & D, and core manufacturing operations, are mostly performed at the home base, while subsidiaries carry out peripheral activities in sales, service, and local adaptations. The MNE would “selectively tap” subsidiary resources where technological innovations or advances were developed abroad. A multi-home based organization has emerged, where the MNE taps into specialized labor pools that could also include a contingent workforce, advanced customers, and close competition with leading rivals.

Diamond. Solvell and Zander also look at a “diamond” organization model; this model, however, already corresponds to a polycentric concept of organizations based on regions or nations rather than on a global environment. They review a “Hollywood Paradox,” a localization process said to emerge where a geographic area develops an overwhelming advantage in skills or expertise that becomes a cluster of core functions far beyond that of the competition. Neither concept appears to contribute much to the organizational need identified here.

MNC Subsidiary. Birkinshaw (1995) proposes three types of international organization subsidiaries from the literature: world mandate, specialized contributor, and local implementer. Birkinshaw compared structural characteristics of each against the principles that define hierarchical and heterarchical multinational models. He held that “the relevant facets of the corporate strategy and the external environment are largely built in to the subsidiary’s structural context.” He defines the three subsidiaries as follows:

- **Local Implementer**: limited geography, single country, with constrained products.
- **Specialized Contributor**: expertise in activities closely coordinated with activities of other subsidiaries; highly interdependent with the other subsidiaries.
- **World Mandate**: develops and implements strategy with HQ, but has worldwide or regional charge of product line or entire business; has unconstrained product scope; activities are integrated worldwide but managed from the subsidiary rather than home office.

Birkinshaw claims that the hierarchical model cannot reflect the complexity of the MNC with peripheral operations that eventually develop their own resources and expertise, and thereby reduce their dependency on the parent company. A subsidiary released from tight control combines the MNC theoretical structures of transnational and horizontal organization into a heterarchy that is distinguished from the hierarchy by dispersing resources, management, and decision-making throughout the organization. High autonomy among peripheral units might facilitate the harnessing of independent or contingent labor to meet project requirements unique to a local context.

Broker. The broker organization serves as a necessary intermediary for contingent labor. The networking associated with that enterprise is more difficult to maintain, however, and likely represents a developmental phase for emerging members of the independent workforce rather than a final direct association with global employment.

**Organization Structure Summary**

In a hierarchy, divisions are organized around specific products or markets. The heterarchy model further develops expertise in divisions or subsidiaries so other entities of the MNC may draw on its specialized capabilities. Such expertise might include the contingent labor resource much as a “peripheral silo” might attach to the traditional matrix model. HRD could facilitate development of a hybrid organization model that combines elements of the heterarchy, the matrix organization, subsidiary concepts, and broker mechanism. A heterarchical organization might be the best mechanism to service corporate home and overseas branches. The matrix model matches functional task authority against a project orientation, with the advantages and shortcomings of both elements. The broker organization has been well-suited to recruiting expertise where projects define employment needs for specific tasks within given timelines. Should a new model combine attributes of the structures reviewed above, it must also address issues of standardized training and portability of benefits in an individual country context, where a combination of economics, education, and labor determine project or corporate success.

**Political Relationships**

The political ramifications of trade agreements have consequences for economic health, regional stability, and development of social institutions. The following illustrations demonstrate the variations in political responses to commerce, employment, and cross-border wrangling that have accompanied the emergence of NAFTA.

Labor union influence led the US to negotiate side agreements to NAFTA to protect US jobs they believed to be in jeopardy. Barrett (1997) noted that “most of the jobs lost [in the textile industry] since the NAFTA pact took effect . . . have been the victims of technology, not NAFTA, according to the American Textile Manufacturers Institute report on employment levels in the industry” (p. 4). She added that since trade barriers among NAFTA members were lowered, fiber consumption in US mills has increased every year to its highest levels in industry.
boards have been granted jurisdiction over businesses holding federal charters or operating within federal or state
governing benefits to employees employed within a country. In Mexico, the Federal Labor Board and various state
antidiscrimination provisions of the Civil Rights Act of 1964. Companies are required to obey local regulations
laws to the same benefits as the company’s domestic employees, except where the company violates the
employment regulations. An employee hired by a US company and stationed overseas has no legal right under US
conditions of employment A significant human resource responsibility of a multinational is compliance with local
uses a 20-digit general ledger, rather than the 12-digit practice common throughout the hemisphere.
systems may differ in inventory valuation, principles of revenue recognition, depreciation, good will, consolidation
and Mexico; they no longer guarantee employment and wage levels, reducing labor costs and “neutralizing labor
confirms Gibson’s analysis, as Vicente Fox’s party assumed control. Labor rules are changing in both Argentina
and Mexico, both regimes modified historical alliances of metropolitan sophisticates and regional traditionalists to incorporate technocratic economics that represent the non-political forces of the free market. Both Mexico and Argentina now embrace a “neoliberalism” that relies on conservative business forces in the metro areas, replacing former exclusive ties with labor unions and the poor with selected groups of successful businesses and their workers, appealing to the growing middle classes and elites who had opposed the Peronists and PRI up through the late 1980s. The 2000 elections in Mexico have confirmed Gibson’s analysis, as Vicente Fox’s party assumed control. Labor rules are changing in both Argentina and Mexico; they no longer guarantee employment and wage levels, reducing labor costs and “neutralizing labor obstacles to marketization.” In both countries, new laws now restrict the right to strike, decentralize collective bargaining, limit wage hikes, and make hiring and firing in the private sector more flexible. State-owned enterprises have been sold, eliminating thousands of jobs.

Legal Considerations

International legal practices as well as governmental laws have presented some difficult barriers to expanding the NAFTA concept. The following illustrations point out potentially difficult negotiations to be encountered later on.

Mulcherjee (1997) examined recent court rulings and found that a California judge’s ruling might have far reaching impact over subsidiaries or agents of US companies abroad. The ruling stated that foreign entities could sue US companies if they could prove gross negligence of conduct, such as human rights violations. Greg Wallace, partner with New York’s Kaye Scholer Fierman law firm, asked, “are we seeing the beginning of a human rights standard for companies doing business abroad? This is not about having enough bathrooms or paying minimum wage, this is much more severe, and it revolves around slave trading.” The case cited by Mulcherjee was in Myanmar, and could represent an expansion of the Alien Tort Claims Act.

Global companies often place their stocks on the exchanges of countries where securities and accounting systems may differ in inventory valuation, principles of revenue recognition, depreciation, good will, consolidation of subsidiaries, currency translation, disclosure requirements, and voluntary loss reserves. For example, Venezuela uses a 20-digit general ledger, rather than the 12-digit practice common throughout the hemisphere.

Pincus and Belohlav point out that every country or geographic region has legislation regulating terms and conditions of employment. A significant human resource responsibility of a multinational is compliance with local employment regulations. An employee hired by a US company and stationed overseas has no legal right under US laws to the same benefits as the company’s domestic employees, except where the company violates the antidiscrimination provisions of the Civil Rights Act of 1964. Companies are required to obey local regulations governing benefits to employees employed within a country. In Mexico, the Federal Labor Board and various state boards have been granted jurisdiction over businesses holding federal charts or operating within federal or state
Adult educators might be able to globally address national development needs by educating adults in skill areas. Is HRD thus challenged to facilitate adult education through the new organization? (1991) argues for including “peace education, sustainable development, and transnational exploitation” in functional and intellectual development and adult learning has become relentless apparent throughout the world (1991). Thomas (1991) adds that the “relationship between economic development and adult learning has become relentlessly apparent . . . [with a] continuing need to maintain close functional and intellectual contact between adult education, economics, and politics . . .” (p. 305). Cunningham (1991) argues for including “peace education, sustainable development, and transnational exploitation” in the adult education discourse (p. 375). Is HRD thus challenged to facilitate adult education through the new organization?

Employment Recruiting and Training Implications for HRD

Talbott (1996) looks at building a global workforce. Applicants who have both international experience and foreign language proficiency are in demand. He suggests that recruitment should concentrate on behavioral traits needed to succeed internationally as well as the technical expertise required for the job. He notes that “most often expatriates are selected from within the corporation” because they already understand the corporate culture. Talbott cites statistics from the American Institute for Foreign Study, where “only 5% of college graduates are proficient in a foreign language, and less than half of business students take a course that’s internationally focused” (1996).

The International Journal of Physical Distribution & Logistics Management (1996) suggests that HR professionals looking to do business in Mexico should examine issues beyond the significantly lower labor costs in the country, such as wage and compensation packages, trade unions, training, labor legislation, and cultural differences. The Mexican Federal Labor Law states that employees are entitled to improve their standard of living and productivity through training. Training is mandatory and aims to update or improve employee knowledge, skills and aptitude; to prepare an employee for a new position; to improve safety and prevent accidents; and to improve productivity. Employers and unions must agree on training programs that are then approved and registered by labor authorities.

Montagno (1996) measures the future competitiveness of US firms in their capacity and willingness to provide extensive international training. He suggests that cross-cultural training participants be exposed to experiences in the context of the US cultural environment, where “everyday behavior has cultural clues embedded,” and learning to recognize them is critical for cross-cultural understanding.

The contingent employee might rely on individual skills to personally sell services to client organizations. Adult educators might be able to globally address national development needs by educating adults in skill areas
external to particular organizations. Whatever the subject matter, knowledge and skills that make a worker more salable in a self-directed marketplace will further both individual and organization goals (Beck, 2000).

As employees freely contract with organizations, the extent of their commitment will be measured by how well the organization welcomes them and values their services. OD practitioners might help organizations learn how to attract contingent employees and seamlessly incorporate them into the corporate culture and structure.

Dishier would undoubtedly observe in this model that “the commercialization of adult education has arrived” (1991, p. 395). Another might argue that the model replaces the mandatory nature of human resource training with a voluntary model where Internet access will create a new tool in workers’ hands, linking their specific skill sets and knowledge to opportunities beyond the constraints of national borders.

The new organization model must embrace a philosophy of continuing education as a global contributor to economic development through largely self-directed learning. Organizations can benefit if they also provide structured on-the-job training that a worker can translate into improved skills for a broader marketplace. In this vision, the guiding humanistic values intrinsic to adult education have a natural fit in an HRD large-system model where individual contributions are recognized and highly valued by organizations. Other critical questions remain to be answered: what happens to commitment in the workplace where workers will be gone after a project has ended, and what hemispheric job centers will service this new transient population? And, Can a NAFTA mechanism be created to develop portable insurance and benefit systems that cross national boundaries where multinational companies are not already providing such benefits? A functional element in the new model might be adapted to manage portable packages with a yet to be determined hemispheric benefit banking system.

Findings
This inquiry has identified elements from a number of international organization models that might contribute to a new structure that could facilitate and empower labor availability throughout the Americas. The final goal would extend such a model globally, furthering the development of an emerging, independent workforce. The major contributions of that inquiry so far include the following:

*The matrix* provides a project team orientation, where resources are identified cross-functionally in an organization. If the organizing principle added another “silo” to its traditional, functional lines, to include a peripheral workforce, only a contingent worker entry point into that outer silo would be lacking.

*The heterarchy* provides a localized context, structurally accounting for the cultural, political, and social requirements of the host country. The availability of a global resource to the subsidiary further heightens its ability to draw upon resources far beyond its geographic limits. The entry point for independent labor is less clear, although each subsidiary would present a different legal, political, and social context for work.

*The broker organization* can provide an intermediate step for a more sophisticated, developing workforce. It was suggested earlier that a parent body might already exist in NAFTA, a division of which could develop and oversee hemispheric standards for credentials, portability of benefits, and other employment mechanism issues. It was not so clear, however, where the self-directed learning that is foundational to an independent workforce might evolve. It was suggested during the discussion about recruitment and training that HRD in its international practice might provide the leadership among corporate and governmental bodies to place the role of continuing education as an important adjunct to any system adopted to further international commerce.

Finally, the legal, social, and cultural differences in the Americas argue for an HRD effort that addresses the politics of organization development, leading the development of resources that heightens the economic vitality and independence of hemispheric neighbors, rather than furthering a foundation that has been considered exploitative of US and Canadian interests.

Conclusion
The new EU currency, the Euro, is meant to symbolize a new era of European cooperation and prosperity. Its volatility against the US dollar, however, illustrates the barriers that yet remain as national structures give way to a communal economic system. HRD can help the US move beyond similar nationalist challenges in the Western hemisphere to long-term economic viability by developing a new organization model better suited to the realities of an increasingly fluid labor market for global commerce. That commerce grows in complexity when the movement of labor is factored into global economics. Economic development is hindered by policies and practices that restrict labor movement according to national boundaries rather than interdependent economic regions. A mechanism that would support the development and circulation of labor to meet regional needs will further the economic health of the Americas in the near future and globally in coming decades, empowering human resources beyond our custom.
Further investigation is needed to determine the adaptability of a new organization model to the EU and to the Pacific Rim, where workers’ rights remains an important issue for the international HRD practitioner. This inquiry looks to a future role for international HRD where a growing corporate focus on outsourced and contingent employment can at the same time empower an independent workforce.

Differences in Priority for Competencies Trained between U.S. and Mexican Trainers

Larry M. Dooley
Kenneth E. Paprock
In-Sun Shim
Elsa Gonzalez y Gonzalez
Texas A&M University

One of the greatest challenges in the modern world is the knowledge, skills and abilities of the labor market. As a result, the educator and trainer must recognize the importance of having highly trained and qualified personnel. An important commitment of the signing of the free trade agreement (NAFTA) was the collaboration specifically in the educational and professional training fields. This paper examines the differences in competencies for training programs between Mexico and United States companies.

Keywords: Training & Development, International Training, Training Competencies

Numerous researchers and professional organizations such as the American Society for Training and Development (ASTD) and the National Society for Performance and Improvement (NSPI) have investigated the roles and competencies required in carrying out human resource development (HRD) functions. In 1989, during the Human Resource Development Practice Model investigation, the competency concept was redefined, culminating in 35 competencies. These competencies have become the basis for human resource training and currently are being used as a training model domestically as well as internationally.

There are cultural and societal background differences between the United States and other international countries including different importance of training competencies. Texas A&M University has conducted training programs in Mexico for several years. Although all thirty-five competencies are being trained for, the Mexican culture places different priority on the competencies as far as rank of importance is concerned. Therefore, the purpose of this paper was to discover the difference in priority for competencies trained between U.S. and Mexican companies.

Training & Development in Different Cultures

The United Kingdom, France, Canada, and the United States have been researching an educational model to determine the change in priority of training competencies over the last 20 years (Paprock, 2000). Considerable progress has been made in identifying the competencies important to training and development; ASTD has led this effort in developing the roles and competencies for HRD practitioners.

A competency is defined as an area of knowledge, skills, attitudes, or intellectual strategies that are critical for producing key outputs (McLagan, 1989). Competencies can be the key components in strategic, operational, interpersonal, and technical tasks and decisions (McLagan, 1996). It is necessary to understand the context in which the competencies are needed. The identified competencies have been instrumental to the development of instructional materials for various types of needs in training programs. ASTD published a national study identifying 35 key competencies that professionals in Human Resource Development possess (McLagan, 1989). These competency models can be decision tools for training requirements.

As McLagan (1996) recalled, she and ASTD offered menus of outputs and competencies in 1989 so HRD practitioners could construct their own work profiles. They provided tools for using the models in such activities as career planning, assessment, organization design, and selection. However, these assumptions have been changed based on the time and situation. Whereas the assumptions focuses on changes in technology, economic pressures, and increased need for business and industry to operate in the international environment in 1983, the 1989 study highlighted such workplace challenges as accelerated rates of change, a concern for quality and customer service, and globalization. They also indicated the organization's requirement at that time.

Global businesses today need employees who can manage themselves, teams that can do their own human resource work, and human resource management and development practices that are just in time rather than when-the-course-is-given. Therefore, McLagan suggested the delegation of the responsibilities of day-to-day people management and development to line managers, self-managing teams, and employees themselves. If time and situation have changed the assumptions, what can be the influence by the culture?

It is not difficult to understand that effective work behavior is shaped by societal cultures. Cultures operate from conceptual models by creating belief systems to filter expectations for appropriate and inappropriate behavior (Hansen & Brooks, 1994). When individuals become socialized and enculturated in a specific society, they have learned a complex set of explicit as well as implicit rules. These are concerned with how they should act among their peers who share the same culture by virtue of being raised under the same rules (Lonner & Malpass, 1994). Meaning making is reflected in rules that guide decision making, values, perceptions, expectations, situational evaluation, communication styles, and so forth. These conceptual systems influence how they interpret and understand organizational realities. The cultural frames also affect the business organization. Like other subcultures, corporation's cultures are shaped through similar organizational experiences, training, and professional associations. In other words, societal values, organizational affiliation, and occupational alliances shape employees' beliefs and values. HRD is an occupational subculture (Hansen & Brooks, 1994).

The work by the American Society for Training and Development might have the biases of America's own socio-culture beliefs because those data were collected only in the United States. When Valkeavaara (1998) examined human resource development roles and competencies in five European countries, although they considered the training and development highly in terms of training volume and financial investment, the importance of the competency training is different to the each country. The comparison indicates the diversity of the roles of European HRD practitioners based on its cultural variation.

Hofstede (1984) examined the culture in multinational corporations through the survey that measured ecological dimensions. He explored the differences in thinking and social action between 40 different nations using the four dimensions of cultural differences, which are power distance, uncertainty avoidance, individualism, and masculinity. His findings tell us there are differences in work related values between cultures based on the dimensions. Although the U.S. and Mexico border each other, their cultural differences are huge. This research finds there is a different distinct corporate identity or company subculture between these two countries.

Mexico and the U.S., according to his study, have quite different index scores. For example, while Mexico has 81 in the power distance index score, which indicates how the environment of organization is related to the authority and power, the U.S. has 40. Mexican employees have 82 in the uncertainty avoidance index, which shows how people are dealing with anxiety and stress in the organization, the U.S. employees have 46. In the individualism index, the U.S. has 91, Mexico has 30. In the masculinity index score, they have similar index scores.

Hansen and Brooks (1994) examined empirical studies reported between 1982 and 1992 that compares two or more countries and world regions focused on a business context. They analyzed the concept of HRD, training and development, career development, and organization development through studies basically conducted by the ASTD and additionally acknowledged the systemic and allied nature by reporting cross-national studies from management and organizational behavior. They concluded that HRD roles are interpreted differently in different cultures, HRD varies in the degree to which it is supported in different cultures, and techniques for transferring managerial and HRD technology are subject to country-specific differences. Their review of cross-cultural studies in business contexts provides the basis for development of training programs in Mexico.

There are few research studies devoted to human resource development cultural differences in Mexico. Since NAFTA, American and Canadian managers need to understand the key human resource challenges in Mexico and how these are to be successfully managed. One specific research study conducted in-depth interviews with top executives from Canada and Mexico from the business point of view (O'Grady, 1995). This study found difficulties in employing and managing Mexican employees from a Canadian perspective. He suggested eight key human resource management challenges for Canadian managers who are doing business in Mexico, and indicated several tips for Canadian companies in Mexico. He concluded that Canadian executives should recognize cultural differences prior to entry and account for these differences in their strategic decisions to manage the Mexican operation.

These findings also challenge us that not only managing human resources but also developing human resources reflects underlying assumptions and values of one's own culture. Human resource development programs need to be modified to succeed in Mexico.
National Network

In 1991, the Department of Educational Human Resource Development at Texas A&M University, in association with ASTD and NSPI, established a certification for trainers. The certification was based on nine studies dating to 1974. The first was from the U.S. Army TRADOC study in 1974. Other studies identifying competencies for trainers during that period were Civil Service Commission (1975-76), National Institute of Education (1975), Canadian Training Methods study (1976), Pinto & Walker’s Study for the ASTD (1978), Competency Analysis for Trainers by the Ontario Society for Training and Development (1982), McLagan and McCulloch’s Models for Excellence (1983), and McLagan’s Models for HRD Practice (1989), which served to fulfill the following purpose:

- Summarized 11 roles of HRD professionals
- Identified and defined 53 HRD competencies.

These competencies have been updated by ASTD Models for Learning Technologies by George M. Piskurich and Ethan S. Sanders, published in 1998. Environmental factors such as the globalization of business and the accelerated rate of changes in technology identified by Ken Paprock, one of the authors, have been included to maintain currency of the program. A summary of all these studies are included in the next table:

Leading to U.S. Certification

Using 35 key competencies from the ASTD study as a guide, Texas A&M University and local chapters of ASTD and NSPI designed a hands-on experienced-based program for Training and Development practitioners, who were already experienced and for those who were new to the field.

The Training and Development Certification Program consists of four 21-hour weekend sessions once a month for four months, plus follow-up activities to be completed between sessions. Competencies are structured into a program agenda around four general competencies of the HRD function according to McLagan: Business Competencies, Interpersonal Competencies, Intellectual Competencies, and Technical Competencies. At the end of the program, graduates receive a Certified Training Professional (CTP) certificate through Texas A&M University.

International Certification

Texas A&M University has been successful in training trainers in other countries. Currently another group of 50 is being certified. The goal is to collaborate with those countries that have a need for new trainers and/or trainers who need to upgrade their skills.

The plan for trainer certification is usually negotiated with the host country taking into consideration their economic situation and their human resource needs. The following is a brief description of steps in the certification when working internationally. All of these steps relate to the need assessment of the country’s plan for modernization and the list of the priority competency needs from the pre-assessment self-inventory.

1. The first group(s) is trained by trainers through Texas A&M University.
2. The original sessions are conducted in English, but audio/visual materials in the language of the host country are also used.
3. From the first group of trained participants, some are identified who will participate in the second group as instructors.
4. The second group(s) is trained by trainers, with Texas A&M University trainers in the majority.
5. In the second session, an effort made to have most of the material in the language of that country.
6. By the third group, the majority of the trainers should be from the host country.

International Certification, the Case of Mexico.

In the case of this study, currently almost 100 trainers have been certified in Mexico through Texas A&M University, the second edition of this program in Mexico has already concluded. The Training and Development Certification program (T&DC) consists of four 15-hour weekend sessions once a month for four months, plus follow-up activities to be completed between sessions. Competencies are structured into a program agenda around four general competencies of the HRD function according to McLagan: Business Competencies, Interpersonal Competencies, Intellectual Competencies, and Technical Competencies. The T&DC program in Mexico was planned taking into consideration their economic situation and their human resource needs.

Research Questions

1. What are the rankings of competencies desired by trainers in the US?
2. What are the rankings of competencies desired by trainers in Mexico?
3. What is the difference in rankings between competencies desired by trainers in U.S. and those perceived by trainers in Mexico?
4. What is the impact of these differences on training of human resource professionals in different cultures?

Methodology

Social researchers now study a problem with several different types of research methodologies. According to Brewer and Hunter (1989), this diversity of methods implies rich opportunities for cross-validating, findings, and theories. Inside this methodological diversity, multi-method research is one such approach. The method for the first stage of the present study gathered information on previous studies completed in the U.S. and Canada. This specific approach is known as "meta-analysis", and ..."it is nothing more than the attitude of data analysis applied to quantitative summaries of individual studies" (Galss, McGaw, and Smith, 1981, p. 21). The results of the meta-analysis stage determined the ranking of competencies for the U.S. and Canada. This list was then compared to the data gathered in the second stage which was completed prior to the training in Mexico.

Prior to each international certification program, each participant completed a pre-assessment survey. The instrument was administered to approximately 100 participants, 50 from the 1999 program, and another 50 from the 2000 program. The participants are trainers from most all states in Mexico. The instrument was translated into Spanish for these participants. In 1999 there were 37 responses out of 45 participants. The rate of return for this group was 82%. The second grouping of trainees began in August 2000. The rate of response for this group of 49

was 44, or 89%. The rate of response overall is 86%. There were seven additional participants from the University co-sponsoring the training who were not paid participants and therefore they did not complete the instrument.

The following section shows a summary of the findings of the first two groups, one from 1999 and one from 2000. These groups participated in the training and pre-assessment inventory. However, due to changes in the environment, the authors decided that some areas (with an asterisk) must be emphasized or added to the basic 35 competencies in order to reflect advances in technology and business practices during 2000 program. The top ten competencies reported in 1999 and 2000 are listed in Table 2.

A comparison of the competency ranking from the two groupings of Mexican participants is shown in Table 3. A general profile of those attending the training includes persons who work in training or human resources in a variety of businesses, such as automobile manufacturing, banking, government; both state and federal, and academic institutions. The greatest percentage was from business organizations. In both 1999 and 2000 the number of participants in any group was limited to 25. Two groups each year were trained during the same time periods. All groups had participants who had from zero training experience to some who had as much as twenty years.

The instrument development was primarily a list of competencies from the McLagan study and used by Hansen and Brooks. However, in order to remain current with the environmental changes occurring, the 2000 inventory included those additional competencies that were identified for the Mexican context by the authors. Shown are the top ten choices with an asterisk. Also the following were discarded or accommodated for the 2000 instrument: performance observation skills, business understanding, computer competence, industry understanding, organizational understanding, intellectual versatility, and data reduction. This is consistent with the more current study by Piskurich and Sanders (1998) in which they were projecting increases and decreases in importance of competencies related to changes on technology, economics, politics, and social systems. For a more complete list of competencies see Table 5.

Conclusions and Recommendations

The results in this study in comparing the training needs of United States trainers with Mexican trainers show some very interesting trends. The first research question asked US trainers to prioritize the training competencies they perceived to be the most important. The second research question asked the same question of the Mexican trainers. Although there is some differences in the priority order, both the Mexican trainers and the US trainers listed essentially the same top ten competencies from the total list of 39. The standard deviation on all these competencies in the top ten list ranged from .87 to 1.4. The higher standard deviation could be attributed to the wording of the statements since training for additional competencies was included. As an example, distance education could have been confused with the competency of computer competence and electronic systems skill.
The third questions addressed the differences in the ranking from the US trainers and the Mexican trainers. The concerns and needs according to the priority rankings for the Mexican trainers demonstrates concerns in technology development as the newer technologies are being introduced. Another concern that is consistent in the top ten is a focus on organizational understanding. As new foreign industries enter Mexico they bring with them different structures and systems from their previous culture. This also relates to the need for applying methods for cost benefits. In the past, cost of training was not a skill high on their job descriptions.

Question four concerned the impact that these differences will have on training of human resource professionals in different cultures. In all, these data demonstrate that it cannot be assumed that countries at various stages of development have different priorities in the competencies needed for training and development; more studies need to be completed in developing nations. The authors believe that developed countries possibly can relate close to the list that has been generated and accepted in various organizations. We also cannot be assured that they will accept this list of competencies as corresponding to their cultural and economic development. Therefore, there needs to be a constant adaptation of materials to fit the culture and a constant adjustment to the level of participants that attend training sessions for training trainers. It was discovered that those with experience tended to attend the earlier group’s sessions; novice trainers began to attend as the experienced trainers completed the training and discussed their experiences. The basic mission of the program is to increase the number of trainers trained from these countries.

Contribution to New Knowledge in HRD

Human resource development has a growing presence in countries in Europe, Asia, Australia, South Africa and soon, India. However our neighbors in both Canada and Mexico do not have the same presence. An important commitment of the signing of the free trade agreement (NAFTA) between Canada, Mexico and the United States, was the permanent collaboration between the three countries specifically in the educational and professional training fields. Mexico has the challenge then to join the competitive labor market, aiming to respond to the demand for international labor and high-qualified products. If we are to make in-roads to HRD as a field of study and practice, it is imperative that we address Mexico.

Texas is one of the major states that is attempting to address the issue with Mexico. The main reason for this is due to the demographic projections of the impact Mexico and the border region will have on our population in the next thirty years. The Texas population is merely an example of the impact Mexican-Americans will have in the future.

The Texas population, is expected to experience substantial growth in the coming decades, and one which will likely become increasingly diverse and mature. Due primarily to the proximity to the border region, the Anglo population in Texas is projected to only increase by 20.4 percent from 1990 to 2030, the Black population however would increase by 62 percent and the Mexican-American population by 257.6 percent. The total state population would become less than one-half Anglo by 2008 and, by 2030, the proportion of the population that is Anglo would be 36.7 percent while the Mexican-American population would account for 45.9 percent and the Black population 9.5 percent. Of the total net change in the population of Texas from 1990 to 2030, 87.5 percent is projected to be due to growth in the minority population of the State (Murdock, et al, 1996).

President-elect Bush has indicated that he will continue his concern for the border region and Mexico in particular as President. It is imperative that we conduct more and more research in HRD in Mexico if we are to compete in the global economy. Mexico is an area where the Academy of Human Resource Development could and should have a major impact. There are no professional organizations or much literature specific to Mexico in existence at this point. Since Mexico is generally looking to their neighbors to the north for support, it is imperative that the Academy steps up to provide this partnership.

Organizational Trust: An Orientation for the HRD Practitioner

Christina L. Lafferty  
The George Washington University

Brad D. Lafferty  
Air University

Recent studies have pointed out the importance of organizational trust as a driver of organizational performance and, ultimately, organizational success. This review of literature on organizational trust examines the theory and research from a Human Resource Development (HRD) point of view. The results focus on cognitive-based theories, affect-based theories, and combined cognitive- and affect-based theories. A recent fusion approach is also presented, followed by a review of pertinent empirical research on organizational trust and performance.

Keywords: Organizational Trust, Trust Theory, Performance

"Today's leaders must not only have the stature to attract top talent, they must have the kind of character that retains it. Talented people have options. They can walk out the door at any time...A key attribute of this new kind of leader is the ability to generate and sustain trust."

Warren Bennis, 1997, Industry Week

A recent study by Watson Wyatt Worldwide (2000), revealed that of 7,500 employees surveyed at all job levels and in all major industry sectors, only half trust their senior leaders. Yet such trust, Watson Wyatt argues, is one of the seven key drivers of employee commitment and, thus, of performance. In fact, trust in senior leadership among those firms studied correlated with a 108 percent return to shareholders, as opposed to a 66 percent return among those firms having low employee trust in senior leaders.

We in HRD practice within economic communities. Francis Fukuyama (1995) notes that "in all successful economic societies these communities are united by trust" (p. 9), trust which "has a large and measurable economic value" (p. 10). Trust is a viable concern for HRD because it "does not reside in integrated circuits or fiber optic cables...trust is not reducible to information" (Fukuyama, 1995, p. 25). In short, trust is about people. Nor is this link between trust and economic performance cause for HRD practitioners to view organizational trust as anathema, despite recent debates on performance-based practice (Holton, 2000). We firmly agree with the assertion that HRD "can elevate human potential and enhance the human experience by focusing on both performance and learning" (Holton, 2000, p. 63).

Clearly the time has come for HDR practitioners to turn our attention toward organizational trust. Problematically, however, organizational trust is a phenomenon that until recently has at best been approached obliquely through trust studies in HRD’s root disciplines: education, anthropology, sociology, psychology, and management. What we know about trust, organizational and in general, has never been integrated from an HRD perspective, and, consequently, its functional role remains virtually unexplored. Our purpose here, then, is to examine organizational trust related to three questions. The first forms our theoretical frame for the review: What typology of trust offers HRD practitioners the most useful framework for organizing and understanding organizational trust theories? The second organizes selected seminal literature to frame what we know to date: How has organizational trust theory evolved, as framed by the selected typology? The final pragmatic question is: What is known about the role of organizational trust in performance?

Methodology

The methodology used was content analysis of literature related to organizational trust. Levin’s (1999) work first piqued our interest and served as a jumping-off point. In addition to pursuing the avenues related to HRD that her work offered, we searched the following databases: ABI/Inform, Dissertation Abstracts International, Educational...
Resources Information Center, PsychInfo, and Sociological Abstracts. Keywords included trust; organizational trust; trust and organizations; trust and management; trust and leadership; trust and research; and trust and theory. Reference lists of selected articles were examined for additional literature until we hit a repetitive saturation point. Literature was considered for inclusion from three standpoints: relevancy to organizational trust, relevance to HRD practice, and rigor. Specifically, we included articles from juried journals as well as work by authors considered by credible researchers to be seminal in the study of trust. Two dissertations were included based on their rigor and relevance to the subject as framed for this paper. We should mention that the exemplars presented here by no means represent all the work on trust or organizational trust. Space limitations necessitated a tight focus; what we present here is primarily an introduction to the field.

Theoretical Framework

Typologies of trust abound; many overlap, containing multiple elements of HRD's core disciplines. Most of the early ones were limited to interpersonal trust. Golembiewski and McConkie (1975), for example, focused on interpersonal trust operating on multiple levels interpersonal, group and organization. They characterized trust as "strongly linked to confidence in, and overall optimism about, desirable events taking place" (p. 133) and as "a salient factor influencing central dynamics in the full range of social systems" (p. 177). Cook and Wall (1980) looked at interpersonal trust in the workplace. Through this venue, they determined that studies of trust may be characterized by three approaches: indirect, situational, and self-report. From a slightly broader perspective, Hosier (1995), examining trust as a link between organizational theory and ethics, sorted the trust literature into five categories: individual expectations, interpersonal relations, economic transactions, social structures, and normative philosophy. Weidner (1997) took a definitional approach, sorting 62 definitions of trust into six categories: trust as attitude, belief, expectation, behavior, attribute, and as a multidimensional construct. British management researchers Clark and Payne (1997) approached the trust literature from four theoretical orientations: personality theory, experimental orientation, sociological theory, and organizational theory.

The theoretical framework used in this literature review comes from recent work by Levin (1999) based on McAllister (1995), which offers the most useful way of organizing trust literature from an HRD standpoint because it synthesizes preceding typologies. McAllister's research revealed two distinct types of trust: affect-based and cognitive-based. Retrospectively, it is possible to distribute the trust literature into three categories: the cognition-based approach, the affect-based approach, or the combined affect- and cognition-based approach. The cognition-based approach focuses on expectations, weighing options, and making conscious choices. Firmly rooted in the Western tradition, it is an outgrowth of the Greek principle of self-interest. The affect-based approaches focuses on feelings related to trust, such as confidence, warmth, acceptance, and security; while not exclusively Eastern, it does allow for elements of the Eastern tradition in the exploration of trust. The combined approach considers both rational and emotional elements. Levin (1999) notes that "although cognition- and affect-based trust may be loosely coupled, each form of trust functions in a unique manner and has a distinct pattern of association to antecedent and consequent variables" (p. 27). The typology is not limited to a single level of analysis, nor is it overlapping except in a most deliberate sense. Further, while it recognizes the formal study of trust as rooted in psychology, it categorizes a vast body of cross-disciplinary literature in a way we find more practical for the HRD practitioner than a typology based on HRD root disciplines.

Results

The Cognitive-based Approach to Trust

The idea of inferring trust from behaviors is at the heart of the earliest studies of trust. Social psychologist Morton Deutsch (1958) offered a seminal definition of trust that founded the cognitive approach to the construct: An individual may be said to have trust in the occurrence of an event if he expects its occurrence and his expectation leads to behavior which he perceives to have greater negative motivational consequence if the expectation is not confirmed than positive motivational consequences if it is confirmed. (p. 266) In Perspectives on Social Power, William Riker (1974) expanded the notion of trust as cognitively-based: (1) Trust is an action, a piece of behavior, something somebody does. It is, of course, an internal event like choosing, judging, preferring, etc. and cannot, therefore, be directly observed. But internal events result in external actions (e.g., speech and movement), and from these one infers the internal behavior. (2) Trust is a decision to be dependent on other people. It can be contrasted, therefore, with various kinds of self-reliance.
Furthermore, trust involves risk, since the other people on whom one has decided to depend may or may not prove worthy. These last two features are what make the act of trusting such a complicated event...

(P. 65)

Rotter, a contemporary of Deutsch, examined interpersonal trust from the social learning perspective (Rotter, 1954, 1966). He defined trust as “an expectancy held by an individual or a group that the word, promise, verbal or written statement can be relied on” (Rotter, 1967, p. 651; 1971, p. 444). Studies using Rotter as a theoretical framework have pointed out the correlation of trust to influence, internal locus of control, low need to control others, high self esteem, and openness to others’ influence (Frost, Stimson, & Maughan, 1978); and gender differences in trust and interpersonal functioning (Heretick, 1984).

Zand’s (1972) discussion of trust is firmly rooted in Deutsch (1957, 1958, 1960, 1962, 1973), containing the elements of vulnerability, external locus of control, and a situation in which the penalty for abused trust is greater than the gain from fulfilled trust. Trust, he asserted, influences and is influenced by three cognitive-based factors: information, influence, and control. Over time, the interaction among the constructs reaches equilibrium. Ultimately, trust reduces social uncertainty (Zand, 1997).

Gabarro’s (1978) cognitive take claimed that trust develops over time and is based in three cognitive delineators: character, competence, and judgment. Gambetta (1988) examined trust as linked to situations in which there is no time to monitor. He agreed with Zand (1972) and Luhmann (1979) that trust is related to the degree of uncertainty. Recently, theorists (Meyerson, Weick, & Kramer, 1996) have used Gambetta (along with Luhmann) to support the theory of swift trust, where members of temporary groups in a unique situation exhibit behavior that presupposes trust, but without the traditional sources of trust.

Butler (1991) took a situational approach to trust in developing his trust instrument, the Conditions of Trust Inventory (CTI). The CTI was derived from his earlier research on situational trust in specific others (Butler, 1983, 1986; Butler & Cantrell, 1984). Butler, building upon Gabarro’s (1978) work, identified ten conditions of trust: availability, competence, consistency, discreteness, fairness, integrity, loyalty, openness, promise fulfillment, and receptivity.

Up to this point in time, most of the literature on trust focused on individual or interpersonal trust with an occasional nod toward group trust (Gibb, 1965, 1972). In 1995, Hosmer undertook a thematic review of trust literature with the express purpose of looking at organizational trust. She then derived the following cognitive-based definition of organizational trust:

**Trust** is the reliance by one person, group, or firm upon a voluntarily accepted duty on the part of another person, group, or firm to recognize and protect the rights and interests of all others engaged in a joint endeavor or economic exchange. (p. 393)

Similarly and concurrently, Mayer, Davis, & Schoorman (1995) approached organizational trust along these cognitive lines. Their definition echoes Hosmer’s:

[Trust] is the willingness of a party to be vulnerable to the actions of another party based on the expectation that the other will perform a particular action important to the trustor, irrespective of the ability to monitor or control that other party. (p. 712)

In addition, like Hosmer, they incorporate concepts into their model recognized by prior theorists as important to an understanding of trust: vulnerability (Rotter, 1954, 1966, 1967; Sabel, 1993), expectancy (Deutsch, 1958; Rotter, 1954, 1966, 1967), and monitoring (Gambetta, 1988).

The Affect-based Approach to Trust

Philosopher Trudy Govier (1994) says that “trust is an attitude based on beliefs and values and typically involving feelings and implying behavior” (p. 238). Affect-based trust theorists see trust as based on feelings, attitudes, and emotions. The earliest affective trust theorist was Gibb (1965, 1972, 1978). He tied trust directly to feeling; moreover, he saw trust as important to organizations, especially in relation to groups within the organization. His theory of trust focused on four affective variables: trust, openness, realization, and interdependence.

Rempel, Holmes, and Zanna (1985) designed a model of affect-based interpersonal trust. Their component theory asserts that trust is based on experiences. Depending on what stage the relationship is in, the experiences upon which trust is based change, as does the interpretation of those experiences. Trust has four critical elements: 1) it evolves from past interaction; 2) it involves attributions made regarding reliability and dependability; 3) it involves a willingness to risk; and 4) it is “defined by feelings of confidence and security in the caring responses of the partner and the strength of the relationship” (p. 96). From these elements, Rempel et al. (1985) derived three components: predictability, dependability, and faith.
From a fourth affective perspective, Sabel (1993) defined trust as "the mutual confidence that no party to an exchange will exploit the other's vulnerability" (p. 1133). It is a precondition of social life that is both cultural and malleable, depending "on the actors' reinterpreting their collective past...in such a way that trusting cooperation comes to seem a natural feature, at once accidental and ineluctable, of their common heritage" (p. 1135). In short, trust becomes possible in likely situations because refraining makes it "feel" natural.

The Combined Affect- and Cognitive-based Approach to Trust

Like many of their predecessors, Golembiewski and McConkie (1975) focused on interpersonal trust. However, they determined that trust was both an affective and a cognitive construct. They characterized affective trust from an organic perspective. Trust is "nurturant sun" (p.134): warm, accepting, and nurturing. Trust is "necessary rain" (p. 135): uncertain, implying risk. Finally, trust may bear "fruit" that is "dysfunctional or even pathologic" (p. 138): inflexible and rigid regardless of context or situation. From the cognitive standpoint, they emphasized Zand's (1972) concept of trust as a having a spiral reinforcing quality between trusting behavior and risking behavior.

Some sociologists also took a combined approach to trust. In 1985, working heavily from Luhmann (1979) and Barber (1983), Lewis and Weigert (1985) argued that trust functions primarily as a sociological construct rather than as a psychological one. They assert that trust has three bases: a cognitive process basis, an emotional basis, and a behavioral enactment basis.

Trust in Organizations

It was not until the 1990s that theorists looked at trust specifically within the organizational context. Mayer, Davis, and Schoorman's (1995) affect-based model of trust looked at dyadic trust between individuals within an organization. Jarvenpaa, Knoll, and Leidner (1998) applied the model looking at trust between groups within an organization. Still others (Ring and Van de Van (1992) looked at organizational trust in the establishment of strategic alliances, applying this viewpoint to sub-units within complex multidivisional organizations.

McAllister (1995) was one of the first to wed organizational trust (from the interpersonal perspective) to an affect- and cognitive-based model. He examined the role of trust in interpersonal cooperation between managers and professionals in organizations and created a model that depicted linkages between the two types of trust, their antecedents, and their outcomes. What made this model so interesting and significant is that McAllister incorporated most of the major themes of trust that previous theorists had addressed. Moreover, he integrated them in such a way that the dynamic nature of trust became evident. This was the first effective integration of the psychological and sociological dimensions of trust.

Though Levin (1999) typed Cummings and Bromley (1996) as cognitive-based trust theorists, a close examination of their model reveals that they are, in fact, proponents of the combined approach. They operationalized organizational trust in three ways. "Trust," they define, is...

...an individual's belief or a common belief among a group of individuals that another individual or group (a) makes good faith efforts to behave in accordance with any commitments both explicit or [sic] implicit, (b) is honest in whatever negotiations preceded such commitments, and (c) does not take excessive advantage of another even when the opportunity is available. The rationale for this definition for trust rests on the socially embedded, subjective, and optimistic nature of most interactions within and between organizations that involve trust. (p. 303)

They developed the Organizational Trust Inventory (OTI) to measure trust between units in an organization or between organizations themselves. The OTI measures trust across three dimensions: keeps commitments, negotiates honestly, and avoids taking excessive advantage.

A Fusion Theory

Recently, Sashkin (1996) fused elements of the three approaches to trust — affective-based, cognition-based, and combined affect- and cognition-based — into a single, integrated theory of organizational trust. He defined organizational trust as “the trust that employees feel toward management and the degree to which they believe what management tells them” (Sashkin, 1990, p. 6). The elements of feeling and belief denote both affective and cognitive elements. Levin (1999) explained that “the confidence felt by employees represents the affective element of trust, and belief in what management says represents the cognitive element of trust” (p. 42).
Sashkin’s interest is clearly organizational; specifically, he focuses on how individuals within the organization and in the aggregate perceive the behaviors of senior- and executive-level managers (Levin, 1999). Moreover, Sashkin considers trust integral to leadership. In his Visionary Leadership Theory (Sashkin, 1996b), trust corresponds with credible leadership, one of four transformational leadership behaviors. The source of organizational trust is senior- and executive-level management (Sashkin, 1996), which aligns with other theorists who support the central role of management, especially top management, in developing trust (Cohen & March, 1974; Creed & Miles, 1996) and reducing ambiguity (Sako, 1995). What delineates Sashkin’s construct is that it employs an organizational level of analysis by looking at the behaviors of senior and executive level managers as a group. It is the behaviors of leaders at the highest organizational levels that serve to establish a climate (Denison, 1996) of organizational trust (Sashkin, 1996). By engaging in behaviors that strengthen confidence and belief in top management, these senior leaders increase feelings of security (Rempel et al., 1985) and reduce employees’ feelings of ambiguity, feelings with both an affective and cognitive component Ambiguity reduction functions cognitively to improve efficiency, effectiveness, and productivity, and affectively to reduce employee stress (Levin, 1999).

Sashkin and Levin developed the Management Behavior Climate Assessment (MBCA) (Sashkin, 1996; Sashkin & Levin, 2000) to measure organizational trust. Its consistency scales consider how senior executives act toward different people, what they tell different people, how they act at different times, and what they say at different times. The credibility scales assess the match between executives’ words — what they say — and past actions, future actions, promised actions, and future outcomes. To date, it is the only instrument that measures organizational trust at the organizational level of analysis, to include trust of aggregated individuals of the organization as a whole and trust of groups within the organization of the organization as a whole.

**Trust and Performance**

Virtually every organization today is seeking ways to address problems that affect performance. More than forty years ago, Likert (1958) stressed the importance of considering human factors when discussing measures of organizational performance. He specified levels of confidence and trust (along with motivation, loyalty, communication, and decision making) as key to organizational performance (Garay, 2000). More recently, Bennis (1997) identified organizational trust as a critical factor that may contribute to improved economic performance. Jones and George (1999) offer a symbolic interactionist model postulating that unconditional trust is a mechanism by which organizations can develop unique capabilities that provide an unmimicable competitive advantage; in contrast, Whitener, Brodt, Korsdaarg, and Werner (1998), operating from the perspective of social exchange theory, intimate that managerial trust may be critical for success in interdependent task performance, reengineering efforts, and marketplace positioning. There is, however, scant empirical research exploring the nature of the connection between organizational trust and the effectiveness of the people who make up an organization, or of the organization as a whole. Nonetheless, there is evidence suggesting that a relationship does exist. For example, Zand (1972), in a carefully controlled experiment, showed that higher levels of trust induction in a group resulted in significantly greater group performance as compared with induction of low trust levels. Levin (1999) demonstrated that performance across six organizations was related to organizational trust levels, although this relationship did not reach a level of normally acceptable statistical significance due to sample size. Based on these indications, it is reasonable to assume, as does Hosmer (1995), that if trust leads to greater cooperation among the members of an organization and, in turn, to improved organizational performance, then organizational trust offers a worthwhile opportunity for HRD research.

Theorists seem to agree that a trust-performance link may in fact exist, though they are clearly divided as to the nature of that relationship and how it functions. As we have noted, some empirical research indicates that trust improves performance in groups and dyads; however, the evidence as it pertains to organizations is sparse. More recent studies have pointed to the notion that there is a measurable relationship between organizational level trust and certain organizational performance indicators. In addition to the Levin (1999) findings linking organizational trust to financial performance, Gilbert (1995), for example, found organizational trust to be a predictor of organizational commitment, which is directly related to turnover. Another study (Zaheer, McEvily, & Perrone, 1998) found that trust between customer and supplier organizations correlated highly with performance indicators related to customer satisfaction with supplier performance. The idea of organizational performance as a function of employee trust in senior leadership is prominent in a new study (Davis, Schoorman, Mayer, & Tan, 2000), which empirically demonstrated a significant positive relationship between employees’ dyadic trust of a general manager and financial performance and a marginally significant negative relationship to turnover.
While the literature demonstrates that it is reasonable to assume that organizational trust may be related to positive performance outcomes, that postulate has yet to be successfully tested empirically.

Contributions to HRD Knowledge

The study of organizational trust holds great potential for new and significant knowledge associated with HRD practice:

**Contribution to Theory.** Little is known about organizational trust per se. However, several psychometrically sound instruments now exist to measure organizational trust (Butler, 1991; Cummings & Bromley, 1996; McAllister, 1995; Sashkin & Levin, 2000). Judicious use of these instruments may add to what is known about trust at the organizational level of analysis and how it relates to other critical HRD considerations.

**Leadership and Trust.** Research in organizational trust may help identify linkages between senior executive management behavior and the degree of trust which employees hold in their employing organization. Understanding such linkages may enable senior level executives to select those behaviors that subsequently enhance organizational effectiveness. Moreover, the study may provide a theoretical basis for senior executive development of staff organizational trust.

**Mechanisms of Organizational Trust.** HRD work in this area may assist in determining actions senior leaders can take to engender organizational trust among employees, thus leading to improvement in organizational performance. This avenue of investigation may also serve to further understanding of causal relationships concerned with a) how leadership behaviors impact organizational performance; b) how organizational trust interacts with diversity factors such as demographic and biographical variables to affect organizational performance; c) the functional relationship between organizational trust and performance indicators related to cost and profit; and d) the function of organizational trust as a lever in the organizational system as a whole.

Conclusion

While the study of trust is not new, research into its explicit role in organizations is a nascent endeavor. Though abbreviated in scope, the literature reviewed here nonetheless demonstrates that there is still much to be learned regarding the functions and mechanism of organizational trust. Expanded research into the manner in which organizational trust affects performance factors and ultimately the financial bottom line is an important first step. We propose that mining the wealth of knowledge that the study of organizational trust offers HRD cannot help but better equip us for the challenges ahead.

A Conceptualization of Interpersonal Trust in the Workplace

Sandra L. Williams
University of Illinois

Presented is a review of the existing literature on interpersonal trust in the workplace. It focuses upon trust at the individual level and conditions trust within a coworker relationship. From this perspective a conceptual framework is presented for the understanding of interpersonal trust in work settings. Following the conceptual presentation, implications for new knowledge and practice in the HRD field are offered.

Key Words: Trust (Psychology), Interpersonal Relations, Trust in the Workplace

With the demise of the structured bureaucracy as an organizational model, the hierarchical ordering of work flows is declining. Collaborative networks where work is cooperative rather than individualistic are an increasingly popular form of organizational structure (Spritzer, 1999). Scholars have widely acknowledged that trust can lead to cooperative behavior among individuals within organizational settings (Mayer & Davis, 1999). Trust in the workplace has also been linked to improved teamwork (Jones & George, 1998), ad-hoc group formation (Meyerson, Weick, & Kramer, 1996), and increased coordination between managers (McAllister, 1995). Organizations today are looking for tools to understand trust and its impact upon the work groups and networks which increasingly surface in flatter organizational structures (Lewicki & Bunker, 1996). Organizations are also looking for ways to promote trust between people and groups to enhance the output created under these collaborative conditions (Jones & George, 1998).

Purpose Statement

The purpose of this review is to determine the current state of knowledge of and research pertaining to interpersonal trust in the workplace. The concept of trust in the workplace, and its recognition in an expanding body of literature, demonstrate trust's importance in organizational life. Recent work reflects an interest in trust from both the human resource management and organizational behavior disciplines (McAllister, 1995; Mishra, 1996; Pfeffer, 1998). Additionally, several compendia of literatures on trust have recently been published (see Academy of Management Review, July, 1998; Hosmer, 1995; Kramer & Tyler, 1996) which reflects this increased attention on trust in the workplace in general.

Theoretical Framework

Different theoretical foundations to the concept of trust are present in the literature, but are focused for this review in the behavioral sciences. Despite the foundational theory differences, commonalities for two specific parameters which condition trust are present in the literature.

Theoretical Foundations

The general concept of trust emanates from theoretical foundations in economics, psychology, and social-psychology (Lewicki & Bunker, 1996). Economic theory postulates trust as a calculative exchange between parties based upon a rational analysis of the costs and benefits to a transaction (Williamson, 1993). Psychological theory views trust as a belief or feeling originating in early childhood that creates personality differences and influences a psychological condition of readiness to trust (Worchel, 1979). Social-psychology views trust as an expectation of behavior between individuals or between groups of individuals (Deutsch, 1960). In a recent review of trust research, Rousseau, Sitkin, Burt, and Camerer (1998) claimed considerable convergence in the contemporary scholarship on trust as an accumulation of concepts within the same network of ideas, rather than as a fragmentation of the conceptual theory of trust. Theorists from each of the above fields are found to be united on the essence of trust as
central to the human condition and on the influence trust has upon personal behavior (Hosmer, 1995).

This investigation of the literature focused upon trust at the interpersonal level, adopting the social-psychological viewpoint of trust as an expectancy of another person's behavior. Reflective of both the interpersonal level at which this review focused and the dynamic nature of interpersonal dependence in workplace settings, trust was confined in this investigation to coworker behavioral reliance within a workplace context. Theories on interpersonal trust in other contexts such as romantic or academic situations, were not considered. Likewise, trust at the process level or organizational level (Hosmer, 1995) was not considered.

Conditional Parameters

The general concept of trust is known to be conditioned by the parameters of risk and reliance (Lewis & Weingert, 1985). Despite different theoretical origins, scholars have been cited as fundamentally agreeing upon a general conceptualization of trust that includes risk and reliance as broad conditional elements (Currall & Judge, 1995; Lewis & Weingert, 1985). In interpersonal situations, uncertainty regarding the intentions and actions of an individual is a source of risk (Rousseau et al., 1998), as is ambiguity about future outcomes of the actions of others (Lewicki & Bunker, 1996). Reliance involves a willingness toward interdependence between parties (Lewis & Weingert, 1985).

Research Questions

To address interpersonal trust among coworkers within organizational settings, this investigation of the literature sought to determine how interpersonal trust was conceptualized by scholars from a basis within the theoretical framework. The review was guided by the following questions:

- How has interpersonal trust in the workplace been defined?
- What are the dimensions of trust at the individual level in the workplace?
- What antecedents lead to the development of interpersonal trust in the workplace?
- What are the known outcomes of interpersonal trust in the workplace?

The existing literature was surveyed utilizing keywords of trust, interpersonal trust, workplace, work organizations, organizations, and work. Searches were conducted in the data bases of ABI/Inform, ERIC, Wilson Select, and Psychinfo in order to uncover both work setting based trust studies and behavioral science based literature. Identified articles were then screened for approaches to trust at the individual level. Approaches to trust at the group or organizational level were generally excluded as the focus for this review was at the coworker level.

Research Conceptualization of Trust

The literature on interpersonal trust in the workplace revealed some commonalities to the definition of interpersonal trust and its form within professional settings. Additionally, the research revealed characteristics or dimensions of interpersonal trust, antecedent influencers to interpersonal trust, and several outcomes of interpersonal trust.

Definition and Professional Context Influence on Interpersonal Trust

While early researchers lacked agreement on a suitable definition of trust (see Gambetta, 1988; Rotter, 1971), scholars have recently been found to fundamentally agree on a meaning of interpersonal trust that involves a behavior undertaken in uncertain conditions (Rousseau et al., 1998; Lewicki & Bunker, 1996). In examining conceptualizations of trust from several researchers, Rousseau and colleagues (1998) found a root assumption that trust is a personal condition that causes action. In general, interpersonal trust was defined as an individual's behavioral reliance upon another person under a condition of risk (Currall & Judge, 1995). The terms "behavioral reliance" in this definition reflects the action taken under a personal psychological condition. Further, risk is reflected in the lack of control over the other party (Hosmer, 1995). Dependence upon unknown actions of the other party represent the risk parameter.

Also revealed was some consensus on different features of interpersonal trust within the professional or workplace context. In professional relationships, trust does not involve conditions under which physical harm may occur or life may be lost (i.e. trusting the paramedics in life threatening emergencies). However, variations in the risk and reliance parameters alter the level and potentially the form that trust takes (Lewicki & Bunker, 1996). The dynamic nature of the internal workplace is regarded as constantly impacting an individual's psychological intention to accept risk, be vulnerable, and engage in trusting behavior (Rousseau et al., 1998). Therefore, any particular
professional setting and its contextual characteristics are likely to impact the nature of trust which exists (Sheppard & Sherman, 1998).

**Multidimensional Characteristics of Interpersonal Trust**

Barber (1983) postulated trust as a multidimensional construct, incorporating expectations of two dimensions, competence and fiduciary responsibility (i.e., concern). Later studies (Bromiley & Cummings, 1995), provided empirical support for the concept of trust as a construct composed of multiple dimensions. Recent research has begun to treat trust exclusively as a multidimensional construct (Butler, 1991; Currall & Judge, 1995; Mishra, 1996). This review of the trust literature identified a categorization of four generally accepted dimensions of interpersonal trust. The dimensions are: openness/honesty, competence, caring and reliability (Butler, 1991; McKnight, Cummings, & Chervany, 1998; Mishra, 1996). A comprehensive conceptualization of interpersonal trust, inclusive of the risk and reliance parameters described above and the four dimensions of interpersonal trust discussed below, is shown in Figure 1. Each individual dimension of interpersonal trust is briefly discussed below.

![Figure 1. Conceptualization of Interpersonal Trust In a Professional Context.](image)

* an individual’s behavioral reliance on another person under a condition of risk (Currall & Judge, 1995)

**Openness/Honesty.** Openness/honesty involves each of its two component parts. Openness, as a separate dimension of trust, has been referred to as freely sharing ideas and information (Butler, 1991). Openness, involves the disclosure of accurate information (Currall & Judge, 1995; Whitener, Brodt, Korsgaard, & Werner, 1998) and not the filtering or distorting of information. Accurate and forthcoming information, as well as adequate explanations of decisions have been found to lead to higher levels of trust between individuals and their immediate superiors or managers (Korsgaard, Schweiger, & Sapienza, 1998). Honesty, which has also been termed behavioral integrity (Whitener et al., 1998), involves the consistency of a person's actions with his or her espousals. Butler and Cantrell (1984) found honesty to be the most important trust dimension in work situations between both superiors and subordinates.

**Competence.** Competence involves skill and ability to perform necessary tasks. Within the interpersonal trust construct, it involves knowledge of a person's skill level and ability to perform a future task for which that person is relied upon. Gabarro (1987) distinguished between functional competence (knowledge and skills related to a certain task) from personal competence (people skills). Butler and Cantrell (1984), however, combined these distinctions and defined competence as technical and interpersonal skills required for one's job.

**Caring.** Caring involves the treatment and exchange behavior between persons that reflect concern for basic human needs and limited opportunism (Currall & Judge, 1995). At a minimum, this dimension of trust means that one party believes it will not be taken unfair advantage of by another (Bromiley & Cummings, 1995). However,
trust with regard to caring goes beyond a failure to be opportunistic and involves concern for the welfare of others (Mishra, 1996). Caring with respect to trust in an organizational setting has also been termed sharing (Whitener et al., 1998), which includes employee involvement, and delegation of control.

Reliability. Reliability involves acting upon promises or claimed skills (Curtal & Judge, 1995), and has also been termed behavioral consistency (Whitener et al., 1998). Reliability also involves actions over time and across situations such that future actions can be predicted with a degree of accuracy (Mayer & Davis, 1999). Reliability, also termed predictability or behavioral consistency, has been found to be an important aspect to trust by many scholars (Gabarro, 1987; Whitener et al., 1998), as the risk parameter, or willingness to be vulnerable to the actions of others, appears to be moderated by the extent the others' actions can be predicted.

Combined Dimensions. In the conceptual framework presented, these separate dimensions of trust represent the components of an overall interpersonal trust construct. Additionally, each dimension of trust has been found to combine multiplicatively to create the overall degree of trust between two parties (Mishra, 1996). Low levels of one dimension may offset overall trust, even if higher levels are found in other dimensions. For example, an individual may be considered competent at work and able to perform the necessary tasks required of a job, but may not be trusted by coworkers if the person's words and actions are not reliable.

Antecedents to Interpersonal Trust

In addition to the dimensions of interpersonal trust within the workplace, research has also examined factors which lead to trust between co-workers; thus, certain antecedent influencers have been identified (Butler & Cantrell, 1984; Hosmer, 1995; Whitener et al., 1998; Mayer & Davis, 1999). These antecedent influencers include a general propensity to trust and certain behavioral characteristics.

Propensity to Trust. McNight et al. (1998) differentiate influencers into those present with regard to the trusting person (disposition to trust) and those observed in the trusted party (trusting beliefs). Disposition to trust or propensity to trust (Mayer, Davis, & Schoorman, 1995) is regarded by some researchers as a necessity for initial trust to occur (McKnight et al., 1998). Initial trust involves contexts where there is no experience or firsthand knowledge of the other party (McKnight et al., 1998). In these cases, initial trust involves the assumption of another party's future action or behavior based upon a presumed level of competence or skill, for example, computer program experts partnered to address a specific software issue (Meyerson et al., 1996). However, for sustained trust over time in the workplace, influencers arising from knowledge of the other party are generally considered necessary (Butler, 1991; Currall & Judge, 1995; Mayer & Davis, 1999). These knowledge-based influencers can collectively be labeled as behavioral characteristics (Butler & Cantrell, 1984), also termed behavior categories (Whitener et al., 1998).

Behavioral Characteristics Which Influence Trust. Specific behavioral characteristics that lead to the development of trust have been considered repeatedly in the literature. Early researchers identified as few as two characteristics (Hovland, Janis & Kelley, 1953), while later work delineated numerous characteristics (Butler, 1991). Mayer et al. (1995) conducted an extensive review of the research on trust antecedents and discovered three behavioral characteristics that appeared most often: ability, benevolence and integrity. These three characteristics have been utilized subsequently in further research on the antecedents of trust (Currall & Judge, 1995; Mayer & Davis, 1999; Whitener et al., 1998) and have been cited as the most commonly used trust factors in the literature (McKnight et al., 1998).

According to Mayer et al. (1995), ability is "that group of skills, competencies and characteristics that enable a party to have influence within some specific domain" (p. 717). The domain is specific because the trustee may be highly skilled in one area specific to a profession, while not highly skilled, trained or experienced in a different area (Mayer et al., 1995). Ability has been used by researchers synonymously with competence (Butler, 1991; Butler & Cantrell, 1984; Mishra, 1996). It is considered cognitive in formation and may be confirmed by professional credentials or certification (McAllister, 1995). Ability as a critical behavioral characteristic has also been described as perceived expertise (Hovland et al., 1953) or expertness (Gabarro, 1987), although all imply a competence or set of skills applicable to a single domain (Mayer et al., 1995).

Benevolence is demonstrating concern for the welfare of others (McAllister, 1995; Mishra, 1996). On an individual level, Mayer et al. (1995) and Mayer & Davis (1999) define benevolence as "the extent to which a trustee is believed to want to do good to the trustor" (pp. 718 and 124, respectively). However, benevolence as an influencer to interpersonal trust formation is considered more than an intention or belief (McKnight et al., 1998). It is identified behavioral characteristics of another, in whom one may be considering to trust. Mayer et al. (1995) cite numerous researchers who have identified benevolence-like behavioral characteristics as a basis for trust. McAllister (1995)
cites findings from attribution research in claiming that certain behaviors including "demonstrating interpersonal care and concern rather than enlightened self interest" as critical for the development of affect based trust (p. 29). Benevolence not only is reflected in behavior, it is a behavioral characteristic that connotes a personal orientation which is not self, but other-directed (Korsgaard et al., 1998).

Whitener et al. (1998) define behavioral integrity as consistency between words and deeds, and suggest that employee observations of a manager's behavioral consistency enables them to make attributions about the manager's "integrity, honesty and moral character" (p. 516). Regarding the development of trust, the words-and-deeds connection appears to be creating a foundation with regard to integrity. Mayer et al. (1995) found the relationship between integrity and trust to involve a set of principles to which one party adhered and which is deemed acceptable to the other party. Hosmer (1995) refers to these principles as "moral values" (p. 384), as did Butler & Cantrell (1984).

Integrity and consistency were significant trust determinants in Butler and Cantrell's (1984) model, and integrity was included as a trust factor in Butler's (1991) 10 conditions of trust. Integrity has also been included in several models from Mayer and colleagues (Mayer & Davis, 1999; Mayer, et al., 1995). Thus, the inclusion of integrity as an antecedent influencer to the development of trust is well grounded in previous approaches to trust.

Outcomes of Interpersonal Trust

Recent work reflects an interest in trust, particularly interpersonal trust, from the perspectives of both individual outcomes and organizational outcomes (Kramer & Tyler, 1996).

Organizational Outcomes. Work in the organizational behavior and human resource management disciplines has focused attention upon trust as facilitating organizational performance outcomes such as efficiency, cooperation, coordination, and team performance. These organizational outcomes are presupposed to result from trust within groups (Shaw, 1997). However, little evidence was found in the literature that supports the notion of organizational performance outcomes arising from trust between groups. Rather, these organizational outcomes have been concluded from individual level data (see Fishman & Khanna, 1999; McAllister, 1995).

Individual Outcomes. Interpersonal cooperation and teaming as individual outcomes of trust have been explored by several researchers (see Jones & George, 1998; Gambetta, 1988), and there appears to be wide acknowledgement that trust can lead to cooperative behavior among individuals within organizations (Mayer et al., 1995; McAllister, 1995). Jones and George (1998) linked unconditional trust directly to interpersonal cooperation and teamwork to result in a workplace condition termed "productive interdependence" (p. 535). These researchers claim that unconditional trust can fundamentally change the quality of exchange relationships, and actually convert a group of individuals into a synergistic team.

McAllister (1995) distinguished between affect-based trust and cognition-based trust. In his study of trust between managers in an organization, the existence of affect-based trust was found to facilitate cooperative behavior and increase coordinated action among individuals (McAllister, 1995). However, even without the affective and cognitive distinctions, trust has been found to promote ad-hoc between-person work coordination without prior knowledge of or affect toward others (Meyerson et al., 1996). Further, trust in the workplace has been found to decrease transaction costs, the control and monitoring expenses related to personnel (Bromiley & Cummings, 1995) and to facilitate increased communication between persons (Fishman & Khanna, 1999).

Finally, although interpersonal trust at the individual level in workplace settings has not been studied extensively as an antecedent influencer to organizational trust, its link to organizational performance outcomes is clear. Thus, cooperative behavior, increased coordinated action and team formation all appear as performance-related outcomes of interpersonal trust in workplace settings. These organizational performance outcomes, particularly team formation and work group cohesion, may prove to be important influencers to organizational trust, although such a conclusion cannot be drawn from the interpersonal trust research reviewed herein.

Implications in HRD

Theory suggests that trust is a critical factor for collaboration between employees, and trust has been found to lead to positive outcomes with regard to team formation, cooperation, and coordinated performance. Current research results can assist organizations, HRD practitioners, other HRD researchers, and educators in business and HRD to more fully understand interpersonal trust and its development. Organizations can learn to internally build and develop trust within their employee ranks from an understanding of factors which influence its emergence. Identifying the dimensions that comprise interpersonal trust, particularly between individuals within work situations, may specifically help executives, managers, and human resource professionals to foster environments conducive to
trust building. Through a fuller understanding of interpersonal trust and influencers to its emergence in the workplace, HRD professionals can develop methodologies and practices to cope with the condition of interdependence present in work environments of less hierarchical structures.

Other researchers on interpersonal trust might benefit from a conceptual understanding of antecedent influencers to trust, or to a specific dimension of interpersonal trust. Applied researchers might benefit from a fuller understanding of interpersonal trust when examining trust within an existing work setting, since much of the existing research on trust has been in non-professional settings (Butler & Cantrell, 1984; Currall & Judge, 1995; Rotter, 1971). Theorists might benefit from a perspective on trust within the conceptual framework presented as a basis from which to approach the topic.

Finally, educators in both HRD and business curricula might benefit from this compilation of knowledge regarding interpersonal trust as a depiction of the current understandings of one component of the work environment. Educational programs and courses in both HRD and business might be expanded to reflect the condition of interpersonal trust within which individuals function in a work setting. Interpersonal trust is gaining increased attention in both the organizational behavior and human resources fields (Mayer et al., 1995) and further scholarly research from both the organizational behavior and HRD disciplines is hoped to result.

Organizational Trust and Attachment to an Immediate Leader: A Pilot Study

Colleen E. Duffy
Walden University

Christina L. Lafferty
The George Washington University

Brad D. Lafferty
Air University

This pilot study explored whether attachment to the immediate leader affects organizational trust. Organizational trust scores of individuals having positive attachment to the immediate leader were compared with those having negative attachment. Results showed that attachment to an immediate leader did not significantly affect organizational trust scores. Implications for support of Sashkin's theory of organizational trust are discussed.

Keywords: Trust, Organizational Trust, Attachment

In today's modern and highly efficient organizations, where technology rules and doing business requires precise tactics and savvy strategic decisions, attachment -- the propensity to trust -- is still a defining factor in the degree of cohesion between organization members. Even in the most high-tech companies, we still hear phrases like, "I'd want him in my foxhole," or "I'd trust her with my life."

Trust allows us to put faith in another person, to take that person at their word, to count for true what that person says and to rely on their actions. Organizational trust is similar, yet with a significant distinction: its referent is not an individual, but a complex construct that includes members, policies, and practices that are shaped by its leaders. In the military, which holds its leadership directly responsible for life or death decisions, trust is critical. Yet arguably, even in this organization whose members are legally charged to obey the lawful directives of those of superior rank, those who do not trust their leaders may be less likely to fully risk their own well-being under orders. Conceivably, lack of trust in leadership could compromise commitment and lead to the failure of an essential mission. Similarly, organizational trust is vital in the civilian sector as well. The recent events surrounding the Firestone tire recalls demonstrate clearly how a disconnect between an organization's leaders and its members can result in mistrust leading to "mission failure" that spells injury and even death.

One problem about organizational trust is the issue of its locus. Exactly which leaders drive organizational trust? Is it shaped more by first-line leadership -- what we shall hereafter refer to as immediate leaders -- or by senior or executive level leadership as a whole? Sashkin (Sashkin & Levin, 2000) argues that organizational trust is driven by senior and executive managers of that organization. Nyhan and Marlowe (1997), on the other hand, contend that that "an individual's degree of trust varies between his or her supervisor and the organization as a whole" (p. 616), indicating that immediate leaders play a role as well. If so, attachment -- how much employees like or dislike an immediate leader -- may play an as yet undefined role in organizational trust.

Purpose of the Study

The purpose of this pilot study is to explore whether attachment to the immediate leader affects organizational trust. Specifically, the study examines two military directorates (hereafter referred to as "groups") within a military division to determine whether members feel less trust for their organization when they are supervised by an individual for whom they feel negative attachment (dislike) than when they work for one for whom they feel positive attachment (like). In this study, the organization is the military division comprised of seven directorates; immediate leader refers to the officer in charge of a directorate; senior or executive level leadership refers to division leaders who are above the immediate leader level; and members refers to persons working for an immediate

Copyright © 2001 Colleen E. Duffy, Christina L. Lafferty, and Brad D. Lafferty
leader. This pilot study is the first of its kind in examining the potential relationship between organizational trust and attachment to the immediate leader. This may help identify linkages between employee perception of their leaders, immediate and senior level, and the degree of trust which employees hold in their employing organization. Understanding such linkages may enable leaders at all levels to select those behaviors that subsequently enhance organizational trust.

Theoretical Framework

The organizing framework for the study is Sashkin's theory of organizational trust. Sashkin (1990) defines organizational trust as "the confidence that employees feel toward management and the degree to which they believe what management tells them" (p. 6). His theory integrates three approaches to trust: affective-based, cognitive-based, and combined affect- and cognition-based. Affective-based theories (Gibb, 1965, 1972, 1978; Rempel, Holmes, & Zanna, 1985; Friedman, 1991; and Sabel, 1993) examine trust as rooted in feelings, attitudes, and emotions. Cognition-based approaches to trust (Deutsch, 1958; Barber, 1983; Cummings & Bromiley, 1992; Gabarro, 1978; Hosmer, 1995; Mayer, Davis, & Schoorman, 1995; Rotter, 1967; and Sako, 1995) view trust based on analysis of behaviors. Combined affect- and cognition-based approaches (Cook & Wall, 1980; Golembiewski & McConkie, 1975; Lewis & Weigert, 1985; McAllister, 1995; Ring & Van de Ven, 1992; and Zucker, 1986) function as the name suggests.

What delineates Sashkin's construct is that it employs an organizational level of analysis by looking at the behaviors of senior and executive level managers as a group. He asserts that it is the behaviors of leaders at the highest organizational levels that serve to establish a climate of organizational trust (Sashkin, 1996a, 1996b). By engaging in behaviors that strengthen confidence and belief in top management, these senior leaders increase feelings of security (Rempel et al., 1985) and reduce employees' feelings of ambiguity, feelings with both an affective and cognitive component. Ambiguity reduction functions cognitively to improve efficiency, effectiveness, and productivity, and affectively to reduce employee stress (Levin, 1999). Sashkin identifies credibility and consistency as the primary and secondary factors, respectively, of organizational trust (Sashkin & Levin, 2000). The Management Behavior Climate Assessment (Sashkin & Levin, 2000) measures the climate of organizational trust from a behavioral perspective relative to these two factors.

The second theoretical construct involved is attachment. Attachment theory, originally outlined by John Bowlby (1969/1982, 1973, 1980) is a life-span theory of social development. Johnston (2000), examining managers' behavior patterns, characterized attachment theory as an examination of "interaction patterns and accompanying emotions in close, nombusiness relationships" that are "linked to experienced-based mental models of the self and others" and which "can serve as a conceptual framework for understanding adult relationships" (p. 4). Secure patterns of attachment are characterized by a general propensity to trust; insecure patterns of attachment lead to ineffective use of others in problem-solving situations (Arend, Gove, & Sroufe, 1979; Frankel & Bates, 1990) rooted in an based on a general reluctance to trust.

We found no direct research on the relationship between attachment to an immediate leader and trust of the organization itself. Still, there are some enticing hints that such a relationship may exist. DeVries (1993), for instance, ties trust to leadership in general, noting that: "trust depends on communication, support, respect, fairness, credibility, competence, and consistency on the part of the leader." (p. 176) Cole and Cole (1999) concur, acknowledging trust as key to managerial success and stressing the importance of "cooperative, positive relationships with followers" (p. 3), which are elements of positive attachment. Kim and Mauborgne (1993) link organizational trust antecedents to employees' belief in organizational leaders. Additionally, Krackhardt and Porter (1985) found organizational trust to be positively associated with friendship centrality in the work place, a notion that others (Yoon, Baker, & Ko, 1994) have linked to organizational commitment. Recent research (Lafferty, Wagner, & Levin, 1999) found that differences in organizational trust in groups working under different immediate leaders linked to ethnicity. Considering these studies in conjunction with the clear associations between attachment and interpersonal trust (Korsgaard, Schweiger, & Sapienza, 1995), it is not unreasonable to think that an organizational trust connection is at least worthy of exploration.

Research Questions & Hypothesis

Do organization members' feelings of attachment toward an immediate leader affect their level of organizational trust? Proponents of Sashkin's theory would expect the null hypothesis to be borne out. However, if attachment to the immediate leader affects organizational trust, then we would expect to see H1 supported.
HO: There is no significant difference between organizational trust scores (as measured by the MBCA-Core Version) of members who work for an immediate leader whom they like (positive attachment) and those who work for an immediate leader whom they dislike (negative attachment).

H1: There is a significant difference between organizational trust scores (as measured by the MBCA-Core Version) of members who work for an immediate leader whom they like (positive attachment) and those who work for an immediate leader whom they dislike (negative attachment).

Methodology

Research Design

This pilot study employed a one-shot case study design (Campbell & Stanley, 1963) to determine if there is a difference between organizational trust scores of members having negative attachment to an immediate leader and those expressing positive attachment to an immediate leader. The study used the Management Behavior Climate Assessment – Core Version (MBCA-CV) (Sashkin & Levin, 2000) to assess levels of organizational trust in the two directorates. The determination of positive or negative attachment was based on perceptions of the respective directorate leaders that were informally voiced by directorate members to the researchers over a period of one year.

Sample

The focus population is the military members working in two directorates (Groups) within a military division having seven directorates total. Group 1 (negative attachment) has a total population of nine, of whom eight members participated in the study. Group 2 (positive attachment) has a total population of fourteen, of whom twelve participated. Table 1 shows the demographic and biographic data distribution of the two sample groups. We selected the groups each represented wholly positive or negative attachment to the immediate leader.

Instrumentation

The Management Behavior Climate Assessment – Core Version (MBCA-CV) is a 16-item instrument derived from the MBCA, a 50-item questionnaire that measures organizational trust on four scales: Credibility, Consistency, Relevancy, and Overall Trust. Both versions assess the climate of trust created in an organization by the actions and behaviors of the executive/senior level managers. (Levin, 1999). The Core Version used for this study is comprised of two scales, Credibility and Consistency; each scale is made up of eight items. We selected the Core...
Version for two reasons. First, this version is made up of the items from the psychometrically sound full-scale MBCA that factored cleanly in repeated administrations over a wide variety of populations (Sashkin & Levin, 2000). Second, since this was a pilot study, the abbreviated version was deemed sufficient to determine if the study was worth pursuing in broader scope.

**Dependent and Independent Variables**

The dependent variables for organizational trust are the participants’ scores assessing leader credibility and consistency as measured by the MBCA-CV. The independent variable is the immediate leader of each group, toward whom the group members expressed positive or negative attachment.

**Biographic and Demographic Variables**

Data were collected on seven secondary biographic and demographic variables: gender; ethnicity; age; education; military rank; time in service; and marital status. These data were used to describe the sample and, as needed, to provide control for any intervening variable unrelated to attachment, as well as to eliminate rival hypotheses and possible confounding effects.

**Research Procedures**

The MBCA-CV, the demographic questionnaire, a one-dollar participation incentive, and a stamped, addressed return envelope were assembled under a cover letter explaining research focus, timeline and instructions for completion (return within three weeks), voluntary participation, and authorization for distribution. All materials were individually packaged and hand-distributed by a researcher to each directorate.

**Results**

Response rate was 89 percent for Group 1 (negative attachment) and 86 % for Group 2 (positive attachment). Scores for the MBCA-CV scales are interpreted as follows: 5 = very high; 4 = high; 3 = average; 2 = low; and 1 = very low. Table 2 displays the MBCA-CV scores for both groups.

We noted that MBCA-CV scores for Group 2 (positive attachment) contained a single outlier in each scale that fell outside the lower quartile of both Consistency and Credibility and affected the calculation of means and variances for Group 2 (Fig. 1). Group 1 (negative attachment) had no outliers, but the majority of its data fell below the median.

This small sample size invited using an independent t-test to draw statistical inferences about the two samples’ means (Aczel, 1999; Leedy, 1996). Significance was set at .05 (95% confidence interval). Results of the independent t-tests are at Table 3.

Independent t-tests revealed that there was no significant difference between the groups in MBCA-CV scores for Consistency ($p = 0.465$), Credibility ($p = 0.337$) or Both Scales Combined ($p = 0.395$). Since there were no significant findings, there was no reason to test for effect of intervening variables (demographic or biographic).

Discussion

This pilot study supported the null hypothesis that there is no significant difference between organizational trust scores of employees who work for an immediate leader whom they like and those who work for an immediate leader whom they dislike. Therefore, we can conclude from the evidence here that employees’ preference for or aversion to an immediate leader does not appear to influence their organizational trust level. This leads us back to the notion that organizational trust is based on employees’ perception of the senior leaders’ behavior — not the immediate leader — as consistent and credible (Levin, 1999; Sashkin & Levin, 2000). Senior leadership in this organization consists of those leaders above the directorate level, at the division level. It is, therefore, reasonable to assume that the two groups reported the same perception of the climate of trust in the organization (division) based on the division’s senior leadership as opposed to the intermediate leadership of the directorates. These results indicate that attachment to an immediate leader — positive or negative — does not significantly influence how employees perceive the behaviors of senior or executive level leadership as a whole.

Limitations of the Study

A major limitation was the very small sample sizes of each group, eight and twelve, respectively. A sample of 30 or more per group would have allowed more comprehensive analysis and testing of the data. Next, the assumption of positive or negative attachment to immediate leaders was based wholly on common perceptions within the division informally reported to the researchers. Future research calls for rigorous empirical measurement of leader-follower attachment concurrent with administration of the full MBCA. It follows that use of the Core Version of the MBCA limited the discriminant potential of the study. It is possible that the 50-item version may have revealed significant difference that the scaled-down version did not reveal. Lastly, the results of this small survey, taken within the very circumscribed and traditional society of a military division, obviously cannot be generalized to other organizations within or outside the military.
Conclusion: New Directions for HRD

Warren Bennis (1997) recently called for "a new kind of leader...[with] the ability to generate and sustain trust" (p. 84) if organizations are to thrive in the 21st century. The construct of organizational trust is still nascent, however, and much research remains to be done if we in HRD are to gain some mastery of its operational nature. This pilot study represents an initial venture into the complex mechanism of organizational trust, leadership, and attachment. Despite its limitations, it indicates enticing avenues for further investigation into attachment and organizational trust, especially given the growing body of research on organizational trust. McMurray, Scott, and Pace (2000) recently noted that studies of this nature "are a contribution to the interconnectedness at the foundational level" (p. 589) of HRD. We certainly recommend expanding this study using larger and more varied samples, the full MBCA, and a psychometrically sound measure of attachment.

The Importance of Individualism and Collectivism as they Relate to Interpersonal Trust

Ghazala Ovaice
University of Illinois, Urbana-Champagne

This essay examines the theories of individualism and collectivism (I-C), as well as theories of interpersonal trust. From this theoretical perspective a better understanding of the relationship of individualism and collectivism to interpersonal trust is developed. Also this paper suggests that interpersonal trust may, in fact, differ based on tendencies towards I-C and the varying components of trust. Finally, this paper purports several practical implications for global HRD professionals based on the relationship of I-C to interpersonal trust.

Key words: Individualism, Collectivism, Interpersonal Trust

The trend of globalization is by no means new to business and industry, however the effects of this trend demand attention from researchers across disciplines of education, business, psychology, sociology, and economics to name a few. As organizations enter new markets, become part of joint ventures, and partake in mergers and acquisitions, the demand for cross-cultural research related to business has grown tremendously. Specifically, the human dimension of this global activity has come to the forefront of such cross-cultural research.

It is this human dimension that interests human resource development (HRD) professionals. Blurring global lines and increases in workforce diversity require HRD professionals to not only be competent themselves, but also to develop the competencies of their workforce in the cross-cultural implications of virtually all workplace issues. Hence the need to study global issues in relation to workforce preparation, becomes relevant for HRD professionals especially those HRD professionals involved in global HRD. International HRD professional assume the responsibility for educating and developing a workforce that crosses many cultural lines. As a result, international HRD professionals and more specifically international organization development professionals become responsible for not only acquiring the knowledge related to cross-cultural workplace issues, but they must also disseminate that knowledge to their workforce through career development, training and development, and organization development. In order to do so, they must first turn to existing research and literature related to cross-cultural workplace issues. Several landmark studies in the past have laid a strong foundation for cross-cultural research. For example, Hofstede’s (1980; 1983; 1991) study on the consequences of culture on work related values and Triandis’ (1993, 1994, 1995, 1998) numerous works related to the constructs of individualism-collectivism (I-C) have provided researchers in many disciplines with the base upon which they have continued to build cross-cultural research (see also, Trompenaars 1993; Hickson & Pugh, 1995; and Smith, Dugan, & Trompenaars, 1996).

Cross-cultural researchers have found that traditional views of workplace dimensions must be reassessed in light of the changes in multinational workforces and globalization of business structures. In the new global environment, the notion of trust is one issue of interpersonal and inter-group dynamics that is critical to the success of multinational organizations. Trust has been shown to contribute to more effective implementation of strategy, greater managerial coordination (McAllister, 1995), cooperative behavior (Kramer, 1999; Mayer et al., 1995) more effective work teams (Lawler, 1995), reduced transaction costs (Bromiley & Cummings, 1995), a basis for commitment to carry out agreements (Schurr & Ozannem, 1985), and is important to individual satisfaction (Anderson and Narus, 1990).

According to Doney, Cannon, and Mullen (1998), the growing attention to the importance of trust and the concurrent emergence of global and multinational workplaces has “highlighted the need for us to understand how trust develops and the ways national culture impacts the trust-building process (p. 1).” They indicate that the societal norms of national culture have established values that guide people’s behavior and beliefs (Doney, Cannon, & Mullen, 1998). For example, each culture often has varying views on how and whether or not trust should be established (Triandis, 1994). Earley and Gibson (1998) suggest that to better understand organizational phenomenon and the cultural contexts within which organizations operate the national culture values of I-C must be investigated as antecedents. Trust, as an organizational phenomenon has also been associated with being context-specific (Kramer, 1999). Consequently, this paper will attempt to address the relationship of I-C to interpersonal trust.

Copyright © 2001 Ghazala Ovaice
Through examining existing theories of I-C and interpersonal trust and the potential relationship of these theories several implications for HRD professionals will be addressed.

Theoretical Framework

Building on Fishbein & Ajzen’s (1980) Theory of Reasoned Action and their decision model, a few trust researchers (i.e., Currall & Judge 1995 and McKnight, Cummings & Chervany 1998) have suggested frameworks for intentions to trust. These researchers purport that an individual’s attitudes, beliefs, and cognitions will shape his intention to trust ultimately moderating whether that individual engages in trusting behavior. Similarly, this essay proposes that an individual’s cultural syndrome (i.e., their individualist or collectivist nature) serves as an antecedent to their propensity to trust (see Figure 1). That propensity to trust will then moderate their intent to trust based on the individual’s knowledge of the trustor’s reliability, openness, concern, and competence. Finally, the intent to trust will determine the perception of trust an individual has toward the trustee (i.e., trust in the primary manager or trust in the primary work team).

Problem Statement

International organizations are realizing that their workforce is rapidly becoming multinational due to increases in globalization, mergers and acquisitions, and joint ventures (Marquardt & Engel, 1993). As organizations continue to employ workers from different national cultures both domestically and internationally, HRD is now pressed with a new dilemma in improving performance at the individual, team or organizational levels with a global focus. That is, HRD professionals are now being asked to consider effects of national culture (which includes values and beliefs) on their performance improvement initiatives.

In addition, the notion of trust is one interpersonal dynamic that has received a great deal of attention in the organizational sciences recently (Kramer, 1999). While there is research looking at the moderators, mediators, and outcomes of the construct of trust, a large gap exists in the trust literature regarding the antecedents of trust; especially the cultural dimensions as possible antecedents. The limited extant literature on culture as an antecedent of trust inhibits HRD professional’s ability to effectively analyze, design, develop, implement, evaluate and manage performance improvement or promote organizational learning in a global arena. That is, a review of literature will provide an understanding to the implications of differences in interpersonal dynamics on a global workforce to continuously improve performance and learning in an efficient and effective manner. Therefore, this essay is guided by the following research question: what is the relationship, in the extant literature, between cultural syndrome and interpersonal trust in the workplace?

Review of Literature

This section will review the extant literature related to culture and interpersonal trust. The literature will be discussed according to the cultural trust model presented above. In the model, it has been purported that culture, specifically the national culture values of individualism and collectivism, serve as antecedents to one’s propensity to trust. This propensity to trust then moderates a trustor’s perception of trustee in the trustee. The perceptions of trust
are formed based on reliability, openness, concern, and competence as components of trust. The outcome then is a perception of trust in the trustee (e.g., manager or team).

**Theories on Culture**

The literature related to culture and specifically to cultural syndromes is vast. The focus of this literature review will be only on literature that is specific to the national culture values of individualism or collectivism (i.e., cultural syndromes). Much of the cross-cultural literature draws from early works: Kluckholm and Strodebeck's (1961) five value orientations, Rokeach's (1973) 36 values, and Hofstede's (1980) five dimensions of culture. The commonality in these frameworks, and others since then, is the distinction between individualistic and collectivistic value orientations. Hofstede's (1980) five dimensions of work-related values are perhaps the most commonly used in cross-cultural research. In particular, Hofstede's dimension of individualism has been the most commonly replicated and supported dimension (Nicol, 1994).

**Mental Programming.** Hofstede's (1980) work looked at 116,000 employees of a multinational corporation in 40 countries during 1968 and 1972. He used a factor analysis method to find four main work related values: Power Distance, Individualism, Masculinity, and Uncertainty Avoidance. Later, Hofstede (1989) added the fifth dimension of Long-Term Orientation.

Hofstede (1984) has noted that individuals within a culture are mentally programmed over the years to adhere to certain cultural values. Similar to Triandis' (1995) notion of subjective culture, Hofstede states that mental programs are "developed in the family in early childhood and reinforced in schools and organizations, and that these mental programs contain a component of national culture. They are most clearly expressed in the different values that predominate among people from different cultures (pp. 11)." Hence, the explanation for some cultures being high or low along the four work-related dimensions mentioned earlier can be explained due to the mental programming of that culture.

According to Hofstede (1980) power distance reflects the degree of inequality in a society. Masculinity reflects distinctions in gender roles while femininity reflects a society where social gender roles overlap (Erez, 1994). Uncertainty avoidance reflects the level of threat one feels in uncertain or unknown situations. Finally Hofstede (1980) also identified individualism as a work-related value. Similar to the Triandis (1995) discussion below, Hofstede (1980) relates individualism to patterns of relationships between an individual and the group. Erez (1994) explains the major themes of individualism as being "distinct and separate from the group, having an emphasis on personal goals, and showing less concern and emotional attachment to in-groups...workers [in] individualistic cultures are expected to act according to their personal needs and self-interests (Erez, 1994, pp. 572)." However, Smith, Dugan, & Trompenaars (1996) have further differentiated the notion of individualism by stating that some researchers define:

- to use the term primarily in terms of continuity of group membership, (e.g., Triandis, 1990), others focus more upon the values governing one’s relations with others (e.g., Schwartz, 1992)...Hofstede's (1980) operationalization does separate different priorities in one's interpretation of work-role obligations, but these priorities open a variety of interpretations. (pp. 261)

Over the years Hofstede's (1980) work has been both replicated and refuted. That is, while numerous studies have been conducted to replicate his studies with some degree of reliability, several studies have also not been able to replicate his findings. Most often empirical research has been able to replicate the dimensions of power distance and individualism. Chew (1996) notes that the generalizability of Hofstede's (1980) work is limited, due mostly to the fact that the data were gathered from only one multinational corporation (and its subsidiaries).

As a result of Hofstede's (1980) foundational work and the work of many of his predecessors the terms of individualism and collectivism have come into common place when discussing work-place values as well as cultural orientations. Since some questions have arisen regarding the reliability of his findings, other more recent and comprehensive models of individualism and collectivism have evolved over the years.

**Cultural Syndromes.** Triandis (1995) provided the most comprehensive explanation of I-C, based on empirical research. Triandis (1995) believes that cultures and countries are relatively equivalent, but he states that countries consist of hundreds of cultures and corresponding subcultures. He defines subcultures as "shared beliefs, attitudes, norms, roles and values found among speakers of a particular language who live during the same historical period in a specified geographic region...[and] are transferred from generation to generation (pp. 6)."

Triandis (1994) has noted that cultures can be broken down into subjective and objective aspects of cultures. Objective aspects of culture are made up of such man-made artifacts as tools, roads, radio stations etc. whereas the subjective aspects of a culture are made up of the categorizations, associations, norms, values and roles (Triandis, 1994). According to Triandis (1994), the analysis of subjective culture allows for an understanding of how...
people perceive and view their social environment. When the pieces of the subjective culture are constructed around a central theme then there is a “cultural syndrome” (Triandis, 1995). Hence, Triandis views both individualism and collectivism (IC) as the central themes around which a culture can be constructed. An individualistic central theme is one in which the theme includes the idea that individuals are the unit of analysis and are autonomous. A collectivistic theme is one in which the theme incorporates the notion that groups are the unit of analysis and individuals, in Triandis’ words, are “tightly intertwined parts of these groups (pp. 6).” Hui & Triandis (1986) conducted a study of social scientists from various parts of the world asking them to respond to a questionnaire, as they believed an individualist or collectivist would respond. According to Hui & Triandis (1986) the responses converged suggesting that there is consensus about the meaning of these dimensions.

While these constructs are often presented as being at two ends of the cultural spectrum, Triandis (1995) states that in actuality all individuals have both cognitive tendencies and it is through both the subjective and objective environments in which we find our upbringing that we have more of one tendency in comparison to the other in any given social setting. In addition, Triandis (1995) has noted that the notions of individualism and collectivism are supported by studies of beliefs, attitudes, and values. It is this specific strand of cross-cultural literature (i.e., looking at beliefs, attitudes, and values) that this essay attempts to discuss in terms of antecedents to trust.

**Contexts in Individualism-Collectivism.** Tendencies toward individualism or collectivism are often context specific (Matsumoto, Weissman, Preston, Brown, and Kupperbusch, 1997). Triandis (1988) indicates that differences in individualism and collectivism differ across social context. Matsumoto et al. (1997) also note that while attitudes and values can transcend specific situations there are still substantial individual and group differences that exist. Hence, for the purposes of this essay only the workplace context will be addressed. The workplace context is one in which there is likely to be more “tightness”, as Triandis (1995) has described (pp. 87). Therefore, this tightness will likely lead work place relations to a pattern that is most common to that specific national culture.

**In-groups and Out-groups.** In discussing the values or cultural syndromes of individualism and collectivism the terms “in-group” and “out-group” must be further clarified. According to Triandis (1995), in-groups refer to those groups for whose “welfare a person is concerned, with whom that person is willing to cooperate without demanding equitable returns, and separation from whom leads to anxiety (pp. 9).” He goes on to describe in-groups as having similar characteristics and for whom a person feels a “common sense of fate.” In contrast, out-groups are described by Triandis (1995) as “groups with which one has something to divide, perhaps unequally, or are harmful in some ways, groups that disagree on valued attributes, or groups with which there is conflict (pp. 9).”

Membership within in-group and out-groups will impact the level of trust between the trustee and the trustor. According to Hofstede (1991) trusting relationships must be first established before conducting business with individuals from collectivistic cultures. However, trust building in such collectivistic cultures is likely to take a long period of time, yet once they are formed such relationships are lifelong (Triandis et al., 1988). According to Shaffer and O’Hara (1995), “as trust is a necessary condition for in-group membership and slow to achieve among members of low individualistic countries, first-time relationships with service providers such as merchants, policemen, government bureaucrats, etc. are probably seen as out-group interactions (pp. 6).” They go on to state that “individualistic societies probably have higher levels of interpersonal trust, particularly during initial encounters, when compared to their collectivistic counterparts (Shaffer and O’Hara, 1995, pp. 6).”

Given this review of extant literature related to individualism and collectivism. It becomes clear that an individual’s individualistic or collectivistic tendencies are programmed or formed based on their subjective culture. Hence effecting their propensity to trust. The following section will review the current trust literature looking specifically at the components of trust and propensity to trust.

**Basic Assumptions of Trust.** Basic assumptions exist regarding the nature of trust in the current trust literature. Several researchers have noted that the notion of trust is based on (1) the willingness of a trustor to be vulnerable to the trustee; (2) the acceptance of risk on the part of the trustor towards the trustee; (3) the need for interdependence between the trustor and the trustee; and (4) the idea that trust is a multidimensional level construct (Hosmer 1995; Mishra 1999; Mayer, Davis & Schoorman 1995, Nicol 1994; Rousseau, Sitkin, Burt, & Camerer, 1998). All of these assumptions are predicated on the notion that the trustor will not behave opportunistically, will not take unfair advantage of a situation, has something that the trustor wants or needs and that the level of trust can vary in a given situation or context as well as in terms of the relationship between the trustor and trustee (i.e., manager-subordinate, co-worker, child-parent etc).

**Foundations of Trust.** No unifying definition of trust currently exists as the concept stems from varying fields of study and relies heavily on the assumptions of the authors. Trust is a multidimensional and multidisciplinary concept for multi-level relationships (Rousseau et al., 1998). Hosmer (1995) conducted a thorough review of the trust literature in an attempt to identify an appropriate definition of trust through the lenses of various
fields of study (e.g., economics, psychology, sociology, and management theory). According to Rousseau, et al (1998), economists tend to view trust as calculative or institutional while psychologists perceive trust in terms of attributes of the trustor and trustee based on internal cognitions. Still yet, sociologists observe trust to be part of social relationships among people or institutions.

Hence, in order to clearly understand the basis of trust in terms of extant literature many of the varying perspectives must be examined. Through his review of literature Hosmer (1995) identified five different perspectives from which trust can be viewed: individual expectations, interpersonal relationships, economic exchanges, social structures, and ethical principles. The notion of trust in terms of interpersonal relationships will be the focus of this paper as trust in the context of the workplace most specifically relates to this strand of literature.

Hosmer (1995), defines trust in terms of interpersonal relationships by first looking at Zand’s (1972) definition suggesting that trust was an “individual’s willingness to increase his or her vulnerability to the actions of another person whose behavior he or she could not control (in Hosmer, 1995, p.3).” Thus, the decision to trust remained that of an individual, however, the consequences of that action were now dependent on the actions of another person (Hosmer, 1995). Hosmer (1995) also notes, Butler and Cantrell’s (1984) addition of inequality in position when defining trust in terms of interpersonal relationships. They proposed five components of trust and the degree to which individuals differed on these characteristics depended on their position (e.g., superior-subordinate).

Butler and Cantrell’s (1984) five components are as follows: (1) Integrity—the reputation for honesty and truthfulness on the part of the trustee; (2) Competence—the technical knowledge and interpersonal skill needed to perform the job; (3) Consistency—the reliability, predictability, and good judgement in handling situations; (4) Loyalty—benevolence, or the willingness to protect, support, and encourage others; (5) Openness—mental accessibility, or the willingness to share ideas and information freely with others (In Hosmer, 1995, Butler and Cantrell, 1984).

Hosmer (1995) goes on to note the later additions by Cantrell (1991) and that by Ring and Van de Ven (1992) that trust goes beyond simple benevolence (in the loyalty component) but is really the confidence of the trustor that the trustee will behave in a manner that will not harm the trustor and that will look out for the good will of the trustor, respectively. Finally, Butler (1991) states that “the literature on trust has converged on the beliefs that (a) trust is an important aspect of interpersonal relationships, (b) trust is essential to the development of managerial careers, and (c) trust in a specific person is more relevant in terms of predicting outcomes than is the global attitude of trust in generalized others” (Hosmer, 1995, p. 4).”

Similar to Butler and Cantrell (1984), Mishra (1992; 1994; 1996) operationalized trust to include the following four components: (1) Competence—confidence in the trustee’s abilities to perform up to expected standards; (2) Reliability—expectation of consistent behavior over time, especially between words and actions; (3) Openness—perceptions of openness and honesty in the trustee (especially) in terms of communications between the trustor and the trustee; (4) Concern—concern for the welfare of others.

Like Butler and Cantrell (1984), Mishra included openness and competence components in his conceptualization of trust. While Butler and Cantrell distinguished openness from integrity, Mishra included the notion of honesty (i.e., integrity) into openness. Whitener et al. (1998) include this openness dimension in their communication component where accurate information is provided, explanations are given for decisions, and the trustee has a sense of openness with the trustor. The unique aspect of Mishra’s work is that his components of trust resulted from interviews he conducted with 33 executives in the automotive industry regarding trust issues in crisis situations. The strength of his empirical findings comes in the alignment of his components with existing theoretical frameworks (Butler & Cantrell, 1984). His concern component corresponds with Butler’s benevolence category. Whitener et al. (1998) see the concern component as consisting of three different parts: (1) consideration and sensitivity for employees needs and interests, (2) protecting employee interests, and (3) refraining from exploiting others for one’s own benefit or interest. Finally, Butler and Cantrell’s idea of consistency and McKnight et al.’s (1998) predictability trust belief are encompassed in Mishra’s reliability component. This component looks to the consistent, predictable and reliable behavior of the trustee. Much like Mishra’s components and Butler and Cantrell categories McKnight et al. also posit that the trustor’s intention to trust relies on the following trusting beliefs: benevolence, competence, honest, and predictability.

Similarly, Mayer, Davis, & Schoorman’s (1995) definition of trust includes the notions of ability, benevolence, and integrity. Their definition makes the assumption that when embarking in a “trust” relationship there is inevitably a degree of vulnerability by the trustor towards the trustee. Mayer et al. (1995) have also noted that in order to adequately assess the degree to which a trustor is willing to trust a trustee both the trustor’s “propensity to trust and the trustor’s perceptions of the trustee’s ability, benevolence, and integrity must be discerned (p. 10).” Therefore, Mayer et al. (1995) view this propensity towards trust as an antecedent to trust.
While some researchers have found disposition to trust to be a significant antecedent (McKnight et al. 1998; Mayer et al., 1995) other researchers have indicated that disposition to trust is either an assumption that has yet to be proven (Holmes, 1991) or at the very minimum is not a precise determinant of trust (Johnson-George and Swap, 1982). Few authors (Mayer et al., 1995; McKnight et al., 1998) have cited the notion of a propensity or disposition to trust as an antecedent to trusting behavior. McKnight et al. followed Fishbein and Ajzen's (1980) theory of reasoned action for decision making as a framework for trusting behavior. They posit that attitudes and perceived norms lead to behavioral intentions that in turn will lead to actual behaviors. Similarly, McKnight et al.'s model of initial trust formation highlights a disposition to trust as an antecedent followed by cognitive processes as moderators leading to trusting beliefs (i.e., beliefs regarding the trustee's benevolence, competence, honest, and predictability). Based on the trustor's beliefs an intention to trust is established. Hence, in this model the actual trusting behavior is viewed as an outcome (as suggested in the theoretical framework above).

Culture and Trust. Few studies have shown a strong relationship between culture and trust. Shaffer & O'Hara (1995) looked at the effects of country of origin on trust and ethical perceptions of legal services. Shaffer and O'Hara (1995) found that individuals from low individualism countries will express less trust of a service professional than persons from high individualism countries. Consequently, Shaffer and O'Hara (1995) have found that trust varies along low and high individualism countries.

Shaffer & O'Hara (1995) have found that high power distance and high collectivism show a strong distinction between in-groups and out-groups. They go on to state that in these countries trust is essentially based on in-group membership. Hence, in “collectivistic countries in-group membership and ultimately trust may take longer to achieve... In individualistic countries business is conducted with whole companies, in collectivistic countries business is conducted with individuals (who are members of one’s in-group; therefore the relationship is then with one person and not the entire company p. 13)."

Similarly, Yamagishi & Yamagishi (1994) found that Japanese citizens reported lower levels of trust compared with their American counterparts. This appears to be a rather surprising finding given the expectation that Japanese culture is often identified with “close, stable, long-term social relations (Kramer, 1999, p. 10). However, Yamagishi & Yamagishi (1994) note that in actuality Japanese culture can be distinguished by high stability whereas American culture does not have a comparable sense of stability and social uncertainty. Therefore, when in a situation of instability Americans are more concerned with reducing the stability and uncertainty through personal knowledge of the trustor as well as reputational information whereas the Japanese rely on assurance of predicted stability of interpersonal and interorganizational relationships (Kramer, 1999).

Nicol (1994), in his study of American and Mexican students found that trust is in fact a multidimensional concept that serves as a foundation for assessing cultural influence on trust. Nicol found the application of the trust concept “to differ systematically along cultural lines (p. 101).” Specifically, he found that the more collectivist culture would placed a higher emphasis on the relationship dimension of trust, while the more individualistic culture placed a higher emphasis on the institutional agent and caution dimensions of trust.

Some criticism exists regarding the empirical verification of trust as a culture level construct. Strong & Webber (1998) investigated the culture dimensions of trust, using Hofstede's (1980) framework, but they failed to find significant differences in trust between cultures in an international study of 122 business leaders; they purport that culturally determined perceptions of trust are simply an “artifact of the academic research community” (p. 1). Still yet, McAllister (1995) differentiated between affect and cognition based trust as well as hypothesized that cultural-ethnic similarity could be antecedents to cognition based trust. However, ethnic similarity was not found to be associated with cognition-based trust.

McAllister’s (1995) findings along with Strong & Webber (1998) bring to bear a controversial stance in the trust literature. Where a few researchers over the years have found empirical relationships between trust and culture, Strong & Webber’s (1998) and McAllister (1995) findings seem to go against the conventional grain of cross-cultural studies that have found relationships between national culture values and interpersonal relationships. Yet questions arise regarding the construct and measures utilized for both culture and trust by these researchers. As such, the model and constructs presented for trust and culture in this essay suggest that culture will in fact have a relationship to perceptions of trust in the workplace. Hence, implications for future research relate specifically to the need for establishing this relationship between culture (i.e., tendencies toward individualism and collectivism) to trust in context of the work place.

Discussion and Implications

Understanding the relationship of individualism and collectivism to interpersonal trust in the workplace has several implications for HRD professionals. First, as HRD professionals tend to serve more and more as change agents and internal consultants within the organization they will find that relationship building is integral in their day to day communications. Consequently,
trust is foundational in those relationships. HRD professionals themselves will have to be cognizant of their workforce’s tendencies towards placing emphasis on varying components of trust based on culture. Nicol (1994) suggested that individuals with collectivist tendencies will place a higher emphasis on relationships. In addition, as Shaffer and O’Hara suggested, in-group membership is key to individuals with collectivistic tendencies. Thus, HRD professionals will have to identify the implications of these findings into their day-to-day roles. The success of each role that HRD professionals find themselves performing (e.g., instructional designer, trainer, change agent etc.) relies on the HRD professional’s ability to establish trust in their relationships with both internal and external clients. The blurring global lines and multinational workforces existing in business and industry today further illustrate the need to apply these principles or findings. That is, studying the cultural dimensions of employees in a multinational organization is an attempt to make the best multinational uses of varying employee disposition (Davison, 1994).

Second, therefore, HRD will then need to take into consideration such culturally based preferences when developing project teams, working in temporary work teams as well as when dealing with global managers. Team development and management development will need to include awareness around such varying cultural tendencies in relation to trust. This awareness can potentially be brought to bear in expatriate training, education around internal communication, as well as the aforementioned team and management development workshops, especially with those teams and managers functioning at the global level.

Finally, changing organizational structures, in particular the rise in virtual work spaces and teams, joint ventures, and mergers and acquisitions require HRD professionals to incorporate principles of culture. Specifically, they must turn to the cultural variances in trust when looking to establish and maintain trust in these dynamic organizational forms and settings, especially in a global marketplace. Schurr and Ozanne (1985) suggested trust leads to “a constructive dialogue and cooperation in problem-solving, facilitates goal clarification, and serves as a basis of commitment to carry out agreements (pp. 9).” Kramer (1999) noted that trust must be conceptualized as a social orientation toward other people and toward society. Consequently, HRD professionals must understand the cross-cultural implications of trust both within and between organization, especially in such unstable environments as that of recently merged or acquired corporate cultures. In order for such partnerships to be successful employees must feel a sense of trust with their work group, their manager, and the organization as a whole. In attempting to maximize performance and human potential of such employees, HRD professionals will need to be knowledgeable of the relationship between culture and trust amongst work related values; for it is these work related values that will ultimately influence the productivity and performance of an organization.

This is an innovative session exploring performance at multiple levels in organizations. In addition to the organizing team, the following scholars and practitioners have graciously agreed to participate by serving on an expert panel and facilitating group discussion—Roger Cude, Jill Hough, Victoria Marsick, Hallie Freskill, Darlene Russ-Eft, and Richard Swanson.

Keywords: Performance, Multilevel, Theory

HRD professionals have effectively used systems theory to build a body of knowledge related to individual, team, and organizational learning and performance. However, our knowledge of the complex relationships that link these processes across organizational levels remains limited. In a paper presented at the 2001 AHRD Conference, “A Multilevel Theory of Performance: Seeing the Forest and the Trees,” Susan Fisher reviews the literature on multilevel theory-building and the need for multilevel theories in the study of organizations. Multilevel theory is presented as a means both to explore the “meso” regions of organizational activity that lie between the individual and organizational levels and to integrate views of performance from micro and macro disciplines. It is the focus on the meso region with its myriad forms of complex social interaction that will be explored further in this innovative session. Exploring potential applications for a multilevel performance frame in this interactive format is likely to add further insight into the usefulness of this approach. Participants will be encouraged to grapple with the practical issues inherent in multilevel thinking and gain a hands-on understanding of the purpose of multilevel theory.

The idea that the study of organizations is inherently multilevel is not new (e.g., Behling, 1978; Coleman, 1986; Rousseau, 1985; Simon, 1962). The development of multilevel theory and research, however, has been slow to evolve. In an introduction to a special section in Academy of Management Review on multilevel theory, Klein, Tosi, & Canella (1999) suggested that the complexity of multilevel approaches has slowed their development. The theory summarized in Fisher’s conference paper is one of the few attempts to capture the true complexity of organizational performance by incorporating the proposals of contemporary multilevel theorists. The resulting theory is so complex that it brings into question the usefulness of such approaches and leaves open the question of whether the benefits of multilevel approaches outweigh their inherent difficulties.

This session offers the opportunity for HRD scholars and practitioners to consider this important and timely question in an atmosphere of collective discovery. Hopefully the ideas generated from this session will also point to specific areas of the theory that might be carved out for testing through empirical research.

Session Objectives

The session will be led by a team of three organizers. In addition, a panel of five experts representing scholars and practitioners from multiple disciplines have agreed to facilitate group discussions among the participants and serve as panel members. Equal emphasis will be placed on theory, research, and application to ensure that the interests of all participants will be addressed. The session is designed around five objectives:

• To raise participants’ awareness of multilevel approaches to the study of organizations.
• To create an opportunity for exploring the potential of multilevel frames when dealing with organizational performance issues.

Copyright © 2001 Susan Reynolds Fisher, Darren Short, and Catherine M. Sleezer
• To provide participants with ideas for using multilevel theory in HRD applications and emphasize the importance of grounding practice in theory.
• To provide the organizers with feedback on the usefulness of the theory.
• To engage in interactive learning.

Session Content and Structure

The session is designed in five parts: (A) introduction and group discussion; (B) group discussion debriefing; (C) linking discussion to multilevel thinking; (D) eliciting expert opinion; and (E) summarizing learning. The objectives and design of each of these sections follows.

Part A
Facilitator: Darren Short
Objectives:
- To describe the session structure and introduce the organizers and guest panel members.
- To introduce a case study developed for the session which outlines a complex organizational performance issue such as might be encountered in a real organization.
- To divide the participants into discussion groups and assign facilitators (guest panel members).
- To allow the groups to discuss how they would approach the performance issues as represented in the case from specific perspectives including process, learning, individual, team, and organization.

Length: 30 minutes.
Mechanism: Brief presentation by main session facilitator followed by group discussion.
Content: Case study outlining a real-world organizational performance problem

Part B
Facilitator: Darren Short
Objectives:
- To share the insights on the specific case performance issues emerging from discussion groups.
- To develop evidence of the multilevel components of organizational performance as they emerge from the case.
- To elicit examples of how participants focus on different levels when considering organizational performance.

Length: 20 minutes
Mechanism: Informal presentation by discussion group representatives. Facilitator to summarize content on flip chart.
Content: Ideas and examples developed in participant groups.

Part C
Facilitator: Susan Fisher
Objectives:
- To highlight the multilevel nature of organizational performance as exemplified in group views of case issues.
- To introduce a multilevel theory of performance and demonstrate how it might be applied to issues emerging from the case.
- To allow participants to experience how links from theory to practice may be useful in dealing with performance issues.
- To generate examples of how the multilevel theory of performance might be applied and tested.

Length: 20 minutes
Mechanism: Presentation by facilitator using examples elicited from group discussion to outline a multilevel theory of performance.
Content: The summarized ideas generated by the participant groups and illustrations from Fisher's paper.
Part D

Facilitator: Catherine Sleezer

Objectives:
- To elicit expert feedback on multilevel approaches to organizational performance in general.
- To gain further insight into usefulness of multilevel theory.

Length: 15 minutes

Mechanism: Panel discussion—ininformal sharing of ideas by panel of guest experts.

Content: Guest panelists will have received supporting material prior to the session. Participants will receive handouts summarizing Fisher’s framework.

Part E

Facilitator: Darren Short

Objectives:
- To summarize learnings as they have emerged from the session.
- To elicit suggestions as to where these new insights might lead.

Length: 5 minutes

Mechanism: Facilitated discussion

Content: Material elicited during the session.

Outputs

To support the learning expected to take place in this session, the organizers have planned for two types of output. First, the paper on which this session is based will be revised to include a section summarizing the main learning points from the session, the reactions of attendees, and new insights into the usefulness of multilevel theory as generated by participants. The revision will be submitted to Human Resource Development International. Second, the organizers will establish a network of interested participants from the session to take forward their shared interest in multilevel approaches to organizational issues. The network born of this session will share e-mail addresses so that a listserv may be generated for members to report on progress in multilevel performance research and share new articles and books on multilevel approaches. In addition, there may eventually be sufficient interest to propose an Advances issue on multilevel applications in HRD. If this possibility materializes, the session organizers will assist in identifying possible chapter authors and the areas of interest within the AHRD community.

Contribution

The session organizers have been wrestling with the issues related to multilevel views of organizational performance for the past year and look forward to the opportunity to share them in an interactive session that emphasizes learning through discovery. We also hope that the experience will make a contribution to HRD in the following four ways: (1) by raising participants’ awareness of multilevel approaches to the study of performance; (2) by demonstrating a need to expand our frame of reference and integrate knowledge from allied disciplines such as social psychology and organization theory; (3) by creating a forum for exploring the theory-to-practice link that HRD scholars have been calling for (e.g., Swanson, 1999; Holton, 1999); and (4) by developing a new network for sharing knowledge and research related to the application and testing of multilevel performance theories.

Virtual Executives: A Paradox with Implications for Development

Andrea Hornett
Penn State University

This article derives from a case study exploring power. Members of a virtual team describe power differently for situations inside versus outside the team. Inside, the team's collaborative power innovates solutions. Outside, the virtual team fails to survive continuous organizational conflicts. These conflicts suggest virtual teams are not supplanting other forms of organizing and that executives operate in multiple, co-existing organizing systems. Accordingly, this article poses issues for further research on and practice with virtual organizing and executive development.

Keywords: Virtual Organizations; Power; Executive Development.

If virtual forms of organizing are replacing other forms (Duarte & Snyder, 1999; Fisher & Fisher, 1998; Grenier & Metes, 1995; Lipnack & Stamps, 1997), is power still defined as the ability to allocate resources (Pfeffer, 1981, 1992a & b)? This study interviewed executives in a large corporation to explore their understanding of power based on their experiences in a virtual team.

Virtual Teams

A virtual team is a geographically dispersed group of people who rely primarily on electronic communication to accomplish their common purpose (Lipnack & Stamps, 1997). While other business teams break down boundaries of departmentalization, chain of command, and hierarchy, virtual teams do that and more. They break down the boundaries of space and time (Doheny-Farina, 1996; Finholt & Sproull, 1990; Hiltz & Turoff, 1993; Jarvenpaa & Leidner, 1998; Lou, 1994; Mankin, Cohen, Bikson, 1996; Marca & Bock, 1992). In addition to changing relationships electronically (Fisher & Fisher, 1998; Grenier & Metes, 1995; Miller, 1996; Schrage, 1990; Zuboff, 1988), virtual organizing promises to be egalitarian (Rheingold, 1994).

While the expectation is that power can be shared in virtual environments, there is little empirical evidence. However, there is some limited evidence about power from the literature on teamwork.

Teamwork & Power

Clegg's work is directly concerned with clarifying power as a concept in organizational science (1989; 1994) and empirically identifying power at work in organizations (1990). However, he does not focus specifically on teams, nor does most of the teamwork literature isolate organizational power as a variable.

This relative lack of focus on power and teams may stem from the paradoxical nature of power and teams (Smith & Berg, 1987). Teams can liberate power by breaking down external structures (Katzenbach & Smith, 1993), and control power by maintaining internal, latent hierarchies (Brooks, 1994). Teamwork can be both empowered by external authorities (Spreitzer, 1995) and dis-empowered by internal peer pressures (Barker, 1993). This study sought to ascertain how virtual team members themselves understood power.

Research Questions & Methods

This study was driven by three questions: does power function in virtual teams? If so, how? How do virtual team
members make sense of power? In order to try to understand both the ambiguous notions of power and the ephemeral nature of working virtually, I designed a case study (Miles & Huberman, 1994) of a virtual team.

I proposed to engage in iterative, qualitative interviewing with the virtual team members (Seidman, 1991). I selected a team of powerful executives in a Fortune 50 company based in the United States.

The Virtual Team

The team selected for this study had only four members but each held positions at a fairly high level, reporting to Vice Presidents and General Managers. Two team members had been with the company less than three years and two had more than twenty years with the company. All had worked in large corporations for more than twenty years. These team members knew corporate strategy and shared a mission that provided cohesion to the team (Lipnack & Stamps, 1997).

The team’s mandate came from the company’s Chief Executive Officer who served as the project’s sponsor. The team’s assignment was to solve a complicated, persistent, strategic problem with a long, difficult history of resistance to a solution.

The team in this study is distinguished from other electronic groups in the company by three characteristics. First, this team was not the exclusive method for organizing work; it was crosscutting (i.e. composed of representatives from various departments). Second, the virtual team was not the only assignment; members also held regular jobs with executive management and strategic responsibilities. Third, the team’s purpose and the problem to be solved straddled two different businesses, each over $2 billion in size, each with different histories, priorities, and markets.

The complexity of the team’s organization and its assignment indicated that it was breaking down several forms of organization. At the same time, this virtual team co-existed with on-going structures that were a complex mixture of line and traditional staff functions (marketing, budget, etc.), chain of command, and unique staff functions involved with proprietary technologies.

Approach

To understand the team’s situation, I interviewed each member at least three times over a nine-month period and traveled to three locations to record most sessions in person. The interview approach was chosen because interviews provided opportunities for team members to share the language by which they make sense (Weick, 1995) of power and because this approach was used in empowerment research (Bartunek, Lacy & Wood, 1992).

The decision to interview on more than one occasion was motivated by accepted practice in interpretive studies and to mitigate moodiness and the idiosyncratic nature of phenomenological reports (Lincoln & Guba, 1985; Seidman, 1991). Multiple interviews provide the means to check for internal consistency on the part of the participant and among participants.

In this study, interviews provided a means to check emerging patterns with the participants in an iterative, on-going basis, as I traveled from one to another. Further, the rapport I developed with the participants over the occasions of the interviews provided an opportunity to hear their deep, personal thoughts, their ‘inner voice,’ as opposed to a ‘public’ voice (Seidman, 1991).

The first interviews were brief, introductory and procedural. The second interview sessions ranged from one to three hours in length with each member of the virtual team. The third round of interviews ranged from one to one and a half hours and were used to confirm or disconfirm emerging themes, clarify questions on organization and technology, and understand sequences of events and major players. The third round provided an opportunity to go deeper and to get more of the participant’s own language in explaining phenomena. The interview format was constantly adjusted to pursue confirmation of data.

The participants were “proactive in defining their own issues in relation to the investigation” (Cassell & Symon, 1994, p. 6). For example, while they answered the questions defining teamwork succinctly, they went on at length in response to the questions about memorable moments and examined situations outside the team. Because the interviewees had energy and interest for discussing events outside the team, and because they reported no power issues within the team, the interviews quickly turned into opportunities to spontaneously ‘follow the data’ in an iterative fashion (Miles & Huberman, 1994) by asking follow-on questions to pursue the notions of power and conflict in the stories of events and forces outside the team.

The final two interviews were redundant, in many respects. For example, ‘conflict’ stories were repeated from previous rounds, scenarios were re-stated depicting the difficulties the larger organization was experiencing...
in grappling with the extensive nature of the problem to be solved, and the merits of the team’s solution were reaffirmed. The last two interviews, while providing no new information, did confirm that I had reached the saturation point (Glaser & Strauss, 1967) where no additional 'data' is provided.

To reduce bias, transcripts were independently transcribed. In addition, my own coding was compared with coding by two other independent researchers using a coding structure designed to capture definitions of power and narratives of sense making about power and teamwork. Inter-rater reliability was eighty percent.

Researcher Bias

In selecting this virtual team, my preference for a cohesive, high-level group biased the study towards organizational issues of power. I wanted a virtual team that would know strategic intent and be empowered so that they could describe power to me in their own words.

As Duke (1976) says, when the topic is power, the researcher is ensnared by an orientation to power. To compensate for this trap, I employed several methods to establish trustworthiness (Lincoln & Guba, 1985), including the crosschecks on coding and additional interviews on findings with several corporate members outside the virtual team.

Delimitations

This study focused on one virtual business team. This team is not co-located. It has members who work for different organizations within a very large corporation.

Limitations

This study necessarily employed retrospective sensemaking (Weick, 1995). Participants told their own stories of situations as they tried to make sense of power.

This is one case. It was designed to try to understand some of the phenomena at work with a virtual team and power. It is neither feasible nor desirable to generalize to all virtual teams. However, findings can be explored for further study.

Significance

This study contributes to the literature on virtual teams by capturing the language by which virtual team members make sense of their work and power. Because the team members of this virtual team are also corporate executives, these findings suggest some significance for education and development of executives in virtual organizations and, therefore, are of significance to researchers and practitioners in Human Resource Development.

Findings

There are two key findings from this study. The first is that there is power in collaboration. This virtual team found a solution to a complex problem of strategic significance that the company had failed to resolve in two previous efforts. The team employed systems thinking and visual representation.

The second finding is that the virtual team members describe power as outside the team. This virtual team was frequently in conflict with pre-existing organizing structures, despite corporate policies of empowerment and despite having the CEO as a project sponsor. Participants saw real power as those activities outside the team disrupting the team’s effort. The next sections provide more detail on these findings.

The Power of Collaboration

The virtual team worked together for approximately a year to develop a solution and present that solution to the organization. During that period, they twice met face-to-face. Subsequently, they communicated primarily by phone, occasionally by email, and by televised meeting technology with others outside of the team. They were guided in their deliberations by four management practices: empowerment, teamwork, a corporate problem solving process, and systems thinking. Each of these is discussed below.
Empowerment. Empowerment is an official (formal) approach to work in this company. Posters extolling the benefits of empowerment are on walls throughout the organization, including the offices of top-level executives. Employees are trained on its features and uses while interventions are provided to managers and teams to enhance empowerment practices.

Teamwork. Use of teams is part of the culture for accomplishing work. A participant said: “There’s a real expectation that people do work in teams.” Another felt: “Some issues are best – are only – addressable by a combination of people.” One claimed: It would be hard for me as a manager to imagine what I can do alone.” In addition, teamwork was fundamental to this virtual team’s mission. Members solicited commitment from those outside the team by communicating the team’s shared perspective. One participant said: “Why our virtual team is here is to try and make sure that we all speak with a consistent voice and that we know how to represent this stuff.”

Problem Solving. The team members employed an official problem solving process whose roots are in a rewarding history of quality improvement efforts. The process is required training for all employees within their first 90 days with the company. The dominant assumption of this process is that solutions can be engineered; that progress is linear and can be “packaged” into discrete increments. In discussing the problem solving process, the team leader used the term ‘shared language’ and others described it as the ‘culture’ or ‘the approach.’

Systems Thinking. The virtual team devised a systems drawing that represented its solution in a holistic manner. “It’s a different mental model, a different systems model.” The team felt good about its concept. One said: “That is an impelling power, this excitement that’s generated because you’re on the right track for a change.” And they believed in the power of the design to convince others. “So any kind of system you can envision is incorporated by this particular picture.” “So everybody ... is really thrilled now that we have one systems model that we can talk to. They can talk to customers with this. It communicates.”

In addition to their pride in their product, the team members were proud of their process. They respected each other and believed they had a good balance of expertise and temperament in the team. Their conflicts with the outside organization strengthened the team. “Through thick and thin, this little group has always come together.” The team does this with “mutual trust, mutual respect and appreciation for the strength and weaknesses of each other and confidence, confidentiality.”

The team persisted, the members claimed, because they felt committed to their purpose: solving a problem. This commitment was so strong that one participant declared that it is not technology that creates virtual teams but empowerment. As proof of their beliefs, the team won an award for excellence. Perhaps that is why the team had such difficulty making sense of the lack of acceptance in the organization for their ideas.

The Power of Conflict

The virtual team members felt plagued by politics outside the team. They could not reconcile the organization’s rhetoric about empowerment with their lived experience when they were instructed to change reports about their work, left out of important meetings, and had ideas misrepresented to key decision makers.

What were the sources of these conflicts? Some team members cited the different histories and purposes of the two businesses involved. One team member characterized the conflicts as a choice between long term planning and positioning for the market versus short-term sales and profit goals. Each of these is not an atypical corporate phenomenon. However, this company preached empowerment and the team believed that the conflicts were evidence that empowerment was not working. "They beat up my message pretty well and it really impacted the credibility of the whole [name of project] initiative." Empowerment was further eroded by the corporation’s project management system that served to institutionalize conflicts for the virtual team.

The corporation’s project management process initiates and tracks projects and is predicated upon a mode of thinking that expects periodic progress reports about discrete solutions. Often, progress reports are given by persons who are not members of the project teams but higher in the hierarchy or outside the chain of command in staff assignments. This process misrepresented the virtual team. “So basically we did the work to put together the strategy and that’s not what got presented and that’s not what was approved.”

This corporate project tracking process is designed to secure multiple perspectives and these multiple perspectives created complex communication issues for the virtual team. One participant observed that after virtual team meetings, due to pressures and perspectives from outside the team, “things would start to be unwound back to the different viewpoints.” He added: “different people are exercising their power in different ways to control
their own domains and on some level we're doing the same thing to try and drive the outcome that we're looking for." The team's use of a systems diagram to win support alienated outsiders who thought it depicted too large a scope, too ambitious an approach, by being holistic. However, the team persisted and in its ongoing conflict, the virtual team believed that the team's existence was evidence of corporate commitment to its approach. “As long as the team remains functionally, then it's doing whatever it needs to do.”

While the team was unaware of this, there is some evidence that the virtual nature of the team might have masked the fact that its existence was being ignored. The existence of the team may have represented inertia rather than commitment. The team’s geographic dispersion and periodic, rather than continuous, work effort may have meant that real commitment was not tested. It was assumed.

Virtual is vulnerable when the team literally lacks ‘face time’ for developing mutual understanding with others in the organization. Indeed, the team’s vulnerability coupled with its inability to fully articulate the power and influence issues led me to a third finding.

The Third Finding

The third finding is less finding and more noticing that something is missing. The virtual team members lack language for talking about power. This surprised me since I was expecting leaders to volunteer information about power, as they had with McClelland (1955; 1975; 1987). Instead, these executives hemmed and hawed in response to follow-up questions and requests for clarification about power. They paused for long periods in contrast to their usually lively flow. When they did speak of power, they employed unsophisticated metaphors for force (“drive to,” “rub noses in,” “counteract”) and resistance (“nothing is going to happen;” “they won’t hear you”).

When I compare the extent and nature of the language in the transcripts for discussion of technologies with the discussion of power, the team members are precise and clear about technologies and less voluble, more hesitant and limited with regard to power. This is similar to my comparison with their language for teamwork. They are confident and forthright when discussing the value of each member of the team and the nature of their work together. They do not pause, nor do they grope for words or ask me what I think. They know what they think and are positive and articulate in their opinions. In contrast, they are neither confident nor articulate regarding power.

Within a year of the completion of this study, the company officially reorganized. Persons in positions of hierarchy over this team were re-assigned. The corporation acquired a company whose technology held potential for meeting the same strategic objectives that had been the virtual team’s goal. Reorganization and acquisition were implemented while the virtual team’s solution was not.

Conclusions

At the beginning of this study, I asked: if virtual ways of organizing are replacing other ways, is power still resource allocation? The answer from this case is that the virtual way of organizing did not replace other ways of organizing. The corporation’s hierarchy, project management processes, and acquisitions budget were all more powerful than the virtual team and its solution. And, yes, there is power in resource allocation.

However, there is also power in virtual teams. The virtual team literature (Duarte & Snyder, 1999; Lipnack & Stamps, 1997) is correct that these new ways of working can add value. This virtual team had the power to find a solution to a complex, strategic problem that the corporation had failed to resolve twice before. As a problem solver, the virtual team proved to be superior to two past approaches: one that regulated compliance to solve the problem and the other that created an organization of about a hundred employees to work on the problem.

So why did the virtual team’s solution not win acceptance? Perhaps the literature is too optimistic about the ability of these new ways of working to supplant traditional methods (Lipnack & Stamps, 1997). The executives who participated in this study were members of both the traditional organization and the virtual team. Although they did not consciously acknowledge this, their allegiances were split, straddling both worlds. The expert power (French & Raven, 1959) of the virtual team could not completely supplant their positional authority (French & Raven, 1959) because their identity and membership in the organization lies in their positions. Their status is based on position. Their recognition and rewards are tied to their positions. Perhaps this dual allegiance is what caused them to pause and fumble for words to describe power. They were flummoxed by conflicting powers.

What about the CEO? He was the team’s sponsor and the source of their cash award for excellence. Why did the CEO’s involvement not tip the scales of power in favor of the virtual team? It appears that the CEO’s
power was counterbalanced by his joint roles as both sponsor of the team and director of the traditional structures and systems. This is the essence of the executive paradox: the same individuals are both the administrators of traditional systems and pioneers of new approaches.

Executive Paradox

How does this case portray the 'executive paradox,' a phenomenon where the same people are in charge of change and status quo? In this case, there were two factors empowering the traditional organization. The first factor is the virtual team's use of systems thinking. This approach presented a different schema, a different way of framing and solving problems than the sequential, corporate approach. The traditional decision makers and decision-making processes could not accept this approach. It was too different, too apparently comprehensive, and, holism was perceived as excessive ambition. Second, the virtual nature of the team made it invisible in the corridors of power. The resource allocation power (Pfeffer, 1981, 1992a & b) of the traditional organization prevailed because the virtual team was, by definition, not a resourced entity. It was out of sight, out of mind, and out of budget. Further, the virtual team members had no corresponding, non-traditional vehicles or mechanisms outside of their team for gaining acceptance and resources. This virtual team was not an organizing component, nested in the middle of a hierarchy of organizing systems but, rather, a source of competing values. It was not in the breakdown or supplanting of bureaucracy, but in the conflict with it that power manifested. And, when it did, the virtual team lacked language for making sense of their dilemma.

While teamwork literature has not focused specifically on power, it assumes that teams add value to bureaucratic organization of work. Therefore, the literature holds an implicit assumption that the expert power of a teamwork approach to organizing opposes the positional power of the bureaucracy. Consequently, in these organizations employing multiple forms of organizing, executives should be prepared to recognize multiple, complex, co-existing value systems. And, executives should possess a rich language for power to enhance their ability to navigate these complex systems (Brown & Duguid, 2000).

Implications for Executive Development

Evidence of the paradox emerging from this study is that the virtual team was both egalitarian and hierarchical. The members were egalitarian in their dealings with one another and hierarchical in their membership and involvement in their corporation. But, they could not sustain the tension. They could not maintain and balance competencies for both situations. Eventually, the teamwork ended and the bureaucracy prevailed. If virtual teams such as this one are to be successful, they need to find a way to sustain being both competent egalitarian collaborators and competent positional power brokers, without having to choose between the two roles.

As organizations increasingly use virtual teams, executives will have to learn how to identify and use which competencies when. Increasingly, the jobs, titles, and positions in traditional organizations will compete for allegiance and resources with the needs, deadlines and expertise necessary for projects. Both systems will co-exist and may, as in this case, co-exist in conflict.

Already, the strains between these co-existing systems are evident in the call for compensation reform (Crandall & Wallace, 1998), but compensation is only part of the solution. If executives are simultaneously sources of new solutions and barriers to innovation, they need to be developed to manage within their paradox. They need to acquire language for expressing conflicting power dynamics. Without a language for power, how can they make sense of their dilemmas? How can they both innovate and stabilize? How can they maintain global reach while maximizing personal understanding? This one case cannot answer these questions but it serves to provide some understanding of what is at work inside the paradox.

Team Development and Group Processes of Virtual Learning Teams

Scott D. Johnson  
Jared V. Berrett  
Chanidprapa Suriya  
Seung Won Yoon  
Jason La Fleur  
University of Illinois at Urbana-Champaign

This study describes the community building process of virtual learning teams as they establish group roles and norms. Student teams in an online HRD masters degree program were studied to understand (1) how virtual learning teams develop and (2) what processes and strategies are used to accomplish team tasks. The results show that virtual teams collaborate effectively from a distance by using a set of processes and sharing the leadership role among team members.

Keywords: Virtual Teams, Cooperative/Collaborative Learning, Online Learning

In the approaching 21st century, organizations face many challenges from increased globalization and rapidly changing technologies. While technological advancements in the workplace continue to be the primary factor in maintaining a competitive advantage, organizations also recognize the need to address the technical knowledge and skills of the workforce. This has led to an increased emphasis on the role of learning in organizations, where individuals must view learning as a major component of their work responsibility within the organization. The nature of work within organizations is also changing from individual assignments to team-based activities. The change toward increased team-based responsibilities has paralleled the growth of communication technologies that can be used to support work teams. Teams are now able to communicate, collaborate, and perform irrespective of time and space.

The role of teams is not confined to the workplace. Today's workforce and education providers are realizing the benefits of collaborative teams in the learning process. Hundreds of studies have demonstrated that learning is most effective when students work in groups and verbalize their thoughts, challenge the ideas of others, and collaborate to achieve group solutions to problems (Johnson & Johnson, 1989). While the benefits of collaborative learning have been established for face-to-face teams, the impact of distance and time on virtual team roles, functions, and processes has received little attention. Working in a virtual team is unique because of the physical separation of the group, yet little is understood about how distance and time affects their ability to make plans, communicate, and work to accomplish team goals.

The purpose of this study was to describe the community building process of virtual learning teams as they form, establish roles and group norms, and address conflict. The goal of this study was to generate recommendations for integrating successful virtual learning teams into Internet-based training courses. This study was guided by the following research questions:

- How do virtual learning teams develop and determine their group process?
- What processes and strategies do virtual learning teams use as they carry out their team tasks?

Theoretical framework

Understanding teams, collaborative learning, and team environments is becoming more important because of advances of technology, globalization, and because organizations are moving toward utilizing more network structures and team-based functions (Lipnack & Stamps, 1997). The term "virtual team" is becoming more prevalent as teams move from being primarily co-located, where team members are located in one physical location, to virtual, where team members are geographically unrestricted.

Collaboration studies have overwhelmingly shown that cooperative learning situations promote student achievement within problem solving settings as well as higher productivity, greater social skill development, and increased self-esteem (Johnson & Johnson, 1989). Work groups, or teams can be defined as "interdependent
collections of individuals who share responsibility for specific outcomes for their organization" (Sundstrom, DeMeuse, & Futrell, 1999, p. 120). Definable characteristics common to all collaborative work groups include: (1) a definable membership, (2) awareness of one's membership, (3) a shared sense of purpose, (4) member interaction, and (5) ability to act as an individual unit as well as a unit of individuals (Knowles & Knowles, 1959).

Many researchers have studied how groups develop into functional teams and select group processes to accomplish their tasks. Tuckman (1965) introduced a widely accepted model of the way groups develop and work together. The model highlights the four stages of forming, storming, norming, and performing. Forming refers to a period in which members try to determine their positions in the group, procedures to follow, and the rules of the group. The second stage, storming, starts when conflict arises as team members resist the influence of the group and rebel against accomplishment of the task. The norming stage begins when the group establishes cohesiveness and commitment to its tasks, finds new ways to work together to accomplish the tasks, and sets norms for appropriate behaviors. The final stage, performing, occurs when the group shows proficiency in working together to achieve its goals and becomes more flexible following the procedure for working together. Each stage of Tuckman's model is an essential step for a team and much like other linear models, if the first step is not accomplished, the latter stages will not be successful.

Another contemporary framework of group development, presented by Gersick (1988), is called Punctuated Equilibrium. This framework suggests that regardless of group structure, tasks, or deadline; groups work on their tasks in the same temporal pattern. Gersick found that internal group processes focused primarily on the time frame set for a team project. Five time segments characterize her framework: three brief transition periods at the beginning, mid-point, and the end, and two long work periods between the transition points. The first transition point starts when the group has its first meeting and immediately establishes its strategies and approaches to accomplish its tasks during the first long work period. Then, at the mid-point of the group project time, the group goes through the second transition that sets the direction for the second long work period. The mid-point transition involves the reexamination of group strategies, procedures, and goals. The second long work period is similar to Tuckman's performing stage, where the outcome becomes the focus of attention. The last transition point is the completion period where the group finishes its tasks and adjourns. It is clear that the effectiveness and outcome attainment of teams is dependent upon the resolution of conflict, developing roles within the team for working together, and supporting one another as individual learners.

Virtual teams are groups of individuals who interact through various communication technologies to accomplish its common goals. Virtual learning teams are being used in education as well as corporate training programs in an attempt to enhance collaboration and cooperative learning experiences. In the expanding market of virtual universities and online degree programs, virtual learning teams are being used to increase collaboration, communication, and ultimately student learning (Bailey & Luettehans, 1998). These virtual teams rely on Internet technologies such as videoconferencing and chat rooms to interact and become functional work teams. Virtual teams allow instructors of online courses to assemble effective teams in a short period of time, enhance the utilization of external resources, and increase team member interaction and collaboration (Townsend, DeMarie, & Hendrickson, 1996). Using virtual teams also promotes knowledge sharing and enhances the application of knowledge and skills (Horvath & Tobin, 1999).

Even though various studies of teams using computer-mediated communication have contributed to an increased understanding of both face-to-face and virtual teams, the results are inconclusive (McGrath & Hollingshead, 1994). Most studies comparing face-to-face groups and virtual groups using communication technology suggest that face-to-face teams are more effective. McGrath and Hollingshead (1994) examined fifty studies on computer-assisted group performance and found that computer-mediated groups tend to have fewer interactions and less information exchange among members than face-to-face groups. Virtual team members can exchange verbal information as efficiently as a face-to-face team, but their ability for non-verbal exchange is severely limited, which can contribute to increased misunderstanding among members (Warkentin, Sayeed, & Hightower, 1997). In another study, traditional teams were found to have better internal leadership and coordination than virtual teams (Burke & Chidambaram, 1994; Eveland & Bikon, 1989).

Theory development and empirical research are needed to better understand and respond to the challenges that virtual teams face (Furst, Blackburn, & Rosen, 1999). Although there have been several related studies in this area, few research efforts have focused on the virtual team within the formal online education context. Online learning teams are usually more unique than those created in more traditional educational settings. Often these students are working professionals who have a limited history of working together, and few prospects of working together in the future. Thus, further understanding of group formation and team dynamics in virtual environments is critical to the integration, creation, and support of online learning teams.
Methodology

This study was guided by an inductive analysis to understand the dynamics of virtual learning teams. Both quantitative and qualitative methods of inquiry were used to capture the dynamic interaction within groups and the underlying factors that guided group process and decision making. The analysis was aimed at discovering the critical elements that emerged during team development and an analysis of factors that influenced team process.

Participants

The participants in this study were students enrolled in an HRD masters degree program that was taught entirely online. Thirty-six graduate students were enrolled in the course, representing ten different states and two countries. The class was divided into seven virtual teams comprised of five or six team members. The groups were formed based on geographical location to reduce the impact of disperse time zones on group interaction. The exception to this was a group comprised of two Koreans, two students from Florida, and one student from Connecticut.

Technologies for Virtual Team Support

The Internet-based technologies used in the online program were specifically selected to support communication and collaboration within the virtual teams. The online course supported the direct use of e-mail, a collaborative web forum (WebBoard™), synchronous text chat, and Internet pagers (i.e., Instant Messenger™, Yahoo! Messenger™, ICQ™). The virtual teams also had the opportunity to use other collaboration technologies to support their work. These technologies ranged from traditional forms such as conference calls to multimedia forms such as NetMeeting™.

Instrumentation

Several established instruments were used to assess virtual team development and process. Lurey's (1998) Virtual Team Survey was used to obtain information on the team's process, leadership, technology use, and perceptions regarding overall team performance and individual satisfaction with the team. Nemiro's (1998) Background Survey of Virtual Team Members was used to assess the team member's feelings about working in a virtual team and to identify the typical types of interactions that occurred. The online versions of these instruments were identical to the paper versions in both format and content. In addition to these administered instruments, electronic logs of interactions among the team members were captured and analyzed. These included the archived logs from group chats, e-mails, and discussion board postings. An interview guide was developed to ensure consistency during the follow-up interviews of the team members.

Procedures

Data were collected over a three-month period following the completion of the six-week online course. Virtual team members were sent an e-mail message that asked them to complete the instruments within a set time frame. The subjects completed the forms online and submitted their results electronically. All instrument data were entered into a statistical software package for analysis.

Following the collection of survey and course data, three members from each team were interviewed. Two members of the research team conducted the interviews over the telephone. Having two researchers participate in the interviews facilitated the process of note taking and allowed the interviewers to compare notes and discuss the information obtained following each interview. The identification of strategies and problems that influenced team performance was determined by open-ended questions asked of each team member during either phone interviews or follow-up personal e-mail exchanges.

Data captured electronically using internal data logs from various communication technologies were downloaded and formatted for analysis. Determining the purpose of each of the messages sent using the various technologies involved an initial summarization of the message content followed by a classification based on the purpose of the message. While the set of purposes used to classify the messages were initially organized according the established models of group interaction, the final classification was allowed to emerge from the analysis.
Results

Team Development

The students were assigned to a virtual team at the beginning of the course. A web page was posted a week before the class began that showed who was assigned to each team. This listing included the Instant Messenger™ screen name and e-mail address for each team member. No formal guidance was offered to the teams in terms of their formation and development other than a due date for the first team assignment, which was approximately two weeks after the online course began. This led to different rates of development for the teams as each virtual learning team evolved and defined their group protocols/norms and leadership.

One team established contact prior to the beginning of class while the rest of the class members waited until the first formal class synchronous session to begin to interact socially online. The teams initially tried to define their group norms by discussing team purposes and goals and performed some informal team building activities. This involved getting "acquainted with one another, sharing what we knew about the course, and setting up a tentative schedule/procedure." Although this seems relatively straightforward, these preliminary activities were often the source of much difficulty, as shown by the comments provided during the interviews:

- "It was tough getting together with the technology. It took awhile to get used to." 
- "What took 10 minutes face to face took an hour online."
- "It was hard to make decisions. Not having nonverbal cues made it harder."

During the first online meeting, the teams tended to have one individual accept responsibility for coordinating and compiling the first team assignment. This became a standard for later assignments. It was also during these first meetings that the majority of the social networking began. This "getting to know you" interaction continued for several team meetings, and gradually diminished over time. Some of the comments made by the students during the interviews included:

- "Talking about a forming or storming phase, we didn't really go through that, or if we did, it was very rapid."
- "The first couple weeks were hit and miss ... it was hard to coordinate everyone's schedules"
- "I met one team member on AIM before class began. I took the initiative 'Hi, I'm Mariah, your future teammate ...'"
- "I think we met after the first class. We talked a bit about ourselves, our backgrounds, what we thought of class. We familiarized each other with technology ... Informal teaching and instruction of other team members. We talked about assignments and how we would do them."
- "It was difficult negotiating to meet online ... what night and time worked best for everyone varied with children, work schedules, etc."

Verbal and non-verbal cues played a role in the overall social team building process and interaction. For instance one team member stated. "We never got too personal – others in the team did not know I was pregnant until the last week of class. This is something that would have been obvious if we were meeting face to face, but it just never came up online." Others, as they began to depend on one another to develop and create deliverables for the course, felt like they could trust their teammates, but one in particular stated that they were "Craving human contact – such as a team member looking me eye to eye and saying 'I'm going to take care of this.' As much as I want to trust team members, I don't know them as well. I have concerns about accomplishing a large team project – especially one that might require a physical product."

Team Norms and Processes

As in traditional face-to-face teams, norms were developed to facilitate team performance. The responses received in response to several questionnaire items indicate this. For example, punctuality was indicated as being important for team communication and teamwork ($M = 4.27$, $SD = 0.51$). Other team norms, such as knowledge and information sharing ($M = 4.46$, $SD = 0.50$), requiring active participation ($M = 4.07$, $SD = 0.52$), and timely response in terms of feedback ($M = 3.82$, $SD = 0.42$) all indicate a high expectation of adherence to team norms by all individuals within teams.

Although each team was unique, there were commonly shared elements in their process, especially the work procedures for completing team assignments. Generally, the teams settled into a work process similar to the one described below after the first two or three assignments. Of course this varied between teams, with some teams meeting less and others meeting more often (up to three or four times a week).

1. Meet after the class synchronous session to define roles for the assignment and discuss timeframes for completion.
2. Do reading individually and get together by Monday and post individual input on WebBoard™.
3. Meet synchronously as a team two days before the assignment was due and refine input.
4. The team compiler would draft and post with revised input.
5. Assignment posted for final approval and additional comments one day before due date.
6. Any additional comments would be added and posted into a final draft.

Each team's process was continually refined as the teams progressed through the class and became more efficient in assembling their work. The students made several interesting statements unique to specific team group processes and procedures during the interviews:

- "During the WebBoard chat, one person would tend to lead the group discussion by keeping the team focused on the task at hand. There seemed to be a split between males and females within the group."
- "For conflicts, we'd speak to the person individually on private chat (AIM) and not discuss it in front of others. It is difficult to resolve communication issues [online]."
- "If someone missed a meeting, a summary would be posted or forwarded to him/her. There was an expectation to check the WebBoard 5-6 times a day. We developed our own language and abbreviations to ease communication."
- "Coming up with a document took awhile online initially, but we got more efficient. We came up with our own abbreviations — own language (p = paragraph, s = sentence). We had our own jargon as a team."
- "We had a captain each week. We didn't meet much. We used the WebBoard more, and our meetings were short."

Team Leadership and Roles

The role of leadership was an interesting aspect of the virtual teams. Surprisingly, only two of the seven teams had a leader emerge in the group. Most of the groups shared the leadership role between everyone, often rotating on a weekly basis. Responses to the interview question, "Did you have a leader in the team?" are shown below:

- "Those who were experienced with technology were more dominant."
- "Leader, gatekeeper (reminding when assignments were due). There were different roles at different times. These roles shifted informally. It was very much like an actual team, except roles emerged virtually."
- "One person emerged as the leader for the team, and this person would keep the group on task. This person had strong opinions and personality."
- "We did not have a leader, and this was problematic ... It's difficult to [form a team] face to face, and even more so with a virtual team. People are too polite and don't resolve conflicts."
- "No. Roles varied based on what the assignment was, because we all had different backgrounds. Everyone had a specialty; there was an English reviewer, two people to write-up the assignments, two people to critique. It depended on personal scheduling."
- "No. The person who compiled was kind of a 'leader for the week.' We didn't designate, but shared it throughout the course."

Comparing the results of the questionnaire to the statements made in the interviews resulted in some seemingly conflicting responses. For example, the questionnaire item, "The team leader was appointed by team members" received a low value ($M = 1.54$). This initially can be interpreted negatively, but the response may have been due to the fact that the role often shifted through the team. Additionally, the item "Team members alternated their role to be team leader ($M = 3.22$, $SD = 0.82$) conflicted somewhat with the interview responses. However, there was a general consensus that whoever the leader was, they "kept individuals working as a team" ($M = 4.31$, $SD = 0.55$). One result of the lack of consistent leadership may be seen in the responses students gave to the statements "Team members had a shared understanding of what the team was supposed to do" ($M = 2.84$, $SD = 0.50$) and "Team members used their own judgment in solving problems" ($M = 4.14$, $SD = 0.54$). This may be indicative of a task-oriented approach to team performance resulting in less of a "team" and more of an individual work group.

Team Interaction, Interdependence, and Trust

Virtual teams are uniquely dependent on team interaction and individual acceptance as they collaborate from a distance in their individual social network. As mentioned above, each of the teams formed in a uniquely different way, which fostered varying social interdependence from group to group. The teams' perceptions of their effectiveness and cohesion also varied from team to team. In general, each team exhibited a collectively positive team perception of individual teammates and their willingness to contribute to a common vision and commitment in
achieving team goals. As a member of one team said "We worked very cooperatively. Each of us has the capacity to trust each other explicitly to do well." Another student claimed, "It was a team thing - we all made suggestions, we all contributed. It was a group effort and it was shared leadership."

However, not all team member perceptions of whether or not their teammates were contributing to effective team outcomes were congruent. For instance, during an interview one team member suggested that there was cohesion and team effectiveness when leadership emerged and "everybody in the group found a role as a communicator, giving feedback, providing content, or writing the drafts" within the team. In contrast, one of her teammates made the claim that "We never became a team. There was spotty participation throughout, and things were often left in a half finished state."

Conflict resolution stemming from lack of willingness to participate, lack of planning, or individual disagreements seemed to be three social issues that influenced the successfulness of building team trust and unity. In two of the teams, bad feelings about an incident were never resolved. Individuals were able to simply log off of the chat sessions at any time they felt like it and could virtually disappear if they chose to. When conflicts were not resolved effectively it hampered the progression of the team. One team found that "it was difficult to resolve communication issues" but when they occurred, they would "speak to the person individually on private chat, keep on private chat, and not discuss it in front of others" which was a problem one of the teams ran into - a public dispute. Overall, teams found that they "Had to have a lot of trust with other members" and although the majority of the teams had no real problems with this, any type of trust issue made collaboration very difficult.

To better understand the students' social interaction needs, they were asked to respond to the question "Did you feel the need to meet face to face?" Respondents repeatedly claimed that meeting face to face was unnecessary. Out of 20 interviews, 17 students felt that it was not necessary to meet face to face. They felt that, in general, everything that was required of them was accomplishable virtually without the face to face interaction. However, there were discrepancies in some of the interviewee responses. One student said "No - it is not necessary to meet face to face, we got an idea of each other's personalities online," but later the same student said "One of the biggest drawbacks is the distances apart from each other. You can't get together and discuss over coffee or exchange information. This hampers getting it all together." In fact, three of the teams had some team members meet face to face at different times where it was geographically feasible and suggested that these meetings were beneficial in building social relationships with their colleagues. Individuals who were left out of the face to face meetings summarized their feelings well by saying, "It would have been fun or great, but wasn't necessary. Those who met face to face had a better relationship. But they didn't let it hinder other relationships."

Several benefits of not meeting face to face emerged, including (1) not meeting face to face enabled more flexibility in scheduling meetings, (2) people were less inhibited from a distance, and (3) in the long run, it is less time consuming because of "less socializing and more focus on the task." It appears that even though meeting face to face was not necessary for most of the course requirements for these participants, there is evidence that it is still desirable when possible. One team member stated "Collaboration is enhanced by face to face. You can do anything if you are paired up right - it's more or less a comfort level. The most significant thing I discovered is that I am a social learner, and the WebBoard™ doesn't fulfill that need. I realized that we as a society have moved on though, and I have to adapt." Perhaps those who are ready to meet the changing dynamics of business and education will be those that can adapt well to the changing nature of communication and information delivery.

**Discussion**

Although the Tuckman and Gersick models were considered to serve as frameworks for structuring the findings of this study, the data are insufficient to claim that they do or do not fit. Further research will be needed to determine this. However, virtual learning teams do seem to evolve around project timelines, group processes, and interpersonal relationships much like face to face teams. These processes included the activities identified by Tuckman in the terms of Forming, Storming, Norming, and Performing. The concept of stages also seems to be relevant to virtual learning teams as it was evident that the level of performance did seem to be dependent on how well the teams were able to establish procedures, resolve conflicts, and collaborate to bring about a successful task.

Typical situations for the teams emerged as well and were found to be interesting. Initial meetings in the teams seemed to involve the creation of group norms and procedures in order to set the directions in which teams will accomplish their tasks. Since the first assignment was due two weeks after the course started, the first team meetings occurred within the first week of the course. Team members generally tried to get to know each other quickly and get right on task. For some of the teams, an individual in the team tended to emerge as a team coordinator and initiated the interaction. Then, they developed a procedure for how the task should be accomplished. This procedure was later used as a team standard for working on subsequent team assignments.
It is also interesting that all teams went through a task process that is similar to Gersick's (1988) framework, although the time element differed as a result of the compressed nature of the assignment time frames. This typically included team interactions online and decisions on how the procedures and timeframes would be established for working on team assignments. Each member individually completed course readings and posted input in the class WebBoard™. Then, they met again online to integrate all their postings. A team compiler revised a final draft and posted it on WebBoard™ for other team members to review before submitting it to the instructor. The team task processes were developed as the teams went through the first class assignment and the teams became more efficient in their work process with later assignments.

Another interesting finding was the emergent roles of shared leadership in the team—as a coordinator and compiler. Four out of seven teams mentioned that leadership of the team was shared among team members, but they indicated that the compiler of each assignment became the team leader during that week. This resulted in the leadership role rotating among members for each assignment. The other two teams saw the team coordinator as a leader for the entire time, and they also served the role of facilitator and coordinator. They kept track of the assignment due date and often initiated the first interaction among the team.

Problems in the virtual teams came from a lack of willingness to participate, lack of planning, conflicting schedules, or individual disagreements. Most of these are social interaction issues. Lack of non-verbal cues made those issues invisible to other team members. While most participants mentioned that they missed face-to-face meetings, they said it was not necessary and they could accomplish all of the assignments without face-to-face interaction. It is likely that non-verbal language played an important role in social interaction and team building but not in the task process. It seems that with a short period of time for team building and because of the limitations of the distance education environment, team members did not spend much time on social tasks. The virtual teams needed to be quick in defining their processes, be familiar with the various communication technologies that were available, and be efficient in collaboration among team members in a virtual environment.

**Recommendations**

Several strategies appeared to be important to virtual learning teams for improving team development and group processing. The primary issues to be considered include:

1. **Team Building and Collaboration Skills.** Virtual teams need more time in the beginning to coordinate their first task and establishing relationships and protocols in their initial meeting. Instructional material on team effectiveness, formation, planning, and facilitation should be included early in online programs. Instructors must become a mediator and facilitator of virtual teams. The tendency is to form the teams and assume that people know how to interact and efficiently operate in "virtual teams" but it is not so. The majority of good teams do not occur out of happenstance - they are developed.

2. **Timeframes for Task Completion.** The timeframe for course projects should be reasonable and allow enough time for students to adjust themselves to work in a virtual environment. Working together online appears to take longer than face-to-face.

3. **Virtual Learning Team Assignments.** In many online courses, team projects have been used to evaluate student performance. As with any collaborative learning project, the types of assignments or work assigned in teamwork situations should be carefully considered. There should be a clear objective and benefit established for using group assigned tasks, especially in a virtual environment. They should not be assigned just because and assignment is expected. The majority of the interviewees suggested that if the task was too complex, it would be difficult to accomplish without the option of face-to-face interaction.

4. **Team Member Readiness in Technologies and Virtual Collaboration.** Team effectiveness in using collaboration technologies can determine the effectiveness of virtual teams. The better the team members are in using communication technologies, the more efficient in teamwork they should become.

This paper provides a glimpse of how online virtual teams develop and carry out their tasks. Like many descriptive studies, the results of this study were not meant to be generalized to other virtual teams, although the uniqueness of these virtual learning teams and their environment provide insight into how they develop and progress throughout their team life. Further research should address the issues of dynamic interaction during online meetings, the role of the instructor in establishing and supporting virtual learning teams, how teams select and use technology to support the group performance, and what actions help teams better collaborate and lead to greater team performance and individual learning.

Developing a Consulting Tool to Measure Process Change on Global Teams: The Global Team Process Questionnaire™

John W. Bing
ITAP International, Inc.

As international organizations strive to improve their global reach, the role of distributed teams and the role of human processes in improving performance on these teams are important success factors. However, there are few studies of such teams using instruments whose psychometric properties are understood, instruments that can both measure changes over time and compare teams. The Global Team Process Questionnaire™ is described and researched in this paper to identify its properties.

Key Words: Consulting; Teams; Intercultural

Companies using global teams (this term will be used for teams distributed regionally or globally) have found that such teams are required to expand internationally with effectiveness. "For the first time since nomads moved into towns, work is diffusing rather than concentrating... In all industries and sectors, people are working across space and time." (Lipnack & Stamps, 1997, pp. 2-3) Global teams are utilized for research and development, to operate lines of business in a networked or matrix fashion, to serve the requirements of global customers in their locations and to implement innovations and change on a wide-scale basis. Organizations have found that global teams can be a competitive advantage and that not all teams are equally productive, even though they may be similarly constituted in terms of the professional qualifications of team members.

Managing such teams requires understanding the relationships between the following areas: (Rhinesmith, 1993):

- Personal styles
- Stages of team development
- Effective team functioning
- Stage of professional development
- National culture
- Corporate culture
- Functional culture

Rhinesmith notes that it is a mistake to automatically assume that “cultural differences [are] the primary driving forces in multicultural interaction. Many observers have found, however, that most multicultural teams are driven first by personal factors and issues of team development such as roles, responsibilities, power, and conflict.” At the same time, culture plays an undeniable role: “The mistake made by many managers is not that they leap to cultural solutions from personal differences, but that they do not know enough about cultural differences to determine whether or not they are a factor.” (Rhinesmith, 1993, pp. 131-2).

In the face of the complex factors influencing the functioning of global teams, some kind of method is required to disentangle the threads of interactions. Team Leaders and their managers cannot be assumed to be experts in this area; if help is not forthcoming, leaders, managers, and team members must peer into the “soup” of such relationships and guess which ingredients are contributing to, and which detracting from, team effectiveness. Such guesswork may often be misguided and in any event guesswork is difficult to standardize. Great team leaders may be intuitive, but intuition cannot be passed on to others and is often inconsistently effective.

The Global Team Process Questionnaire™ (referred to below as the “GTPQ”) is a device which has been designed to identify those factors contributing to and detracting from team effectiveness for both team leaders and members. These factors include communications, roles and responsibilities, leadership, trust and other factors (see the list of questions in Table 1) identified as critical to healthy team process.

Copyright © 2001 John W. Bing
Using such a tool as the GTPQ, improvements can be made through a targeted and efficient approach. Some of these improvements may be in the training and development of the team leader and team members; some may require personnel changes; and some organizational development interventions. The GTPQ is a diagnostic tool which allows decision-makers to take actions using better, more targeted information.

Five years ago a Swiss-based pharmaceutical company asked ITAP International, a consulting firm located in Princeton, New Jersey, USA, to develop a method for measuring process performance on three global teams. The teams were composed of scientists from Europe, the Americas, and Japan. They met four times over a period of two years, and continued their team responsibilities during the intervening periods. Their purpose was to reduce research and development time in three drug delivery areas: Oral, skin, and subdermal. The teams were tasked with similar assignments and because the composition of the teams was similar, they became ideal candidates for studying differences in human processes on global teams.

A questionnaire was developed to measure human process on these teams, and was administered four times over the two-year period that these teams met together. At the end of the two years, specific questions from the GTPQ were compared with peer rankings provided by the participants and these correlated positively; in other words, the highest-peer ranked team also had the highest GTPQ results on the questions tested. In addition, measures on team process on all teams fell when the teams' parent company was merged with another company, providing support for the notion that the questionnaire results were reflecting the impact of “real world” events. (Bing & Smith, 1995).

Over the past five years, the questionnaire has been further developed and provided to other global teams, many of them working in the pharmaceutical industry, and it has also been provided to employees in the consumer products and information technology fields and to the United Nations Industrial Development Organization (UNIDO).

The research outlined in this paper was conducted within the past year on two sister teams within a pharmaceutical company. Each team is focused on coordinating drug development within a single therapeutic area, or closely related area. The teams consist of representatives from traditional departments within the pharmaceutical company but the primary coordination and focus for drug development within therapeutic areas are the responsibility of the team and the team leader. These traditional departments include marketing, operations, clinical trials, regulatory affairs, and so on.

The stakes for the team, for the team leader, and for the company, are large. Very few compounds survive the rigorous weeding process required for registration and successful marketing of a drug, and generally there are few teams which manage to pull off such a success. Success is, of course, impossible with a compound which does not survive the process. However, in an odd way, certain kinds of failure are shadow successes; for failed compounds must be identified quickly and accurately to insure that the team accomplishes its mission of bringing only safe and effective drugs to market. Conversely, long, drawn-out processes which eventually lead to the withdrawal of a compound cost the company time and money and are double failures.

The teams studied herein completed the questionnaire for the first time some months ago, and the results are compared in this study. The questionnaires were administered electronically. Each team consist of about ten members. The results of this first iteration of the questionnaire has been reported to the team leaders.

**Problem Statement**

Teams are one of the principal mechanisms by which the operations of organizations are globalized, that is to say, are carried out internationally. It is likely that those teams that have the most effectively levels of human process will assist the organization as a whole to be more productive. However, in order to test this hypothesis, it is necessary to develop cross-team human performance metrics and then to statistically compare these metrics with other measures of productivity. This paper presents an approach to the first half of this challenge.

A global team is defined here as a team which is located in more than one country, or that has participants from more than one country temporarily working in the same location. Pharmaceutical teams of the kind described in this paper typically have both configurations.
Theoretical Framework

Various superb quantitative and qualitative approaches have been undertaken to better understand national cultural differences (Hall, 1976; Hofstede, 1984; Trompenaars, 1993). These studies have been successful in widening awareness of the influence of culture on relationships, performance and effectiveness within organizations.

Group dynamics within a multicultural and global context has also been explored for some time, often in the context of studies on management and human resources (Adler, 1986; Hofstede, 1991; Odenwald 1993; Berger, 1996; Harris & Moran 1996; Black, Morrison, & Gregersen, 1999). In some of these studies, the influence of culture on organizations was studied primarily in terms of the entire organization or upon individuals working within the organization. It is only within the more recent past that the importance of global teams has been recognized as a key factor within international organizations.

Since the Global Team Process Questionnaire™ was created it has been utilized with global and multicultural teams in the pharmaceutical, chemical, consumer product, and information technology industries. There have been over twenty teams studied. Team sizes range from 4 to 32 members.

The Global Team Process Questionnaire™ is constructed of three parts. The first section consists of “base” questions which are used with all clients. These form the statistical core of the questionnaire. These questions have been developed and redeveloped over time. For example, the question: “Are the objectives of your team clear?” was originally written: “Is the agenda of your team clear?” and was revised because the word “agenda” was sometimes taken to refer to the more limited sense of “calendar.” Other questions were similarly revised over time. The questions have always been written in English because it has been the business language utilized by all of the teams studied.

The second section of the questionnaire consists of questions requested by different team leaders. These are typically related to process on one specific team, and are therefore unavailable for comparison with teams in other organizations, although they may be utilized for statistical comparisons on the same team over time or on a sister team in the same department or organization which uses the same question set. This is in fact the case reported in this paper.

Of course there are qualitative measures which provide insight into the processes and issues on these teams but which are not suitable for statistical manipulation. Therefore questions which require written responses are utilized to expand the information provided by the Likert-response questions and to serve as a check against the natural limits of closed questions.

How would measurement results from a questionnaire of this type differ on global and multicultural teams from domestic or monocultural teams? There is very little in the literature on this subject. However, landmark studies on national differences on questionnaire surveys by Hofstede, André Laurent, and Trompenaars have shown that certain questions will provoke responses that differ along national lines. For that reason the next step in questionnaire research on this subject should be to compare results based on demographics of global team members. These demographics will be added to the next iterations of the questionnaire mentioned herein. In the meantime, questions on communications and other human processes (goal-setting, trust-building) which have been shown to be especially sensitive to cross-cultural differences will likely indicate cultural differences; however we have no way of knowing which component is cultural, and which should be attributed to other causes. Even a question in this survey specifically related to culture, “What impact have cultural differences had on team performance?” is interpretational in nature and responses depend upon the respondents’ concept of, for example, the roles culture and personality play in everyday life. Therefore, the data we now have available will not answer the question of the extent to which culture influences human processes on teams; that must follow the addition of demographic variables to the statistical analytic process.

This is an important theoretical question. From a practical point of view, however, team leaders and their managers are not particularly interested in the extent to which, for example, culture influences communications on their teams. They are very interested, however, whether communications as a whole on such teams are good or bad because in general they believe that this will effect the productivity of those teams. And when other forms of analysis implicates cultural factors, then in general managers and team leaders appreciate interventions to raise the awareness and skills of team members to understand and positively utilize these differences.
Methodology

Table 1 lists the questions utilized as “base” questions in the version of the GTPQ used in this study. Respondents use a six-level Likert Scale in assigning values as answers.

Two global teams performing similar work within a pharmaceutical company (developing discovered compounds from clinical trials through regulatory approval to market) were administered the GTPQ with the same questions within the same time period of one month. The teams contained twelve members each in number and were composed of medical doctors and professionals with doctorates in related fields. At the time the questionnaires were administered, both teams had members located in the U.S. and Belgium. The team leaders were also located one in Belgium and the other in the U.S. The questionnaires were administered by email and returned by email. The results were provided to the teams within one month of the initial administration of the questionnaires. These results were provided in two formats:

1. For each question, statistical averages for the teams’ response and in addition, where available, pharmaceutical industry averages on the same questions. Comments were also collected and anonimized to provide an additional level of meaning to each question.

2. “Spidergrams,” sometimes called radargrams, were produced. These showed how each (anonymous) respondent had answered each question, and whether the respondents were in agreement or disagreement on the response to these questions.

One-way ANOVAS were run for the groups. The results were compared in order to determine the significant differences between the two teams on specific questions. The measurement level requirement for a data analysis with ANOVA is an interval scale. Although Likert scales are strictly speaking not interval scales (the difference between the scale items is not exactly the same for all respondents because of their assumptions), scales like the one used in the GTPQ are commonly treated as if they would provide this measurement level. The ANOVA table was chosen to display the significant differences between the two teams here in this report. To check the significance of differences on a higher statistical level a General Linear Model (GLM-Univariate) was computed for each question. The reported results were confirmed. (Krukenberg, 2000).

The results are compared to determine if these can yield recommendations to the team leaders to improve process effectiveness on the teams. Since neither group is a “control” group, and since neither group received an experimental treatment, the purpose of the comparison is not to determine whether a specific treatment did or did not have an effect, but rather to take a first look at whether the questionnaire can discriminate between teams in a useful way. “Useful,” in this sense, means that recommendations for improvements in team process can be made from information provided through the use of the questionnaire.

Results and Findings

The following questions showed significant differences between the two teams at the .05 level.

5. How effective is the work of your team?
9. Group communications: My team has excellent / fair / poor communications.
10. Relevance of my team’s work to the company’s strategic goals?
11. Level of trust on team.
12. Ways of resolving conflicts.
13. Problem resolution on team.
16. Effectiveness of team leadership.
17. Consistency of direction from team members.

All of the significant results were on the positive side for one team (Team A), and negative on the other (Team B). In other words, Team A showed consistently higher scores on team process than Team B for those questions which reliably distinguished the two teams. (For questions at a lower level of significance, the results were more scattered.) What kind of conclusions can be made from this limited information?

First, there is a difference in perceived process effectiveness between these two teams. The members of Team A clearly have a better opinion of their team’s work than members of Team B. Interviews with members of both teams conducted during a preconference needs assessment confirmed these findings.

Second, there were broad areas cited for problems on Team B, including leadership, trust, and conflict resolution. Two months after the administration of this questionnaire, the leader of team B was reassigned to another position.

</tbody>
</table>
The purpose of this questionnaire is to analyze process effectiveness on teams and to suggest ways in which ineffective or harmful process can be reduced. By identifying specific areas for improvement, targeted change interventions can be made, either through training and development efforts or through other approaches. Conversely, the topics embedded in questions that elicit a positive response are not good candidates for useful interventions to improve team performance, since they are already highly rated.

For example, one of the areas that often comes up in the GTPQ analysis as one for improvement is question #3: “Are the objectives of your team clear?” However, in this case, there was very little difference between the two team responses, and the responses were within the normal range for pharmaceutical teams. (ITAP International has established a database of responses for teams by industry so that industry averages can be computed.)

On the other hand, another question (Question #9 in Table 1) which has in the past correlated with team performance (Bing & Smith, 1995) refers to the quality of group communications. Here, Team B’s score is both significantly lower than Team A’s response, and it is also significantly lower than the pharmaceutical industry average on this question. Therefore, any work with the team which focuses on communications has the assurance of targeting a significant problem. Other problems on Team B that can be approached to improve process effectiveness on the team are leadership, trust, problem and conflict resolution, and team cohesiveness.

Such a targeted approach can save an organization both time and money, since team leadership and upper management can make decisions on change and interventions based on a more assured understanding of the problems on such teams.

Conclusions and Recommendations

Clearly, this is only the beginning of research to determine both the effectiveness of this tool and what can be accurately described in terms of process effectiveness on global teams. Here are some areas which need to be researched:

1. Demographic research: How do nationality or cultural difference influence the process effectiveness of teams? Do teams with members of many cultures have significantly different results on group process than do teams with fewer cultures? How does homogeneity or heterogeneity of age or gender influence processes on such teams?
2. Measures over time: Do teams tend to improve their functioning in general over time without interventions?
3. What is the relationship between types of interventions to improve team effectiveness and GTPQ-measured changes in effectiveness?
4. Relationship of teams to the larger organization: What conditions in the larger environment foster team process effectiveness? What conditions can decrease such effectiveness? Are global teams in merging companies generally negatively impacted (replicating an earlier study)?
5. Relationships of teams to each other: Can teams with high process effectiveness mentor those with lower effectiveness?

How this research contributes to new knowledge in HRD

Although there has been much research conducted on teams with respect to process effectiveness, there is less research in the area of global or cross-cultural team development, with some notable exceptions. (Berger, 1996; Devereaux & Johansen, 1994, Saphiere, 1996). However, little emphasis has been placed on two aspects of global team development: Long-term, longitudinal studies of individual teams, and cross-team comparisons. This paper focuses on cross-team comparisons; longitudinal study of teams is in progress utilizing these same two teams. There is some evidence already that longitudinal studies will detect both internal team changes and external influences on these teams.

Second, team development is typically handled through generic training courses, in which principles of good team development are provided. The same has been true for global team development. The approach taken through the GTPQ and documented in this paper offers the opportunity for team members, leaders, and managers of these teams to take specific steps both to remediate problems on such teams and potentially to have effective team leaders assist other teams in their business or academic areas with ways to improve process. Such targeted intervention should be both more effective in bringing desired results and in addition should be an investment to improve productivity.

Note: I would like to thank my colleague Jochen Krukenberg, candidate for the degree in Intercultural Communication and European Studies from the University of Applied Sciences in Fulda, Germany, for his assistance in data analysis and interpretation during his period of internship at ITAP International.
The Role of the Learning Coach in Action Learning

Judy O'Neil
Partners for the Learning Organization

Action learning helps organizations use learning to deal with change. The learning coach plays an important part in action learning, yet there is little research about his/her role. The purpose of this study was to determine what practitioners think is distinctive about how they help managers learn from experience in action learning. Conclusions show there are external and internal influences that shape the interventions coaches use, and govern consistency between espoused theory and theory-in-use.

Keywords: Learning Coach, Action Learning, Change

Action learning is one of several strategies that can be used to stimulate the development of learning to help with change in organizations. Learning coaches help participants in action learning programs reflect upon and learn from experience. There is a lack of research about how learning coaches help individuals in organizations learn from experience and what this learning process looks like. The purpose of this study is to gain a better understanding of why and how learning coaches do their work.

Problem Statement

The problem addressed in this study is that there is inadequate documentation about what learning coaches do and why they do it. Little is known about how learning coaches help people in learning from experience and how this involves reflection and critical reflection. The purpose of this study is to determine what practitioners think is distinctive about their role as learning coaches as well as how they help managers learn from experience by using reflection or critical reflection. This study identifies themes from the work and words of practitioners, which are used to advance theory about learning from experience, and ways in which learning coaches in action learning help individuals within organizations deal with and learn from change.

Theoretical Framework

Recently, organizations have begun to experiment with forms of working and organizing that call for a fundamental reassessment of the role of learning as a way to deal with change. One way to engender change through learning is through learning from experience. Kolb (1984) and Boud and Walker (1996) believe that learning from experience is represented by a cyclical process. Considered to be of particular importance is the emphasis on action and reflection. Simple reflective practices can include reflecting back on action for learning; while more critical reflective practices can include questioning the governing values underlying basic assumptions and modes of operation, and refining and reframing business problems (Mumford, 1996).

This study looks at one strategy for helping managers learn from experience called action learning. Action learning is defined as:

an approach to working with, and developing people, which uses work on a real project or problem as the way to learn. Participants work in small groups to take action to solve their project or problem, and learn how to learn from that action. A learning coach works with the group in order to help them learn how to balance their work, with the learning from that work (O'Neil, 1999, p. 14.)

Theoretical Schools of Action Learning

“One of the problems of describing action learning is that it means different things to different people” (Weinstein, 1995, p. 32). Based on an analysis of what has been written, I have concluded that there are four theoretically based schools of action learning (O'Neil, 1999). Further understanding of these schools has since been expanded upon by others (Hicks, forthcoming; Yorks, O'Neil & Marsick, 1999). These four schools are summarized.
in Table 1 - Theoretical Schools of Action Learning. The four schools are categorized by what appears to be the underlying basis for the way in which practitioners view that learning takes place during action learning. The different schools have much in common, but their different views of learning have an influence on the way in which a learning coach practices his/her role. The most significant difference for this paper is that the Tacit school, while considered by its proponents to be action learning, doesn't use a learning coach (Noel & Charan, 1988).

<tr>
<td>Revans (1989)</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The Scientific school is rooted in the work of Reg Revans, considered the 'father of action learning', who described his 'method for achieving managerial objectives' as consisting of Systems Alpha, Beta and Gamma. Given his early background as a physicist, these systems have a basis in the scientific method (Revans, 1982). Learning occurs through asking questions, which leads Revans to a learning formula, \(L=P+Q\) (\(L=\)learning, \(P=\)programmed instruction, \(Q=\)questioning insight (1982). Questioning insight has been described as 'discriminating questions' (Pedler, 1991); \(P\) is, "the expert knowledge, knowledge in books, what we are told to do because that is how it has been done for decades" (Weinstein, 1995, p. 44).

As part of the Experiential school, many proponents of action learning see Kolb's learning cycle as its theoretical base (McGill & Beaty, 1995; Mumford, 1996). Action learning enables learning in each stage of the experiential learning cycle (McGill & Beaty, 1995).

Practitioners in the Critical Reflection school believe that action learning needs to go beyond the simple reflection found in the Experiential school to focus on critical reflection through critical thinking (Brookfield, 1987; Mezirow, 1990); on the basic premises that underlie thinking. In critical reflection, people recognize that their perceptions may be filtered through uncritically accepted views, beliefs, attitudes, and feelings inherited from one's family, school, and society. Such unfiltered perceptions often distort one's understanding of problems and situations.

The main differences between the Tacit school, and those previously discussed, is its focus primarily on action through the project. Little explicit attention is place on the process of learning, which makes it primarily incidental (Marsick & Watkins, 1992).

The Learning Coach

The literature does not provide an explicit definition of a learning coach. Each author describes the learning coach differently based on how he/she understands the learning process (McGill & Beaty, 1995; O'Neil & Marsick, 1994; Revans, 1978). The literature does provide a picture of certain characteristics or traits. These characteristics and traits enable the learning coach to play many roles.

One of those is that of a process consultant (Casey, 1991; McGill & Beaty, 1995; O'Neil, 1997; O'Neil & Marsick, 1994; Weinstein, 1995). Skills are also identified for learning interventions. In the three schools that use learning coaches, the coach primarily works with the group through the use of interventions, i.e., questioning, reflection. The kinds of interventions and the frequency depend upon the kind of learning in which he/she would like the group to engage. The literature, however, primarily consists of prescriptions written from the personal experience of practitioners (Casey, 1991; McGill & Beaty, 1995; Mumford, 1993; Pedler, 1991). While there has been some research on learning outcomes in these programs, (ARL™ Inquiry, 1995; Weinstein, 1995; Yorks, O'Neil, Marsick, Nilson & Kolodny, 1996), there has been no research that has specifically focused on the role of the learning coach.

Most, but not all, authors consider the role of the learning coach as important (Casey, 1991; Marsick, 1990; McGill & Beaty, 1995; Mumford, 1993). Revans (1978) thinks that the learning coach role should be limited to the
start of a program to ensure that managers understand that they have the latent ability to learn from one another. "Although it is theoretically possible, we know of few examples where action learning groups operate without coaches". (Pedler, 1991, p. 291).

Research Questions

The questions that frame the conceptual focus of the research are:

- What do learning coaches do to help individuals learn from experience?
- When does that help result in simple reflection, and when does it result in critical reflection?

The more specific sub-set of questions that help to answer the larger questions is:

- What external influences affect the practice of these learning coaches?
- What skills, knowledge and interventions do these learning coaches think they use in their work?
- What internal influences affect the practice of these learning coaches?
- What is the self-perception of these learning coaches—their espoused theory—of what they do?
- How does the self-perception of some of these learning coaches (those observed in a program) compare with their actual practice—their theory-in-use?

Research Design

Sample

This study relies on elite interviews. I had a personal relationship with practicing learning coaches in the United States, England, and Sweden. I knew, and had worked with, some of my subjects, who therefore agreed to participate in my study and provide access to a number of additional learning coaches. My subjects were a convenience sample based on these contacts.

My population is composed of 23 practicing learning coaches—14 males and 9 females: 6 from the US, 13 from the UK and 4 from Sweden. Four of these coaches participated just in the first step of the study. Twenty of the 23 were over the age of 40. Several of the learning coaches who participated in the research have been learning coaches for a number of years, are well published, and are considered by other practitioners to be well-known authorities. All of the learning coaches who participated in the study had backgrounds that enabled them to understand and practice action learning, and all had participated in one or more action learning programs.

Data Collection

The first step in implementing my research design was modified use of the "Self-Q" interview (Bougan, 1983), which involves asking potential interviewees what they think the researcher should ask to understand their expertise. I used the first two interviews in Bougan's process frame the semi-structured interview schedule. This interview was used with 5 coaches, 4 of whom were not part of the semi-structured interviews or observations.

The next step was to conduct in-depth, semi-structured interviews. The interview schedule was constructed from the literature and output of the "Self-Q" interviews. The interviews were conducted with 12 learning coaches who were not observed in an action learning program and with 7 learning coaches who were.

In the course of this research, I was not able to observe all of the subjects. The sites I observed were a multi-national food organization in the United States using an action learning program to help transform itself into a global organization, and a university in England using action learning as a basis for its masters and doctoral programs geared to people working within varied organizational settings. I observed 4 of my subject learning coaches at the US site—1 US male, 1 US female, and 2 Swedish males—and 3 of my subject learning coaches at the England site—3 UK males. Observations took place after the semi-structured interviews.

Steps for Analyzing and Synthesizing Data

I used the constant comparative method to analyze and synthesize data (Merriam, 1998). I used NUD*IST (Non-numerical Unstructured Data Indexing Searching and Theorizing) a data analysis software program for my analysis. Once in the NUD*IST database, interviews were reviewed while I listened to the recording in order to re-
live’ each interview, while checking for accuracy and completeness of the transcription. During this process, I also began an “open coding” scheme of the data (Strauss & Corbin, 1990). Using the literature and “in vivo” codes, I developed an initial coding scheme. These initial codes were revised, expanded, clarified and synthesized throughout the analysis process. Data were synthesized and reported using the study’s research questions. Pseudonyms were used in reporting the findings.

**Validity, Reliability and Limitations**

Because it is difficult for external readers to judge whether or not the researcher’s interpretations are correct, Brookfield (1990) suggests rules that I followed in my study to contribute to its credibility, transferability, dependability and confirmability. These include—justify and document one’s activities and conclusions; use sufficient quotations to allow readers to judge the validity of the findings; seek to acknowledge the limitations of interpretive research and their inherent disadvantages; use triangulation; acknowledge the importance of his/her presence in the research encounter.

My research had an inherent subjectivity because I was the data collector, data interpreter and a learning coach practitioner. Despite precautions, a certain amount of bias was unavoidable. Both the “Self-Q” and semi-structured interviews were self-report methods and were only balanced in part by observations. Finally, I may have brought some additional bias to the research since I knew many of the coaches so well.

**Findings**

The findings from this study fall into 3 general areas. First, external influences on the roles of the learning coach; next, the primary role of the coach, that is, interventions with his/her group; and last, the internal influences on the coach. The combination of the interviews and observations also resulted in some findings regarding coaches’ espoused theories versus their theories-in-use (Argyris & Schon, 1978). These findings result in conclusions about the basics of a learning coach’s practice.

**External Influences**

The external influences found in this study include the coaches’ personal background, for example, history, skill and knowledge, and people who had an impact on them. These influences also reflect the type of action learning programs in which the coaches work.

These findings demonstrate that people who come from very varied backgrounds can perform the role of the learning coach. While there are a number of skills and knowledge people could bring to the role, one of the most important is that of the ability to help groups work with their process. “Learning coach and process consultant are not the same, but I think clearly there are a number of skills germane to both.” The findings showed a particular emphasis on not viewing oneself as an expert and the maturity to put aside one’s needs and focus on the needs of the group. There are additional skills and attributes that are also necessary and important for a learning coach to have or develop that go beyond helping groups with their process, to helping groups focus on their learning.

The design of the action learning program in which coaches work can also have a significant influence on how they work with their group. The interaction that a coach would have with a group would be different depending on whether the design called for participants to have individual projects or group projects. The length of the program can have a significant impact on the work of the coach. If the program is very short in duration, the group has more to do and learn in a shorter time, so the coach may take a more active role than in a longer program. Sponsors of projects can influence how a group and coach work together; participants who understand the action learning process behave differently in the group than those who don’t.

**Interventions**

The learning coaches in the study confirmed that the skill sets, and interventions, of the process consultant were an important part of the repertoire of the learning coach. The coaches went on to emphasize, however, that while this skill set was needed it was not sufficient. While many of the interventions an coach might make, for example, providing feedback to individuals and the group, are the same as might be made by a process consultant, there is a separate set of interventions required for a learning coach to be effective. These interventions take the action learner to a ‘deeper, learning level’ as one coach stated. These interventions have a common thread of creating situations that would promote and support learning as shown in Table 2.
This focus on learning makes sense when thought of in light of the Schools of Action Learning. The primary underlying assumption in the schools is how coaches think about the way that learning takes place through action learning. In order to enable participants to learn through scientific problem solving, simple reflection, or critical reflection, a learning coach needs to shape his/her practice to help bring learning about by choosing specific interventions for learning that fit their practice.

Internal influences

The findings showed two main kinds of internal influences. First, their espoused practice, and for some their actual practice, demonstrated support for the conclusion that their beliefs about how learning takes place impacted their practice. Second, coaches described an internal view, or metaphor, that helped shape their practice as well.

When their words are looked at through the lens of the Theoretical Schools of Action Learning, twelve of nineteen of the coaches interviewed and/or observed “fit” into a particular theoretical school. These coaches also described an internal view—metaphor—that appeared to influence their practice. Other coaches in the study reflected one of the two internal influences or none at all. I inferred that this theoretical underpinning and metaphor were indications of a strong sense of self-awareness that lead to an informed choice about interventions, and a resulting consistency between beliefs and actions. Without this self-awareness, coaches could exhibit inconsistency in what they said they wanted to accomplish and what they actually did with a group.

Espoused schools. Table 3 illustrates the school the twelve coaches espoused.

Beliefs about learning influenced the choices these coaches made about their interventions. As an example, the models that Al talked about using fit a scientific framework of problem solving and his description of when he usually made interventions portrayed a very structured approach.

I tend to refer more than anything else to the basic problem solving model. And later related to the learning cycle model. But out of the problem solving model. The set itself will organize its own timetable for meetings and will stop the meeting and plan a review and I’ll be invited to make an intervention. That’s the usual thing. Together with summing up the end.
In the Experiential school, Bruce, in response to a question about what models he used with groups, talked about an instrument and model similar to the Kolb model. As he later described his work with various groups, he discussed his use of reflection as a consistent intervention.

It's not a term I'm familiar with but if it means that you and the group, you ask the group to pause and reflect, yes I certainly do that. Always at the end of a session. When they've finished. Let's spend some time reflecting. So I think inevitably at the end of a particular period of time.

These twelve coaches, identified in Table 4, had a clear view in their minds of a cycle of learning from experience. The models they espoused and their descriptions of their work also suggested that reflection in the cycle was crucial. Where the distinction came into play was in their beliefs about the kind of reflection that they felt was crucial for the kind of learning they believed should take place in action learning.

Metaphors for practice. Many practitioners and theorists discuss internal views—metaphors—in the literature that appear to help describe and shape their practice (Botham, 1993; Casey, 1991; O'Neil, 1996). Continuing with the concept of metaphors used by these other coaches, the following shows views that were expressed by coaches in the study. It appears these metaphors reflect a belief system that influences how coaches work. They described the metaphors of the Radical coach, the Consecrated/Religious, the Deep Diver, the Legitimizes, and the Mystery Maker.

The Radical learning coaches interpreted a significant part of their role as enabling participants to become empowered and use that empowerment to question and challenge authority. Their view of action learning fit a more radical mindset that of development within an approved paradigm. Carrying forward with illustrations of the coaches portrayed in the Theoretical School descriptions, Pete, in the Critical Reflection school, portrays himself as a Radical coach.

For me what's different is the vision of what you're trying to bring about. You're not necessarily trying to bring about more effective organizations in the sense that might be described in a particular ideology or philosophy. ... And it's not necessarily understood that way by the people who run the organization or have the power. So it's—I think he's (Revans) much more subversive than process consultation.

The Consecrated/Religious coach has an underlying current of spirituality to their work and submerges or subordinates their needs to that of the group. Ben in the Critical Reflection school is an example.

... servants seeking service rather than 'I have something you can buy from me'. People who are making a living may be troubled by it. (Ben)

The Deep Divers described their work as going below the process level of the group to a 'deeper' learning level. They often saw themselves as being very intuitive in their work, so much of their thinking was below the surface.

The Legitimizers conceived of one of their main roles to be that of someone who is just there. By just being there, they are instrumental in creating an environment in which people are free to learn. Lance, in the Critical Reflection school, saw himself in this role.

You legitimate the situation. To reflect and to do something which you usually don't do. ... You represent the whole idea of the program and just being there and seeing the group, and listening to the group is sometimes enough to get a lot of things happening which have never been able to happen.

The Mystery Maker was a role that was criticized by learning coaches in the study, although many admitted to struggling not to take on the role themselves. Mystery Makers create a mystery about what they do. Through this mystery, they bring the focus of the group on themselves and what they know. They 'steal' learning opportunities from the group.

And that you've got to watch and that means more—not less—self control. And knowing that if you've got this potential in you to devise a bully pulpit and then come across as sort of a sage/guru figure. And every time you utter something of any significance, people sort of write it down. (Ben)

These findings demonstrate that a number of learning coaches' practices are based on both an explicit theoretical basis, as well as an internal, metaphorical view. Having explicit internal views of his/her practice appears to influence the potential of a match between a coach's espoused theory and theory-in-use.

Conclusions and Recommendations Regarding the Role of the Learning Coach

Based on some of the key findings of my research, we have a more insightful view of the role of the learning coach (Table 4 - Basics of a Learning Coach's Practice). In this table, I again look at some of the learning coaches discussed earlier in the findings. They represent examples of 12 learning coaches in my study who had a self-awareness of how they think learning takes place in action learning and had an internal metaphor that influenced
their practice. Both of these internal influences appeared to impact the kind of learning interventions the chose to make. These relationships provide us with one way to be able to look at the findings, so are not always true in every instance.

As an example, Ben appeared to be a strong Consecrated/Religious coach. He talked about “servants seeking service” and described one of his interventions with the phrase, “my intervention seemed to create some sort of atmosphere which almost helped heal the thing”. When asked about developing a learning coach, he described a need for deeper, critical reflection in their reflections.

Because it may not be able to move forward. It may be a way of moving deeper. I think that is the thing that we are talking about rather than sort of moving forward.

This research is limited to the learning coaches interviewed and the programs observed. Similar studies need to be done with other coaches and in other programs. A focus on learning coaches new in their practice would help to find out whether they are guided by deep belief systems as well. Other methods, such as critical incidents or case studies, could provide greater depth of understanding of the practice of learning coaches. Since this research used qualitative methods to explore an area in which there was no documented research, additional work should be done to evaluate the validity of the data, findings and interpretation.

How this Research Contributes to New Knowledge in HRD

I would propose two reasons why these 12 coaches were consistent in their practice. First, they were among the most experienced in the research. The literature stressed the importance of personal characteristics like the willingness to learn from experience and one's mistakes and errors (McGill & Beatty, 1995; O'Neil & Marsick, 1994). The experience these coaches had may have provided a different window on the way they made judgements than I might have acquired had I studied only coaches who were early in their practice, but these findings confirmed the need for continued development. Despite their experience, in answer to a question about how they rated themselves as learning coaches, the 12 felt they needed to continuously learn. “I need to learn all the time and I think it's dangerous to be a person who has a routine of doing things.”

Second, while the literature placed emphasis on the process of learning from experience in both action learning and the development of the coach (McGill & Beatty, 1995; Pedlar, 1991), my study also shows the importance to learning coaches of looking deeply and constantly at their own belief systems when taking the role of coach. Action learning can be more of an art than a science. As a result, it is important that learning coaches are prepared for their role in a way that will help them become very clear about their own belief systems, in addition to acquiring a repertoire of strategies for helping people learn from experience and practice in their selection and use.

The Impact of the Dimensions of the Learning Organization on the Transfer of Tacit Knowledge Process and Performance Improvement

Miguel Hernandez
University of Georgia

The argument advanced in this study was that the process of within-firm transfer of tacit knowledge is influenced by an organizational environment fostered by the implementation of the seven dimensions of the learning organization (Watkins & Marsick, 1993). It was also assumed that this process in turn mediates the impact of these dimensions on performance improvement.

Keywords: Learning Organization, Transfer of Tacit Knowledge, Performance Improvement

Once largely ignored or discounted, knowledge capital is becoming an important component of economic, innovation, and management theories. Developed and developing nations are devoting more resources to knowledge creation, thus increasing the global pool of knowledge. Organizations and government are beginning to recognize the value of knowledge as a leveragable resource. Knowledge has become an important determinant of competitiveness and, by extension, of a nation’s economic well-being (Pinelli et al., 1997).

According to leading futurists and business leaders, we have clearly entered the knowledge era; the new economy is a knowledge economy. Knowledge provides the key raw material for wealth creation and is the fountain of organizational and personal power (Marquardt, 1996). Every company depends increasingly on knowledge: patents, process, management skills, technologies, information about customers and suppliers, and old fashioned experience. This knowledge that exists in an organization can be used to create differential advantage. In other words, it is the sum of everything everybody in the company knows that gives the firm a competitive edge in the market place (Steward, 1991). Knowledge has become as important for organizations as financial resources, market position, technology, or any other company asset. Knowledge is seen as the main resource used in performing work in an organization (Marquardt, 1996).

The link between a firm’s knowledge-base and its competitive advantage is recognized by scholars who hold a resource-based view of the firm (Barney, 1991; Rumelt, 1984; Wernerfelt, 1984), as well as by scholars who take an organizational learning perspective (Argyris & Schoo, 1978; March, 1991; Senge, 1990).

What these distinct perspectives have in common is a focus on the knowledge-base of the firm described in terms of two critical dimensions (Polanyi, 1958; Nonaka, 1994). The first refers to its tacit nature, i.e. to unarticulated knowledge which is not amenable to simple formalization; while the latter pertains to its explicit dimension, which makes it codifiable in systematic ways.

The tacit component of firm knowledge-base makes its formalization difficult, reducing its ease of transfer across organizational boundaries. Thus, a number of resource-based scholars have argued that tacit knowledge is a valuable source of competitive advantage because it protects a firm against boundary leakages of firm-specific know-how assets (Shuen, 1993). In addition, tacit knowledge has a higher return generating potential when put to work within the boundaries of the firm (DeLeo, 1994).

Though sharing a common starting point, the resource-based view and the organizational learning perspective differ in terms of focus. Resource-based scholars focus on impediments to flow of tacit knowledge across boundaries, while organizational learning scholars focus on the conditions affecting within firm mobilization of tacit knowledge.

Research in these two areas also can be dichotomized on the basis of content versus process. Within the resource-based view of the firm, the focus is upon the content of knowledge—tacit as well as articulated—building upon what individuals and organizations know (e.g. “core competence” Prahalad & Hamel, 1990; and “dominant logic” Prahalad & Betties, 1986), to explain why tacit knowledge is not amenable to transfer across firm boundaries. On the other hand, the organizational learning perspective draws scholarly attention to how organizations foster the internal transfer of knowledge, shifting the focus to the process of knowledge transfer as a source of competitive advantage.

The empirical evidence provided so far by these emerging research perspectives shows that we know very
little about how and to what extent firms are actually able to affect the transfer of tacit knowledge process within firm’s boundaries, nor is there conclusive evidence available which suggests that internal transfer of tacit knowledge translates into performance improvement.

To fill this gap, the present study focused upon the process of within-firm transfer of tacit knowledge and developed some initial steps to move beyond a set of descriptive considerations to the rudimentary elements of a unified framework, one which captured the seven dimensions of the learning organization (Watkins & Marsick, 1993) as determinants of a learning organization environment that impacts the process of within-firm transfer of tacit knowledge.

The central premise on which the framework is based can be described in the following terms: the implementation of these seven dimensions, which are the changes that organizations must make to become learning organizations, foster a learning organization environment that impacts on the transfer of tacit knowledge process. It is also assumed that this process mediates the impact of the seven dimensions of the learning organization on performance improvement.

Theoretical Framework

The Learning Organization

Recent studies suggest that the key to success for an organization is embodied in its ability to implement and appropriate new technology (Wilbmn, 1991). However, adopting new technology does not ensure its successful integration and its optimum use. A company must be able to adjust to the demands and opportunities the new technology creates in order to realize its full advantage.

There is no simple formula for making the changes required to fully exploit a new technology. Indeed, every organization is unique and must identify and implement the changes required to enhance its own effectiveness. Argyris and Schon (1978) describe this process of identifying and implementing required changes as organizational learning. They suggest that an organization is, at its root, a cognitive enterprise and it learns and develops knowledge. The concept of a learning organization has evolved from the ideas of organizational learning, but it differs in that it includes not only the learning of the organization, but learning within the organization (Ulrich, Von Glinow & Jick, 1993). Learning organizations create intentional processes that accelerate the creation and utilization of knowledge across the system (Marsick & Watkins, 1997). Watkins and Marsick (1993, 1996) delineate the learning organization as one that captures, shares, and uses knowledge to change the way the organization responds to challenges. They describe seven dimensions or action imperatives necessary for organizations to progress toward becoming a learning organization: create continuous learning opportunities (Continuous Learning), promote dialogue and inquiry (Dialogue and Inquiry), promote collaboration and team learning (Team Learning), empower people toward a collective vision (Empowerment), establish systems to capture and share learning (Embedded System), connect the organization to its environment (System Connection), and provide strategic leadership for learning (Provide Leadership).

For the purpose of this study, a learning organization was defined as one that is characterized by continuous learning for continuous improvement, and by the capacity to transform itself. It is an organization in which people are aligned around a common vision, sense and interpret their changing environment, and generate new knowledge that they use to create innovative products and services to meet customers needs (Marsick & Watkins, 1999).

Tacit Knowledge

People know more than they can tell. Personal knowledge is so thoroughly grounded in experience that it can not be express in its fullness. In the last 30 years, the term tacit knowledge has come to stand for this type of human knowledge—knowledge that is bound up in the activity and effort that produced it (Horvath, 1999).

The study of tacit knowledge has spanned several disciplines in the social sciences, and its provenance in an earlier, natural philosophy is extensive. Polanyi’s (1973) philosophical treatise on personal knowledge, with its distinction between “focal knowledge” and “knowledge of subsidiaries,” laid a theoretical foundation. Wagner and Sternberg (1986) define tacit knowledge as work-related practical knowledge learned informally on the job. Sternberg’s investigations of tacit knowledge in the workplace helped to move tacit-knowledge research out of the laboratory and into the lexicon of applied social science (Sternberg et al., 1995).

Although not explicitly framed in terms of tacit knowledge, Argyris’ studies of defensive reasoning established the reality and consequences of unspoken knowledge within organizations (Argyris, 1990). Nelson and Winter’s evolutionary theory of economic growth (Nelson & Winter, 1982) incorporated Polanyi’s work on tacit
knowledge into a knowledge-based theory of the firm. Working in the same tradition, Kogut and Zander, (1992) showed how tacit knowledge affects the diffusion of innovation within firms and the appropriation of those innovations by competitors. By studying a range of technology-intensive businesses, Leonard-Barton (1995) showed how knowledge embedded in people, tools, and practices can develop within and sustain businesses. Nonaka and Takeuchi (1995) offered a model of organizational knowledge creation in which the socialization of individual tacit knowledge drives a reliable cycle of continuous innovation.

The transfer of tacit knowledge within organizations takes place through dissemination and documentation, which refer to the existence of general-purpose routines, which allow for the mobilization of knowledge beyond the specific tasks for which they have been designed (De Leo, 1994). A number of scholars (Brown & Duguid, 1991; Orr, 1990; Nonaka, 1994) have been focusing on the impact of dissemination modes, such as informal gatherings or information exchanges, which have the prerogative of diffusing tacit knowledge beyond the purpose for which they have been designed. In order to be effective, dissemination modes are coupled with a documentation effort (Orr, 1990; Nonaka, 1994), which allow individual members to capture the value of the ideas and methods which have been made available to them through dissemination mechanisms.

This fairly recent recognition of the importance of knowledge in contemporary society (Quinn, 1982; Nonaka, 1991, 1994; Senge, 1990) has raised many questions concerning how organizations transfer knowledge within firm boundaries (Itami, 1988; Kagono, 1994; Hedlund & Nonaka, 1993).

Conceptual Model

To better capture the relationship between the conditions influencing the process of tacit knowledge transfer and its impact on knowledge performance, a unified conceptual model was proposed; a framework within which different determinants were placed and the relationships between them analyzed. The adoption of a unified conceptual model enabled the researcher to sort out the contradictions that exist when different factors affecting the internal transfer of knowledge are considered collectively. Within the conceptual model shown in, the process of transfer of tacit knowledge is impacted or influenced by a learning organizational environment fostered by the implementation of the seven dimensions of the learning organization. This process is also assumed to have a direct impact or influence on performance improvement.

Significance of the Study

The growing interest developed around transfer of tacit knowledge and its impact on performance has not been matched yet by an equivalent effort to provide empirical evidence supporting the hypotheses at the basis of this research paradigm. In addition, most of the attention has been captured by impediments to mobilizing knowledge, with little concern about the processes and conditions which influence the effectiveness of tacit knowledge transfer within organizational boundaries. Most of the work accomplished to date has largely taken for granted the benefits of within firm transfer of tacit knowledge. Up to now, little effort has been put forward towards measuring the impact of tacit knowledge transfer on performance.

The descriptive richness and variety of the contributions have resulted in a list of considerations, focusing on distinctly unrelated factors, whose impact on the transfer of tacit knowledge has been assumed to be obvious. This study helped to fill this gap by generating empirical evidence relative to the process of within firm mobilization of tacit knowledge and its impact on performance improvement.

The present study contributes to the literature on the emergent knowledge-based view of the firm and knowledge management. The knowledge-based view focuses on the creation, integration, use and protection of knowledge by firms, thereby advancing understanding of the economic influence of knowledge on firms (Spender, 1996). While the effort to advance a knowledge-based view of the firm provides a theoretical contribution toward the management of knowledge, it too is plagued by existing difficulties in measuring transfer of tacit knowledge (Bloodgood, 1997). This study contributes to learning organization theory. The contribution of the seven dimensions of the learning organization to the creation of an environment conducive to the transfer of unarticulated knowledge will be examined. Implications will be drawn that might be adopted and used by practitioners or adult education researchers devoted to the study and/or implementation of learning organizations.

This study provides adult educators and human resource developers with empirical data on which learning organization characteristics most impact on the process of transfer of tacit knowledge, knowledge performance, and financial performance. This data could be used to create organizational systems, programs, and/or interventions aimed at the optimization of the effects of these dimensions or action imperatives in order to maximize the benefits of the transfer of tacit knowledge.
Methodology

For the purpose of this study, learning organization environment, tacit knowledge transfer and performance improvement were viewed as latent variables. A latent variable is a construct or hypothetical “entity.” They are unobserved variables whose “reality” we assume or infer from observed variables or indicators (Kerlinger, 1986). Latent variables are not directly measurable, although they can be indirectly identified by a set of measurable indicators. The latent variable “Learning Organization Environment” was identified on the basis of seven indicators or dimensions: continuous learning, empowerment, team learning, embedded systems, systems connections, dialogue and inquiry, and providing leadership. The latent variable “Tacit Knowledge Transfer” was identified on the basis of two indicators: the level of knowledge dissemination and the extent of knowledge documentation. “Performance Improvement” was identified on the basis of two indicators: the levels of knowledge performance and financial performance. The seven dimensions of the learning organization, that is to say the degree to which each dimension has been addressed in the firm, were considered the independent variables which foster the necessary environment for transfer of tacit knowledge to occur.

Instrumentation

The initial data collection instrument for this study was a survey composed of six parts: items to measure the dimensions of the learning organization, items to measure dissemination and documentation of tacit knowledge, items to probe on organizational culture as an enabler of the process of transfer of tacit knowledge, items to probe tacit knowledge utilization, items to measure knowledge performance and items to gather demographic information. The items to measure the dimensions of the learning organization and knowledge performance were those that appear in the Dimensions of the Learning Organization Questionnaire (Watkins & Marsick, 1997). The items to measure the level of tacit knowledge dissemination and the extent of tacit knowledge documentation were adapted from Kogut and Zander, 1993; De Leo, 1994; the Knowledge Management Assessment Tool (O’Dell & Grayson, 1998); and the Learning Organization Profile (Marquardt, 1996).

The complete data collection instrument was translated, adapted, and validated so it could be used with Spanish-speaking populations (Hernandez, 2000). Pilot testing of the translation was completed through administration of the instrument to members of the intended audience in order to determine content and predictive validity and if items elicit the same response regardless of translation. The “organizational culture,” as an enabler of the process of transfer of tacit knowledge, and “tacit knowledge utilization” constructs were eliminated due to lack of divergent validity of the related items and due to the fact that they became irrelevant to the study as the study evolved.

Data Collection

A purposive, non-random sample was used. The target population was medium to large size private manufacturing corporations located in Bogotá, Colombia. To be included in the sample, a company would have to meet several criteria: it must be 1) private, 2) engaged in manufacturing operations, 3) medium to large size (number of employees was the only metric used to determine its size.), and 4) in operation at least 10 years.

Once the target population to be sampled was determined, the availability of a list of population elements from which a sample may be drawn was assessed. Worldwide or regional lists of manufacturers can be obtained from sources such as Bottin International. This source registers names and addresses of more than 300,000 firms in 100 countries, under 1,000 product classifications, by trade and by country.

In this particular study, two lists were used: a) The Latin American Companies Handbook, b) Latin America 25,000/Dun & Bradstreet’s key business directory. Thirty companies enlisted in both lists were selected and then information about the company itself was drawn. Initial contact with the company was by e-mail to the executive director, explaining the study and requesting authorization to survey employees at different levels within his/her organization. Eight companies agreed to be part of the study. Data collection was done on site. The final copy of the instrument was distributed and administered directly by the researcher and a total of 906 valid responses were properly collected. The interest in Colombia stems from the fact that Colombia is a member of the most important trading block of the region: the Andean Pact. It has also a literate and dependable work force, a robust private sector, competent macro-economic management, political stability, and a good record of economic development (World Bank, 1999).
Data Analysis

The data collected was entered and analyzed using the LISREL 8.30 statistical package (Jöreskog & Sörbom, 1999). The unit of analysis was the aggregate data collected from private manufacturing corporations located in Bogotá, Colombia.

The research question, to what extent is the process of tacit knowledge transfer impacted or influenced by the seven dimensions of the learning organization and to what extent does this process in turn impact or influence performance improvement as depicted in the conceptual model? called for structural equation modeling (SEM). Various strategies may be employed in empirical applications of structural equation models: strictly confirmatory, model generation, and model comparison (Jöreskog, 1993). The model generation strategy was used in answering this question.

In the structural equation model shown in Figure 1, the latent construct LOE is identified by \( \theta_1 \) on the basis of seven indicators: \( Y_1 \) (CONTLEAR), \( Y_2 \) (DIALINQU), \( Y_3 \) (TEAMLEAR), \( Y_4 \) (EMBEDDED), \( Y_5 \) (EMPOWERM), \( Y_6 \) (SYSCONNE), and \( Y_7 \) (FROLEADE). The latent construct TKT is identified by \( \theta_2 \) on the basis of two indicators: \( Y_8 \) (DOCUMENT) and \( Y_9 \) (DISSEMIN). The latent construct PI is identified by \( \theta_3 \) on the basis of two indicators: \( Y_{10} \) (KPERFORM) and \( Y_{11} \) (FPERFORM). The structural relationship coefficients or directional 'influence' linkages are identified by the Greek letter “beta” (\( \beta \)). Namely, \( \beta_{12} \) (influence of \( \theta_1 \) on \( \theta_2 \)), \( \beta_{23} \) (influence of \( \theta_2 \) on \( \theta_3 \)), and although not implied conceptually \( \beta_{13} \) (influence of \( \theta_1 \) on \( \theta_3 \)).

The structural relationship coefficients, their significance and their magnitude provided an important criterion for model evaluation, termed the plausibility criterion, referring to a judgment made about the theoretical argument underlying the specified model (Saris & Sönderkamp, 1984). According to this criterion the decision regarding the correct model should also be based on the theoretical correctness of the model demonstrated by its structural relationships. There has to be some balance between the fit indices and the theoretical predictions regarding the relationships among research variables. The accuracy of the theoretical predictions was tested by the structural relationships in the model shown in Figure 1.

The factor loadings linking latent constructs to indicators are marked with the Greek letter “lambda” (\( \lambda \)). Factor loadings for the indicators of the LOE are identified by \( \lambda_{11}, \lambda_{12}, \lambda_{13}, \lambda_{14}, \lambda_{15}, \lambda_{16}, \lambda_{17} \); for the indicators of TKT are identified by \( \lambda_{28} \) and \( \lambda_{29} \); for the indicators of PI are identified by \( \lambda_{101} \) and \( \lambda_{111} \). Statistical significance of factor loadings was judged on the following t-test criterion: \( |t| \geq 2.00 \) (Jöreskog & Sörbom, 1996: 103).

Results

Factor loadings were analyzed in order to assess statistical significance by their t-value \( (|t| \geq 2.00 \Rightarrow \) statistically significant), and to ascertain their actual contributions to their respective latent construct. The maximum value they could have is 1 due to the fact that they are derived from a correlation matrix. Their value were relatively high and homogeneous with the exception of the factor loading for financial performance (FPERFORM).

In order to investigate if there was any direct structural relationship between LOE (\( \eta_1 \)) and PI (\( \eta_3 \)) an “influence” path (\( \beta_{13} \)) not implied in the original conceptual model was included (see Figure 1).

As can be seen in Table 2, the t-values for the structural coefficients \( \beta_{21} (20.34) \) and \( \beta_{32} (4.09) \) are greater than 2 and positive. Thus, these coefficients are conceptually attuned to the model and statistically significant. In the case of the coefficient \( \beta_{31} (-0.69) \), two observations were made. First, the inferences that could be drawn from its negative sign are conceptually inadmissible, and second \( |t| < 2 \), rendering this coefficient statistically insignificant. Therefore, it was unbiased to say that there was not a direct structural relationship between the LOE and PI, and that any indirect influence was mediated by TTK.

Goodness of fit statistics were analyzed and the model was refined until the Bentler-Bonett normed fit index (NFI), Bentler-Bonett non-normed fit index (NNFI), the comparative fit index (CFI), the relative fit index (RFI ), the root mean square error of approximation (RMSA) indicated a 'very good' fit.

Conclusions

The results suggest that the impact of the dimensions of the learning organization on knowledge performance is mediated by the tacit knowledge transfer process. Linear structural relations analysis revealed the significance of the dimensions ‘empowerment’ and ‘provide leadership’ in the implementation of a learning organization. Financial performance was found to structurally load poorly on the latent variable PI (performance improvement), suggesting
the need for a richer conceptualization of this factor or for the development and inclusion of other indicators of performance improvement.

The conceptual model presented here makes a valuable contribution to the effort to move Learning Organization research forward by incorporating transfer of tacit knowledge as one of the many possible mediators of the relationship between the dimensions of the learning organization and performance improvement. In addition, the findings are also expected to enhance and deepen the understanding of issues relating to LOE, TKT, and PI in organizations, which are useful to building theory in learning organization and knowledge management studies. Finally, it is hoped that this study will encourage or at least arouse interest in future research in similar areas, as more research on these subjects is necessary, especially in Latin America.

The Relationship between Distance Coaching and the Transfer of Training

Libin Wang  
China Agricultural University  

Tim L. Wending  
University of Illinois at Urbana-Champaign

This paper examined the relationship between distance coaching, a post-training strategy, and the transfer of training. More specifically, the paper studied the relationship between (1) distance coaching activities and transfer of training, (2) trainees' perceptions on coaching and transfer of training, and (3) distance coaching activities and trainees' perceptions on coaching.

Keywords: Transfer of Training, Distance Coaching

Global competition, technological advancement, and transformation of the traditional workplace are raising the pressures to improve performance in all types of organizational settings (Broad, 1997). Training is one of the most frequently employed human resource development (HRD) strategies to improve employee and organizational performance. However, a series of studies indicated that less than 15 percent of what people learn in training actually transfers to the job in a way that enhances performance (Baldwin & Ford, 1988; Broad & Newstrom, 1992).

Statement of the Problem

"The transfer of learned knowledge and skills from instructional programs remains a paramount concern for training researchers and practitioners" (Burke, 1997, p. 115). Since the desired outcome of training is performance improvement, no matter how good the training program is, it is inadequate if it does not produce significant new behaviors in the workplace (Leifer & Newstrom, 1980). It is recognized that the period after training seems to be the most crucial for facilitating transfer, several authors suggest that post-training interventions need to be explored (Baldwin & Ford, 1988). However, rigorous empirical investigation in this area remains scant (Burke, 1997).

Coaching is being increasingly exploited as a post-training strategy to enhance transfer (Olivero, Bane, & Kopelman, 1997). Coaching is an ongoing, follow-up process designed to help the trainees effectively apply knowledge and skills learned in training and overcome the barriers to improve performance (Lawson, 1997; Joyce & Showers, 1982). However, practitioners' assertions on coaching, “backed by scant research-need to be empirically tested: does coaching significantly enhance the application of trained skills?” (Miller, 1989, p.2). The development of Internet-based technologies has provided a solution to the problem of limited post-training contact to support transfer of training (Johnson, Wending, & Wadsworth, 1999), but too little is known about using Internet effectively for educational purposes (Locatis & Weisberg, 1997). There is a need to study if coaching strategies can be employed effectively with the aid of communication technologies.

Research Question

This study was guided by the following research questions:
1. What is the relationship between coaching activities and the transfer of training?
2. What is the relationship between perceived coaching success and the transfer of training?
3. What is the relationship between coaching activities and perceived coaching success?
4. What communication technologies were used?

Theoretical Framework

Transfer of Training

Since 1980’s, transfer of training theories emerged to highlight the interaction among the trainee
characteristics and the work environment as the primary source of influence on transfer of training (Baldwin & Ford, 1988; Broad & Newstrom, 1992). Some trainee characteristics thought to affect transfer have been suggested in the literature: motivation, self-efficacy, and self-expectancy. Motivation to transfer can be described as "the trainees' desire to use the knowledge and skills mastered in the training program on the job" (Noe, 1986, p. 743). Self-efficacy refers to an individual's judgment on "how well one can execute courses of action required to deal with prospective situations" (Bandura, 1982, p. 122). Expectancy theory proposes that people interact proactively with their environments based on their expectancies about the likelihood of the desired outcomes (Howard, 1989).

Work environment factors that affect transfer can be classified into three categories: organizational climate, social support, and task support. Organizational climate is generally defined as the perceived structures, values, systems, and qualities of a particular organization (Jones & James, 1979). The primary sources of social support are management/supervisors, work groups, and trainers. The existing literature does not place sufficient emphasis on trainers' roles in transfer following the training. Broad and Newstrom (1992) recognized the transfer responsibility of trainers has not always been recognized or fully accepted. Peters and O'Connor (1980) described task support as the availability of job-related information, tools, materials, and required services and help from others.

The traditional transfer strategies are not sufficient for achieving substantial positive transfer because they focus only on the period of acquisition of skills within a training process. The recent literature has focused primarily on the period after training as the crucial time to facilitate positive transfer (Michalak, 1981). Many post-training strategies have been suggested in the literature. The main purpose of these strategies is to build a facilitating transfer climate through forming a support group or buddy system to support transfer. Specifically, these strategies attempt to help trainees clarify the expectations and goals for transfer, provide feedback, provide social, emotional, and task support, and thus increase trainees' motivation and self-efficacy to transfer (Broad & Newstrom, 1992).

Coaching

Coaching practices are common in the field of athletics, management, and education. Rackham (1979) cited evidence that most skill training is wasted without management coaching to sustain the newly acquired skills. Michalak (1981) found that coaching activities by managers are essential to the transfer and application of skills learned in the classroom to the work situation. Joyce andShowers (1980) recommended that future research with an emphasis on the effects of coaching for application of training was needed.

The literature review revealed that there are not universal coaching activities and processes. Even though the actual appearances of coaching procedures are different, the main coaching activities can be drawn from these points: (1) building an non-threatening environment, (2) identifying and analyzing performance gap, (3) setting performance expectation and goals, (4) formulating action plan to accomplish that goal, (5) providing constructive feedback, (6) providing resources, (7) providing psychological and emotional support, (8) problem-solving, and (9) observing and monitoring the progress to achieve the goal (Lawson, 1997; Olivero et al., 1997).

In summary, the main components of coaching are quite similar to the techniques of transfer strategies. The literature also indicated that coaching activities could enhance trainees' self-efficacy, self-awareness, and motivation to transfer (Joyce et al., 1980). Therefore, coaching appears to be a process consisting of a set of transfer techniques.

Methodology

This study was explorative and correlational in nature. In order to measure research variables and assess their relationships, this study used both quantitative and qualitative approaches to collect and analyze data. "As many of the phenomena we examine are amorphous or difficult to measure directly, these phenomena will require multiple measures to adequately assess the issue" (Worthern, et al., 1997, p.342). The demands of rigor in this study were addressed through employing multiple measures to present multiple perspectives from multiple information sources.

Population and Sample

The sample for this study was drawn from trainees of an international training program on "training of trainers." The training program was sponsored by the World Bank, Asian Institute of Technology, and Department of Human Resource Education at the University of Illinois at Urbana-Champaign. A total of 28 participants representing 18 different countries from 5 continents attended this training program. All program participants met in
Bangkok in June of 1998 to attend a three-week training course. Six collaborative peer learning groups (PLG) were established with each group consisting of 5-6 participants and an assigned coach. PLGs were created based on participants' fields of subject-matter and areas of interest. Each participant was required to develop a detailed action plan for the next distance coaching phase.

Distance coaching was conducted during July-December of 1998 after the training session. The Internet-based distance learning methods and facilities were established to facilitate and support participants to practice their newly acquired knowledge and skills and collaborate with his or her "virtual" learning group and online coach. Internet-based technologies used included e-mails, asynchronous WebBoard postings, and synchronous text chats.

The sample of this study was the 28 participants who completed the ITQ program. All 28 participants are senior or master trainers in their respective institutions and have training-related experiences. About 93% of them have at least bachelor degrees. Twenty-three of the 28 participants were from Asia, and the rest are from Europe, South America, and Africa. All the six coaches possess doctorate degrees, hold faculty positions in universities. Three of the coaches were from the United States, one from Thailand, one from Malaysia, and one from Australia.

**Instrumentation**

Four instruments were developed to collect data for this study: (1) Transfer Assessment Report (TAR), (2) Questionnaire on Transfer of Training, (3) Codes of Coaching Activities, and (4) Online Questionnaire on Perceived Coaching Success. These instruments were used to measure the three research variables: transfer of training, coaching activities, and perceived coaching success. The researcher decided to use Ford’s et al.’s (1992) and Quinones et al.’s (1995) approaches to measure transfer of training in three dimensions because their model corresponded to what this researcher wanted to know about the transfer in this study. These three dimensions are: (a) breadth of transfer: the number of distinctive trained tasks are performed; (b) Frequency of Transfer: the number of times trained tasks are performed; and (c) difficulty of Transfer: complexity or difficulty level of performed tasks.

Each participant was given a guideline for writing the TARs. The purpose of the TAR was to guide the participants to reflect and document the tangible transfer outputs and evidences. The questionnaire on transfer of training, complementing the TAR, measured three dimensions of transfer. First, the researcher developed a transfer list for each participant based on his or her TAR. This list specified what knowledge and skill element was transferred. Second, each participant was asked to rate how frequently he or she applied each knowledge/skill element on the transfer list on a scale from 1 to 5, with 1 being “never” and 5 being “always.” Third, the participant was asked to rate the perceived difficulty level for each applied knowledge/skill element on the transfer list on a scale from 1 to 5: with 1 being “very easy” and 5 being “very difficult.”

In order to analyze and count coaching activities from communication logs, ten predetermined codes on coaching activities were generated from review of literature by the researcher. The ten codes were: (1) defining performance expectations, (2) defining coaching topics, (3) scheduling coaching sessions, (4) building relationships with participants, (5) providing resources to participants, (6) providing feedback to participants, (7) facilitating problem-solving, (8) developing the action plan, (9) addressing participant concerns, and (10) monitoring progress.

The purpose of the online questionnaire on perceived coaching success was to obtain participants' perceptions of the distance coaching process. Through an extensive literature review, the researcher identified 10 major factors contributing to successful coaching: (1) preparation for coaching, (2) goal-setting, (3) interaction with coach (4) relationships with coach, (5) feedback from coach, (6) resources from coach, (7) concerns from coach, (8) encouragement from coach, (9) disciplining coaching process, and (10) monitoring progress. A 39-item questionnaire was developed to address these factors on a five-point Likert scale (from “strongly disagree” to “strongly agree”).

**Data Collection and Analysis**

Due to incompleteness of data, one PLG with three participants was dropped for further study. Three types of communication logs reflecting the interaction between the coach and participants were chosen for content analysis in this study: group asynchronous WebBoard postings, e-mails between coaches and participants, and group synchronous text chats. These communication logs occurred during distance coaching phase from June-December of 1998 were captured electronically and printed. The transfer assessment reports of participants were obtained from the principal coach in April of 1999 after getting permission from the participants. The questionnaires on transfer of training were sent through e-mail attachments and the questionnaire on perceived coaching success was put in a Website. After multiple follow-ups, 20 out of 25 participants responded, giving a response rate of 80%.
The sum of distinctive knowledge/skill elements on the transfer list created from the TAR was the measurement of breadth of transfer. The mean of ratings on frequency was the measurement of frequency of transfer. The mean of ratings on difficulty was the measurement of difficulty of transfer. To be able to combine the results on all three dimensions and measure the overall transfer, the result on each dimension was calculated z-score, and the sum of the three z-scores was the result of the overall transfer.

The communication logs occurred during distance coaching phase were subject to content analyses for coaching activities with the ten pre-determined codes. An adapted form of the Contact Summary Form suggested by Miles and Huberman (1994) was used in coding qualitative data. Sentences or paragraphs in communication messages were the primary units of coding. After coding, each code was assigned to each participant who was involved in this communication. Finally, the frequency of each code for each participant was summed.

Factor analysis and reliability analysis was conducted for instrument on perceived coaching success. Then the mean for each success factor was calculated. The average rating of the ten factors is the measurement of the overall coaching success. Bivariate correlations and stepwise multiple regressions were the primary methods used to assess the relationships among the three research variables: transfer of training, coaching activities, and perceived coaching success.

Results and Conclusions

Relationship Between Coaching Activities and Transfer of Training

The results of this study indicated that the following five of 10 coaching activities had significant relationships with the transfer of training:

1. Providing Resources. This study finds that the coaching activity providing resources had a significant positive relationship with breadth of transfer ($r=0.50$, $p<0.05$) and explained about 25% of variance in breadth of transfer. Throughout this study, providing resources included coaches’ activities to give participants information, suggestions, materials, and express willingness to offer help and consultation. This finding is consistent with task support required for transfer in the transfer literature. Employees who do not have the resources (i.e., time, materials, information) to complete work assignments successfully become frustrated and are not productive during the work day (Peters & O’Connor, 1980), nor developing or practicing ways to apply new knowledge or skills (Kehrkahn, 1995). Often expressions of support have been found to be helpful as well (Stowell, 1987).

2. Building Relationships. It was also found in this study that coaching activity building relationships had a significant positive relationship with difficulty of transfer ($r=0.45$, $p<0.05$) and overall transfer ($r=0.46$, $p<0.05$) and explained 21% of the variance in the overall transfer. Activities of building relationships in this study included: exchanging good wishes, expressing interests and concerns about each other’s family members, holidays, trips, job changes, and making jokes. Lawler (1973) suggested that affiliation or social interaction and identification with a social group is one of the extrinsic factors that inspire people in work organizations to perform. Building relationships may have enhanced participants’ motivation to transfer through strengthening participants’ association and interaction with their coaches.

3. Problem-Solving. This study reveals that coaching activity problem-solving had positive relationship with breadth of transfer ($r=0.50$, $p<0.05$) and negative relationship with difficulty of transfer ($r=-0.58$, $p<0.05$). In this study, communication technologies were the vehicles that allowed the delivery of coaching activities. Therefore, helping the participants to solve technical problems to encourage technology use and sustain enthusiasm to transfer became important. On the other hand, the coach and the participant spent time problem-solving might be indicative of more time participants encountered technical problems. Frequent encountering of technical hardship may block the transmission of coaching activities to facilitate transfer of training and lead to decreased participant motivation to try more challenging tasks.

4. Defining Expectations. Stepwise multiple regression revealed that the more the coaches expressed their expectations to expect participants to make progress toward work plans and preparation for the next evaluation phase, the less difficult tasks the participants tried. These activities which periodically communicated expectations were actually a kind of reminding and monitoring activity that held participants accountable for their progress. Research conducted over the past few years indicates that accountability can result in performance improvements (Schlenker, 1986). However, intensified information processing associated with accountability does not always guarantee improved performance. In fact, intensive information processing that induces high stress and anxiety lead to reduction in performance (Schlenker & Leary, 1985). In transfer literature, outcome expectations of individuals are known to have an effect on their behaviors. For instance, people with low outcome expectations tend to
procrastinate potentially difficult tasks, work less hard on them, easily abandon the tasks when encountering obstacles, and attribute low abilities instead of efforts to keeping them from succeeding (Bandura, 1977). Schlenker and Leary (1985) proposed that outcome expectations will be lowered when: (a) audiences are perceived to be more demanding, less supportive, and more evaluative, (b) situations are more demanding, difficult, evaluative, or ambiguous, and (c) an actor’s self-perceived skills and resources to the task are lower.

In this study, the more the coaches expressed their expectations, the more the participants may have perceived their coaches to be demanding or evaluative. If this perception is accompanied by insufficient support from the coaches, constraints from participants’ work environment, tough tasks, or low individual abilities, coaches’ expectations may discourage participants to try more difficult tasks.

5. **Scheduling Coaching.** Stepwise multiple regression revealed that, as a predictor, coaching activity scheduling coaching was negatively associated with breadth of transfer and with difficulty of transfer. Scheduling coaching in this study were coaches and participants’ activities regarding the scheduling of synchronous chats. This may imply that some coaches had difficulties to organize the chats with their groups due to low group cohesion. This may also mean some coaches were more democratic in scheduling coaching and took extra effort to have everyone’s input in scheduling. Therefore, effective ways to schedule coaching with groups of people from different countries with different states of technology and time zones needed to be given more consideration.

### Relationship Between Perceived Coaching Success and Transfer of Training

This study measured participants’ perceptions on ten factors that are critical for the success of coaching, the results indicated that five of the ten factors had significant relationships with the transfer of training.

1. **Preparation for Coaching.** This study concludes that the participants’ perceptions of how well the coach prepared for coaching had a significant positive relationship with breadth of transfer (r=0.51, p<0.05) and with overall transfer (r=0.68, p<0.05), and explained about 26% variance in breadth of transfer and about 46% of variance in overall transfer. Perceived preparation for coaching in this study measured the extent to which the participants perceived that the coach prepared well for the coaching, carefully reviewed the documents that have been submitted, and knew the issues for coaching. This finding confirms Stowell’s (1987) study on effective coaching: one of the most striking findings from their interviews with coaches and employees was the amount of emphasis given to planning and preparation prior to the coaching discussion. Employees appeared to easily pick up the level of preparation of their coaches. Therefore, this finding suggests that a well-prepared, well-structured, and purposeful coaching have importance for transfer of training.

2. **Interaction with Coach.** This study also reveals that perceived interaction with coach was positively related to frequency of transfer (r=0.72, p<0.01) and overall transfer (r=0.50, p<0.05). Perceived interaction with coach explained about 52% of the variance in frequency of transfer. Perceived interaction with coach in this study measured to what extent both coaches and participants brought their experiences, expertise, ideas, and needs to the coaching process. This finding is consistent with Huczynski and Lewis’s (1980) description of a supportive supervisor required in a favorable environment for transfer. This supervisor should be one who is open to suggestions, listens to new ideas, and allows use of new methods. This finding suggests that if participants are given more opportunities to have their contributions and inputs to the coaching process, they may have higher transfer performance.

3. **Relationships with Coach.** A significant positive relationship between perceived relationships with coach and frequency of transfer was also found in this study (r=0.66, p<0.01). Perceived relationships with coach in this study measured to what extent the coach and the participant had mutual respect, trust, and feeling of freedom to express themselves. This finding confirms the literature which shows that trainees attempting transfer need emotional support that make them feel secure, respected, loved, and admired (Jacobson, 1986). Tracy, Tannenbaum, and Kavanaugh (1995) pointed out social interactions and work relationships is one component of continuous learning environment in which transfer of training will be enhanced.

4. **Encouragement from Coach.** This study indicates that there was a significant, positive relationship between the perceived encouragement from coach and overall transfer (r=0.55, p<0.05). Perceived encouragement from coach measured to what extent the participant felt that the coach was optimistic about the participant’s abilities to succeed and recognized participant’s achievement and success. The positive correlation is consistent with the literature highlighting that trainees’ perceptions of supervisory and co-worker encouragement is a component of social support constituting environment favorability (Kehrhahn, 1995). Noe (1986) suggested that intention to transfer will be positively affected if interventions enhance confidence in learners’ abilities to use the new skills.
5. Monitoring Progress. Stepwise multiple regression reveals that as a predictor factor, perceived monitoring progress was negatively associated with the frequency of transfer. In this study, monitoring progress measured to what extent the coach maintained contact with the participants regarding the progress made toward planned activities. Monitoring progress was also a kind of activity to hold participants accountable for their work plans and the next phase for evaluations. This may lead to lower outcome expectations due to associated stress and anxiety, and thus decreased performance level.

Relationship Between Coaching Activities and Perceived Coaching Success

Coaching activities defining expectations and defining coaching topics had significant, negative relationships with a series of perceptions of participants about the coach and the coaching including: (a) preparation for coaching, (b) concerns from coach, (c) encouragement from coach, and (d) the overall coaching success. Review of communication logs indicated that defining coaching topics were primarily coaches’ activities to set the agenda for synchronous chats. Generally, there were two themes within the agenda: reporting the progress of the work plan and preparing for the evaluation meeting at Bangkok. Therefore, defining coaching topics, similar to defining expectations, was also a type of “evaluative” activity, which may be interpreted by participants to be more demanding, less considerate, and less encouraging. This finding is consistent with the effect of accountability and low outcome expectations which were discussed in the section on “Relationship Between Coaching Activities and Transfer of Training.” Similarly, coaching activities defining coaching topics, monitoring progress, together with scheduling coaching, were each significantly, negatively related to perceived feedback from coach. These evaluative, demanding activities may place pressures on participants instead of providing supportive feedback for future improvements.

The coaching activity addressing participants concerns had significant, positive relationship with perceived relationships with the coach. Addressing concerns in this study were coaching activities such as addressing participants’ concerns and difficulties in a sympathetic and understanding way. In Ennis et al’s (1989) study on characteristics of an effective learning environment, they described communication in effective learning environments as communications that are “empathetic” and “concerned.” These types of communications help establish the atmosphere of consideration, which is an important component of social support (Noe, 1986). This finding suggests that showing considerations to participants in words is one way for them to perceive a better relationship with the coach.

Use of Communication Technologies

This study revealed that synchronous chats carried the majority of coaching activities (about 40%), while e-mails carried about 31% and asynchronous WebBoard postings carried about 29%. Providing resources, building relationships, and scheduling coaching were the major types of coaching activities (23%, 21%, and 15%, respectively). Synchronous chats carried the majority of coaching activities of building relationships (56%) and providing resources (52%). This suggests that participants may prefer immediate interactions with the coach toward building relationships and seeking resources.

Conclusion

This study concluded that both actual coaching activities that occurred and participants’ perceptions about the coaching had significant relationships with the transfer of training. This study added support to the existing body of knowledge that providing social support and task support to trainees can improve transfer of training. The following supportive coaching activities and skills can facilitate transfer of training: building relationships with training participants, providing resources, giving encouragement, communicating interactively, solving problems, and well preparing for coaching. These activities can help participants be more active in seeking the coach’s support in various forms and enhance participants’ motivation to transfer. Some evaluative or demanding coaching activities and skills should be used with caution such as monitoring progress and defining coaches’ expectations. These activities intended for improving performance may induce pressures and anxieties and thus lower performance.

It was thought that coaching activity providing feedback to participants should have an important effect on transfer of training though this study did not confirm this assumption. The effect of feedback is influenced by situational and personal factors such as: (a) attributes of the supervisors, (b) attributes of individuals receiving the feedback, and (c) the message itself (Ashford & Cummings, 1983). In this study, since the feedback about transfer
effort was given by external HRD professionals, the effect of feedback on transfer of training may be not as powerful as the feedback given by participants’ immediate supervisors or managers.

**Implications**

Since the components of online coaching were identified from non-distance coaching literature, the researcher of this study suggests that the implications of this study can be generalized to coaching in non-distance settings. However, this study has a small sample size, which may limit its capacity to be generalized to a large group of people. It will be beneficial to conduct a similar research with a larger sample size and with different types of organizations in order to create the results that can be generalized to other settings.

**Implications for HRD Practitioners**

The existing literature focuses on sources of social and task support from the trainees’ work environment, especially trainees’ managers, supervisors, and co-workers. The findings generated from this research evidenced that the social and task support provided by HRD professionals could also enhance transfer of training. These support activities may be important for trainees’ transfer attempt especially in the absence of organizational and management support. Therefore, HRD practitioners should take a more active role in facilitating transfer of training through coaching during the post-training period. Building a post-training support system is important to be incorporated as a component of the training program.

Based on the results related to the effectiveness of each coaching activity and perception on coaching, HRD practitioners should equip themselves with supportive coaching skills and carefully examine the effects of those evaluative coaching activities in an ongoing effort to improve individual performance.

HRD practitioners should be able to communicate with business managers that they can help trainees transfer what they learned into on-the-job performance. HRD practitioners can teach and train corporate management on how to better build a supportive environment for transfer of training and effective coaching, and how to act as good coaches to help trainees transfer their training. HRD practitioners can also build a joint coaching relationship with trainees’ managers and practice the most effective ways to share the coaching activities.

HRD practitioners should continue to explore the potentials of technologies for supporting transfer of training.

**Implications for HRD Educators**

HRD educators should revise the curriculum to incorporate transfer of training as an important component. HRD educators should prepare students with the understandings, capacities, and techniques necessary to develop and implement post-training interventions to enhance transfer. HRD educators should educate students to take a comprehensive view on transfer of training and consider three factors: work environment, trainee characteristics, and instructional design.

**Implications for HRD Researchers**

HRD researchers should continuously explore the post-training interventions such as coaching strategies that may be employed by HRD professionals to facilitate transfer of training.

HRD researchers should examine the influences of trainees’ work environment and trainee characteristics on the effectiveness of coaching. Numerous transfer studies have confirmed that work environment and trainee characteristics factors have influences on transfer of training. It might be beneficial to examine if coaching can cope with or neutralize some of the negative environment factors, which environment factors can limit the effectiveness of coaching, and how to take trainee characteristics into account wisely when implementing coaching strategies.

HRD researchers should also compare the effectiveness of face-to-face coaching with that of distance coaching. The use of technologies in training and education settings is still a new phenomenon and the impact of technologies on communication requires further study. A comparative study between face-to-face coaching and distance coaching may lead to an insightful understanding on the advantages and disadvantages of distance coaching, so that HRD professionals can make informed decisions when implementing distance coaching.

Louisiana State University

Neal Chaloftsky
The George Washington University

Three fundamental perspectives dominate the debate about what the goals of HRD should be – the learning, performance and spirituality of work perspectives. This paper describes an effort to articulate the tensions between these perspectives, clarify their underlying values, and examine how seemingly discordant values can be integrated into a unified conception of HRD. As a result, a new statement of purpose for HRD is presented that the authors believe reflects the underlying synergy of these perspectives.

Keywords: Human Resource Development, HRD Purpose, HRD Goals

HRD has been called a field in search of itself (Watkins, 1990) and a good deal of literature has emerged in the last five or more years aimed at describing what is or should be the purpose of HRD. In general, this literature approaches the definition of purpose from at least three different perspectives that can be characterized as the learning, performance, and spirituality of work perspectives. The debate among these different perspectives has at times been heated, has generated little consensus, and has done little to move the field forward in terms of a philosophy of purpose. It is, as Ruona and Lynham (1999, p. 215) have pointed out, a conversation having us – that is, a conversation that is ongoing and becomes the prominent focus such that little else actually happens except the having of the conversation. Very few new thoughts are generated, positions are defended, tradition weighs heavy, and very little progress is made in understanding and creating new meaning.

This paper reports on a journey undertaken by a small group of HRD scholars and practitioners to analyze the tension and gulf between these perspectives. The context was the joint Pre-conference on Integrity and Performance in HRD at the 2000 Academy of Human Resource Development international conference held in Raleigh, North Carolina. Our goal in this preconference was to clarify the fundamental values about what HRD should be and to explore if and how these values could be woven together. Our efforts led us to articulate a new statement of purpose for HRD that we believe reflects the synergy of the learning, performance, and spirituality of work perspectives:

The purpose of HRD is to enhance learning, human potential, and high performance in work-related systems.

The impetus for this effort came out of a concern shared by the participants and articulated elsewhere that the apparent disparity in perspectives and values could threaten HRD’s contributions and, ultimately, its sustainability and the sustainability of organizations, society and the ecosystem (Hatcher, 1999; Ruona, 2000). Although our goal was to find a common ground that celebrates the diversity of values in our field, our intent was not to be reductionist or to delimit the field through rigorous definition. Nor do we suggest the statement of purpose presented here represents a finished end product. We believe, however, that the new statement of purpose provides a starting point for discovering the unity in our field. We hope that this effort represents what will be an ongoing process of reflecting on, clarifying, and articulating a meaningful and sustainable philosophy of HRD.
Historical Context

The Academy of Human Resource Development has offered pre-conferences as part of its annual international 
research conference since 1997. These pre-conferences are designed to provide a venue for dialogue and discussion 
of contemporary research and practice issues facing HRD scholars and practitioners. They also provide professional 
development opportunities for HRD scholars and practitioners.

The Performance Pre-conference had customarily focused on theory, definition, research, and application 
of performance improvement. However, one of the themes of the 1999 Performance pre-conference became a 
discussion of the “tension” between two perspectives in HRD, the holistic learning and performance perspectives.

Since its inception the Integrity Pre-conference has addressed issues surrounding spirituality, meaning in 
work, how individuals conceptualize the meaning of work, and how these concepts influence learning. In 1999 the 
pre-conference’s focus was on the role of spirituality in work and it manifestation in work environments and work-
related learning, and how these non-instrumental, non-secular issues influence HRD research and practice.

Early planning phases for both of the 2000 AHRD Performance and Integrity pre-conferences focused on 
evolution, the next iteration of discussions, themes, and evaluations, which emerged from the 1999 pre-conferences. 
As the pre-conference chairs developed strategies for the 2000 conference, it became obvious that conceptually the 
groups were converging. Consequently, the Performance and Integrity pre-conferences were merged in 2000 and 
conducted as a Joint Session of the AHRD Pre-conference on Integrity & Performance in HRD.

The Three Perspectives

To fully appreciate the diversity of views about the purposes of HRD a brief sketch of three fundamental 
philosophical perspectives of HRD are presented. The purpose of these sketches is to give readers a richer context 
for understanding what drove the pre-conference session and the significance of its outcomes.

The Spirituality of Work Perspective. The concept of spirituality at work is multidimensional, 
transformational, and is expressed through one’s ability to find meaning in everyday life and the capacity to create a 
meaningful world (Chalofsky, 2000; Neck & Milliman, 1994). Spirituality is a very personal thing concerned with 
making meaning of one’s reality and finding significance in that meaning. It is a function of all life experience, 
including work, and has been described as “a reaffirmation of self [that is] characterized by a contextual awareness 
of oneself as one journeys inward to discover the self” (Chalofsky, 2000, p. 97). Spirituality emphasizes inner 
growth that is realized through the interaction of self, context, and life experiences. The growth can become 
transformational in that it empowers individuals to take an active and creative role in shaping the world in which 
they live and work.

This perspective emphasizes a holistic approach to the human development and the development of 
organizations that is reflected in two fundamental elements. First, it recognizes the need to develop the whole 
person (Dirks, 1996). It is concerned not only with individual cognitive development but also emotional, moral, 
ethical, creative and relational development. It is focused on development that will enable individuals to realize 
their full potential in a meaningful way, and is concerned with issues surrounding meaning of work, how individuals 
experience work, and how they make meaning out of that experience. Dirks and Deems (1996), for example, call 
for an ecological approach to work, one that “bridge[s] the gulf between the psychological and the organizational, to 
see the needs of the individual and the workplace as a continuum, to understand the ‘inner life’ as intimately and 
deeplly connected to and embedded within an outer life” (p. 276). Because of HRD’s expertise and compassion to 
address skills and quality of life issues, both of which are critical for organizational success, this perspective stresses 
that one of HRD’s key functions is to help organizations move toward a more ‘human’ relationship with their 
personnel.

Second, the spirituality of work perspective sees work as having a transcendent element that goes beyond 
individual and organizational boundaries. This view is grounded in the notion of interconnectedness, a systems 
perspective that sees the world as a complex of parts braided together into a unified whole (Capra, 1996). The 
implication is that HRD values and goals should extend beyond issues of work objectives, tasks, structure, 
productivity, or performance to a concern for the health and humanness of our organizations, society, and the world 
as a whole (Hatcher, 2000; Hawley, 1993). For example, Rousseau & Arthur (1999) argue that organizations have a 
duty to contribute to both individual work expertise and quality of life. Hatcher & Brooks (2000) have noted a 
number of emerging economic, systems, and psychological theories that encourage us to “take responsibility for the 
world beyond our organization, and recognize that with each interaction we have and each action we take, we are 
co-constructing a new organization” (p. 9).
This perspective also finds expression in a developing discourse in the HRD literature surrounding issues of social responsibility (Hatcher, 1998; 2000) and sustainable human development (Bates, in press), although how the expression of these values can be managed in an organizational context is not yet resolved. Some suggest that, as architects of organizational performance systems and facilitators of human learning and development, HRD should embody these values and express them in organizations through a legitimate ‘check and balance’ role (McAndrew, 2000), or through development of strategies that reflect societal and ecosystem needs (Hatcher, 1998, 2000). Bates (in press) applies Burgoyne and Jackson’s (1997) ‘arena thesis’ and characterizes HRD as a mediator mechanism where value and goal conflicts between work systems and the requirements of sustainable human development are clarified, negotiated and resolved.

The Learning Perspective. Underlying the learning perspective is the fundamental belief that enhancing learning should be a primary goal of HRD, and organizations that adopt such a focus will have a more satisfied and productive workforce and will be more effective. This perspective emphasizes change through learning and sees HRD as “the field of study and practice responsible for fostering long-term, work-related learning capacity at the individual, group and organizational levels in organizations” (Watkins, 1989, p. 427). HRD is thus primarily concerned with “increasing the learning capacity of individuals, groups, collectives and organizations through the development and application of learning-based interventions for purpose of optimizing human and organizational growth and effectiveness” (Chalofsky, 1992, p. 179). Two fundamental focal points of the learning perspective are adult learning theory and research and development addressing the concepts of the learning organizations and organizational learning.

Adult learning is represented by a complex of theories, models, ideas, and principles, perhaps the most popular of which is embodied in a set of six core adult learning principles that Knowles (1990) labeled andragogy. Although it is generally agreed that adult learning plays an important role in HRD, there is a continuum of beliefs about how adult learning should be conceptualized. On one hand, some advocate that the real value of adult learning lies in its ability to contribute to individual development (Dirkx, 1996). Individual development, in turn, is framed to include not simply the accumulation of knowledge or skills, but the development of cognitive schemes and ways of thinking that can enlighten and transform personal experience (Barrie & Pace, 1998). In fact, in one of Knowles’s (1975) lesser-known works, Self-Directed Learning, he called for a definition of competency that included not only knowledge and skill, but also understanding, attitudes, and values. This view emphasizes the intrinsic value of learning over its instrumentality, does not limit adult learning in HRD to organizational contexts, and believes that the decisions about when and what learning occurs should reside primarily with individual learners (Hiemstra & Sisco, 1990). At the other extreme, there are those that posit that the worth of workplace adult learning can only be judged by the extent to which it contributes to the performance goals of the sponsoring organization (Swanson & Arnold, 1997). This view emphasizes organizational needs over those of the individual and believes that when individual and organizational needs are not wholly congruent, organizational needs take precedent. Van der Krogt (1998) discussed this tension as “learning systems as a tool for management” vs. “learning systems as a tool of personal development”.

As implied in the Watkins and Chalofsky definitions cited above, there is also a need to move to a broader, more transformative definition of workplace learning that allows for learning to be a critical part of organizational culture (Watkins and Marsick, 1993). Senge (1990) defined a learning organization as an organization that is continuously expanding its capacity to create its future and change in response to new realities. Learning is the driver of this capability and HRD is responsible for “facilitating or monitoring all types of learning in the workplace including formal, informal, and incidental learning” (Watkins & Marsick, 1992, p. 118). Learning organizations are those that have woven a continuous and enhanced capacity to learn, adapt and change into their culture. Here values, policies, practices, systems and structures are oriented toward supporting and accelerating the learning of all employees. This learning results in continuous performance improvement in areas such as work processes, products and services, the structure and function of individual jobs, teamwork, and effective management practices. Learning organizations view learning holistically and seek to develop individuals as competent, well informed, critical thinking adult learners who are continuously seeking to grow and be high performing (Bierema, 1996). Holistic, transformative learning leads to personal growth (intellectually, psychologically, spirituality, and morally), which then leads to high performance, workplace meaning & satisfaction, and organizational effectiveness.

The Performance Perspective. Holton (in press; 2000) has defined performance as accomplishing units of mission-related outcomes or outputs. A performance system is any system organized to accomplish a mission or purpose. It is important to note that the term performance system is used instead of organization. Performance systems are simply purposeful systems that have a specified mission. All organizations are performance systems, but some performance systems are not an organization. For example, a community could become a performance system
if it adopts a mission. Thus, the performance paradigm holds that the purpose of HRD is to advance the mission of the performance system, which sponsors the HRD efforts, by improving the capabilities of individuals working in the system and improving the systems in which they perform their work. Holton (2000) outlined eleven core theoretical assumptions of this perspective:

1. Performance systems must perform to survive and prosper, and individuals who work within them must perform if they wish to advance their careers and maintain employment or membership.
2. The ultimate purpose of HRD is to improve performance of the system in which it is embedded and which provides the resources to support it.
3. The primary outcome of HRD is not just learning, but also performance.
4. Human potential in organizations must be nurtured, respected and developed.
5. HRD must enhance current performance and build capacity for future performance effectiveness in order to create sustainable high performance.
6. HRD professionals have an ethical and moral obligation to insure that attaining organizational performance goals is not abusive to individual employees.
7. Training/learning activities cannot be separated from other parts of the performance system and are best bundled with other performance improvement interventions.
8. Effective performance and performance systems are rewarding to the individual and to the organization.
9. Whole systems performance improvement seeks to enhance the value of learning in an organization.
10. HRD must partner with functional departments to achieve performance goals.
11. The transfer of learning into job performance is of primary importance.

In addition, five myths about the performance perspective were identified:

1. Performance is behavioristic. The performance paradigm is not the same as behaviorism. The performance paradigm is most concerned that performance outcomes occur, but in no way should it be interpreted to restrict the strategies and interventions employed to behavioristic ones.
2. Performance is deterministic. Another mistaken belief is that the performance paradigm demands that outcomes of HRD interventions be pre-determined before the interventions. Performance advocates are just as comfortable as learning advocates with less certain outcomes, provided that outcomes do occur at some point.
3. Performance ignores individual learning and growth. The performance paradigm honors and promotes individual learning and growth just as much as a learning paradigm does. The key difference is that the performance paradigm expects that learning and growth will benefit the performance system in which it is embedded.
4. Performance is abusive to employees. There is little doubt that a performance approach to HRD can be abusive to employees, particularly when organizations use cost-cutting through downsizing as a substitute for sound performance improvement. However, this is a problem of implementation, not one that is inherent in the theoretical framework.
5. Performance is short-term focused. Once again, this is a problem of implementation, not theory. It is true that many organizations place too much emphasis on short-term results. However, most organizations have learned that focusing on short-term performance and not building capacity for long-term success does not work. There is nothing inherent in performance theory that says it must be short-term.

The performance perspective pushes HRD to grapple with two basic questions: Could HRD sponsored by a performance system survive if it did not result in improved performance for the system? Second, will it thrive if it does not contribute in a substantial way to the mission of the organization? Like all components of any system or organization, HRD must enhance the organization's effectiveness. The challenge is to consider how performance should be incorporated in HRD theory and practice, not if it should be.

The performance perspective maintains that HRD will only be perceived as having strategic value to the organization if it has the capability to connect the unique value of employee expertise with the strategic goals of the organization (Torraco & Swanson, 1995). Performance advocates see little chance that HRD will gain power and influence in organizations by ignoring the core performance outcomes that organizations wish to achieve. By being both human and performance advocates HRD stands to gain the most influence in the organizational system. If the field of HRD focuses only on learning or individuals, then it is likely to end up marginalized as a staff support group.

The Performance/Integrity Pre-conference

The goal of the pre-conference was to explore ways in which the apparent gaps between these seemingly disparate conceptual camps could be bridged. Early pre-conference planning discussions revealed that the debate over
appropriate goals and philosophy of HRD had created false dichotomies and extreme and passionate views consistent with what may appear at first glance to be fundamentally different and mutually exclusive orientations. It became clear that entering into a dialogue aimed at exploring the similarities and differences between these perspectives would enhance understanding of the tension and hopefully provide insights that would help integrate the field of HRD. A fundamental assumption was that integration was desirable and that working within the inherent tension between these perspectives was a positive rather than a negative issue. The tension stimulated thought and constructive action and should be embraced rather than viewed as something that needed to be “fixed”. With this in mind, the following pre-conference goals were articulated:

1. Clarify the nature of the three perspectives and the tension between them.
2. Investigate the implications of these perspectives for research and practice.
3. Explore the desirability and possibility of synthesis.

In the pre-conference session, groups crystallized around each of the three perspectives. The three groups were asked to “define” and/or describe their perspective as it related to the other perspectives and discuss how their perspective might be implemented within organizations. The “learning” group reported that learning in an organization is a paradigm shift that becomes the core value and can be viewed as a benefit. Learning is aligned with organizational culture, integrity of the individual, and with the ethics of the organization. Thus, the purpose of HRD is to create learning organizations conducive to integrity of the individual and ethics of the organization. The idea of learning/spirit must be conscience within the organization. To accomplish this we might develop conversational spaces that facilitates discourse on spirituality, learning, ethics, and integrity issues. These spaces might help executives see how the three perspectives are aligned and “buy-in” to the idea that all three are relevant and equally important within the organization.

The “performance” group said that a congruent relationship between spirit and performance results in pride in work, but there are problems with different “levels” of work requiring different pay levels. For example, how do you instill pride or meaning of work in a low pay, low prestige, or low value-added job? Thus, there is a relationship between the work done and meaning of work: the kind of work being done may create problems in linking spirituality/meaning of work and performance. To address this issue it may be possible to restructure work in ways that help the worker identify the inherent spirituality and meaning of the work. The group also the importance of an organizational culture that allows for all three perspectives, and described several challenges. The first was how to help management understand the value of the three perspectives and then how to get their support and assistance in creating or instilling them within the organization. Another related challenge was how the three perspectives are measured and how they might be linked to what is already important within an organization.

The performance group continually stressed the notion that performance can not be ignored in an organizational system. That is, every organization of every type has to perform, and measuring that performance is critical. For example, even churches routinely talk about performance metrics such as membership, persons assisted, money raised for certain ministries, and so on. They suggested that it would be unrealistic for HRD to not be concerned with performance. They also quickly acknowledged that performance can be misused in organizations and can become abusive to employees—but so can learning. Thus it is important to talk about the ethical use of performance, but not to discard the construct as part of HRD’s purpose.

The “spirituality” group developed a “performance-learning-meaning” model placing these three elements within a helix-like structure. As the meaningfulness of work increases so does learning and performance, thus all three are interdependent and mutually supportive. Parker Palmer’s ideas around expressive and instrumental work were discussed and it was noted that most work environments emphasize the latter over the former. This led to a discussion of the resistance to meaning in work within corporate environments, the “just tell me what to do” syndrome, and the extent to which HRD has a responsibility to the resistant worker to offer an alternative vision. That is, we have a moral obligation to act on our understanding of the value in finding meaning in work. Many people are conditioned by the systems in which they work so HRD must work on the system’s understanding of the meaning in work.

As practitioners, we must educate and enlighten at the individual level – how it influences the individual and the contextual level – how to advance the idea of spirit at work. To do this we need to identify what work means to us and understand that we can’t always act on our own value system; the “we shouldn’t but can’t afford not to work for this company anymore” dilemma. So, we need to find ways to protect ourselves and use spirituality at work as a means of self-discovery and enhancing self-worth.

Within training programs, if we subscribe to the ideas of human potential inherent in spirit and meaning what is the implication for our practice? How do HRD programs manifest these issues – how do we give people individual capacity to work on, to build on the tension between the three perspectives – and within our academic programs? As researchers, we need to do research in areas where this is working to identify how and what is going
on. We must also ask how do we begin to talk about spirituality at work at all levels? Finally, do we have a moral
obligation to do this and to move our organizations toward social responsibility?

After the three groups presented their thoughts an open discussion ensued with pertinent ideas documented
on flip charts and summarized as follows: The three perspectives were illustrated with each of the three perspectives
inside three interconnected circles; the area where the three intersect being where we should place our efforts. The
idea that we must establish “common ground” meant that we needed to work to bring the perspectives together and
begin to focus on their similarities and areas of convergence. Many participants expressed concerns that current
purposes and definitions of HRD would be insufficient to support the convergence and that we should focus on the
reformulation of the purpose and definition of HRD.

It was agreed that the redefinition or purpose statement process should start with ideas or themes around
common ground between the three perspectives of performance, learning, and spirituality. Ideas or common themes
included work, learning, human potential, tension, balance, core values, process, product, sustainability, alignment,
performance, and system. There was much discussion around the meaning of and possible substitution of human
potential for spirituality. It was agreed that human potential was more descriptive of the goals of HRD and less
ambiguous than the idea of spirituality since it may be defined and conceptualized in many different ways in
different cultures. Another important discussion was around the issue of whether or not HRD happens only within
an organizational context, or whether or not it may apply outside the constraints of the organization. Asking the
question “what would happen to the concept of HRD if it was removed from its organizational context?” facilitated
this discussion.

A Statement of Purpose for HRD

As a result of these discussions a working purpose statement of HRD was formulated: The purpose of HRD is to
enhance learning, human potential and high performance in work-related systems. We believe this purpose
statement reflects the synergy of the performance, learning, and spirituality perspectives. Because the language used
in the statement enjoys common use among HRD scholars and practitioners, the following description of terms is
offered for clarification and as a starting point for dialogue about what this purpose statement does or should mean
for the field of HRD.

Learning. In the context of our purposes statement, learning is defined as a relatively permanent change in
work system capabilities. It can result from formal, planned learning experiences such as those that occur in training
situations. It also includes structured and unstructured self-directed learning, as well as unplanned, spontaneous
learning that occur when one learns from one’s work (Watkins, 1998). Learning occurs at the individual level and
involves the acquisition of verbal information, intellectual skills, motor skills, attitudes, and cognitive strategies that
enhance the ability or potential of individuals (Gagne & Medsker, 1996). Learning is also applied to larger work
systems (groups, organizations, and other goal-oriented collectives) through the concept of a learning organization
(Senge, 1990). Learning is therefore an essential part of developing high performance work-related systems and
enhancing learning must be an integral part of a contemporary purpose/definition of HRD.

Human potential. Human potential is defined as the latent capabilities in humans for growth and
development. Building human potential is critical for HRD because of the implications it has for the ongoing
adaptation, change, and the well being of individuals and work systems (Bates, in press). The term human potential
is used instead of spirituality because the latter is viewed as a relatively ambiguous term subject to divergent views
and definitions that would detract from its functional meaning and consistent interpretation within HRD, especially
within diverse work cultures.

Performance. Performance is defined as the outcomes or achievements that result from goal-directed work
system behavior. High performing work systems are those that optimize the fit between system elements (people,
processes, information, technology, or sub-systems) in ways that enable the work system to meet or exceed its
performance goals (Nadler & Gerstein, 1992). The use of the term high performance includes recognition of the
social responsibility of HRD within private and public environments.

Work-related Systems. A work-related system is defined as an interdependent, organized architecture of
human activity directed toward the accomplishment of a valued goal or outcome (Bates, in press). The structure,
complexity, and goals of work systems distinguish them from organized human activities directed at play or
recreation. The choice of the term work-related systems versus organizations, companies, or related terms we
believed explicitly recognizes the wide range of contexts in which HRD operates. This notion conceives work
systems to include individuals themselves, organized work teams, and formal for-profit and public service work
organizations. It comprises informal organizations, such as community-based organizations, composed of a varying
number of individuals without a formal organizational structure that act interdependently to accomplish often vaguely defined goals. The concept also extends to collections of interdependent work-related sub-systems, such as those reflected in regional or national workforce development systems, educational systems, health or social service systems. These larger work systems reflect organized networks of smaller work systems that are fit together in ways that allow the larger system to respond to a broader range of customer demands and environmental threats or opportunities (Bates, in press).

Defining work-related systems as HRD's domain of activity makes several fundamental assumptions. First, it assumes that work-related systems are created to enhance the human condition. Second, it assumes that work systems are entities that do not exist independently from the people that comprise them. Rather, work systems are composed of people and processes, often multiple collectives with complex systems of social relationships, which have a shared set of symbols (e.g., language) and experience. Finally, the fact that work-related systems are composed of people makes them the appropriate focal point for HRD activity.

Implications for the Field of HRD

The results of this pre-conference revealed that the three perspectives evident in HRD today are not so distant as they appear and that there was much to learn from the integration of these concepts. Although the relationship between these three perspectives has often been contentious, we discovered that this diversity of views is a source of strength for HRD and that there is a good deal of fundamental convergence between the perspectives. Result of the pre-conference made it clear that a new way of looking at HRD, a new worldview or paradigm was needed to help the field and it's professionals add real value to people, organizations, and societies in the future. It also highlighted the interconnectedness of the three approaches.

It seems reasonable to assume that diversity of viewpoints or worldviews that the HRD profession continually promotes must also be reflected in our purpose and/or definition statements. To the extent that the purpose statement offered here reflects this diversity it is incumbent upon the profession, and in particular its researchers and scholars to examine this purpose, to apply it, and validate it thoroughly before it is institutionalized and eventually canonized. Additionally, to meet the needs of such a diverse and eclectic group as those involved in the HRD profession the implications of what this small group of scholars attempted to accomplish and what they developed as a result of the 2000 AHRD pre-conference should be further investigated and the dialogue possibly continued. It is our hope that, at a minimum, this new statement of purpose pushes HRD to look beyond its instrumentality and offers us a start to create unity amongst us while providing more meaningful and holistic parameters within which we can and should positively shape and inspire the systems in which we work.

Participants

When asked to share lessons learned from the pre-conference, participants indicated that they had not previously realized the value of the convergence of the three perspectives and how we had, as a field of practice and research, continued either consciously or subconsciously supporting divergence. There was also consensus that a new "paradigm" or way of viewing HRD should be developed using the purpose statement created in the pre-conference as a starting point. Many participants said it, and validate it thoroughly before it is institutionalized and eventually canonized. Additionally, to meet the needs of such a diverse and eclectic group as those involved in the HRD profession the implications of what this small group of scholars attempted to accomplish and what they developed as a result of the 2000 AHRD pre-conference should be further investigated and the dialogue possibly continued. It is our hope that, at a minimum, this new statement of purpose pushes HRD to look beyond its instrumentality and offers us a start to create unity amongst us while providing more meaningful and holistic parameters within which we can and should positively shape and inspire the systems in which we work.

References

The development of an ethics code is considered an essential step in turning an "occupation" into a "profession". Typical definitions of "profession" include member commitment to ethical conduct. The Academy of Human Resource Development has taken the posture that for an individual to function effectively in a professional role there must be ethical guidelines. Four organizations were reviewed to determine historical foundations and monitoring mechanisms for implementation of ethics codes. Aspirational versus punitive applications for AHRD are discussed.

Keywords: AHRD Standards, Codes of Ethics, Ethics Committees, Professions

History of AHRD Work on Ethics and Integrity

Beginning in 1996, the Academy of Human Resource Development (AHRD), began considering the issue of ethics and integrity (Jacobs, 1996; Marsick, 1996, 1997). As various conference sessions and discussions continued, the AHRD Board along with more and more members became convinced that the Academy should develop a code on ethics and integrity, particularly given the mission of "leading the Human Resource Development Profession through research." Beginning in the spring of 1998, a taskforce was formed to develop such a code. The taskforce included Janet Z. Burns (Georgia State University), Peter J. Dean (University of Tennessee and The Wharton School of the University of Pennsylvania), Tim Hatcher (University of Louisville), Fred Otte (retired, Georgia State University), and Hallie Preskill (University of New Mexico), with Darlene Russ-Eft (AchieveGlobal, Inc) as committee chair. After initial development and review, a final document was prepared and approved by the Board in November 2000, and the Standards on Ethics and Integrity were published by AHRD (1999). At the same time, the Board decided to designate the members of the group as the AHRD Committee on Ethics and Integrity.

Abstract ethical statements, such as the AHRD Standards, provide an undefined amount of guidance to researchers and practitioners. Therefore, recognizing the need for further clarify, the Committee embarked on the development of a set of case studies. At the 2000 Academy conference, the Committee sponsored an innovative session to describe the development of case studies and to solicit contributions from the membership (Burns, Hatcher, & Russ-Eft, 2000). Further details on the history of the AHRD work on ethics and integrity can be found in Hatcher and Aragon (2000) and Russ-Eft (2000).

The work on ethics and integrity is a major step in the development of HRD as a profession. The Standards on Ethics and Integrity represent the collective wisdom of AHRD at this point in time. In order to continue in the growth process, thoughtful consideration and input by the membership is necessary. Recently the membership of AHRD has begun to question if an aspirational ethics document takes the profession far enough. Aspirational ethical principles simply provide guidance to professionals for resolving dilemmas and conflicts. In contrast, an enforceable code implies sanctions for specific acts based on formal judgements. Therefore, several research questions have emerged.

Research Questions

1. What are the experiences of similar organizations with regard to aspirational versus punitive codes of ethics?
2. If AHRD wants to pursue professionalism, does this require a punitive code with some enforcement?
3. What are the responsibilities if enforcement is undertaken?

Theoretical Framework

In attempting to answer the research questions, it is imperative to define the construct of "profession." Wilensky (1964) suggested that the development of professions proceed according to five stages. These five stages are as follows: (1) people begin to work in that field on a full-time basis; (2) programs develop to train people in the skills needed for that field; (3) professional associations begin to develop; (4) concerns begin to arise regarding licensure; and (5) codes of ethics begin to appear.

When entering into discussions about ethical codes, theorists have offered alternative models of ethical decision making. Teleological theory is a consequentialist theory. Opposed to teleological theory is deontological theory or a nonconsequentialist view of ethics (Hatcher, 1999). Simply stated, teleological theory focuses on the results of an act while deontological theory focuses on the act itself. Deontology espouses that the rightness of an action takes precedence over and can be judged independently of the consequences of the actions, or the results are not as important as the nature of the act in question. In regards to how one views ethical behavior, we suggest that those who subscribe to teleological theory would be tend to subscribe to codes that are more punitive in nature while those subscribing to deontological theory may subscribe to aspirational codes.

We will use the Wilensky stages and the teleological/deontological distinction in ethical theory to discuss three professions and one organization comprised of various professions. The research questions will be addressed by examining the experiences within four organizations: the American Evaluation Association, the American Psychological Association, public school teaching, and the Internal Revenue Service.

The Experience of the American Evaluation Association

The American Evaluation Association (AEA) is an organization of academicians, researchers and practitioners bearing some similarities to AHRD. The following paragraphs will compare the two organizations.

As for stage 1, certain members of AEA work in the evaluation field full-time. These evaluators tend to work in government agencies and in non-profit or for-profit organizations. Similarly, certain members of AHRD work in the HRD field full-time. In terms of stage 2, Altschuld, Engle, Cullen Kim, and Macee (1994) reported that about 20 training programs have substantial numbers of evaluation courses. Since its inception, AHRD has made granted the Outstanding Academic Program award to four different universities. As for stage 3, that of the development of professional organizations, AEA has existed for over 10 years. The predecessor organizations (Evaluation Research Society and Evaluation Network) began about 10 years prior to AEA. In contrast, AHRD began more recently than did AEA, but its predecessor organizations (Professors’ Network and the Research Committee of the American Society for Training & Development) existed for many years prior to the birth of AHRD. Regarding stage 4, the AEA Board first commissioned a review of the possibilities for accreditation of instructional programs in evaluation (Trochim & Riggins, 1996) and later commissioned a taskforce to review the potential of certifying evaluators (Altschuld, 1999). More recently, the AHRD Board has considered the possibilities for certification of HRD professionals (Altschuld, 1999).

Finally, as for stage 5, evaluators have developed several ethical codes over the years. In 1982 the Evaluation Research Society (ERS) adopted standards for program evaluation. The standards were never published or formally adopted before the organization's merger with by AEA. AEA merged with ERs to form AEA. The Joint Committee on Standards for Educational Evaluation published the Standards for Evaluations of Educational Programs, Projects, and Materials, and more recently The Program Evaluation Standards (Joint Committee, 1994). Then, AEA itself adopted and published the Guiding Principles for Evaluators (AEA, 1995). Similarly, AHRD has begun to develop work on an ethics code, with the publication of the Standards on ethics and integrity (1999).

The contents of these two ethical codes are very different. The Program Evaluation Standards (Joint Committee, 1994) are very detailed and begin with an Introduction and a section on Applying the Standards. The Standards include Utility Standards (Stakeholder identification, Evaluator credibility, Information scope and selection, Values identification, Report clarity, Report timeliness and dissemination, and Evaluation impact), Feasibility Standards (Practical procedures, Political viability, and Cost effectiveness), Propriety Standards (Service orientation, Formal agreements, Rights of human subjects, Human interactions, Complete and fair assessment, Disclosure of findings, Conflict of interest, and Fiscal responsibility), and Accuracy Standards (Program documentation, Context analysis, Described purposes and procedures, Defensible information sources, Valid information, Reliable information, Systematic information, Analysis of quantitative information, Analysis of
qualitative information, Justified conclusions, Impartial reporting, and Metaevaluation). In contrast, the Guiding Principles for Evaluators are less detailed and focus on five principles: (1) Systematic inquiry, (2) Competence, (3) Integrity/honesty, (4) Respect for people, and (5) Responsibilities for general and public welfare.

Given the similarities in history between AEA and AHRD, we can now turn to the question of the use of the ethical code for the purposes of reviewing reported cases of “unethical” practices. Altschuld et al (1999) pointed out that the guidelines might not yet be fully integrated into the daily practice of evaluators. Thus, the current status in evaluation is that ethical codes do exist. In fact, several somewhat overlapping ethical codes exist in evaluation. These ethical codes have been incorporated to some greater or lesser extent into the research and practice of evaluators. Furthermore, AEA maintains an ongoing Ethics Committee. The purpose of this committee is to undertake periodic review and revision of the Guiding Principles and to provide input into work undertaken by the Joint Committee on Standards for Educational Evaluation. Nevertheless, the Ethics Committee does not review reported violations of the codes, and no procedures currently exist for dealing with such violations. The AEA ethical code, therefore, can be characterized as aspirational rather than punitive.

The Experience of the American Psychological Association

The American Psychological Association (APA) is the major professional psychological organization in the United States. It is made up of members who are teachers, researchers, diagnosticians, measurement experts, curriculum designers, therapists, consultants, expert witnesses, and consultants to management. These roles continue to expand in number and function since APA's founding in 1892 and incorporation in 1925. In applying Wilensky's model of the growth of a profession, stage one fits with APA. As with AEA and AHRD, many psychologists are in the practice of psychology on both a full and part-time basis. In terms of stage 2, APA accredits Doctoral, Internship, and Postdoctoral training programs in professional psychology and maintains a Committee on Accreditation. A list is updated annually, and is available from the APA Office of Program Consultation and Accreditation. The American Psychological Association has a rich history that covers Wilensky's stages 4 and 5. The APA established an ethics committee in 1938, but did not adopt a formal ethics code until 1953. Today, APA has a comprehensive "ethics program" in which the ethics committee is one component. To develop their first code, the APA solicited input from the membership and received and used more than one thousand cases as a database. The code is not static. Over the years, the code has undergone a number of minor as well as major revisions. Revised documents were published in 1958, 1963, 1968, 1977, 1979, 1981 and 1992.

Currently, the 1992 APA (American Psychological Association Ethics Committee, 1992) code remains in place. However, according to the Report of the Ethics Committee, 1999 "significant action was taken toward the revision of the Ethical Principles of Psychologists and Code of Conduct" (American Psychological Association Ethics Committee, p. 938). An Ethics Code Task Force of APA plans to hold two to three meetings per year until the code is revised. The task force has projected the completion year of 2002. The task force has written two drafts and both drafts were provided to the Council of Representatives, the Board of Directors, and APA boards and committees. The membership was provided information highlighting changes in the APA Monitor and commentary was sought. The task force held a discussion session with audience comments at the 1999 APA convention in Boston. Information gathering is a significant component of the Ethics Committee's plan for revision of the Ethics Code. Concurrently, in 1999 APA addressed a proposed revision of the Ethics Committee's "Rules and Procedures" (American Psychological Association Ethics Committee, 1996). This revision was delayed pending further study of the ethics program (American Psychological Association Ethics Committee, 2000).

The current Ethical Principles of Psychologists and Code of Conduct is comprehensive and consists of an introduction, preamble, and six annotated principles and eight general standards. The principles fall under the following headings: Competence, Integrity, Professional and Scientific Responsibility, Respect of People's Rights and Dignity, Concern for Others' Welfare and Social Responsibility. The standards are: General Standards, Evaluation Assessment or Intervention, Advertising and Other Public Statements, Therapy, Privacy and Confidentiality, Descriptions of Education and Training Programs, Forensic Activities and Resolving Ethical Issues. The Preamble and General Principles are not themselves enforceable rules. The Ethical Standards are enforceable rules for the conduct of psychologists. Membership in the APA commits members to adhere to the APA Ethics Code and to the rules and procedures used to implement it.

As Wilensky mentions in stage 4 of the model, licensure is a considered component of a profession. Currently a license is required for many areas of practicing psychology. State licensing boards establish and monitor the entry-level qualifications required to offer services to the public. State licensing boards may also monitor the conduct of the psychologists whom they have licensed. A state licensure board can inform APA that an action has been taken or charges are pending against one its members. In the profession of psychology, where all
Public School Teaching Grades K-12 as a Profession

Public school teaching in the United States is another profession following the professional development model suggested by Wilensky. As with the other professions discussed thus far, teachers for the most part work in full time positions, as indicated in Stage 1 of the model. Stage 2 of the model also fits, as programs to train teachers reside in colleges and universities, and generally lead to different levels of degrees from the Bachelor level up to a Doctorate. Many teacher education programs are accredited by organizations that implement national standards, such as National Council for Accreditation of Teacher Education (NCATE). Additionally, many teacher education programs must be approved by a state accrediting organization. For example, in Georgia, the program approval agency is the Georgia Professional Standards Commission (PSC). Accompanying the standards for teacher education program accreditation, the majority of states now require some kind of minimum competency test for beginning teachers in order to obtain a teaching license/certificate. The focus of these tests varies from state to state. For example, in Georgia, teachers are tested for basic competency by the PRAXIS I examination. Prospective teachers must also pass a PRAXIS II content area test. There is currently a push for national teacher certification, as each state's department of education has unique requirements for certification in that particular state and it can be difficult for teachers to move from state to state. Some states share a regional credential such as Connecticut, Maine, Massachusetts, New Hampshire, New York, Rhode Island, and Vermont (Kellough, 1999).

Stage 3 of Wilensky's model is relevant to the profession of teaching. There are numerous professional organizations available for teachers. Local teachers' organizations are usually discipline-specific, such as for mathematics (National Council of Teachers of Mathematics), science (National Science Teachers Association) or vocational (Association for Career and Technical Education). In most states, there is a statewide organization, typically affiliated with a national organization. For example, in the area of vocational teaching in Georgia, teachers can become members of the national organization, Association for Career and Technical Education (ACTE) and GACTE. In addition, there are the National Education Association (NEA) and the American Federation of Teachers (AFT), which, in a few locales, have merged as the collective bargaining organization for teachers. In addition, there are many other professional organizations such as Phi Delta Kappa and the Association for Supervision and Curriculum Development. Kellough (1997) lists 56 periodicals from professional organizations for teachers.

Stage 4 of Wilensky's model applies to the teaching profession. In fact, teaching may be unique from the other professions mentioned thus far in that certification/licensure is mandatory in order to obtain a teaching position in a public school.

Let's look at stage 5 of Wilensky's model, and examine codes of ethics in the teaching profession. After examination of 6 teacher education textbooks, (Armstrong & Savage, 1994; Jacobsen, Eggen & Kauchak, 1999; Kellough, 1997; Moore, 2001, Moore, 1999; Sparks-Langer, Pasch, Starki, Moody, & Gardner, 2000) it is interesting to note that little mention is made of ethics or a code of ethics. Professional behavior is addressed in some of the textbooks in regard to joining a professional organization, or taking staff development courses to update skills. No codes of ethics appeared in the textbooks examined. Since each state has a licensing agency, it appears that each state would have to be contacted to obtain a code of ethics for that particular state, assuming that each state has one.

The authors selected the state of Georgia for closer examination. The agency responsible for teacher certification in Georgia is the Georgia Professional Standards Commission (PSC). Within the PSC resides the Professional Practices Section (PPS) that is responsible for examining criminal or unethical behavior. The PPS is authorized by the 1998 Georgia Senate Bill 535 (Georgia Professional Standards Commission, 1999) to investigate reports of criminal conduct, violations of professional or ethical codes of conduct and violations of certain rules, regulations and policies by school system educators. The PPS also enforces the requirement that local school systems promptly report criminal conduct and have the authority to impose disciplinary action or a denial of a certificate against an educator. Additionally, the law charges the PSC with adopting standards of performance and a code of ethics for educators.

The Georgia Professional Practices Commission (1994) ethics document for educators includes a preamble, introduction, supplemental definitions and the code of ethics. The code of ethics is comprised of canons, ethical considerations and 13 standards of conduct. Canons are the aspirations of the profession, and the ethical
considerations are not a binding code of conduct. The standards of conduct establish mandatory prohibitions and requirements and are binding to educators in the state of Georgia. If the standards of conduct are violated, the educator may be investigated by the PPS and also by the local board of education. The PPS has the power to enforce the standards of conduct and can discipline an educator and revoke a teaching certificate. A shorter version of the code is distributed to teachers in a brochure. The brochure does not include the canons and the ethical considerations. However, the brochure (Georgia Professional Standard Commission, no date) includes sections entitled "Reporting" and "Disciplinary Action."

The Experience of the Internal Revenue Service

Generally one would not think of making a direct comparison between a professional organization such as AHRD and a large Federal agency like the Internal Revenue Service (IRS). With a second look, however, the similarity and the need for ethical standards appears. The Academy, through work done by scholars and practitioners, is dedicated to leading the development of the human resource development profession through research. Employees of the IRS have the following mission, “Provide America’s taxpayers top quality service by helping them understand and meet their tax responsibilities and by applying the tax law with integrity and fairness to all.”

To continue the comparison of the AHRD and the IRS, stage 1 of Wilensky’s (1964) model for the growth of a profession shows similarity. Of the four organizations examined in this paper the IRS is by far the oldest. Government service employees regularly spend their entire 30-year careers in the Service.

Wilensky’s stage 2 refers to how an organization develops training programs specific to the organizations needs. The IRS has developed an adaptation of the Instructional Systems Design (ISD) model for training design and development. This model, the Training Development Quality Assurance System (TDQAS) (Wright, 1995) has been used successfully as a guide for training program design, development and delivery. Approximately 80-million dollars is dedicated each year to training IRS employees. These funds support all forms of HRD initiatives in the areas of organization development, career development, and training and development.

Wilensky’s stage 3 refers to the fact that in professional organizations professional associations begin to develop. The Service, in recognizing the importance of professional associations, supports its employees in their individual efforts to align themselves with the professional organizations important to their area of expertise. The IRS has a number of HRD professionals and many belong to the American Society for Training and Development.

Stage 4 of Wilensky’s model addresses concerns that begin to arise regarding licensure. As has been mentioned previously, there are numerous occupations within the Service that require licensure (law enforcement, accounting, etc.). Human Resource Development or Training and Development, as it is more commonly referred, currently do not have any form of licensure or certification.

While the IRS has had little more interest than maintaining status quo as a stage 4 imperative, the opposite appears to be the case for Wilensky’s stage 5. In 1989, the House Subcommittee on Commerce, Consumer, and Monetary Affairs challenged the ethical values of the IRS. As a result of the hearings the Commissioner instituted a Service wide ethics-training program. A nationally known ethicist, Michael Josephson (Government Ethics Center: Josephson Institute of Ethics, 1991) produced a one-day, video based ethics workshop that was facilitated by IRS instructors. The workshop presented the following 10 ethical values that have since become the framework for the IRS ethics process:

<table>
<thead>
<tr>
<th>Honesty</th>
<th>Caring and Concern for Others</th>
</tr>
</thead>
<tbody>
<tr>
<td>Integrity</td>
<td>Respect for Others</td>
</tr>
<tr>
<td>Promise Keeping</td>
<td>Civic Duty</td>
</tr>
<tr>
<td>Loyalty</td>
<td>Pursuit of Excellence</td>
</tr>
<tr>
<td>Fairness</td>
<td>Personal Responsibility/Accountability</td>
</tr>
</tbody>
</table>

Josephson helped develop five principles of public service ethics: Public Interest, Objective Judgement, Accountability, Democratic Leadership, and Respectability.

Since these initial efforts in the ethics arena, the IRS has continued to promote ethics and integrity as key components of the business of tax administration. In 1993, an employee survey-feedback initiative contained questions about ethics; and in 1994, all executives held forums with employees to discuss ethical issues. IRS organizations created ethics coordinator positions. A manual was developed that gave course developers instructions on how to weave ethical scenarios into all technical training material. A standard ethical values page is a part of the front matter of all training material. A vender has been contracted to produce additional ethics training materials for the Service. In addition to all of this, ethics training has moved into the electronic delivery mode through distributed education using the IRS Intranet. Additionally, the IRS’s Office of Government Ethics (OGE) has developed an Ethics Home Page.
Enforcement of Ethical Conduct - Comparisons of Applications of Ethics Codes

At least two mechanisms are in place to protect the public from unlawful, incompetent and unethical actions in the marketplace. First, there is control through general criminal and civil law that is applicable to all citizens. Second, there are profession specific legal controls that emerge from state licensing boards and federal regulations. The licensing boards establish entry standards for a profession, define practice, delineate offenses and sanctions, and serve as a means of enforcement under criminal law. However, as a profession develops and reaches Stage 5 of Wilensky's model, codes of ethics begin to appear. In fact, in many professions, control is exerted by peers, through an ethics code and ethics committees serving as a peer control mechanism. Stage 5 appears to be an important growth step for a profession as it is the recognition that there are some unethical acts that are neither illegal nor in violation of any policy except the ethics code. Generally, ethical professional standards expect behavior that is more correct or more stringent than is required by law. In such cases, ethics committees may be the only source of redress. In many instances conduct that is not in violation of any criminal or civil law would be defined as unethical according to the profession's code. For example, lecturing from outdated notes, administering assessments without adequate training, failure to give adequate or timely feedback to supervisees are only a few of the hundreds of possible examples illustrating acts that are not illegal, but which the HRD profession considers unethical.

In reviewing the various professions and organizations it was found that different professions and organizations approach enforcement of ethical codes in very different ways. In the case of AEA and AHRD, no procedures are in place for reporting and dealing with ethical violations. These associations appear to take a deontological or aspirational approach to ethics. In contrast, APA, the Georgia PPS, and the IRS have defined procedures in place. Thus, these organizations seem to use a teleological or punitive approach.

Although APA, the Georgia PPS, and the IRS use a teleological or punitive approach to ethical violations, there are differences in how these three organizations undertake investigations and apply sanctions. The APA operates as an association primarily comprised of volunteers, as is true of AHRD. It established an ethics committee in the late 1930's although the first ethics code did not appear until 1953. Today the APA ethics committee consists of eight voting members, six non-voting associates and a liaison from the APA Board of Directors. Members of the Ethics Committee are elected by the membership. The Ethics Committee develops a list of prospective members. The Board of Directors may supplement the list. The ballot is submitted to the Council of Representatives. Terms are for three years, with the committee electing a chair and a vice chair each year. The committee appoints committee associates for two year terms. The public member is elected by the Council of Representatives after being nominated by the committee and approved by the Board of Directors. The APA Ethics Committee has clearly delineated Rules and Procedures for processing complaints, the main activity of the Ethics Committee (Report of Ethics Committee, 1999, p. 939). The lengthy document contains five parts: Objective and Authority of the Committee, General Operating Rules, Membership, Show Cause Procedures Based Upon Actions by Other Recognized Tribunals, and Complaints Alleging Violation of the Ethics Code. The Ethics Program has the authority to expel members from APA.

In contrast, in Georgia, state law sanctions the PPS. The PPS has a five-step process to handle unethical behavior by an educator. If a case is referred to the PPS, it will determine if an investigation is warranted. If so, an investigator prepares an investigative summary for review by the commission. Then the Commission reviews the investigative report it determines probable cause to take any disciplinary action against the educator's certificate. If action need to be taken, an educator disciplinary hearing is held through the Office of State Administrative Hearings (OSAH). Each case is heard before an Administrative Law Judge. Notice of the decision is sent to the educator and the Commission. Either party has 30 days to request a review of the Administrative Law Judge's initial decision. The Commission makes the final decision. Since this is a multi-step process, there are several places in the process where the case can be closed. Disciplinary actions vary, with the most stringent being revocation of any certificate, license or permit held by the educator. An educator whose certificate has been revoked may petition the Commission for the right to reapply for certification after a three-year period (Georgia Professional Standards Commission, 1999).

Finally, the IRS differs from the other organizations in that it is not a professional organization per se but is a federal agency, comprised of several different professions. Therefore, in this context, federal law provides sanctions for violations of ethical behavior.
Expanding the Collective Wisdom of AHRD

AHRD has entered into Stage 5 of Wilensky's model. The Standards on Ethics and Integrity are similar to other professional ethic codes, specifically those of AEA and APA. Despite the variations in length and specificity, most professional ethic codes have similarities such as maintaining competence, protecting confidentiality and or privacy, acting responsibly, avoiding exploitation, promoting the welfare of consumers served and upholding the integrity of the professions through exemplary conduct. Such codes represent efforts to record some of the more definable rules of conduct. The codes signify the voluntary assumption of the obligation of self-discipline above and beyond the requirement of law. Codes are aspirational in that respect. Codes are educational in that they provide members of the profession with guidelines for the kind of ethical behavior, according to the historic experience of the group, that is most likely to occur. A code can also serve to narrow the area in which a professional has to struggle with uncertainty. The AHRD document seems to do all the above.

In examining various organizations, it has been shown that there are alternative approaches taken with enforcement of ethics documents. The approaches range from completely aspirational, such as AHRD and AEA, to a combination of aspirational and punitive, as characterized by APA and the PPS in which enforcement occurs through banishment from the organization (APA) or banishment from a profession such as teaching (PPS). As part of a continuing effort to ensure that decisions about the use and revision of the Ethics Code remains an open and collaborative process, the AHRD Ethics committee's next step is to open conversations with the membership at the 2001 conference in Tulsa, Oklahoma regarding aspirational goals versus punitive sanctions. The conversation could lead the AHRD ethics committee to further research in ethics management and enforcement.

The Role of Codes of Ethics in the Future of Human Resource Development

Wendy E.A. Ruona
University of Georgia

A. Carol Rusaw
University of Louisiana, Lafayette

The creation of the AHRD Standards on Ethics and Integrity was an important milestone for HRD. This paper explores how these Standards fit with the evolution of this emerging profession and with philosophical activity in it; discusses the critical role that professional associations play in developing the ethics of its members; and suggests specific steps AHRD may consider to facilitate the use of the Standards on Ethics and Integrity.

Keywords: Ethics, Professionalization, Socialization

The Biographer Richard Holmes once referred to one of his subjects as “a powerful personality without a solid identity.” The same could easily be said of Human Resource Development (HRD). It is a field of practice comprised of thousands of contributors from diverse disciplines such as education, psychology, sociology, and business. It is a field where its professionals practice in multifarious contexts, among diverse clientele, and for varied ends. It is a field that celebrates its diversity and interdisciplinary nature—and it should because this diversity is a strength that facilitates reflection-in-practice that Schon (1987) and Argyris (1993) ascribe to greater decisional accuracy, creativity, and learning.

Yet at the same time, HRD is faced with mounting challenges to more strongly distinguish and legitimate itself. And it is the field’s diversity that makes defining agreed-upon foundations, values, and beliefs difficult. In 1999 The Academy of Human Resource Development, after three years of actively involving its members in deeply exploring various aspects of ethics in HRD, took an important step in helping HRD legitimize itself and its professionals by introducing their Standards on Ethics and Integrity (AHRD, 1999). In recognition of the manifold roots of HRD, the AHRD Standards outlines a common set of values and principles upon which HRD professionals can build their work. They provide guidance and standards of conduct for HRD professionals.

Now, as the field continues to multiply and undergo fervent growth, the question of enforcement of these standards will be increasingly considered. To respond to this next phase challenge, this paper 1) relates the recently published Standards to the processes by which fields of practice become professionalized; 2) explores the role of ethics in the development of HRD; 3) discusses the critical role that professional associations play in developing the ethics of its members; and 4) suggests specific steps AHRD may consider to facilitate the use of the Standards on Ethics and Integrity.

HRD as a Profession

Sociologists have long studied professions, professionalism, and professionalization. While defining “profession” is still a challenge, there are three prominent approaches to theorizing about professions and professionalization. The first is the process approach which posits that professions travel a path toward full professional status, starting at different points, progressing through distinct phases, and traveling at different speeds. The assumption here is that all occupations will or can become professionalized. The second is the trait approach, which hypothesizes that professions share traits or characteristics in common, and that occupations reach professional status when they achieve specific characteristics. Lastly, the power approach differentiates (and critiques) professions based on the power relationships held by practitioners in their social exchanges with society and individual clients.

The trait or characteristics approach has been the most commonly referenced in literature about applied fields of practice. There are dozens of characteristics cited in this literature. Table 1 offers a synthesis of four noted authors’ lists—including only characteristics that were cited by at least two of the four author(s), and omitting characteristics that were identified in only one author(s)’ list.

These characteristics are starting places by which to define a profession, and are also part of a “dynamic process involving a high degree of interaction among the elements within the profession’s boundaries and between the profession and its environment” (Gellermann et al., 1990, p. 16).

**HRD and Professionalization**

Strict interpretation of the above criteria may preclude calling HRD, as well as many other fields, a “profession”. Many HRD practitioners, on the other hand, certainly qualify as “professionals” on most or all of the criteria listed above. There is little guidance as to when a field of study actually qualifies as a profession. This is complicated by the proliferation of new fields of study that have arisen in the 19th and 20th centuries and the emerging reorientation of the term “profession” in the sociological literature. Lipartito and Miranti (1998), for instance, propose to define professionals as purveyors and creators of expertise rather than stressing the classic characteristics models. This hints at a new trend in the professionalization literature—one that focuses on expertise and expert groups within organizational contexts.

A further complication for our purposes here is that HRD is considered to be comprised of three strands that some see as processes and others see as discrete fields of study. They are (a) Training and Development (T & D), (b) Organization Development (OD), and (c) Career Development (CD) (McLagan, 1989). Each of these communities are themselves taking steps towards professionalization. For instance, Gellermann et al. (1990) reports the results of an extensive study of values and ethics in OD.

However, it is undoubtedly true that HRD is considering the issue of professionalization. The topic was highlighted during a 1998 AHRD symposium (Chalofsky, 1998; Ellinger, 1998; Mott, 1998; Rowden, 1998) where various aspects of the issue were explored. Moreover, marked progress (summarized in Table 2) can be seen in each of the characteristics identified above.

Given this list, it seems appropriate to acknowledge the critical role that the Standards play in helping HRD to develop necessary foundations for professionalization, and to call HRD an emerging profession.

**Ethics and Professional Ethics**

As HRD has developed characteristics of a profession and has begun to examine its distinctive values, competencies, and practices, it must also begin to more fully understand what the Standards represent and to look at how members enact what they profess. Ethics is the critical examination of this conduct. It is concerned with action, in the sense that action is the result of choice, undertaken in light of desirability. There are two primary components of ethics (Honderich, 1995). First, is *morality* which speaks to issues of what is good (right and wrong) and what ought to be done. Second, is *axiological ethics* which is concerned with values. This component doesn’t focus directly on what should be done, but rather on what is worth pursuing or promoting and what should be avoided.

Ethics are principles derived from philosophical activity. Philosophy has traditionally been concerned with three basic (and big) issues: being (ontology), knowing (epistemology), and acting (ethics). If one thinks about these foci as separate areas of inquiry, then philosophy does not seem to serve much purpose. However, in actuality, these

</tbody>
</table>
| Develops organized and specialized body of knowledge, based on a theory and research | • The Academy of Human Resource Development (AHRD) was established in 1993 with a vision to lead the profession through research.  
• Three research-based journals have been established during the last seven years: (a) Human Resource Development Quarterly, and (b) Human Resource Development International, and (c) Advances in Developing Human Resources.  
• The extent to which the body of knowledge that HRD draws upon is specialized and grounded in theory is currently an issue of much debate (Jacobs, 1990; Watkins, 1990; Brethower, 1995; Swanson, 1999; McLean, 1999). However, the fact that this is such a vital issue can be considered indicative of some progress in this area. |
| Defined area of competence                                                    | • Many competency models have been produced, most notable include McLagan (1989) and Rothwell (1996).                                                                                                           |
| Values                                                                         | • Ruona (2000) has recently reported results of a qualitative study exploring core beliefs underlying HRD.                                                                                                     |
| Standards of Practice and Ethics                                              | • The Academy of Human Resource Development introduced a first draft of a Standard of Ethics and Integrity in March, 1999 (AHRD, 1999).  
• OD, an emerging profession in its own right and considered to be part of the tripartite that comprise HRD, has recently published its 22nd revision of its International Code of Ethics (Organizational Development Institute, 1999). |
| Monitors the practice and its practitioners                                   | • The same AHRD committee that is drafting a Code of Ethics for HRD is currently discussing issues of enforcement.  
• There is increasing talk in HRD's literature about certification (Ellinger, 1998), and alternative ways to monitor for quality and ethical practice in HRD.                                                      |
| Educates and trains professionals                                              | • There are numerous academic programs in HRD and closely related topic areas nationally and internationally. A 1998 ASTD directory of academic programs listed over 280 programs in the United States (White, 1999).  
• ASTD recently began offering certificate programs all over the United States in an effort to educate on specific competencies.                                                                 |

three areas all work together to make philosophy what it is. In this sense, from a systems perspective, the whole is more than the sum of its parts.

Ruona and Lynham (1999), after a study of the various components of philosophy and their relevance to HRD, view them as three key, interacting components:
• Ontology: the component that explicates a view of the nature of the world and of phenomena of interest to HRD (how we see the world);
• Epistemology: the component that explains the nature of knowledge in HRD, and the necessary and sufficient requirements to hold and claim knowledge in the field (how we know/about the world);
• Ethics: the component that makes explicit how we ought to act, individually as well as communally in HRD. It outlines espoused aims, ideals and proper methodologies and methods for HRD inquiry and practice (how we should act in research and practice). (p. 211)
These three components interact in a dynamic and systemic way, together forming a guiding framework for a congruent and coherent system of thought and practice in HRD. Figure 1 shows the interactive and dynamic relationship among the key components integral to a sound philosophical framework. It elucidates the connections—demonstrating that how we see the world determines how we think about the world, how we think about the world determines how we act in the world, and how we act in the world, in turn, reflects how we think about and see the world. And, that each of these components reflects and influences the other.

Figure 1. A Philosophical Framework for Thought and Practice

Role of Ethics & Codes of Ethics

In this sense, then, ethics are normative. In other words, they indicate how professionals should act, and the extent to which this action should be congruent with ontological and epistemological aims and ideals. Ethics urge congruence between ontological and epistemological assumptions and the espoused actions of a field. Thus, they play an important role in putting the standards and requirements of acceptable methodology and methods for research and practice in place. Making ethics explicit helps to set and clarify the guiding tone and rigor for action in HRD.

The intent of codes of ethics such as the Standards is not to prescribe or to limit the richness of beliefs and values that are held in a diverse professional community. Rather, codes of these kinds are minimalist in nature—tending to identify the lowest common denominator that holds the community together. As a result, codes are often quite general and universal principles that require personal interpretation, application, and reflection.

Developing and Fostering Professional Ethics: The Role of Professional Organizations

To a great extent, then, the codes of ethics outline the “should” for its professional members—the best practices and standards for practice. However, some will argue that they are worth little if they do not actually shape practice in the field, and that without some system of enforcement they cannot have any influence over thought and action in HRD. The following section outlines the critical role that professional associations play in developing ethics in a profession. Because these associations are often at the nexus of individual, institutional, and legal interests pertinent to a particular field, they ultimately have immense influence over shaping, rather than proscribing, ethics.

Role in Developing Core Concepts

Professional associations have common characteristics that give members collective identity. The characteristics include a common set of values, beliefs, and behaviors that members share and pass on (Knox, 1992).
Schein (1972) states that professions have a "calling" to a lifetime work and an accumulation of specialized body of knowledge and skills members acquire over a prolonged period of education and training. The possession of extensive knowledge gives professionals a great deal of power, influence, and status. Professional associations attempt to protect core principles and practices, or the technical basis of the knowledge (Engel & Hall, 1973). This often means defining and delimiting their interests in view of non-professional individuals and groups (Harries-Jenkins, 1970). It also entails producing commitment among members. By forming associations, professionals can develop a shared understanding of foundational principles, beliefs, and practices that govern how members apply knowledge.

**Role in Learning**

Through associations, professionals can also develop and expand the collective core technical knowledge. By sponsoring formal learning events (such as workshops, seminars, symposia, and conferences) professional associations stimulate discussion and publish scholarly papers. Formal learning events not only build upon an existing base of professional knowledge, which associations transmit to members; the events also communicate knowledge to individuals and organizations having interests in the profession (Kornhauser, 1962). Formal learning enables associations to arrange contexts and media for disseminating information and to regulate, to some extent, its application.

Professional associations also encourage informal learning among members as further means to communicate core knowledge and ethical use. Informal learning is distinguished from formal primarily in its use of 1) experience rather than theory, 2) unintentional motives rather than planned objectives and systematic action to achieve goals, and 3) use of self as the basis for learning rather than persons outside oneself (Merriam & Caffarella, 1991). Informal learning may be encouraged through a variety of ways. One form of is adapting styles and tactics through vicarious learning (Gioia & Manz, 1985). Knowledge gained from seeing how adept individuals typically approach problems, identify and gather resources, develop tentative hypotheses, and carry them out can provide ideas for application to a variety of decision-making situations. Further, professional associations can enhance the development of less-experienced members through committee leadership, service opportunities, and formal learning facilitators. Through professional association networks, members can identify mentors who may support career development (Miller, 1985; Rusaw, 1989; Wolf, 1983).

**Role in Developing Metacognition**

Ethical knowledge is a type of metacognition, which functions as blueprints for behavior in the ill-defined expectations of practice. Although long periods of formal study may have equipped professionals with requisite technical knowledge for entry into a field, professional associations have, as noted, assumed guardianship of learning beyond the academic years. Metacognitive development often appears as "sensemaking," (Weick, 1979) in which professionals develop meaning of complex and novel situations and determine direction for action. Professional associations, through their formal and informal learning experiences, become forums from which members can examine their assumptions and standard responses and learn different ways to think about the difficult problems and issues they face. Through associational learning events, members can develop knowledge classification schemes that enable them to define "professional" conduct in particular instances.

**Role in Socialization**

Professional associations are important agents in creating a community among members. The basis of community is not only a shared body of core concepts and values acquired through knowledge acquisition and judgment; it is a feeling of identity with others and with a larger purpose. In promoting understanding and right application of knowledge through personal and interpersonal relationships, professional associations can strengthen member commitment (Brockett, 1988).

Professional associations encourage community through various forms of socialization. Socialization involves transmission of knowledge and cultural understanding, legitimization of credentials, and personal development of others (Jarvis, 1987)—processes that frequently occur as rites of passage or as rituals. Through formal and informal socialization processes, professional associations pass on expectations, values, and core ideologies (Van Maanen & Schein, 1979).
**Proscriptive versus Ascriptive Socialization.** Some professional associations socialize members proscriptively, or through direct control over individual decisions made on behalf of clients. Proscriptive socialization gives the professional associations authority via the extent of formalized learning, the type of enforcement sanctions permissible, the degrees of allowable discretion, and extent of shared agreement to a technical core of information. Professional associations having legal authority over administering a clearly-defined body of technical knowledge have coercive power. They frequently use licensure, authorized according to statutes, as a means of compelling members to take courses. Further, proscriptive associations have governing boards that are enacted by law to arbitrate ethical conduct. An example of a proscriptive professional association is the American Medical Association.

Other professional associations, however, accept members from a variety of disciplines and develop codes of ethics based on commonly-agreed upon values, beliefs, and principles. The basis for enforcing ethical codes in voluntary professional associations is “ascriptive” or commitment based on weight of shared tacit understanding. Socialization dimensions in ascriptive professional associations are individual, informal, random, variable, serial, and investiture. In essence, ascriptive professional associations accept the existing values, beliefs, and practices of members and integrates them into an evolving base of knowledge and practices. Ascriptive professional associations, which frequently admit individuals from diverse disciplines, may form from new or rapidly changing fields of knowledge. In ascriptive professional associations, it is difficult to define and to reproduce a core body of knowledge, and, consequently, it is difficult to develop and enforce a common code of ethics. Codes that are developed are usually broad, generic, and humanistically oriented and emerge by membership discussion and consensus. As with the AHRD Standards, the codes encourage adherence through moral commitment.

**Strengthening Moral Commitment to Ethics: Some Implications for AHRD**

Although the Academy of Human Resources is not a proscriptive socialization agent, it can facilitate commitment to the codes of ethics by playing the role of an inspirational leader. The inspirational or charismatic role of individual leaders has been widely described in management literature (Shamir, House, and Arthur, 1988; Trice and Beyer, 1986; and Bass and Avolio, 1994). Some salient characteristics include creating a noble vision of a desired future state, showing strong commitment to certain values or ideals, managing meaning through use of symbols, building favorable images, using techniques of impression management, shaping expectations through rewards, and stimulating intellect and creativity. If individual leaders affect the character of their organizations, then professional association leaders who display inspiration can create an inspirational professional association. How might AHRD accomplish this?

**Create Shared Vision and Values**

The Academy for Human Resource Development may help construct a common future scenario of the field through sponsoring formal and informal learning events. Learning involves the re-ordering of ideas as well as affections to achieve a particular goal. The academy can encourage learning through posing the types of goals HRD can and should pursue. Facilitating symposia, workshops, search conferences, and conferences are excellent learning vehicles.

**Foster Changes in Behavior and Conduct**

Along with envisioning common futures, the Academy can guide developing member responses through training programs. Workshops focusing on attitudinal outcomes and behavioral changes are especially key. These learning events might be centered about ethical dilemmas that practitioners may encounter, such as choices concerning types of information to reveal during client feedback sessions.

**Create Rewards and Incentives for Ethical Conduct**

The Academy leaders should focus on the use of an array of psychological and affective rewards to reinforce ethical standards and conduct among practitioners. These could include formal recognitions of individuals and groups that have exemplified ethical conduct in their areas of practice. Rewards could also be given to research that examines ethical practices and contributes to behavioral and social science. In addition, the Academy could promote certification programs that infuse ethical conduct in personal and client relationships. Such a program
should be voluntary and completion should carry prestigious weight in assessing individuals’ portfolios of credentials.

**Promote and Disseminate Basic and Applied Research**

A hallmark of a professional society is the production of research and writing in a given discipline. The Academy has already taken a lead role in sponsoring research and disseminating it in professional journals and meetings. A primary research agenda to strengthen ethical conduct would be to promote both empirical and field studies. Some examples might be studies of human resource management decisions, uses of pay and incentives in organizational change, contracting relationships with clients, small group problem solving interactions, and downsizing dilemmas.

**Conclusion**

The Academy of Human Resource Development has taken an important first step in recognizing the importance of ethical principles and conduct among members in publishing the *Standards*. Because of the diverse disciplines within HRD, as reflected in the backgrounds and characteristics of members, however, the AHRD cannot proscribe use of the *Standards* and impose controls for their violation. The society can, however, promote adoption of the *Standards* by facilitating their understanding both at the ontological as well as practical levels. This can be accomplished through sponsoring formal and informal learning events, creating incentives for valuing and practicing ethical conduct, encouraging research into HRD ethics and publishing results widely, and modeling ethical conduct among AHRD leaders. In brief, the development of the *Standards* provides a blueprint for further development of professional ethics. Reinforcing these standards, a critical next step for the Academy’s role as a professional association, involves a commitment to act upon them.

Understanding the Work Beliefs of Nonprofit Executives through Organizational Stories

Ava S. Wilensky
CORE InSites

Carol D. Hansen
Georgia State University

To strategically support the unique needs of nonprofits, HRD scholars and practitioners require a deeper understanding of the culture and of their executives who shape their belief systems. Through qualitative interviews that featured a story component, a core theoretical concept emerged that suggested that nonprofit executives are a diffuse managerial subculture. The study’s participants saw themselves operating in a complicated and ambiguous world as they balanced business and personnel requirements with the spiritual motivation of their service mission.

Keywords: Nonprofit Executives, Qualitative Research, Stories

Today, more than ever, HRD is needed in nonprofit organizations. Driven by a dwindling volunteer population, a larger reliance on a small but permanent staff, and demands for improved structure and greater accountability (McFarland, 1999; Young, Banis, & Bailey, 1996), our expertise is called upon to help these agencies more carefully align personnel requirements and organizational structures with missions and business objectives (Sheehan, 1996). To effectively nurture cultures where new systems of performance management can thrive, HRD professionals must clearly understand the assumptions and goals of nonprofits, in general, and of their executives, in particular. Available research on nonprofit executives is limited in its quantity and its theoretical grounding. Missing, in particular, are data that explore the cultural side of nonprofits (Austin, 1989; Levy, 1988; Schmid, Bargal & Hasenfeld, 1991; Young, 1987) and the perspectives and behaviors of their directors.

Problem Statement

Studies suggest that an organization’s executives greatly shape formal and informal codes and assumptions (Hansen & Kahnweiler, 1997; Kouzes, 1999; Schein, 1985; Trice & Beyer, 1993) and thereby influence our strategic significance (Hansen & Kahnweiler, 1995). What we know about the subculture of executives’ beliefs comes mostly from research conducted in the for-profit sector (e.g. Gustafson, 1984; Jackall, 1988; Knudsen, 1982). However, nonprofit organizations are different (Drucker, 1990a, 1990b; Egri & Herman, 2000; Gelatt, 1992; Najam, A., 1996; Vladeck, 1988) and their environments offer greater challenges and hazards to our field. Because the goals of nonprofits are typically not hard financial targets, but soft human issues that must respond to the sometimes diverse needs of multiple contingencies, accountability is an ever-present struggle (Luecke, Shortill, Meeting, 1999; McDonald, 1996; Rojas, 2000). Likewise, forecasting is less predictable as nonprofits are often at least partially staffed by volunteers and funded by grants and/or charitable contributions (Heimovics, Herman, & Coughlin 1993). It is this sense of ambiguity and uncertainty that causes the systematic application and accountability of HRD interventions to be a formidable task.

Theoretical Framework and Research Questions

The most extensive form of sub-cultural patterning is linked to the kind of work people do. Occupational subcultures are distinct groupings within a larger organizational culture (Trice & Beyer, 1993) and are cohesive despite the fact that they typically cross organizational boundaries and often lack consistent face-to-face interactions (Haralambos & Holborn, 1991). Shared tenets spread throughout the subculture forging professional ties, creating social bonds, and influencing each executive manager and his or her respective organization (Trice & Beyer, 1993).

This theoretical body offered a foundation for the following research questions.

- In what way(s) do nonprofit executives define their function and mission?
• What do nonprofit executives see as significant motivating factors, obstacles or risks in their organizations?

Of particular interest to our study was prior research on for-profit executives (Hansen & Kahnweiler, 1997; Mintzberg, 1973, 1989). Mintzberg's findings supported our own by showing that a manager's work is fragmented, diverse, and with much emphasis on personnel issues. Hansen and Kahnweiler also found that people concerns were a high priority. In particular, their data illustrated the executives' tendency to reproduce their own values by unconsciously promoting and grooming individuals who shared their belief systems. Additionally, business acumen was valued more than technical skill. In nonprofits, permanent staff is small in number and typically hired for their technical knowledge. This difference led to the following research question by causing us to wonder how nonprofit executives might view personnel development and its link to organizational missions.

• How do nonprofit executives see themselves, their personnel and their organizational structures and missions as similar or different from their for-profit counterparts?

Finally, a study of HRD specialists in for-profit organizations by Hansen, Kahnweiler, and Wilensky (1994) indicated that practitioners in our field were highly dependent on the strategic support of executive management in order to carry out their work. An HRD specialist's ability to gain this aid was influenced by the degree to which the practitioner's goals and tactics were similar and therefore compatible with the cultural beliefs of executive management (Hansen & Kahnweiler, 1995). We thus asked the following research question.

• How might the beliefs of nonprofit executives influence HRD goals, priorities, and strategies?

Methodology

We chose the organizational story as a tool for studying the subculture of nonprofit executives (Conger, 1998; Hansen & Kahnweiler, 1993). More than most other data collection methods, stories allow researchers to examine perceptions that are often filtered, denied, or not in the informants' consciousness (Martin, 1982). As such, it is not necessary for stories to be factual representations of events, relationships, or ideology. Rather, a story reflects what a cultural member believes to be true, not what others may confirm as true. (Feldman, 1991; Martin, 1982; Martin & Powers, 1983; Mohan, 1993).

A unique aspect of the story analysis used in this study was the examination of the stories' individual components. Drawing from previous research models (Hansen & Kahnweiler, 1993; Hansen, Kahnweiler, & Wilensky, 1994), story elements included heroes, villains, motivating forces, morals, and plot development. It has been found that a subject's perception of what constitutes a hero or a dilemma, for example, influences plot development and subsequently reveals what the informant considers to be positive or negative forces and conflict resolution methods (Hansen & Kahnweiler, 1993).

Story data were collected by the lead author through open-ended interviews with 28 executives (11 females and 17 males) from 28 organizations and provided the primary data set for this study. At the time of the research, each interview participant was serving as director or assistant director of a national or international nonprofit organization. Interviews took place at each nonprofit's U.S. headquarters in Atlanta, Boston, New York, or Washington, D.C. Participants were obtained using snowball sampling which allowed key participants to identify social and professional networks from which the interviewees were drawn (Bernard, 1988). In line with guidelines developed by Herman and Heimovics (1989, 1990, 1991) the participants came from publicly supported nonprofit organizations; executives from grant making foundations or religious institutions were not included, and executives from hospitals and colleges were excluded on the basis of institutional complexity and competition from other sectors.

Individual interviews were audiotaped and transcribed. They lasted between an hour and two hours and consisted of two parts. First, participants were asked to relate a short story about their organization. Following, a semi-structured interview scheme, participants were asked to identify the story components and these interpretations offered a base for probing their beliefs related to the research questions. Triangulation was accomplished through the review of executives' annual reports letters as cultural artifacts and through the observation of executives' focus groups. The study utilized grounded theory methodology to inductively code and derive categories and thematic relations (Strauss & Corbin, 1990). While the data from this qualitative study are not generalizable, and are limited to nonprofit organizations, we believe that the findings illustrate probable differences between the for-profit and nonprofit sectors.
Research Findings and Conclusions

The results are organized and presented in accordance to their link with the first three research questions. The fourth research question connecting this study's findings to the work of HRD practitioners is addressed the final section of this paper.

Missions and Functions

While exploring the first of the four story elements (heroes, heroines, and positive forces), we found that executives were very willing to discuss the positive aspects of their organizations, usually intertwining their missions and visions of their organizations with this component. In executives' stories, the mission of the organization was often described in terms of its ethical commitment to serve the community and address societal problems. Throughout the data, the mission was communicated with great passion and commitment, typically concerning lofty ideals and values about human potential and the necessity of equalizing the imbalances and injustices that exist in contemporary societies. Culminating in a kind of spiritual expression, the executives saw work in nonprofits as encompassing a social consciousness and commitment as well as divine inspiration and benevolence. This spiritual expression permeated these executives' conceptualizations of work. The challenge was to change the world by making a difference in the lives of individuals. Through building capacity, providing support, administering care, and critical intervention, executives perceived the work of nonprofits as a way to affect and heal humanity. A participant wrote:

I think we have to live our lives with purpose and meaning and we have to make sure the world is better when we leave it than when we found it. I think we have to model caring and concern for our children and our friends. This agency allows me to do it. We live in a world where we have to learn to live with others and build ties with them. You hope the world can change. But nothing will happen if you don’t go out and do it.

Having limited administrative budget and support staff, nonprofit executives typically viewed their power to come not from financial ownership in the company, but primarily from their ability to maneuver and motivate people around the mission. They spoke, in particular, about change issues, which were frequently worrisome to the board, staff, and clients. Thus, organizing and monitoring these stakeholders was a substantial responsibility and consumed extensive amounts of their time and energy.

Organizational and personnel development also emerged as an important functional role that served as the focus of story plots. In particular, the participants were concerned with altering organizational systems to remain current and responsive to their rapidly changing circumstances. To this end, an organization's people (both staff and volunteers) were considered to be its essential strength. A participant said:

We are made up of a very small paid professional staff. I really believe that Drucker is right. I don't believe there are any volunteers; there is paid and unpaid staff. And our volunteers are the vast majority of our organization. They are the unpaid staff. And we treat them as staff in that we give them as much quality information as we can in order for them to move us toward the mission of our organization. Our job as paid staff is to make sure that we research, find the answers, ask the questions, and develop the techniques by which these volunteers can be effective.

Of note was that over half of the stories' plots concerned the offering of quality services that would empower and change people's lives in times of bottom-line accountability. Thus, finding adequate funds to provide programs intrinsic to their organizational missions and administering their operations in a cost-efficient manner also emerged as another fundamental part of their work. This function was described as difficult and the lack of business acumen was often seen as a story villain. Much of this data was linked to the second research question regarding perceived obstacles.

Motivating Forces, Obstacles, and Risks

The spirituality associated with the participants' work was a primary motivating force. This point is particularly remarkable when considering that no religious institutions were included in the sample. These executives frequently regarded ethical principles as the hero or positive force of their stories. A concern for ethics thus provided the main catalyst for offering quality services that were superior to those mandated by government legislation. Established on high ideals and ethical foundations, this quality was often portrayed as the embodiment or articulation of divine inspiration. Divine inspiration was the basis of the executives' explanations for the ability to persevere through trials and barriers in order to accomplish their organizations' missions. One participant stated:
(We) run what is something between a cross of a business and a ministry. You've got to be called to this kind of work and see that there is a way to serve, to give back.

In addition, people were consistently identified as heroes and motivating forces in participants' stories. Executives frequently mentioned their appreciation of volunteers in moving their organizations' missions forward. It is noteworthy that, while focusing on the abilities of others, executives repeatedly denied or diminished their own individual importance in the organization. Moreover, this self-effacing quality was apparent when executives judged the significance of the organizational mission to be more consequential than the talents or importance of any one particular individual.

Executives also saw people as the primary impediment to the progress or delivery of services of the organization. Participants identified people who misused power, who did not have a vision or a realistic understanding of the problems that the organization addressed, and who would not collaborate or cooperate with change actions, as villains and hindrances. An executive explained:

"It is interesting that no one articulating an [oppositional] view has ever come out of working directly with the people. And it's in your relationships with people that the judgments tend to fall away, when you really understand what you're up against. And I suspect that a lot of political people produce this armchair philosophy, judging people from a distance, and don't really understand the reality of the situation."

As the fourth story element, the stories' morals taught the importance of having faith in all people, be they internal or external to the organization, along with the importance of accepting social responsibility for the less fortunate. People were viewed as having the ability to improve their lives or change the lives of others. Finally, the general ambiance of the government, as well as the organization's relationship with the community or population it served, had important bearing on the ability of the executive and his or her organization to fulfill the mission and serve its clients. Executives perceived meeting the needs of clients as the most important barometer of organizational success and as the primary reinforcement for nonprofit work. Of particular note was a belief in the importance of offering quality services through committed people who were open to change and collaboration but whose work was constrained and complicated by legislated mandates and funding control.

**Comparison to For-Profit Counterparts**

Without exception, nonprofit executives believed that for-profit organizations are more easily managed and accomplish tasks in a relatively simplistic manner. For-profits were seen as existing to produce specific goods or services for consumers who had a disposable income. Moreover, for-profit executive management was seen as having a large budget and support staff with which to exercise extensive control over organizational processes, products, employees, and other stakeholders. The lack of which often played the villain in the participants' stories.

Because the nonprofit product was less concrete and definitively more people-focused than a for-profit product, executives believed that a bottom-line evaluation of success was difficult at best. They concluded that the unique demands generated by stakeholders and the instability of funding assurance, coupled with the lack of predefined and reinforced positional power made executive management in this sector a unique experience. Executives concluded that the bulk of operational processes could take place in any venue or sector, but that funding concerns and managing volunteers presented unique situations only present in the nonprofit world.

**Conclusions**

Strong consistent patterns from the study's participants regarding how work was defined are in keeping with studies of occupational cultures (e.g. Trice & Beyer, 1993). A particular distinction of these findings was the altruistic nature of the participants' calling and organizational goals. As a contrast, studies of for-profit executives have addressed the functional nature of their work; they have not included spirituality as a primary aspect (e.g. Daft & Weick, 1984; Moussavi & Evans, 1993). This common sense of "being different" from for-profit counterparts was an important theme that emerged in data associated in the third research question and a key denominator in the sub-cultural development of nonprofit executives. Additional aspects of occupational bonding found in the data addressed the second research question. These included similar perceptions of threat in the form of external constraints, inter-organizational competition for and the instability of funds, and an unrealistic or disinterested societal grasp of their work. Two final bonds that are consistent with the literature on occupational sub-cultures were the inability to distinguish work from non-work and the belief that self-image is enhanced by one's labor. The data from this study indicated that these criteria were fulfilled through an ethical focus and a spiritual expression of the participants' service missions.
Inspirational and benevolent qualities that both distinguished and motivated these executives was based on a strong ethical commitment that has been suggested in prior research. O'Neil (1992) for example, theorized that in nonprofits, ethical issues are more important and therefore, management is more complex than in other sectors. Also confirming this premise, Rubin (1990) developed a theory of sectorial ethics and surmised that legal and normative ethics in relation to administrative and technical practices in nonprofits were more complex than in for-profits.

Implications for HRD

Not only do the perspectives of top executives influence how an organization's mission is interpreted, it is also important to note that top management influences the nature of educational and developmental interventions not only for themselves, but also for their employees (Raghuram, 1994). Data from this study confirm such tendencies in the nonprofit sector. It thus seems reasonable to assume that, as in the for-profit sector, dissonance between the work of HRD specialists and the organization's prevailing beliefs may send confusing signals and often results in low employee retention, performance, and morale. The more knowledge we garner about executive management in nonprofits, the easier it will be for HRD professionals to determine what organizational and employee development goals, strategies, and priorities will most effectively support both functional and spiritual missions.

Goals and Priorities

This study confirmed that consistent with their counterparts in other sectors, nonprofit executives place high priority on their staff. This finding is constant with studies that stress the alignment of personnel skills, a sense of identity (Dutton & Dukeridge, 1991; Margolis, 1998), and a shared mindset (Ulrich et al., 1993) with an organization's beliefs and goals and thus suggests that the recruitment and retention of appropriate staff is paramount. Nonprofits need staffs that, like their executives, are motivated by the spiritual expression of their mission. This is a baseline criterion for these personnel; however, it may not be entirely limited to this sector. While for-profit executives appear to be more driven by financial gain, their employees are increasingly motivated by spiritual work connections which may be a factor in retaining talent, and drive alignment concerns as recently evidenced in both the academic and practitioner literature (e.g. Moxley, 1999; Vaill, 1998). Staff are also needed whose business acumen enables them to carry out the functional mission while possessing the spiritual values needed to embrace the ethical principles of the organization's societal charge. As nonprofit executives perceive their roles and organizations to be culturally fraught with unique and complicated conditions, it is also critical to hire personnel who can cope with the ambiguity of changing environments and accountability issues that are often difficult to control and define.

As nonprofits respond to the new demands of their constituents, they will need management systems that support more efficient work styles, leveraging of resources, and strategic planning. Nonprofits can reduce fear and support change by transforming their cultures into learning organizations that benefit from cross-functional collaboration and the sharing of lessons learned from prior successes and failures. Such environments are generally associated with collective meanings (Dixon, 1997) and lead to high trust cultures which are considered to be more effective in promoting synergistic problem solving and innovative risk taking (e.g. Fukuyama, 1995; Organ & Ryan, 1995; Van Dyne, Cummings & Parks, 1995).

Strategies

Finally, in implementing these recommendations, HRD professionals must gain the trust of nonprofit executives in order to obtain resources, have autonomy, and be influential. Research on trust (Kramer, Brewer & Hanna, 1996) suggests that such bonds occur from viewing organizational threats in a similar way and by developing a willingness to depend on others. Studies of trust and top management in the for-profit sector suggest that confidence concerns are extremely important to them because they must make important decisions based on very little certainty (McCall & Lombardo, 1983). Data from this study suggest that the issue of trust may be even more important for the nonprofit executive who sees himself as operating with less control than his or her private sector counterparts.

Work-related Values of Managers and Subordinates in Manufacturing Companies in Germany, Georgia, Kazakhstan, the Kyrgyz Republic, Russia, and the U.S.

K. Peter Kuchinke
Alexander Ardichvili
University of Illinois at Urbana/Champaign

This paper is based on a survey of over 4,000 respondents from ten manufacturing companies in two Western countries and four countries of the former Soviet Union. The study is using Hofstede's framework and instrumentation, and explores work-related culture dimensions of managers and employees in the ten companies. The results point to within and between country variation in cultural dimensions, differences between managers and their subordinates, and the influence of demographic factors on culture.

Keywords: Culture, International HRD, Work values

One of the focal issues in comparative and cross-cultural organizational, management, and human resource-related research is the impact of culture and cultural values on management and organizational behavior. Societal culture, which can be described as a "collective mental programming" of people who share a similar environment, shapes work-related cultural values and behavior in organizations (Hofstede, 1997). In recent years, given the expanding international trade, business, and investment activities, and the growing presence and influence of multinational enterprises (MNEs) throughout the world, research on work-related cultural values has grown both in amount and criticality (Thomas & Mueller, 2000). Understanding variations in multiple cultures and the differences in work-related values across the globe is an essential criterion for competitive survival (Adler, 1991). Inadequate awareness of international variations in cultural systems, including values, can exacerbate expatriate failure (Black & Mendenhall, 1989; Nicholson, Stepina, & Hochwarter, 1990; Tung, 1987). It has been observed that business practices vary as a result of work-related cultural value differences (Ronen, 1986; Ronen & Shenkar, 1985), that management styles are culture-specific (Bartlett & Goshal, 1992; Carlson, Fernandez, & Stepina, 1996; Dorfman & Howell, 1988; England, 1978; Ronen & Shenkar, 1985), that human resource management practices must be tailored to fit local conditions (Nasierowski & Coleman, 1997), and that national culture affects the value and belief components of organizational culture (Cavenaugh, 1990; Chatman, 1989; Louis, 1983; Schein, 1992).

This paper reports the results of an empirical study of work-related culture dimensions of managers and employees. The study represents the first attempt to compare work-related cultural values of managers and employees in four countries of the former Soviet Union, and in the West, which is especially important given the need for generating normative recommendations for policy makers, business executives, investors, and training professionals seeking to facilitate the transition of the newly independent states to a democratic society and market economy. The study was conducted in ten manufacturing enterprises in four countries of the former Soviet Union (Russia, Georgia, Kazakhstan, and Kyrgyz Republic), and two countries of the West (the US and Germany). The choice of these countries was dictated by the following design considerations. First, we wanted to compare countries with established market economies and those undergoing radical economic transition; second, we wanted countries in the two groups to share, on the one hand, institutional, political, and economic frameworks, and to have, on the other hand, different socio-cultural and historical backgrounds. The four post-communist countries in this study share institutional and economic frameworks that emerged as a result of more than 70 years of communist regime. At the same time, they have different historical and cultural legacies: Georgia, the Kyrgyz Republic, and Kazakhstan have been absorbed by the Russian empire fairly recently (in the 19th century), have long and rich histories of prior independent statehood and cultural development, and all have different official languages (Brown, 1994). Similarly, Germany and the US share the foundations of the economic system (capitalist market economy), and have similar levels of technological and economic development, but have significantly different socio-cultural, political, and historical legacies. Finally, we have chosen companies from the same sector of industry—manufacturing—as opposed to services, transportation, or agriculture. Thus, controlling for a number of country-

level environmental factors, and for the industry factors, we created conditions under which the similarities and differences in work-related value dimensions observed in different countries become more salient.

The study focuses on three major research questions: 1) the degree of variance of work-related cultural dimensions between the six countries; 2) the level of variance in cultural dimensions between two groups of respondents: managers and non-managerial employees; and 3) the role of demographic characteristics (age, gender, and education) in variation of socio-cultural value dimensions.

The five dimensions of Hofstede's framework, used in this study, are well known. The first dimension is Power Distance (PDI), defined as the degree of inequality among people that the population of a country considers as normal. The second dimension, Individualism (IND), is the degree to which people prefer to act as individuals rather than as members of groups. The third dimension, Masculinity (MAS), is the degree to which such "masculine" values, as assertiveness, competition, and success are emphasized as opposed to such values as quality of life, warm personal relationships, and service. Uncertainty Avoidance (UAI), the fourth dimension, is the degree to which people in a country prefer structured over unstructured situations. Finally, the fifth dimension—Long-term Orientation (LTO), was intended to account for specific traits of many Asian cultures, which have not been covered by the first four dimensions (Hofstede, 1993). Long-term Orientation is defined as the degree to which people's actions are driven by long-term goals and results, rather than the short-term results and the need for immediate gratification.

According to Hofstede (1997), the U.S. business culture is characterized by low PDI, LTO, and UAI, and high IND and MAS. German managers display low PDI and LTO, and high UAI, MAS, and IND. Regarding Russian managers, Hofstede hypothesized that they would be characterized by high PDI, high UAI, medium-range IND and low MAS (Hofstede, 1993). Bollinger (1994) and Naumov (1996) tested Hofstede's hypotheses in their studies of Russian managers, and found support for these predictions on all four dimensions. Elenkov (1997), in his comparative study utilizing Hofstede's dimensions, found that the U.S. managers are more individualistic than their Russian counterparts and the managerial culture in the United States is also characterized by lower power distance, and uncertainty avoidance than the Russian managerial culture.

Prior research providing data on Hofstede's socio-cultural value dimensions for Georgia, Kazakhstan, or Kyrgyz Republic could not be found. Thus, due to the lack of specific findings on these three countries, relational hypotheses regarding the differences in socio-cultural dimensions between all 6 countries in this study could not be developed, and our first research question was formulated as follows:

R1: What are the socio-cultural value dimensions of managers and employees in selected organizations in the six countries? Are there significant differences between these six countries on any of the socio-cultural dimensions?

National culture interacts with occupational culture (Hofstede, 1980; 1997; Trompenaars, 1997). Trompenaars (1997) indicates that "people with certain functions will tend to share certain professional and ethical considerations" (p. 7). Regarding the dimensions used in this study, Hofstede (1997) has found the following relationships between occupational status and culture. First, if a country scored high on PDI, this applied to all occupational levels; in low PDI countries, employees with lower occupational status (e.g., production or clerical employees) had much higher PDI scores than middle and high status professionals and managers (Hofstede, 1997, pp. 30-31). Regarding masculinity, Hofstede (1997) found that the higher status people display lower levels of MAS than skilled production employees (pp. 86-87). On the other hand, Hofstede's (1997) results on IND and UAI suggest that people in different occupations could not be classified into "individualist" or "collectivist" (p.57), or uncertainty avoiding and non-avoiding (p. 117) groups. Follow-up studies have confirmed only some of these observations. Thus, McGrath, MacMillan, and Scheinberg's (1992) have found that managers, when compared to entrepreneurs, had lower Power Distance, Individualism, and Masculinity, and higher Uncertainty Avoidance. Managers, when compared with engineers and production employees, have been found, in a German/US comparative context, to be more highly individualistic, more masculine, and lower on power distance (Kuchinke, 1999). To investigate the impact of occupational culture in the six countries in this study, the following question was formulated:

R2: Are there significant differences in socio-cultural values between managers and non-managers in the six countries on any of the five dimensions?

Hofstede's (1980; 1997) research also indicated the relationship between demographic variables and culture, this relationship allowing to differentiate between groups within a given country. This relationship is complicated by the interaction between the demographic variables. To give just one example, Hofstede (1997) indicates that young men (age bracket 20-29) hold strongly masculine (assertive) values, and young women—moderately masculine values. At the same time, older men (50-59) hold strongly feminine values and have scores comparable to older women (50-59). Hofstede cautions that gender, age, and social class cultures, being categories
within larger social systems (national cultures), can only partially be classified according to the five dimensions, since not all dimensions ally to them (p. 17). To investigate the impact of demographic characteristics, the third research question was formulated as follows:

R3: What are the effects of demographic differences in age, gender, and education on socio-cultural values in the six countries on any of the five dimensions of culture?

Method

This study was conducted using causal-comparative, one-shot survey design (Howell, 1992). Twelve sites (3 divisions of one company and 9 independent companies) in six countries were surveyed. Companies in the former USSR were identified and contacted by the Center of Sociological Research (CSR) of the University of Moscow (three companies in Russia, three in Kyrgyz Republic, two in Kazakhstan, and one in Georgia). All ten firms were in the manufacturing sector of industry. Two levels of employees were surveyed: middle-level managers, and non-managerial employees, including engineers and production employees. A survey was administered to stratified random samples of employees of each of the companies in the U.S., Russia and Kazakhstan, and to populations of all employees in Germany, Georgia and the Kyrgyz republic.

The five work-related cultural value constructs were measured by using Hofstede's 1994 version of the Values Survey Module, VSM 94 (Hofstede, n.d.). The VSM 94 has been used extensively in the past and have known psychometric properties (Søndergaard, 1994). The instruments were obtained from the test author in the English and German versions and given to the U.S. and German participants in their native languages. The survey was conducted in Russian in Russia, Kazakhstan and the Kyrgyz Republic, and in Georgian in the Georgian Republic. The instrument was translated into Russian and Georgian by the representatives of the CSR. A back translation was made by independent translators. The translations were compared to the original sources to identify and correct errors that could have arisen from interpretation differences. A pilot survey was conducted with a sample of 100 employees of an experimental plant of the University of Moscow to identify potential problems with the interpretation of terms and concepts.

Since we were interested in country-level comparisons, the results reported in this manuscript are based on pooled country-level data. The country-level response rates ranged from 31% in Russia to 75% in Kyrgyz Republic, with the total number of usable responses at 4,065. To address the issue of possible response bias, chi-square comparisons were made between the demographic data on respondents and on all employees in a given company, obtained from the personnel departments. These comparisons showed no significant differences between survey respondents and non-respondents in the two job categories on key demographic variables. The overall percentage of male respondents was 68%, and higher than 70% in Georgia, Germany, and the US. The two US sites had a much older population with a modal age between 50 and 59 years, while the overall age bracket for the 6 countries was 30 to 39 years. Managers at the German and U.S. sites had a modal level of education comparable to a Master's degree, while non-managerial employees at the German site had a higher modal level of education than their U.S. counterparts. Overall, the educational levels of employees and managers in all four countries of the former USSR were high, with the majority of managers possessing a 5-year college degree or higher, and the majority of employees having at least a 2-year college degree.

Results

The scores for the five dimensions of culture, PDI, IND, MAS, UAI, and LTO were calculated based on the formulae provided by the test authors (Hofstede, n.d.) using weighted means of individual items and constants which result in a distribution ranging from 0 - 100, although higher or lower scores are possible (Hofstede, 1994). This allows for comparisons with previously published scores. The internal reliability for the entire instrument was $\alpha = .88$, but the dimension of Uncertainty Avoidance fell short of the minimum required and was therefore excluded from the analyses. This dimension had shown poor internal reliability in previous studies (see, for example, Kuchinke, 1999; Yeh, 1988). The MAS scale also fell below the recommended value but was included in the analyses because it approximated the cut-off score. However, the low reliability coefficient of $\alpha = .53$ for this dimension raises concerns about its factor structure, and this needs to be seen as a limitation to the study. While most of the culture scores were within the range of 0 - 100, several countries scored above or below. Power Distance scores, in particular, were negative for the four countries of the former Soviet Union, indicating very low levels of this dimension. Although direct comparisons with previously published country scores are not possible—Hofstede's dimensions are meaningful in comparing countries, not tracking change over time—several observations arise. In the original study of IBM employees in 39 countries (Hofstede, 1980), the US had ranked higher in PDI
than Germany, in this study, the ranking was reversed. Hofstede's (1993) prediction of high PDI scores among Russian employees was not supported by this study. On the contrary, Russia and the three other former communist countries scored uniformly very low on this dimension. True to prediction and previous findings, the US led the list of countries in Individualism. All four countries of the former Soviet Union scored near the top on MAS. Russia and the Republic of Georgia showed higher levels of long-term orientation than the other four countries.

To answer the questions about country-level differences, a multivariate analysis of co-variance (MANCOVA) was conducted with Country as the independent variable and demographic information (age, gender, and education) as well as job category statistically controlled for. To correct for the heterogeneity of variances among the dimensions (a violation of assumptions for MANCOVA), the sample sizes for each country were equalized by selecting, at random, a sample of 392 from each of the six countries. Given equal sample sizes, as Bray and Maxwell (1985) point out, "all of the test statistics tend to be robust, unless the sample sizes are small" (p. 34). An omnibus MANCOVA showed significant differences (p < .001). Follow-up univariate analyses of covariance (ANCOVAs) using conservative Scheffe post-hoc tests showed these differences in more detail. To facilitate the description of the contrasts in culture dimensions, Table 2 also indicates which countries differ on each dimension. The four countries of the former Soviet Union had uniformly low levels of Power Distance compared to the US and Germany. These four countries also differed from their Western neighbors in terms of Masculinity. Levels of Individualism varied to a much lesser degree, with US employees showing the highest level.

Hofstede (1980; 1997) had pointed to the interaction effects of country and occupation and presented some initial evidence that occupational cultures, indeed, moderate country effects. In this study, the differences between managers and non-managers were assessed. Significant differences between both occupations groups were found for the entire sample and for each of the six countries. Overall, managers tended to be lower on PDI, more highly individualistic, subscribing to more masculine values, and were less oriented towards the long term. Individual countries, however, differed from the overall sample. For PDI, only Russia and Georgia showed differences between managers and non-managers. Russian managers tended to have lower PDI scores than non-managers, while Georgian managers ranked higher. In Russia, Kyrgyzstan, and the U.S., managers expressed more highly individualistic values. Masculinity differentiated the two occupational groups only in Georgia where managers subscribed to values that were oriented more towards caring and nurturing. Long-term orientation, finally, was found to differ between the two groups in Kazakhstan and Germany. In both countries, managers were less oriented towards the long-term than their subordinates. Cultural values are influenced by country, occupational, and demographic variables. To assess the relative strength of each, hierarchical regression analyses were conducted for each of the four culture dimensions as dependent and three sets of forced-entered independent variables: (1) country; (2) job category; and (3) age, gender, and education level. For each dimension, country membership emerged as the strongest predictor, explaining between 35% (LTO) and 46% (PDI) of variance. Job category emerged as a predictor only for IND and added very little to the variance. Age, gender, and education were significant predictors for all four dimensions, but here, too, their contributions to the variance in the dependent variables were small.

The final set of analyses addressed the effects of age, gender, and education and their interaction on cultural values. Univariate analyses were conducted for each of the four dimensions of culture and the three demographic variables as independent variables, holding job category constant. The relationship between PDI and Education was curvilinear, with employees with a bachelor's degree being more highly accepting of an inequality of access to power than employees with higher or lower levels of education. Female employees scored significantly lower on the dimension than their male counterparts. Education levels also influenced IND, and here, too, the relationship was curvilinear: employees with high school education ranked much lower on this dimension than those without it and those with a bachelor's degree or higher. There was also an interaction effect between gender and age: male employees aged 40 or younger showed markedly higher levels of IND than their female peers, but males of age 41 or older scored lower than their female colleagues of similar age. For MAS, there was a monotonous increase in masculine values associated with age. For LTO, finally, the distributions by age and education levels were bimodal. Employees between 31 and 40 and those between 51 and 60 were less inclined to orient themselves toward the long-term than the other age brackets. Similarly, employees with a high school diploma and those with a master's degree as the highest level of education scored higher on this dimension (indicating lower levels of long-term orientation) than employees who did not graduate from high school or had attained a bachelor's degree.

Implications, Limitations, and Future Research Directions

Related to country-level comparisons, this study found significant differences to Hofstede's data on work values on some dimensions. Hofstede's (1984; 1997) data had indicated that both the US and Germany had low PDI, high IND, relatively high MAS, and low LTO. Our data confirmed the Hofstede results on IND, PDI, and LTO.
However, our findings differed from Hofstede’s results on MAS: for our sample, this index has migrated into the low category. A comparison of our data with findings by Rotondo et al. (1997) suggests that this observations may not be due to idiosyncrasies of our specific sample: our results are consistent with Rotondo et al. (1997) findings on PDI, IND, and MAS. Both Rotondo et al. and our findings on MAS could be indicative of a generational shift in work related values, away from assertiveness, materialism, and separation of women’s and men’s roles towards more nurturing atmosphere and conditions under which women increasingly gain positions of power and influence in the society.

Our study has also found significant differences with most of previously published scores for Russia. First, although previous studies have found high levels of PDI in Russian managers and employees (Bollinger, 1994; Naumov, 1996; Elenkov, 1998), we (and earlier Rotondo et al., 1997) have found low PDI scores for Russian respondents.

Regarding MAS, the study findings were in contrast with Hofstede’s (1993) predictions on Russia, and earlier findings by Bollinger (1994) and Naumov (1996) who argued that Russian managers ranked low on MAS. In this study, Russian managers and employees had high levels of MAS. Again, our results were consistent with the Rotondo et al. (1997) findings. The same high MAS scores were obtained for the other three countries of the former USSR. Among potential explanations for these results on MAS is, first, a possibility that a separation between men and women, characteristic of more traditional societies, is still significant in these four countries. At the same time, the MAS dimension is not just describing the gender role differences. Hofstede (1997) indicates that in highly masculine countries, such as many Latin American and Mediterranean nations, achievement, ambition, and possession are valued highly, and there is a greater centrality of work in the lives of individuals along with higher levels of work stress. Therefore, a high level of MAS in countries of the former USSR could be related to difficulties of the economic transition, which, among other things, put a much stronger emphasis on achieving material well-being, high status, and assertiveness in business transactions (see, e.g., Kabilina, 1997; Schreibman, 1998), than is the case in more stable market economies.

The six countries differed less on the dimension of Individualism. While the US was found to be highest, this sample showed Individualism in four of the remaining five countries to be equal and quite high. High levels of the Individualism dimension are associated with an orientation to the Self rather than the community, an emphasis on individual initiative and decisions, identity anchored in the individual rather than the collective, and the norms of autonomy, variety, and pleasure as opposed to order, duty, and security. It is possible that an increase in IND in the former Soviet Union could be traced back to the changes in environmental factors, especially the disappearance of guaranteed life-long employment, a drastic reduction in benefits and services provided by the state, and an increased need for reliance on individual strengths, talents, and hard work. This finding calls into question recent analysis by Kets De Vries, who argued that the “democratic centralism that lay so central at the heart of communism” (Kets De Vries, 2000, p. 76) remains, in fact, a distinguishing characteristic of Russia today.

One of the important implications of this study is that some cultural values might be rooted deeper in culture’s fabric and therefore could be less malleable than others. For instance, PDI and MAS scores for the US, Germany, and Russia were substantially different from the earlier reported levels, whereas IND and LTO were closer to the earlier reported or predicted scores. These findings offer a support for an observation made by McGrath et al. (1992) that some cultural values (e.g., PDI) are more malleable than others (e.g., IND). Thus, our study seems to provide support for Rotondo et al.’s (1997) conclusion that although a nation’s work-related values reveal deep-seated preferences for certain end states, they are subject to change over time as external environmental changes shape the society’s fabric. A practical implication of this finding for managers, researchers, and training professionals is that they should use caution in using work-related value classifications in their work. Instead of relying on previously generated scores, they may need to conduct specific assessments of work-related values for each individual organization they are working with.

Regarding the impact of demographic factors, our study concluded that nationality emerged as the most important predictor of all four work-related values while job classification or demographic characteristics accounted for very little in the variance of each work-related value. This finding speaks to the important role of nationality in culture, despite the fact that recent writing (e.g., Triandis, 1995) questioned the centrality of nationality for determining cultural values.

The study suggests that grouping countries based on cultural, geographic, or religious proximity could be questionable. For example, one could expect that Kazakhstan and the Kyrgyz republic, being closer to one another in terms of geographic location, religion and language, than to Russia and Georgia, would form a homogenous subset, and would differ from the other two republics of the former USSR. However, on all four socio-cultural dimensions, either one or both of the first two countries were aligned with Russia and/or Georgia. This suggests that any attempts to develop strategies, policies, or training programs for the former SU, or to conduct organization...
development interventions based on Western theories, should be tailored to each country’s specificity, and the former SU republics should not be treated as homogenous in their work cultures.

Valuing the Employment Brand: Attracting Talent that Fits

Diane M. Bergeron
Columbia University

Employment branding benefits both individuals and organizations. It functions as a recruiting tool in a competitive labor market and communicates the organization's values and work environment to potential applicants. Individuals may be more or less attracted to an organization depending on their type of career anchor and the extent to which their personal work values are similar to those of the organization. Specific propositions of this developing concept are discussed.

Keywords: Employment Brand, Recruiting, Work Values

Attracting and retaining top talent are two of the biggest challenges facing organizations today. Not only because of the decreasing size of the workforce but also because of the increased competition for the same talent pool. There are a number of trends that threaten a wide-ranging shortage in talent. Until this point, the executive population has grown more or less in line with the GDP. Today's reality is that the size of the workforce is decreasing. Baby boomers are beginning to retire in large numbers and the cohort group moving in to take their place, the 35-44 year-olds in the U.S., will decrease by 15% between 2000 and 2015. A survey of over 6,000 corporate executives revealed that 75% said their companies had insufficient human resources and that this talent shortage was hindering their ability for continued growth (Chambers, Handfield-Jones & Michaels, 1998). Compounding the labor shortage problem is an increase in competition for workers. A booming economy has given rise to a large number of small and medium-sized companies. These companies are targeting the same people as the larger firms and are proving to be fierce competition because of their greater opportunity for impact and wealth. Added to this equation is the Department of Labor's prediction that the number of white-collar jobs will increase over the coming years.

Once new talent has been brought into the organization, the challenge becomes one of employee retention. Turnover is a frustrating and expensive problem and costs industry an estimated $11 billion per year. The cost of replacing an individual can be greater than 100% of an individual's salary if extensive recruiting and relocation are involved (Singer & Fleming, 1997).

Companies are making major financial investments to attract talent and there has been an almost single-minded focus on recruiting by top organizations (Chambers et al., 1998). With technological advances, the manner in which organizations need to recruit candidates has undergone significant changes. Gone are the days when a company could easily control its image in the labor market. Company information is more easily accessible than ever before, with most of it coming from external sources (e.g., press releases, stock prices, analyst reports, Fortune 500 report, Wet Feet Press, etc.). Because of this, organizations need to be more vigilant in managing their employer image. If they do not, the competition will do it for them.

Organizational Identification

Employer image is important because it provides an identity which functions as an attractor for potential job applicants. Based on Tajfel's (1978, 1981) social identity theory (SIT), social identification is the perception of membership to some human collective or group. Some principles of social identification are relevant in explaining why individuals identify with organizations and their subsequent attraction to them. The first is that identification is a perceptual cognition not necessarily related to any behaviors or affective states and the second is that individuals personally experience the successes and failures of the group (Foote, 1951). This means that an individual does not necessarily need extensive contact with an organization to feel identified with it. In feeling this sense of identification, an organization's successes and failures can be personally experienced by the individual. Social identity theory maintains that identifying with specific social categories, such as an organization, enhances one's self-esteem (Tajfel, 1978).

Self-continuity is one of the principles of self-definition that explains both the attractiveness of an organizational image and why it increases identification (Dutton, Dukerich & Harquail, 1994). Steele (1998) maintains that individuals want to preserve the stability of their self-concepts over time and in different situations.
This stability is either augmented or diminished depending on the individual’s perception of his or her organization’s identity. Dutton et al. (1994) state that when an individual perceives an organization’s identity to be similar to his or her self-concept, it enhances the stability of the self-concept and can strengthen the person’s identification with the organization by making the perceived organizational identity more attractive. The first reason for this is that when organizational identity corresponds with one’s self-concept, it is easier to process and understand information. People pay attention to and process information pertaining to the self more easily than they process “self-irrelevant” information (Markus & Wurf, 1987). Thus, an organizational identity that matches the self may make that organization more attractive. The second reason for the increased attraction is that there are easier opportunities for self-expression when a person’s self-concept and an organization’s identity are similar (Shamir, 1991). Super’s (1957) self-concept theory posits that people attempt to actualize the skills, talents and interests reflective of their self-concept by means of their career choice. They actively seek a work environment that is similar to their goals, interests and skills (Holland, 1996; Super, 1988). It follows that individuals will be more attracted to an organization where they feel the freedom to show more of their true selves and can behave in ways that are characteristic of themselves and their values. This is because maintaining the integrity of the self and being internally consistent is important to people (Steele, 1998). Behaving consistently means acting in ways that are authentic and reflect one’s personality characteristics and values (Gecas, 1982).

In evaluating organizations for possible employment, job seekers usually have limited information (Rynes, 1991). Because it is difficult to obtain adequate information about the numerous aspects of a job before joining an organization, job seekers will use whatever information is available. Several studies on applicant attraction to firms have found that the amount of information provided positively influences attraction to the organization (e.g., Rynes & Miller, 1983). Individuals may use employer image as additional information in evaluating an organization and the components of the job. Just as consumers use brand images as signals about the quality of a product (Shapiro, 1983), applicants use employer images as signals about job characteristics.

**Person-Organization Fit**

Person-organization fit is defined as the congruence between patterns of organizational values and patterns of individual values. It is about what an individual values in an organization, such as it being a meritocracy (Chatman, 1989). Person-organization fit focuses on the interaction between the organizational values and the individual’s values and how it affects the person’s behaviors and attitudes. There is a tendency for people to choose situations and to perform better when organizational values match their own (Schneider, 1987). When people do not fit their environment they are more likely to leave the organization (Pervin & Rubin, 1967).

An individual’s employing organization is an important aspect of his or her social identity (Ashforth & Mael, 1989). When a person joins an organization, it makes a statement about the person’s values (Popovich & Wanous, 1982). Values are conceptualized as relatively stable individual characteristics, over which organizational socialization is unlikely to have much influence (Lusk & Oliver, 1974). Research on work values is based on the premise that they are derived from people’s basic value systems (George & Jones, 1997). A value system is “an enduring organization of beliefs concerning preferable modes of conduct or end-states of existence along a continuum of relative importance” (Rokeach, 1973, p. 5). Values are important because they guide behavior and provide individuals with criteria against which to characterize their work experiences (Lewin, 1951). Work values are a fundamental aspect of the work experience because they define the meaning that people derive from work, jobs and other organizational experiences (James & James, 1989). Values also function as abstract and relative evaluative standards by which people identify opportunities that will allow them to behave in their preferred modes of conduct (Rokeach, 1973). This would include making judgments about organizations as potential employers and the extent to which individuals would be able to behave in accordance with their values. Research conducted by Meir and Hasson (1982) found that when an individual’s values match the values of a particular organization, the individual will be happier and is more likely to maintain an association with that organization.

Research on the effects of work values and job choice decisions demonstrates that individuals are more likely to choose jobs whose value content is similar to their own value orientation (Judge & Bretz, 1992). This suggests that the applicant’s perception of the attractiveness of an organization may depend on the values that are emphasized within the organization. This is because a need for congruence causes people to seek consistency and integration among the different elements of their self-concept and making choices about what is really important is a way to maintain this self-consistency. These values constitute a major part of an individual’s self-concept and have been identified as instrumental and terminal values (Rokeach, 1973). Instrumental values are preferred modes of conduct and include values such as competence, sociality and integrity. Terminal values are preferred end states of being and include values such as personal gratification, self-actualization and security.
Schein (1990) says that dominant themes emerge for each person in the form of critical skills or abilities the person wants to employ or critical needs or values that govern one's orientation towards life. As time goes on, the self-concept begins to act as a guidance system and as an "anchor" that constrains career choices. He defines the career anchor as part of one's stable self-image and is "the one element in a person's self-concept that he or she will not give up, even in the face of difficult choices" (p. 18). The concept arose from a longitudinal study (Schein, 1978) about the key career choices and events of participants and why they had made certain choices. The reasons for the responses and the pattern of participants' feelings in making these choices were consistent although the career events and changes themselves were very different. Participants referred to being "pulled back to something that fitted better" when they tried a job that did not feel right to them (Schein, 1990, p. 20). This research, along with the interviews of several hundred people in different career stages, led to the development of eight career anchor categories. The career anchors are listed below along with a brief description of each:

Technical / Functional Competence. The exercise of their talent and the satisfaction of knowing they are experts is of supreme importance to this group. These people build a sense of identity around the technical or functional areas in which they are succeeding and they demand maximum autonomy in achieving organizational goals. Challenging work is the most important characteristic of their work.

General Managerial Competence – Key motives and values for these people are corporate advancement to higher levels of responsibility, opportunities for leadership and contributions to the success of the organization. Their work and their role in the organization must reflect this.

Autonomy / Independence – Regardless of the type of work, this group of people has an overriding need to do things in their own way, at their own pace and against their own standards. They cannot stand to be constrained by other people's rules, procedures, working hours and other norms. This type prefers clearly bounded work within his or her area of expertise.

Security / Stability – These people have an overriding need to organize their careers so that they feel safe and secure and so that future events are predictable. Jobs that require steady, predictable performance are preferred and the context of the work is more important than the nature of the work itself.

Entrepreneurial Creativity – People with this anchor have an overriding need to create new businesses of their own by developing new products or services, by building new organizations or by taking over existing businesses and reshaping them. The need to create is an obsession and there is a tendency to become easily bored, such that they constantly require new work challenges.

Sense of Service, Dedication to a Cause – These people are more concerned with central values they want to embody in their work. They are oriented more towards these values than toward actual talents or areas of competence involved. Career decisions are usually based on the desire to improve the world in some way. Being able to perform work that influences organizations or social policies in the direction of their values is important.

Pure Challenge – Some people anchor their careers in the perception that they can conquer anything or anybody. They define success as overcoming impossible obstacles, solving unsolvable problems or winning out over tough opponents. They seek increasingly difficult challenges and do not seem to care in what area the problem occurs.

Lifestyle – People who organize their existence around lifestyle are, in one sense, saying their careers are less important to them and, therefore, that they do not have a career anchor. This category is included because a growing number of people who are highly motivated toward meaningful careers are adding the condition that the career must be integrated with total lifestyle. (Schein, 1990, pp. 20-32)

These anchors have been found within a variety of occupations, such that people with different anchors can be found in the same occupation. For example, two marketing managers may have completely different career anchors, which suggest they may be attracted to work environments that espouse different value systems and have different organizational attributes.

Applicant perceptions of job and organizational attributes (compensation, work environment and type of work) have a positive direct effect on attraction to firms (Powell, 1984). Past research has shown that pay and advancement opportunities are important attributes in the job choice process (Feldman & Arnold, 1978; Rynes et al., 1983). The work of Judge et al. (1992) examined these two variables along with organizational values as influences on job choice decisions and found that pay and advancement opportunities were less important than values. Their research suggests that organizational work values are a major factor in job seekers' decisions when information about an organizational value system is available. This information is important to individuals in choosing between organizations and, by providing it, organizations may be able to increase the chances of person-organization fit. Judge et al. (1992) commented that job matching based on value congruence may function when the values are
salient, but it may be that the organization's value orientation is not often known to job seekers. The point is that work values can only have an effect on job choice decisions when they are made available. Therefore, it would behoove organizations to consider the messages they convey in their advertising and in their recruiting processes because the accuracy of this information may have implications for applicant attraction.

Employment Branding

Organizational identity is comprised of a shared understanding of the central and unique characteristics of the organization, which can be manifested in qualities such as values and beliefs, mission, structures and processes, and organizational climate (Albert & Whetten, 1985). The SIT literature suggests that the degree to which an organization can differentiate itself from others by providing a unique identity is a way to increase identification. Cable and Turban (2000) demonstrated that recruitment image is positively related to job seekers' evaluations of job characteristics, thus applicants use employer images as signals about job characteristics. An organization can provide persuasive signals about what it represents by influencing a variety of symbols (Pondy, Frost, Morgan & Dandridge, 1983). Some of these signals include the message the organization transmits to the labor market, the images used to visually represent its message and the vehicles to disseminate the message.

Because of increased competition and the current labor shortage, companies that do not distinguish themselves from their competitors are at a significant disadvantage when it comes to recruiting top people. The question is how a company distinguishes itself from its competitors. The answer lies in "employment branding"—the process of identifying what is unique about a company and marketing it to a target population. Branding has traditionally been used to refer to the process of marketing products. The lessons and principles of product marketing can be used to build and manage an employment brand. Employment branding is the establishment and cultivation of a substantive and unique impression in the minds of target applicants (Buss, 1988). It is a process that enables an organization to define and articulate its distinctive employment proposition relative to the competition. Comprised of the package of functional, economic and psychological benefits identified with the employing company (CLC, 1998), a brand is basically a promise to applicants regarding what it will be like to work for a company. The end game is to ensure that applicants have a clear perception of a company's employment value proposition. In developing a brand, a company is essentially building an ownable position in the marketplace that will provide it with a real competitive advantage in attracting talent to the organization. The relationship between the company and its applicants is based on trust and loyalty generated by consistent delivery of the brand promise (Kahler Holliday, 1997). A company creates its brand over time with strong consistent positioning, packaging and performance. Organizations see the branding of their employment offer as similar to the branding of a product in the marketplace. In this case, the labor market.

The employment brand is comprised of a number of attributes, each of which contributes to the strength of the brand. There are 12 dimensions that constitute the overall employment offer (Clemson, 1998): reward system; post employment; external reputation and awareness; policy and values; fairness and cooperation; corporate culture; communication; recruitment and induction; performance management; development; work environment; vision and leadership.

These twelve factors are taken into consideration in developing the employment brand. Branding is a process built from internal and external strengths as well as job applicant perceptions. If a company does not know its benefits and weaknesses from an employment perspective, the brand will not be based on reality. And if the brand is not based on reality it will not deliver on its promise to applicants. Therefore, in order to be effective, the employment brand must be based on research. Branding is the end point, not the starting point, of the process (Kahler Holliday, 1997).

Key Propositions of Employment Branding

**Proposition 1: Knowing the target audience results in a more effective employment brand.** A critical error in branding is to assume that the employment brand can be presented the same way to all target audiences. Brand campaigns do not always work and one of the reasons is because the brand may not "involve" the applicant. Involvement is a major concept in the marketing literature that describes consumer behavior and refers to the degree of personal relevance (Peter & Olson, 1987). Personal relevance is the extent to which an individual perceives the brand as helping to achieve consequences and values of importance to the individual. The more important and central these desired consequences and values, the higher the consumer's level of personal involvement (Peter et al., 1987). This being said, the brand has to be relevant to what the job applicant is seeking. The marketing of the brand is based on the values and needs of the target market. It is necessary to craft a message that is tailored to the types of
Job applicants and how it differs from an organization's own offer. This is especially important because, competitors communicate the subtle aspects (e.g., culture, values, quality of coworkers) of what it is like to work there. The cost of entry into the labor market. The brand will show applicants how the company is different and will have upgraded their offers so that past differentiators, such as salary and perks, are no longer strong draws—they are activated in an applicant's memory and included in his or her consideration set.

Proposition 2: Analyzing a company's employment offer results in a brand that better meets applicants' expectations. The marketing of a brand is, essentially, making a promise to the applicant that his or her experience will match what is being marketed. Employment branding is not about identifying the target group and then changing the brand content to become something the target applicant wants. It is about identifying what the company has to offer, letting the labor force applicants know about it and then figuratively asking the applicant if he or she is interested in being a part of that organization. In order for this to happen, branding needs to be based on solid research. Conducting internal surveys, focus groups and one-on-one interviews is the first step. This is the best way to insure that the process is data-based and will help to begin articulating the company's employment offer. The second step is to conduct focus groups of recent campus hires in the organization to find out the employment value proposition being offered. This group is still new enough to the organization to be able to describe the culture. The third step is to conduct individual interviews with recent hires and past graduate summer interns to get additional in-depth information. Experienced hires are interviewed to determine what a longer-term career with the company may look like and how to market this to prospective applicants. The fourth step is to obtain any existing survey data that may be available, such as a values survey or employee attitude survey.

A summary of the findings across the sources is compiled to develop a list of common themes that will begin to articulate the attributes of a company's employment offer. The themes are used to develop a tag line and supporting message that encapsulate the employment brand. The brand will enlighten applicants as to how the company is different and will communicate the subtle aspects (e.g., culture, values, quality of coworkers) of what it is like to work there. The tag line should be strong to convey something fundamental about the organization to the job applicant. Different functions or departments of the organization should be able to use the tag line and feel it is relevant. It should be vague enough to allow a number of different interpretations in order to have universal appeal.

Proposition 3: Targeting the employment brand to meet applicants' needs and values increases the value of the brand. Applicants evaluate brands in terms of the needs they meet and the values they help satisfy. Because of limitations in cognitive processing, applicants cannot consider each and every attribute of an employment brand when making a job choice decision. For this reason it is important to identify the attributes that are most important to applicants, how information about these attributes is remembered and how the brand rates on each of the attributes. Applicants, essentially consumers in the labor market, have different perspectives on the benefits and risks of joining a particular organization. Organizations can subdivide their target applicant pool based on the types of benefits that each group perceives the organization to have (i.e., any of the attributes or combination of attributes that comprise the brand). By increasing or decreasing the salience of brand attributes, a company can make its brand more appealing to certain subgroups of job applicants.

Proposition 4: Analyzing competitors' employment offers results in a more effective employment brand. Job applicants have a range of options in choosing an organization as an employer. Among these options are a number of alternatives, including type of organization (e.g., non-profit, government, corporate), industry (e.g., investment banking, consumer product, pharmaceutical) as well as the type of company within a chosen industry (e.g., Pfizer, Merck, Eli Lilly). Given their limited time, energy and cognitive capacity, applicants usually only consider a subset of organizations within this almost endless range of alternatives. This subset, known as a consideration set, is comprised of organizations with which the applicant is already familiar as well as organizations that the applicant has found accidentally or through intentional search (Peter et al., 1987). In the consideration set, awareness of some of the organizations may be activated directly from memory. If an applicant feels that he or she is already aware of the important choice alternatives, the applicant is unlikely to search any further. Therefore, an organization must be included in the consideration set of at least some applicants in order to be successful in its talent attraction efforts. Employment branding is a strategy that increases the likelihood that the organization will be activated in an applicant's memory and included in his or her consideration set.

It is difficult for companies to stake out a unique niche in the marketplace if they do not know what their competitors are offering. Competing employment offers should be analyzed to understand what is being offered to job applicants and how it differs from an organization's own offer. This is especially important because competitors have upgraded their offers so that past differentiators, such as salary and perks, are no longer strong draws—they are the cost of entry into the labor market. The brand will show applicants how the company is different and will communicate the subtle aspects (e.g., culture, values, quality of coworkers) of what it is like to work there.
Competitors must be constantly monitored because branding is not a static process. Other organizations can use their messages to reduce the effect of their competitors' brand value.

**Proposition 5:** Proper "packaging" is critical to the success of the employment brand. Organizations should view the packaging of their employment brand in the same manner in which they package their products or services. Part of the branding process consists of using a logo, tag line and supporting visuals to reflect the company's message. The packaging should be consistent across marketing materials (e.g., web site, brochures) in order to build and reinforce the brand. An applicant's contact with the company also influences the brand. The brand message should be visible in every point of contact with the applicant — from initial communication to final round interviews. If an applicant sees that the company does not "live its brand" in any of these interactions, the integrity of the company's message will be questioned.

**Proposition 6:** Proper marketing is critical to the success of the employment brand. Although the attributes of the employment brand account for its success or failure, the quality of the marketing strategy is also critical. At times, the image of the brand is the only relative advantage an organization has to offer. Within a specific industry, the employment brands offered are relatively equal in their functional utility to the applicant (i.e., in terms of being employed and fairly compensated). In order to heighten the differentiation from competitors, a favorable image is created through other elements of the marketing mix. Promotion is commonly used because it informs applicants as to what employment attributes they should be seeking and emphasizes the superiority of its brand in terms of those attributes. A number of distribution tactics can also be employed to gain an advantage over competitors. This can include mailed brochures, the type of magazines in which the organization advertises and the offerings on the company’s web site.

**Proposition 7:** The effectiveness of the employment brand can be measured. If a brand is the aggregate of a company’s promise, the job applicant's experience and the company's reputation, then it must be managed as conscientiously as the company's sales figures. By isolating and quantifying the elements of the brand, a company can track its recruiting efforts and strategize accordingly. Tracking studies of potential applicants' attitudes can help a company measure the effectiveness of the brand. By measuring the effect of the brand on its hiring numbers, a company can measure its return on investment. Measurement may include campus image surveys, company web site surveys, charting increases in applicant resumes or increases in hiring numbers. Measurement will also help identify any misperceptions and allow the company to revise the brand in order to correct them.

**Proposition 8:** Applicants' attitudes can be changed to perceive the employment brand more favorably. The strength of a brand is grounded in its constancy and repetition. Because of this, it is not advisable to frequently change the employment brand. In order to make the brand more effective, strategies can be devised to change applicant attitudes. There are three strategies that can help change attitudes: (a) add a new positive salient belief about the attitude object; (b) increase the strength of an existing positive belief, or (c) increase the evaluation of a strongly held belief (Lutz, 1975).

The most common attitude-change strategy is to add a new salient belief to the existing beliefs that an applicant has about the organization. This may entail adding a new attribute to the brand. Ideally the attribute would be one that tracking studies have shown to be of growing importance to applicants (e.g., work/life balance). Not only does this add another positive dimension to the brand, but it also addresses changing applicant needs. Changing the strength of already salient beliefs is another way that attitudes can be changed. This includes attempting to strengthen beliefs about positive attributes or weaken beliefs about negative attributes. Tracking studies are again useful in identifying the strengths and weaknesses of an organization's employment attributes. The third way to try and change attitudes is by changing the evaluative aspect of an existing, strongly held belief about a salient attribute. This entails linking a more positive, higher-ordered consequence to that attribute. An example is if the perception of entry-level compensation at an organization is viewed somewhat negatively. In the employment brand, the organization could emphasize its focus on development and link it to more rapid advancement in the organization, which leads to faster increases in pay than its competitors. These three strategies can be effective in changing applicants' attitudes to perceive the brand more favorably.

**Conclusion**

Employment branding benefits both the organization and the individual. By attracting applicants that fit the organization's work environment, a number of other benefits may be realized. Locke (1976) suggests that job
satisfaction is related to the extent that one’s work environment allows or encourages the attainment of one’s values. Research shows support for the relationship between value congruence and job satisfaction and organizational commitment (Meglino, Ravlin & Adkins, 1989). Better person-organization fit should also reduce turnover. In one study, O’Reilly and Chatman (1986) found that people who were attracted to an organization based on value congruence indicated high intentions to stay with the organization. In another study, Chatman (1991) found that a strong fit between organizational values and individuals’ values predicted employee satisfaction and intent to stay with the organization a year later. Congruence between individual and organizational values has also been linked to a higher likelihood of organization citizenship behavior (O’Reilly et al., 1986).

Employment branding can function as a recruiting tool that establishes a clear idea in the minds of job applicants as to what an organization is, what it stands for, and what it will provide for them. Just like traditional product marketing, the employment offer must meet applicant preferences, be differentiated from competing offers and have a strong reputation. Branding involves the creation of an indelible impression on job applicants through branded interactions with them. The impression is meant to be lasting and can build loyalty to a particular company when an applicant is evaluating his or her employment offers. A strong employment brand can be key to attracting talent in a competitive labor market. It is a way for companies to stand out from their competitors and can serve as a symbol that attracts immediate attention in the job market. Creating a brand requires a balance of applicant perceptions and wants, current company employment strengths and potential positionings within the competitive labor market. Building a brand now will ensure a stronger labor market position in the future.

Companies spend substantial effort to market their products but not nearly enough on marketing the company to prospective employees. Branding dollars need to be looked at as an investment in the future of the company and in the value of the employment brand. The aspects of the company that affect the brand need to be integrated in order to work together and deliver on the brand’s promise to applicants.

The concept of employment branding is still in the development stage. A more complete conceptual framework needs to be constructed in order to understand how the process operates. Companies can then use this strategic tool to distinguish themselves from competitors, polish their employer image and attract a better fit of talent to their organization.

Evaluation of the Method of Modelling: A Case Study of the Finnish Steel Industry

Ville Nurmi
Rautaruukki OYJ, Metsform

The study aims to evaluate the method of modelling. The method seeks to improve professional knowledge and skills of the participating persons. It also aims to develop the work processes, which are modeled. The method has been developed for the purposes of the pulp and paper industry to facilitate the transition from the manual process control to the automation systems. This case study is the first application in the steel industry.

Key words: Evaluation, Industry, Modelling

The paper has two intentions. First, to described the method of modelling as an educational implication to support both specific goal-directed transformative learning focused on work process, and learning in specific contexts, i.e. work places. Second, to evaluate the application of the method in order to identify its effectiveness in the industrial setting.

Problem Statement and Theoretical Framework

The method of modelling has been invented and developed by the researchers of the Finnish Institute of Occupational Health for the purposes of pulp and paper industry, during the transition from the manual process control systems to the automation systems in the late 1980s and early 1990s. In this study, the method is applied in the steel industry for the first time. Even though, the basic structure of the metal industry is quite the same than in the pulp and paper sector, it is necessary to identify the effectiveness of the method in this area. The modelling has been implemented also in the health and service sectors. There are not obvious limitations, why it could not be applied in almost any type of industry, where exists a need to improve the work process and vocational knowledge and skills of the personnel.

Individuals construct the various communication situations and countless observations continuously. These observations become mental models by the thinking process which human beings implement consciously and unconsciously. There are also mental models about the work processes. In order to improve the knowledge and skills of the personnel the mental models have to be shared and formulated to correspond the reality of the work place. The method of modelling of the work process has been developed to advance sharing of the individually constructed mental models among the members of the work unit. The transformation from the manual control systems to the automation systems was the practical need for the method (Bainbridge, 1992; Norman, 1983).

Research Questions

As mentioned in the problem statement section, the paper aims to describe the method of modelling and to evaluate it. There are not research questions for the description part. But it is evident that the description is necessary in building the foundation for the evaluation of the method.

For the evaluation part of the study, there are three specified research questions. First, is the method of modelling effective in improving the conceptual mastery of work among the participants? Second, is the method of modelling effective in improving the work atmosphere among the participating personnel groups? Third, is the method effective in improving the productivity of the production unit in the target organization?

Methodology

The description part of study includes a plain clarification about the method. It builds a foundation for the second
empirical part emphasizing the evaluation of modelling. The evaluation part includes three methods referring to the research questions.

To answer the first research question, the test of conceptual mastery of work is applied. The participating workers of the target organization answer the paper-and-pencil questionnaire containing basic conceptions of their everyday working life. Study subjects are asked to mark for each proposition, whether it is correct or false. As a result, the test provides a percentage number referring to the share which a person masters of the all crucial concepts of his work. The test is done before and after the modelling is employed. Besides the participating production line of the steel factory, the personnel of the four other production lines answer the test, too, to provide control group setting for the study. The changes in the conceptual mastery between the pre and posttests among five production lines are analyzed through ANOVA procedures (Leppänen, 1993; Nurmi, 1998, 1999).

To answer the second research question, a work atmosphere assessment is applied in the participating production line, as in four other personnel groups. The measurement takes place after the implementation of modelling. The survey tool is "Healthy Organization", which is developed for the purposes of working life in the European Union. Finnish expert organization disseminating this tool is the Finnish Institute of Occupational Health. Differences between five production lines are analyzed through ANOVA procedures.

To answer the third research question, the production figures, the amount of occupational hazards and absenteeism amounts of the five production lines are compared and analyzed through statistical procedures.

The first two analyses are implemented till the end of year 2000. The data for the third section could not be gathered before the end of the year 2001. Because the adequate follow-up time period must be at least one year in the large, slowly changing organizations, such as is the steel factory. There are five production lines in the factory. Each line has approximately 20 workers. Therefore, the respondent group in all is about 100 persons.

Results

Description of the Method of Modelling

The modelling refers to the systematic analysis of the work process. The participators, who are the operators and supervisors themselves, address each major attribute of the work. It includes also theoretical analysis; why certain processes are done as they currently are. The ultimate goal is to develop simultaneously the work process and vocational knowledge and skills of the operators (Leppänen, 1993).

The analyzed elements are the following:

- the goals of the work (what are we intending to accomplish)
- the target of the work (what are we changing, working up)
- the equipment of the work (by which tools are we working up)
- the worker (who does the work)

The mental models and the effective usage of them are the focus points. The modelling aims to expand the mental models and understanding of the work process, and to make the knowledge transfer from the expert workers to the newcomers more effective. The modelling is entirely based on the expertise of the participants, and it is fully focused on the actual work process (Leppänen, 1993; Leppänen et al., 1996).

In the modelling, the participants analyze the work process in terms of products, raw and additional materials, machines and processes, co-operative networks, and critical process phases. Each area is modelled further according to the framework created by the participants. For instance, the product model may contain the following dimensions:

1. List of the products and clients,
2. the purpose of use,
3. special requirements, e.g. quality,
4. exceptions in manufacturing,
5. possible problems in manufacturing,
6. the percentage share of production, and
7. The development needs of the product.

The models are analyzed and progressed in the meetings where representatives of several modelling teams are working together. The external consultant or the supervisor of the participants facilitates the modelling.
Contributions to HRD and Future Challenges

There are several challenges for the method. The roots of the modelling are in the heavy industry, but it can be applied to the various areas of human activity. It has been used already in the service sector, e.g. communal canteens, and in the provisions industry. The latest experiment in one training course was to model the various work processes, products, and raw materials of a professional ice-hockey team.

The challenge is to develop the internal organizational players to be facilitators of learning. The process may be more successful, if the external advisors coordinate the application, but the continuous improvement will not be achieved through this way. The supervisors and other foremen have to face the fact that team-building decreases the needs for the traditional management actions, such as control and decision-making. The modelling is a tool, which change agents can apply in developing the process with the personnel.

The models include development ideas for the products, the processes etc. It takes a tremendous amount of efforts to implement or even just process all of them. For the participants, it is necessary that they see their own chances to influence. They can assimilate the development of the work to be an evident element of their work practice. It would increase the effective usage of the knowledge capacity of the personnel, if the operators continuously plan, how the process can be improved to be more appropriate.

Undoubtedly, there are several ways to develop the method to better meet the various needs of the work place learners and to promote on-the-job learning. Although, the main intention of the method is not in the emancipation or enlightenment of the workers, it includes elements that can be applied in other types of transformative and action learning activities and programs, as well.

Performance-Level Evaluation Methods Used in Management Development Studies from 1986-2000

Doris B. Collins
Louisiana State University

This research begins with Burke and Day's 1986 meta-analysis on the effectiveness of managerial training as its starting point, and uses a Results Assessment System lens to analyze 18 management development studies from 1986-2000 that had performance-level outcomes. Studies included involved managers, leaders, and/or executives. This research was completed to develop an understanding of common evaluation characteristics of performance-level evaluations because the number of management development programs is expected to grow in the next decade.

Keywords: Evaluation; Management Development; Organizational Performance

Evaluation of management development programs is not a new phenomenon. Kirkpatrick's model for evaluation of training and development has been used for forty years to measure training effectiveness. Yet, research indicates that organizations are spending little time evaluating the effectiveness of their management development programs (Sogunro, 1997). It appears that many corporations take for granted that management development efforts will result in improved management skills without valid data to prove the return-on-investment (ROI).

Annual budgets for management development programs are expected to grow throughout the next decade as companies “recognize the shortage of talented managers, the importance of developing bench strength, and the need to widen perspectives in order to compete globally” (Gibler, Carter, & Goldsmith, 2000, p. xii). Organizations are concerned about the management inadequacies of their employees and are committing to education and training that deepen the skills, perspectives, and competencies of their managers. A review of evaluation literature shows that there has been a resurgence of interest in the evaluation of management development programs by HRD professionals (Moller & Mallin, 1996). However, questions remain as to whether existing evaluation models adequately measure the intended outcomes, especially where the goals of management development programs are to enhance organizational performance.

Management development is defined as every form of growth or stage of development in the life cycle that promotes, encourages, and assists the expansion of knowledge and expertise required to optimize one’s management potential and performance (Brungardt, 1996). Training evaluation is defined as the systematic collection of data regarding the success of training programs (Goldstein, 1986). Training evaluation occurs when specified outcome measures are conceptually related to intended learning objectives (Kraiger, Ford, & Salas, 1993). Evaluation is normally conducted to determine if training objectives were achieved or the accomplishment of training objectives resulted in enhanced performance of the individual on the job. It enables trainers to continuously monitor their programs and to identify points of intervention for program improvement. In addition, evaluation is becoming more critical as human resource departments are being asked to justify their training programs and compete for limited financial resources.

In an unpublished study by Collins (2000), only 16 out of 54 management development studies from 1986-2000 had organization-level performance (Rummler & Brache, 1995) as the outcome variable. This leads us to wonder why so few studies measure the organizational effectiveness of management development programs. This research analyzes management development interventions with a Results Assessment System lens (Swanson & Holton, 1999) to determine common characteristics among studies evaluating organizational performance improvement efforts. It is done in an effort to provide some theoretical undergirdings for future research to determine underlying reasons organizations are spending so little time evaluating the effectiveness of their management development programs. Hopefully the findings will influence HRD professionals or corporate managers to measure performance at the organization level (Rummler & Brache, 1995), or inspire organizations to evaluate programs when they might not have a tendency to do so.

Using the Results Assessment System as a HR Tool

The Results Assessment System (Swanson & Holton, 1999) defines outcomes broadly to relate to the results of changes in leadership style in top management, worker satisfaction, work teams, or organizational change (Lynham & Swanson, 1997). The Results Assessment System provides three outcomes levels, each subdivided into two outcome categories. Performance level outcomes are subdivided into system or financial and learning level outcomes are subdivided into expertise or knowledge. System outcomes are defined as mission-related outputs in form of goods/services, having value to the customer, that are related to the core organizational, work, process, and group or individual contributor to the organization. Financial outcomes measure the conversion of outputs of goods/services attributable to the intervention to money and financial interpretation. Expertise outcomes measure whether human behaviors have effective results and optimal efficiency, acquired through study and experience within a specialized domain. Knowledge outcomes are defined as mental achievement acquired through study and experience. Outcomes with a performance-level result are the focus of this study. Perception level outcomes are not a focus of this research.

The assessment of organizational performance requires that mission-related performance outcomes be carefully specified and connected to the mission of the system (Swanson & Holton, 1999). Performance-level outcomes can be at the whole system level (organization), a work process within the system (subsystem), or a work group (team). According to Swanson and Holton (1999), “every intervention should lead to systems outcome(s) at some point” (p. 69). Outcomes are defined as “measures of effectiveness or efficiency relative to core outputs of the system, subsystem, process, or individual” (Swanson & Holton, 1999, p. 69).

Methods

A qualitative research method was used to analyze management development studies from 1986 - 2000 that had performance-level outcomes and involved managers, leaders, and/or executives. Studies that were included were located by conducting computer searches with UNCOVER and ABI Inform, scanning bibliographies, reviewing journal articles and proceedings from the annual conferences for the Society of Organizational and Industrial Psychology and the Academy of Human Resource Development. Also included were the applicable management development studies cited in The Impact of Leadership by Clark, Clark, and Campbell (1992). Key words used in the computer search include evaluation, assessment, outcomes, impact, effectiveness, and influence in combination with the following subject areas: leadership development, managerial training, management training, management development, executive development, leadership education, leadership, management education, and management skills. This research located 18 management development studies with an organizational impact since Burke and Day’s (1986) meta-analysis of the effectiveness of managerial training.

Once studies were located and reviewed, codes were provided for the category of management development intervention, the training content area, and the intended outcome of the management development experience. The management level of the individuals in the sample, the size of the sample, the type of management development intervention, and the instrument(s) used to measure outcomes were also recorded. To validate the coding scheme, each article was reviewed a second time and the coding choice was compared with the first review to ensure similarity. In addition, two doctoral-level human resource development students read four of the most recent studies and independently coded the sample studies. One rater disagreed in only one coding element, but the raters discussed and agreed on the appropriate coding.

Intervention Categories

Leadership development studies include not only formal training, but also a full range of experiences that are suggested by McCauley, Moxley, and Van Velsor (1998) to include mentoring, job assignments, feedback systems, on-the-job experiences, developmental relationships which include exposure to senior executives, and leader-follower relationships. Experiences found in the 18 studies of this analysis fit into intervention four categories:

- **Developmental Relationships**: Experiences in work settings where another individual influences the manager’s personal development such as one-on-one mentoring or coaching.
- **Formal Training Programs**: Structured training programs designed to develop the individual manager.
- **Job Assignment**: Assignments to an entire job, as redesigning a system or part of a job, or serving on temporary task forces.
Structured Experiences: Group activities that include goal-directed, live-action, and task-based interactions such as leaderless group discussions, simulations, and targeted exercises.

Training Content Areas

Competency areas featured in the high-performance leadership competency model (Holton & Naquin, 2000) provided a basis for categorizing studies by training content areas. The high-performance leadership competency model was used as it provides the only known definition of management development outcomes that includes “improving performance” as a core dependent variable, or an explicit outcome of leadership. By using this model, content areas more appropriately reflect leadership in today's organizations. Therefore, organizational level (Rummler & Brache, 1995) performance outcomes of team management (Baker, Walsh, & Marjerison, 2000) and strategic leadership competencies (Collins, Lowe, & Arnett, 2000), which enable high-performance leaders to lead strategically in an environment of continuous change, were incorporated into the content areas. Baker et al. (2000) describe team management as the development and leadership of strong, effective organizational teams and the promotion of responsibility for team performance. Strategic leadership includes transforming culture and values of the organization, implementing change, and promoting continuous organizational improvement (Collins et al., 2000).

Results and Discussion

While management development literature from 1986 through 2000 was reviewed, all eighteen (18) studies located for this research occurred in the time span from 1991-1999. No management development studies with performance-level outcomes were found in the literature from 1986-1990.

Methods of Evaluation

Quantitative or Qualitative Method. The measurement of organizational performance often involves both quantitative and qualitative testing at both the learning and the performance level of the Results Assessment System. Both qualitative and quantitative methods are important in analyzing strategic leadership interventions; including how strategic leadership can be developed and used to create cultures in which both people and performance are valued. The ideal assessment for organizational performance incorporates both quantitative and qualitative measurement methods.

Five studies (30%) in this research exhibit a mixture of quantitative and qualitative assessment methods (Knene, Pennings, & Schreuder, 1992; Murphy & Settich, 1992; Riechmann, 1992; Sashkin, Rosenbach, Deal, & Petersen, 1992; Watad & Ospina, 1999). However, the most common method of assessment in this research was quantitative (n = 12, 66%). But, according to Schein (1990), no quantitative method alone can assess culture. Therefore, changes in performance based upon transformational leadership should be evaluated with both qualitative and quantitative methods to produce the best evaluation results.

Six percent, one study (Riechmann, 1992), used qualitative research methods. Through qualitative research we can learn how to help leaders develop and create or change cultures. Qualitative research can help define the important variables and constructs and determine what is worth measuring, at which point it becomes appropriate to turn to quantitative methods of measurement.

Measurement of Informal Training. One study (Uhl-Bien & Graen, 1992) utilized developmental relationships, or strong leader-follower relationships, as the management development intervention. While there are more coaching, action learning, self-development processes, mentoring, and peer-related learning activities (Garavan, Barnicle, & O'Suilleabhain, 1999; McCauley et al., 1998) occurring in organizations than fifteen years ago, these informal training methods are more difficult to measure as they cannot be viewed in an objective manner.

Pretest-Posttest Measurements. Four studies (22%) included in this research utilized pretest-posttest measurements, or random assignment to experimental and control groups (Barling, Weber, & Kelloway, 1996; Moxnes & Eilertsen, 1991; Sashkin et al., 1992; Svyantek & DeShon, 1992). This result is not surprising, as research reported in management development literature most often does not typically have control groups or random assignment processes.
Performance-Level Evaluation

Of the studies reviewed, four (22%) intentionally evaluated the management development experience at both the performance and learning levels (Barling et al., 1992; Howell & Avolio, 1993; Koene et al., 1992; Sashkin et al., 1992). All other studies (n = 14, 78%) completed management development evaluations on performance level data only. Of performance-level evaluations, nine studies (64%) evaluated system performance only, four (29%) evaluated financial performance only, and one (7%) evaluated both system and financial performance (Koene et al., 1992).

An observation from this research is that systems can vary within an organization and so can the outcomes. Six studies (33%) measured performance of business units, teams, or groups, which are considered systems within an organization (Avolio & Howell, 1992; Howell and Avolio, 1993; Penwell, 1992; Riechmann, 1992; Spoth, 1992; Uhl-Bien & Graen, 1992). However, research indicates that there is a problem in linking leadership, in terms of individual behavior and characteristics to a performance-level variable as organizational culture (Sashkin et al., 1992).

Timing of Evaluation

While most management development evaluations are at the learning-level and measure trainees' reactions at the end of the program, analysis of the 18 studies in this research indicates that performance-level measurement of management development programs requires a greater commitment of time than evaluation at learning-levels (Swanson and Holton, 1999). The evaluation process took two or more years in fifty percent of the studies (n=9). Svyantek and DeShon (1992) evaluated the impact of the intervention over a 17-year time span. The evaluative study by Spoth (1992) covers a 14-year time span. It is interesting to note that these two studies involve large corporations, one being Chrysler and the other Fortune 500 companies. Three studies required five years for the completion of the evaluation (Fullagar, 1992; Williams, Greene, & Bergman, 1992), one required four years (Sashkin et al., 1992), and four studies covered a time span of three years (Moxnes & Elertsen, 1991; Uhl-Bien & Graen, 1992; Watad & Ospina, 1999; Westcott, 1995). Four management development studies in this research required a time span of one to two years (Avolio & Howell, 1992; Barling et al., 1996; Glynn & Slepian, 1992; Howell & Avolio, 1993). Some studies did not record a time frame for the evaluation process (Koene et al., 1992; Lohmann, 1992; Murphy & Settich, 1992; Penwell, 1992; Riechmann, 1992).

Because organizational changes often take many years, the evaluation of organizational performance outcomes also takes a long-term commitment for HRD. Organizations cannot for the most part make a long-term time commitment for evaluation of management development activities. Career changes by HRD professionals, top management, or trainees often slow down the evaluation process or causes the results not to be reported. In today's environment, work is fluid, organizations are flatter, organizational structures frequently change, and people make more lateral movements (Byham, 1999). In addition, most training likely occurs at the grass roots level, leading to more evaluations at the individual than organizational level (Rummel & Brache, 1995). Also, managers who are responsible for evaluation are less likely to evaluate interventions affecting their own performance, as they perhaps would be fearful of the end result since it applies directly to them.

Instrumentation

Both quantitative and qualitative methods were used to evaluate performance-level outcomes in fourteen studies (78%). Four studies, or 22%, used one instrument to evaluate effectiveness (Glynn & Slepian, 1992; Lohmann, 1992; Riechmann, 1992; Spoth, 1992).

Quantitative methods were found in 17 (94%) studies. Those studies used instruments developed outside of the organization, such as Argyris Learning Model, Repertory Grid Technique, Hofstede construct, Rotter's locus of control, Jackson's personality inventory, Multifactor Leadership Questionnaire (MLQ), Bass' leader charisma scale, Leadership Behavior Questionnaire (LBQ), Leadership Description Questionnaire (LDQ), and Project Leader-member Exchange Scale (PMLX). Quantitative methods measuring group performance often used the SYMLOG (Systematic Multiple Observation of Groups) instrument. The only qualitative study in this research (Riechmann, 1992) used self-reports as the instrumentation method.
Intervention Categories

Job assignments (JA) were the most common interventions in this analysis (n = 9, 50%). Examples of job assignment experiences were transformational leadership changes in ideology, implementation of shared values, or succession of presidents. Formal training programs (FT) were found in five studies (27%) with a strategic emphasis on executive leadership as the primary focus. Of the remaining studies, three studies (17%) incorporated structured experiences (Penwell, 1992; Riechmann, 1992; Westcott, 1995), and one study (5%) had developmental relationships as the intervention (Uhl-Bien & Graen, 1992).

Transformational leadership, encompassed in this study in the job assignment (JA) intervention category, functionally changes the strategic direction at the organizational level. According to Friedman (2000), “management always matters, but in this more complex and fast-paced system, management and strategic vision matters a lot more” (p. 231). Therefore, it is important to align the goals for management development programs with the strategic vision of the organization, and to train managers in their new roles in strategic management.

Content Areas

Twelve studies (66%) focused on strategic leadership as the primary the content area for interventions. This is not surprising as the occurrence of strategic leadership interventions can be attributed to the need of organizations to change to meet the demands of a competitive environment as a result of globalization.

Recommendations for Future Research

HRD must make huge strides in the development of performance-level evaluation activities (Swanson & Holton, 1999), especially those that test long-term impact of the intervention on the organization. Some topics that should be researched further are described in the following paragraphs.

**HRD professionals must take the lead in addressing the lack of performance-level evaluation methods.** A limited number of management development programs with organizational outcomes are reported in the literature. Obviously, standard evaluation methods are not enough for organizations to measure organizational-level performance improvement (Rummler & Brache, 1995). Because organizations are facing a multitude of outcome-based demands on their time and resources, the development of an evaluation instrument should not be left up to the management of the organization. HRD should take the lead in combining evaluation theory with performance-based management development theory to create the appropriate system for measurement of organizational-level performance improvement. Many organizations utilize individual learning outcomes to reflect performance at the organizational level. However, there is no research that explicitly justifies that learning at the individual level translates to organizational performance. Further research must be done on the outcomes of management development programs at the organizational level (Rummler & Brache, 1995).

**HRD must take the initiative to link management development programs to organizational strategy.** Management development programs have received criticism in recent years. Sometimes management training programs fail because they have no connection to real life in the company (Berry, 1990; Carlisle & Henrie, 1993) or fail to add value to corporate strategy. Traditionally training and development systems are relegated to narrowly defined support roles, where individuals are trained around current job-based deficiencies or predicted knowledge and skill needs (Olian, Durham, Kristoff, Brown, Pierce, & Kunder, 1998). For results to occur, the intervention must be linked with organizational goals and have utility or payoff to the organization. HRD should take the lead by strategically aligning training and development systems that advance and sustain the organization’s competitive position in its market.

**HRD must become the learning centers for global organizations.** An inconsistency occurs when HR practitioners, operating in the same knowledge-based paradigm, are required to enable radical changes in organizations in response to rapid changes in business environments (Beddowes, 1994). HRD practitioners must take the lead with management development interventions in global organizations. However many HRD practitioners must change the basic way of doing their business, increase their knowledge about globalization, and change their perspectives to function in global organizations. As a result, HRD professionals must change from the Kirkpatrick (1996) reaction paradigm of evaluation to one that measures effectiveness of strategic development initiatives. Practitioners who use the four-level approach alone are quite likely to arrive at erroneous conclusions about their training programs in global organizations. Therefore, it is the responsibility of HRD to create and use a model that has the appropriate
constructs, which can be used as a diagnostic tool for determining critical influences that need to be measured along with global outcomes.

Conclusion

The evaluation task is daunting. Research reported in the literature on the effectiveness of management development programs is sparse, partially because of ineffective performance-level evaluation methods. However, high-performance leadership organizations always assess the impact of their management development processes (Collins et al., 2000; Fulmer & Wagner, 1999) and use that gap analysis to make improvements. Program evaluations provide the data to generate buy-in and to focus on the current mission-related objectives.

HRD professionals should develop performance-level evaluation methods so that organizations develop the bench strength to compete globally. However, the challenge is huge for HRD because the type and intensity of the evaluation process depends on the objectives of the management development effort and the organization’s culture. Therefore, evaluation methods must be specific, but yet broad enough, to satisfy the evaluation needs of all organizations. Meanwhile, refined evaluation methods are needed to conduct more empirical research in the future on performance-level outcomes of management development programs.

Redefining Performance: Productivity and Return on Investment in Physical Therapy

Scott S. Harp
Barry University

In the field of physical therapy, the measurement of performance has been predominantly accomplished through productivity calculations. Return on investment (ROI) has been shown as an effective tool for evaluating performance in other businesses. Without a practical model for determining the ROI in this service-oriented healthcare field, managers must create useful tools to accurately measure human performance. This theoretical paper begins the conceptual analysis of such an instrument to measure ROI in physical therapy practice.

Keywords: Return on Investment, Productivity, Performance

Recent shifts in healthcare reimbursement have caused managers and employees to redefine their understanding of performance. Many workers are experiencing longer shifts and increased workload to meet the job demands of their company. Using Swanson's (1999) definition of performance as the “valued productive output of a system in the form of goods and services” (p. 5), traditional measures for evaluating the actions of employees and programs in healthcare may no longer be appropriate. With the diverse dynamics of the modern workforce, each profession must discover methods to appropriately measure performance by building models or tools that focus on its unique role (Holton, 1999). Productivity measures have been used extensively in healthcare to measure the performance of individuals, and yet, this concept has been poorly defined. Productivity may, as Kaplan and Norton (1996) suggest, inadequately reflect the accomplishments of the employee in relation to the desired outcomes. This calculation may be inaccurate, misleading, and unrealistic in today's healthcare environment.

The profession of physical therapy (PT) is a healthcare sector with particularly heavy reliance on productivity as a performance measure. Productivity has been widely used in PT practice to measure the performance and potential revenue from an individual, group, and/or a clinical program (e.g., Bohannon, 1987, 1984; Dupont, Gauthier-Gagnon, Roy, & Lamoureux, 1997), and to determine the compensation and rewards for clinicians and therapy departments (Nosse, Friberg, & Kovacek, 1999). However, few studies have related the concept of productivity to the financial results and measures of human performance.

The American Physical Therapy Association (APTA) has developed the Guide to Physical Therapist Practice, which serves as a tool to outline and explain the abilities, capabilities, and skills of the members of the PT profession (1999). In this document, the performance of a physical therapist is included in five distinct roles: administration, education, critical inquiry (research), consultation, and patient/client management (practitioner). These roles are new to many therapists and expand the career opportunities and educational requirements of the field. These roles become evident through the documentation of outcomes for administration, education of clients, problem-solving approaches from research, consultation with other practitioners, and management of client caseloads. However, a model does not currently exist to effectively evaluate the employee's performance within these roles.

One such instrument for determining the outcomes and effectiveness of performance and programs is return on investment (ROI). ROI is often used in the field of human resource development (HRD) to measure the outcome of a program or training. ROI has been defined as the culmination of all activities of a company (Rachlin, 1997), and as both a management and a financial tool for measuring performance and company investments (Friedlob & Plewa, 1996). ROI has also been shown as a valid tool for measuring the performance of employees (Fitz-enz, 2000). By calculating the ROI of performance, PT managers or supervisors can determine both the benefits and costs of their employees and of the company's clinical programs.

Research Problem

This paper is intended to assist PT managers in identifying areas of opportunity for individual, team, and department/program growth within the five roles of the physical therapist. With an emphasis to increase employee productivity in the clinical setting, a need exists in the PT profession to relate productivity to performance, and to

Copyright © 2001 Scott S. Harp
identify factors, other than productivity, that can be investigated to measure ROI. The measurement of performance in terms of ROI may yield different results than the traditional calculation of productivity. If therapists demonstrate the ability to perform the five essential roles, is productivity the most valuable indicator of performance and potential revenue? The purpose of this paper is to begin the conceptual analysis of a model that may lead to a useful instrument, which evaluates performance in PT clinical practice. This paper investigates productivity and ROI models from multi-disciplinary sources and attempts to link related concepts and methods from the business and management field to the practice of PT.

Theoretical Framework

The theoretical framework for this paper concerns the proposal of a conceptual analysis for the development of a model that serves to measure the return on investment of a healthcare delivery system.

HRD and Measuring Performance

Performance has often been measured by conducting performance appraisals and comparing performance to benchmarks (DeSimone & Harris, 1998). Determining an all-encompassing definition of performance in the workplace has been a difficult task for HRD. Performance may be measured in terms of individual, process, and organizational perspectives (Rummler and Brache, 1992), or in relation to quantity, time, and quality (Swanson, 1999). The relationship between HRD and performance is based in part on their focus of measuring output in order to identify areas for improvement. The measurement of performance allows the organization to evaluate the efficiency and the effectiveness of its efforts (Bates, 1999).

ROI represents a value that compares program costs to benefits and has been used as a benchmark for increasing profits, establishing objectives, and measuring results in businesses worldwide (Rachlin, 1997). It has been used extensively to reduce the factors of intuition and judgment and to measure the performance of management and employees (Friedlob & Plewa, 1996). In HRD, Phillips (1996) discussed the role of ROI in training evaluation to measure the monetary benefits in relation to the training costs. Phillips (1998) later emphasized the need to test and measure performance to ensure acquisition of skill and knowledge. By shifting the ROI model from human resources and management to human performance, managers may more precisely assess the knowledge, skills, and abilities of their employees.

Background

Characteristics of Physical Therapy

PT involves the preservation, development, and restoration of physical function (APTA, 1999). Single therapy treatments may last from 15 minutes to over 2 hours per patient. The billing standards also vary depending on the payer for the service. In some cases, there are specific charges for given treatments. For example, if a client requires a computerized strength test, there may be a set fee for this action. PT may also be billed in time increments. Typically, therapy is billed to a third party payer in units. One unit is equivalent to 15 minutes of therapy. In 1997, the Healthcare Financing Administration implemented the Balanced Budget Act, which imposed the Prospective Payment System (PPS), which modified the billing system and set dollar amounts for certain treatments and group activities (Department of Health an Human Services, 1998). PT departments have consequently undergone changes in their methods of reimbursement. As managers seek to increase reimbursement, clinicians may be requested to increase their levels of productivity. These changes in reimbursement, as well as staffing changes in the clinic, indicate that productivity may not be the most accurate indicator of performance and positive financial results.

PPS requires that therapists calculate the number of minutes of therapy for a patient on a weekly basis to determine the dollar reimbursement. To calculate an individual's productivity, the clinician would divide the number of minutes billed during the day by the number of minutes he or she was able to provide treatment. Clinicians may choose to treat clients in groups of two or more depending upon the clinical program and the insurance stipulations. Clinics may require the therapist to average a predetermined level of productivity in order to remain in good standing with the company or to receive bonuses and promotions. This formula does not, however, account for the changes in reimbursement structure or the actual revenue or outcomes from PT services.

Productivity is commonly used to measure performance in PT for many reasons. It is a relatively quick and simple figure to calculate, as opposed to the concepts of service and quality, or “soft” data as described by Phillips
and it provides a percentage to establish benchmarks or compare employees. The debate concerning the effectiveness of measuring productivity may stem from the definition and usage of the term itself.

Productivity has been defined as the number of patients treated divided by the number of treatments (Dupont et al., 1997), and as the amount of time spent conducting patient care (Ladyshewsky, 1995; Ladyshewsky, Bird, & Finney, 1994). However, these examples only deliver a partial view of human performance because only one variable is considered. Investigating other possible factors that influence productivity would offer a more comprehensive measure of performance (Risher & Fay, 1995). Nosse et al. (2000) have defined productivity as the relationship between the values of the resources used—or input—and the value of what is produced—or output. The authors were identifying organizational processes, but this definition parallels Swanson's concept of performance (1999) by investigating values in terms of dollars, outcomes, and company growth, and initiating therapy managers to expand their definition for productivity.

Potential of ROI for Measuring Performance in PT

Numerous formulas for ROI in healthcare have been proposed (e.g. Japsen, 1997; Rosenstein, 1999). However, these models measure the use of equipment and clinical decisions and not human performance factors. Although ROI models have not been proposed in the PT clinical setting to measure individual, group, and program performance, a financial model for clinical education programs has been presented (Lopopolo, 1984). Lopopolo’s model provides useful insight into the development of a framework for discussing ROI and its relation to productivity by measuring the costs for operating a department in terms of capital and business expenses, rather than human performance. Ladyshewsky and Barrie (1996) have also developed a tool to audit costs and benefits in clinical education. Components of this model may be useful in developing ROI when calculating program costs. Although group performance and supervision has not been studied in the clinical setting, group productivity in the clinical education of students has been shown to increase with appropriate supervision (Dupont et al, 1997). The relationship between productivity and ROI may provide relevant insight to collaborative models being implemented in clinical practice (Zavadak, Dolnack, Polisch, & Van Volkenburg, 1995).

The identification of other factors than productivity in developing a model is critical to measuring the performance of the five roles. One should be able to evaluate the learned skills of administration and education, the manual and “hands-on” skills of the clinician, and the interpretive and research abilities of the consultant and critical inquirer. Traditionally, PT has focused ROI on the administrative function, even though therapists are trained to perform in all five roles. To conceptually analyze performance at these five domains, an understanding of the present method of measurement is needed. Then, one can begin to develop a new approach to calculating ROI in the PT profession.

Exploring a ROI Model for PT

The determination of ROI for this paper consists of the calculation of direct and indirect costs, development costs, overhead costs, and compensation and benefits for PT staff, and for calculating the revenue generated in clinical practice. Since healthcare often gains economic benefits from cost reduction, instead of increasing revenue, therapy managers may be able to increase ROI by finding ways to decrease the costs to the department without any change in productivity. Managers need to be aware of these potential cost-saving measures in order to adequately evaluate the performance of the staff.

As in business and HRD, the essential factors that directly affect the ROI for the clinic include productivity, promotability, transferability, and retainability. These factors have been shown to highly correlate with increased ROI (Fitz-enz, 2000; Rachlin, 1997). The factor of promotability captures the potential of an employee to advance in his or her job role. This advancement may be a part of an individual's career development (Greenhaus, 1987). Transferability is the ability of the employee to learn new or different job skills, or improve his or her knowledge base. This component may be evaluated by managers to better understand the learning component of performance for the employee. Learning is associated with a “change” in the behavior, cognition, or affect of the employee that is a result of acquiring a new skill or knowledge (DeSimone & Harris, 1998). Retainability refers to the organization's ability to retain an employee's services. Employee retention may save an organization time and money by reducing training costs, decreasing the hiring of temporary workers, and increasing job satisfaction ratings (Fitz-enz, 2000). The extent to which individuals, groups, and/or programs have an effect on ROI depends upon the appropriate evaluation technique as well as appropriate self-assessment data for these factors.

A traditional belief system in the PT profession is that increased productivity will lead to promotion, retention, and job transfer (Bohanon 1987, 1984; Domenech et al., 1983). By meeting or exceeding expectations in
productivity, one can move from the patient/client manager role to administration or consulting. Increased productivity may also warrant job recognition, which may lead to the transfer to other roles. If productivity is linked to compensation and benefits, employee retention may also be improved. This traditional system emphasizes one determinant--productivity--and its role in performance (see Figure 1). If productivity is not the most accurate indicator of performance, and ROI involves more measures than productivity, the use of productivity as the sole indicator of performance may be misleading.

Figure 1. Traditional Belief System for Productivity. Productivity expectations influence job promotions, employee retention, and the potential transfer of knowledge and careers.

Findings and Results

A link between ROI and productivity in physical therapy may be made by incorporating productivity, transferability, and retainability equally into the ROI model as shown in Figure 2. These three essential factors are measured to evaluate performance and ultimately, the opportunity for promotion to other roles of the physical therapist. If ROI is viewed by employees and managers as a more accurate measure of performance, then these related concepts could positively influence productivity, improve the transfer of learning, and retain valuable employees. For example, if one can relate increased production with retention or the opportunity for job transfer, then he or she may increase the probability of job promotion. By calculating the productivity measurements for the individual, group, and program, accurate comparisons among clinicians can be made. A manager can divide the anticipated revenue by the sum of the compensation, benefits, training, marketing, and program development costs to yield a more accurate view of ROI for the practice than the traditional measure of productivity alone.

PT managers should be able to adequately evaluate these ROI factors in order to lead to an effective model. A therapist’s ability to transfer to different therapy environments involves the acquisition of new skills and/or knowledge. This attainment may be measured through the employee’s attendance in continuing education courses or the development of research for the profession. Transfer may include the placement of the employee in a different setting based upon learned abilities or skills. Learning opportunities can also be obtained through continuing education or on-the-job training and may add to the existing proficiencies of the employee. The effects of retention may be measured through leadership, responsibility, and management skills, as well as time spent with the organization. Productivity involves the measurement of manual skills as well as time management abilities. By appropriately assessing each factor, one may determine which one of the five roles best describes the individual. Table 1 identifies potential relationships between the five essential roles of the therapist with examples of possible measurement tools for each ROI factor.

Conclusions

Healthcare practices are often unaware of the potential opportunities to improve and measure human performance in the workplace. Physical therapists were once trained to become educators of the patients, managers of their caseloads, and clinicians that are efficient in their clinical skills. Now, the roles have expanded and the job requirements have increased. Even though these domains of the therapist may be diverse, only the efficiency of the practice is routinely measured. This concept of performance remains new and difficult to explain for many professionals (Swanson, 1999).

Figure 2. Model for ROI in PT Practice. Promotion is dependent upon transfer of learning, job retention, and productivity. Dividing by the costs associated with human performance would yield the return on investment in the physical therapy clinical environment.
Accurately measuring the ROI of human performance may be one of the most difficult tasks facing the PT profession today. The role of the HRD professional has been stated to solve individual and organizational problems by enhancing performance in multiple dimensions and demonstrating value to the learner (Ruona, 2000). Watkins (2000) stated that HRD is about making a difference in people's lives and being a helping profession. Similarly, PT is founded on a belief of providing help to others in order to improve their physical performance. By designing a tool to assist PT managers to accurately evaluate the performance of their employees, HRD professionals can assist in fostering this meaningful opportunity for learning and change.

Contribution to New Knowledge in HRD

As healthcare continues to evolve and the financial reimbursement changes, new methods for managing patients need to be identified. While many of the administrative functions of a PT clinic undergo major transitions, patients continue to require the high level of skill that physical therapists are trained to provide. Over the past few decades, therapists have been challenged by the need to increase productivity without a reduction in service to the patients. Giving extra time to one patient often means another patient may suffer from the lack of physical therapy intervention. Even though therapists have had to become jugglers of time and masters of scheduling, they are still measured by archaic formulas that only address one component of their multidimensional talents. By addressing attention to other dimensions, managers and administrators may gain insight to these human elements of performance and realize the potential growth of ROI in their clinical practices.

Although this conceptual analysis is intended to explore productivity's role in ROI and to provide a practical tool for therapists, it is not intended to provide an all-encompassing measurement device for the profession to use in all practice and educational settings. ROI, rather than productivity, may serve to provide a more accurate indicator of the performance of staff and programs in PT clinical departments. Therefore, future research is required to implement a model in the clinical setting to evaluate the performance of both the individual and organizational components of physical therapy. These findings can then be compared to prior productivity calculations to produce an accurate determinant of performance for the profession.

Indigenizing Knowledge Transfer

Gary N. McLean
University of Minnesota

Following an exploration of examples within human resource development (HRD) in which ethnocentric perspectives predominate, numerous suggestions, based primarily on the author's observations and experiences, and supported with selected literature, are made for developing a global perspective. Without such a perspective, efforts to transfer knowledge, within both academia and corporate HRD settings, are almost certain to fail.

Keywords: Knowledge Transfer, Indigenous Knowledge, International HRD

THEODOTUS: Caesar, you are a stranger here, and not conversant with our laws. The kings and queens of Egypt may not marry except with their own royal blood. Ptolemy and Cleopatra are born king and consort just as they are born brother and sister.

BRITANNUS (shocked) Caesar: this is not proper.

THEODOTUS (outraged) How!

CAESAR (recovering his self-possession) Pardon him, Theodotus: he is a barbarian, and thinks that the customs of his tribe and island are the laws of nature.

(George Bernard Shaw's Caesar and Cleopatra, Act II)

The faculty of the University of Minnesota have defined Human Resource Development (HRD) as "a process of developing and/or unleashing human expertise through organization development and personnel training and development for the purpose of improving performance (Swanson, 1995, p. 208). This definition reflects the individualistic and masculine characteristics of the United States consistent with the findings of Hofstede (1991) and is similar to the definitions that have emerged in the U.S. (Weinberger, 1998). Interestingly, though not labeled as U.S. based, all of Weinberger's definitional references were to U.S. literature.

However, in a recent paper, McLean and McLean (2000) explored definitions in a world-wide context and found that there were many variants to this definition. Definitions varied according to historical, economic, cultural, and political contexts. For example, human resource development is not differentiated from human resources in France (Hillion & McLean, 1997) or the People's Republic of China (Yan & McLean, 1998). The recent economic crises in Asia have thrust HRD into a national role in countries such as the Republic of Korea (Kwon, personal correspondence, Sept. 29, 1998) and Thailand (Virakul, Personal correspondence, June 19, 1998). HRD in Thailand also has a strong emphasis on community development (Na Chiangmai, 1998). Emerging market economies, such as in Russia (Ardishvili, 1998), and religion, as in India (Rao, 1996), also influence a country's perceptions of HRD. McLean and McLean's (2000) review also identified several definitions that appeared to be very similar to those found in the U.S. and concluded that there were three possible explanations for this:

- By far the most extensive literature on HRD that has been identified in this research is out of the US and the UK, with India emerging as having an extensive literature, though it is not yet readily available or recognized outside of Asia. This problem was illustrated in the writing of this paper. One of the reviewers, presumably from the UK, provided what appeared to be an excellent set of resources, with suggestions that they be incorporated into the paper. Only one of the references, however, was available to the author in the time available to do a revision. And many of those resources were in English, but were published in the UK and in the Netherlands.
- The predominance of US-based or modified definitions may, in addition to the predominance of the literature, be explained by the fact that many international students are being educated about HRD in the US. This exposure to US definitions has influenced how HRD is viewed in other countries. This process is not dissimilar to the emergence of US popular culture around the world.
- Professional organizations also seem to play an important role in the predominant influence of certain cultures. For example, the McLagan and Suhadolnik (1989) study, which has been so influential, was

Copyright © 2001 Gary N. McLean
funded and disseminated by the American Society for Training and Development (ASTD). Much of the English language scholarly literature in HRD is sponsored by US and UK professional organizations (e.g., Academy of Human Resource Development, Society for Industrial and Organizational Psychology, International Society for Performance Improvement, The Organization Development Institute, University Forum for HRD), while the Academy of Human Resource Development (India) is emerging as a significant source of literature in India.

Purpose of the Paper

Each of these explanations has to do with knowledge transfer. The transfer, however, did not take into account the culture or context of the receiving country, but, rather, definitions emerged that were appropriate for a dominant culture. The purpose of this paper, then, is to explore the content and the process for knowledge transfer that takes into account the context of the receiving culture. It may also be possible to create knowledge that incorporates components from many cultures as knowledge is transferred in a mutual context, rather than in a one-way transfer.

In the above instance, for example, McLean and McLean (2000) proposed a definition for HRD that might be acceptable across several cultures:

Human Resource Development is any process or activity that, either initially or over the long-term, has the potential to develop adults' work-based knowledge, expertise, productivity, and satisfaction, whether for personal or group/team gain, or for the benefit of an organization, community, nation, or, ultimately, the whole of humanity.

Attempts to find one approach to fit all must be made with caution. Here are two examples from the HRD field. A client requested my assistance in helping to implement world-wide an individual employee incentive program for making process improvement suggestions. In spite of my caution that many cultures were team or group oriented rather than individually oriented, the client moved forward with the program unmodified. When the program was implemented in Thailand, near disaster occurred as the workers refused to participate unless the team were rewarded instead of the individual. And what was perhaps even more egregious was that the rewards made available for making suggestions that improved productivity considerably were very unequal, ranging from a truck in the U.S., as the top reward, to a jacket as the top reward in Mexico. In another obvious example, a major multinational corporation decided that it would become global by requiring that all of their facilities, regardless of country, use the same accounting package, without regard to the country's currency, labor laws, accounting practices, and so forth. Obviously, the project was doomed to failure.

While the field of HRD (and education) will probably always have to live with a certain degree of ambiguity (Mankin, in press; McLean, 2000), this definition does incorporate many of the components of definitions found across the global contexts.

Nature of the Problem

In the broader economic and business contexts, there has been much debate regarding the applicability of Western management theory and practices to the economic progress of developing countries. Both transnational corporations and non-government organizations often make the ethnocentric assumption that what works in the West is best for management throughout the world. Yet O'Toole (1985, p. 54) correctly observed that "there is no 'right way' to manage all companies at all times."

Many management principles and theories that have emerged from practices found, and studies conducted, primarily in the United States, or, certainly, in developed economies, find themselves being applied in developing economies with little to no modification. Historically, management theory and practices in developing countries have been heavily influenced by developed countries—the textbooks used, much of the research conducted, the instructional support materials used, and the training of many of their faculty. Yet O'Toole (1985, p. 17) observed that a corporation's needs are defined, at least in part, by "the society of which it is a part." So, too, should the education of managers reflect the society in which they are to operate. That suggests, therefore, that it may not be possible to take a set of principles developed in one cultural setting (e.g., the United States) and transfer it wholesale to another cultural setting (e.g., Bangladesh).

Forti (1981) underscored the problem:

Few single approaches could be applied internationally with any hope of success, both because the nature of man's (sic.) basic needs is perceived differently in different countries and because the solutions appropriate to one country would be unsuitable in another with a different sociocultural and ecological setting. (p. 2)
Laurent (1986) conducted a study of participants drawn from managers participating in executive development programs at INSEAD, who were from a wide variety of companies and countries. According to the study, the largest indicator of management assumptions was nationality, which had three times more influence than any other characteristic. Laurent concluded that Management (with a capital M) does not exist and that organizations should not ignore societal and cultural contexts.

This conclusion is consistent with that drawn by Trompenaars (1994):

Rather than there being one best way of organizing, there are several ways, some very much more culturally appropriate and effective than others, but all of them giving international managers additional options in their repertoires if they are willing and able to clarify the reactions of foreign cultures. (p. 21)

Many developing countries are struggling to develop an indigenous understanding of management for their own cultural environment. In India, for example, Chakraborty wrote several articles (e.g., 1986) and texts (e.g., 1985) underscoring the impact that Yoga and the Vendantic tradition should have on Indian management theory. Sheth (1986) wrote that there are two schools of thought among Indian management scholars:

(1) those who regard western models...as relevant to all countries, although they recognize the need for minor cultural adaptations, and (2) those who have significant doubts about the applicability of the western concepts and models to the Indian environment and, therefore, are in search of alternative approaches relevant to the socioeconomic and cultural spectrum of contemporary India. Scholars in the second category are likely to be aware of the Indian philosophical and spiritual traditions and believe that these traditions contain models of effective living and working in modern India. (p. 108)

Some Possible Solutions

What is called for is a process of knowledge transfer that honors the culture to which the knowledge is being transferred. This brings indigenization into play. According to the dictionary, indigenization refers to making a process "innate or inherent" as it "exists...naturally in a region or country" (Neufeldt & Guralnik, 1988, p. 687).

Although not much research is found regarding the importance of indigenized materials for knowledge transfer, it certainly appears that one solution to knowledge transfer is to develop materials that are consistent with the culture to which they are being transferred. During a major World Bank project in Bangladesh, the Business Management Education and Training Project, it was found that instruction in the three major universities' faculties of commerce (Dhaka, Rajshahi, and Chittagong), the Institute of Business Administration, and the Bangladesh Management Development Centre, were based on theories learned by faculty in the U.S., U.K., and Australia, or Russia. The textbooks used were primarily from the U.S., even though many of the students could not read English, and the economy in Bangladesh at that time was a controlled economy, with most industry nationalized. As a result of the project, five indigenous textbooks were developed, three books of case studies and two books of research were published (in English and Bengali) for use in the country's management development activities (McLean, 1986). In addition to the content of the materials, such materials should also be sensitive to the country's language, cultural norms, political and economic systems, and so on.

Attention must also be given to the level of technology required. There are many stories of U.S. based organizations developing sophisticated web-based materials that cannot be accessed or downloaded in other countries. For example, fire walls are widely used in Saudi Arabia to prohibit the importation of information that is considered undesirable. Therefore, web-based threaded discussions, a very useful tool for knowledge transfer among many participants, cannot be used. However, creative use of e-mail can overcome this deficiency and, while slightly less effective, can still be useful for sharing in widespread dialogue.

Another major factor in the indigenization of knowledge transfer is extensive knowledge of cultures, and the specific culture to which the knowledge is to be transferred, on the part of the transferor. The last time I counted, we have students majoring in HRD at the University of Minnesota from 36 countries. That means, then, that HRD faculty must be widely traveled and knowledgeable of many cultures if they are to include appropriate modifications and observations during class. With such attentiveness, not only will students be better prepared to modify knowledge appropriately for their home culture, but all students will become more sensitized to all cultures, and faculty may well learn about theories and concepts that could be appropriate, with modification, in cultures other than those from which they emerged..

As Latimer (1999) said, "Transferring knowledge is particularly challenging when it involves bridging differences in instructional and learning styles from one culture to another" (p. 50). Knowledge of multiple cultures will enable faculty to honor both learning and cultural styles. Faculty will understand the reluctance of students from Korea to participate in heated discussion or call the faculty member by his or her first name. Faculty will appreciate the difficulty some students have in providing feedback to peers or to the faculty member. They will understand
why some students prefer lecture while others prefer interactive and experiential activities. By modeling cultural sensitivity and by presenting material in the way in which it is most easily received, it is probable that the knowledge will be transferred more effectively and in a way that is more applicable for the student and for the student's context.

Another responsibility that we have as university faculty is to help people understand their own culture. I have found that this is often not the case. In a USAID project in Poland (McLean & Schaeffer, 1992), participants in a marketing workshop often expressed negative comments about Polish products. As a means of teaching participants how to use blind taste tests in marketing research, I set up a number of tests using Polish products for which negative comments had been made with the parallel products from countries they looked to for excellence. So we tested Polish cola against Coca-Cola, Polish butter against Danish butter, Polish chocolate against Belgian chocolate, and so on. To the great surprise and pride of the workshop participants, they actually chose the Polish product over the foreign product over half the time. They learned something about their own culture in the process. And they also learned that "the other" isn't always the best.

Another way in which faculty can assist in the indigenization process is through mentoring in research projects. I have found that most of my international students are highly motivated to find out more about how HRD impacts their country. It has been relatively easy to encourage students to partner with me in conducting research in their home country, and I almost always give them first author status as a way of encouraging them to continue to do their research. You will see several of these in the reference list of this paper. Most of these students are continuing an active research life, and I find myself continuing to do international research in partnership with these former students who are now colleagues.

Indigenization can also occur by interesting others in doing research in a different cultural context. Each year, the HRD program leads a class on an international field trip. Each student in the course selects an aspect of HRD that he or she would like to know more about in that context. This year, our trip was to Thailand. Invariably, students learn a great deal about the theory and practice of HRD in that country, and often this information is even "new" to those in that country. From this year's trip, at least four students have been able to develop their papers and will be presenting them in Costa Rica at the annual conference of the International Management Development Association (Brown, 2000; Kowske, 2000; Lundblad, 2000; McLean, L. D., 2000). There is a good possibility that they will also be published in refereed journals. Not only will this forward our knowledge and understanding about Costa Rica, but it will also expand these students' understanding of international HRD issues.

Another way of partnering in the knowledge transfer process to insure the emergence of indigenous theory and practice is to learn to ask rather than assume. In 1997, I was asked to work with the Personnel Center of Liaoning Province, Shenyang, People's Republic of China. If I had operated on my understanding of how personnel functions exist in the United States, I would have made many errors, and my recommendations for modernizing their procedures would have been totally useless. By asking questions and understanding as best I could how the Center operated within the PRC context, I was able to make much better contributions than I had simply transferred "best practices" from the U.S. context, which is what had actually been requested.

As stated in the Problem Statement section, ambiguity is a factor of life that must be accepted and, I have suggested often, celebrated. As a citizen of both Canada and the U.S., I appreciate the ambiguity that comes from striving to be a world citizen. The greater the comfort the knowledge transferor has with ambiguity, the less likely that person is to insist on a one right way approach and the more likely to affirm multiple cultures and the need for indigenization. As Tillich (1963) stated, "Life at every moment is ambiguous" (p. 32). Thus, selecting individuals to do the knowledge transfer who are comfortable with ambiguity will support the indigenization of knowledge transfer.

Latimer (1999) discovered that "knowledge transfer works best when the recipient is the driver of the transfer, and the sender's role is that of supporter, coach, and supplier of key resources" (p. 51). Any attempt to impose transfer is likely to meet with failure. A widely used approach to encouraging participation in training is through a train-the-trainer approach, so that the trainers are from the same cultural background as those receiving the knowledge (Sullivan, 1995).

Finally, knowledge transfer is most likely to be indigenous when the exchange is mutual. When the transfer is seen as one way only, it is less likely that attention will be paid to making the material indigenous. For the exchange to be mutual, conversation and dialogue must take place, encouraging broad understanding of the needs of each party. An on-the-job or in-country approach is most likely to encourage this mutuality, if both parties are committed to it. I learn much more about a culture when I am immersed in it, for example, than I do simply by reading about it.
Conclusion

As Swanson (1990) rightly observed, "The global economy does not allow cultural differences to justify poor performances...nor does it allow managers to profit as easily from their own below-average performances" (p. 106). Much more research is needed in this area of indigenizing knowledge transfer. The focus of this paper has been on cross-cultural HRD. Many questions remain to be answered. Which management philosophies or training methods are most effective, why are they effective, and where are they effective? Which elements of cultural differences ought to be the greatest concern? Even without answers to these questions, it is clear that, if developing countries hope to compete in global markets, or even in their own markets, they will need an indigenous management theory and subsequent practices in order to meet the demands of their business environment. Further, as university faculty, we have obligations and responsibilities to insure, so far as possible, that the knowledge that we transfer into our cultures will meet the needs of the cultures represented among our stakeholder groups, whether students, other professionals, or clients.

How to Develop Human Resources: Technical Rationality or Social Moral Responsibility?  
A Comparison of Western and Chinese Human Resource Theory and Practice

Baiyin Yang  
University of Idaho

De Zhang  
Tsinghua University

This paper proposes a theoretical framework of cross-culture study in organizational behavior. The framework is then used to compare American and Chinese human resource theory and practice. Chinese managerial philosophy is featured as being centered on social morality, while American managerial philosophy is characterized as technical rationality. Traditional Chinese human resource practice is ruled by human beings while American human resource practice tends to be ruled by law.

Keywords: Cross-Cultural Study, Human Resource Theory, China

This paper proposes a theoretical framework of cross-culture study in organizational behavior. It compares Eastern and Western human resource (HR) theory and practice and the impact of cultural and social variables. China and the United States are selected to be representatives of the Eastern and Western world. The examples of cultural and social differences are drawn from these two countries. HR activities are part of organizational behavior, and cross-cultural comparison of organizational behavior has gained more attention during globalization process. Lytle, Brett, Barsness, Tinsley and Janssens (1995) maintain that the process of globalization has presented a strong need of cross-cultural research in organizational behavior.

In the field of human resource development, there is a keen need for cross-cultural and cross-national comparative research because of increasing awareness of globalization. The rapidly increasing globalization of business calls for more studies on international human resource management and development (Brewster, Tregaskis, Hegewich, & Mayne, 1996; Kuchinke, 1999; Maznevski, & DiStefano, 2000; Peterson, 1997). The cultural and managerial differences between the East and West have been studied extensively, mostly in the areas of culture and values. Similarly, the vast amount of literature describing or analyzing Eastern and Western styles of management usually have aimed at the general management domain. There is a paucity of literature examining Chinese and American human resource theories and practices in relation to cultural and social contexts.

Theoretical Framework

As a step toward the synthesis of cultural and social differences across countries and the implications for organization theory and practice, we propose a theoretical framework as presented in Figure 1. This framework is established on existing conceptual models of cross-cultural research in organizational behavior (Earley, 1997; Lytel et al., 1995). It is posited that HR theory and practice is part of organization theory and practice. It suggests that cultural and social variables are in the dynamic relationship and they have direct impacts on HR theory and practice. On one hand, HR theory and practice is part of broadly defined organizational behavior. Cultural orientations and social variables determine organizational behaviors in general and HR practice in particular. We view HR theory as part of managerial philosophy and HR practice as part of organizational behavior. On the other hand, organizational behavior has a reinforcement function that perpetuates its contexts such as cultural and social structures.

Culture is one of the key concepts to understand international or cross-cultural human resource study (Kuchinke, 1999a; Maznevski, & DiStefano, 2000). Culture has been normally conceptualized as a complex set of norms, values, assumptions, attitudes, and beliefs that are characteristics of a particular group (Lytle et al., 1995). Triandis (1993) maintains that culture is the group's strategy for survival and it constitutes the successful attempt to adapt to the external environment. It is generally accepted that culture represents the "software of mind" (Hofstede, 1991, p. 3) rather than hardware. For the purpose of consistency, we define culture as a complex system of beliefs, values and social norms shared by a group of individuals.

As there are many ways to define culture, cultural dimensions or aspects have been conceptualized in

Copyright © 2001 Baiyin Yang and De Zhang
various forms and terms. We posit that there are three basic components of culture: values, beliefs and social norms. A value system is a set of explicit or implicit conceptions of the desirable or preferable ends shared by a group of people. A belief system consists of explicit conceptions that have been viewed as true representation of reality. Social norm is habit or behavior of individuals or groups implicitly existing in their daily lives. The value component reflects what is important for an individual or group of individuals, and thus it determines good from bad, right from wrong. The belief component indicates what is true among human beings’ conceptions and distinguishes true from false. The social norm consists of unspoken conceptions about doing in daily practice.

Our conceptualization of culture implies dynamic relationships among three major components. The three components of culture, value, belief, and social norm, correspond to three knowledge facets in a holistic theory (Yang, 1999). Culture is a unique aspect of group or social knowledge. Consequently, the value system reflects critical facets of knowledge, the belief system is explicit or technical facet knowledge and the norm system is implicit or practical knowledge. Yang also outlines the interactive patterns among three knowledge facets. Take the value system as an example. A value is a conception of something preferable by a person or a group. At the nation or country level, a value is something socially preferable or desirable. On one hand, individuals can learn a value through the belief system (what is believed to be true) or social norm system (what is actually happening). The learned value then is integrated into the value system, resulting in either a consistent integration (simply knowledge accumulation) or inconsistency (which may bring a transformative learning). On the other hand, values and value systems are relatively stable and tend to influence the other two sub-systems of culture. The value system is critical in guiding action (within the social norm system) and in regulating human beings’ technical knowledge (within the belief system).

Comparison of Cultural and Social Factors

Cultural Differences

There are many approaches to define cultural dimensions and to study cultural differences. For example, Kluckhohn and Strodtbeck (1961) suggest six cultural orientations. Hofstede (1980) suggested four dimensions underlying organizational behavior. Table 1 summarizes the comparison of the American and Chinese cultures in value and belief systems.

Value System. Five major dimensions within the value system are interrelated factors that influence individual and organizational behaviors. The first dimension is human beings’ relation with the natural world. The Western culture seems to place value on mastery, while the Eastern culture emphasizes harmony. Traditionally, Chinese view harmony as the ultimate goal of human kind (i.e., “Tian Ren He Yi,” or “The great harmony between human and the nature.”)

The second dimension within the value system is the relationship among people. Kluckhohn and Strodtbeck (1961) point out three orientations along this dimension: individual, collective and hierarchical. The individual orientation maintains that our main responsibility is to and for ourselves and immediate families. American culture is characterized by individualism while Chinese culture is typified as collectivism. In the collectivistic culture such as Chinese, individual is less valued than a perceived collective interest.

The third dimension within the value system is the perceived importance among various activities conducted by human beings. We label this dimension as the priority of activities. Kluckhohn and Strodtbeck (1961) suggested three orientations: doing, thinking, and being. The doing orientation maintains that our natural and

preferred mode of activity is to be continually engaged in accomplishing tangible tasks. The thinking orientation maintains that our natural and preferred mode of activity is to consider all things carefully and rationally before taking action. The being mode is to do everything in its own time. The Western culture places priority on thinking and then doing, while the Eastern culture emphasizes on being and doing.

The fourth value dimension is the basis of moral standard. As parts of the value system, the first three dimensions offer explicit and implicit standards for individual and group judgement, the fourth dimension suggests preferred ways of making a moral judgement. Wilson (1993) argues that there are four universal morals shared by all people: sympathy, fairness, self-control, and duty. The Western culture tends to use reasoning as a tool in making moral judgements (Kohlberg, 1969) and is concerned with different levels of judgement: good, right, and ought (Girvetz, 1973). Thus, the Western moral standard leans to fairness and duty while the Chinese culture tends to use sympathy and self-control as the moral standard.

The fifth dimension in the value system is the priority along time and it directs our main concerns and energy along the nature-time framework. Kluckhohn and Strodtbeck (1961) list three orientations along this dimension: past, present, and future. The Western culture tends to be future oriented and the traditional Chinese culture emphasizes on present mode in decision-making process. Weber (1904/1930) asserted that time is money for the Protestants. Time orientation is somewhat related to religious beliefs. Weber contended that: "Waste of time is thus the first and in principle the deadliest of sins. The span of human life is infinitely short and precious to make sure of one's own election. Loss of time through sociability, idle talk, luxury, even more sleep than is necessary for health... is worthy of absolute moral condemnation... [Time] is infinitely valuable because every hour lost is lost to labour for the glory of God. Thus inactive contemplation is also valueless, or even directly reprehensible if it is at the expense of one's daily work. For it is less pleasing to God than the active performance of His will in a calling" (1904/1930, pp. 157-158).

Belief System. Belief system is different from the value system because the former concerns the priority or importance while the later assumes what is true in the world. The belief system is composed by those basic assertions about the natural world and human beings. These assertions are basic and fundamental hypotheses that cannot be easily proven to be true or false, and thus human beings have to accept such assertions. Human beings have to hold some basic beliefs as guidelines for their actions. Thus, the belief system also includes basic assumptions about the nature world and human beings. While the value system reflects the priorities of an individual and a group of individuals, the belief system contains views about the natural world and human being that cannot be easily tested. We think that at least six dimensions can be identified to examine cultural differences.

The first dimension of the belief system is the nature of human beings. The Western belief system was established on the assumption that the basic nature of people is essentially bad. This was probably due to the Christian influence that accepts human kind as a result of eating evil fruit. On the contrary, the Chinese belief about human beings tends to assume the basic nature of people is essentially good, or at least is changeable ("Ren Zi Chu, Xing Ben Shan", e.g., "Human is born with goodness" from Confucianism).

The second dimension of the belief system is related to the first one. One's religious faith is one of the fundamental keys to one's basic assumptions about the world. The Western culture seems to have a strong religious faith. The major religion in the Western world, Christianity, views God as single superpower external to human
beings. The traditional Chinese religion did not have such a belief about a single superpower. The Chinese word of
god, "Shen", has multiple meaning rather than being attached to one superpower. "Shen" means god or divinity, it
also means anything that is mysterious, marvelous, supernatural. In the Chinese literature of mythology, there are
many gods that hold power over human being.

The third dimension of the belief system concerns the nature of knowledge. The Western culture has
heavily leaned toward a rational tradition, which views knowledge as objective and that reality exist independently
of mental representations of the world (Mazirow, 1996). Such a tradition also posits that logic and rationality are
formal and that intellectual standards are not arbitrary. The Chinese view of knowledge is subjective and has an
instrumental function. Different perspectives on the nature of knowledge are related to the views about reality. The
objective perspective of knowledge might be a result of a view of a single reality, which is assumed to be created by
a single superpower and to have consistent and lawful relationships among its elements. The subjective perspective
of knowledge views multiple realities and implies an interpretive approach to the natural world (Roth & Yang,
1997).

The fourth dimension of the belief system is about the change of the natural world. Marshak (1994)
contends that the Western OD approach is based certain beliefs and assumptions that view change as linear,
progressive, destination or goal oriented, based on creating disequilibrium, and planned and managed by people who
exist separate from and act on things to achieve their goals. On the other hand, the Eastern or Taoist model
comprises beliefs and assumptions that change is cyclical, processional, journal oriented, based on maintaining
equilibrium, and observed and followed by people who are one with everything and must act correctly to maintain
harmony in the universe. Beliefs and assumptions about change are related to the belief dimensions discussed
previously. The Western culture holds that there is a single best reality [created by the God] for humans to achieve
in a forward way. The Eastern [particularly Taoist] culture assumes multiple realities and that there is no best or
better mode of change. The Taoism emphasizes that there is a constant ebb and flow to the universe and everything
in it is cyclical: "Tian Bu Bian, Tao Ye Bu Bian" (i.e., "The nature is not changing, and thus the Tao remains in constant").

The fifth dimension of the belief system relates to the inherent motivation of human beings. Based on the
assumption that human beings are naturally evil, the Western culture presumes a materialistic motivation. The
Eastern culture, however, maintains that the essence of human kind is in its spirit. In the case of conflict, people
should pursue the spiritual direction rather than the material one. The Eastern culture recognizes that people might
be seduced by the materialistic world and by selfishness, and it thus calls for self-control and cultivating. There is a
Buddhist scripture that captures such a view: "Ku Hai Wu Bian, Hui Tou Shi An." (i.e., "The materialistic sea is
endless, coming back [to be good one] can reach the shore"). In the combat world, Western soldiers are instructed
to protect themselves while Chinese soldier are educated to "She Shen Qu Yi" (i.e., "sacrifice your body for justice
and righteousness").

The sixth dimension of the belief system is concerned about the ideal destination of human beings. The
Western culture emphasizes individual rights and freedom and views fully developed individuals as the ultimate
goal. The Eastern culture places the harmony among human beings and the nature as the ultimate goal. Thus a
harmonized society is viewed as much more important than an individual’s right or growth in China. The Western
culture seeks fully developed human potential with an active, individualistic approach.

Social Differences

Rohmer (1984) defines a social system as the behavioral interactions of multiple individuals who exist
within a culturally organized population. Society is a complex system and there are numerous aspects that can be
examined. We have identified the most relevant aspects of society in examining the impacts on organizational
behavior. Table 2 lists several aspects where the USA and China have dramatic differences. We included two
cultural dimensions, power distance and tight versus loose (Earley, 1997) and renamed them as social structure and
reinforcement of social norms. We place these dimensions in the category of social contexts because they belong to
neither the value system or the belief system. In fact, these two dimensions are contained by the social norm system.

China. China is the world’s largest third-world nation in terms of its economic development. China’s
population has exceeded 1.2 billion. Geographically, China is the world’s fourth-largest country (after Russia,
Canada, and US). China is also a country that has thousands of year history. For centuries China has stood as a
leading civilization, outpacing the rest of the world in agriculture, technology, arts and sciences. China gradually
became a semi-colonized country since the mid nineteenth century when it lost an opium war to the British Empire.
Western imperialists forcibly opened China’s trading doors by addicting a considerable portion of the population to
opium. For almost a century, China suffered from famines, civil unrest, military defeats, and foreign occupation.

After World War II, the Communists under Mao Zedong established a new republic, ensured China's sovereignty, imposed the communist ideal of egalitarianism and great harmony. Under Mao's leadership, Chinese regained respect and dignity but economic development was stagnated. After 1978, Mao's successor Deng Xiaoping launched reforms and decentralized economic decision-making. Output quadrupled in the next 20 years and China now has the world's second largest GDP.

Beginning in late 1978 the Chinese leadership has been moving the economy from a sluggish Soviet-style centrally planned economy to a more market-oriented economy. The old collectivization in agriculture (i.e., commune structure) was replaced by a system of household responsibility, more decision-making power was given to local officials and plant managers in industry, and the government finally allowed a wide variety of private-owned enterprises. At the same time China opened to the Western countries and the "open door" policy has resulted in increasing foreign trade and investment. The reform is a successful one as it quadrupled GDP since 1978. In 1999, with its 1.25 billion people but a GDP of just $3,800 per capita, China became the second largest economy in the world next to the USA. Agricultural output doubled in the 1980s, and industry also posted major gains. On the darker side, the social structure has been transformed from a flat system (egalitarian, stagnated, lassitude) to a vibrating hierarchy (bureaucracy, corruption, impetuous). Deng Xiaoping invented the term of "a socialist market economy" to describe his vision of China. One of the biggest challenges for his successors in next few years is to balance a highly centralized political system and an increasingly decentralized economic system. At the same time, the economic reform has opened a Pandora's box (e.g., individual interests that lead to selfish behaviors) that has caused a tremendous challenge. In sum, China is the largest industrializing country that has many problems to face that were previously faced by many other developing countries.

The United States. Unlike China which has a long history filled with chaos and civil wars, the relative short history of the USA witnessed only two major traumatic experiences in the nation's history (Civil War and the Great Depression). Buoyed by victories in World Wars I and II and the end of the Cold War, the USA remains the world's most powerful nation-state. The economy is marked by steady growth, low unemployment and inflation, and rapid advances in technology. The USA has the most technologically powerful, diverse, advanced, and largest economy in the world, with a per capita GDP of $33,900. In this market-oriented economy, the pyramid of social structure is moderately high and it loosely reinforces the social norms. Both political and economic systems allow private individuals and business firms to make most of the decisions. At the same time, government does not run business and it has to buy needed goods and services predominantly in the private marketplace. The USA is featured as a loose country in terms of its reinforcement of social norms. The American economy is characterized by increasing high-tech and service. American firms are at or near the forefront in most areas.

Comparison of Human Resource Theory and Practice

Managerial Philosophy

Table 3 summarizes the major differences between the Eastern and the Western approaches to management. The interactions among three cultural systems (value, belief and social norm) have resulted in different spiritual attachment in different social contexts. For the majority of Americans, the term "spirit" means the relationship with the God. Thus the featured spiritual life is standing aloof from worldly affairs in the American culture. On the contrary, the dominant spiritual idea in China is Confucius teaching: "Xiu Sheng, Qi Jia, Zi Guo, Ping Tian Xia" (i.e., "cultivate one's moral qualities, set up family, serve for the country, and work toward equality and harmonized world"). Consequently the Chinese view of spirit as it exists only in entering into worldly affairs.
As a result of interactions among values, beliefs, social contexts and spiritual attachment, American management theory and practice rely on technical rationality. Organizations are set up to maximize their earnings or profits. Organizations are established on an individual basis. Individual employees are hired and fired based on mutual will. The overall managerial strategy is characterized as a proactive approach, which requires positivistic means in problem solving (i.e., an empirical approach, a fact-finding process toward a positive direction). Decisions making is characterized as a rational process (i.e., linear, step-by-step, maximize outcome). It assumes that the problem is clear and unambiguous and that managers clearly know their options and preferences. Such management approach also emphasizes innovation and progression as viable means to reach the organizational mission (i.e., profit). System and structure have been placed heavy weights in management theory and practice. Thus, American management philosophy can be featured as technical rationality.

Viewing the world as chaotic and human beings as naturally good (or at least can be educated to be good), Chinese management philosophy takes a vastly different stand from the West. The Chinese culture impels individuals to enter into worldly affairs to find their spirit. Traditional private businesses are set up on a family basis with a managerial philosophy of benevolence and righteousness. Business is viewed as an instrumental entity to yield goods and service to fulfill its social responsibility. Chinese businesses tend to depend on networking closely related to family and lineage (Chi-Cheung, 1998). The overall managerial strategy is reactive (i.e., “Ying Bian”) or sometimes passive (“Wu Wei Er Zhi”, i.e., “manage by letting things take their own course”). Such managerial philosophy is consistent with the naturalistic/interpretive problem solving method. Decision-making process can be characterized as “muddling through.” One of Deng Xiaoping’s major reform theories is so called “Mo Zhe Shi Tou Guo He” (i.e., “grope for stones while passing the river”). Related to this problem solving style is the emphasis on the human side rather than the system side in management. Rules and regulations do not appear to be as important as human beings. Managers in a collectivistic culture prefer personal appeals and emotional strategies rather than rational decisions (Shane, 1994). Consequently organizational process and practice have received more attention than structure and system. The essence of the Chinese managerial approach can be found in the dated Confucianism classic “The Golden Mean.” This mean managerial method prefers to bring about equilibrium rather than to create disequilibrium. It requires balance not only between human beings and the environment but also among people in a community or society. The underlying force that drives such managerial philosophy is social morality that calls for organizational ethics and social responsibility. Zhang (1993) contends that “Yi Li Lian Quan” (i.e., “overall balance between justice and profit”) is the driving force for the enterprise competition in East Asian.

**HR Theory and Practice**

We listed the differences between American and Chinese HR practice in Table 4. We will try to compare the two countries in virtually all HR areas including the nature of employment, selection, compensation, promotion, and evaluation. We also have taken an HR outlook for the two countries in the following areas: HRD emphasis, goal, HR function in organization, and the main characteristic of HR practice.

The USA is a market-oriented capitalist country. Human resource practice has been determined by its cultural and social contexts. Moreover, HR practice has been integrated into its social and cultural systems and become part of social norm system. Most jobs in the USA are contracts based on will. That is, both employer and employee find their best fit to meet their mutual needs in a free job market. Employee selection is largely based on ability and competence. Employee compensation is established on the basis of work performance and contribution to his/her organization. Performance evaluation is conducted with quantifiable data in a scientific way. Human
resource development has been placed on training and development. The basic function of HR is to contribute to the overall organizational performance in terms of profit making and thus is viewed as one kind of capital (i.e., human capital).

</tr>
</tbody>
</table>

The implicit goal of such HR practice is to fully develop individual potentials in a competitive job market. Overall, the US HR practice can be characterized as a rational approach and ruled by law.

Prior to the economic reform launched in 1978, the dominant management philosophy in China was one of economic egalitarianism. Such philosophy works toward a classless society and requires little difference between the salaries and compensation of managers and workers. Economic egalitarianism can be traced thousands years back to the Chinese history that is filled with corrupted old dynasties and new dynasties in turn. The new dynasties were normally brought by uprisings with certain egalitarian slogans (e.g., “Tian Xia Wei Gong,” or “land under heaven belongs to all”). Throughout the long history of China, virtually every party and government emphasized the importance of morality and personal integrity. An appointment is made primarily on the basis of a person’s morality or loyalty to the party in power. Leaders and managers were selected even though they are not necessarily technical competent. Such practice of HR utilization has been best summarized by an ancient Chinese politician and scholar, Shima Guang, in his famous annalistic-styled historic book “Zi Zhi Tong Jian.” This book became a must-read for later rulers. Shima proposed a dialectic relationship between two key qualities of an individual: “De” (i.e., “morality”) and “Cai” (i.e., “competence”). He posited that morality is the commander of competence which, in turn, provides a ride for the morality. He further classified all individuals into four types. The first type is called “Sheng Ren” (i.e., “wise person”) who possesses both strong morality and talent. The second type of person is called “Xian Ren” (i.e., “person with virtue”) who shows strong morality but probably less competence. The third type of person is named as “Xiao Ren” (i.e., “mean person” or “villain”) who has certain ability but poor personal integrity. The fourth type of person is called “Yong Ren” (i.e., “mediocre person”) who is low in both competence and morality. Shima suggested that the wise person should be the first choice in personnel utilization, followed by the person with virtue. When neither the wise person nor the virtue person is available, he maintained that the mediocre person should be selected rather than the villain because the mean person would work for his/her own interests rather than work for the community and society. Though being less competent, the mediocre person is better than the villain because of inability of doing harmful things to the organization/community/society. The key principle of Chinese HR is often called “De Cai Jian Bei” (i.e., “having both political integrity and competency”).

Traditionally, employment in China is long-term, long enough to be life-long. Employee selection was based on morality and social connections, while personal competence was regarded as less important. In China, “Guanxi” (i.e., social connections) has been formalized as valid means of employment. Guanxi refers to a network of personal favors and obligations stemming from various social ties. Aufrecht and Bun (1995) observed that the lack of a free market for so many commodities makes Guanxi a particularly tricky obstacle to reform. Compensation was largely established on seniority rather than performance. Promotion was conducted on the basis of loyalty and social acceptance. Performance evaluation was largely qualitative nature and tended to be subjective. HRD emphasis was placed on management and utilization rather than training and development. Human resource is a new concept being introduced to China after reform. Most organizations do not have HR departments and they establish personnel departments to take care of all personnel related affairs (Lin, 1999). One of the major HR functions was to bring about desired social outcomes (e.g. no one should be unemployment) rather than economic outcome (e.g., profit and efficiency). Thus HR was supposed to function as a part of the broad social system working toward social harmony. Overall, HR practice can be characterized as being ruled by human beings (i.e., “Ren Zhi” or “Yi Ren Wei Ben”).
Contributions to New Knowledge in HRD

The present study contributes to the knowledge base of HRD in a number of ways. First, the theoretical framework proposed in this paper provides a useful tool in a cross-cultural study in organizational behavior. Second, the comparison of HR theories and practice between the USA and China in this paper will provide adequate explanations and practical tools for the HR professional working in an international arena, particularly between the USA and China. Third, this paper provides a framework for scholars and HR professionals to reflect on their own values and belief systems in order to improve research and practice. Each culture has its fundamental values and beliefs and shows some unique norms. There is no judgement in our analysis in terms of which culture is superior or better. Each culture has successfully evolved hundreds or thousands of years in the civilization process and developed certain relations between the environment and among its members. However, these relations among the cultural factors are not static. Cross-cultural examinations help us to learn valuable elements from other cultures. Manager and other HR professionals can borrow some fresh ideas and effective practices from other cultures through cross-cultural study.

Conclusion

This paper proposed a theoretical framework of cross-cultural study in organizational behavior. It is posited that culture contains three major subsystems: values, beliefs and social norms. This framework is then used to compare American and Chinese HR theory and practice. Organizational behavior is included as part of a social norm system which, on a macro level, interacts with its value system and belief system. Content analysis revealed that Chinese managerial philosophy and HR practice are drastically different from the American one. Chinese managerial philosophy is featured as being centered on social morality, while American managerial philosophy is characterized as technical rationality. On one hand, different managerial philosophies attribute to different values, beliefs, thinking and doing styles, and a number of other social and cultural factors. On the other hand, different managerial philosophies have resulted in different HR theories and practices. Traditional Chinese HR practice is ruled by human beings while American HR practice tends to be ruled by law.

Care should be taken into account in generalizing the concepts and conclusions presented in this paper. What we have done was a comparison between traditional or normative modes of cultural and social dimensions between two countries. As a result of rapid social and technical changes and increasing international exchanges and communications, every culture is changing. For example, one might be able to find a strong individualist feature of organizational behaviors in these newly established regions of China due to privatization and rebellion of traditional ideology. For a large and complicated country like China, we need to examine several competing value systems. We should overcome a simplification that assumes a unitary and consistent culture for each country. Most countries are facing dramatic changes and experiencing cultural reconfigurations. We should examine cross-cultural and cross-national organizational behaviors in the light of dynamic relationships among cultural elements as proposed in this paper rather than view them as static.

Enhancing Commitment and Overcoming the Knowing-Doing Gap: A Case Study at the Technikon Northern Gauteng (TNG) in South Africa

Hilda Martens  
Limburg University Center, Belgium

Jan Verhagen  
Fontys, The Netherlands

This case-study deals with the problem of overcoming the knowing -doing gap and increasing commitment in an action-research project. It is based upon a social constructionist framework and was conducted at TNG, a Tertiary Educational Institution in South Africa. After preparatory interviews, a Strategic Human Resource Management Conference brought all managers of the TNG together in a context where a set of 'process and context characteristics' were applied.

Keywords: Organizational Commitment, Knowledge Transfer, South Africa HRD

Pure knowledge about HRM and Organizational Change is rapidly increasing. But the application of this knowledge, or putting this knowledge into practice is difficult and doesn’t seem to be able to keep up the pace. As academics we need a shared 'view' on and 'knowledge about 'process and context characteristics', based upon research. This case study wants to contribute to this need.

South Africa has undergone an enormous transformation process. Institutions for professional education such as the Technikon Northern Gauteng (TNG) play a major role in this process. TNG is a formerly disadvantaged Tertiary Educational Institution in South Africa. It mainly focuses on providing bachelor degree studies (3 year programs). The institution is situated in Soshanguve (a township near Pretoria), has six faculties, about 600 employees and about 8,500 students.

The Technikon, with its faculties of economics and management, education and commerce, can count on a lot of highly educated staff members that are skilled to solve problems and bring about changes. But these 'knowledgeable' people are not used to exchanging ideas, to decide in consultation on a common goal that all of them want to reach; they don't lack knowledge, but they fail to share it. On top of that, there is the division between the so-called 'powerful people', qualified to make decisions, and the labourers. Effective communication between both parties is often problematic. And thus problems occur that are difficult to solve: individuals alone can't make it happen. This is not a South African problem or a problem of a specific country. It is an organizational problem.

Problem statement

The TNG doesn't lack competent staff: they know a great deal about HRM and Organizational change, they are motivated and loyal to the institution they work for and certainly show commitment to the institution's goal, i.e. providing students with a decent professional training and education. But how can we make them put their knowledge into practice? How can we increase their ability to turn knowledge into action?

Theoretical framework

This action-research project focuses on overcoming the knowing-doing gap and on increasing commitment. It is based on a social constructionist view on organizations.

1. Research demonstrates that the success of most interventions designed to improve organizational performance depends largely on implementing what is already known, rather than from adopting new or previously unknown ways of doing things.” (Pfeffer & Sutton, 2000). Many successful interventions rely more on implementation of simple knowledge available within the organization than on creating new insights or discovering secret practices.

Copyright © 2001 Hilda Martens and Jan Verhagen
used by other firms. This means that overcoming the gap between knowing and doing is very important for an organization’s performance. Although there are differences in knowledge across organizations, a much larger source of variation in performance stems from the ability to turn knowledge into action. If the employees learn from their own actions and behavior, then there won’t be much of a knowing-doing gap because they will be “knowing” on the basis of their doing, and implementing that knowledge will be substantially easier (Pfeffer & Sutton, 2000).

2. The key to quality and productivity, to obtain sustained, superior performance is employee commitment. This is especially true in services, e.g. in research and education, at universities and schools where the performance of the service-people at the key-moments of delivering is decisive. The four supports of commitment read as follow: (a) clarity about goals and values; (b) employee competencies that allow success; (c) the degree of influence that employees have; (d) the expressed appreciation given to employees for their contributions (Kinlaw, 1993).

(a) Clarity about Goals and Values. For commitment to a job an employee must have a focus. Focus is created by communicating the strategic goals and core values of the organization downward through each level. Supervisors and their subordinates have to have the same opinion over: the number-one purpose as a work group and what makes this purpose important and over the values that currently and ideally drive the work group’s performance.

(b) Employee Competencies that Allow Success. People develop commitment toward what they believe they can do well. If managers want commitment, they must make sure that employees have the ability and willingness to be successful in their jobs. The most personal strategy for building competence is coaching.

(c) The Degree of Influence that Employees have is the Third “Leg” of Commitment. Employees do not perform nearly as well when they are consistently denied any input in their jobs and are expected to follow unquestionably the decisions of their leaders. There are three areas for influence innovation, planning and problem solving; and three kinds of influence within each area: inputting, deciding and implementing. Inputting means identifying problems, researching data, providing technical information and expertise. Decision making means participating in decisions about problem definition, about which problems will be addressed, etc.; Implementing means designing solutions, undertaking and evaluating strategies, etc. Coaching is the key for extending the influence of employees. In their coaching conversations with employees, managers permit employees actively to identify their own needs and to help shape the ways these needs are met.

(D) The Expressed Appreciation Given to Employees for their Contributions. People work best when they believe that what they do matters to someone else - especially their bosses. Of course, there is need to recognize superior performance. But one needs to recognize more than performance. Employees often feel more appreciated for having their pain recognized than for having their performance recognized. Of course appreciation can also be something creative or even outrageous or can be deliberately made in public (Kinlaw, 1993).

3. We chose to study an organization from a social constructionist angle (Wieck, 1995; Gergen, 1994,1996) and to see an organization as the result of ongoing negotiations between all the parties involved in the organization. The creation and sharing of ‘meaning’ is the basic process of organization. This means that an organization is seen as a co-creation, as something in a constant state of becoming. In social constructionism organization diagnosis and organization intervention are closely linked. Working on a diagnosis and seeking joint visions implies a constant construction and deconstruction of shared ‘meaning’. We therefore deliberately avoid scientific research that studies an organization as an “object” from an exogenous perspective. We consciously choose to do action research (see methodology).

This is the framework of our research: an action-research project, based on a social constructionist view on organizations and directed towards overcoming the knowing-doing gap and towards an increase in commitment to work towards solutions.

In previous action research about Optimization of personnel management in the Belgian Tax Administration, situated within the same theoretical framework (Martens,1997; Martens & Corthouts 1997 & 1998), we formulated the following process and context characteristics that were helpful to overcome the knowing-doing gap and increase commitment of employees to act on solutions.

1. Introduction and support of top management and authorisation by the hierarchy.

2. Take viewpoints, opinions, ideas, perceptions, limitations and objections of the other party or parties seriously; unconditionally, genuinely and consistently with an appreciative attitude.

3. Propose or introduce a long-term principle of co-operation. Look for a jumping-off point, a common value or goal of real interest to all parties, as this will have a positive effect on every participant. Seek for a win-win relationship between organization and individuals as well as between researchers and clients by establishing contact and by discussing the aims of the research, their contribution, the further processing and the expected output.

4. Reaching joint agreement on the directions and the operational procedures to be taken in each step. Every time a next step needs to be taken in , careful consideration of all parties is required. The next step is not taken
unless all parties consider it meaningful and take up their responsibility for it. The end result of each step is jointly evaluated, before moving on to another stage.

5. Openness in communication. Encourage people to be honest with each other and to say what is really on their minds. Parties should encourage each other to be equally frank and forthright. In this way, an open atmosphere is created: there is plenty of space for questions, discussions and individual opinions (trying to use model -2 behavior of Argyris, 1990)

6. Reframing information, creating openings to view things from different angles. For example, by appreciating different opinions yielding different views on reality (see 1) and by "experiencing" that there is no such thing as THE ONE objective reality, participants learn that many subjective perceptions of different individuals should be considered contextual data which need to be taken into account

7. Gradual recognition of the role of external facilitators, action-researchers and valid conversation partners. These 'process and context characteristics' do not assure success. Neither can we provide you with practical instructions for using them. But we will investigate whether they are clear enough to act as goals and guiding principles in the interaction process with our client. In order to do so, we will act '...as an active agent within the organizations themselves, serving for example, as consultant, organizational participant, board member or evaluator.' (Gergen, 1996, p.372) And further: 'the postmodernist view offers an alternative vision of organization science, one that places a major emphasis on processes of social construction, that emphasizes continuing interchange, continuing reflection and transformation. (Gergen, 1996, p.374).

We will further investigate and improve these 'process and context characteristics' in this TNG-project.

Research questions or propositions

This case-study concentrates on overcoming the knowing-doing gap and increasing commitment in an action-research project based upon a social constructionist framework.

If we, researchers and clients constantly try to realize the above formulated 'context and process characteristics' in this project, is it then possible to overcome the knowing-doing gap and to increase commitment? Or do we need other conditions? Which ones?

Methodology and/or research design

We explain our preference for action research, the situation of HRM at TNG, our proposal: a HRM-conference for all managers, with preparatory interviews and a debriefing at the rectorate, the results of the conference.

Action research

The desired output of action research consists of solutions to actual problems on the one hand, and of making a contribution to scientific knowledge and theory on the other (French and Bell, 1995). This is research with the objective of steering present and future action from the inside, and with the typical co-operation between individuals working within the system (referred to as "clients") and individuals outside the system (referred to as "researchers"). We regard this action component, working alongside with TNG-employees and the implementation of research results, as a particular mission and challenge. This action-research research strategy implies an iterative process of purposeful data-collection, feedback to the client group, discussion of data, action planning, action and evaluation. The perceptions yielded by this cyclical process are continuously the subject of implementation and testing. This increases the validity of the generated knowledge in the context of the professional university sector. This process of collectively negotiate the new way of organizing is the most decisive within the learning process. (Swieringa 1990). In this way we involve people in research and action so that the organization benefits from its inside knowledge and skills, and, what's even more important, that people are motivated to help each other out. By choosing action-research, we opt for a win-win operation between TNG and research. We opt for co-operation between researcher and clients and work in close contact with top-management of the TNG.

The situation of HRM at TNG

In the past 5 years quite a few things have changed at the TNG, with some remarkable changes in HRM at TNG: structural changes were brought about, the personnel policy has been revised and a lot of co-workers changed. A lot of improvement plans were devised, some of these were worked out in close contact with key persons, others were made without consulting. Few of these plans have been implemented so far. Key persons have the feeling that
they have to discuss problems concerning their daily working situation over and over again, and they do think about solutions to these problems; but they feel that few things really change. Many of these ‘daily’ problems affect more than one department and people of different departments reproach one another. HR tasks and responsibilities aren’t divided up clearly between HR department and line-management, managers are complaining about the services of the HR department, reproaches are made towards one another. As a result, there sometimes isn’t any staff to teach classes... HR-policies and procedures are not in place, some are outdated, disputed, unknown, confusing and sometimes even ignored and there aren’t any plans on paper. The problem with situations such as this one is that matters are usually dealt with on an ad hoc basis: Line-managers tend to go their own way and solve HR issues in a way that (sometimes) suit them best; meanwhile the HR people continue to fight their own uphill battle. Next to a general feeling of discontent and discomfort on both sides and a strong need to improve the current situation, individuals and groups feel they don’t have enough power to bring about changes.

One of the HR-experts has completed several missions since 1997 and has built up very good relations with academic and administrative managers on different levels, as well as with the people of the HR-department. Together they put together an “Introduction Booklet” for new staff members (1997) and organized several training sessions dealing with basics in HRM and project management for managers in general and for Personnel Officers. He also did quite a lot of personal coaching for new Personnel Officers. However, due to a high turnover rate in the Personnel Department and the lack of a HRM Director, it sometimes seems to be an uphill battle.

Our proposal

From December 1999 onwards, both HR-experts worked on a proposal containing ‘context and process characteristics’ that would help achieve their goal, i.e. overcoming the knowing-doing gap and increasing the employees’ commitment. This is important to finalize a sound HRM together with the local staff. The experts discussed their proposal with the local co-ordinator in December 1999.

In order to create a context in which managers could share knowledge and learn from their own actions we would like - to unite academic and administrative managers of different levels and the top management or rectorate - to discuss and analyze the problems with the whole group and to focus on solutions rather than reproaches.
- to motivate every individual to deal with those aspects of problems and solutions that he or she can handle because he or she is able to take that responsibility
- to be clear about expectations, roles and contributions in the client – supplier relationships between different departments and services.
- for the rectorate to commit to and support the commonly agreed upon solutions and provide the resources needed to implement these solutions. If it is impossible for them to provide these resources, they should explain why.
- to do all this in a very effective and efficient way in order to create a feeling of acceptance in the in and between groups of participants. We want them to be proud with the outcome and stimulate them to proceed and keep up the good work.

With this in mind a Strategic Human Resource Management Conference was held on February 16th-17th 2000, which was open to all managers of the TNG. Before the conference took place, the two HR-experts sat together with the rectorate and with the participants (divided in small groups of 2-6 persons) to discuss and negotiate the purpose and the roles of all parties.

The following objectives were discussed and negotiated with all participants before the conference took place: (1) Develop written and broadly accepted strategic plans for the near future; (2) To work together as a HR department and line management and to learn more about where we are standing now and what direction we want to take; (3) Develop shared perceptions on present and future HRM.

These proposals and objectives are the vehicles to realize the ‘process and context characteristics’ helpful to overcome the knowing-doing gap and to increase the employees’ commitment. In line with this action research study, we first talk with each group separately to analyze their current situation and compare it with their ideal situation, to discuss their own expectations and those of their superiors, and to think about a plan of action to move closer to this ideal situation. We organized this process within each group before the conference in preparatory interviews and between all groups during the conference.

The preparatory interviews

The conference was preceded by a number of interview-rounds for the different groups of managers. The rectorate, the deans, heads of the departments, directors of administration and supporting services were all involved
in these sessions. We invited all managers before the conference and hoped to talk to an as large and representative group as possible. 60 out of 71 managers came to the interviews. We talked with them in groups of 2-6 persons for approximately 1.5 hours. In these preparatory interviews 'the process and context characteristics' mentioned above were our guiding principles.

We always started with a short introduction to discuss the purpose of the conference. Then we asked everyone about their experiences, expectations and concerns and what the outcome of this conference would or could be. We went on explaining that, to us, HRM covers the HR activities of the HR department as well as those of the line management. Then we showed them the conference schedule and explained the methodological specificity. We put a lot of stress on the fact that we expected them to contribute and made it very clear that we would just take up the role of facilitator. In these interviews with almost all academic and administrative managers, we commonly investigated and discussed their problems and frustrations. We brought various kinds of expectations together and made them more realistic. Finally we discussed their roles and responsibilities, and worked on motivation and trust.

We handed out schedules with the purpose of the program and the two days procedure. Each interview round was closed with the following questions: Are you willing to commit yourself to solving the existing problems? Are you willing to contribute during the conference? Are you willing to continue to work on improvements after the conference? Some participants were truly enthusiastic, others had their doubts. These doubts were taken seriously. But in most cases, we succeeded in breaking their barriers after a lengthy discussion. However, three individuals (all three of them belonging to different groups) remained uncertain.

In our first interview with the top management we talked about a number of things: first of all, we indicated that if problems occur, they can be solved or at least controlled by the management team in 80% of the cases. We also asked whether they would be prepared to support the results of the conference and whether they would take necessary measures, even drastic ones. We also asked them to open the conference, to express their expectations and to show their commitment. They promised to do their best to support the conference and its results.

The conference

The rector opened the conference and pointed out the importance of finding sensible solutions to many of the HRM-problems, so that TNG would be able to fulfill her mission in a better way. Then we started with the results of the interviews, as summarized above. We proposed to work together towards a solution to the problems discussed and to stop reproaching one another and to work according to our 'process and context characteristics'.

We pursued a participatory approach. Ideas, perceptions and interpretations were prioritized and evaluated in a sequence of sessions during the two days of the conference. These sessions dealt with: (a) the trends or developments that affect HRM of TNG, (b) the stakeholders and their interests, (c) the purposes of HRM, (d) 4 steps of the SWOT-analysis and finally (e) the strategic action plans.

In order to assure an ordered course of events (i.e. inventory and prioritization), the participants were split up in heterogeneous groups of 6-8 persons, each sitting at a table. In each session everyone was asked to write down his/her own opinion on separate sheets of paper. E.g. what do you consider the most important trends or developments that are coming up and that will affect Technikon's HRM policy? Then, participants exchanged answers and opinions and voted on their importance. In this way, a ranking of topics that deserved priority was obtained. These were gathered on a central table and after an explanation by each table-leader, participants were asked to vote once more. In this way we came to a group decision in each session. This decision consisted of the prioritized answers of the entire group. All this was done in accordance with a relatively tight plan.

So we started with a first session: the identification of trends that influence the HRM at the TNG. In a second session, the stakeholders of TNG were stated. Because there was a large diffusion as to what the field of HRM operations is and what the borderlines are between the work of HR department and the work of the managers, we decided to give a short lecture on the HR models of Tichy (1984) and Beer (1985), the expected results of a good HRM and different possibilities to divide the HR-work between the human resources department and the line-managers. We thought that this short theoretical lecture would mean more to the participants than an unclear participatory discussion. In the third session the objectives for human resources at TNG were discussed and formulated. Then the interactive SWOT-analysis followed. This took us almost half a day.

Then the most important part of the conference, the development of strategic plans, began. We started off by forming four voluntary workgroups, all of them working on different issues: a first one on human resources policies; a second on a human resources manual; a third on staff training and development and a fourth on the clarification of the division of responsibilities and work between the human resources department and the managers. Each group got an assignment that was designed to work towards solutions to the formulated problems. Every assignment consisted of defining objectives, activities and a timeframe.
Making these assignments had a positive effect on the energy level of the participants. Many participants explicitly mentioned that they were making progress. Especially the presence of important decision makers gave them the feeling that problems could be discussed and that improvements could be made. The four groups worked on very differentiated, well-equilibrated and realistic assignments. When the results of the four assignments were presented, volunteers were encouraged to actually carry out the proposed work. Each group or 'taskforce' elected a chairperson and was placed under the mentorship of a dean.

At the very end of the conference, one of the black managers asked us the parole to initiate a short prayer of thanks and so the conference ended unforeseen in a very authentic and impressive way. When they left the conference, participants pointed out that just at the end nobody of the rectorate was there anymore. But a debriefing was planned and one of the HR-experts was willing to personally follow up the results after the conference. He also promised to discuss potential problems with the rectorate. This meant a lot to the participants.

The debriefing at the rectorate

So, during the next day’s debriefing at the rectorate, we asked one member of the rectorate to act as a godfather for the four taskforces and to pay attention to the links between the four task forces. We also asked them to take action, to provide the necessary professional staff at the human resources department in order to solve the most serious problems (e.g., no lecturers to teach as a result of delays). We wanted our two-day workshop to be inspiring and motivating: if the participants have a positive short-term experience, it stimulates them to keep developing and improving.

Results and findings

On the one hand, there are the results useful to TNG in particular; on the other hand there are the scientific findings about process and context factors to overcome the knowing-doing gap and increase commitment.

Results of the conference for TNG

We designed the intervention in such a way that the objectives of the conference could be met. Looking back on the objectives we see that: (1) TNG has written and accepted strategic plans for the near future now; (2) we worked and learned together as a HR department and line managers and (3) we also think we have contributed to the development of shared perceptions on human resources at least at the level of the existing problems and what has to be done about it in the near future.

First there are the four project groups with specific strategic plans for HRM: (1) for human resources policies, (2) for a human resources manual, (3) for staff training and development and (4) for the division of responsibilities and work between the human resources department and the managers. The four groups work on a very differentiated, well-equilibrated and realistic assignment, that consists of objectives, activities and a timeframe; volunteers carry out the proposed work; a chairperson for is elected for each group and is placed under the mentorship of a dean. One member of the rectorate will act as a ‘godfather’ for the four taskforces and pay attention to the links between the four taskforces. Participants, rectorate and we as HR-experts thought of it as high-quality assignments. And they were commonly negotiated and agreed upon! In this way the knowledge available in the organization was brought together to solve the problems.

Secondly there is the process result of sitting two days together in multi-functional groups of people who are in supplier-client relations. Participants have been encouraged to work together in diverse groups: young and old, black and white, academic and administrative, men and women, different religions etc. and they told us during and after the conference that they had learned to appreciate each other more than before. These two days of formal and informal talks and conversation increased the quality of the communication and interaction between the different groups at the TNG, they reported.

Thirdly there are the negotiated and ‘shared’ intermediate results of the conference dealing with (a) the trends or developments that affect HRM of TNG, (b) the stakeholders and their interests, (c) the objectives for HRM at TNG, and especially (d) the SWOT-analysis of HRM at TNG. The consciousness between the participants of having an agreement on these questions can be a good starting point for further actions and are indeed the topics of the workgroups. We made sure that every participant got a full conference report within one week after the conference.
In the official evaluation of the whole IPD-project in October 2000, IMEconsult (2000) writes about our action research ". . . a lot of people have been involved in the workshop and this has resulted in encouraging debates about managerial issues. A start has been made with developing strategic plans and objectives. The attitude (of the HR-Department) has changed from being a closed Kingdom into a more service-oriented department. People were offered a lot of opportunities to contribute to organizational development." But also: "There still is a variety of opinions on what HR should do and what the responsibility division between management at all levels and HR department should be like." And: "There still is "a focus on individuals instead of systems or mechanism."

Overcoming the knowing-doing gap and increasing commitment

In order to overcome the knowing-doing gap and to increase commitment, we organized a strategic HRM-conference at TNG as an action-research project. The different steps of the iterative process of purposeful data-collection, feedback to the client group, discussion of data and action planning interacted constantly. Participants gave feedback throughout the conference and adjustments were made on the spot whenever necessary. The data-collection, and the process of learning to discuss problems and deal with them as a group were very important. In preparatory interviews we invited all managers to make a joint diagnosis and eventually to propose solutions; we put heavy emphasis on the 'process and context characteristics' that we continually tried to realize and to safeguard. These interviews with the participants just before the conference, turned out to be very valuable, not only as a means of preparation, but also to establish the 'context and process characteristics' and to obtain insight in the current problems and feelings.

All these different diagnoses formed the starting point for the conference. We stressed that all different viewpoints would be taken seriously. The rector opened the conference by explaining the common goal that nearly all participants had personally and fully agreed upon during the interviews. The common goal and the first steps to be taken were truly based on a shared view. During the whole of the conference we tried to stimulate open and effective communication, the reframing of information, the creation of openings for viewing things from different angles, e.g. by having individuals write down their personal opinions first, and then list them and make up a ranking in group. The conference was an inviting and save context, they told us, to work together and to exchange ideas, diagnoses, expectations, frustrations and possible ways to improve things. People reported that they had seldom communicated with each other so deeply on these TNG-topics. Within TNG we stimulated to work on the general need to improve things and to do it together. During the conference personnel officers and managers from the rank and file worked together on a plan for strategic improvements. Working together towards a common goal in a new setting, in a safe context seemed to be a very good way to stimulate commitment, mutual respect and understanding. The conference was organized by outsiders, who were increasingly recognized as facilitators and valid conversation partners. This was obtained by continually stimulating the use of 'the process and context characteristics', by addressing people in their own languages, e.g. by referring to activities and forms in the abbreviations and the code names used by the TNG and if necessary, by proposing and explaining frameworks and concepts that the client can use and adapt to its own situation and then demonstrate their added value.

The seven above-mentioned 'process and context characteristics' were gradually proposed and realized and were clear for the participants. These 'process and context characteristics' should not be considered accurate prescriptions of activities or cause result-relationships but they were clear enough for these managers to use as guiding principles in interactions.

Besides these 7 factors, the following aspects were often mentioned as being 'helpful'. During the conference the managers worked together in cross-functional groups, all together in the same room and at the same moment, towards the only truly important thing: the better functioning of HRM of TNG. This created a lot of positive energy; they almost 'forgot' about their own frustrations and put aside their prejudice against other individuals or groups. The immediate presence of important decision makers made it possible to view problems from different angles and in all aspects. All participants brainstormed together about ways to overcome the existing organizational barriers caused by the strict division of labor. These factors "working with cross-functional groups, all together, at the same moment and in the same place" was reported over and over again as very valuable. This phenomenon has already been described by Weisbord as: "The search conference or getting the whole system in the room, links values and action in real time. It promotes productive workplaces by using more of each persons reality" (Weisbord, 1987, p. 295)
Conclusions and recommendations

This study is a snapshot of TNG in a continuing, an ongoing organizational change process. If one looks back at 'the process and context factors' we tried to install, one might consider them as rather basic recommendations, as common sense: (1) Introduction and support of top management (2) Taking the viewpoints of other parties seriously (3) Looking for a common value or goal of real interest to all parties (4) Reaching joint agreement on the directions and the operational procedures to be taken in the next step (5) Openness in communication. (6) Reframing information, creating openings for viewing things from different angles. (7) Gradual recognition of the role of external facilitators, action-researchers and valid conversation partners and (8) working with cross-functional groups all together, at the same moment and in the same place. But this doesn't mean that these recommendations are common practice! Quite a few projects that were going on at TNG created frustrations and got stuck, possibly because the above-mentioned process characteristics were not applied....

How this research contributes to new knowledge in HRD

The conclusions may not seem to be very innovative at first sight. It is astonishing that a contribution to scientific knowledge can lay in the search of means and methods needed to put scientific knowledge into practice. Maybe we need to do more research and refine these 'context and process characteristics' or maybe find other forms to overcome the knowing doing-gap. Indeed, by studying and doing research we gain knowledge. But gaining knowledge is not the problem, it's the 'doing' part that causes problems. It is also striking that the problems we worked on are also familiar to our own university as well as other universities and organizations. HRD-academics need the courage to be unconventional en need to be convinced that research on overcoming knowing-doing gaps is not an inferior branch of research. On the contrary, it's necessary and very useful indeed!

The intent of this innovative session is to provide a discussion forum for practitioners and researchers to help set new directions for the field of CPE across multiple professions. In this session participants will: 1) Analyze the development of the field of CPE, 2) Contrast significant issues, trends and research studies that are shaping and changing the field; and, 3) Propose a vision of the future of CPE research and practice.

Keywords: Continuing Professional Education, Professional Practice Development, Professional Learning

Session Description

The purpose of this session, structured as a practitioner forum, will be to initiate an analysis and discussion of the current nature and scope of continuing professional education (CPE), raising awareness of the trends and issues likely to affect the field in the future. CPE is being influenced by changes in our society, workplace, professional practice, as well as changes in learning theory, evaluation practice, and ethical responsibilities. The session will focus on linking new research and theory to the practice of CPE by analyzing trends affecting CPE, learning and professional practice, including workplace learning, evaluation, market realities, and finally, ethical decisions in CPE.

Purpose

Continuing professional education (CPE) has undergone significant change in the past decades; and yet, there is little professional discussion that assists practitioners in developing an expanded understanding of the new issues, developing trends, or future needs of this important segment of adult education and human resource development. In his classic text, Continuing Learning in the Professions, Houle (1980) stated: "The task for this generation is to move ahead as creatively as possible, amid all the distractions and complexities of practice to aid professions... constantly to refine their sensitiveness, enlarge their concepts, add to their knowledge, and perfect their skills so that they can discharge their responsibilities within the context of their own personalities and the needs of the society of which they are collectively a part." (p. 316).

Even though these words were written 20 years ago, the need for CPE as a field of practice to move ahead creatively still exists. In many ways, the field of CPE is even more fragmented now than in Houle's (1980) conceptualization. CPE providers tend to identify with and practice within their individual professions rather than within the general field of human resource development. Yet, there is a great deal that CPE providers can learn collaboratively from each other regardless of the specific profession to which they belong.

The intent of this innovative session is to provide a discussion forum for practitioners and researchers to help set new directions for the field of CPE across multiple professions. This innovative session has been designed in three sections. These sections will: 1) Provide a brief review of the development of the field of CPE; 2) Analyze
significant issues, trends and research studies that are shaping and changing the field; and, 3). Propose a vision of the future of CPE research and practice.

Goals

During this innovative session the participants will:

- Discuss the development of the field of CPE and link this to current theory and practice.
- Discuss current issues and future trends in the field of CPE and analyze the research implications of these issues and trends.
- Propose future directions for practice, research, and theory development in CPE.
- Explore theoretical and practice connections between CPE and HRD.

Content

In the first part of this innovative session, presenters will examine the development of CPE and discuss trends and issues currently shaping the field. Presenters will analyze how workplace education, distance education, collaborative practices, and regulatory agencies are shaping current practices. Presenters then identify critical issues that must be addressed in building new creative systems of continuing education.

The second section of this innovative session will analyze issues and trends within the field of CPE. The presenters will focus on models that facilitate the development of professional expertise and suggest a new model of learning in and from the workplace. Presenters will also offer a new way to understand how professionals learn within the context of their professional practice. Presenters will then challenge the field of CPE to begin developing a unique evaluation theory that can be applied in the practice of CPE. Drawing from cross-disciplinary evaluation theory, presenters will identify practical methods by which practitioners can conduct comprehensive program evaluation for the purpose of improving professional service. Presenters will then outline how the interplay between program planning and marketing is essential for CPE providers in highly competitive markets. They offer practical approaches to marketing based on their extensive experiences in the field of CPE.

The final section of this innovative session will focus on setting future directions for the practice and research of CPE. Presenters will challenge CPE providers to understand professional practice in a new way. Presenters will argue that professionals are losing decision-making authority and professional autonomy as systems, rather than individuals, assume control of professional practice. Finally, the presenters will synthesize information discussed and propose a reframed vision for the field of CPE.

Format

Presenters will have approximately 10 minutes to lay the ground work for the concepts of their presentation as outlined in the content section of the proposal. Following the brief presentations, the participants will be divided into three groups to further discussion and analyze:

- Development of the field of CPE and implications for research and practice
- Issues and trends in CPE and implications for research and practice
- Future directions for practice, research and theory

The session moderators will integrate and summarize the discussion at the conclusion of the symposium. This summary will be posted on the web following the conference and symposium participants will be invited to continue in the discussion.

Organizational Performance: The Future Focus of Leadership Development Programs

Doris B. Collins
Louisiana State University

This research analyzes 54 leadership development studies from 1984 – 2000 and determines the extent to which the intended outcomes of those leadership development programs focus on organizational performance. This research used Burke and Day's 1986 meta analysis on managerial training as its starting point. Burke and Day's study found mixed results on the effectiveness of training programs. This research confirms that organizations have begun to take a more systemic approach to leadership development.

Keywords: Leadership Development, Organizational Performance, Meta Analysis

Many organizations are concerned about leadership inadequacies of their employees, and as a result, are committing to education and training that deepen the skills, perspectives, and competencies of their leaders. Gibler, Carter, and Goldsmith (2000) indicate that annual budgets for leadership development programs will continue to grow throughout the next decade as companies "recognize the shortage of talented managers, the importance of developing bench strength, and the need to widen perspectives in order to compete globally" (p. xii). Most organizations recognize that effective leadership is one of the most powerful competitive advantages an organization can possess. However, research reported in the literature on the effectiveness of leadership development programs is sparse, which leads one to believe that relatively few organizations are evaluating the effectiveness of their leadership development programs. That leadership development efforts will result in improved leadership skills appears to be taken for granted by many corporations, professional management associations, and consultants (Sogunro, 1997).

Most organizations today are facing a multitude of outcome-based demands on their time and resources – demands that stem from a variety of driving forces including federal mandates, increased competition, and national accreditation standards. Leadership development outcomes are even more important in global organizations than in traditional organizations because of dual reporting structures, proliferation of communication channels, overlapping responsibilities, and barriers of distance, language, time, and culture (Friedman, 2000). Leadership development programs that are linked to the organizational mission, strategy, and goals are likely to produce outcomes valued by the organization (Rummiller & Brache, 1995).

For this research, outcomes of leadership development programs are defined in terms of organizational performance. An outcome is defined as "a measurement of effectiveness or efficiency (of the organization) relative to core outputs of the system, subsystem, process, or individual" (Holton, 1999, p. 33). Leadership development is defined as "every form of growth or stage of development in the life-cycle that promotes, encourages and assists the expansion of knowledge and expertise required to optimize one's leadership potential and performance" (Brungardt, 1996, p. 83). Leadership development studies include the full range of leadership experiences as suggested by McCauley, Moxley, & Van Velsor (1998) such as mentoring, job assignments, feedback systems, on-the-job experiences, developmental relationships which include exposure to senior executives, leader-follower relationships, and formal training programs.

The purpose of this research is to analyze the outcomes of available leadership development studies from 1984 – 2000, after Burke and Day's meta-analysis (1986), to determine if leadership development programs have changed from a focus on individual performance to a focus on performance at the organizational level (Rummiller & Brache, 1995). It uses a "macro" lens that incorporates the full range of leadership development programs (McCauley et al., 1988), the Results Assessment System evaluation model (Swanson & Holton, 1999), and a new high-performance leadership competency model (Holton & Naquin, 2000). The high-performance leadership competency model provides the only known definition of leadership development outcomes that includes "improving performance" as a core dependent variable, or an explicit outcome of leadership. Hopefully, this research will provide some theoretical undergirding for future research in determining the underlying reasons organizational-level outcomes do not appear as the major driving force behind design and implementation of
leadership development programs. This research also analyzes the changes in content of the leadership development programs, the types of leadership development intervention categories, and the intervention instruments used.

Burke and Day's Meta-Analysis of Managerial Training

No comprehensive analysis of managerial or leadership training has been done since Burke and Day's (1986) cumulative analysis on managerial effectiveness. However, the focus of managerial leadership has shifted in the past decade to strategic leadership because of increasing global competitiveness, continuous restructuring activities, demographic changes in the workforce, customer demands, and rapid technological changes (Gibler et al., 2000; Hooijberg, Hunt, & Dodge, 1997). Leadership in a global organization requires that leaders delegate decision making, geographically disperse key functions across units of different countries, de-layer at the organizational level, de-bureaucratize formal procedures, and differentiate work responsibilities and authority across networked subsidiaries (Friedman, 2000). In addition, studies on leadership theories and practices introduced into the literature since 1986, such as transformational leadership (Bass, 1985), team leadership (Hackman & Walton, 1986; Larson & LaFasto, 1989), 360-degree feedback (Lepsinger & Lucia, 1997), and on-the-job experiences (McCauley & Brutus, 1998) have also spurred new content areas in leadership development research.

Leadership Development Literature

Volumes of literature exist on the concept of leadership, but in comparison, the literature on leadership development and its impact is minuscule. Research indicates that little is known about what outcomes or knowledge, skills, or processes in leadership development programs contribute to organizational performance (Campbell, Dunnette, Lawler, & Weick, 1970; Fiedler, 1996; Lynam, 2000). Performance improvement at the organizational level (Rummler & Brache, 1995) is typically inferred, implied and assumed as an outcome of leadership and leadership development. Performance improvement (Torraco, 1999) and high-performance leadership competencies (Holton & Naquin, 2000) have recently been linked and provide a potential focus for leadership development programs, which will make it easier to measure outcomes. Yet, despite the immense amount of investment in leadership training on the part of corporations and governments, there is little evidence that such training results in a more effective leadership behavior (McCauley et al., 1998). Hopefully, the results of this research will help us better understand leadership development programs and their contribution to organizational performance.

Method

Qualitative research has been conducted to determine studies that involve a leadership development experience, which includes managers, leaders, and/or executives. Studies for this analysis were located by conducting a computer search with ABI Inform, UNCOVER, scanning bibliographies, and reviewing journal articles and proceedings from the annual conferences for the Society of Organizational and Industrial Psychology and the Academy of Human Resource Development. Also included are all applicable leadership studies cited in The Impact of Leadership by Clark, Clark, & Campbell (1992). In the computer search, key words used include outcomes, impact, effectiveness, and influence in combination with the following subject areas: leadership development, management development, managerial training, management training, executive development, leadership education, leadership, management education and management skills. A review of approximately 1000 titles, abstracts, and/or articles provided 54 studies that meet the sample criterion defined for this analysis. Most studies were located primarily in management and psychology journals.

Once studies were located and reviewed, codes were provided for the content area, the category of leadership development intervention, and the intended outcome of the leadership development experience. The management level of the individuals in the sample, the size of the sample, the type of leadership development intervention, and the instrument(s) used to measure outcomes were also recorded. To validate the coding scheme, each article was reviewed a second time and the coding choice was compared with the first review to ensure similarity. In addition, two doctoral-level human resource development students read four of the most recent studies and independently coded the sample studies. One rater disagreed in only one coding element, but the raters discussed and agreed on the appropriate coding.
Definition of Leadership Development Content Areas

The high-performance leadership model (Holton & Naquin, 2000) provided the base for the leadership development content areas in order to more appropriately reflect leadership in today's high-performance organizations. Therefore, team management (Baker, Walsh, & Marjerison, 2000) and strategic leadership competencies (Collins, Lowe, & Arnott, 2000), which enable high-performance leaders to lead strategically in an environment of continuous change, were incorporated. Content areas selected are Employee Development; Employee Performance; Human Resource Systems; Job and Work Design; Strategic Leadership; Supportive Environment; and Team Management (Baker et al., 2000; Collins et al., 2000; Wilson, Boudreaux, & Edwards, 2000). Definitions of content areas are as follows:

- **Employee Development (ED).** Building nurturing relationships that help employees to reach their highest potential.
- **Employee Performance (EP).** Execution of job behaviors that accomplish organizational goals including the establishment of clear employee goals and use of motivation to build employee commitment.
- **Human Resource Systems (HRS).** Linkage of the right employee to the right job and human resource policies and procedures to job activities. Evaluation of the organization’s policies and procedures in relation to employee performance and development of leaders whose values closely match the organization.
- **Job and Work Design (JWD).** Determining an organizational structure to meet goals and structuring jobs so individuals can achieve personal, process, and organizational goals.
- **Strategic Leadership (SL).** Transforming the organizational culture and institutionalizing change to promote continuous organizational improvement. Communication of strategy and performance information to relevant subsystems. Collaborative efforts that lead to valued outcomes.
- **Supportive Environment (SE).** Building organizational systems (personnel, technology and control) with an open atmosphere and adequate resources, that enables effective performance.
- **Team Management (TM).** Development and leadership of strong, effective organizational teams.

Definition of Intervention Categories

Each leadership development study was assigned a category based upon the full range of leadership development experiences described by McCauley et al. (1998) with one additional category assigned for on-the-job-experiences. Definitions of intervention categories used in this research are:

- **Developmental relationships (DR).** Experiences where another individual influences the manager’s personal development such as one-on-one mentoring or coaching.
- **Feedback Intensive Programs (FIP).** Data fed back to participants in a safe, supportive environment such as 360-degree feedback and exclusive of assessment informal feedback settings.
- **Formal Training Programs (FT).** Structured training programs designed to develop the individual employee.
- **Job Assignment (JA).** Job experiences scheduled for a definite period of time that push managers out of their comfort zone, such as redesigning a system or part of a job or serving on a temporary task force.
- **On-the-Job Experiences (OTJ).** Job experiences where managers learn, grow, or undergo personal change as a result of the experiences (McCauley & Brutus, 1998).
- **Structured Experiences (SE).** Structured goal-directed, live-action, task-based interactions such as leaderless group discussions, simulations, and targeted exercises.

Definition of Measurement Instruments

Measurement instruments varied greatly among the studies identified for this analysis and included both quantitative and qualitative measurements. Some studies used organization-constructed instruments for quantitative analysis. Other studies used instruments designed externally as SYMLOG (Systematic Multiple Observations of Groups), PMLX (Project Leader-Member Exchange Scale), WGCTA (Watson-Glaser Thinking Appraisal), LISRIL, WABA (Within and Between Analysis), Argyris’ Learning Model or MLQ (Multifactor Leadership Questionnaire).
Definition of Leadership Development Outcomes

The Results Assessment System model (Swanson & Holton, 1999) was used to determine if the results of the studies are at a performance or learning outcome level. Performance-level outcomes are typically outcomes at either the organization or group level while learning outcomes are typically at the individual level of the organization (Rummler & Brache, 1995), but also can serve as a measure of learning at the group level.

The Results Assessment System (Swanson & Holton, 1999) specifies three outcome levels with two outcome categories delineated for each respective outcome level. The performance outcome level is categorized as either system or financial outcomes while the learning outcome level is categorized as either expertise or knowledge outcomes. The perception level will not be covered in this research. The performance - system level includes mission-related outputs in form of goods/services, having value to the customer, that are related to the core organizational, work, process, and group or individual contributor to the organization. The performance - financial level is determined by the outputs of goods/services converted into a money and financial interpretation. The learning - expertise level measures human behaviors that have effective results and optimal efficiency acquired through study and experience within a specialized domain. The learning - knowledge level assesses mental achievement acquired through study and experience.

Results

The results shown in Table 1 indicate that 16 (30%) out of the 54 recorded studies had performance-level outcomes. Thirteen studies (81%) with performance-level outcomes measured system performance while three (19%) addressed financial performance as the outcome variable. Another interesting finding was that four (7%) out of the entire group of 54 studies had team or group effectiveness as the outcome variable. The results also show that 38 studies (70%) had a learning-level (knowledge or expertise) outcome. In contrast, Burke and Day (1986) found that only two (3%) out of 70 studies were concerned with performance and 68 (97%) with learning. To compare the results, 30% of the studies in the current analysis have performance-level outcomes whereas the Burke and Day study reflects only three percent with performance as the outcome variable. Just as Burke and Day's (1995) analysis, the current research also found mixed results on the success of the leadership development intervention. A typical finding in the studies was that independent variables in some studies reflect no correlation while in other studies there was a strong correlation between variables. Three studies in the current research had overall negative findings (Facteau, Facteau, Schoel, Russell, and Poteet, 1998; Moxnes and Eilertsen, 1991; Thoms and Klein, 1994).

Results in Table 1 show that Strategic Leadership was the most frequently researched leadership development content area (n = 18, 33%), followed by Employee Development (n = 11, 20%), and Supportive Environment (n = 8, 15%). Seventeen studies (32%) fell in the remaining content areas identified in this analysis. That Strategic Leadership has become a focus of leadership development programs is not surprising as current organizations must continually function in less stable, continually changing environments than those in studies reported in the Burke & Day (1986) meta-analysis.

In Table 2, the results indicate that formal training (n = 22, 41%) continues to be the primary category for leadership development intervention. Job assignments (n = 17, 32%) was second out of the six categories of
leadership development interventions. The intervention categories found least in the assessment research are feedback intensive programs, on-the-job experiences, and structured experiences.

The results indicate that multiple constructs were used to evaluate the effectiveness of the leadership development programs in many (n=29, 53%) of the studies in this analysis. Often a qualitative method as an observation, interview, focus group, or self report was used in combination with an internally or externally-developed survey instrument. Another interesting finding was that five studies (9%) appeared to be totally qualitative (Bolman & Deal, 1992; Gengler & Riley, 1995; Kovner, Channing, Furlong, Kania, & Politz, 1996; Marson & Bruff, 1992; Spreitzer, McCall, & Maboney, 1997). An analysis of the instrumentation used per content category revealed that the majority of instruments were surveys developed outside the organization (n = 28, 52%), and approximately 20 different instruments used. Measurement instruments developed within the organization were used in 15 studies (28%). Other types of instruments found in the analysis were observations, audiotape, simulations, feedback systems, and task rankings.

The results indicate that instruments developed outside the organization were used more often in the Human Relations Systems and Strategic Leadership content areas than in studies from other content areas. See Table 3 for analysis of instrumentation. Examples of externally developed instruments used in each of the content areas are as follows:

- **Employee Development (ED).** Multifactor Leadership Questionnaire (MLQ), Management Skills Profile (MSP), Management Development Questionnaire (MDQ), and Leadership Effectiveness Adaptability Description (LEAD-Self).
- **Employee Performance (EP).** LISERL VII, Survey of Management Practices (SMP), California Psychological Inventory (CPI), and MSP.
Human Resource Systems (HRS). The Multifactor Officer Questionnaire (MOQ), Leader-Member Exchange (LMX), Leadership Styles Inventory (LSI), LEAD, MLQ, MSP, and LISERL.

Job and Work Design (JWD). Watson-Glaser Critical Thinking Appraisal (WGCTA) and Kolb's Adaptive Style Inventory.

Strategic Leadership (SL). Leadership Behavior Questionnaire (LBQ), Argyris' Learning Model, Myers-Briggs Training Instrument (MBTI), Repertory Grid Technique, Systematic Multiple Observations of Groups (SYMLOG), Hofstede construct, and LDQ.

Supportive Environment (SE). The Vroom-Yelton model, LMX, MLQ, and SYMLOG.

Summary

Even though leadership development programs are pervasive (Burke & Day, 1986), research on the effectiveness of leadership development programs is sparse. It appears that organizations are not evaluating and reporting the results of their leadership development programs. However, performance-level outcomes are more critical than ever because organizations are facing a multitude of outcome-based demands on their time and resources. Therefore, organizational level outcomes should be the driving force behind the design and implementation of all leadership development programs.

This research shows that there is a trend toward organizational performance as the outcome of leadership development programs. The 1986 Burke and Day meta-analysis of the effectiveness of leadership development programs indicated that only three percent of the studies were at the organizational level while 30 in this analysis measured organizational variables.

This research also shows that the content of leadership development programs has changed. Strategic leadership and team management skills are the most distinctive changes in the content of leadership development programs since Burke and Day's (1986) study. Strategic leadership was the most frequently found topic of programs in this analysis and this is not surprising as the fluid, evolving, dynamic networks of today's global organization dictates the need for visionary leaders with a different set of leadership skills (Pucik, 1997).

While formal training programs remain prominent leadership development venues, this research proves that other types of developmental programs are prevalent. Examples of leadership development programs found that did not occur in Burke and Day's (1986) research include job assignments, feedback intensive programs, mentoring, and on-the-job experiences. While a report on the effectiveness of these types of programs occur occasionally in the leadership development research, it is obvious from this analysis that the outcomes of these experiences are not assessed as often as formal, structured training programs. These programs are likely not assessed because characteristics of these developmental job experiences cannot be expressed in objective features.

Future Research Issues in Leadership Development

Leadership development is a young but growing field that we still know very little about. Consequently there are many voids in the literature that are open to future research. Four of those areas are defined in the paragraphs that follow.

Most leadership models have been developed for an era of a more stable, predictable environment. High-performance global organizations embrace continuous change as a core value (Collins et al., 2000). Therefore, organizations will need leadership that is "able to think and act differently, and be able to integrate critical thinking into practice" (McCauley et al., 1998, p. 571). Because organizations will shift towards greater complexity, global competition, continuous quantum change, and collaborative team orientations, more evaluations based on the high-performance leadership competency model (Holton & Naquin, 2000) are needed to adequately depict leadership development outcomes of future global organizations where performance is linked to strategy.

How future leaders will impact the role of team leadership is virtually unknown. Leadership appears to be undergoing a change that is erasing the distinction between leaders and followers and organizing around teams (McCauley, Moxley, & Van Velsor, 1998). The idea of leadership will be thought of as reciprocal connections of people working together. Future research should focus on outcomes of leadership development experiences that increase team performance.

There is a deficiency of real scholarly knowledge about leadership development. More research is needed to fully understand leadership development. A replication of Burke and Day's meta-analysis could provide additional knowledge about leadership development and also provide a theoretical undergirding for future research. Also, a standardized assessment instrument should be developed by researchers to assist organizations in performing evaluative studies that will adequately measure performance at the group, team, or organization level (Rummier &
Brache, 1995). HRD should take the lead in developing appropriate performance-level evaluation methods. The top management of organizations has too many demands on their time and does not have the theory and research-based expertise necessary to accomplish the task.

**Leadership requirements of future global organizations are not yet understood.** HRD practitioners must understand the changing and complex, overlapping skills needed for competent leadership requirements of future global organizations. Therefore, strategic leadership competencies for a global environment should be incorporated into future evaluative studies so as to understand what is known about the field across multiple organizations and countries.

**Conclusion**

For leadership development programs to be truly effective they should add value to the entire organizational system at all of the core levels: organization, group, and individual. This research proves that recent leadership development programs have begun to focus on enhancing system (organizational) performance. An organizational approach should become the future direction for leadership development programs as it integrates programs/systems and measures the impact. Approaching leadership principles at the organizational system level will allow organizations to meet the adaptive challenges of an increasingly more complex environment. However, completion of more well-designed, thoroughly-reported empirical studies are needed to provide the necessary data to support that leadership development programs truly enhance organizational effectiveness.

Hidden Dimension of Leadership Success: Implications for Building Effective Leaders

Anne Khoury
University of New Mexico

Leadership development, a component of Human Resource Development (HRD), is becoming an area of increasingly important practice for all organizations. This theory paper proposes that the hidden dimensions of successful leadership are personal credibility and self-efficacy. A successful leader in this model is defined as one who can inspire others and turn aspiration into action to accomplish business results. The model illustrates that as leaders fulfill this business goal, credibility x self-efficacy is the basis.

Keywords: Leadership Development, Action Learning, Leadership

The Problem

Having worked in leadership development for a number of years, both in the public and private sector, I have always wondered why our programs fail to develop effective leaders. Development programs seem to improve skills and competencies and increase self-awareness. Participants state they enjoy our programs and find them meaningful. Yet, bottom-line business results do not improve over the long run and staff continue to report problems with management valuing and involving them in the work of the organization. Like most traditional leadership programs, our programs at Los Alamos National Laboratory start with competencies and a focus on the individual.

At the Laboratory we have identified a set of leadership and management competencies that we use to assess, develop, and evaluate our management staff. To determine the impact of our leadership development programs we use after course participant and supervisor feedback, upward performance appraisal results, a yearly organizational climate survey, and individual performance appraisals. All but the after course evaluations indicate that the impact desired, creating effective leaders, is negligible at best.

Thinking about this situation and the input and output model, I think something happens at the throughput stage when managers lead or participate in our leadership development programs, that is not competency related or environmentally dependent, which makes an individual an effective leader. It is something implicit rather than explicit, and I believe it is personal credibility and self-efficacy (belief in self as a capable leader).

Supporting this proposition is the fact that, in our changing world, the leaders of the future will be known less for what they say and more for what they deliver, less by what they control and more by what they shape, and less by goals they set and more by the mind-sets they build - (Ulrich, 1996). To be able to accomplish these behaviors, a leader needs to possess substance as well as competency. Workers will no longer follow a manager because of positional power as they did in the past. Our future leaders must not only inspire but must be able to turn aspiration into action through the people they lead. "Followership" is no longer a guarantee just because one has a management title.

This paper proposes that two "hidden" dimensions, personal credibility and self-efficacy, are essential ingredients to gain "followership". Both of these elements have more to do with substance than with form. Traditionally, we have concentrated our leadership development programs on form, e.g. competency development, and have done little to enhance substance, e.g. values, beliefs, actions, belief in self. Substance is what makes an individual one who is worthy to work in an organization, privileged with the power to manage and inspire others. I'm proposing herein that we need to provide leaders with opportunities to develop substance by enhancing their personal credibility and self-efficacy through our leadership development programs.

Because of the relationship between personal credibility and self-efficacy and a leader's ability to lead, an assumption of this approach is that by designing our leadership development programs to enhance these two dimensions, bottom-line business results will improve. Another assumption is that this improvement in business result has important implications for the success of our leadership development programs.

A Proposed Model

The proposed Leadership Success Continuum Model is based on the assumption that credibility of action is a significant determinant of whether a leader will be followed over time. Without personal credibility a leader cannot lead. Additionally, the proposed theoretical model is built on the assumption that without a belief in oneself as a leader, the roles and tasks of leadership become overwhelming and conviction for the task diminishes. The model, outlined in Figure 1, indicates that as personal credibility and self-efficacy increase, leadership effectiveness expands.

The theory is that a successful leader possesses a high degree of personal credibility and self-efficacy; while a leader, not characterized as successful, possesses a low degree of personal credibility and self-efficacy.

A successful leader in this model is defined as one who can inspire others and turn that aspiration into action to accomplish business results. This is accomplished through creating vision, building commitment, improving team learning and results, and developing and enabling others for success. To accomplish these actions, leaders not only need the competency or know how to make this happen but they need the substance to "cause" people to follow their vision and direction.

Figure 1. The Leadership "Success" Continuum

The model implies that without personal credibility, as defined by those who are to follow, and a belief in oneself, the leadership actions necessary to lead others in the accomplishment of organizational, business, or spiritual results will not impact as successfully.
Figure 1 also illustrates that as leadership fulfills the goal of turning aspiration into action, personal credibility x self-efficacy is the basis. There is implied synergy in this model based on the assumption that belief in self and others’ beliefs in you, the leader, compounds success and desired result/action. Another synergistic aspect implied in the model is that as results are achieved, personal credibility and self-efficacy increase. Also, as indicated by the arrows in Figure 1, as personal credibility and self-efficacy fluctuate, success in turning aspiration into action and results also varies.

Critical Questions and Methodology

In proposing this theory, key questions to be answered include:

1. What does the literature say about self-efficacy and personal credibility as “influencers” of behavior?
2. Does the literature indicate a connection between personal credibility and/or self-efficacy and successful leadership?
3. What leadership development methods are being used or could be used to develop personal credibility and self-efficacy?
4. Is there sufficient support in the literature to justify that there are dimensions beyond competency that need to be developed in our leaders?

A qualitative literature review, coupled with an analysis of current theory and research to determine and extract model related aspects, yield the results discussed in the next section.

Review/Analysis Findings

The Current Thinking

Credible leaders have the personal habits, values, traits, and competencies that engender trust and commitment from those who take their direction- (Ulrich, 1996). As we move from the machine models of work into the era of knowledge workers, loyalty can no longer be obtained by the paycheck- (Drucker, 1995). Instead, management becomes a social function in which relationships are key- (Wheatley, 1992). To inspire loyalty and commitment from the knowledge worker, leadership credibility is a major determinant as is the willingness of leaders to share power by allowing workers exceptional opportunity for putting their knowledge to work. (Drucker, 1995) Credibility of action is the single most significant determinant of whether a leader will be followed over time- (Kouzes and Posner, 1995).

Credibility comes from the alignment of our values, beliefs, and actions. In other words, leaders model their values and beliefs through their actions. Leaders with personal credibility say what they mean and do what they say. Credible leaders can be counted on. Block quotes Martin Buber saying, - "There are three principles in man's being and life, the principle of thought, the principle of speech, and the principle of action. The origin of all conflict between me and my fellow-man is that I do not say what I mean, and that I do not do what I say." (1993, p. 238).

In a recent case study of over 400 respondents from four continents (America, Asia, Europe, Australia), Kouses and Posner (1995) measured what actions exemplified quality leadership. The top four actions, from both of their 1995 and 1987 surveys, included characteristics of personal credibility. These actions were honesty, forward-looking thinking, the ability to inspire, and competency. I would also add compassion and belief in others' abilities to accomplish results as key to personal credibility. Peter Block would add stewardship.

Stewardship according to Block is to hold something in trust for another (1993). In other words, stewardship is the willingness to be accountable for the well being of the larger organization by operating in service, rather than in control, of those around you. These characteristics of personal credibility come from the substance of the person and are exhibited through his or her actions.

Similarly, a person’s dynamism doesn't come from special powers. It comes from a strong believe in a purpose and the willingness to express that conviction. Leadership has nothing to do with what we look like. It has everything to do with what we feel, what we think of ourselves- (Kouzes and Posner, 1995). In fact, Bandura (1986) has argued that whether or not people will undertake particular tasks or strive to meet particular goals depends on whether or not they believe they will be efficacious in performing the action. The stronger one's self-efficacy, the more one will exert effort and persist at a task.

According to Bandura's self-efficacy theory, decisions that people make about whether or not to attempt certain courses of actions and about how long to pursue them, are to an important extent determined by judgements of personal efficacy (1991). The correlation between self-efficacy and health related outcomes in the areas of
smoking, pain management, cardiac rehabilitation has been established- (Holden, 1991). Studies have also established the correlation between parental self-efficacy and their children’s academic abilities (Seefeldt, Denton, Galper, and Younossi, 1999) and Bandura and others have established the correlation between student self-efficacy and academic achievement- (Bandura, 1993, Schunk, 1991, and Torkzadeh, Pflughoef, and Hall, 1999).

Seemingly the literature indicates that these two dimensions, personal credibility and self-efficacy, are important attributes which improve a leaders ability to encourage others to action. Personal credibility inspires worker loyalty and direction and self-efficacy gives the leader the motivation to lead against, at times, hostile and challenging forces. People don’t do extraordinary things unless they have the will to do so. Leadership is the act of mobilizing others to want to struggle for shared aspirations- (Kouzes and Posner, 1995). Interestingly, leaders who understands self-efficacy know that when the people they work with feel strong, capable and efficacious themselves extraordinary things can be accomplished.

Additionally, because personal credibility is key to the relationships we develop, the relational aspects of our work become key. More and more studies focus on followership, empowerment, and leader accessibility- (Wheatley, 1992). Ethical and moral questions are no longer fuzzy religious concepts but are key elements in our relationships with staff, suppliers, and stakeholders. As Barbara Wheatley states: “If the physics of our universe is revealing the primacy of relationships, is it any wonder we are beginning to reconfigure our ideas about management in relational terms?”- (Wheatley, 1992, p. 12). This emphasis on relationship elevates the primacy of personal attributes or the substance of the person into juxtaposition with personal competencies.

Reviewing the literature to look for implications for our leadership development programs a number of interesting possibilities emerged. For example, recent studies have found a strong correlation between task relevance and one’s belief in one’s ability to do the task- (Coffin and Maclntyre, 1999; Weiner, 1990). An implication of this study is that by increasing the task-relevance of the competency to be developed, self-efficacy can be enhanced.

Additionally, according to Bandura (1974, 1986), outcome expectations relate both to the learner’s understanding of what activities are required to reach a learning goal and to their belief that the learning goal can be achieved and/or applied. Once success is achieved, self-efficacy is increased. In other words, success breeds success when expectations are clear. By focusing competency development on business results, task relevance can be increased which, in turn, increases application success and self-efficacy.

The literature also indicates that to develop leaders who feel unique, competent, secure, empowered and connected to the people around them, e.g. high self-esteem and self-efficacy, leaders need support and feedback in actual developmental job experiences. Leadership skills are developed; they are not usually basic cognitive abilities.

A Study Example

To illustrate this point, Robert Wood and Albert Bandura (1989) had working professionals manage a simulated organization. Participants had to match employee attributes to job requirements and master a complex set of decision rules in how best to guide and motivate their employees. Half the subjects were told that decision-making skills are developed through practice (and hence are acquired skills); the others were informed that decision-making skills reflect the basic cognitive capabilities that people possess (and hence are stable skills). Throughout the simulation, the subjects rated the strength of their perceived self-efficacy in getting the group they were managing to perform at various productivity levels. Those in the stable-skill group displayed a progressive decline in perceived self-efficacy, while those in the acquired-skill condition maintained their sense of managerial efficacy. Those in the stable-skill group were quite uncharitable in their views of their employees, regarding them as incapable of being motivated, unworthy of supervision, and deserving of termination. In contrast, those in the acquired-skill condition set more challenging goals in subsequent trials and made more efficient use of analytical strategies, because from their perspective errors didn’t imply a basic cognitive deficiency.

Leadership Development as a Process

Applying the results of this study, it seems leaders and perspective leaders need practice in on-the-job experiences and need to be supported through planned placement, mentoring and coaching. Rather than being left to self-develop and apply learning in practice after assessment and competency development experiences, leaders need to be coached and mentored on the job. Job coaches can be other leaders and/or human resource development staff. By supporting leaders as they continue to acquire skills, the Wood and Bandura research study indicates this development will not only develop the self-efficacy of leaders, but will positively impact management expectations of employees and accomplishment of job goals and objectives.
David Bradford and Allan Cohen (1997) support the position that development needs to be a process rather than an event by stating that development needs to be continuous and intentional and is best accomplished through day-to-day interactions on the job. Similarly, Zenger, Ulrich, and Smallwood (2000) purport that mechanisms for follow-up and tools for holding people accountable, after competency development, need to be put in place for effective leadership development. When this occurs, they state, leadership development is transformed from an event into a process. In supported on-the-job experiences, leaders perform in real, pressured work situations. Here they learn to fail, try again, and succeed.

In real work situations one also exhibits and develops personal credibility. Because personal credibility is key to the relationships we develop, the relational aspects of our work are critical. To best assist managers in dealing with the relationship results of their personal credibility, it is helpful to see the manager in action on the job and provide appropriate coaching and mentoring. Rather than waiting for an organizational intervention after failure, proactive, planned on-the-job coaching should be part of the designed leadership development program.

Similarly, competencies make the most sense and are the most relevant to leaders if they are linked closely to results- (Zenger, Ulrich, Smallwood, 2000). For example, leaders who coach (competency) may create loyalty which results in retention of workers; may communicate an expectation of continual improvement that results in improvement in productivity; and, may create a work climate of open, direct, candid communication that could foster quicker problem resolution and result in projects that are more on-target. All of which increase personal credibility.

Based on this expanded view of leadership and leadership development, three generic diagnostic questions seem to emerge from the literature that can be used to assess leadership quality. These are:

1. **Personal credibility.** Does this leader have credibility with those with whom he or she works? Do individuals trust, respect, admire, and enjoy working with this leader? Do those who work with this leader as subordinates, peers, customers, or supervisors feel a personal and emotional bond with him or her?

2. **Self-efficacy.** Does this leader believe he or she can lead, e.g. shape a vision, create commitment to the vision, build a plan of execution, develop capabilities, and inspire people to the making things happen? Does this leader have conviction for the work he or she is inspiring? Does the leader have high expectations of him or her self, others, and for the business unit success?

3. **“Unit” business success.** Does this unit have high levels of productivity as measured by financials, customer satisfaction, employee morale? Do customers and suppliers have a high loyalty factor to the products and/or services of the unit? Does the leader have enthusiastic commitment to the unit and its business goals?

**Recommendations for Implementation**

Application of this model to leadership development programs implies a basic change in our curriculum philosophy and structure. First, we need to broaden our focus beyond competency development. In addition to developing competencies, we need to build learning opportunities that encourage our participants to reflect and explore the affects of their behaviors and decisions on others and business results. And, because of the relationship between successful completion of relevant tasks and self-efficacy, these reflection opportunities need to be job based.

Second, we need to think of our programs as a process of development rather than as an event for the substance elements of ourselves are not as readily apparent to us as are our skills. As a result, leadership development plans should ideally be developed to include such elements as job placements, assigned mentors and coaches, support/reflection networks, and education and training options. This longer term planning for leadership development will lend itself to building a belief in self through supporting and coaching success rather than by punishing failure. It will also support the synergy of personal credibility x self-efficacy which occurs when business results are successfully accomplished.

Finally, because broad based, systems feedback is important in the development of personal credibility, double-loop learning opportunities are key and need to be included as a major “design spec” in the development of reflection experiences.

**Implications for Future Research**

Leadership development theory focused on personal credibility and self-efficacy has interesting prospects. It builds on motivation and expectancy theory and seeks to incorporate recent schools of thought on leadership, participative
management, and empowerment. In discussing the relationships among self-efficacy, personal credibility and leadership success, many assumptions were made which need to be further explored. The weak point of this theory is that it has a relatively narrow empirical base.

For example, there is an assumed relationship between task relevance and self-efficacy but the strength of this relationship and whether or not it is one of parallel occurrence or causality needs to be explored.

Additionally, there are interesting ancillary relationships to be explored in future research initiatives. These include the ability to form relationships at work and personal credibility; commitment level and self-efficacy; empowerment and self-efficacy; emotional intelligence and self-efficacy; and, high expectations of self and others and unit business success. Research in these areas could lend important insights into the implicit components that form our substance, and, as such, assist us as we develop leaders for the future.

Current leadership development models have been built on Newtonian mechanics by searching for better methods to objectively develop leadership competencies (form). The new physics seems to cogently explain that there is not an objective reality and there are no formulas that describe "reality" (Wheatley, 1992). There is only what we create through engagement with others and with events (substance). This points to hidden dimensions that we must explore if we are to understand leadership; and, in better understanding the qualities of leadership, promote development.

This paper proposes that personal credibility and self-efficacy are two major elements of a person's substance and of a leader's ability to build relationships to accomplish business objectives. Without a high degree of both of these two dimensions, the literature and this theory seem to indicate, leaders may not be as successful.

A Study of Leadership Roles, Styles, Delegation and Qualities of Indian CEOs

T. V. Rao
Raju Rao
Soumya Dixit
T V Rao Learning Systems Pvt. Ltd.

This study identifies the effectiveness with which various leadership and managerial roles are performed by Indian CEOs. Using 360 Degree Feedback 26 CEOs were studied. They were good at managing their seniors, but weak in inspiring and developing their subordinates, culture building and long term goal setting. Their leadership styles were largely developmental. Delegation, activity level, positive thinking, communications, etc. were their strengths and reactivity, irritability, low empathy, patience and participative nature were weak areas.

Keywords: Leadership , 360-Degree, Indian-CEOs

Leadership has been defined in so many ways and by different authors and experts. Tichy and Cohen (1997) the authors of "Leadership Engine" points out: "The scarcest resource in the world today is the leadership talent capable of continuously transforming organizations to win in tomorrow's world. The individuals and organizations that build Leadership Engines and invest in leaders developing other leaders have a sustainable competitive advantage." (p.8)

According to Tichy and Cohen:
- Winning leaders with a proven record take direct responsibility for developing other leaders
- Winning leaders can articulate and teach others how to make the organization successful. They tell stories about their past and explain their learning experiences and beliefs
- They have well-developed methodologies for teaching others.
- Leadership talent can be nurtured and it is never too late or too early to develop one's own leadership abilities, and talent of others.
- Leaders are normally viewed as those people who motivate one or more individuals or groups of people to do a specific thing.

- Leadership is critical for Business development or for any form of development. Leadership is no more limited to a few.
- Every one's leadership competencies can be developed.
- It is imperative for managers to explore their talent and develop their leadership competencies for their own good and the good of their organizations.
- Self awareness is the most very critical first step in developing their leadership talent.
- Organizational programs and plans are required to develop leadership talent and leadership development programs do help developing the same.

If leadership is so critical and the future of corporations depends upon having as many leaders as possible it is critical for corporations to develop more and more of leadership talent. Many leadership programs focus on specific traits rather than any comprehensive qualities. This is because it is difficult to have any one quality focussed. It is for this reason many organizations have attempted in the last one-decade to use the 360-degree feedback as Leadership development tool. In India also it is becoming popular.

RSDQ Model of 360-Degree Feedback

TVRLS (a consulting company based in India) has developed a model for Indian Top and Senior Management in
terms of managerial and leadership competencies needed, which is termed as the RSDQ model (Roles, Styles, Delegation and Qualities). This model of leadership and managerial effectiveness views effective management and leadership as a combination of four sets of variables. These are: Roles performed, the Style of leadership, Delegation and Qualities.

**Roles.** The extent to which the individual plays various leadership and managerial roles and activities. There are a number of roles, which have to be played by every manager in order to be an effective manager. These are both transformational roles (leadership roles) and transactional roles (managerial). Some of these are: Articulating, communicating and monitoring vision and values, policy formulation, planning and goal setting, introducing and managing new technology and systems, inspiring, developing and motivating juniors, managing juniors, colleagues and seniors, team work and team building, culture building, internal customer management, external customer management, and managing unions and associations.

Each of these roles had both transactional and transformational activities. For example, “articulating vision and values for the organization” is a transformational activity, “monitoring to ensure that the values are followed” is transactional activity.

**Styles.** While effective managers recognize all the leadership roles and perform them well, it is not only the roles or activities that determine the effectiveness but also the way in which they are played. The model envisages that managers may play most roles well, devote time and effort but could be insensitive to the style with which they carry out these activities. Rao (1986) has classified the leadership styles, on the basis of the earlier research at the Indian Institute of Management, into the following: (i) **Benevolent or Paternalistic leadership style** in which the top level manager believes that all his employees should be constantly guided treated with affection like a parent treats his children, is relationship oriented, assigns tasks on the basis of his own likes and dislikes, constantly guides them and protects them, understands their needs, salvages the situations of crisis by active involvement of himself, distributes rewards to those who are loyal and obedient, shares information with those who are close to him, etc. (ii) **Critical leadership style** is characterized as closer to Theory X belief pattern where the manager believes that employees should be closely and constantly supervised, directed and reminded of their duties and responsibilities, is short term goal oriented, cannot tolerate mistakes or conflicts among employees, personal power dominated, keeps all information to himself; works strictly according to norms and rules and regulations and is highly discipline oriented. (iii) **Developmental leadership style** is characterized as an empowering style, where the top manager believes in developing the competencies of his staff, treats them as mature adults, leaves them on their own most of the times, is long term goal oriented, shares information with all to build their competencies, facilitates the resolution of conflicts and mistakes by the employees themselves with minimal involvement from him.

Developmental style by nature seems to be the most desired organization building style. However some individuals and some situations require at times benevolent and critical styles. Some managers are not aware of the predominant style they tend to use and the effects their style is producing on their employees.

**Delegation.** The RSDQ model considers level of delegation as an important part of a senior executive's effectiveness. This dimension has been included because most senior managers seem to have difficulties delegating, especially those effective managers who get promotions fast in their career. In view of these experiences, delegation has been isolated as an important variable of leadership. Those who delegate release their time to perform higher-level tasks and those who don't continue to do lower level tasks and suppress their leadership qualities and managerial effectiveness.

**Qualities.** The model envisages that managers should exhibit qualities of leaders and world-class managers (e.g. proaction, listening, communication, positive approach, participative nature, quality orientation etc.). Such qualities not only affect effectiveness with which top-level managers perform various roles but also have an impact on the leadership style and hence are very critical.

**Objectives**

This study aims at answering the following questions: 1. What are the various roles and activities the Indian CEOs perform extraordinarily well? 2. What roles and activities are they weak at performing? 3. What are their predominant styles of leadership and supervision? 4. What is the impact of their styles on their subordinates? 5. What are the patterns of delegation? 6. What are the qualities they exhibit and what do they lack?

**The Instruments.**

These issues were studied using the results from 360 Degree feedback on an instrument based on the RSDQ model of TVRLS. The questionnaire had five parts: the first part dealt with Leadership and managerial roles and an
assessment of how well he performs various roles or the 75 activities associated with these roles? The questionnaire measuring these consists of 75 items grouped under the various leadership and managerial roles explained earlier. Each CEO was assessed on a six point scale where a score of 6 represented that the CEO performs that activity or role extraordinarily well (percentage score of 100), 5 represents that he performs that role or activity very well (80% score); 4 represents that he performs that role reasonable well (60% score); 3 represents that he performs that role satisfactorily (40% score); 2 represents that he performs that role not so well and rather unsatisfactorily (20% score) and 1 represents that he performs that role very poorly or very inadequately (0% score).

The second part consisted of a Leadership Styles questionnaire that assessed the style of dealing with 12 different situations like managing rewards, managing conflicts, managing mistakes, assignment of tasks, communication etc. For each situation three alternative styles that are supposed to be the most characteristic of Indian Managers (on the basis of previous research) were presented and the assessor was asked to indicate to what extent each of the styles characterize the individual. The respondent is expected to distribute six points between the three styles using six points. The points were later converted into a percentage score. The style average was calculated using the average score obtained by each candidate on the style item.

Delegation was measured using a 10-item scale that measured various symptoms of delegation or non-delegation. The extent to which the candidate exhibits each of these symptoms was assessed by the percentage of assessors checking the items.

The fourth part of the questionnaires consisted of assessment of the extent to which the candidates performed on each of the 25 qualities of leadership. A seven point semantic differential scale was used where "+3" score indicated that the quality is extremely characteristic of him (100%) score, "+2" indicated that the quality is somewhat characteristic of him (84%), +1 indicated that it is a little characteristic of him (67%); "0" indicated that the quality is as much a characteristic of him as the negative part of it, "-1 " indicated that the negative side of that quality is more characteristic of him than the positive side (33%), "-2" indicated that the negative side of it is more characteristic of him (17%); and "- 3 " indicated that the quality is not at all characteristic and the opposite of it is most characteristic of him (0%).

The Sample.

The sample consisted of 26 CEOs from Indian organizations. These are all different organizations in the manufacturing sector, services, information technology, consumer electronics, financial services etc. The organizations are located in different parts of the country. The CEOs are all those responding to the 360 Degree initiatives. They all belonged to organizations that are interested in using 360-Degree feedback as a development tool. Each of these CEOs was assessed by their colleagues, subordinates and their seniors (other Board members etc.). All these 26 CEOs were assessed by 373 Assessors. The number of assessors ranged from 2 in one case to 38 assessors in another case. The assessment of others was only taken into consideration for the purpose of this paper. Self-assessment was not taken into consideration. It was assumed that the combined assessment of other persons is representative of the actual performance of the individual CEO.

Limitations.

The study is based on 360-Degree feedback and is only indicative of perceptions of the assessors. An actual observational study may indicate the actual roles performed, time devoted, the impact etc. This study, at best, could be limited by the perceptions of the assessors, and so suffers from the usual limitations of 360-Degree feedback studies.

Results

Trends of the Effective Leadership and Managerial Roles: Top five effectively performed and the bottom five less effectively performed roles by the Indian CEOs. Tables 1 and 2 present the five best performed and five least well performed roles by Indian CEOs. The group as a whole scored the highest and lowest respectively on these items. The tables also present the range of scores among the 26 CEOs studied.

The top five of the well performed activities in Table 1 indicates that the Indian CEOs are good at managing their seniors. They communicate and liaise well with them, understand their expectations, take guidance and also influence their thinking. Most of the seniors for these CEOs include their Chairman, Board Members, and other full time Directors. The Indian CEOs are weak in managing their unions and also in providing periodic feedback to their juniors. Two of the five least well performed roles deal with managing their junior employees.

</tr>
</tbody>
</table>

A further analysis of the data revealed that culture building, inspiring and developing staff by investing time and effort on their development are assessed as the least well performed activities. It seems from the 360 degree Feedback data that the top management are still busy impressing their seniors than juniors. If they have to be good leaders, they need to shift their focus to competence building of their juniors.

Leadership Styles and their Impact

The analysis of the Leadership Styles indicated that while Indian CEOs are predominantly developmental in their style. For example: when mistakes are made they tend to encourage people to learn from their mistakes (53% score) rather than protecting the subordinates and salvaging the situation themselves (34% score) or getting emotional even for minor mistakes (13%). When conflicts arise they encourage people to solve their problems in such a way that they develop capability to resolve conflicts in future (58% score) rather than giving their judgement and making the employees dependent on them (30% score) or reprimanding the erroring side (12% score). The development style was indicated in the way they take decisions, the way they assign the tasks, the way they communicate and the way they treat the juniors in other matters. In all these areas their benevolent or paternalistic style was about 30% as compared to 60% developmental style and 10% critical style.

As a result of this developmental style they seem to be creating certain amount of empowerment. The data also indicated that even the 30% of paternalistic style, which is characterized by value for relationships and a tendency to favour few of their subordinates, leads to a substantial degree of dependence. About 30% of their subordinates perceived them as favouring a few. This is a high percentage.

The Indian CEO is in transition. Most organizations in the past used to be managed with a paternalistic style. This style seems to create dependence while it also gets loyalty and hard work. Juniors of the CEOs who predominantly use paternalistic style were found to have high degree of dependency and at the same time admiration for the CEO. However, only some of their juniors reported of learning from them. They seem to work in order to maintain a relationship and out of admiration for the boss rather than out of enjoyment of the work.

While developmental style was the most predominant style for all the CEOs, there were a few CEOs who scored high on critical style. This CEO's were found to create resentment among their subordinates some of whom felt that they are unable to learn much while working with such CEOs. Such CEOs found the 360 degree feedback very helpful and prepared plans to change their styles.

Delegation

The extent to which the symptoms of delegation or non-delegation are exhibited by the CEOs is presented in Table 4. The table indicates that the Indian CEOs in general are delegating type. The table indicates that in general the Indian CEOs are perceived as delegating about 74% of the time. Their delegation tendency drastically comes down when problems arise. They generally prefer their subordinates to check with them when problems arise.
On all the other areas the delegation seems to be reasonably good. There is, however, a great degree of variation among the CEOs on the extent to which they delegate. There were a few who have tremendous difficulty delegating (zero delegation).

**Behavioral Qualities**

The assessment of the 26 CEOs on 25 behavior Qualities is presented in Table 5. The CEOs in general are rated very high on almost all the 25 behavioral qualities. However they scored high on some qualities. The percentage scores are given in brackets. A score of around 80% can be treated as a high exhibition of that quality (the opposite of it is only 20%).

<table>

<td>100</td>
</tr>
<tr>
<td>5</td>
<td>Proactive rather than reactive</td>
<td>71</td>
<td>43</td>
<td>90</td>
</tr>
</tbody>
</table>

An analysis of the open ended questions asking their assessors to mention their strengths and weaknesses revealed that technical knowledge, activity level, dynamism, delegation, interpersonal skills, hard work, and flexibility were more frequently mentioned strengths. On the other hand, open mindedness, change orientation and irritability were more frequently mentioned weak areas. As a great degree of variation was found, it is difficult to conclude any of these as commonly shared strengths or weaknesses.

**Conclusions and Recommendations**

The study indicates the following on Indian CEOs:
- There is a great degree of variation in the effective performance of roles, styles, delegation and qualities. This indicates the need for 360 Degree feedback as tool to create more self awareness.
- They are not yet taking direct responsibility for developing others as leaders. They seem to do little to inspire and develop their juniors.
- While they are good at articulating their vision, and communicating the same to their juniors, the impact of this gets limited and they are not able to teach others about how to make the organization successful. They
are still operating at conceptual level and are reluctant to share their past and explain their learning experiences and beliefs.

- They are not spending adequate time and effort to develop their own leadership abilities, and the talent of others. Their investment in the 360 degree feedback is just a beginning.

Most Indian CEOs are far off from the leadership roles outlined by Tichy and Cohen (1997). They still need to demonstrate their ability to invest on developing others as leaders. They are probably using their communication skills impress their seniors more than inspiring their juniors. This transformation is needed fast.

In sum, Indian CEOs seem to be good at boss management and weak at managing Unions and also on transformational roles. They seem to perform less effectively the transformational roles. Among the transformational roles their strengths lie in articulating vision for the unit and influencing the thinking of their seniors. On a large number of other areas like culture building, inspiring and developing staff etc. they need to develop a lot more. Future leadership programs should focus on their change management skills. Their styles are predominantly developmental. Professionalism seem to have set in to a good degree in terms of their styles. Only in crisis situations like managing mistakes and conflicts their paternalistic style seem to come to surface. They seem to delegate a good deal. High activity level, positive thinking, communications, change orientation etc. are some of the notable strengths. Proactivity, cool and composed nature, empathy, patience and participative nature could be developed more to make an impact. Some of these roles and qualities could be developed. Leadership development programs could be focused on the above-indicated gaps.

The Influence of the Implementation of a Transfer Management Intervention on Transfer of Training

Patricia R. Saylor
South Windsor Public Schools

Marijke T. Kehrhahn
University of Connecticut

Research and theory on transfer of training has indicated that transfer management interventions may improve transfer outcomes and influence employee perceptions of transfer climate. This study evaluated the effectiveness of transfer management interventions provided by a change facilitator in establishing a positive transfer climate and promoting achievement of transfer goals set by middle school teachers.

Keywords: Transfer of Training, Transfer Management, Transfer Design

Employees of today’s organizations are faced with the challenge of continually updating their skills and applying new technologies to enhance their work performance. Employee training programs are still the most popular method for transmitting knowledge and introducing technology skills in the effort to improve employee performance (Broad, 1997). Yet transfer of training, or the application of knowledge and skills that have been newly acquired during training, continues to be a major concern of human resource development specialists and managers. Are employees applying what they’ve learned in technology training? In what ways can HRD practitioners support and enhance the transfer of training?

Public school personnel, like employees of many other enterprises, are faced with the challenge of learning new technology skills and integrating them into their daily practice. Our study evaluated the effectiveness of transfer management interventions provided by a change facilitator in establishing a positive transfer climate and promoting achievement of transfer goals set by middle school teachers.

Problem Statement

The problem of transfer of training continues to be a concern for HRD practitioners and managers. Broad (1997) noted that while training is the most frequently used method for improving workplace performance, “research, observations of training professionals, and testimony from many managers show that most current training efforts do not result in significant transfer of new skills and knowledge to the job.” (p. 8). The rate of transfer has been reported across the literature to be from 10% (Georgensen, 1982) to 40% (Broad & Newstrom, 1992).

Over thirty years of research on the transfer of training phenomenon has illuminated transfer as a complex process that is influenced by learner, instructional, and environmental variables (Baldwin & Ford, 1988; Ford & Weissbein, 1997). HRD researchers of training transfer have offered discussions concerning barriers to transfer (e.g., Newstrom, 1985), factors for performance improvement (e.g. Rummler & Brache, 1995), and comprehensive models of transfer (e.g. Noe, 1986) to shed light on the transfer process. Holton (1996), stating that “evaluation of interventions is among the most critical issues faced by the field of HRD today” (p. 5), proposed a model for the evaluation of employee training programs that designates transfer of training, the change in individual performance as a result of applied learning, as an important outcome variable to examine.

Theoretical Rationale

Holton (1996) proposed, based on past research, that individual performance outcomes are influenced by motivation to transfer newly acquired knowledge and skills, individual job attitudes, transfer conditions within the work environment, and the implementation of transfer designs. This segment of Holton’s model was the foundation for the reported research. In this study, motivation to transfer was defined as the measure of the employee’s
perceived applicability and usefulness of technology skills (Noe, 1986) and the level of challenge, anticipated support, and intention to use new skills (Kehrlahm, 1995).

Proposed individual characteristics that influenced transfer of technology training were teacher efficacy and age. Teacher efficacy (Ashton & Webb, 1986), the perception of one’s own abilities to perform a new task coupled with one’s belief that teaching efforts will overcome other obstacles to successfully bring about student learning, was studied as the participants’ beliefs that their successful integration of technology into the curriculum would enhance student learning. Age was selected as an individual variable because of its relationship in other studies to apprehension to learn about and use technology (Hastings, Sheckley, & Nichols, 1995) and slower acquisition of new skills (Pascual-Leone & Irwin, 1994). Transfer conditions within the work environment called environmental favorability (Noe, 1986), included informal social support from peers, administrators, and a technology change facilitator, and task support, in the form of resources such as time and equipment (Peters & O’Connor, 1980). In addition, teachers’ perceptions of the school climate to support change (Sagor & Barnett, 1994) were expected to influence their transfer behavior.

Transfer design was a critical component of our study. Transfer designs are interventions connected with the training program that will have a direct influence on transfer. Holton (1996) stated that transfer designs “vary considerably depending on content, cultures, and other situational factors” (p. 15). Broad (1997) advocated for the development of transfer management interventions to dramatically improve transfer rates. Broad suggested specific strategies which included: Addressing trainees’ personal concerns to reduce anxiety; providing coaching and information to trainees as needed; building a sense of community among learners, offering a variety of program options; and, creating opportunities for practice and time to meet with instructors. The Concerns-based Adoption Model (CBAM; Hord, et al., 1987) is a systematic approach to transfer and change management. According to this model, individual change is a developmental process whereby individuals must address personal concerns before they can approach the task; similarly they must address task management concerns before considering impact on student outcomes. Using Hord et al.’s model as a guide, we designed and implemented a transfer management program to increase transfer goal attainment. A Technology Change Facilitator (TCF) facilitated the planning, instruction, and support for the transfer effort.

Ford and Weissbein (1997), in their update of Baldwin and Ford’s (1988) classic review of transfer of training research, emphasized the need to study training designs that enhance transfer, and continued examination of individual and environmental factors that seem to promote or inhibit transfer. Holton (1996) noted that future research should identify specific variables that should be measured with regard to changes in individual performance as a result of training. The reported study set out to examine transfer of technology training across an entire organization, a middle school, to determine the contributions of transfer design as well as individual and environmental variables.

Research Questions

RQ1 To what extent can the implementation of a transfer management intervention improve transfer of training outcomes?

RQ2 To what extent can the following variables: teacher efficacy, environmental favorability (social support, task support, school climate), motivation to transfer, and age, account for differences between employees who transfer training (Users) and those who do not (Non-Users)?

Methods

Quantitative and qualitative data were collected over the course of one school year. The yearlong focus allowed time for the transfer management intervention to be fully implemented and to carefully examine its influence on the growth and implementation of technology-related skills. Data collection was targeted at gathering information to illuminate the factors that contributed to the transfer of technology training as faculty worked to meet their technology transfer goals for the year.

Participants. The research was conducted in a typical suburban middle school located in New England. Administrators included a principal and two associate principals, as well as a district-wide curriculum specialist for each academic discipline. The entire middle school staff of 75 certified teachers participated in the mandatory professional development program. The 68 teachers who participated in the study consisted of 25 men and 43 women, ages 25 to 59, who had been employed at the school for 1 to 35 years. They were classroom teachers from
grades 6, 7, and 8, as well as cross-grade specialists, such as unified arts, guidance, and music teachers. Sixty-three participants had attained a Master's Degree or higher.

Transfer Management Intervention. The transfer management intervention was planned to address the ongoing needs of individual learners and to provide an environment conducive to learning, practicing, and implementing new technology skills. The professional development program included an initial training session, presence of a change facilitator (TCF) who focused her work on the implementation of technology-related changes by promoting individual use and addressing concerns, and a year-long program of formal and informal activities and supports that promoted learning and application. The transfer management intervention was designed by the researchers, the TCF, and the building staff development team and was implemented by the TCF. Specific features of the transfer management intervention are listed in Table 1.

- Determine personal transfer goal by establishing a technology implementation goal  
- Develop specific approaches to achieving the goal and assessing goal achievement |
| Technology change facilitator (Hord et al., 1987) | Role:  
- Mediate between the individual learners and the workplace context  
- Listen to staff concerns and address these concerns as part of the professional development effort  
- Adjust the effort to meet the needs of individual learners and work demands  
Personal qualities:  
- Strong teacher efficacy  
- Knowledge of adult learning principles and outstanding training and leadership skills  
- Willingness to be available to teachers |
| Formal learning opportunities (Olivo, Bane, & Kopelman, 1997) | - 26 one-hour classes that addressed faculty's common learning needs on a sign-up basis  
- Deliberate practice sessions focused on adaptation of skills for classroom use  
- Specific instruction in use of software and technology |
| Informal learning Guided and independent practice (Broad, 1997) | - Hands-on practice sessions  
- Feedback readily available from TCF and peers  
- Participants chose and defined their own goals  
- Supervisory goal discussions at three evaluation conferences during the year  
- Coordination and synchronization of department level goals  
- TCF followed up on goals and offered assistance  
- Continual reminders from peers and the learning community to focus on and achieve goals |
| Learning teams (Broad, 1997; Killion & Kayler, 1991; Kiener, 1994) | - Learners organized their own collaborative sessions (informal breakfast meetings, team meetings, after school meetings) around common goals  
- Meetings used for planning, reflective dialogue, problem solving, and adaptation of skills to collection so that...
Coaching and technical assistance (Broad, 1997)

- TCF provided facilitation, problem solving, and mentor support for teams
- TCF orchestrated:
  - Observation sessions for reluctant learners in classes in which technology was being used
  - Dissemination of journal articles
  - Teaming of faculty who were not working on goals with mentors who had successfully accomplished goals
  - Individual tutoring from TCF and other experts upon request
  - Establishment of growing list of technology experts who could answer questions and solve problems in a hurry
  - Publication of monthly newsletters that highlighted tips, resources, networking opportunities, and help sessions
  - Publication of a help manual that included simple steps for independent practice

The wide variety of transfer management activities addressed the concerns of most participants and the results showed that addressing a variety of levels of concern facilitated transfer for many individuals. Following Pranger's (1998) research, the model-in-action demonstrated an intensive coordination of informal and formal learning opportunities using the resources of a skilled facilitator and knowledgeable peers.

Data gathering. Quantitative and qualitative data were collected throughout the school year. Prior to the start of the professional development effort, each faculty member completed a Demographic Information Sheet to provide information about age, gender, subject area taught, highest degree attained, years of teaching experience, various indicators of technological expertise, and involvement in other professional development initiatives. The Gibson Teacher Efficacy Scale (1984) was administered to determine participants' general teaching efficacy \( r = .70 \), their belief that teachers in general make a difference with students, and personal teaching efficacy \( r = .78 \), their belief in their own ability to make a difference by learning new skills. In addition, the School Climate Inventory (Sagor & Barnett, 1994; \( r = .82 \)) was administered to determine the degree to which participants felt that the school climate was conducive to change. Immediately following the initial training session, teachers set and recorded their personal technology literacy goal (transfer goal) for the year, assessed the quality of the training using an evaluation form, and reported on their intention to implement what they had learned in the session using a Motivation to Transfer scale \( r = .73 \).

During the ensuing months, one researcher conducted regular visits to the school. She contacted the TCF frequently to monitor and record information about interventions, observed activity in the computer lab, and informally interviewed teachers and administrators to monitor the general progress of the implementation plan. Anecdotal data was carefully documented for later analysis. One month before the end of the school year, an Environmental Favorability survey \( r = .78 \) was administered to measure participants' perceptions of resources and support that helped them reach their technology goals. The survey included items about perceived frequency of social support from peers \( r = .79 \), administrators \( r = .72 \), and TCF \( r = .80 \), and the perceived usefulness of this social support from peers \( r = .60 \), administrators \( r = .47 \), and the TCF \( r = .69 \). At the last staff meeting of the year, teachers revisited their transfer goals and assessed their goal attainment. Each teacher was given a Levels of Use open-ended questionnaire, adapted from the Levels of Use interview format (Lyness, 1985), to assess implementation of their technology-based learning and the degree of success in reaching their transfer goal. In addition, each teacher was assessed and assigned a level of technology expertise (nonuser, low-end user, moderate user, high-end user) by the district technology supervisor. These data were used to triangulate individual reports of goal attainment.

Data analysis. Quantitative data from the five instruments (Levels of Use assessment, Gibson Teacher Efficacy Scale, Motivation to Transfer scale, Environmental Favorability scale, School Climate Inventory) were analyzed to develop a composite profile of teachers who successfully reached their transfer goals. Qualitative data were evaluated to add depth and detail to the emerging profile of those who transferred training.

First, the researcher scored each teacher's response to the Levels of Use questionnaire. Participants were assigned one of seven Levels of Use (0 = no interest; 1 = seeking orientation; II = preparing to implement; III = mechanical implementation; IVA = routine implementation; IVB = refining implementation; V = collaborating with colleagues to achieve collective implementation; and VI = seeking new goals and making major modifications in use)

Cronbach's alphas reported in the text are those calculated for the sample.
of technology skills) by matching key words found in their responses to those indicated in the Level of Use scoring manual (Loucks, Newlove, & Hall, 1975). To assure the accuracy of the assignment into User/NonUser categories, two experts reviewed the written interviews to confirm assignment to appropriate categories. Self-reports on accomplishments described in the interviews were cross-checked with documentation of individual participation and goal attainment kept by the TCF and district technology skills assessment reports to confirm the accuracy of self-reports. Users were defined as those subjects whose use of their self-determined technology goal reached at least a mechanical level. Nonusers were those who had not yet begun to use the innovation.

Once individuals were assigned to either User or Non User groups, the groups were examined for distinguishing differences using discriminant function analysis. We then sought to further explain differences between the groups by using qualitative data to support or illuminate distinctions found in the quantitative analysis.

Results

RQ 1 To what extent can the implementation of a transfer management intervention improve transfer of training outcomes?

The overall purpose of the study was to determine whether the implementation of a transfer management intervention carefully designed to support learning, application, and goal accomplishment would result in higher participation and better results than standard staff development and in-service efforts. Overall, 79% of the teachers (54 teachers) involved in the study engaged with and reached their transfer goals. Using the Levels of Use framework as a guideline to determine transfer, eleven teachers were using technology mechanically, indicating that they had initiated use on a short-term basis. Fifteen teachers were routinely using technology as part of their day-to-day work. Seventeen teachers had reached a level of refinement, varying use of the technology to increase the impact on students. Eight teachers were collaborating with colleagues to achieve a collective impact on students, and three were seeking major modifications or adapting their goals to expand use of technology.

In this study, 21% of the participants (14 teachers) did not engage with or reach the transfer goals they had set. At the end of the year, seven teachers remained at the lowest level of non-use, indicating no interest in technology implementation. Two teachers reported that they were seeking orientation in order to begin work on their transfer goals and five participants were preparing to implement their goals. Years of research on the relationship between attendance at a professional development workshop or seminar and change in individual performance have consistently found that very few traditional programs result in more than low levels of transfer of training (Baldwin & Ford, 1988; Broad, 1997). Even the most generous estimates of transfer set the rate at about 40% (Newstrom, 1990). Against the background of the reported ineffectiveness of traditional professional development programs, a transfer rate of 79% is exceptional.

Qualitative data collected through open-ended questionnaires pointed to what learners felt were the most effective features of the transfer management intervention. Responses to the question: “What factors contributed to your success with your technology goal?” were thematically coded for content. Teachers acknowledged: 1) the Technology Change Facilitator, specifically support, coaching, availability, and responses to questions on a timely basis; 2) peers, specifically access to peer expertise, coaching, and availability; 3) anticipation of follow-up and knowing there was a plan to provide technical assistance and support in place; 4) the availability of a range of activities at various times that met individual needs and allowed learners to work at their own pace; 5) availability of feedback from TCF and peers; and, 6) expansion of the network of experts from whom learners could seek advice. Clearly, the responsiveness and availability of social support resources focused on the application of new technology skills influenced the high rate of transfer.

RQ2 To what extent can the following variables: teacher efficacy, environmental favorability (social support, task support, school climate), motivation to transfer, and age, account for differences between employees who transfer training (Users) and those who do not (Non-Users)?

Discriminant Function Analysis (DFA) was used to test RQ2. The rationale behind discriminant analysis is to make use of existing data dealing with group membership and relevant predictor variables to create a formula that will accurately predict group membership, using the same variables with a new set of participants. Univariate analysis of the independent variables by group was conducted to select the most parsimonious equation for the DFA. The analysis revealed the highest effect sizes for differences between groups were perceived social support (d =
teacher efficacy ($d = 1.02$), motivation to transfer ($d = .70$), and age ($d = .80$). Perceived task support ($d = .24$), quality of training scale ($d = .05$) and school climate ($d = .09$) were not included in the final DFA because there were no significant differences between Users and Non-users with regard to these variables. Independent variables that demonstrated the highest effect sizes in univariate analyses were entered using the direct method.

The results of the final discriminant analysis for independent variables associated with transfer of training of technology skills are presented in Table 2. The table includes classification results, as well as a simple summary of number and percent of participants classified correctly and incorrectly for each group. As shown in Table 2, 86.76% of the cases were correctly classified. The analysis predicted Users, those who successfully transferred training, with 94.4% accuracy. Only 3 Non-users (5.6%) were incorrectly classified as Users. The analysis predicted 57.1% of Non-users as such, and 42.9% of Users incorrectly as Non-users. This analysis indicates that Users can be differentiated from Non-users on the basis of the variables teacher efficacy, perceived social support, motivation to transfer, and age.

Percent of "grouped" cases correctly classified: 86.76 %

The analysis of RQ2 reported a Wilks' Lambda of .71 ($p< .0002$). According to this statistic; 29% of the variance associated with group membership is explained by the independent variables ($1-\Delta = .29$), leaving 71% still unexplained. In addition, Wilks Lambda (U-Statistic) can be determined using the step-wise method. In the present study, the approximate contribution of particular variables using this method ($1-\Delta = %$) were as follows: Perceived social support contributed 15% of the variance in transfer of training ($\Delta = .85$); teacher efficacy contributed 14% of the variance ($\Delta = .86$); motivation to transfer contributed 9% ($\Delta = .91$); and age contributed 8% ($\Delta = .92$). The total is greater than 29% because of overlapping variance.

Additional Analyses. Two additional analyses were conducted as follow-up to the DFA. The researchers examined the composition of the group of Non-users predicted to be Users, and the composition of the group of Users predicted to be Non-users. Individual scores on instruments and qualitative data were examined to determine why individuals were mis-classified.

Why had the six teachers not met their transfer goals when their profiles indicated that they would be Users? While all six participants had high teacher efficacy, three did not perceive social support to the same degree as users, two were not as motivated to transfer, and three were older than the 95% confidence interval for age. The further examination of the data implied that all four independent measures must be at optimal levels in order for transfer to occur. Anecdotal data from Levels of Use questionnaires and person interviews indicated that these teachers had individual reasons for lack of transfer: availability of equipment, timing of training, lack of job applicability, involvement in other initiatives, fear of computers, and lack of personal ability. In other words, these individuals fit the profile to be Users, but individualized concerns interfered.

Based on the first follow-up analysis concerning these teachers, the researcher examined two additional areas. First, specific questions posed in the Motivation to Transfer instrument provided insight. In particular, when asked, "How applicable are the new knowledge and skills you’ve learned to your job?" all of these participants responded “Not at all applicable.” Second, examination of the technology goals set by these participants revealed that all had committed to a non-specific goal at the beginning of the study, such as “improvement in computer use,” and “becoming familiar with programs.” As suggested in prior research, the perceived applicability of the new knowledge and skills and the specificity of set goals influence the effort to transfer training.

Also of interest to the researchers was the question: Why did three teachers implement their transfer goals when variables used in the discriminant function analysis predicted that they would not? While these participants fit

2 Effect sizes were calculated using the Cohen's $d$ convention (1992).
the Non-user profile on every independent variable they all appeared to have been influenced to reach their transfer goals. One individual worked in a department in which use of technology was high and was encouraged by peers to persist in integrating technology. Another teacher worked to become much more computer literate on his home computer and transferred those skills to his work environment. The third individual was strongly encouraged by his administrator to use technology on the job. The follow-up analysis indicated that even those teachers whose profiles indicated that they would not transfer training could be influenced to transfer in various ways.

Conclusions and Recommendations

The results of the study support the segment of Holton’s (1996) model of HRD Evaluation and Research (p. 17) that proposed that motivation to transfer, perceptions of transfer climate, and the implementation of a transfer design have a direct influence on transfer of training. In addition, the job attitude teacher efficacy, or the belief that learning and applying new technology skills would produce positive outcomes for students, positively influenced transfer of training efforts. The results of the study shed light on specific aspects of the transfer of learning and applying new technology skills would produce positive outcomes for students, positively have a direct influence on transfer of training.

Motivation to Transfer. Motivation to transfer explained 9% of the variance in transfer of training in this study. Motivation to transfer was framed as a combination of perceived applicability and usefulness of new technology skills, as well as the level of challenge associated with application, the anticipated support for applying new skills, and the intention to achieve the transfer goal. The applicability and usefulness of technology knowledge and skills appeared to be a deciding factor in the study as those who did not meet their transfer goals clearly stated that there was no applicability of technology skills to their specific jobs. For HRD professionals, the implication of these results highlight the importance of working with learners to develop a level of understanding of new technologies that can lead to the perception of applicability to their specific job. Assuming applicability, even for the most obvious skills, may not be enough; HRD professionals must assess learner perceptions of applicability and may need to develop interventions for those learners who have not made the connection.

Transfer Climate. In this study, perceptions of the availability and usefulness of social support explained 15% of the variance in transfer of training. Interestingly, there was no difference between the group of teachers who reached their transfer goals and those who did not in terms of the perceptions of the school climate for supporting change. All the teachers saw the school climate as ready for and supportive of change. The resources and supports that were offered through the transfer management program were equally available to all teachers and all were encouraged to participate in the formal and informal activities; however, teachers who met their transfer goals perceived social support to be more available and more useful. The results of this study mirror the results of Shore and Wayne (1993) that demonstrated that perceived organizational support predicted organizational citizenship behavior. Many employees consider transfer of training to be organizational citizenship behavior (i.e., “extrarole behavior that is generally not considered a required duty of the job, p. 775). Further research may confirm the relationship between the propensity to perceive supportiveness and the willingness to engage in activities that are seen as voluntary yet beneficial to job performance.

Job Attitudes. While teacher efficacy, which explained 14% of the variance in transfer of training outcomes, is a construct specific to school settings, it is grounded in the concept that individuals have beliefs that learning and applying new skills will result in positive outcomes at a strategic level. Further, positive teacher efficacy implies that the individual feels that their efforts will not be thwarted or minimized by environmental barriers. Based on the results of this study, we propose that individuals are more likely to sustain an effort to transfer training if they feel their efforts will result in valued outcomes.

Transfer Design. The value of transfer design for facilitating a high rate of transfer is quite clear from the results of the study. Much like the findings of Olivero, Bane, and Kopelman (1997), we found that an extensive effort to provide opportunities for practice and feedback following participation in the initial training program was successful in producing changes in individual teacher performance among a large percentage of the participants. While the effort was extensive, the payoff was high. HRD specialists who seek to increase training effectiveness may find, based on these results, that there is no easy road to transfer. Design and implementation of transfer management interventions that are customized to the culture, the content, and the learners may be one of the most critical skills sets for HRD practitioners who are challenged to improve employee performance through learning.

How This Research Contributes to New Knowledge in HRD

This research contributes to a growing body of research that emphasizes the importance of the context within which application of new knowledge, skills, and attitudes take place, the workplace environment. Not only does this research confirm a segment of Holton’s (1996) model for evaluating HRD efforts, it offers an example of a comprehensive transfer management intervention.
that worked to promote a high rate of transfer of technology training among the staff of an entire organization, a middle school. HRD practitioners who struggle with the transfer problem can glean ideas from the features of the transfer management intervention that they can test in their own arenas. Further, HRD practitioners may be inspired to develop and customize comprehensive transfer designs to improve the outcomes of their practice.

Learning Strategies: A Key to Training Effectiveness

Paula Willyard
Tulsa Community College

Gary J. Conti
Oklahoma State University, Tulsa

Learning strategies allow trainers to quickly identify the individual differences of learners. This study measured the learning strategies of 456 adults; 45 were interviewed concerning how they apply their learning strategies and how instructor actions are either conducive or detrimental to their learning. The findings revealed a connection between the image of the organization and the type of learners attracted to it and described learning characteristics that can be utilized by trainers to improve learning.

Keywords: Adult Learning, Learning Strategies, Individual Differences

Adult Learning

Because of the demands of the Information Age, many organizations are becoming learning organizations. The useful and immediate application of new knowledge demands well-trained employees and necessitates an effective training program. Training is so important and vital to an organization's development that it must be effective and resources must be maximized. However, the teaching-learning process for this is complicated. More is involved in training than the transfer of knowledge at the cognitive level. Because of the diversity of individual learners, the needs of each learner should to be incorporated into the training activities.

Malcolm Knowles revolutionized both the study of adult learning and the process of teaching adults with the advancement of the concept of andragogy. Andragogy was originally defined as the "art and science of helping adults learn" but can be better envisioned as a set of assumptions about learners" (Knowles, 1980, p. 43). These assumptions are the bases of a learner-centered approach to the teaching-learning transaction. This contrasts to the teacher-centered approach that assumes the learner to be dependent, to bring limited experience to the teaching-learning transaction, and to seek primarily subject-centered educational experiences. In the teacher-centered approach, learning readiness is based on chronological maturation and not on either the social roles or the developmental tasks the learner is experiencing (pp. 43-44).

Andragogy provides a learner-centered approach for the instruction of adult learners. Andragogy is based on the following set of assumptions about the learner: (a) the adult learner's experience is acknowledged and utilized as a rich valuable resource for learning, (b) the adult learner moves from dependency toward self-direction, (c) the adult's readiness to learn relates to both developmental tasks and to an individual's social roles, (d) the adult learner is motivated by internal factors such as self-esteem and achievement, and (e) adults maintain a problem-centered focus which lends itself toward a need for immediacy of application of new learning (Knowles, 1980, pp. 43-45).

Meaningful adult learning experiences have the potential to transform the lives of the learners. Transformation theory attempts to analyze and explain the process through which adults make meaning of their experience. Adults delineate or understand their experience by interpreting information through several filters including the educational, religious, and socialization processes. Prior learning from each of these avenues tends to constrict, distort, and limit the adult learner's acting, believing, learning, perceiving, and thinking. "It is not so much what happens to people but how they interpret and explain what happens to them that determines their actions, their hopes, their contentment, and emotional well-being and their performance" (Mezirow, 1991, p. xiii).

Adult learning can be viewed as an interpretation of information utilizing one's existing set of expectations through which meaning and ultimately one's life are constructed. "In transformative learning, however, we reinterpret an old experience (or a new one) from a new set of expectations, thus giving a new meaning and perspective to the old experience" (Mezirow, 1991, p. 11). Through this process, an individual can release oneself from flawed and inadequate
reasoning to embrace a more comprehensive and flexible understanding of oneself and the world.

Adults choose to learn for a variety of emotional, personal, professional, and social reasons. "It may be that the circumstances prompting this learning are external to the learner (job loss, divorce, bereavement), but the decision to learn is the learner's" (Brookfield, 1986, pp. 9-10). This position provides the adult learner with the power to either remain in a learning environment that enriches or to withdraw if the learning proves inadequate or unsatisfactory.

Learning Strategies

One way to implement adult learning principles is by addressing individual differences. Consequently, learning styles and strategies have been the subject of numerous research initiatives and much discourse in adult learning (Fellenz & Conti, 1993; Conti, Kolody & Schneider, 1997; Kolb, 1984). There are few psychological processes that have been examined with as much vigor. Early investigation centered upon teaching and teaching style as well as learning style assessment and individual differences in learning. A major shift in focus was ushered in when Kidd (1973) announced that the field of Adult Education was moving from a teacher-centered focus to a learner-centered focus. Others began to adopt a similar stance in their research of this area (Brookfield, 1986; Conti & Fellenz, 1991a; Conti, Kolody, & Schneider, 1997) as researchers recognized that "one can learn how to learn more effectively and efficiently at any age" (Smith, 1982, p. 15).

Kidd (1973) skillfully summarized this emerging trend which placed utmost importance upon the learner.

In all ages, of course wise men have recognized that learning is the active, not the passive, part of the process: the learner opens himself, he stretches himself, he reaches out, he incorporates new experience, he relates it to his previous experience, he reorganizes this experience, he expresses or unfolds what is latent within him. (p. 14)

A learner-centered approach emphasizes the learner as a critical, dynamic component of the learning process. Along with greater freedom, this role entails increased responsibility for one's own learning (Knowles, 1980, p. 48).

Current exploration and inquiry have shifted to the realm of learning strategies and their relationship to the learner in a variety of settings (Conti, Kolody, & Schneider, 1997; Gallagher, 1998; Gehring, 1997; Kolody, 1997). "Today, educators and cognitive researchers are focusing on how information is learned as opposed to what is learned" (Leflon, 1994, p. 192).

Learning strategies are the methods and techniques an individual utilizes to learn or acquire knowledge. Learning strategies differ from learning style in that they are techniques rather than stable traits and they are selected for a specific task. Such strategies vary by individual and by learning objective. (Conti & Fellenz, 1991a, p. 64)

Utilization of learning strategies is contingent upon both the circumstances and the current learning situation. "Learning strategies are the techniques or skills that an individual elects to use in order to accomplish a learning task" (Fellenz & Conti, 1993, p. 3).

Adult learning tends to be pragmatic and problem-centered. Learning of this type is often referred to as "real-life learning".

One of the major characteristics of adult learning is that it is often undertaken for immediate application in real-life situations. Such learning usually involves problem solving, reflection on experience, or planning for one of the numerous tasks or challenges of adult life. Thus the phrase "real-life learning" has been used to distinguish typical adult learning from the academic learning of formal situations that is usually spoken of as studying or educating. (Fellenz & Conti, 1993, p. 4)

Real-life learning in the field of Adult Education has been conceptualized as consisting of the five areas of metacognition, metamotivation, memory, critical thinking, and resource management (Fellenz & Conti, 1993).

Studies based on this conceptualization of learning strategies have delineated three groups of learners with distinct learning strategy preferences (Conti & Kolody, 1999). Through cluster analysis, three categories of learners have been discovered and labeled as Navigators, Problem Solvers, and Engagers. "Navigators are focused learners who chart a course for learning and follow it" (p. 9). Planning and a strong sense of purpose personify both this group of learners and their utilization of learning strategies. Problem Solvers utilize critical thinking skills. Problem Solvers tend to both generate alternatives and test assumptions as a part of their primary learning strategy (p. 12). "The Engagers are passionate learners who love to learn, learn with feeling, and learn best when they are actively engaged in a meaningful manner with the learning task" (p. 13). Engagers enjoy the learning process and derive personal satisfaction from interaction with others.
Methodology

The purpose of this study was to describe the learning strategies of adults at a community college. Although community colleges have a different mission than organizations in business and industry, adult learners at community colleges in many ways are representative of those found in the world of work. Because community colleges are the primary access points for a multitude of diverse students into post-secondary learning situations, those in the business community can gain insights about adult learners by examining those at community colleges. This study, which was conducted in the community college setting, sought to answer the following research questions: (a) what are the identified learning strategy preferences for adult learners at the community college, (b) how do learners in each of the learning strategy groups describe their learning process, and (c) what instructor actions are conducive to learning and what actions by the instructor are detrimental to learning.

This was a descriptive study that involved 456 students at Tulsa Community College's Southeast Campus. A stratified, cluster sample of students was used in which at least 100 students were selected from introductory courses in the four academic divisions of Business Services, Communications, Liberal Arts, and Science and Mathematics. All 456 participants completed the Assessing The Learning Strategies of Adults (ATLAS) and a demographic survey. ATLAS is a valid and reliable instrument that identifies learning strategy preferences and places a person in the category of either a Navigator, Problem Solver, or Engager (Conti & Kolody, 1999). A total of 45 students were interviewed for a more in-depth exploration of issues related to learning strategy usage and to how instructors contribute to learning for each group of learners.

Both quantitative and qualitative data were collected. Quantitative data were collected using the ATLAS learning strategies instrument, a survey form, and college records. ATLAS can be completed in approximately 2 minutes and produced the categorical data of each person's learning strategy preference group. The demographic survey elicited information about each person's background and gathered each participant's Social Security Number. This number was used at the end of the semester to solicit the person's exact grade point average from the official school records. Nearly two-thirds (63%) of the 456 participants on whom qualitative data were collected were females, and slightly over one-third (37%) were males. The group ranged in age from 17 to 57 with an average age of 23.3. Chi square was used to compare the observed frequency of the learning strategy responses for this group to the expected learning strategy norms on ATLAS.

Qualitative data were gathered from 45 interviews with 15 adults in each of the three learning strategy groups of Navigators, Problem Solvers, and Engagers. The interviews were between 25 and 45 minutes in length and explored factors related to the student's learning process, barriers in this process, and the instructor's influence in this process. The gender and age distribution of those interviewed mirrored that of the general sample. The interviews were recorded and then analyzed to discern emerging themes.

Findings

One of the most striking findings of this study is in the area of learning strategy preferences. In contrast to the expected distribution in the general population, Engagers were over-represented with 54.2% of the population ($X^2=105, df=2, p=.001$). Both the Navigators with 23.9% and Problem Solvers with 21.9% were underrepresented. The anticipated distribution based on the norms for ATLAS was 31.8% for Engagers, 36.5% for Navigators, and 31.7% for Problem Solvers (Conti & Kolody, 1999, p. 18).

Each learning strategy group described their approach to learning. Navigators revealed that they rely upon (a) planning and organization, (b) internal and external organizers, (c) grades and feedback, (d) working alone rather than in groups, and (e) monitoring. Navigators can become so preoccupied with academic success and achievement that they become hypercritical of themselves.

I like to compile information and set it up and work from that to see whatever goal I need to reach. I try to follow the plan as much as possible. (48-year-old African American female)

I am concerned with material that fits into meaningful patterns. I section it out and make outlines and do lists. All of the description [of a Navigator in the ATLAS booklet] matches me to a "T". (21-year-old Caucasian female)

I am very hard on myself. I am never happy with myself or within myself. I am a perfectionist at times. (27-year-old African American female)

I try to be and do what I can do to the best my abilities. Sometimes I go beyond that and do more than I should have to especially in school. My husband says you're only one person. (28-year-old Caucasian female)

Problem Solvers employ (a) a trial and error process, (b) visualization, (c) practical experimentation, and (d)
questioning as their primary approach to learning. Problem Solvers utilize questioning not only for their own benefit but also to promote greater understanding for others in the class as well.

It is easier to understand if I can visualize it. If I can see myself doing it then I can pretty much obtain it. If I cannot remotely imagine it or trying it, then I have no success being there. (24-year-old American Indian female)

I like finding ways around to get what you are trying to get to—finding other routes to get to it. (25-year-old Caucasian male)

When I try to solve a problem, there is an easier way. There are many tactics to use in solving a problem besides one way. Then I come up with how I will do it. Don't set your mind on one spot—use thinking abilities in other areas. Go beyond that and beyond what I'm in now. (54-year-old African American female)

I question a lot, on everything. I feel like I'm the over-questioner to other people afraid to raise their hand and ask a question. If you're thinking it, other people are too, but maybe they are afraid or shy and won't ask. (31-year-old American Indian female)

Engagers tend to take on the attitude the instructor possesses toward learning. If the instructor is passionate about learning, then Engagers will be also. Conversely, if the instructor is disinterested and impersonal, then Engagers will disengage from the learning as well.

I won't engage if I'm not interested. If I have to do it, I will go through the motions. But once I get started getting into it, it becomes interesting because it is something I don't know. (39-year-old Caucasian female)

I focus on learning not evaluation. Everything I do I give it my all and expect to come out on top. If I'm not learning and I'm not interested, I'm not going to learn. I have to be interested. It has to appeal to me. (41-year-old Hispanic female)

Instructors' actions greatly influence the learning process for the groups of learners (Knowles, 1980). Therefore, each learning strategy group also described the instructor's actions that were perceived to facilitate learning. Navigators indicated that they preferred instructors who (a) were approachable and willing to provide feedback, (b) maintained standards that were challenging but not rigid, and (c) provided clear expectations.

The perfect teacher is one who shows interest in students and cares if students make it through the class. One who is willing to give one-on-one attention and shows he cares and is there if you have questions. They explain things in detail so you can understand. (27-year-old African American female)

I want to know what is expected of me. It bothers me if the instructor is not real specific. If nobody tells me what is required, then I don't know. (38-year-old Caucasian female)

Problem Solvers desired instructors who (a) allowed them to question and discuss learning in an open forum, (b) utilized a step-by-step process in teaching (c) were thorough, (d) provided a hands-on environment, and (e) promoted the learning of all students in the classroom.

Class is best if it is an open forum to really interact with instructors and classmates and debate the topic or subject. I like open-ended questions that give you leeway to answer the way you want and instructors who give personal examples. (23-year-old Caucasian male)

I like instructors who had an open forum for talking so everybody understands. They make sure everybody is on the same page. (18-year-old African American male)

Engagers wanted instructors who (a) place learning above evaluation, (b) develop a personal relationship with them, (c) make learning fun, and (d) are passionate about learning themselves.

It matters a lot. If they don't care and don't have a passion, I don't learn or do as well. If it is not important to them then it's not going to be important to me. (43-year-old Caucasian male)

If I'm not learning anything, it is a waste of time. They make it interesting and make the learning fun. We played jeopardy-like games in anatomy class. We knew the answers to the questions, but we had fun. (39-year-old Caucasian female)

Instructor's actions can also hinder the learning process for the groups of learners. Certain instructor actions can be viewed as distracting from the learning process. Each group described instructor actions that they perceived as distracting from the learning process. Navigators dislike it when instructors (a) do not answer questions, (b) do not provide feedback, and (c) do not explain assignments. Problem Solvers dislike it when instructors (a) do not allow or promote questioning and (b) do not respect students. Engagers dislike it when instructors were (a) dispassionate about teaching their subject area and (b) unwilling to develop a personal relationship with students.

Each learning strategy group utilized different initial actions for learning projects not related to academic endeavors. Navigators referred to (a) deadlines, (b) examples, and (c) the opinions of experts. Problem Solvers referred to (a) having an idea of the broad objectives before they begin, (b) considering the alternative methods of reaching the final goal before making a decision on how to proceed, and (c) visualizing the end results before beginning. Engagers
stated that they desire (a) a belief that the learning will be valuable, (b) a need for the learning they are going to undertake, (c) confidence in their ability to accomplish the project, and (d) the possibility for enjoyment in the process before initiating a learning project.

The concept of learning strategies is a developing area that offers those working with adults such as those in training roles in business and industry with ways to address individual differences. This study contributes to the development of descriptions of each of the learning strategy groups and further expands them. For example, Engagers and Problem Solvers see learning as a community activity where cooperation is promoted instead of competition. Engagers exemplify this characteristic primarily through their strong desire to collaborate and work in groups (Conti & Kolody, 1999, p. 14). Problem Solvers in this study were individuals who envision learning as a group endeavor where everyone is responsible for assisting classmates that may not understand the material. Problem Solvers clarify concepts through the utilization of questioning as a technique to allow fellow students to benefit from this process. The notion of teamwork is central to both Problem Solvers and Engagers.

Navigators do not like group work and instead see learning as a collaborative effort between themselves and their instructor. Navigators need external verification or recognition such as grades or a test to validate their learning. They want standards and then want to compete against those standards.

I don't settle for second best. If I'm going to do something, I do it all the way. If I do it, I do it right. If not, it is a waste of my time. (21-year-old Caucasian female)

Navigators are engrossed by the desire for achievement, and as a result they are always aiming higher and adopting increasingly rigorous standards of performance for themselves. This strong need for perfection may reduce their satisfaction with accomplishments.

The instructor's attitude is critical to the teaching-learning transaction for all three groups of learners. Instructors need to attend to both the affective and cognitive domains to address the needs of all learners. For example, Engagers' performance in teaching-learning situations is contingent upon the establishment of a personal relationship with the trainer. This relationship is the foundation of the learning process for Engagers. They are actively "engaged" in the learning as long as the instructor remains involved and is interested in the subject area. However, Engagers will disengage from learning if the instructor appears to be disinterested in the subject matter or is perceived to be teaching just to earn a living. Instructors that are willing to inspire students may help provide a key component in retaining them in learning situations (Boyer, 1990). One Engager stated his feelings concerning instructors' attitudes as follows:

If the teacher doesn't care, then I'm not getting my money's worth. I'm not getting their full potential if they don't care. If they care, you can tell you are getting their all and everything they know. You are getting the same knowledge. If they don't care, it is pretty much a waste of time. (30-year-old African American male)

The importance of the instructor's attitude is not only essential to Engagers but is also important to both Navigators and Problem Solvers. Navigators desire attention and respect from the instructor. Navigators want the instructor to be available to them in order to obtain feedback concerning their performance. Problem Solvers want both a more collaborative learning process and respect from the instructor. Problem Solvers also seek a learning environment where their questions and input are both heard and regarded as significant. Additionally, Problem Solvers prefer relationships with the instructor in which they are considered as true partners in the educational process. Clearly, instructor attitudes are essential to all three groups of learners although each is exemplified in distinct ways.

Discussion

The axiom "knowledge is power" has been stated numerous times related to a multitude of situations. Utilizing this statement in reference to gaining information pertaining to one's learning strategy preference is no exception. This is especially applicable in a society where "there is no one education, no one skill, that lasts a lifetime now" (Naisbitt & Aburdene, 1985, p. 141). There is little question that:

It pays to develop awareness and understanding of self as a learner. One can gain valuable insight into personal blocks to learning, to personal strengths and weaknesses, as well as personal preferences for the methods of learning and for learning environments. (Smith, 1982, pp. 21-22)

Awareness is a central component of learning how to learn. This characteristic is vital because "if you know how to learn, you can adapt and change no matter what technological, social, or economic permutations occur" (Naisbitt & Aburdene, 1985, p. 133).

Providing employees with an awareness of their own learning strategy preference may encourage them to further consider their current strategy utilization. This new awareness could also provide an impetus to further investigate additional methods that could be more effective in improving performance. "Learning strategies provide each student with the potential to adjust in an appropriate way for each learning situation" (Conti & Fellenz, 1991b, p. 20). The ability
to expand one's repertoire of available strategies can lead to improvements in both learning and performance.

Learning occurs both in the affective and cognitive domains. Bloom and his associates identified three domains of learning as the (a) cognitive domain which deals with the recall or recognition of knowledge and the development of intellectual abilities and skills, (b) the affective domains which describes values and attitudes and the development of appreciations, and (c) the psychomotor domain which deals with physical activities (Bloom et al., 1956, p. 7). For Engagers, "the affective domain is the dominant factor in learning" (Conti & Kolody, 1999, p. 14). They "consider work as an extension of themselves and are motivated by feelings of satisfaction or pride" (p. 15). However, oftentimes instructors focus only on the content of the learning situation. Such an approach can cause Engagers to feel alienated. By addressing both the affective and cognitive domain learning needs in a training situation, trainers can help provide Engagers with increased self-awareness concerning their feelings and thoughts in certain learning situations. Engagers may feel guilty about not being interested in a specific learning situation and may not realize that their learning strategy preference is making them uncomfortable in particular learning environments. Trainer recognition of both the affective and cognitive learning needs could not only help Engagers realize that there is nothing wrong with them, but it may also provide answers as to why they are uncomfortable in certain situations. By recognizing this aspect of their learning, Engagers can begin to better understand their own behaviors in learning situations. However, Engagers need trainers to attend to both the affective and cognitive components of learning in order to maximize the process.

Knowledge of the principles of adult learning can be effective in establishing a supportive environment that will enhance student learning for all students (Knowles, 1980), and this is particularly so for Engagers. Training in the administration, utilization, and intent of learning strategies could allow trainers the opportunity to incorporate instructional techniques that foster individual differences. It could also provide them with an array of alternative teaching techniques that are specifically designed to meet the needs of each learning strategy group. ATLAS is an easy to administer instrument that trainers could use for this purpose.

Adult learning principles encourage cooperative learning environments, and teamwork is becoming a fundamental requirement in the world of work. A knowledge of the learning strategy preferences of each of the three groups of learners can facilitate this group effort. This is especially important for Navigators because cooperative learning procedures do not support their natural learning strategy preference. In order for this learning to occur, Navigators will need to embrace strategies that incorporate these aspects into their learning process. Knowledge and awareness of alternative learning strategies can provide Navigators as well as all learners with the ability to interact more effectively with others in learning situations. In addition to preferring personally competitive learning situations, Navigators have such a strong desire to seek perfection on learning tasks that in order to help them become more balanced as learners they may need to incorporate the learning strategy of conditional acceptance. Conditional acceptance is the ability of critical thinkers to work at a problem long enough that they become satisfied with the product and move on to new learning (Conti & Kolody, 1999, p. 8). Likewise, a knowledge of such factors as how Problem Solvers use questioning and how important the attitude of the leader is to Engagers can affect how the group works together on learning projects.

The cooperative learning needed in a learning organization can be facilitated by Problem Solvers. Previous studies have shown that Problem Solvers have a tendency to generate a wide range of alternatives related to the learning task and to seek further exploration of topics. This study discovered that one way that they do this in a group setting is through asking questions of the trainer. They ask not only about that in which they are interested but also about that in which they think others in the group are interested. If the trainer and the other learners in the group are aware of this trait, these questions can serve as a continuous formative evaluation of the group's understanding of the content. However, for this to be effective for the group and especially for the Problem Solvers, trainers must reassess the tendency in many training sessions to rigorously lay out a training schedule and to consider only those things explicitly defined in the specified learning objectives as valid learning.

Recent studies have indicated that learners tend to be attracted to learning environments that project an image that is compatible with their learning strategy preference. This study (Willyard, 2000) and a study by James (2000) found that Engagers are overrepresented at the community college and in Adult Basic Education classes. Spencer (2000) and Conti and Ghost Bear (2001) have discovered that Problem Solvers are overrepresented in studies related to learning on the Internet. Even though the learners are not consciously aware of the label or exact description of their learning strategy preferences, Engagers are attracted to the inclusive, learner-centered atmosphere that the community college provides and that matches their learning strategy preference. This could be because community colleges both offer personal environments that are responsive to learners' needs and place the teaching mission above all else (O'Banion, 1999). If this is true for other organizations as it appears to be emerging from the research, then organizations should be keenly aware of the image that they project because this image is sending subtle messages to learners who may potentially be entering the organization. This is especially so for organizations that seek to be learning organizations.
Clearly, learners can no longer be treated as a monolithic group in learning situations. The concept of learning strategies presents a way to quickly identify individual differences among the learners. The typology of Navigators, Problem Solvers, and Engagers identified by ATLAS can be useful for initially identifying groups of learners in the training setting. "Such labels can be beneficial to the selection of appropriate methods and techniques when they are used to focus understanding, discussion, and reflective thought about the learner; however, they can be detrimental if they are used to avoid critical thinking about the learners" (Conti & Kolody, 1998, p. 137). Thus, a knowledge of learning strategy preferences offers the trainer a tool for quickly addressing the needs of each learner and for understanding ways to make learning more efficient for each learner. Equipped with such a tool and such knowledge, the trainer can be in a position to increase the effectiveness of everyone in the organization.

An Examination of Learning Transfer System Characteristics Across Organizational Settings

Elwood F. Holton III
Hsin-Chih Chen
Sharon S. Naquin
Louisiana State University

No previous research has compared and contrasted learning transfer systems across organizations and training types, primarily because no standard instruments were used in previous research. This study, based on a subset of responses in the LTSI response database, is the first to conduct such a comparison. Using a sub-set of 1099 respondents, transfer systems are compared across three organization types, eight different organizations, and nine different types of training. MANOVA and univariate ANOVA were used to compare transfer systems.

Implications for HRD practice and research are discussed.

Keywords: Transfer of Learning, Transfer Climate, Measuring Transfer of Learning

Transfer of learning has long been an important HRD research issue. Since Baldwin and Ford's (1988) review of the literature over a decade ago, considerable progress has been made in understanding factors affecting transfer. Much of the research has focused on training design factors that influence transfer (cf. Kraiger, Salas & Cannon-Bowers, 1995; Paas, 1992; Warr & Bunce, 1995). Another stream of research has focused on factors in the organizational environment that influence individuals' ability and opportunity to transfer (Rouilliard & Goldstein, 1993; Tracey, Tannenbaum & Kavanaugh, 1995). Other researchers have focused on individual differences that affect the nature and level of transfer (Gist, Bavetta, Stevens, 1990; Gist, Stevens, Bavetta, 1991). Finally, recent work has focused on developing instruments to measure transfer and its antecedent factors in the workplace (Holton, Bates, Ruona, in press; Holton, Bates, Seyler, & Carvalho, 1997).

Unfortunately, the existing research is, for the most part, not action-oriented (Holton & Baldwin, in press). That is, most existing authors have stopped at the point of identifying, describing or measuring factors that may influence transfer without investigating how those factors might be effectively changed or managed. For example, of the 58 total studies included in the two most comprehensive reviews of the transfer literature (Baldwin and Ford, 1988; Ford & Weisbein, 1997), only those concerning training design dealt much with change or intervention. One notable exception have been studies examining the effectiveness of two post-training interventions (goal setting and relapse prevention training) with all of them finding enhanced transfer (Burke & Baldwin, 1999; Gist, Bavetta, Stevens, 1990; Gist, Stevens, Bavetta, 1991). Finally, recent work has focused on developing instruments to measure transfer and its antecedent factors in the workplace (Holton, Bates, Ruona, in press; Holton, Bates, Seyler, & Carvalho, 1997).

Furthermore, as Holton (2000) noted, research has not established whether there is an optimal norm level for components of an organization’s learning transfer system. Theory often seems to suggest that the most potent learning transfer systems are those with high levels on all factors. However, cultural variations across organizations suggest that not all organizations will or should build the same types of transfer systems. Case evidence supports this. For example, one organization in which the authors have worked had a very strong team culture that made peer support a more powerful predictor of learning transfer than supervisor support. In a state government agency, the exact opposite was true.

Such case evidence suggests that a different conception is needed. First, it is possible that a total overall level of transfer system factors is needed—not an absolute level on any one of them. That is, transfer system factors may operate together as a constellation to influence transfer. Some elements might be interchangeable or compensate for missing elements. For example, strong reward systems might compensate for poor peer support or transfer design. Alternatively, a fit perspective might be more appropriate whereby certain cultures will require certain elements of a transfer system to be stronger than in other cultures. This perspective would explain why supervisor support is essential in a bureaucratic structure (i.e., government agency), but peer support is less salient. Thus, there would be an optimal level for a given organization with a specific culture.

Holton (2000) goes on to suggest that it is best to search for leverage points for change. It seems likely that the particular factors in an organization’s transfer system that are optimal for intervention will vary widely. The leverage point is likely to be a function of the absolute level of a particular factor and its salience in a particular organization’s culture. Most organizations would like to see a simple decision rule such as “if supervisor support is less than 3.0, an intervention is needed.” This is too simplistic. A value of 2.5 on the supervisor support scale in the government agency might be a critical leverage point, but the same 2.5 found in a team-based organization might not be a leverage point because the supervisor is less important.

Unfortunately, there has been no research investigating the most basic question of how learning transfer systems differ across organizational settings. Previous research has focused mostly on explanation of transfer processes within a specific organization. Before the question of optimal norm levels of transfer factors can be considered, basic questions about differences across organizational settings have to be explored. Identifying differences in transfer systems provides a better understanding of 1) what current transfer systems are like, 2) if current transfer systems are robust in organizations, and 3) what potential transfer factors jeopardize transfer of learning. Understanding transfer system differences across different situations would help organizations become aware of what parts of a transfer system need improvement to enhance transfer of learning. This study empirically examines the differences in transfer systems across eight organizations, three organizational types, and nine training types. It addresses the following research questions:

1. Are there significant differences in transfer system characteristics between organizational types (profit, non-profit and public sector)?
2. Are there significant differences in transfer system characteristics between specific organizations?
3. Are there significant differences in transfer system characteristics between different training types?

Method

Measures. The Learning Transfer System Inventory (LTSI) was developed by Holton and Bates (Holton, Bates & Ruona, in press). The constructs of the LTSI were established based on a conceptual model (Holton, 1996) and previous research (Holton, Bates, Seyler & Carvalho, 1997a, 1997b) validated by factor analysis. It is one of the most robust transfer system assessment instruments developed. A convergent and divergent validity study showed that most of the constructs had only low correlations with other related variables (Bookter, 1999) further reinforcing the uniqueness of the transfer system constructs. Some scales have also shown initial evidence of criterion validity in predicting motivation to transfer, learner perceptions of the training utility, and operating procedure use on the job (Bates, Holton, & Seyler, 2000; Ruona, Holton, Bates, & Leimbach, 1999; Seyler, et al. 1998)

The 16 LTSI constructs provide a comprehensive assessment of factors that influence transfer including program-specific transfer factors and general transfer factors. It is comprised of 68 items grouped into 16 constructs (see Table 1). The 16 constructs were categorized into four major groups: trainee characteristics, motivation, work environment, and ability (Noe & Schmitt, 1986). Trainee characteristics include learner readiness and performance self-efficacy constructs, while the motivation scales include motivation to transfer learning, transfer effort-performance expectations, and performance-outcome expectations. The work environment scales include feedback/performance coaching, supervisor/manager support, supervisor/manager sanctions, peer support, resistance/openness to change, positive personal outcomes, and negative personal outcomes. Opportunity to use learning, personal capacity for transfer, perceived content validity, and transfer design comprise the factors of the ability scales. All of the items use a 5-point Likert type scales from (1) strongly disagree to (5) strongly agree.

Outliers were discovered. MANOVA assumptions and outliers were also investigated. No significant violations of assumptions or influential outliers were taken into account (Keselman, et al., 1998).

Bonferroni adjustment was used because it is most appropriate for multiple analyses when overall Type I error is simultaneously, eliminating the experimentwise error rate problem.

Fidell (1996), when research questions involve multiple dependent variables, if each question because the research questions involved multiple dependent variables (Tabachnick & Fidell, 1996). Therefore, only a subset of available responses was used in this exploratory study. Organizations were not selected from the available data if the sample size of these organizations was more than 300 or less than 40. Only U.S. organizations were selected because cross cultural validation on the LTSI has not been completed.

The final selected sample consisted of 1099 individuals employed by eight different U.S. organizations comprised of four private sector (three manufacturing and one services firm), three public sector agencies (one federal and two state government), and one non-profit organization (only one was available in the dataset). For research question three, the training was categorized into nine different types of training including supervisory, public management, technical/computer, soft skills (e.g. interpersonal, coaching, conflict management training), new employee academy, business professional, competency, leadership, and sales training programs. Training type information was only available for 617 of the 1099 respondents in this sample. The decision to select this sample for research question three resulted from the consideration of equal groups and various training types. Training types with more than 200 or less than 35 respondents were not selected in the sample of research question three.

Data Analysis. Multivariate analysis of variance (MANOVA) was used to answer all three research questions because the research questions involved multiple dependent variables (Tabachnick & Fidell 1996; Hair et al. 1998). The sixteen constructs of the LTSI were used as the dependent variables. According to Tabachnick & Fidell (1996), when research questions involve multiple dependent variables, if each dependent variable is tested individually severe inflation of Type I error. In MANOVA, correlated dependent variables are considered simultaneously, eliminating the experimentwise error rate problem.

Post hoc comparisons with univariate analysis of variance was then used to explore the findings in more detail. A Bonferroni adjustment was used because it is most appropriate for multiple analyses when overall Type I error is taken into account (Keselman, et al., 1998). Prior to these analyses, the data were examined for adherence to MANOVA assumptions and outliers were also investigated. No significant violations of assumptions or influential outliers were discovered.

| Personal Capacity for Transfer | Extent to which individuals have the time, energy and mental space in their work lives to make changes required to transfer learning to the job. | My workload allows me time to try the new things I have learned. | 4 | .68 |
| Peer Support | Extent to which peers reinforce and support use of learning on the job. | My colleagues encourage me to use the skills I have learned in training. | 4 | .83 |
| Supervisor Support | Extent to which supervisors/managers support and reinforce use of training on the job. | My supervisor sets goals for me which encourage me to apply my training on the job. | 6 | .91 |
| Supervisor Sanctions | Extent to which individuals perceive negative responses from supervisors/managers when applying skills learned in training. | My supervisor opposes the use of the techniques I learned in training. | 3 | .63 |
| Perceived Content Validity | Extent to which trainees judge training content to accurately reflect job requirements. | What is taught in training closely matches my job requirements. | 5 | .84 |
| Transfer Design | Degree to which training has been designed and delivered to give trainees the ability to transfer learning to the job, and 2) training instructions match job requirements. | The activities and exercises the trainers used helped me know how to apply my learning on the job. | 4 | .85 |
| Opportunity to Use | Extent to which trainees are provided with or obtain resources and tasks on the job enabling them to use training on the job. | The resources I used to use what I learned will be available to me after training. | 4 | .70 |

GENERAL SCALES

Transfer Effort-Performance Expectations

Expectation that effort devoted to transferring learning will lead to changes in job performance.

Performance-Outcome Expectations

Expectation that changes in job performance will lead to valued outcomes.

Resistance/Openness to Change

Extent to which prevailing group norms are perceived by individuals to resist or encourage the use of skills and knowledge acquired in training.

Performance Self-Efficacy

As an individual's general belief that they are able to change their performance when they want to.

Performance Coaching

Formal and informal indicators from an organization about an individual's job performance.

The final selected sample consisted of 1099 individuals employed by eight different U.S. organizations comprised of four private sector (three manufacturing and one services firm), three public sector agencies (one federal and two state government), and one non-profit organization (only one was available in the dataset). For research question three, the training was categorized into nine different types of training including supervisory, public management, technical/computer, soft skills (e.g. interpersonal, coaching, conflict management training), new employee academy, business professional, competency, leadership, and sales training programs. Training type information was only available for 617 of the 1099 respondents in this sample. The decision to select this sample for research question three resulted from the consideration of equal groups and various training types. Training types with more than 200 or less than 35 respondents were not selected in the sample of research question three.

Data Analysis. Multivariate analysis of variance (MANOVA) was used to answer all three research questions because the research questions involved multiple dependent variables (Tabachnick & Fidell 1996; Hair et al. 1998). The sixteen constructs of the LTSI were used as the dependent variables. According to Tabachnick & Fidell (1996), when research questions involve multiple dependent variables, if each dependent variable is tested individually severe inflation of Type I error. In MANOVA, correlated dependent variables are considered simultaneously, eliminating the experimentwise error rate problem.

Post hoc comparisons with univariate analysis of variance was then used to explore the findings in more detail. A Bonferroni adjustment was used because it is most appropriate for multiple analyses when overall Type I error is taken into account (Keselman, et al., 1998). Prior to these analyses, the data were examined for adherence to MANOVA assumptions and outliers were also investigated. No significant violations of assumptions or influential outliers were discovered.
Motivation to Transfer Learning respondents, respectively. The ratio of the largest group to smallest group was 2.52. (see Table 2).

Results

Research Question 1. Research question 1 asked if significant differences existed in transfer systems across organizational types. Organizations were categorized into three types: public, private, and non-profit organizations (see Table 2). Public, private, and non-profit organizations included 475 (43.2%), 432 (39.5%), and 192 (17.5%) respondents, respectively. The ratio of the largest group to smallest group was 2.52.

MANOVA analysis showed statistically significant differences (Wilks' lambda = .718, F = 11.632) on all criteria indicating that transfer system characteristics differed across organizational types. Univariate ANOVA tests showed that all of the scales were significantly different across organizational types, with the exception of two scales, learner readiness and performance self-efficacy (see Table 2 below).

Post hoc comparisons were then examined for differences among pairs of organizational types. When comparing public and private organizations, only six out of twenty-six paired comparisons showed significant differences. The results showed that performance-outcomes expectations (M=3.40 vs. 3.15), opportunity to use learning (M=3.68 vs. 3.49), and personal capacity for transfer (M=3.28 vs. 3.15) scales in private organizations were significantly higher than those in public organizations. However, the supervisor sanctions (M=2.75 vs. 2.31), resistance to change (M=2.83 vs. 2.59), and personal outcomes negative (M=2.62 vs. 2.21) scales in public organizations were significantly higher than those in private organizations. However, the supervisor sanctions (M=3.54 vs. 3.35), personal capacity for transfer (M=3.59 vs. 3.40), and personal outcomes negative (M=3.35 vs. 3.13) scales in public organizations were significantly higher than those in non-profit organizations. This may imply that employees in non-profit organizations are more motivated to transfer their learned skills to the job as well as expect that their transfer effort will lead to changes in job performance than employees in public and private organizations.

Using the four major categories of transfer systems discussed earlier, no significant differences were found on trainee characteristics scales in any paired comparisons. On the motivation scales, two out of three scales, the motivation to transfer learning and transfer effort, revealed that the non-profit organization was significantly different from public and private organizations. For the motivation to transfer scale, the nonprofit organization was significantly higher than public and private organizations (M=4.18 vs. 3.94 and 3.92, respectively) while on the transfer effort-performance scale, the non-profit organization was significantly greater than the public and private organizations (M=4.08 vs. 3.93 and 3.95, respectively). This may imply that employees in non-profit organizations are more motivated to transfer their learned skills to the job as well as expect that their transfer effort will lead to changes in job performance than employees in public and private organizations.

Within the seven environment scales, the results showed that the non-profit organization was significantly higher than public and private organizations on four environment-associated scales including performance coaching (M=3.25 vs. 3.04 and 3.05, respectively), supervisor support (M=3.40 vs. 2.98 and 2.84, respectively), peer support (M=3.59 vs. 3.40 and 3.34, respectively), and personal positive outcomes (M=2.95 vs. 2.34 and 2.39, respectively). The results also revealed that the supervisor sanctions (M=2.75 vs. 2.31 and 2.32, respectively) and resistance to change (M=2.83 vs. 2.59 and 2.56, respectively) scales in public organizations were significantly higher than private and non-profit organizations. On the ability scales, the results showed that employees in private organizations had significantly higher opportunity to use learning than employees in public and non-profit organizations (M=3.68 vs. 3.49 and 3.51, respectively).

Overall, the results revealed that the employees in the non-profit organization had higher motivation to transfer learning than public and private organizations. Public organizations had significantly higher resistance to new learning, while private organizations had significantly greater opportunity to apply learning.
Research Question 2. Research question 2 sought to determine if significant differences existed in transfer systems across the specific organizations in the sample. Eight organizations were included in the analysis (Table 3).

The largest group contained 211 respondents and the smallest group included 66 respondents for a ratio of 3.20. MANOVA analysis revealed significant differences (Wilks’ lambda = .341, F = 10.787) across organizations indicating that the transfer systems were significantly different across the selected organizations. In the between subject ANOVA, all of the transfer scales were significantly different across the selected organizations (see Table 4).

The post hoc comparisons for research question 2 revealed that respondents in organization 2 rated supervisor sanctions significantly higher than any other organization in this study (M=2.83 vs. 2.43, 2.54, 2.28, 2.52, 2.16, 2.37, and 2.32, respectively). This implies that the supervisor sanction issue in that particular organization probably needed to be improved in order to enhance transfer of learning.

Organization 8 appeared to have a substantially different transfer system than other organizations. In organization 8, the performance coaching scale was significantly higher than organization 3 and 4 (M=3.25 vs. 2.96 and 2.96, respectively). The supervisor support scale was significantly higher than organizations 1, 3, 4, 6, and 7 (M=3.40 vs. 2.96, 2.84, 2.79, 2.88, and 2.74, respectively). The peer support scale of organization 8 was significantly higher than organizations 2, 6, and 7 (M=3.59, vs. 3.22, 3.30, and 3.30, respectively). The personal positive outcomes scale of this organization was significantly higher than organizations 1, 3, 4, 5, 6, and 7 (M=2.95 vs. 2.13, 2.39, 2.34, 2.46, 2.40, and 2.38, respectively), and the personal negative outcomes scale was significantly higher than organization 1, 4, 5, 6, and 7 (M=2.75 vs. 2.09, 2.15, 2.38, 2.05, and 2.29, respectively). In summary, five out of seven work environment associated scales in organization 8 were significantly higher than at least two other organizations. This may imply that the work environment in this organization was generally better than other organizations in this study. This result is also consistent with other researchers’ suggestions that each organization has its own positive and negative transfer factors that may either promote or prohibit learning and transfer (Mathieu, Tannenbaum, and Salas, 1992; Holton, Bates, and Ruona, 2000).

Research Question 3. Research question 3 sought to determine if significant differences existed in transfer systems across training types. Nine different training types were included in this analysis as shown in Table 5.
The largest group was 118 (19.1%) respondents; the smallest group was 38 (6.2%) respondents; and the ratio of these two extreme groups was 3.11. MANOVA analysis indicated that the transfer systems are significantly different (Wilks' lambda = .296, $F = 5.909$) across training types. In the between subject ANOVA, all of the scales were significantly different across training types, except for two scales, perceived content validity and performance coaching (see Table 6).

* Soft skill training: interpersonal, coaching, and conflict management training

Post-hoc tests showed that no significant differences were found on performance coaching, peer support, and perceived content validity scales in the paired comparisons. Respondents who received new employee academy training rated personal negative outcomes ($M=2.94$ vs. $2.34, 2.05, 2.04, 1.88, 2.11, 2.50, 2.21, and 2.15, respectively) and supervisor sanctions scales ($M=3.87$ vs. $2.87, 2.46, 2.24, 2.37, 2.43, 2.46, 2.56,$ and $2.28$, respectively) significantly higher than those who received any other training types. However, the opportunity to use scale was rated significantly lower than any other training types ($M=3.01$ vs. $3.85, 3.64, 3.60, 3.62, 3.47, 3.48, 3.87,$ and $3.66$, respectively). In addition, respondents in the same training program rated personal outcomes positive significantly higher than public management, technical/computer, and soft skill training ($M=2.66$ vs. $2.08, 2.09,$ and $2.14$, respectively).

Respondents who received competency training rated the motivation to transfer learning scale significantly lower than supervisory, public management, leadership, and sales training programs ($M=3.54$ vs. $4.06, 3.91, 4.03,$ and $4.06$, respectively). Performance-outcomes expectations for supervisory training was significantly higher than public management, technical/computer, soft skill, new employee academy, and competency training programs ($M=3.69$ vs. $3.25, 3.03, 3.16, 2.89,$ and $3.18$, respectively). Respondents who received leadership training rated the performance-outcomes expectations ($M=3.39$ vs. $2.89$), opportunity to use learning ($M=3.87$ vs. $3.01$), and transfer design ($M=4.01$ vs. $3.55$) significantly higher than those who received the new employee academy training, while the leadership training respondents perceived supervisor sanctions ($M=2.56$ vs. $3.83$) and personal negative outcomes ($M=2.21$ vs. $2.94$) significantly lower than those who received the new employee academy training.

Respondents who received sales training rated motivation to transfer learning ($M=4.06$ vs. $3.74$), performance-outcomes expectations ($M=3.42$ vs. $2.89$), opportunity to use learning ($M=3.66$ vs. $3.01$), and transfer design scales ($M=4.00$ vs. $3.55$) significantly higher than those who received new employee academy training. Sales training respondents rated supervisor sanctions ($M=2.28$ vs. $3.83$), resistance/openness to change ($M=2.64$ vs. $3.04$),
and personal negative outcomes ($M=2.15$ vs. $2.94$) significantly lower than those who received new employee academy training.

Implications and Future Research

This study documents for the first time that transfer systems are significantly different across organizational types, organizations, and training types. While this might be intuitively obvious to those who work in organizations, no previous research had documented and compared transfer system factors as was done here. The results from research question 2 confirm the highly variable nature of transfer system factors across different organizations. It is also distressing to note the overall low levels reported on most transfer system factors. For the most part, employees reported severe weaknesses in their organization's transfer system as evidenced by the number of mean responses hovering around 3.0.

Research question 1, which examined differences by organizational type, showed that all but two scales (learner readiness and performance self-efficacy) were significantly different across types of organizations. Results from private sector organizations showed that employees perceive that changing their performance is more likely lead to valued outcomes, that they have more opportunity to use their learning, can have more capacity for trying new learning. Employees in public sector organizations, on the other hand, perceive that their supervisor is more likely to oppose their use of new methods learned in training, that they are more likely to encounter resistance to change, and are more likely to have negative personal outcomes if they do not apply their training. The nonprofit organization included in this study, appeared to have a particularly strong transfer system with higher motivation to transfer and but if more supervisor support.

Results from research question three were also quite interesting. First, there were no differences in perceptions of perceived content validity across the training types. However, all training was rated with only moderate content validity as the mean score was approximately 3.4. Supervisor support was also rated to low across all training types, confirming the widely held belief that supervisors do not generally support training like they should. The two personal outcomes scales were also low, confirming that organizations generally have not adequately linked training to performance outcomes. The results also indicate at perceptions of transfer system factors vary depending on the type training. This supports the notion that organizational systems' support for transfer varies depending on the type training.

These results also point to the importance of using a diagnostic instrument such as the LTSI. Transfer systems are not uniform and stable but rather vary depending on the type of organization, culture of the organization, and the type training. Human resource professionals in organizations need to diagnose their transfer systems and identify the key factor or factors that will have an influence on trainees' transfer of learning. A transfer system survey, such as the LTSI, can be used as a diagnosis tool prior to training and as an evaluation tool after training to examine transfer systems within organizations.

Earlier we introduced Holton's (in press) notion of leverage points for change in learning transfer systems. This study suggests that the leverage point conception may have some merit. The LTSI results suggest that different interventions might emerge for each of the organizations included in this study. Furthermore, these results suggest that different interventions might be needed for different training types within a single organization. Of course actual transfer outcomes data would be necessary to confirm this hypothesis, but it appears to have promise.

It should also be noted that many of the differences between groups were somewhat small. They were statistically significant because of high power due to large cell sizes. Because this instrument has not been heavily utilized in predictive studies, the effect of these differences on performance outcomes is unknown.

Overall, this study is the first to provide descriptive and comparative data about organizational transfer systems. If learning transfer research and practice is to become more action oriented as was advocated at the beginning of this paper, it is important that additional research of this type be conducted to better understand the state of the practice and gaps that need to be closed. One of the key benefits of using a standard validated instrument like the LTSI is that we can begin to make comparisons across organizations as was done here. Prior to development of this instrument, such comparisons were not possible because each study tended to use its own unique measures. As work continues with the instrument, new insights on the dynamics of organizational transfer systems are expected to emerge.

The findings of a recent qualitative study raises the possibility that the question driving the ongoing debate of performance vs. learning is actually the wrong question, and, furthermore, that the fragmentation of the profession into these "camps" simply does not depict true and important differences separating various approaches to HRD. We must begin to engage in philosophical activity in HRD to elucidate issues central to deeply understanding the field and the important differences in it.

Keywords: Philosophy of HRD, Purpose of HRD, Qualitative

The debate about the purpose of human resource development (HRD) has raged in our literature during the last 10 years. The answers that have emerged thus far have been presented as two "camps", each advocating its own aim—one argues that HRD is for the ultimate purpose of improving performance (Swanson, 1995) while the other argues that HRD is for the purpose of learning (Watkins and Marsick, 1995). The focus has been on the perceived dualism between these two goals, and the issue has taken center-stage at international conferences, dominated entire monographs, and is debated in numerous articles.

The findings of a recent qualitative study (Ruona, 2000, 1999) raises the possibility that the question driving this on-going debate is actually the wrong question to be asking, and, furthermore, that the fragmentation of the profession into the performance vs. learning "camps" simply does not depict true and important differences separating various approaches to HRD. One certainly intuitively suspects that there are emerging paradigms in HRD—each approaching the practice and theory of HRD with their own set of underlying assumptions, values, and core beliefs about its purpose and aims, values, and practices. However, we should not be too quick to assume that the two emerging paradigms are performance vs. learning, or that there are only two paradigms!

Instead, we must begin to ask different questions that will elucidate issues central to deeply understanding HRD and the important differences in the field. Philosophy, at its core, is disciplined reflection, and it is the activity that best enables us to do that. While philosophical activity in HRD has thus far been rather limited, with notable exceptions (Barrie and Pace, 1998; Kuchinke, 2000; Marsick, 1991; Watkins, 1991), it must be rigorously pursued to gain clarity about the assumptions that are driving practice and knowledge building in HRD, and to stimulate dialogue about critical issues facing the field.

Purpose and Research Questions

The purpose of this paper is to share the strongest theme that emerged from a larger study. To provide some background, the purpose of the study was to explore beliefs underlying the profession of HRD. In order to do this, the inquiry explored assumptions and beliefs of scholarly leaders in the field. Specific objectives were to:

1. Explore core beliefs underlying participant's ideas of excellencies to be produced by the profession;
2. Analyze the findings to identify common and divergent beliefs across participants of this study.

The findings presented here represent only one part of the study's findings which were quite extensive. The focus reported is limited to the issue of who HRD serves which was a naturally emerging theme from that qualitative data.

Organizing Framework Underlying Original Study

The organizer for this study, "If the profession of HRD was excellent in all ways, what five-seven things would be true?", was the guiding question posed to all participants. It originates from an interpretation of Frankena's (1965) framework for analyzing a philosophy, and Magee's (1971) revision of that framework (see Figure 1). The
framework is based on the discipline of logic, and forwards the proposition that practical precepts about what should be done must be supported by a line of reasoning that justifies those conclusions. Therefore, he states, that any normative philosophy has two parts:

Figure 1. Organizing Framework for the Original Study.

(1) a comparatively philosophical and theoretical line of questioning involving A, B, and C, to show what excellencies are to be cultivated..., and (2) a comparatively empirical or scientific and practical line of reasoning, involving C again and D and E, to show how and when they are to be cultivated. The conclusions of the first part become the premises of the second part. (p. 9)

Although this framework has been used only in the philosophy of education, it is believed to be a potentially valuable framework to help analyze and map beliefs in the profession of HRD. This study is an effort only to begin that journey by asking HRD scholarly leaders to surface their ideas of excellencies to be produced, and probe those for core beliefs driving them.

Methodology

This was an exploratory and descriptive study, using qualitative methods. Initial in-depth, face-to-face, interviews were conducted with eight of the ten participants, and two were phone interviews. Each participant was provided with a worksheet to prompt their thinking which simply stated the following organizing question: “If the profession of HRD was excellent in all ways, what five-seven things would be true?” Participants were directed to use this question as a springboard to spur conversation during the interviews and were instructed that the focus of the interview would not be on their list of excellencies, but rather on the assumptions and beliefs driving those ideas of excellencies. These initial interviews were unstructured to facilitate discussion of topics raised by the participants.

All interviews were approximately two hours long and were audio-taped. Interviews were transcribed professionally, and were carefully verified by the researcher. In addition, member checks (Guba & Lincoln, 1989) were conducted with each of the 10 participants to ensure accurate interpretation and to discuss follow-up questions. These were tape-recorded phone conversations that were then partially transcribed by the researcher.

Sample

Qualitative inquiry focuses on in-depth, small, information-rich cases selected purposefully. It was estimated that members of the scholarly community might be well-suited for participation in this study because of (a) their intense and scholarly interest in HRD and (b) the likelihood that this was a pool of people who are quite familiar with a diverse range of issues facing the field, and have done quite serious thinking on issues related to HRD. All participants were then chosen on the basis that they have served a leadership role in a scholarly association related to HRD. That is, each participant has been either: (a) an incoming, current, or past president of the Academy of Human Resource Development (AHRD), or (b) a current or past chair of the American Society for Training and Development’s (ASTD) Research Committee. This sampling criteria was chosen because (a) they
represent two primary scholarly associations of the field, (b) leaders of these associations are elected/nominated by their membership, (c) these are active scholars who have made marked contributions to the field of HRD. The current and previous four leaders from each of the associations were solicited for this study, and are listed in Table 1. All participants solicited agreed to participate in the study, and agreed for their names to be published. However, quotes/excerpts are not accompanied with a name, and information that might make it possible to identify the participant has been edited out of any published documents.

Analysis

Qualitative data analysis demands inductive reasoning to search for important meanings and patterns in what the researcher has heard and seen. The process used to analyze the data was based on the constant comparative method (Maykut and Morehouse, 1994) and generic coding procedures. These included analysis of three interviews to develop an initial coding scheme, extensive review of all transcripts, recursive evolutions of the coding scheme, the use of an electronic database to facilitate queries and coding, and two peer reviews.

Findings: Who HRD Serves

One of the most provocative questions raised during the interviews conducted for this study was a rather simple one, but one that brings this question of who HRD serves to the forefront: for what end do HRD professionals do their work and for who’s benefit? The participant that raised this shared a story of a person who recently asked him whether HRD was about developing the human resources of an organization or about developing the resources of the human. The answers that emerged and were categorized in this theme indicate a few different perspectives.

The goal of this section is to provide a creative, descriptive, and interpretive account of this theme entitled “Who HRD Serves”. The focus is on reporting the sub-themes that emerged with an attempt, given the limited space provided here, to hear the voices of the participants of the study through excerpted quotes from the interview transcripts. Excerpts from actual interviews are separated from the text and are bulleted by a double-quote (").

HRD Serves Individuals: Developing the Resources of the Human

A strong commitment to individuals and human development emerged here as one participant explicitly stated:

"The HRD profession would be excellent if it saw its role as being responsible to and for individual workers rather than management."

This quote represents this sub-theme well as a perspective that emphasized that HRD should put people and their needs first, over and above those of the organization, because it is defined by its work with people.

"We are defined in part by our work with people, of human resource development. So fundamentally it has to do with people."

Part of how this was demonstrated was through a strong focus on individuals and helping them to fully develop. Building on a notion of whole-person development versus development based on solely job/organizational needs, these participants advocated development of the whole person to his/her optimal potential:

"It is the development of people that is the goal of HRD."

"...we're all about helping people reach their potential..."

When asked about who defines "potential", the answer was that the individual does because individuals inherently work towards self-actualization—striving to grow and work in creative and meaningful ways.

Putting People First Pays-Off: Putting people first was justified because, according to these participants, investment in people pays-off for the organization. While the people that advocated serving the unique needs of the individual first downplay the needs of the organization, they were not ignorant of them. These participants
believed either that tending to people is what best positions the organization for optimal performance, or that HRD simply should not focus on organizations at all. The following quotes emphasize these perspectives:

"A really good organization that puts people first is going to be profitable anyways, because people are going to want to work for them and be productive and loyal. If you put people before profits, you're going to get your profit anyways—it's where you put your effort and energy and focus.

"Business decisions that are made on the bottom line are uniformly unsuccessful. ...They're focusing on the wrong thing. You don't get success by focusing on success, you focus on other things. If you focus on taking care of your employees, they will make money for you.

Minimize Focus on Profit. Moreover, participants also surfaced some suspicion about organizations that focus too heavily on achieving profit over all other things. The commitment to whole-person development was also held up as a more worthy goal than that of chasing profit—emphasizing that profit in and of itself is not bad, but there must be additional, more humane goals:

"To them it's margin, it's not about people.

"...there's just too much power and greed and we see it in all our daily lives. ...it's just power and accumulation. ...but again if that's what we're all about—helping organizations and CEOs become multi-millionaires, I don't want any part of that. There's gotta be something more...got to be a hell of a lot more. And to me the "more" is that I'm in this for people.

Finally, one participant took a much stronger position that focuses solely on human development, regardless of whether profit or organizational performance ensues. And another participant stressed that the organization should be seen as secondary to serving the needs of the individual

"If you don't develop, if you don't make the person, then even if you make a profit, it's not worth it. It's the development of talent that's important. That may result in a profit, it may not result in any profit—and that doesn't make any difference! ...That should not be a consideration in this field at all, and the person who makes that the consideration misunderstands the nature of the field.

"Organizations for me are important in helping individuals achieve their purpose in life.

Putting people first was justified because, according to these participants' beliefs, investment in people pays-off. Thus, organizations were encouraged to focus on people and development (and other worthy goals) and to view profit as a by-product of doing the right things.

HRD Serves Organizations: Developing the Human Resources of an Organization

This emphasis on serving the individual first and having confidence in the return-on-investment for the organization is quite different from an alternative approach that emerged during this study, as represented in the following quote:

"We would be excellent if we were seen as furthering the mission of the organizations or entities that sponsor our efforts.

The excellency described above is the antithesis of the excellency that opened the former section which placed serving the individual first. In this perspective, HRD is primarily responsible to and for the organization. That HRD should primarily serve the organization was tied to the idea that HRD is sponsored by organizations and, thus, should be the primary client. One person interviewed for this study listed the following excellency:

"The profession would be excellent if we understand that the system is always the client...the simple answer would be (from Wilfred Behan's work at Tavistock on to Lewin and Argyris) that the thing that created the field of OD was that they moved beyond the individual as the unit of focus. ...The real stakeholder has got to be the system—that's where the money is coming from, that's the only reason you're there. HRD is fundamentally hosted by some organization or system, it's not a free-floating system.

Aligned with this presumption that HRD is sponsored by organizations and a personal understanding of how organizations function were also strong beliefs that HRD should support organizational mission and contribute to enhanced organizational performance:

"What distinguishes HRD from general education is that it is sponsored by or it's within the boundaries of some kind of organization that has a purpose...and that it should be engaged in furthering that mission.

"And so this is the business side of me. You know, I was born and raised in a family business and understanding that you have customers. You have decided what the fundamental purpose of the organization is and, as a result of that, anything that doesn't align itself with that is vulnerable to be picked off, thrown away, not taken seriously. I understand that and it's OK.

Here is a strong expression of how HRD should be contributing to the purpose of the organization—aligning with its mission and helping the organization achieve its goals while also helping it to connect its parts to the system whole. This was reiterated by someone else, too, when speaking about who HRD's primary client is:
"So when I go into a department, for instance, I'm very interested in how that department is working to enhance the overall organizational mission. And so my role is to help them see that—to help them see the connect or disconnect between what they're doing and what the system is doing.

The realities of organizations seemed to dictate to some participants that HRD serve those needs. A strong concept that emerged was about how organizations are not in the business of learning, and the need for HRD to realize this and work towards the goals of its sponsor:

*Organizations are not in business to learn. They're in the business to perform, and learning is a vehicle to that.*

"I wonder where does that come from? Where do you get the belief that you have the right to exist and to be awarded resources day in and day out? In the final analysis you're only to get what you get based on merit—because you've earned it.

**Mission, Not Just Profit.** People who advocated supporting organizational mission and helping organizations to achieve more also emphasized that this should not be mistaken as a unabashed emphasis on increasing profit. For instance, one person reflected:

"I've never understood why the so called "performance perspective" which is really mission-oriented is a problem. It's goals, vision, purposes—you know, what it is it's trying to do. You're doing it for organizational or system intent.

This quote was a part of a larger discussion about how working towards the achievement of organizational goals has often been misinterpreted, according to this participant, as a focus on only profit. This participant believed that the focus on mission and goals of the organization is a valid assumption for any type of organization (i.e non-profits, government, community organizations, unions, etc...).

More over, participants called for not mistaking this focus on system intent as a need for short-term profit at the expense of all else. Some people interviewed for this study consider there to be a more ethical focus on helping organizations achieve many kinds of performance, and for both short- and long-term interests. These participants encouraged HRD to deal with managing the tension between short- and long-term investment and short- and long-term return on that investment.

**Putting Organizations First Pays-Off.** Just as the people that advocated primarily serving individuals did not ignore the needs of the organization, so too the people that advocated putting the organization first did not ignore serving the needs of the individuals. The following quotes demonstrate this:

"When you look at the issue of impact, to me, the key criteria is that organizations function better, profit more. Then, as sub-set of that, in fact, the way that organizations function better is that they treat their people better—that they have better learning and better people practices.

*Organizations need us to help them thrive in a changing world, if they don't do that they're pretty marginal overall. Then as part of that...I think they'll see clearly that we improve people's lives.*

Finally, there was some discussion from two different participants about the challenges associated with balancing organizational needs with those of individuals:

"If you want to keep jobs, if you want to sustain those things, if you want the most number of jobs for the most people, if you want the top executives to change their thinking and their work behavior, you want the work processes to fundamentally change to be not only better but also more humane...boy, you're going to run into the meat grinder. That's tough work! The easiest thing for an HRD person is to be a humanist at the individual level. Piece of cake!

**Not a Blind Tool of Management.** Serving the needs of the organization was not to be misinterpreted as HRD being a blind tool of management. Some participants called for HRD to use its commitment to individuals as courage to stand up for and demand better, more humane people practices, as demonstrated in the following:

"We would be excellent in all ways if we became advocates, in fact, champions for HRD practices with ethics and integrity. So, like any profession, I think we have the obligation to battle against unethical practices.

Another person talked about how a deep belief in human beings demands courage from HRD professionals:

*...at that point it takes an enormous amount of courage...if that's our job...to talk back to the system, the organization, about it's behavior, it's system, it's logic, it's inadequacies. You know, if you're supposed to be enhancing the whole organization and that organization is violating all your core beliefs, then you have to make some decisions at that point. You have to challenge, you have to have courage to advocate for those core beliefs. So I think that they get your stomach in knots.*

**Serve Multiple Stakeholders: Win-Win-Win**

Still yet there was another perspective emerged during this research as a few participants made a plea to stop all this talk about choosing either the organization or the individual as HRD's primary client. They said:

"But it's the either/or stuff again that gets difficult for me. Well it goes back to, again, an issue that has been confronting the field...and I get irritated every time I see it...when people get into the argument about whether HRD is
performance or learning. Well, it’s just a dumb question to start with! But it goes back to my perception of how much we are driven by either/or questions. Instead of trying to find an “and” question that helps us to embrace a larger and bigger piece of what has the potential of impacting lives in the positive way.

First of all, some people pointed out, HRD actually serves many more than just two clients. Two people pointed out that, at the very least, there are three stakeholders and there should be a more expansive view of stakeholders:

"...there's at least a triadic relationship in any endeavor—the consultant is working for a client, while the beneficiary is somebody else. And so who do we serve?"

"The profession of HRD would be excellent if it recognized the importance of multiple stakeholders. That HRD serves a whole variety of stakeholders—not just management, not just the workers, not just the people sitting in training classes, not just the people who buy the training programs, but they serve a wider community...presumably they even serve the shareholders of the company in some form or another.

Recognizing that more stakeholders presents increased responsibility to balance and work towards the mutual win of many, one person explained that what was needed was a new focus on win-win-win:

"...you know, I've done a substantial amount of work with unions. And this whole idea of not a win-win situation but a "win-win-win" situation—win for the organization, win for the union, win for the individual members. So how do you converge outcomes for these partnerships? How do you get win-win-win situations? But the idea is that it would be not just a hope, but a declared intent with outcomes explicated of what those wins might be.

Two other participants talked about how focusing on multiple stakeholders rather than an “either/or” scenario also necessitated weighing conflicting goals more explicitly to achieve that win-win-win.

Just as some advocated a new conception of multiple stakeholders, another person emphasized that the artificial choice between learning and performance was insufficient to guide the aims of HRD, and discussed how HRD should honor multiple goals or outcomes such as integrity, climate, globalization, and peace. This certainly indicates a move towards a more expansive notion of who HRD serves and what it does in the process.

Analysis of Findings: Who HRD Serves

An analysis of the findings reveals three distinctive sets of beliefs about who/what HRD serves. Each is briefly summarized below, and some of the logic within each set begins to emerge. Some key insights are also discussed.

**HRD Serves Individuals**

The driving force to serve individuals emerged very strongly from one group of participants interviewed for this research. For them, HRD is defined by its work with people, and, as a result, there must be a deep commitment to help people grow, actualize, and achieve self-fulfillment. This commitment to individuals was contrasted with a much lesser commitment to organizations, or, as for some interviewed, by a strong resistance for HRD to work “for” the organization. People who spoke of serving the needs of individuals had strong ideas about putting people first, and a few felt that that should be done regardless of the organization and their needs. There was little discussion about potential needs of the organization or of HRD’s role in helping organizations to fulfill those needs. Nor was there discussion of balancing individual and organizational needs. Rather, the focus was largely on the individual.

A few participants did acknowledge that there would be an eventual pay-off for the organization that invests in people, however there remained a clear distaste for organizations that focus too heavily on profit. This suspicion was reinforced by one participant who explained that HRD professionals who approach their work from the “performance perspective” abuse employees and fundamentally misunderstand the profession of HRD. This is a clear signal of a very different belief system than the one that is described in the following sub-theme that advocated serving organizations.

**HRD Serves Organizations**

This sub-theme introduced what can only be characterized as almost the polar opposite of that forwarded above. Here value was placed on serving the needs of the organization, and helping the organization that sponsors HRD achieve its mission. Indeed, it was implied that HRD is fundamentally defined by its work in and for organizations.

Both of the above positions (serving people and serving organizations) seemed to agree with the logic that effective people practices make for an effective organization. However, as one participant pointed out, it has more to do with how one approaches that belief. This group heavily focused on the organization’s effectiveness and advocated effective people practices as a primary tool to help achieve that success. While the group that advocated
serving individuals approached this primarily from the individuals' perspective. This is a very fine, but significant distinction between these two sub-themes.

Another thing revealed in the data from was a rather different view of organizations. Organizations were viewed as existing to achieve mission/goals. Although the role of organizations was simply not talked about as explicitly in the sub-theme detailed above, there was clearly less valuing of the organizations mission/goals, and a more negative connotation of organizations and their motives. In the "serve organizations" sub-theme, however, there was clear acknowledgement that organizations exist for reasons other than to help people learn, and that HRD should be aligned with the system's mission/goals, within some ethical boundaries around humane and fair human resource and business practices.

What was even more interesting is that the participants that grounded themselves in serving organizations did not say that they would choose the organization over the individual. It was not an either/or dichotomy for them, as it seemed to be for the group where individuals were chosen over the organization. In this sub-theme, commitment to the organization was not assumed to be at the expense of individuals—the commitment to individuals, their development, and good treatment was assumed and deeply held. Additionally, a few participants in this section talked about the challenge of balancing the sometimes conflicting needs of organizations and the individuals. This was characterized as a struggle, and appeared to be an issue that they actively dealt with in their work.

Contrasted with this, the group that focused primarily on serving the needs of individuals did not pay much attention to the organization. A few individuals emphasized that organizational needs should come second, and there was little apparent struggle to balance conflict between the individual and the organization. In fact, one person in that section commented that organizations would have to succeed in spite of HRD. Whereas the group that supported serving the organization would most likely say that organizations succeed because of HRD.

**HRD Serves Multiple Stakeholders**

This idea of "win-win-win" for multiple stakeholders and in multiple ways can almost be characterized as an extension of the sub-theme that emerged above which reflected on balancing the needs of the individual and the organization. The emphasis here, though, was much stronger on being explicit about who potential stakeholders might be, what aims each has, and how all parties involved can optimize around those goals. This is such an important idea for HRD! As can be seen in both the results of this study as well as in much of the HRD literature, the discussion of who is served by HRD has been traditionally dominated by an either/or paradigm. As a result, the conversation has focused on choosing one or the other rather than exploring what it truly might mean to balance multiple stakeholders and multiple aims. There is a clear need for better and more explicit models of partnering for "win-win-win" and for managing divergent needs.

**Conclusion & Implications for HRD**

An analysis of the rich quotes of these scholarly leaders reveals that there are points of convergence and divergence among the beliefs forwarded. The ideas held in common (strong commitment to individuals and the idea that good human resource practices benefit the organization) offer a few foundational beliefs that may be considered as core to the HRD profession. Identifying just a few core beliefs is a critical first step in forming a philosophical foundation for the profession—a foundation on which values, morals, ethics, and best practices will be built. This activity is important in order to ensure the advancement and excellence of the profession, as well as to better differentiate HRD from other human resource professions. In this way, then, this study has helped to elucidate a few potential organizing principles for HRD by tapping the wisdom of experienced and leading scholars.

It is also important to note key differences among these leaders. It is vital that divergent viewpoints develop over basic questions such as those that emerged here, and it is our responsibility to explicitly surface and analyze them. Magee (1971) tells us that “one of the tasks of philosophy is mapping the logic of...discourse, laying it out, so to speak, so that a person can make his way about it successfully” (p. 45). A central finding of this research raises the possibility that the current discourse focusing on the question of the purpose of HRD and the two opposing “answers” of performance vs. learning may actually not be the correct question or answer at all. Rather, these findings show that issue of who HRD serves is a much more telling and divisive issue, and one that may point to two or more distinct emerging paradigms in HRD.

These similarities and differences must be extensively explored in future research so that we can continue to question that which is core in HRD and to identify the divergences which mark various emerging schools of thought within the field. Even with these initial, exploratory findings, we can no longer postulate that core
differences in HRD knowledge and practice are attributable to the camps of performance vs. learning, and we also can no longer continue assuming that all HRD practice and knowledge is derived from and lives in one school of thought. Rather we must acknowledge emerging schools of thought and thoroughly articulate them. It should be clear what the belief systems are, how they vary from one another, and how different belief systems impact the practice of HRD.

Future research should include additional in-depth study of beliefs underlying HRD and the interplay of these beliefs with HRD theory and practice. This study will soon be replicated with a set of leading practitioners to explore any similarities and differences from the academics interviewed here. In addition, many more HRD professionals could be queried about the beliefs that drive their actions in HRD. This can be done by replicating the methodology outlined in Ruona (1999) as well as by conducting extensive surveying. Innovative methodologies such as critical incidents and case studies are also promising as effective tools to uncloak beliefs and share them with the profession for consideration and ongoing dialogue. And, of course, the organizing framework for the study should be utilized in future research as a tool that will help HRD scholars question the logic of core beliefs that are forwarded to begin to truly map sound, integrated belief systems.

The hope is that this research will help the field to better navigate through key issues it is facing and really begin to explore the deep assumptions that drive the field. It is at this level that generative conversations take place and real change begins.

In the UK the academic status of HRD is problematic and has only recently become a significant part of the university curriculum. Part of the 'problem' of HRD relates to the research base which underpins the subject. This paper attempts to derive a conceptual 'map' of HRD in the UK. thus it's focus is on the process of theorising HRD rather than presenting a particular position on HRD theory. The paper does not report specific research findings.

Keywords: HRD in the UK, theorising process, holographic metaphor.

This paper draws upon the emerging body of research in HRD, primarily UK-based, which provides the underpinning for the conceptual, theoretical and practical advance of HRD. We aim to provide an overview of many of the conceptual and theoretical concerns surrounding the meaning and understanding of HRD. These issues and concerns relate to both the ontological and epistemological perspectives on HRD, which in turn influence our vision of researching and understanding HRD. The paper offers a contribution to the on going debate surrounding the theoretical foundations of HRD (Lynham 2000; Walton 1999) and the purpose and value of HRD professional practice (Holton 2000). The paper presents an analysis of the key tenets of the various positions in these debates. In doing so, we provide a comparison of American and European conceptions of HRD. This informs the overview of the diversity of research philosophies, processes and practices currently being applied in the UK. The paper also draws on the work of Keenoy (1999) a sharp critic of the literature of HRM and tries to apply his critique into a better conceptual understanding of HRD by developing a metaphor of HRD as a 'hologram'.

Theoretical Context

The process of defining HRD by academics, researchers and practitioners is proving to be frustrating, elusive and confusing. This suggests that HRD has not established a distinctive conceptual or theoretical identity (Garavan et al., 2000; Hatcher, 2000). The process of defining HRD is frustrated by the apparent lack of boundaries and parameters; elusiveness is created through the lack of depth of empirical evidence of some conceptual aspects of HRD. Confusion arises over the philosophy, purpose, location and language of HRD. This is further complicated by the epistemological and ontological perspectives of individual stakeholders and commentators in the HRD arena (Swanson et al., 2000). All research, to varying degrees, is tied to a particular theoretical framework and to a general body of knowledge. This, in turn, is the product of a complex interplay of philosophical arguments thus, the 'complication' noted by Swanson (op. cit.) is perfectly natural but renders the task of analysing the 'meaning' of HRD more difficult. Inevitably this draws us into the realm of philosophy.

Philosophical and Conceptual Dimensions

As Swanson et al (2000) argue "philosophy is a systematic examination of the assumptions that underlie action" (p. 1126). Therefore, in order to understand action, in this case HRD research, it is necessary to engage with philosophies of HRD to make explicit the rationales underpinning competing perspectives.

They put forward three interactive elements of the philosophical framework of HRD. These are, firstly, ontology (how we see our world); secondly, epistemology (how we think about our world) and, thirdly, axiology (the
values that determine how we should and actually act in research and practice). The dynamic relationship of these three elements will influence an individual's understanding and expression of HRD. Therefore it is useful and appropriate to address philosophical issues in attempting to understand HRD. This has been strongly reinforced recently by the publication of a thoughtful collection of reflections on the philosophical foundations of HRD practice by leading US academics in the field of HRD. (Ruona & Roth, 2000)

The philosopher Thomas Kuhn first introduced the idea of scientific paradigms in his path-breaking book The Structure of Scientific Revolutions in 1962. This book has proven to be seminal in the development of theory and research in the social sciences and is likely to have an equally profound and enduring influence on the conceptual and theoretical development in HRD. The concept of paradigms, introduced by Kuhn (1962), is often used to describe philosophical frameworks informing and guiding scientific research. McAndrew (2000) usefully applies this notion in analysing significant influences on HRD theory and practice.

One of the best-known paradigmatic frameworks is that developed by Burrell and Morgan (1979). They forward four broad paradigms, which affect the development of social theory. These are the functionalist paradigm, which assumes an objective, social reality, which can be empirically analysed and understood through application of scientific methods. Social systems are seen as inherently concerned with stability and continuity to serve regulatory purposes. The interpretive paradigm assumes that individuals and their interactions create social reality, subjectively. Multiple social realities are created maintained and changed and there is no single, objective entity to be analysed and understood. However, in common with the functional perspective, the interpretive paradigm assumes an underlying pattern and order in the social world, i.e. regulatory focus, rather than a change orientation. Much of Burrell and Morgan's (1979) insights still inform contemporary debates in organisational analysis.

The radical humanist paradigm assumes that reality is socially and subjectively created and therefore not capable of objective analysis seeing social institutions as negative in the sense of constraining and controlling human thought, action and potential. These negative aspects tend to alienate rather than focuses on positive outcomes. The concern is with radical change rather than regulation. The radical structuralist paradigm assumes that social systems have independent, concrete and objective existence and are capable of scientific analysis. This perspective also encompasses social systems as oppressive and alienating and assumes an inherent drive for radical change in society.

Variants of these arguments are evident in the emergence of new perspectives on HRD framed as post-positivist (Trochim, 1999) and critical realist (Sayer, 2000) positions. The former of these develops elements of the Burrell and Morgan functionalist and interpretive paradigms whilst the critical realist perspective takes forward a concern with meaning and interpretation that echoes the radical humanist and radical structuralist paradigms. However these have not crystallised into a simple bi-polarisation. Rather the whole area is characterised by paradigm incommensurability, which in turn reflects an impact on methodological development.

To date, there appears to be little sustained and detailed attention given to philosophical influences on HRD, but as Kuchinke (2000) argues "paradigm debates can deepen theory and provide the foundation for new research" (p. 32). This view is supported by Swanson et al (2000), amongst others who identify implications of philosophy for research, theory building, practice and the evolution of HRD. The role of the varying paradigms discussed here, representing as they do different philosophical frameworks, in shaping HRD theory and practice is well illustrated by the work of Lynham (2000). It is evident that a significant outcome of adopting different paradigms will be varying emphasis on the possible alternative purposes of HRD.

This variety of perspectives demonstrates vividly that there is no dominant paradigm of HRD research. It also illustrates what may be meant by 'paradigm incommensurability' in organisational research. However such a position is healthy. There is no single lens for viewing HRD research and there are many voices expressing opinions. It may be that, as HRD academics become more sophisticated in theorising, then greater clarity and paradigm commensurability will occur. It may also be the case that the increasingly influential discourse of postmodernism, which is strongly established in the field of organisation studies (Alvesson & Deetz, 1999; Burrell, 1999) and is now evident in the literature of strategic change, will come to have an impact on HRD researchers (Ford & Ford, 1995).

**Purpose of HRD**

Lying behind the main philosophical debates concerning the nature of HRD, there is a concurrent set of debates concerning the purpose of HRD. According to Holton (2000) the debates on purpose centre on the learning versus performance perspectives. Should HRD practice focus on the well being of the individual or should interests of the shareholders predominate? This section presents a rudimentary map of what the various claims of the purpose of HRD might be. Hatcher (2000) proposes that HRD research should focus on the economic benefits, systems theory, social benefits and ethics of HRD and thus indirectly attempts a reconciliation of these two perspectives.
Kuchinke (op. cit.) presents a classification of schools of thought according to the central focus of the developmental activity: person-centred, production-centred and principled problem solving, each deriving from different philosophical traditions. Gourlay (2000) in attempting to clarify the nature of HRD states that "it focuses on theory and practice relating to training, development and learning within organisations, both for individuals and in the context of business strategy and organisational competence formation" (p. 99).

Garavan et al. (2000) articulate three perspectives of HRD as being concerned with capabilities, psychological contracts and learning organisation/organisational learning. Each of these is associated with different root disciplines. They also imply different purposes in their prescriptions for HRD practice. There is also variability in relation to the purpose of HRD arising from the root disciplines seen to be underpinning HRD. These include; adult education, instructional design and performance technology, psychology, business and economics, sociology, cultural anthropology, organisation theory and communications, philosophy, axiology and human relations theories (Willis, quoted in Walton, 1999). There is also a running sub-terranean debate within the field of HRD on the ‘discipline’ status of some these root disciplines. As well as variability of purpose, conceptual propositions derived from and built on these root disciplines also influence individual perspectives of HRD. For example, in the typology devised by Garavan et al. (2000) the capabilities perspective is primarily associated with human capital theory and the application of economics in a resource based view of the firm. In a similar vein, Weinberger (1998) identifies systems theory as being distinct from learning theory in relation to their influence on HRD, leading to different formulations on the nature and purpose of HRD practice.

What is apparent from the above commentary is that there is no consensus over the conceptual-theoretical identity of HRD and related purpose. The purpose is contingent upon both philosophical and theoretical perspectives.

**Boundaries and Parameters of HRD**

This discussion demonstrates the multidisciplinary nature of HRD makes precise definition difficult. There is some evidence in the literature of ideological or descriptive-normative models for aspects of HRD. For example Walton (1999) has identified ‘Strategic HRD’ as a distinctive, almost freestanding, dimension of HRD. Similarly, the much-discussed idea of the ‘Learning Organisation’, (Senge, 1997) is a good example of the ways in which the normative prescriptive models are used as the basis for examining current practice (Dibella & Nevis, 1998). HRD is often presented as different to training and development with the focus being on learning and development for the organisation as well as the individual. There is often a futuristic focus, with prescribed contingent outcomes. Although there are often attempts to address both the practice and the conceptual aspects of HRD, the drive to express HRD in relation to models, frameworks and typologies, could result in a distancing between rhetoric and reality, similar to that found in HRM debates. As Hatcher argues, "Without a focus on the theoretical foundations of research and practice, HRD is destined to remain atheoretical in nature and poor practice will continue to undermine its credibility" (2000, p. 45; emphasis added).

Historically, the development of HRD can be traced from training and instructional design, to training and development, to employee development, to Human Resource Development (Jacobs, 2000). Traditionally, the field of HRD was defined by practice, not from a theoretical frame or set of research (Lyhnam, 2000). More recently, the emergence of HRD related journals have presented an opportunity to define the field on basis of theory and practice (Jacobs, 2000). There is also a blurring of the boundaries in relation to the affiliation of researchers. Many early American researchers emanated from either an instructional design or an adult educational base. Recently Jacobs (2000) has reported that there are an increased number of manuscripts coming from business schools. This trend is a reversal of the European and UK situation. In the UK, HRD is very much the child of the explosion of HRM literature in the 1980s and 1990s (McGoldrick & Stewart, 1996).

In addition, the scope of HRD research can be seen to be expanding, with recent focus on areas that were not traditionally considered to be within the domain of HRD. These include organisational leadership, organisational values, workforce development issues at the societal level and labour economics (Donovan & Marsick, 2000). Multidisciplinary foundations and an expanding scope both have the effect of expanding the discursive resources and therefore language available to and used by HRD academics and practitioners. This last point is worth a little more elaboration, particularly with respect to Hatcher’s remark, noted above, concerning the poverty of HRD practice being a function of the poverty of HRD theory. Rather than seeking to stake a claim to particular territory, HRD should be looking to enhance its capability to theorise on the basis of a solid research base. As was noted earlier, there is no single lens through which HRD is viewed, nor should there be. The debates which are now emerging from the Academy of HRD in the US and the University Forum for HRD in Europe and the UK, indicate a
growing vitality for the development of good HRD theory. In taking these discussions and debates forward it is essential to pay close attention to issues of language and meaning.

**Language of HRD: ‘jargon-ridden’ and ‘meaning-hidden’?**

There is a clear and continuing paradox concerning the language used in the discourse of HRD. Walton (1999) neatly sums it up as follows: "this constant concern with meaning and learning and their subtleties/shades/tones/cadences by those responsible for HRD can paradoxically be (yet another) reason why the HRD language appears so jargon-ridden and meaning-hidden." He continues: "Words are being asked to express the ambiguities faced by those trying to translate the subtleties of meaning into learning frameworks and language that hopefully capture all the nuances of actual experience and associated reflection, conceptualisation and experimentation" (p. 54). Social processes through which this has been attempted involve the construction of linguistic categories and an alteration in the received meaning of existing expressions. New terms in HRD include, lifelong learning and psychological contracts, whilst terms with scope for new meaning include competence and competencies, integration, teamwork, communication and commitment. Although all of these are useful to describe practices, conceptually there is a danger that these denote rhetorical, often managerial, aspirations and desired states of being. A lack of effective linguistic categories to clarify what is happening within HRD could result in a combination of illusion and allusion, as there are no definitive words to signify its identity.

Many of Walton's concerns resonate with Legge's (1995) sharp critique of rhetoric and reality of HRM. However this point is challenged by Sambrook (2000) who provides an analysis which draws no distinction between rhetoric and reality or words and action. In her view rhetoric is reality and words constitute action. From this approach, she is able to formulate a typology of 'ideal types' which is capable of accommodating discourse from both academic disciplines and professional practice. Such typologies, as well as those suggested by Garavan et al. (op. cit.) and Lyhnam (2000) may well be useful in capturing and making sense of current variety of discourses within the HRD domain. However a proliferation of linguistic terms with variable meanings has obvious consequences for investigating empirical realities.

**Empirical Elusiveness**

Empirical elusiveness (Keenoy op. cit.) derives from an inability to show that HRD has a substantive presence in organisations. In some respects the issues surrounding the empirical absence or presence of HRD are analogous with those discussed earlier with respect to the conceptual parameters and boundaries. The American Society for Training and Development Research committee identified two major empirical gaps in relation to evidence as being between practitioners and researchers, and between practitioners and senior executives (Dilworth & Redding, 1999). Several European commentators, including Harrison (1998), have found little empirical evidence of 'Strategic HRD' in organisations. Others including Sambrook (1998) identify divergence in the stories told by HRD practitioners and non-HRD managers and employees. These studies suggest a need for closer collaboration between researchers and practitioners in order to build more accurate empirical evidence. Such a need has been expressed by both European (Hamlin et al, 1998) and American (Lyhnam, 2000) academics.

**Locations of HRD**

Locations of HRD can be understood in two senses. Firstly, as a description of a physical or sectoral location and secondly, and more importantly, as a feature of the process of organisational design. Reconfiguration of contemporary organisations, the emergence of the small business sector and continued growth in non-standard forms of employment are extending the perimeters of HRD activity. Internal creation of independent business units and growth of outsourcing, subcontracting and down sizing are all impacting on the structures and boundaries of organisations. Similarly the notion of 'employee' appears increasingly transient; employment security is less salient, with apparent continuing growth in temporary, part-time, subcontract and agency work. As a consequence HRD can no longer be seen to operate within the traditional boundaries of an organisation, but spread its influence to the development of those outside, on whom it depends (Walton 1996, 1999). In addition the SME sector is likely to provide a growing location for HRD practice, which may imply an expansion of the meaning of HRD (Hill & Stewart, 2000).

What is apparent from the discussion above is that there is no consensus over the conceptual-theoretical identity of HRD. It can be seen to constitute multiple, shifting, competing and contingent identities, dependent on
philosophical perspectives and influenced by the range of methodological dimensions derived from the literature and from the continuing analysis of ongoing research work.

**Critical Analysis**

It is our argument that conceptually HRD is still in the intellectual shadows of HRM particularly with respect to HRD research in the UK (McGoldrick & Stewart, 1996). It is instructive however to see all the lessons HRD academics can learn from the theoretical development of HRM. Since its emergence in the late 1980’s there have been two distinct strands to the literature advancing HRM. The first of these has been the solid development of texts and journal publications. The second has been a highly critical even polemical literature questioning the academic and root discipline claims of HRM. The strongly critical literature exemplified by Keenoy and Anthony's (1992) portrayal of HRM as “metaphor” and Legge's (1995) critique of the rhetoric of HRM.

One of the sharpest critics is Tom Keenoy (1999) who has written a deeply polemical review of the rise of HRM – which he dubs “HRMism”. The article is both challenging and stimulating and poses questions as relevant to the emerging debates about HRD as to the discussion of HRM. His argument is that HRM concepts, practices and theory are, “a source of controversy, confusion and misapprehension.” Indeed, he goes further and argues that “at the centre of this unfolding obfuscation lies an infuriating but curious paradox: despite mounting evidence of conceptual fragmentation, empirical incoherence and theoretical vacuity, HRMism has gone from strength to strength (Keenoy, 1999, p. 1). These charges of conceptual fragmentation, empirical, incoherence and theoretical vacuity may equally be applied to HRD. However, emerging from his polemical discourse there is a potentially useful metaphor for HRD.

**A Holographic Metaphor?**

The key argument that we wish to advance here, in contra-distinction to the way that Keenoy’s argument is developed, is that utilising the metaphor of a hologram enables the reconciliation of intrinsic confusions and contradictions of conceptual, theoretical and empirical identities of HRD to be understood. “Holograms are projected images, which, as we shift our visual field in relation to them, appear to have contours, depth and in some cases in movement” (Keenoy, 1999, p. 9). The hologram is comprised of two distinct, discrete processes of technology and social, which are entwined. Both must occur simultaneously for the hologram to exist. Human social action and perception are an integral part of the process required to construct the image. Holograms can be described as ‘ techno-social’ artefacts with a complex ontology (Keenoy, 1999, p. 10). Each is real, but each exists in a different domain. We only see what we are looking for. In order to see the other side, the shaded, deeper side of its identity, we need to change our perspective. The hologram provides a metaphor, which depicts ‘social reality’ as multi-dimensional, multi-causal, mutually dependent and constantly changing. The holographic reality is only accessible through a reflexive epistemology, which explicitly acknowledges the role of human beings in creating ‘social reality’.

The following quotation from Keenoy (1999) is modified and substitutes HRD for HRM “The more [HRD] is undermined by conventional academic analysis, the stronger it seems to have become. Viewed from a holographic perspective this paradox is a consequence of employing a limiting two-dimensional epistemology. (....) Trying to fragment the phenomena and then mapping each fragment against a predetermined definition could be responsible for failure to ‘see’ [HRD] for what it is” (p. 10-11).

For Keenoy (1999) all of those implicated [in HRD] may all hold different “conceptual-projections” of HRD, which are likely to contradict their actual experience of HRD. From this HRD can be seen as a series of mutually expressive phenomena, which are transient (p. 17). Therefore it is impossible to conclude that HRD does not exist and impossible to conclude that it does exist. HRD exists in so far as it is the process of coming into being. Although we may not be used to conceptualising HRD as social phenomena in this way, such a conception is already present in the learning organisation discourse, which is depicted as a continuous and never ending process.

The holographic metaphor of HRD has some attraction for some of the reasons that Keenoy is sceptical. Whilst most of this paper has argued that HRD has no singular identity, if it is understood as a hologram it could be defined as singular. HRD’s singularity would be defined through the properties of the hologram which could be described as “the fluid, multifaceted, integrated social artefacts”, which are the ‘continuing-outcome’ of contextualised learning. HRD then serves as the collective noun for the various concepts, theories and methods devised to manage and control learning. This definition embodies our earlier argument concerning the complex interplay of competing ontological, epistemological and methodological assumptions, which assist in understanding the reality of HRD. The benefits of the holographic metaphor are the following.
• It acknowledges anomaly, uncertainty, ambiguity, multiple identities and transience. It is sensitive to the problem of linguistic expression.
• It permits the encompassment and softening of contradictions and paradoxes of different perspectives of HRD.
• It emphasises the analytical significance of the mutually involved processes of social and discursive construction, i.e. the role of social actors in reconstructing reality, whilst being components of reality.
• It provides interesting methodological questions concerning empirical research. This does not necessarily mean the abandonment of conventional modernist methodology, but emphasises the need for greater interpretative sensitivity. It requires analytical space to accommodate paradox, ambiguity instability as normal predictable outcomes within the praxis relationship.

The holographic metaphor seems to offer an alternative to the dualistic limitations of the modernism perspective and avoids the “limitless relativism” found in some varieties of social constructionism.

The use of metaphors in HRD is not a new phenomenon by any means. Short (2000) provides an excellent review of the use of metaphors in a recent paper. However, the attractions of the holographic metaphor are that it allows for a whole new perspective radically different to those currently associated with the debates on HRD. It provides a perspective, which is grounded in the belief that social reality has to be understood as a “fluid, unfolding process of social accomplishment” and, in addition, “draws attention to the experiential nature of observation and the observational nature of experience. ‘Reality’ is a fuzzy shimmer between these two movements” (Short, 2000, p. 18)

The implications for theorising and methodological development afforded by consideration of the holographic perspective may not yet amount to a new paradigm. However it does offer a counter to the initial charges that may be laid at the door of HRD theory of conceptual fragmentation and theoretical vacuity. The methodological implications for research design are immense and challenging. But that is a matter for another paper another time.

Conclusions

We offered a detailed analysis of the theoretical context of HRD research by focussing initially on the philosophical and conceptual dimensions. We argued that HRD has no dominant paradigm, at least in the UK. There is no single lens for viewing HRD and indeed that there are many voices articulating particular perspectives. In relation to our questions on the purpose of HRD we found that there is no consensus over the conceptual-theoretical identity of HRD and related purpose. The purpose is contingent upon both philosophical and theoretical perspectives. Arguments on the theoretical foundations of HRD also constitute the core of debates on its scope and boundaries.

We also discussed at length the issues of the boundaries and parameters of HRD where we argued that rather than seeking to stake a claim to particular territory, HRD should be looking to enhance its capability to theorise on the basis of a solid research base. We also addressed the language of HRD as central to advancing theory and research. Such is the significance of the language of HRD that we concluded that the distinction between rhetoric and reality in HRD is a false one. This was a particular theme in a number of chapters. Finally in the theoretical overview we examined the empirical elusive nature and locations of HRD and argued that both of these were intimately bound up with the changing forms and designs of organisations and the need therefore for research in HRD to address these changes.

The concluding section focussed on the holographic metaphor as a novel perspective on HRD. Our thinking in this regard is at an early stage but felt it provided the basis of a paradigm through which HRD can be expressed as a transient phenomenon more difficult to explain than understand. It is also seen as useful in developing new explanatory models of what HRD 'is' 'might be' or 'can be'. Although there is no agreement on what HRD means, it is nonetheless researched, practised and taught.

Human Resource Development as a Factor in the Inevitable Move to Globalization

Gary N. McLean
University of Minnesota

Globalization is the source of considerable discussion, often emotional, throughout the world's businesses and among consumers and citizens. What does this trend mean for HRD? The implications are explored in this opinion piece, based on the author's experiences in thirty countries and reference to selected literature. Concluding that globalization is inevitable, the author makes recommendations for HRD's role, with emphasis on integrity in the process.

Globalization is one of today's business buzzwords. You can hardly read a company vision statement or read an article on international business that does not take for granted the continuing influence of globalization on business.

Yet, while it affects communications, media, technology, trade, finance, economies, and politics, it is not clear just what globalization means or how individuals, organizations, and governments should respond to it.

As I write these lines, I have just returned from a meeting in Saudi Arabia with the executives of a company that has just made the decision that it must become a "global learning organization." It is a company that has been extremely successful in the Middle East, with literally no competition. But the situation is changing, and they are now facing competition from several other countries. In response, they have decided that they must enter into strategic partnerships (with Germany, Austria, Brazil, the United States, Italy, and others). It has decided that it must have an Internet system (it has had none in the past), and it must establish an MIS system that goes beyond the mainframe. It has some experience in working with managers from various Arab countries, but now it must figure out how to work with managers from several countries, as well as markets, consumers, and business people from those countries. It had felt safe in its isolation, but now it realizes that it must become global to survive.

In spite of continuing efforts of sub-systems to resist (note the recent protests at the World Trade Organization (WTO) meeting in Seattle), the ongoing process of globalization continues to shrink the world. Many want to blame corporations for this process, and there have been many publications and research studies exploring how corporations have tried to maintain control over this process (e.g., Marquardt, 1999). This paper argues, however, that neither corporations, world federations (WTO, GATT, World Bank, IMF, UN), or even governments can control the process of globalization. Factors that continue to feed this process, as well as those that impact the process negatively, corporately and individually, are explored, based primarily on the authors' experiences in 30 countries, but also referencing selected literature. Attempts are made to provide a more global definition of Human Resource Development (HRD) than has been used in the past. HRD is explored both as a facilitator of globalization, and as an outcome of the globalization process. Recommendations for future research conclude the paper.

Definitions

What is globalization? Lodge (1995) described it as a process that is both technological and human. Global information and communication foster the linkage of global agents—multinational corporations—while the globalization process is pulled by customer desires and pushed by talented corporate managers with global managing skills.

Friedman (2000) defined globalization as

the inexorable integration of markets, nation-states and technologies to a degree never witnessed before—in a way that is enabling individuals, corporations and nation-states to reach around the world farther, faster, deeper and cheaper than ever before, and in a way that is enabling the world to reach into individuals, corporations and nation-states farther, faster, deeper, cheaper than ever before. (p. 9)

More often, this word simply means doing business abroad. Rhinesmith (1996), however, pointed out that doing business abroad is only the first step instead of the complete story. To be global, a company must also create "a corporate culture and value system that allow it to move its resources anywhere in the world to achieve the..."
greatest competitive advantage. ...Being global requires a mindset and skills that extend far beyond the current scope of most organizations" (p. 5). Rhinesmith emphasized the importance of people whose global mindset and behavioral change are largely what globalization is about. For many, developing the right people is what "thinking globally" really means (Donlon, Darwent, Cabral, & Grub, 1996).

McLean (1995) defined globalization as an evolutionary process that moves from exporting (with low risk and high control) through various stages of increasing risk with greater equity investment to the point at which the organization emerges as a totally interdependent and interrelated organization, in which the concept of "home country" disappears in favor of a truly global organization and perspective. (p. 309)

Friedman (2000) viewed globalization as "not simply a trend or a fad but is, rather, an international system." He described it as the system that has replaced the old Cold War system. The new system, according to Friedman, has "its own rules and logic" that "directly or indirectly influence the politics, environment, geopolitics, and economics of virtually every country in the world" (p. ix).

The Dilemma

The problem is that globalization is a two-edged sword. It can be seen as positive, usually by those who benefit from it. But it is also viewed as negative, often by those who are most affected by it negatively. The situation is well summarized in the web article, "Perspectives" (1998):

Globalization is dynamic and real, causing numerous and often radical changes in all but the most remote places. Depending on your point of view, circumstances, and prospects, the process can be seen as hugely positive—or grossly negative. But the issue of globalization and our collective response to it promises to define who prospers and who will not well into the 21st century. Inasmuch as the pain caused by some aspects of globalization is undeniable, the real issue is whether the negative effects of its sweeping processes can be ameliorated—and the positive effects enhanced. Because, without doubt, the forward march of globalization itself is unstoppable. The negative effects of globalization can be softened only through new and higher levels of international cooperation and consultation, filtered through a new system of moral values that puts human welfare and social justice ahead of the predominantly materialistic paradigm currently in vogue. The urgency for all peoples everywhere to cooperate together...can never be overemphasized.

It is also true, however, that globalization, though now recognized as a system, is not new. As soon as the cave dwellers began to trade, a form of globalization had begun. When the tribes of indigenous people gathered to trade, select mates, decide policies, and hunt together, globalization was taking place. Marco Polo’s travels to China; the voyages of the Vikings to Greenland and Newfoundland; the explorations of the Spanish, Portuguese, Italians, British, and so on, during the Middle Ages; were all forms of globalization. Friedman (2000) concluded that a similar type of globalization as is now occurring occurred during the period of the mid-1800s to the late 1920s, comparing "the volumes of trade and capital flows across borders, relative to GNPs, and the flow of labor across borders, relative to populations" (p. xvi). This era was also marked with several inventions that caused the world to shrink, according to Friedman, from large to medium: the invention of the steamship, the development of the telegraph, the completion of railroad lines across many countries, and the invention of the telephone. He claimed that recent technologies (microchips, satellites, fiber optics, the Internet), however, have caused the world to shrink from "medium to small" (p. xix). The rapidity of change that we are experiencing suggests that this shrinking of the world will continue unabated.

So, while the dilemma created by globalization is not new, its impact, nevertheless, is exacerbated because of its magnitude. While teaching my International HRD course in Saudi Arabia, with students from Saudi Arabia, Jordan, Sudan, the United Kingdom, and the United States, no issue caused more emotion than our discussion of globalization—both in the classroom and in our Internet conversations. And the backlash against globalization took place while class members made cell phone calls to their stockbrokers in London! It is this dilemma that I would now like to explore.

Factors Supporting Globalization

Many in business take for granted that globalization is good for it, for its owners, for its employees, and for the country in which it is operating. Companies decide to go global for many reasons: new markets, economies of scale, production efficiency, access to a world talent pool, technologies, and competitive resources, among others. As Donlon (1997) concluded, "The question is no longer whether one wishes to compete in the worldwide arena, but
how one can do that successfully" (p. 62). So globalization is seen as a way to open new markets, to acquire flexibility that allows business to go where all of the inputs of business costs, including labor, can be minimized, thus increasing productivity. Productivity allows a business to stay in business, at a minimum, and to increase its market share, at the optimum.

Globalization is also a way of viewing the world as a freer, more open society, in which there is free movement of ideas, people, values, and systems across the globe, allowing everyone, ideally, to be able to choose both a personal and a corporate lifestyle.

Friedman (2000) argued that globalization is the product of the democratization of finance, technology and information, but what is driving all of these is the basic human desire for a better life—a life with more freedom to choose how to prosper, what to eat, what to wear, where to live, where to travel, how to work, what to read, what to write, and what to learn. (p. 348).

In fact, as people see what is in globalization for them, they try more and more to become a part of the system. Those who react against globalization tend to be those who are either already outside of the system (the poorest of the poor) or those who are afraid that they cannot stay in the system and who fear exclusion from the benefits of globalization. But those who want economic and political power, and who believe that they will gain it, either through hard work or luck, globalization will continue its onward march.

Factors Inhibiting Globalization

There is no shortage of arguments against globalization (e.g., Mander & Goldsmith, 1996). Almost all of the factors that inhibit globalization or create a backlash against it have to do with exploitation of one sort or another—workers, child labor, women, the environment, cultures, and even, some would argue, economic and government systems.

Exploitation of workers can occur in many ways. With corporations free to move their work freely across national boundaries, corporations can freely use the threat of a move to extort conditions from the workers. They can move work to wherever it is the cheapest, or at least where it has the best payoff for the investment. Thus, workers who have committed many years to a company may find themselves out of work overnight. Workers have to work under whatever conditions management insists, because that is how they are able to work. This leads, of course, to such abuses as sweatshops, employment of "illegal" immigrants, and even child labor.

Child labor becomes a concern in the global market place because the laws of many countries either do not prohibit the employment of children, or the laws that exist are not enforced. Corporations may then choose to move their production from the United States to Pakistan, knowing that the labor costs are low because children are involved in the production. This is not an easy issue, however. When I was working in Bangladesh, I was working with a textile mill when the U.S. Congress passed a bill putting very stringent limitations on the import of cheap garments. The mill was closed the next day. Many of the seamstresses in the mill were young girls 12-14. Yet, they provided the rice for their families for the month based on their monthly income. If the choice is between child labor and starvation, which is the worst evil? And their only option for employment without the textile mills was prostitution. Fortunately, Congress realized almost immediately the impact of its actions, and reinstated old quotas for the world's poorest countries.

Women, as a group, may also be exploited in the movement towards globalization. As I travel the world, I find that much of the world gets its information about the United States from television shows, such as "Baywatch" and "Dallas." They see how women are treated in such settings, and they assume that this is the way all U.S. Americans treat women. Sexual harassment and even sexual assault may well occur in the workplace, as a result, especially if the woman is from the U.S. Women in many countries have no recourse to such abuse. Either laws do not exist, or it is so difficult to prove guilt under the evidentiary rules, that the victim has very little chance of gaining redress. And they can't walk off the job because the job is too important to their economic wellbeing.

Many of the arguments against the North American Free Trade Agreement (NAFTA) and the more recent ones against the WTO have focused on concerns related to the environment. Companies in the U.S. will move their production to countries (like Mexico) that have far fewer environmental controls, so the argument goes. With fewer environmental controls, production costs will be less, thus increasing profits—but destroying the environment in the process and leaving workers "back home" unemployed. This argument extends to destruction of the rain forest, overmining of natural resources (both mineral and animal), and release of toxins and other pollutants into the air.

Cultural arguments are easy to make. English is becoming the language of business throughout the world. If you don't speak English (and quite well), the opportunities open to you are increasingly fewer. I had a conversation with a person from Kyrgyzstan a few days ago, and he talked about how slow the schools were there to give up the teaching of Russian and replacing it with quality instruction in English. This is a common conversation
throughout the world. Where can you go today and not find McDonald's, Kentucky Fried Chicken, Burger King, Pizza Hut? What city doesn't have Chinese food? Even in staid England the types of restaurants have become extremely diverse, and no one thinks that this is exotic any longer. Television from Sydney with the 2000 Olympics gets beamed around the world. Fashion in one country quickly gets picked up in another country. Ask someone about traditional clothing, and, in many places, you will be looked at as if you were from another century. The reality is that television, especially CNN, the Internet (with its pornography and ready access to different political points of view), cell phones, and videos have all shrunk the world tremendously (Cairncross, 1997). We appear to be moving toward at least having people who are bicultural. Tolbert and McLean (1995) suggested that there was some evidence that we were moving toward a culture of business that transcended individual cultures. Friedman (2000) agreed: "Globalization has its own dominant culture, which is why it tends to be homogenizing to a certain degree" (p. 9). Vogel (1992) observed:

...the increased globalization...is making business practices more uniform. The structure and organization of firms, manufacturing technologies, the social organization of production, customer relations, product development, and marketing--are all becoming increasingly similar. (p. 30)

In the process, some people will view unique cultures of countries as being exploited.

There is far from uniform acceptance of the International Monetary Fund's (IMF) impositions on Korea, Thailand, and Indonesia during the economic crisis of 1997. When we were in Korea, there were handpainted signs posted everywhere (in English!) telling the IMF what these particular Korean people thought of the IMF. Unemployment was experienced in all of these countries such as they have never felt before. And much of it was to protect the foreign banks that had foolishly made very high-risk loans to industries in these countries.

Finally, globalization has exploited government systems. Exploited may be a harsh word here, so perhaps saying that they have dramatically changed government systems is a better way of saying it. Think about the collapse of the Berlin Wall, the demise of communism, the futile efforts of the government of the People's Republic of China to keep information out of the hands of students, only to have them do an end-run with the use of the fax machine. Fundamentalist Islamic and Christian politicians want to get rid of the Internet because of what can be found there. This past December, I had an opportunity to meet with the President of Costa Rica. He talked about the impact of the WTO's sanction against Export Processing Zones (to disappear by 2003). Because many poorer countries have attracted companies with the use of "tax holidays" in EPZs, the WTO has held that EPZs are a form of subsidy, which is against WTO policy. As a result, Costa Rica, and many countries like it, are trying to figure out how they will be able to attract businesses to provide employment for the workers who will lose their jobs as the companies who moved into the EPZs now move elsewhere.

But there's no turning back the clock. When I was in Saudi Arabia, I attempted to have a threaded discussion, as I always do in the International HRD course. The firewalls that had been erected prevented us from doing this. But I found that, if I created a listserv and we communicated using the "Reply to All" button, we could accomplish exactly the same outcome. We saw young teenage boys accessing porn sites in "Internet cafes" there, and I heard one parent talk about how easy it was for their sons to get access to adult sites. They would swap disks at breaks between classes.

HRD's Role

We are not going to throw away the Internet, our cell phones, video technologies, satellite transmission, new markets, and new opportunities for development. That's why I have concluded, as indicated in the title of this paper, that the march to globalization is inevitable. In fact, as technology continues to develop at increasing speeds, I expect that we will find the pace of globalization to become even faster. If you accept this premise, then it seems that the question for HRD is not, "How can we stop globalization?" but, rather, "How can we support a globalization process that minimizes exploitation and truly works for the wellbeing of all of humanity?"

Before specifying the role of HRD in this process, a definition of HRD may be helpful. McLean and McLean (2000) explored definitions of HRD from around the world. Several differences were found within countries and between countries. The definitions collected varied according to three dimensions: scope of activities included in the definition, intended audience for development, and the intended beneficiaries of the outcomes of development. Factors influencing the definitions included the country's economy, government and legislative roles, and the influence of other countries through the impact of multinational companies, students studying HRD in other countries, and the predominance of the English literature coming from the United States, the United Kingdom, and, recently, India. The authors provided the following definition as an attempt to begin exploring a global definition:

Human Resource Development is any process or activity that, either initially or over the long-term, has the potential to develop adults' work-based knowledge, expertise, productivity, and satisfaction, whether for
personal or group/team gain, or for the benefit of an organisation, community, nation, or, ultimately, the whole of humanity.

This attempt does not, however, negate the ambiguity associated with trying to create a single definition of HRD, especially across multiple cultures (Mankin, in press; McLean, 2000).

Given this definition, then, HRD can support globalization while working to minimize exploitation by:

1. Working to improve educational systems within countries. Given that unskilled and semi-skilled work will continue not to be rewarded, perhaps even at a level of survival, it becomes essential that countries put their efforts into developing high quality education so that students can be prepared for the skilled jobs that will be in demand in the future. This requires that HRD professionals focus on both the training of teachers and administrators, as well as policy makers at local, state, and national levels, as well as using their organization development skills to ensure an environment in which professional educators can work effectively and students can learn effectively.

2. The rapidity of change in the workplace will not abate. This requires that organizations have effective change management programs in place. This is the purview of HRD professionals in Organization Development and might include team building, continuous quality improvement, conflict management, organizational structures, and the need for organizations to be learning organizations.

3. Training is a key to developing skill sets required as work processes change. Haphazard, unstructured OJT (on-the-job training) will no longer suffice. HRD professionals will increasingly address worker literacy. Developing multiple skills among the workforce will also be increasingly important for HRD.

4. Workers at all levels are interacting more with workers from a wide diversity of countries and cultures. To do this work effectively, they need to understand cross-cultural communications and effective ways to work within a multicultural workforce. HRD can provide such expertise.

5. Countries are increasingly focusing their national policies around the implications of globalization (such as is already done in Thailand and Singapore, and just this year, in Korea) (McLean & McLean, 2000). Experts in HRD can assist governments in developing policies that will be expansive and not create reactive barriers that will ultimately hurt the individual, the company, and the government.

6. A person who is well prepared in HRD should also be an expert in understanding systems and systems theory. Presenting the "big picture" and the influence of one activity on the system and its subsystems should help an organization and a country to maximize the benefits of globalization without paying a price that is prohibitive for it. Friedman (2000) reminded us that the world is no longer divided up into "narrow areas of expertise" as "the boundaries between domestic, international, political and technological affairs are all collapsing" (p. 24).

7. Given HRD's values, and OD's in particular, HRD professionals can serve as a conscience to an organization that does not understand the implications of exploitative actions. This does not insure that such activities will not take place, but it does help to know that someone has the ethical task.

8. A much better research base is needed for HRD professionals so they can better determine their role within a globalizing context. As with many fields, HRD has moved toward greater specialization, calling for "unleashing expertise" (Swanson, 1995), calling for greater specialization rather than enhancing the role of HRD in helping business people, government officials, policy makers, and others, become experts in generalizations. We need to know better how to do this.

9. Work with governments and NGOs (non-governments organizations) to create fail-safe systems, retraining programs, protective policies, and anything else that would protect those most vulnerable to exploitation (Wilson, 1987).

Specifically, at the level of business organizations, in an attempt to describe a process for becoming global, McLean, Tolbert, and Myers (2000) developed a model, Creating a Global Learning Organization (GLO), for how companies can move toward globalization through organization development (OD), the application of Action Research. The model outlined "several tenets within which the globally inclusive GLO change process is conducted." These tenets follow:

- Create change buy-in and enrollment at all levels.
- Provide effective leadership modeling and articulation of global vision. Such leaders must be: 1) active coaches and mentors; 2) visionaries; 3) strong and consistent communicators; 4) consistent role models; 5) delegators; and 6) service-oriented individuals.
- Conduct culture audit, qualitative and quantitative, for designing OD interventions.
- Create ownership of OD change interventions at all levels and functions.
- Provide extensive team-building and empowerment opportunities.
• Focus on personal and organizational work at the cognitive, affective, and behavioral levels.
• Design training and education processes around learner readiness.
• Build accountabilities for globalization into employee and executive performance.
• Link globalization efforts with all other corporate initiatives.
• Provide measurement for progress around OD change efforts.
• Provide challenge and support for all employees.

HRD is in a position to support these steps within businesses moving toward globalization.

In a CEO panel discussion held by Chief Executive Magazine and Deloitte Touche Tohmatsu International, three important strategies were identified to ensure effective global leadership (Donlon, 1997):
• Organizational consistency—adopt the same thinking and procedures on a worldwide basis in order to obtain scales of economy.
• Human resource capability—have the right people in the right place to compete globally
• Customer-oriented organizational flexibility—cut across traditional corporate hierarchies and establish self-managed teams to serve customers’ global requirements.

Most participants agreed that the best long-term approach is to nurture an adaptive transnational culture so managers can understand the global strategic intent of the organization and its products. One way of doing this is to have more foreign executives in top management participating in business decision-making.

Companies face many challenges in achieving their goals. The traditional way of doing business must be challenged. Global managers need to refocus the 1) boundaries of space, time, scope, structure, geography, and function; 2) boundaries of functional, professional, and technical skills relevant for a past age; 3) boundaries of thinking and classification of rational versus intuitive, national versus foreign, we versus they; 4) boundaries of cultural assumptions, values and beliefs about the world, relations with others, and understanding of self (Rhinesmith, 1996). Other challenges to doing business across borders include developing the needed organization culture and managerial talents. “Corporate culture encompasses the values, norms of behaviors, systems, policies, and procedures through which an organization adapts to the complexity of the global arena” (Rhinesmith, 1996, p. 15). Companies need a common vision and value system to guide decentralized management, so that it can be fast and agile in learning and responding to new development around the world.

As to global managerial talents, there is growing consensus as to the value of employees with cross-cultural skills and teamwork among employees with diverse cultural backgrounds and demographic characteristics (Jain & Verma, 1996). Conn and Yip (1997) found that human resource practices are key in enhancing transfer abilities. A 20% increase in the effectiveness of such practices as global compensation systems, managers’ foreign rotation programs, and worldwide training systems may cause a 3-5% increase in effectiveness of critical capabilities transfer.

Human resources are often among the first to contact new foreign partners (Laabs, 1996). They assess the potential work force in a new country; decipher international labor laws; educate the organization on foreign markets, cultures, and ways of doing business; and create higher standards to select, train, and motivate international talents. Human capital is the source of sustainable competitive advantage to an organization, and its quality may be the only thing to distinguish one company from another in terms of globalization (Laabs, 1996). As a shaper of strategy (Torraco & Swanson, 1995) and as a change agent, HRM or HRD is responsible for nurturing a global corporate culture to increase organizational ability to learn through training and organization design.

The adoption of six new mindsets may help HR people meet demands from global organizations (Rhinesmith, 1995). The first mindset involves gathering information on the latest trends in learning, related technology, training methods, team building, and organization development on a global basis to improve the competitive edge. The second mindset requires the ability to identify, analyze, and manage paradoxes and confrontations due to contradictory needs in a complex global world. The third is viewing the organization as a process rather than as a structure to which value is added to drive the business. The fourth mindset requires the ability to work with people of different functional skills, experience levels, and cultural backgrounds. The fifth is the ability to manage continuous change and uncertainty effectively and efficiently. The last mindset is seeking lifelong learning and being able to manage organizational learning and improvement through exploration of new knowledge, new cultural perspectives, and feedback from a wide range of sources. These six mindsets remind HR professionals that there is much to learn before HR can help organizations succeed in globalization.

McLean and Mai (1999) concluded that

Increasing interdependence among different parts of the world means that globalization will become a way of doing business for most companies. Taking a proactive approach toward globalization may provide the competitive advantage needed to be successful. Mapping out a perfect strategy to compete globally may be
important to survive, but generating a global mindset for an organization as a whole is far more powerful. Globalization requires continuous organizational learning to discover resources, opportunities, and technologies; opening one's mind to differences around the world; foreseeing potential challenges; and thinking globally for the impact of strategic decisions. (p. 339)

An editorial in *Business Week* ("How to Keep....," 1992) called for a strong training role:

What is to be done? Invest heavily in worker training and education, the one proven pathway to higher productivity and the production of high-value-added goods and services....Only a well-trained and educated work force can embrace the kinds of total quality management, just-in-time inventory control, computerized manufacturing, teamwork systems, and other techniques so crucial to producing the goods that generate First World-level profits and salaries. (p. 80)

The ultimate goal for a company may be transforming the organization from an ethnocentric model to a geocentric business model (Heenan & Perlmutter, 1979). To achieve that, people's values and expertise in globalization are the key. And human resource professionals must be the catalysts for the process by enhancing the organization's capacity to manage at least three levels of globalization—strategy/structure, corporate culture, and people (Rhinesmith, 1996).

Recommendations for Research

In many respects, HRD has not been particularly active in research related to international contexts. So it is not surprising that little has been researched or written by those traditionally seen as coming from inside the field of HRD. Some of the questions that HRD could address include:

1. How effectively does HRD address issues related to globalization as experienced by individual employees? Businesses? Communities? Government agencies?
2. What are the values of the field of HRD (and its professionals) and how do they support or hinder HRD professionals from helping to overcome the factors of exploitation that are potentially present in globalization?
3. What approaches are most effective for raising literacy, to provide skills to the unskilled, to develop learning skills, and to develop multiple skills?
4. What organization development interventions are most effective in helping business people and government officials to understand and apply systems thinking, to accept diversity, to manage conflict in a positive way, to work together as teams, to support each other in a coaching environment, etc.? In short, how do we empower individuals to benefit from globalization?
5. How can HRD help develop a comfort with ambiguity and willingness to adapt among people who are traditionally rigid?
6. How can technology illiteracy be addressed, especially among people who grew up in an environment where technology was not present and where people may even have a phobia about the technology?
7. Is a homogeneous culture emerging across traditional cultures? If so, among whom? Do those people view this as positive or negative? If negative, what is needed for traditional and emerging cultures to co-exist?
8. Within various cultures and constraints, what can be done to improve education and keep children in school longer and have better outcomes? Few in HRD have focused on school systems. Forming partnerships with those doing traditional educational research could well strengthen both fields.

There are many, many other questions that could be addressed profitably by HRD researchers. What is first needed is for HRD to affirm its commitment to working within a global context and working to create a humane approach to globalization that will open opportunities for those who have traditionally been exploited. With that mindset, we will see much more effort allocated to research related to globalization by HRD researchers.

Conclusion

I can think of no better way to end this paper than to share a story from Friedman (2000):

High-tech entrepreneurs in Silicon Valley always like to compare their supercompetitive business to the story about the lion and the gazelle in the jungle. Every night the lion goes to sleep in the jungle knowing that in the morning, when the sun comes up, if it can't outrun the slowest gazelle, it will go hungry. Every night the gazelle goes to sleep in the jungle knowing that if the morning, when the sun comes up, if it can't outrun the fastest lion, it's going to be somebody's breakfast. But the one thing that the lion and the gazelle both know when they go to sleep is that in the morning, when the sun comes up, they had better start running. (p. 331)

And so it is with globalization.

A Study of Gender Management Preferences as Related to Predicted Organizational Management Paradigms for the Twenty-First Century

Cathy Bolton McCullough
Oklahoma Department of Career & Technology Education

The purpose of this study was to provide insight into gender management preferences as related to the predicted organizational management paradigms for the Twenty-First Century. Access to diverse management preferences (if any), and the manner in which the combination of these diverse preferences is successful, can assist human resource professionals in guiding organizations to adapt management styles and expectations to best meet the predicted Twenty-First Century rules of business.

Keywords: Management Preferences; Management Paradigms; Organizational Development

The field of human resource development focuses on the human components that lead to business success. Rosener (1995) stated that in the future of business, companies will be distinguished from one another by their use of human resources. Rosener further stated that the proper use of human resources is no longer strictly a matter of social justice. It is a bottom line issue.

To successfully meet the predicted 21st Century management paradigms may require human resource professionals to capture the essence of the changing business environment and transition organizations to positively adapt to new management paradigms with minimal chaos. Understanding how men and women prefer to manage, and under what conditions they work well together, has direct implications on how organizations move through a change process. This study addresses the problem: what are the management differences between male and female managers relative to the predicted organizational management paradigms for the 21st Century? While some may make a leap in judgment that the predicted employee management models of the 21st Century workplace are based on traits most commonly seen in women, this study chooses to take a sample from one population (the banking industry) to discover if management preferences differ by gender, and what the results might mean relative to the predicted new rules of management for the 21st Century.

Theoretical Framework

The core elements of an organization's culture could positively be impacted by a greater understanding of gender preferences relative to management style. Beliefs drive behaviors, and behaviors drive results. When interested in results, it is both practical and appropriate to approach culture via its most obvious dimension: how people act (Fisher & Alford, 2000).

As HRD specialists, introducing a workforce to the aspects of gender management preferences that function well together could make a potentially stronger organizational culture: one that thrives on innovation, input, challenge, and quality. Stereotypic beliefs regarding gender management preferences may be diminished, and the strengths of gender management styles might possibly be brought to a higher level of appreciation.

With pressures being placed on organizational leaders of 21st Century organizations to empower employees, to employ a systems thinking perspective in problem-solving, to heighten customer service initiatives, to be more flexible in production and in managing people, and to provide increased training opportunities for employees, this study may shed light on how well the genders might adapt to managing their workforces, and if the characteristics of one or both genders are beneficial for further adaptation and study relevant to successful management practices for 21st Century organizations. To this point, this study provides insight into one component of human resource capability.

Access to diverse management preferences, and the manner in which the combination of these diverse preferences is successful, can assist human resource professionals in guiding organizational change initiatives relative to 21st Century workforce expectations. It may be beneficial to review the predicted organizational

principles of the 21st Century workplace in order to set the stage for understanding why acceptance of new and diverse management preferences might be necessary and worthy of study.

Table 1 synthesizes Broersma's (1995) view of the old and new rules of business. For businesses to adapt to the 'new rules' may well require new forms of management. This insight directly impacts the essence of human resource development. It provides human resource professionals with the incredible challenge of introducing new ways to think strategically and to apply tools and techniques for capturing knowledge for the good of the whole organization. Understanding the management preferences of men and women can provide additional insights into the preferences from both groups that may be most useful for building stronger organizations in the 21st Century.

Khunmik (1995) cited the skills needed to compliment the predicted business management paradigm for the 21st Century business culture. She suggested that the characteristics consist of observation, listening, whimsy, sensitivity, system-driven skills, and peer-to-peer skills. She pointed out that if these characteristics are coupled with what highly productive employees say motivates them (respect for diversity, desire for empowerment, the sharing of goals, professional training, and open communication), along with the ever-present emergence of the new rules of business, we can begin to visualize the components of individuals who motivate others effectively.

According to Champy (1995) reengineering proved to be successful, yet companies still fell far short of their potential. Champy concluded that his revolutionary work omitted an ever-important variable: people. Reengineering ‘work,’ or operational processes, without reengineering ‘people’ (such as management) led to less than satisfactory results.

The greater the depth of understanding and appreciation for varying types of management preferences, the greater degree to which human resource professionals can positively impact productivity, retention, and morale of organizational workforces. This study attempts to understand management preferences of men and women, and desires to draw conclusions applicable to the predicted 21st Century management change initiatives. This is a study to ascertain the business management preferences of two groups of individuals: men and women.

This study addresses the problem: what are the differences between male and female managers relative to the issues facing business in the 21st Century? Because gender differences in management preferences could differ by industry, job, and geographic location, this study focused on one population: managers working in banks located in the state of Oklahoma.
Purpose and Research Question

The purpose of this study was to examine the extent to which males and females differed in their management preferences. The research question for the study was, 'What are the male and female management preferences of bank managers in Oklahoma relative to the anticipated business management principles of the future?' This study provided information on how the preferences differed, if at all, for this population.

Methodology

This was a descriptive study that assessed male and female management preferences and the possible impact of these preferences on management in the workplace of the 21st Century. The study focused on the preferred management preferences of men and women in leadership positions within banks that were members of the Oklahoma Bankers Association.

The independent variable in this research study was the gender of the managers surveyed. Dependent variables were conflict solving, initiative, inquiry, advocacy, decision-making, and critique. Demographic information gathered were gender, age, salary range, type of organization, size of organization, number of individuals supervised, educational background, race, number of years employed with their current organization, and title.

Population and Sample

The population for this study was women and men from banks that were members of the Oklahoma Bankers Association. The job titles for the population included senior vice president, executive vice president, vice president, assistant vice president, vice chair, and/or the chief operating officer of banks in Oklahoma.

To perform a t-test, a minimum response rate of 25-30 was necessary. Therefore, it was decided that a minimum of 125 surveys mailed to each gender was needed to ensure an adequate return rate. In order to draw a sample from this population, men in the study were individually assigned odd numbers and women were individually assigned even numbers. All odd numbers were drawn first (men), then even numbers were drawn (women). A total of 125 men and 125 women were randomly drawn. These individuals became the sample population for this study.

Data Analysis

Blake, Mouton, and Williams' (1981) Managerial Grid (updated by Blake & McCanse in 1991) was adapted and used to assess the management preferences of the sample population. The assessment was mailed to each participant with a cover letter explaining the research study.

The Managerial Grid was chosen for this study because of its relevance to an individual's concern with people and/or production (output) over six dimensions: Conflict solving (determines whether conflict might be destructive or constructive, depending on how individuals respond to the differing points of view), initiative (measures the degree to which individuals might be inclined to take action, shift directions, or stop an action), inquiry (the gaining of facts and data from coworkers), advocacy (measures the degree to which individuals may or may not be willing to take a stand on an issue), decision making (measures the degree to which production and/or people impact the way in which decisions are made), and critique (measures the individual's willingness to step aside and view alternative possibilities to improve performance). The instrument was also deemed to have face validity for this study by David Schrader, Ph.D., Associate Professor of Speech Communication at Oklahoma State University, and Jim Rhea, Ph.D., President of Greenwood Performance Systems. In addition, the Managerial Grid has been used to assess leadership styles in the academic world (Blake, Mouton, & Williams, 1981), the political world (Blake & Mouton, 1985), and the organizational world (Broadwell, 1995). Regarding the use and application of the Managerial Grid, Lester (1991) quoted a colleague as stating, "If all Blake had offered was a framework, that would have been the end of it. But...he devised the first, most complete and most sophisticated learnship package for those who wished to study organizational development" (p. 96). Lester also stated that with the flattening of organizational structures and with the reduced number of middle managers, the application for the Managerial Grid could be endless. The Managerial Grid has also been used as the model for validating other self-report measures of conflict management styles (Van de Vliert & Kabanooff, 1990).

The statistical procedures used to evaluate the responses were t-tests, chi-square and univariate analysis of variance. To assess any significant differences in male and female management preferences, a t-test was conducted.
A t-test was used because this type of statistical analysis shows the differences between two groups (i.e., male and female) on one dependent variable (i.e., management preference). The Managerial Grid employs seven management preferences. Therefore, seven t-tests were performed.

In addition, a chi-square analysis was used to assess differences in frequencies between men’s and women’s preferred management style. This statistical technique was used because it is appropriate for categorical data. Therefore, this analysis was performed on each of the seven management styles (i.e., 1,9; 9,9; etc.) by dimension (i.e., conflict solving, initiative, etc.).

Data Collection

The randomly selected 125 men and 125 women each received a cover letter explaining the survey, along with the Managerial Grid. The subtitles from the questionnaire were removed to avoid bias on the part of the participants. Also included was a Personal Data Sheet (demographic information).

Each questionnaire was coded to allow tracking of responses. Once the deadlines were reached and respondents were tracked, all codes were destroyed to assure confidentiality. The assessment was mailed to each participant with the request that it be completed and returned within five days. Each assessment included a stamped, self-addressed return envelope.

To examine non-respondent bias, six non-respondents (three men and three women) were contacted by phone and asked to complete the questionnaire. The completed surveys of non-respondents were compared to the original respondents’ questionnaires to examine how closely the non-respondents’ management preferences were to the respondents’ preferences.

Limitations

Findings and conclusions in this study were limited by:
1. The population of managers.
2. The survey instrument (i.e., the wording of certain questions on the survey may make it conducive for answers to fall into the 9,9 preference, and it was given as a self-assessment).
3. The time in which the instrument was administered.
4. The methodology employed by this research study.
5. The fact that the survey focused solely on gender (other characteristics, such as race, class, ethnicity, salary, and age may play a role in management preference as well).

Results and Findings

Thirty-one men and 28 women responded to the survey and were used in the analysis. To examine individual male and female differences in management preferences, a chi-square analysis was performed on each of the seven management preferences of the Managerial Grid (i.e., 1,9; 9,9; etc.). Table 2 illustrates the frequency of most preferred managerial preferences for individual male and female respondents. The chi-square for these data was 9.57 (df = 8), p > .05, indicating there was no gender difference for management preference. As can be seen in Table 2, no men were 1,9 (Country Club Management), and only one woman was of this preference. Eighteen men and 23 women were of the 9,9 (Team Management) preference, while four men and four women reported management preferences of 5,5 (Middle of the Road Management). Two men, but no women, reported a 1,1 (Impoverished Management) preference. Three men were of the 9+9 (Paternalistic Management) preference, and no women were of the 9+9 preference. Four men had tying scores for their dominant management preferences (5,5/9,9 and 1,9/9,9).

To assess gender differences in self-reported management preferences, rankings for each dimension were summed for each of the seven management preferences resulting in seven scores per participant. Male and female means were computed from these scores, and seven t-tests, one for each management preference by gender, were performed. No significant gender differences were found with regard to management preferences.

(Bold indicates responses deserving observation for each dimension)

Conclusions and Recommendations

If, as Rosener (1995) stated, businesses of the future will be distinguished from one another by their use of human resources, then the study of this population has proven interesting. It might be intriguing to discuss the possibilities as to why the results of this study revealed no significant gender differences with regard to management preference. Since both genders overwhelmingly reported an overall management preference for the 9,9 style, it might also be interesting to discuss that when a diversion from the 9,9 preference occurred, it occurred for both genders.

Moir and Jessel's (1991) observations that women desire leadership to encompass encouragement, support, trust, delegation, and independence are supported at best in the Managerial Grid's 9,9 (Team Management) preference. Indeed, it was Blake's (personal communication, October 30, 1996) contention that the 9,9 preference should be every manager's goal. Since 9,9 was the overall dominant management preference in this study for
women, these leadership qualities are supported. However, the research results from this study also included men in this observation (since their dominant and most preferred management style was also the 9,9 preference).

Tingley (1993) and Burke and McKenn (1996) commented that both genders appeared lost as to how to treat one another in the workplace. This study exhibited findings contrary to these observations by Tingley and Burke and McKenn because both genders exhibited the same management preference of 9,9. In addition, when the deviations for individual management dimensions occurred, they occurred for both genders. On the contrary, these same deviations may exhibit evidence that indeed the two genders are at a loss on how to treat each other in certain circumstances. Within given dimensions, the deviations themselves may be caused on the part of both genders by feelings of confusion and inadequacy on how to deal with the opposite gender. This study found both genders melding any distinctions they each might have into the 9,9 management preference (Team Management), and defaulting to other management preferences where conflict solving, initiative, and critique were concerned.

Although the overall management preference for both genders was 9,9 (Team Management), there were deviations from the 9,9 preference when viewing the six managerial dimensions individually. A brief assessment of each dimension may help summarize this study’s observations.

Conflict Solving

While the majority of the respondents reported the 9,9 preference for this dimension, many of the respondents diverted to the 5,5 (Middle of the Road Management) preference for this dimension. Because the genders varied in their preferences within this particular dimension, Tannen’s (1990) observations that each gender exhibits different behaviors in conflictual situations may have credence. Other examinations of gender differences in dealing with conflict might also be supported (i.e., Gherardi, 1995; Tingley, 1993; Kipnis & Herron, 1994). In addition, conflict solving may depend on factors other than gender, such as age, hierarchical position, organizational culture, etc. (Clumsim and Mills, 1989). Gayle, Preiss and Allen’s (1994) observations of two conflict management strategies, competition for men and compromise for women, could also shed light on the reasons for some deviation within this dimension.

Initiative

With regard to the dimension of initiative, neither gender overwhelmingly preferred the 9,9 preference, although eight women fell into this preference. The male respondents exhibited a preference within this dimension for the 1,9 (Country Club Management) and the 9+9 (Paternalistic Management) preferences, as did many women. Due to the extremely scattered preferences within this dimension, this finding might exhibit an internal disparity among individuals and/or their organizations. The organizational atmosphere may be amiable and consistent, but relatively status quo.

Inquiry and Critique

These dimensions center heavily on internal communication flow. The similarities between both genders on the dimension of inquiry may challenge some previous thinking on the perceptions that each gender has of the other and how these perceptions negatively dictate levels of inquiry (i.e., Tingley, 1993; Gherardi, 1995).

With regard to critique, both genders diverged from the 9,9 preference to the 5,5 preference. Both genders, then, may believe in the concept of positive reinforcement and may avoid negative feedback. Both genders may tend to approach negative feedback to subordinates in vague terms. Once again, since both genders exhibited a discomfort with direct and open constructive feedback, a variable other than gender may be responsible. This finding may have been expected for women (as seen in the observations of Tannen, 1990). However, the finding that men have been observed in previous studies to exhibit directness (i.e., Tingley, 1993; Gayle, Preiss, & Allen, 1994) is a contradiction to the finding in this study. However, it is also possible that the men in this population are using feedback as a control mechanism (by withholding information), thereby creating a sense of competition in the workplace.

Advocacy

Both genders reported a 9,9 preference for this dimension. Both genders therefore exhibited support for open and honest communication with subordinates regarding organizational commitment and direction. Both genders, then, were assertive and self-assured while also being open to opposing viewpoints. Based on several
observations (i.e., Jamieson, 1995; Moir & Jessel, 1991), we might have expected this of women but not of men. Hite's (1993) notation that men applied the concept of competition versus sharing of information to interpersonal relationships may be challenged by this study. But because the reactions of both genders corresponded within this dimension of bank managers, Nieva and Gutek's (1981) observation that women leaders functioned similarly to male leaders in the same environment may have credence.

**Decision Making**

Both genders were strongly supportive of the 9,9 preference for this dimension. Perhaps the organizational structure of the banks in this study was more conducive to producing a team managed atmosphere. This assumption would support Dodd-McCue and Wright's (1996) findings that the crucial element to loyal and affiliated employees was the attitudinal commitment of the employees (more so than gender). Perhaps decision makers in these banks were organizing the internal operations and structures to heighten the attitudinal commitment of employees (which would include the supervisors in this study). This research also lent support to Holgeson's (1990) study of circular management, which she contends is a female preference. The 9,9 preference emphasizing team management and the affiliation of trust and respect, however, were shown to exist for both genders in this study, carrying Holgeson's notations into another dimension.

The research findings and the observations cited in the literature weave the common thread that men and women operate from different assumptions. It may be that banks, as surveyed in this study, are managing to bring the strengths of both genders together. Thus, men and women in these environments have possibly discovered organizational challenges to be greater than gender challenges.

**Implications for Human Resource Development**

The field of human resource development centers on the human elements that lead to successful business organizations. Studying whether there are differences between the genders in management preferences and understanding those differences could be essential in helping businesses adapt to better meet the predicted 21st Century business paradigm.

In addition, human resource professionals may need to reemphasize the sense of urgency to apply new ideas for management and leadership from a systems thinking perspective. According to Hamel and Prahalad (1994), senior management in today's U.S. businesses spend less than 3% of their energy on building business perspectives for the future. In most cases, Hamel and Prahalad noted that less than 1% of internal energy was spent on future-thinking initiatives, much less on new ways of utilizing human resources.

Boyett (1995) found that 90% of organizations wanted to reduce expenses; less than one-half were successful. He also recognized that more than one-half of these organizations wanted to improve cash flow; less than 25% succeeded. Many of these same companies also sought improvements in customer service, product quality, innovation, and implementation of new technologies; less than 10% succeeded. We perhaps have evidence, then, of that fact that organizations continue to incorporate change strategies, but the implementation of those strategies is difficult to weave into desired organizational results. Understanding component pieces (such as gender potential management preferences) of why these change efforts do not succeed may enlighten human resource specialists as they plan implementation strategies. Perhaps developing a greater understanding of gender management preferences, and the environments in which they compliment and work together synergistically, is a component piece toward positive organizational development for the 21st Century. Looking at gender preferences may allow workforces to begin working together for a common good, versus focusing on the negative aspects of differences and preferences. It may also allow for greater appreciation of diversity from the viewpoint that both genders bring positive influences to workforce management.

The power of research is that it helps us challenge our assumptions. This study sheds light not only on individual differences in management preferences, but also on how an entire population differed from basic gender assumptions with regard to management preferences. This study also reviewed deviations and similarities across six dimensions in an attempt to ascertain gender management preferences under given conditions. Attributing characteristics to one gender without having a clear view of the preferences for each gender on specific management dimensions could be futile. With this and other information gleaned from future studies, the summary of information provided might bring a greater appreciation and acceptance for a diversity of preferences relevant to organizational survival in the 21st Century.

Considering OD Theories from the Theoretical Foundations of HRD and Performance Improvement

Thomas J. Chermack
Texas A&M University

Susan A. Lynham
Texas A&M University

The field of Organization Development (OD) draws from numerous areas to inform its theory base. This article proposes that core OD theory be addressed from the theoretical foundations of Human Resource Development (HRD) and the perspective of performance improvement. When combined, these views provide a powerful and useful means for identifying and selecting theories of OD for performance improvement.

Keywords: Selecting OD theory, Foundations of HRD, performance improvement

Currently, the knowledge and theory from which practitioners and scholars in Organization Development (OD) may draw is immense and multidisciplinary (Rothwell, Sullivan & McLean, 1995; Cummings & Worley, 2001; French & Bell, 1999). Because the theoretical landscape of OD is so vast, choosing OD theories can be an overwhelming task. In addition, there are many approaches and views regarding the nature of OD theory (Rothwell, Sullivan & McLean, 1995; Cummings & Worley, 2001; French & Bell, 1999).

Using the theoretical foundations of Human Resource Development (HRD) would provide Organization Development (OD) professionals with a useful means of examining and selecting sound theory for OD practice. Housed within HRD, (McLagan, 1989) OD, and therefore OD theory, can be considered and informed by the theoretical foundations of HRD. For the purposes of this paper the theoretical foundations of HRD will be taken to include economics, psychology, and systems theory (Holton, 1999, Passmore, 1999, Swanson, 1997, Torocco, 1997). These three theoretical foundations of HRD (Psychology, Economics and Systems theory) emphasize an integrated approach to HRD, with performance improvement as a necessary, but not necessarily sufficient outcome of HRD research and practice (Holton, 1999, Passmore, 1997; Swanson, 1995, 1997, 1998, 1999). This integrated theoretical perspective, when coupled with the emphasis on performance improvement, can provide a useful means for identifying and selecting OD theories.

An emphasis on performance improvement is critical to the credibility and development of the field of OD because, as Swanson (1999) notes, there is increasing pressure in organizations to meet the demand for high performance. This increasing pressure on performance outcomes requires that areas of practice such as HRD and OD develop principles and models based on performance in order to prevent trial-and-error practice (Swanson, 1999).

The alternative to having foundational theories is a discipline in which practitioners are free to include any theories they may choose. This can be problematic when practitioners attempt to replicate results. Micklethwait & Woolridge (1996) describe the current state of random reengineering as an example of how damaging atheoretical ventures can be. Swanson (1998) suggests that to focus on long-term results, develop the ability to replicate them, and acquire a deep understanding of a discipline, requires a logical and coherent set of foundational theories.

Problem Statement and Research Questions

Without foundational theory or theories and a means for selecting them, HRD practitioners are less likely to be able to replicate results, or develop a deep understanding of results achieved through OD interventions (Swanson, 1999). It is the purpose of this paper to provide a heuristic informed by the theoretical foundations of HRD and performance improvement that provides a mechanism for HRD and OD practitioners to select OD theories for improved practice and research. The following questions serve as the basis for the task of this paper:

1) From an HRD theoretical foundations and performance improvement perspective, what would constitute core OD theory?

Copyright © 2001 Thomas J. Chermack and Susan A. Lynham
2) Given 1, what are some theoretically informed OD for performance improvement theories?

Methodology

The methodology used was a conceptual review, analysis, and synthesis of related scholarly literature. This approach is meant to be used to establish the current state of the body of knowledge about OD for performance improvement theory. In considering OD for performance improvement theory from the perspective of the theoretical foundations of HRD and performance improvement, little material was found that had previously considered this perspective.

The purpose of this paper is to provide a useful means for selecting and identifying OD theories for performance improvement. This approach considers OD theory from two perspectives: first, from that of HRD, and second, that of performance improvement. This approach is graphically represented in Figure 1.

Viewing OD theory from the theoretical foundations of HRD, and also from a performance improvement perspective can be shown in a matrix as indicated in Table 1.

In order for this heuristic to be useful, it is necessary to define the cells within the matrix. First, a definition of key terms, namely, the theoretical foundations of HRD (psychology, systems and economic) and the domains of performance (individual, group, process, and organization) are provided. And second, an integrated definition of each of the theoretical foundations of HRD at each domain of performance improvement is considered. For the purposes of this paper, the definitions presented below will be used to guide and inform the process of selecting core theories of OD for performance improvement.
Definition of Key Terms: Theoretical Foundations of HRD

Following are some key definitions pertaining to the matrix in Table 1, namely, HRD, OD, and each of the theoretical foundations of HRD. The theoretical foundations of HRD are defined from three perspectives, namely, a standard definition of each theoretical foundation, a definition of each theoretical foundation from the perspective of OD for performance improvement, and a purposive definition of each of the theoretical foundations.

For the purposes of this paper, HRD and OD are defined as follows:

- **HRD** is a process of developing and/or unleashing human expertise through training and development and organization development for the purpose of improving performance (U of MN, 1994).
- **OD** is a process of implementing systematic change in organizations for the purpose of improving performance (U of MN, 1994).

**Defining Psychological Theory**

- **Standard Definition.** "The scientific study of behavior and the mind" (Writes, 1998, p. 13).
- **Definition of Psychological Theory from the perspective of OD for Performance Improvement.** A description and explanation of behavior and mental processes of humans and their effect on humans and human system performance (Passmore, 1997).
- **Purposive Definition.** The purpose of psychology theory in the context of OD for performance improvement is to provide useful and relevant knowledge and methods for understanding and affecting human behavior and mental processes in human performance systems (Passmore, 1997; Marsick, 1999; Lynham, 2000).

**Defining Economic Theory**

- **Standard definition.** "The science of analysing the process by which markets equilibrate supply and demand and generate prices." (Randall, 1987, p. 92).
- **Definition of Economic Theory from the perspective of OD for Performance Improvement.** A description and explanation of how the allocation of scarce resources among a variety of human wants affects individual, group, process and whole system performance (Randall, 1987; Torroco, 1998).
- **Purposive Definition.** The purpose of Economic theory in the context of OD for performance improvement is to provide useful and relevant knowledge and methods for understanding and managing the effects of the need to allocate scarce resources across individual, group, process and whole system performance (Randall, 1987; Torroco, 1998; Marsick, 1999; Lynham, 2000).

**Defining Systems Theory**

- **Standard Definition.** "A general science of wholeness" (Von Bertalanffy, 1969, p. 37), or, "Knowledge concerned with systems, wholes and organizations" (Ruona, 1998, p. 888).
- **Definition of Systems Theory from the perspective of OD for Performance Improvement.** A general description and explanation of the interrelationships among inputs, processes, outputs and feedback in systems, in wholes and organizations (Von Bertalanffy, 1969; Ruona, 1998).
- **Purposive Definition.** The purpose of systems theory in the context of OD for performance improvement is to provide useful and relevant knowledge and methods for understanding and affecting the interrelationships among inputs, processes, outputs and feedback in performance systems (Von Bertalanffy, 1969; Ruona, 1998; Marsick, 1999; Lynham, 2000).

Definition of Key Terms: Domains of Performance Improvement

Because this paper emphasizes a performance improvement perspective, the choice of related OD theories is further considered from four domains of performance, namely; the individual, group/social, process and organizational domains (Holton, 1999). The domain definitions are followed by a description of the purpose of each domain.

**The Individual Domain of Performance.** "Technologies and processes designed to optimise the performance of the individual within the context of the organization" (Lynham, 2000a, p. 16-2). The purpose of this domain of performance is to separate and identify technologies and processes critical to leveraging individual performance in a performance system.
The Group/Social Domain of Performance. "An internal subsystem for which performance goals have been set that are derived from and contribute to the mission of the overall system" (Holton, 1999, p. 31). The purpose of this domain of performance is to separate and identify internal subsystems with set goals that contribute to the overall mission in a performance system.

The Process Domain of Performance. "A series of steps designed to produce a product or service" (Rummler and Brache, 1995, p. 45). The purpose of this domain of performance is to separate and identify the processes and steps that cut across subsystems and produce products and/or services for identifying leverage areas for performance improvement in a performance whole.

The Organizational Domain of Performance. "The performance systems mission and the goals derived from it, that specify the expected outcomes of the performance system" (Holton, 1999, p. 29). The purpose of this domain of performance is to separate and identify the mission, goals and relationship with the external environment to identify leverage areas for performance improvement of the overall performance system.

Synthesis of Definitions: Theoretical Foundations and Performance Domains

Table 2 contains the integration of the definitions of the theoretical foundations of HRD and the domains of performance improvement. This integration is necessary because it provides the criteria for selecting OD theories.

Application of the Theory Selection Matrix

By combining the theoretical foundations of HRD with the performance domain perspective, a unique, 12-cell matrix of OD theory is provided (See matrix in Table 3). The matrix further sets up criteria for selecting OD theories in each cell. For example, psychological theory at the individual domain must satisfy both, the definition and purpose of the individual performance domain, and the definition and purpose of psychological theory informed from the perspective of HRD and performance improvement.

The OD theories selected below meet the definitional criteria indicated in Table 2. It is not suggested that these theories make up the core of theory in OD, rather that they are an example of the matrix in action. Following Table 3 is a brief discussion of each theory and how it informs OD professionals about practice for improving performance.

</tbody>
</table>
T-C-P Theory

Tichy’s T-C-P Theory offers a 9-cell matrix for ensuring alignment among organizational components. The focus of T-C-P theory is one of evaluating and integrating the organization from three internal perspectives: technical, cultural, and political. The three internal perspectives are aligned and then evaluated against the economic, political, and cultural forces in the external environment. Tichy’s T-C-P theory informs HRD professionals about the nature
of alignment in internal processes and how given "steps" in a process are linked not only to each other, but also to the internal economic, political, and cultural forces.

Bridges Transition Theory

Bridges (1980) defines three zones of transition, namely, ending, neutral and new beginning. According to Bridges, each phase must be completed before and individual can successfully begin the next. Bridges theory informs HRD professionals about how individuals cope with change. Understanding how individuals cope with change may explain why, after change interventions, individual performance often decreases before it improves (Cummings & Worley, 2001).

<table>
<thead>
<tr>
<th>PERFORMANCE DOMAINS</th>
<th>FOUNDATIONAL THEORIES</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Psychological Theory</td>
</tr>
</tbody>
</table>

Human Capital Theory

Becker (1993) suggests that employee education, training and health care, among other expenditures, be considered investments. De Geus (1997) states that “the ability to learn faster than your competitors may be the only competitive advantage” (p. 21). Human Capital Theory informs OD professionals that economic organizational performance involves much more than sound processes and goals. Organizational performance requires that organization members are seen as a major source of potential competitive advantage and recognized as the foundation of the business itself (De Geus, 1995).

Swanson’s P-L-S Theory

Swanson’s P-L-S Evaluation system focuses on three domains of evaluation; performance, learning and satisfaction and focuses on the impact of the individual on the organization (1996). Swanson’s P-L-S system measures changes in individual performance first in terms of economic impact, followed by changes in knowledge and expertise, and finally satisfaction measurements are considered. The P-L-S system informs OD practitioners that there are many ways to measure individual improvement. The focus on the economic performance contributions of the individual is presented as a necessary, but not necessarily sufficient outcome.

General System Theory

Because General System Theory is defined as a “a general science of wholeness” (Von Bertalanffy, 1969, p. 37), it can be used to explain the organizational level of inputs, processes, outputs and feedback with the external environment. Often thought of as a unifying theory (Jacobs, 1989), general system theory informs OD professionals about the nature of the relationship between the organization and external political, cultural, economic and climate changes. Insights gained from the perspective on general system theory can be extended to all four domains of performance improvement (Rummler & Brache, 1995).

Performance Management Theory

Performance management is an integrated process of defining, assessing, and reinforcing employee work behaviors and outcomes as they pertain to the organization (Cummings & Worley, 2001). “Organizations with a well-developed performance management process tend to outperform organizations without this element of organization design” (Cummings & Worley, 2001, p. 371). Divided into three pieces, goal setting, performance appraisal, and reward systems, performance management specifies, assesses, and provides reinforcement for the desired outcomes.
Performance management theory informs OD practitioners about the impact of individual work behaviors and practices on the strategic objectives of the organization.

**Johari Theory of Communication**

Luft (1961) developed a 4-cell matrix to explain communication with hidden levels within groups. Cell one is comprised of issues that are perceived by both the individual and others, cell two describes issues that the individual is aware of, but conceals from others, cell three contains personal issues that are unknown to the individual, but are communicated clearly to the others, and finally, cell four, which consists of issues that are hidden from both the individual and others. An understanding of the Johari theory can inform OD professionals about the dynamics of group communication as it is influenced by the communication abilities and methods of the individual.

**Group Process Consultation Theory**

Schein defines group process consultation as “a set of activities on the part of the consultant that helps the client to perceive, understand, and act upon the process events that occur in the client’s environment” (1987, p. 34). Group process consultation deals primarily with five processes; communications, group member roles, group problem-solving and decision-making, the development and growth of group norms, and the use of leadership (Cummings and Worley, 2001). Group process consultation is a general model for helping group relations and is systemic in nature as it depicts the group as a pivotal unit within the organizational whole (Schrage, 1990).

**Team Building**

Team building refers to a range of activities that help groups to improve how they accomplish tasks and make decisions. Team building helps problem-solving groups maximize the use of resources and contributions that eventually impact the economic performance of the organization (Cummings & Worley, 2001). According to French & Bell, team building can focus on task accomplishment, relationships, processes, role analysis, and role negotiation (1999). Team building activities attempt to improve and increase the effectiveness of teams within the organization, which can translate directly to the economic benefit of the whole (Schrage, 1990).

**Process Improvement and Redesign**

“Process is the least understood and least managed domain of performance” (Rummler & Brache, 1995, p. 21). Process improvement and redesign involves four phases, namely, performance improvement planning, project definition, process analysis and design, and implementation. Failure to improve and manage process performance is failure to improve organizational economic performance (Rummler & Brache, 1995). An understanding of process improvement and redesign allows OD professionals to affect the way work is accomplished in an organization.

**Intergroup Relations Theory**

There are several strategies for reducing intergroup conflict. Intergroup team building, third party peace-making interventions, organization mirror interventions, and partnering are all common methods for alleviating intergroup tension (French & Bell, 1999). Understanding the dynamics of intergroup conflict enables OD professionals to deal effectively with group system conflict. As organizations shift toward heavier use of the group as the primary unit for conducting problem solving, the process of intergroup management will become critical (Rummler & Brache, 1995).

**Significance of the Study**

There are a number of potential benefits in considering the identification and selection of OD theories from the theoretical foundations of HRD and performance improvement. First, this integrated HRD/PI perspective provides a means for selecting OD theories for improved practice that are consistent with the theoretical foundations of HRD. Second, the theoretical foundations of HRD provide a theoretical anchor for selecting core theories. This integrated HRD/PI view can be used to provide HRD practitioners and scholars with a theoretically informed means for identifying and selecting theories of OD for performance improvement. Finally, the theoretical alignment of OD theory to that of the theoretical foundations of HRD can assist in the development and credibility of both HRD research and practice.

**Contributions to New Knowledge in HRD**

This paper provides a view of theory in OD that is consistent with the theoretical foundations of HRD. The view of OD from the theoretical foundations of HRD and performance improvement has produced a frame for selecting OD theories that have a logical theoretical base.
In the spirit of value-added OD, practitioners need to have a theoretically informed means for selecting OD theories for improved practice. The Theory Selection Matrix presented in this paper provides such an informed framework.

Conclusions and Recommendations for Further Consideration

Currently, theory in OD stretches across multiple disciplines. The variety of theories for OD professionals to choose from is overwhelming and without logical theoretical foundations, OD practitioners will not be able to replicate results or develop a deeper understanding of the discipline (Swanson, 1999). This paper has highlighted OD for performance improvement theories from the theoretical foundations of HRD and performance improvement thereby providing a view of OD that is consistent with that of HRD. A useful next step in the application of the Theory Selection Matrix would be to determine what makes for good OD for performance theory.

Organization Development: An Examination of Definitions and Dependent Variables

T. Marshall Egan
University of Minnesota

Organization Development (OD) has been engaging in an ongoing search for further purpose and definition. Several authors have forwarded definitions of OD and the associated outcomes or dependent variables. Although OD definitions have been discussed in previous research, few authors have attempted to analyze the definitions in terms of outcomes. This article explores twenty-seven definitions of OD published from 1969 to the present. Associated dependent variables are examined.

Keywords: Organization Development, Performance Improvement, Action Research

Organization development (OD) has been engaging in a search for purpose and definition. Many OD scholars and practitioners have developed definitions of OD and countless more have used common definitions to explain theories, rationale and approaches. According to Burke (1994), the term organization development was first coined in 1969. Several definitions can be found from that year (Beckhard, 1969; Bennis, 1969; Blake & Mouton, 1969; Golembiewski, 1969; Lippit, 1969). Each word organization and development have been analyzed and reflected upon by OD scholars (Golembiewski, 1992a, 1992b). There have been many statements in the OD literature to suggest that the field is uncertain of its direction and identity (Church, Wacławski & Seigel, 1996), including the assertion that "nobody agrees exactly what doing OD means" (Church et al. 1996).

The on-going exploration of the term organization development is important to any scholar, practitioner or participant interested in the field (Cummings & Worley, 1997). Historically, OD authors have provided commentary on the everyday workplace environment as well as the theoretical and practitioner based concepts that support the field. This article begins with an introduction of twenty-seven OD definitions and their related dependent variables and summarizes the outcomes OD aims to achieve.

Purpose of the Paper

The purpose of this article is to investigate definitions of organization development. The focus of the article is on two questions: 1) What are the ways in which organization development is defined? 2) What are the characteristics and relationships between dependent variables or outcomes that are identified in organization development definitions? Definitions found in published works from 1969 to the present will be provided and discussed. The dependent variables for each definition will be identified and explored.

History and Challenges in Defining OD

In reflecting on the history of OD, Hornstein (1997) indicated that there is some confusion regarding the actual genesis of OD. Most authors have associated the publications in Addison-Wesley's OD series featuring the work of Beckhard (1969), Bennis (1969) and Schein (1969) as the starting point for the literature specifically directed at the theory and practice of OD (French & Bell, 1999; Cummings & Worley, 1997). There is, however, much discussion regarding OD's beginnings.

It would be audacious to insist that this publication (Addison-Wesley's OD series, 1969) marks the field's official beginning. Perhaps its inception actually occurred at the OD Network's first meeting. Or, maybe OD really got started during the summer of 1967... when the National Training Laboratories (NTL) first offered the Program for Specialists in Organization Development (PSOD). (Hornstein, 1997, p. 43)

There were also developments that proceeded the writings and practice of the 1960s including the work of: McGregor, Shepard, Blake and Mouton, London's work at Tavistock, and Trist and Bamforth's work in weaving sheds and coal mines (French & Bell, 1999). The "Classical School of Thought" emerged in the late Nineteenth Century (Rothwell, Sullivan, & McLean, 1995). These approaches were developed out of Social Darwinism and
the work of Frederick Taylor, Frank and Lillian Gilbreth and Henry L. Gantt (Rothwell et al. 1995). Other roots of OD include economics and human capital theory, participatory management theory, psychology, psychotherapy, social psychology and survey methods.

The most frequently read texts on OD examine the recorded past and the definitions that have been forwarded throughout the years. The most commonly cited first definitions of OD appear to be from the aforementioned Addison-Wesley OD series. These definitions assist us in understanding our past and the identity of OD and its practitioners. Further examination may also help OD practitioners and scholars to chart our futures.

Some OD practitioners and scholars have not framed their practices or research using OD language. Discussions regarding consultation, the practitioner and organizational learning have appeared in the Addison-Wesley OD Series and in other OD related publications without specific mention of the term organization development. Perhaps Argyris and Schön (1996) represent one of the best current examples. Discussions regarding the "learning organization" are widespread and certainly have been influenced, if not entirely instigated by, the work of Argyris and Schön. Despite both authors having been documented as major participants in influencing the field of OD (French & Bell, 1999) and that their work was published as a continuation of the founding Addison-Wesley OD Series, neither the first or second versions of Organizational Learning refers to OD nor does the word organization development appear in the index of either of their groundbreaking books.

Organization development courses and commonly utilized textbooks (Cummings & Worley, 1993) use the term organizational learning, but a member of an organization investing in the "organizational learning" framework may be unlikely to make a connection to the term organization development. Although the disconnectedness in terms may have little impact on practice, it undoubtedly has an impact on the identity of the field of OD. Persons unaware of the connections between OD and organizational learning are unable to access the knowledge developed through decades of practice, research and theory building. This overlap of efforts using different terms may contribute to the blurring of focus on arguably the most important factor in further establishing OD, which centers on identification of outcomes or dependent variables.

Taking a closer look at OD definitions reveals that the aims of OD practitioners vary (Cummings & Worley, 1997). The variation is to be expected based on the OD practitioner's biases, education, exposure to theory and experiences. Although some would take the position that an exploration of OD definitions and their dependent variables is futile based on the relative youth of the field or the individualized perspective of each practitioner, it seems plausible that there would exist themes in the experiences, practices, processes, definitions and outcomes of OD practitioners. By examining previously forwarded definitions of OD, scholars and practitioners may be better able to gauge the relative awareness, similarities and differences in the field.

Some may argue that the signature of OD practitioners, as compared to other internal and external organizational consultants, is the emphasis on values. OD is a field that is based on values and ethics (Rothwell et al. 1995). It is clear that those who have developed their approaches to OD from a values perspective are also focused on general or specific outcomes associated with their contributions to clients, organizations and society. Therefore, outcomes are important to the focus of OD and its practitioners. A significant challenge to exploring the dependent variables that define OD and influence the work of OD practitioners is the naturalistic environment in which much of OD work takes place. It is clear that an examination of the dependent variables in OD cannot be so rigid as to attempt to explore an artificially controlled practice.

Examining Definitions of OD

Authors have commented on the difficulty of assembling OD literature (Pate 1976; Varney, 1990). For the purposes of this study, a review was conducted using several periodical search engines at a major university in the United States that identified journals and books with the title or specific reference to the term organization development. In an effort to extend the possibility for a broad review of the literature, the assembly of the following definitions involved consultation with six leaders in organization development. Each of the six leaders consulted has published and presented widely, led academic and professional OD organizations, and are active OD consultants in the United States and internationally. OD leaders were asked to review a list of definitions that highlighted dependent variables. Each was asked to comment on the thoroughness of the list and to recommend additions or changes. A limitation to the study is that the identified definitions were found almost exclusively in publications from the United States. The following twenty-seven definitions are a product of this review of the academic literature and expert review. Definitions developed by OD organizations or associations have not been included.

| Burke & Hornstein | 1972 | Organization development is a process of planned change—change of an organization's culture from one which avoids an examination of social process (especially decision making, planning, and communication) to one which institutionalizes and legitimizes this examination. | Institutionalization and legitimizing of the examination of social process |
| Hall | 1977 | Organizational development refers to a long-range effort to improve an organization's problem-solving capabilities and its ability to cope with changes in its external environment with the help of external or internal behavior-scientist consultants or change agents. | Improve problem-solving capabilities and ability to cope with changes in its external environment |
| French & Bell | 1978 | Organization development is a long-range effort to improve an organization's problem-solving and renewal processes, particularly through a more effective and collaborative management of organization culture—with special emphasis on the culture of formal work teams—with the assistance of a change agent, or catalyst, and the use of the theory and technology of applied behavioral science, including action research. | Improve problem-solving and renewal processes |
| Beer | 1980 | Organization development is a system-wide process of data collection, diagnosis, action, planning, intervention, and evaluation aimed at (1) enhancing congruence between organizational structure, process, strategy, people, and culture; (2) developing new and creative organizational solutions; and (3) developing the organization's renewing capacity. It occurs through collaboration of organizational members working with a change agent using behavioral science theory, research, and technology. | Enhancing congruence; developing creative organizational solutions and developing renewing capacity |
| Beer | 1980 | Organizational development is a process for diagnosing organizational problems by looking for incongruencies between environment, structures, processes and people. | Problem diagnosis |
| Burke | 1982 | Organization development is a planned process of change in an organization's culture through the utilization of behavioral science technology, research, and theory. | Cultural change |
| Davis | 1983 | Organization development consists of a series of theory based workshops, techniques, programs, systematic approaches and individual consulting interventions designed to assist people in organizations in their day-to-day organizational life and the complex processes this involves. All of this is backed up with beliefs, biases, and values held by the organization development practitioner. | Assist people in organizations |
| Nielsen | 1984 | Organization Development is the attempt to influence the members of an organization to expand their candidness with each other about their views of the organization and their experience in it, and to take greater responsibility for their own actions as organization members. The assumption behind OD is that when people pursue both of these objectives simultaneously, they are likely to discover new ways of working together that they experience as more effective for achieving their own and their shared (organizational) goals. And that when this does not happen, such activity helps them to understand why and to make meaningful choices about what to do in light of this understanding. | Expand candidness; increase accountability; achieve individual and organizational goals |
| Warrick | 1984 | Organization development is a planned, long-range systems and primarily behavioral science strategy for understanding, developing, and changing organizations to improve their present and future effectiveness and health. | Improve effectiveness and health |

Exploring The Dependent Variables of OD

In an effort to explore the dependent variables identified in the definitions presented above, seven experienced OD practitioners (no overlap of membership from the aforementioned expert review panel), with an average of over ten years of experience and all with advanced academic degrees, were asked to review the definitions and the dependent variables. The group of OD experts consisted of three men and four women, six European-American and one African-American. All were born in the United States. Participants were invited to come to a meeting room in a suburban office building in the Midwestern United States to meet for a two-hour focus group associated with OD.

Because many of the OD definitions have more than one dependent variable listed, each dependent variable represented from the 27 identified definitions was included. A single card was created for each of 60 dependent variables. Utilizing the process for creating affinity diagrams (Scholtes, Joiner, & Streibel, 1996), instructions given to participants were to examine the cards. The 60 cards were placed face up and in random order on a large table. Participants were gathered in front of the table on which the cards were positioned side-by-side so that participants could read the writing on each. The group of experts was given instructions from a single facilitator to feel free to move each the 60 cards into any formation or categories that seemed appropriate. Participants were asked not to talk during the activity until the sorting process had reached stagnation. There were no questions posed from participants. During the process, the facilitator did not intervene or talk to any of the participants.

The OD experts reviewed and sorted the 60 cards on which were listed the dependent variables from the definitions of OD. There was no time limit. After sorting the cards for approximately fifteen minutes, the OD experts stopped the sorting process. Without intervention from the facilitator, participants discussed the categories that were created and finalized their organization of the categories of dependent variables. Without prompting from the facilitator, participants asked for additional cards and decided to name each of the ten columns that were constructed as part of the card sort activity. Participants reached consensus in describing the categories as representative of ten key dependent variables in OD. The ten items included the following:

- Advance Organizational Renewal
- Engage Organization Culture Change
- Enhance Profitability and Competitiveness
- Ensure Health and Well-being of Organizations and Employees
- Facilitate Learning and Development
- Improve Problem Solving
- Increase Effectiveness
- Initiate and/or Manage Change
- Strengthen System and Process Improvement
- Support Adaptation to Change

According to the OD experts, examination of the results of this exercise provide an opportunity to consider some key features of existing dependent variables in organization development.

Implications of the Ten Dependent Variable Categories

The ten dependent variables represent categories from the definitions that have contributed to the shaping of OD as a field of study and practice. Regardless of the method of inquiry, categories play an important role in the understanding of a phenomenon (Dey, 1999). For positivist or quantitative researchers, the units and categories make up the core elements of a theory (Dubin, 1976). Categories are important features which enhance our understanding and abilities to communicate about phenomena whether they provide structure for those undertaking biology, rocket science or cooking in the kitchen. Categories matter because they help us to organize, compare and interpret physical matter and human interaction. According to Medin and Barsalou (1987), categories serve four key purposes: classification, inference and prediction, generation, and productivity. To suggest that categories provide an opportunity for understanding does not mean that categories are static or that their construction is the only or best way to order the subject at hand. Instead, categories represent an association of distinctive features whose properties can be attributed through analysis. The dependent variable categories created by the research participants provide an opportunity to examine the aims of OD within a new framework.
Conclusion

OD is not the only field to have had discussions about definitions and identity. The field of Human Resource Development (HRD), a relative to OD, has been having periodic discussions regarding identity and definition as well (McLean, 2000). Discussions in HRD centered on the identification of relevant theories and related fields, the importance of performance, the impact of particular HRD orientations to practice, and the dilemmas created through an examination of the global context. Many of these conversations are similar to those occurring in the OD literature and among practitioners. It seems that many OD theorists who have discussed the evolution of organizations have properly identified the importance of ongoing clarification of mission, purpose and vision, which often relate to intended outcomes or dependent variables, such as those listed above. Efforts to further investigate and extend understanding regarding the definition and the dependent variables associated with OD are needed. The future success of OD and the focus of associated practice and literature are dependent upon continuing dialogue and investigation into practices and outcomes.

Career Goals of Non-Managerial Women: An Adaptive Approach

Linda M. Hite
Kimberly S. McDonald
Indiana University-Purdue University Fort Wayne

While the past twenty years has seen a significant increase in research on managerial women, little has been written on non-managerial women's career development. This exploratory study investigated non-managerial women's career plans. Four themes emerged from the data, suggesting these women take an adaptive approach regarding their careers.

Keywords: Women, Careers, Non-managerial

Problem Statement

As women's participation in the workforce has increased, so has the research on women and work. In the past twenty years there has been a significant body of literature focusing on women's career development issues. Much of the research has attempted to help us understand why women still are underrepresented in many prestigious occupations, why women still are segregated into certain jobs, and why women still find it difficult to reach the upper-echelons in organizations. Some of this work has focused on the need for alternative career development theories/models to explain women's career progress in organizations (Caffarella & Olson, 1993; Gallos, 1989; Larwood & Gutek, 1987; Schreiber, 1998). Others have focused on glass ceiling issues and what has deterred and facilitated women's advancement in organizations (Bierema, 1996; Caffarella, Clark, & Ingram, 1997; Ohlott, Ruderman & McCauley, 1994; Ragins, Townsend, & Mattis, 1998; Wentling, 1996). Additional research has emphasized women's career goals and aspirations (Arnold, 1993; Eccles, 1994; Erwin & Stewart, 1997; Harmon, 1989; Murrell, Frieze, & Frost, 1991; Nauta, Epperson, & Kahn, 1998).

These studies suggest that the human resource development (HRD) function can play an important role in helping women develop their careers (Bierema, 1996; McDonald & Hite, 1998; Wentling, 1996). However, the majority of gender-based research in HRD has concentrated on women in professional occupations (particularly law and medicine) or in managerial jobs (those in positions of authority over programs or people). Additionally, most of the literature regarding women's goals and career aspirations has focused on high school and college students. Very little empirical research has been done on non-managerial women's career aspirations and plans. These women are not in positions of authority. Instead, they are on the front lines of organizations, serving customers, making sales or working in clerical capacities. They have been ignored in most HRD initiatives and by most research endeavors. We know very little about the goals and interests of this group of working women, inappropriately assuming that by focusing on women in management, we have adequately explored women's roles in the workplace. This exploratory study was designed to help bridge that gap in information by examining non-managerial women's perspectives of their careers and the factors that have facilitated and hindered their career plans. Are these women happy with their work roles or do they desire more? Are they on the front lines by choice or due to lack of opportunity? The dearth of research on this population promoted the use of existing frameworks that address gender, studies on managerial women and on the career aspirations of young women, as a starting point.

Theoretical Framework

An examination of research on women's career aspirations and choices reveals a few continuing themes and some unanswered questions. Looking at careers from a global perspective, advocates of career models for women suggest that women's careers cannot be understood, developed, and/or evaluated using many of the traditional career development models/theories, because the focus is on the male experience. Gallos (1989) wrote: "Women's distinctive developmental voice and needs point to fundamentally different career perspectives, choices, priorities, and patterns for women that need to be understood and appreciated. . ." (p. 127)
Many studies highlight life and career considerations. For example, when female students discuss occupational and career choices, they consider a variety of issues. Eccles (1994) wrote: "... Occupational choices are not made in isolation of other life choices, such as the decision to marry and have children, and the decision to balance one's occupational behaviors with one's other life roles..." (p. 605). Perhaps the most pervasive theme in the literature is that family issues such as marriage and children do influence women's goal aspirations and attainment (Arnold, 1993; Erwin & Stewart, 1997; MacKinnon-Slaney, Barber, & Slaney, 1988; Murrell, et al., 1991). For example, Arnold (1993) in a longitudinal study of high school valedictorians, found that the women in her study anticipated interrupting their careers to raise children. She concluded that:

Women perceive, realistically, that high level careers require great commitment. Prestigious male-dominated occupations demand continuous employment and long hours of work. Some women respond to these perceived future demands by lowering their career goals. Other forge ahead and hope that somehow they can juggle valued roles (sic) (p. 175).

In addition, some studies focus on differences in aspirations by gender, by race, or by type of career goal. For example, women appear to have lower career aspirations than men (Bayley, 1992; Arnold, 1993). Arnold (1993) illustrated one possible reason for this again:

Unlike their male peers, who progressively narrowed their career choices during college, the study women pursued a "contingency" approach, with plans remaining open and shifting in the face of expected juggling of work, marriage, parenting, leisure, and community roles. The pressure to remain open to future marriage and family needs that were unknown and uncontrollable during college hindered career planning for many of the women (p. 170).

Further, Bayley (1992) noted that white females' career aspirations were lower than those of black females. Finally, Murrell, et al. (1991) found that female college students indicating a desire to work in male-dominated occupations, had higher career and education aspirations than women who planned to work in female-dominated occupations.

The majority of the studies cited above focused on the career aspirations of high school and college students. One notable exception was Wentling's (1996) research on the career aspirations of women in middle management. She concluded that many in her sample lacked a career strategy and some "had not realized they wanted a career or that it was even a possibility" (p. 265).

While recognizing that not all women have the same aspirations or interests, studies with managerial women may offer ideas to consider when exploring the career goals of non-managerial women. For example, the research on women managers informs us of the factors most likely to assist women in their career development and advancement within organizations. Managerial women frequently cite the importance of "stretch assignments" and taking on risky tasks as being important to their advancement (Catalyst, 1996; Ragins, Townsend, & Mattis, 1998; Wentling, 1996). Demonstrating competence and performing well on the job (Ragins et al, 1998; Ruderman, Ohlott, & Kramer, 1995; Wentling, 1996), being assertive and persistent (McDonald & Hite, 1996), and having good mentors (Hansman, 1998; Ragins, et al, 1998; Wentling, 1996) are often mentioned as additional important factors influencing women's career progress.

Another area of research that may be useful when reviewing the career aspirations of non-managerial women is the work on barriers to career development for female managers. Women managers perceive that discrimination (Cafarella, et al., 1997; Ragins, et al., 1998; Ruderman et al., 1995; Wentling, 1996), unsupportive bosses (Wentling, 1996), and a lack of understanding of the political climate of an organization (Ragins, et al., 1998; Wentling, 1996) hinder their career advancement and opportunities. Other deterrents to women's advancement include lack of general management and line experience (Ragins, et al., 1998), less exposure to assignments involving risk and visibility (Ohlott, et al., 1994), and difficulty adapting to the corporate culture (Bierema, 1996). While the literature to date provides HRD practitioners with some knowledge and recommendations regarding the career aspirations and strategies of women managers, little research has examined the career choices and plans of non-managerial women. What factors affect non-managerial women's career choices? Do the same facilitators and deterrents cited by the literature on managerial women affect the careers of their non-managerial cohorts? This study begins to investigate these issues.

Research Questions

This study explored non-managerial women's career aspirations and planning. The questions posed were focused on aspirations and actual career experiences, with the goal of learning more about what this group of women wanted and what they received from their work lives. The term "career" used in the questions was defined to the participants as referring to paid or unpaid work. The following questions were addressed:
What were some of your early career plans?
How have these plans changed over the years?
How does your current job fit your career plans?
What has helped you fulfill these career plans?
What has hindered you from fulfilling these career plans?
How has this organization helped your career plans?

Methodology

The subjects for this study were twenty-six (26) women employed in non-managerial positions. Four focus group discussions were conducted to gather data related to participants’ career goals and development. Focus group methodology is recommended when the study is exploratory and when “factors related to complex behavior or motivation” are being examined (Krueger, 1994, pp. 44-45). We wanted to obtain data that “emerges from the group” (Krueger, 1994, p. 45). Focus group discussions provide a forum where subjects can interact with one another in a non-threatening manner. Erwin & Stewart (1997) suggested that “diverse ideas may be evoked, inhibitions released, new questions stimulated, and greater diversity of opinions revealed with greater spontaneity in focus groups” (p. 211).

The focus group participants represented a convenience sample. Human resource representatives from two organizations were contacted to determine their interest in this project. These individuals solicited volunteers to participate in this project, with the only parameter being that the potential participants occupy front line positions, as opposed to having responsibility for managing people. Three focus groups involved women employed in a large utility company, the fourth one consisted of females working in a large manufacturing company. The focus groups had 6 or 7 participants each.

Each focus group began with a brief overview of the purpose of the discussion and a definition of career plans. The six major questions listed above were presented to each group to answer. Each focus group discussion was 1-12 hours in length. Company representatives indicated we needed to abide by these time constraints, which may be a limitation of the study. However, there was sufficient time to obtain responses from all participants regarding each question and we began to hear redundancies in responses by the end of each focus group discussion. One researcher served as moderator, while the other took notes. Throughout the discussion, both the moderator and note taker verified participant responses through the use of clarifying questions, additional probes and paraphrasing responses. Immediately following each discussion, a debriefing between the moderator and note-taker took place to discuss “first impressions” and compare and “contrast findings from earlier focus groups” (Krueger, 1994, p. 128). The discussions were tape recorded for review and preparation of abridged transcriptions. Each researcher analyzed the session notes and transcriptions independently to determine major themes emerging from the four groups. The researchers then met to compare findings and to reach agreement on the major themes. Additionally, the abridged transcripts were read and analyzed by an independent researcher, not associated with the project, to control for potential bias in interpretation (Krueger, 1994; Marshall & Rossman, 1989).

Demographics

The twenty-six participants in this study represented a range of ages and experience within their respective companies. Seven of the women reported to be in the 41-50 year age range; six were 34-40; five were 26-33; and four each were at the highest and lowest ranges, 18-25 and 51-60. Regarding years with the organization, half of the participants (13) noted 1-10 years with their companies; eight indicated 21 years or more; five said 11-20 years. Educational levels among the participants varied as well, with nine reporting high school diploma or GED as their highest educational credential; eleven noting post high school work or associate degrees; and six indicating bachelor’s degree completion.

The nature of this sample (non-managerial women) also drew a wide range of position titles and responsibilities. Job titles included sales productivity leader, customer account specialist, lead graphics dispatch clerk, executive administrative assistant, accounting clerk, and equipment processor.

The variety of chronological and service years added strength to the study, although the numbers were small. Additionally, varied positions offered another level of complexity to the sample that enriched the data while illuminating the variety of experiences among participants.
Results

Based on an analysis of the six questions asked of focus group participants, four themes emerged: adaptive goals, family influence, security needs, and organizational support.

Adaptive Goals

The overall theme of adaptation is evident throughout these results. The data reveal a pattern of adjusting goals to meet life circumstances. This tendency shows a pragmatic focus, solidly based in the reality of the current situation, as opposed to setting long term plans. As one woman observed, “I work from a practical standpoint. I want to get the maximum out of what I’ve got the training for....” The first indication of this perspective was when in response to the first question about early career plans, many of the participants began by describing how they had changed their goals over the years, in response to the context of their lives. One woman said her goals had changed to adjust for “real life.” Another agreed, stating, “Life doesn’t always turn out the way you planned.” The term “evolved” was used by several of the participants to describe how their career goals had altered over time. Yet as they went on to describe the cycles of events that led to their revised goals, the processes sounded much more like conceding to circumstances than purposeful evolution. For example, the job changes usually were unplanned and typically were the result of non-work-related decisions.

Other respondents to the first question about early goals showed an interesting dichotomy that also plays into the adaptive mode. At one end of the spectrum, some of the older participants noted they had the traditional choices offered to women: teacher, nurse, secretary, homemaker, so they chose one of the latter two options. These women made other statements regarding not being encouraged to pursue higher goals or not being prompted to set goals at all. One woman illustrated this by stating, “I had three choices, I could be a homemaker, I could be a nurse, or I could be a secretary.... My dad felt college was wasted on girls.”

Another group of participants cited early non-traditional goals that one described as “lofty,” including physician, veterinarian, and lawyer. These goal revelations were followed by explanations about why they decided against those choices. The reasons for changing plans included financial constraints that precluded college, greater interest in marriage and family, or simply finding work at a good wage preferable to more career preparation.

Family Influence

Family appeared as a clear priority in all of the groups. Family responsibilities were cited as guiding the career choices and goal revisions of many of the participants. One woman stated this clearly as she explained her decisions:

I actually thought about goals probably 4-5 years after I started working here, thinking about what would I really like to do and what would I change and I knew it would require going back to school. But as a result of having one child at that time and wanting another one within a few years, I made a personal decision that I’m just not going to pursue anything further for me because I want to have kids and I personally know I can’t do it all.

Another woman offered this explanation for the family over career choice, “I think women have had difficulty always setting career goals, because culturally we are the nurturers and we are the ones having children and by whatever design, culturally or morally or whatever, we tend to make sacrifices of ourselves.”

Family responsibilities also were cited a career restraint, with examples given about opportunities turned down or educational credentials not pursued, because of the desire to be more available to children. Often the potential opportunities involved travel or less flexibility, factors that directly influence home life. For example, one woman responded, “Other personal commitments I found have hindered me. After I had been here a year and a half, I was offered a promotion that I turned down because my husband had died a year and a half before, and I knew it involved a lot of overtime....I wasn’t willing to put my daughter through that.”

While it was evident throughout this study that the participants had made multiple adjustments in their own career plans to accommodate family needs, they also were clear about being satisfied with those choices. Several of the women pointedly said they had no regrets about their decisions to put their families before their careers. Whether that satisfaction was genuine or simply a means of coping with dissonance over lost opportunities could not be determined from the available data. Their pragmatic approach to careers could be used to make a case for either interpretation.
Security Needs

The mindset of family before career also appeared to prompt a high need for job security and a reluctance to risk or to move on. While there were a few exceptions, many of the participants expressed a strong desire to stay with what they knew to be a secure job with good benefits, putting off additional schooling or career advancement opportunities until children are older or more self-sufficient. One woman articulated the difficulty that presented to her, as she weighed putting more time into her career versus having more time with her child. "It's very difficult. It's a constant struggle for me. I want to be the best mom in the world. That's what I want most of all... However, progressing in my career is going to bring more money, which would make things easier for us. I'm a single mom."

Another participant expressed frustration over wanting a different job, but not wanting to sacrifice the accumulated time off she uses to visit grandchildren in other parts of the country. She said, "I'm struggling daily with it. Do I leave here? Do I leave twenty years of service, five weeks of vacation, you know, just to be able to find something I like doing better, or do I put up with whatever they give me because I do have this long service?"

One of her cohorts immediately described this as her "golden handcuffs," recognizing the strong hold of perks and loyalty that come from many years of employment with the same organization, even when the job is less than desirable.

Others commented on the value of having steady employment and good benefits to provide for family members. As one woman observed:

I stay in the job that I have now because of fear if I get a management job I might be chopped off next week... I stay in the job that I am... As far as me spreading my wings now and saying this is what I want to be when I grow up, I'm probably not going to do that, because I'm a single mom and I have that fear that I could lose my job...

Similarly, another participant commented on her own pragmatism in her choices, saying "I've just stayed there, because what was important to me was making a good wage where I have skills and in a corporation of this size, that's where the better wages are and keeping the benefits...."

Other observations focused more on the desire not to risk or to change what has become customary, even if family needs no longer are primary. For example, these two perceptions were shared: "Once you get comfortable, you get in a place that you like, but you know you need to grow... What is supposed to be the next step and what will give you the confidence to go forward?" "You get in a comfort zone and it's hard... to get out and stretch." These comments fit with those of another respondent who cautioned a younger employee not to stay in the same place too long or she will limit her options.

Support Factors

Coupled with the priority given to family and security interests was the desire for scheduling flexibility to accommodate family responsibilities. Many of the participants highlighted the importance of job flexibility to help them accommodate the needs of their families. This came up as they described their job-related choices to date and was reiterated when they reflected on how their companies have been helpful in their career plans. Another organizational factor cited as helpful was a tuition reimbursement programs, although family obligations were mentioned by many of the participants as the reason they have not taken full advantage of this opportunity.

It was acknowledged widely that when advancement did come in their careers, it was in no small measure the result of good mentoring and supervisory support. While these commodities seemed rare among those in this study, a few noted their professional benefit. One of the higher risk-takers among this group expressed satisfaction with her career, and readily praised her mentor within the company, noting "If it had not been for him, I don't think I'd be where I am." Related statements included the importance of knowing the "right" people and getting supervisors' recommendations for moving up in the organization.

Not surprisingly, the lack of support was acknowledged as a hindrance to fulfilling career plans. Perhaps as another indication of a willingness to adapt rather than to initiate, or another example of pragmatism, participants in this study clearly viewed management as having power in deciding who has advancement opportunities. One observed, "We cheerlead for each other, but we don't necessarily get that from, say, people... that have the sphere of influence that we need to pull ourselves up." Another voiced her disappointment in being held back by an non-supportive supervisor, "I've been in departments where supervisors have put big restraints, big restraints. You're capable of so much more and they just won't, don't see it. They won't allow it... very frustrating."
Discussion and Recommendations

The participants in this study echoed several of the themes found in previous research on women's careers. These non-managerial women made career choices that were similar to Eccles' (1994) and Arnold's (1993) descriptions of women's occupational planning. Their career choices were greatly influenced by other life choices. Their careers reflect an adaptive approach, frequently influenced by the need to accommodate others and circumstances in their lives. Paradoxically, while their career choices could be characterized as being malleable, many of these women now seemed less flexible in career options due to their job tenure and parental responsibilities. Several appeared less open to career changes because they perceived their current jobs as paying well and offering good benefits.

Like some of the middle managers in Wentling's study (1996), the majority of these women did not articulate a clear career strategy. As previous research suggests, this lack of planning is related to socialization and family issues. Additionally, this research reaffirmed the importance women place on mentors in their career development. However, while the women in this study discussed mentoring and its importance, it was unclear whether they had had mentors. Only one woman spoke of her personal experience having a mentor and the role that individual played in her career.

The participants in this study focused primarily on extrinsic factors when discussing those things that helped and hindered their careers. Using the gender comparison of managerial women, the literature indicates that external factors such as mentors, family responsibilities, bosses, etc. influenced their careers. However, the research also reveals the importance of intrinsic factors, such as taking initiative, being assertive, being persistent, and taking risks, in their career development. In general, the women in this study did not focus on these types of intrinsic factors. Instead, several expressed concerns about taking risks and exploring other career options. This appears to be a major point of contrast between managerial and non-managerial women.

Given the exploratory nature of this study, the small sample, and the limited types of industries represented, more research is needed to determine if non-managerial women perceive extrinsic factors as more salient to their career progress than intrinsic factors. A number of variables, such as age, locus of control, and self-efficacy must be considered as potential influences on these factors. In addition, the culture of the organization may play a role in how women perceive their developmental opportunities.

The women in this study mentioned few HRD initiatives as being instrumental in their career development. Several indicated they participated in training programs offered by their organizations and some had taken advantage of company tuition reimbursement programs. Overall, while HRD benefited some, all the members of this study did not see it as a critical factor. Consequently, the potential need for HRD intervention is unclear for women in non-managerial positions. However, in an era when organizations must continually monitor, realign, and change in response to the turbulent and unpredictable external environment, it is imperative that individuals be prepared for careers that are nimble as well. The findings of this study suggest that non-managerial women may benefit from assistance in career planning to help them explore ways to maximize their potential, whether they stay in their current jobs or choose to move on.

Contribution to HRD Research

HRD clearly has the potential to contribute to the career progress of all women. To date, however, the research has focused primarily on the careers of managerial women, and how they attempt to succeed in organizations. This study explored the career aspirations and plans of non-managerial women to help HRD practitioners better understand the needs and interests of women at various levels within organizations. More research needs to be done to determine how to address the needs of non-managerial women who want more advancement opportunities. For example, research should explore whether the barriers to advancement facing non-managerial women are the same as those encountered by managerial women or by non-managerial men. HRD also can assist non-managerial women not wanting to move up to remain challenged and interested in their jobs by focusing on career development and training.

As competition and labor shortages increase, there is a need for non-managerial employees to take on more responsibilities and to contribute more directly to systems level success. Understanding the career aspirations and plans of non-managerial women can help HRD as it attempts to maximize the potential of all organizational associates.

The Career Life Cycle and Mentoring: The Opportunity for Reflection as an Outcome for Mentors

Ellen J. Mullen
Betty E. Steffy
John Van Ast
Iowa State University

This is a quantitative look, within the framework of the Life Cycle of the Career Teacher (Steffy & Wolfe, 1997), at whether mentors find mentoring to be an opportunity for reflection and what mentoring activities are predictive of that opportunity. Results suggest that, among these educators, mentoring was a vehicle for mentor reflection, particularly among women. Demonstrating organizational skills and promoting independent thinking were predictive of the opportunity to reflect.

Keywords: Mentor Outcomes, Opportunity for Reflection, Career Life Cycle

Mentoring initiatives have become popular among organizations, both in business and industry and education, for the professional and personal growth of employees (mentees) through mentor coaching, role modeling, professional development plans, observation and feedback, demonstration and direct assistance (Van Ast, 1999). The popularity of mentoring seems to grow as the evidence of its value as a professional development tool expands (e.g., Chao, Walz, & Gardner, 1991; Dreher & Ash, 1990). Interest in mentoring, both in terms of relationships initiated by the mentor or mentee and relationships initiated by the organization, can be seen in both the educational arena and in business and industry. This study focuses on mentoring in education from the perspective of the Life Cycle for Career Teachers (LCCT) model (Steffy & Wolfe, 1997) because of mentoring’s striking relevance and importance to the model’s process of reflection, growth and renewal. Certainly, mentoring is targeted at professional as well as personal growth and serving as a mentor would presumably provide one the chance to reflect on one’s career. This study examined the opportunity to reflect as an outcome of being a mentor and what mentoring activities are predictive of it. The LCCT model and how mentoring fits into it are described below and relevant mentoring literature, from both the business and education perspectives, is discussed.

Mentoring in Business and Industry

An increasing body of studies has shown generally positive consequences of mentoring, with research focusing largely on outcomes for mentees; we know far less about the effects on the mentor. Mentees in business and industrial settings most often report increased salary as an outcome, but mentored individuals also report more promotions, career advancements, and more mobility within organizations (e.g., Aryee, Wyatt, & Stone, 1996; Baugh, Lankau, & Scandura, 1996; Chao, 1997; Scandura & Schriesheim, 1994; Turban & Dougherty, 1994). Mentor benefits potentially include the development of relationships, gaining new information, receiving job-related help, and imparting knowledge to others (e.g., Allen, Poteet, & Burroughs, 1997).

Intrinsic benefits associated with being a mentor most often described in the literature are job satisfaction and perceived career success, as well as more internal satisfaction, satisfaction in helping others, and new perspectives of a mentor’s own situation (Allen, Poteet, & Burroughs, 1997; Ayree et al., 1996; Chao, 1997; Corzine et al., 1994; Ragins & Scandura, 1994; Scandura, 1997; Thibodeaux & Lowe, 1996; Turban & Dougherty, 1994). Still, the majority of mentoring research has focused on outcomes for the mentee while the work focusing on mentor outcomes remains largely nonempirical. Mullen (1997) recently suggested dual foci on mentoring as a reciprocal relationship that benefits both mentor and mentee. Companies using mentoring programs can also reap rewards, such as increased employee satisfaction, and can shape their programs to fit corporate agendas (Berube, 1996; Scandura, 1997). Thus, the mentee, the mentor and the organization all stand to gain from a mentoring intervention.

Mentoring in Education

Mentoring has also been widely viewed as beneficial in the educational arena (e.g., Bush & Coleman, 1995; Rehrig, 1996; Southworth, 1995). Mentored teachers tend to have a better understanding of student needs, and their students show greater learning (e.g., Dembele, 1996; Van Ast, 1995; Mullen & Van Ast, 1999). Mentoring programs enable faculty to improve instructional materials, keep up-to-date on new technology and teaching methods, and to network with other faculty (Foote, 1996).

Mentored teachers also report intrinsic benefits, such as mutual respect, trust, emotional support, and personal development (e.g., Abell, 1995). Campbell (1995) reported that protégés felt less of a need to seek help than nonprotégés. According to Graham (1994), mentors were reminded of the value of their past experience and received an opportunity to examine their own practices, and protégés obtained insight into their style of learning and working and were more confident. Although faculty mentoring programs tend to produce benefits, they appear to be potentially less helpful in terms of career advancement than in other aspects (e.g., Shumate, 1995).

The Life Cycle of the Career Teacher Model and Mentoring

The Life Cycle of the Career Teacher (LCCT) Model by Steffy and Wolfe's (1997) illustrates the developmental phases of career growth among teachers. It also prescribes that support is necessary for positive growth and evolution through the phases. Mentoring would appear to be a critical component of the career life cycle for educators. Having a mentor helps the educator grow and develop in the earlier phases, while serving as a mentor helps the educator continue to grow and develop in the latter phases. The LCCT phases include the Novice, Apprentice, Professional, Distinguished, and Emeritus phases.

The Novice level encompasses the practicum, student teaching, and intern experiences for preservice teachers and is marked by continued skill development and growth in awareness as well as experience. The Apprentice phase begins when the preservice teacher is given full responsibility for planning and delivering instruction and continues into the first-third years as a teacher. This phase is characterized by enthusiasm, energy and passion within the new teacher. The Professional phase of the model describes teachers as growing in self-confidence and gaining motivation externally through feedback from students. Teachers in the Professional phase tend to seek opportunities for continued growth, but may not get enough administrative support because the latter don't perceive the need. The Expert phase is reached when the teacher's performance meets national certification requirements and his/her expertise is ‘cutting-edge’ but still evolving.

The Distinguished phase of the cycle is reached only by those teachers who are considered exemplary by their peers and administrators. Finally, the Emeritus phase includes teachers who have served a lifetime in the expert or distinguished phases of the career life cycle. According to the model, reflection is a critical piece in the evolution towards self-actualization. The current authors suggest that mentoring experiences play a prominent role throughout the phases of the LCCT, beginning with experiences as a mentee and advancing to experiences as a mentor (Steffy & Wolfe, 1997). Thus the investigation into mentoring outcomes, in this case the reflection opportunity in particular, and their predictors is integral to the examination of the career life cycle. While the LCCT was developed with a K-12 educator focus, this study extended the model to other educators.

Research Question

Central to the LCCT model is the idea that professional educators continue to grow and develop through the process of reflection, growth and renewal (Steffy & Wolfe, 1997). Mentoring can play a very important role in that process. This study contends that mentoring is an important vehicle for reflection and looks at the opportunity for career reflection as an outcome of serving as a mentor. The study addresses the question: What mentoring activities are predictive of the opportunity for educator mentors to reflect on their careers? Looking at the mentor's experience within the career life cycle framework: 1) adds depth to the model by incorporating serving as a mentor as an instrumental vehicle for career reflection and renewal; 2) expands the body of knowledge about outcomes associated with being a mentor; and 3) expand the application of the LCCT model to include K-12 administrators, community college instructors, and university faculty. The results will provide unique insight into the role of mentoring in one’s
Reflection is a central component for promoting growth over a professional lifetime career life cycle via the opportunity for career reflection that can emerge from serving as a mentor. If we can find what mentoring activities are related to the opportunity to reflect, then we can potentially maximize both the engagement in mentoring activities and the opportunity to reflect throughout the phases of the LCCT.

Methodology

Participants

Data (overall \( n = 84 \)) were gathered from three subsamples, including: 1) 25 mentors involved in a structured mentoring program for K-12 educators enrolled in a graduate program for school administration preparation; 2) 21 mentors who had been involved in a 2-year structured induction and mentoring program for community college instructors; and 3) 38 faculty who had mentored in a nonstructured faculty mentoring program at a large university.

Data Collection Methods and Measures

Questionnaires were mailed to respondents to gather information regarding mentor activities and the opportunity for mentor reflection. The relationship between opportunity for reflection and mentoring activities items was examined via quantitative analyses described below. Mentor activity items developed for a recent related
study (Mullen, Van Ast, & Grant, 1999) were used to quantitatively measure the extent to which mentors engage in various mentoring activities, including: 1) “Matching needs of mentee with a structured plan for growth and improvement;” 2) “Identifying and affirming mentee responsibilities;” 3) “Identifying role expectations and communicating them clearly;” 4) “Encouraging mentees’ efforts through consistent and appropriate feedback;” 5) “Demonstrating well-defined organization skills;” 6) “Utilizing collaborative teaching/learning methods;” 7) “Encouraging independent thinking;” 8) “Listening to mentees with an open and accepting attitude before responding;” 9) “Promoting mentee risk-taking;” 10) “Diagnosing mentee needs at the beginning of the relationship.”

These items were developed based on activities used in a community college induction/mentoring program (Van Ast, 1999). The response format for the mentoring activities items provided a 5-point scale ranging from 5 = extremely important to 1 = no importance. The opportunity to reflect was measured via an item asking to what extent the mentor had experienced the opportunity to reflect as an outcome of mentoring (5 = very large extent to 1 = very small extent). Demographic items, targeting information regarding gender, tenure, and job type (faculty or administrative), were also included, as were items seeking information regarding the mentoring relationship, e.g., number of formal mentees; frequency of communication with one’s mentee; and hours per month spent with one’s mentee; and formal or informal mentor training.

Data Analysis Strategy

SPSS-PC was used to analyze the data generated via the questionnaire described above. The analyses involved generating descriptive statistics, including means and standard deviations, computing Cronbach's alphas, and running Pearson correlation coefficients and multiple regression equations within and across the three subsamples. The backward regression technique was used to determine which of the mentoring activities measured (i.e., independent variables) were predictive of the opportunity for the mentor to reflect (i.e., dependent variable). The data were analyzed by subsample and as a combined sample to allow us to look both within groups and across all mentors.

Results

Eighty-four of 214 mentors responded to the questionnaire for an overall response rate of 39%, including 38 of 96 university mentors (40%), 21 of 56 community college mentors (38%) and 25 of 62 K-12 principal mentors (40%). Within the overall sample, the average respondent was a male (61.2%) nonadministrative faculty member (57.6%) who had formally mentored 1-2 (mean = 1.39) mentees and spent an average of 1.83 hours per month with his mentee. The average university mentor respondent was male (76.9%); a nonadministrative faculty member (82.1%); had mentored 1-2 (mean = 1.42) mentees formally; and spent 1.41 hours per month with this mentee. The average respondent from the community college subsample was male (66.7%); a nonadministrative faculty member (71.4%); had formally mentored 1 (mean = 1.14) mentees; and spent an average of 1.95 hours per month with the mentee in question. The average principal mentor respondent was female (60%) administrator (92%); had formally mentored 1-2 mentees (mean = 1.56); and spent 2.39 hours per month with her mentee.

Respondents in the overall sample indicated that the opportunity for reflection was fairly important (mean = 3.26)(See Table 1). The mean responses regarding reflection opportunity for the subsamples were 2.77 for university mentors; 3.06 for community college mentors; and 4.14 for principal mentors. Means on the mentoring activity items for the overall sample ranged from 3.40 for “utilizing collaborative teaching/learning methods” to 4.25 for “listening to mentees with an open/accepting attitude,” indicating average responses in the “important” to “very important” range. Mentoring activities mean responses for the subsamples ranged from 2.70 to 4.03 for the university mentors; from 3.55 to 4.40 for community college mentors; and from 4.08 to 4.58 for the principle mentors. Patterns among the Pearson correlations for the overall sample included opportunity for reflection being significantly related to gender (women perceived reflection opportunity as more important) and to all the mentoring activities except “utilizing collaborative teaching/learning methods” (see Table 1). Gender was related to 6 of the 10 mentoring activities, with women reporting higher usage than men.

Table 2 reflects the results of the backward multiple regression. These analyses indicated that, among the university mentors, demonstrating organizational skills was significantly related to the opportunity for mentor reflection (see Table 2). Encouraging mentee independent thinking was a significant predictor of the opportunity to reflect among the community college mentors (see Table 2). For the principal mentors, identifying role expectations, matching mentee needs to a plan, and promoting mentee risk-taking were all significant predictors of the opportunity for the mentor to reflect (see Table 2). In the analysis of the combined data (all 3 subsamples),

Note. Dependent Variable: Opportunity for Reflection.  
*p < .05. **p < .01. ***p < .001.

Discussion and Implications

This research examines relationships between mentoring activities and the opportunity for mentors to reflect, a central piece of the LCCT (Steffy & Wolfe, 1997). Specifically, this study looked at what mentoring activities or practices are predictive of the opportunity for reflection as an outcome of being a mentor, expanding the body of knowledge related to outcomes for mentors and linking it to the LCCT model (Steffy & Wolfe). The data suggest that mentoring does, in fact, allow mentors to reflect on their careers. This would lead us to conclude that serving as a mentor may be a key vehicle for reflection and, thus, growth in the latter phases of a career. We’ve recognized for some time that mentoring is invaluable for the development of the mentee. These data indicate that mentoring may be invaluable for the development of the mentor as well.

Some interesting results emerged from the separate (by subsample) and combined data. First, different mentoring activities were predictive of mentors’ opportunity for reflection for each of the 3 subsamples. This may reflect differences in populations, differences in the mentoring initiatives in each population or, perhaps, measurement issues. Further research delving into these differences is warranted. Results for the mentors in the university subsample indicated that the opportunity for reflection was related to demonstrating organizational skills for the mentee. In other words, mentors who reported demonstrating organizational skills for their mentees also reported having the opportunity to reflect as a result of the mentoring role. Thinking about how one organizes oneself is certainly consistent with reflection and one would certainly have those thoughts when demonstrating organizational skills to others. For community college mentors, encouraging mentees to think independently was related to finding the opportunity to reflect through being mentors. Again, this is an action that could certainly lead one to reflecting on his/her own thinking. With the principal data, results indicated that the opportunity for reflection was related to the mentor identifying role expectations for the mentee, matching the mentee’s needs to a plan, and promoting mentee risk-taking. In other words mentors who engaged in these actions also reported gaining the opportunity to reflect through serving that role. These activities logically could all require introspection in order to engage in them.

Overall, for the combined sample, mentor opportunity for reflection was predicted by demonstrating organizational skills and encouraging independent thinking. It is intuitive that both of these activities would require some introspection, leading to reflection. The notion of having one’s mentee benefit from one’s successes as well as failures is completely consistent with reflection. In fact it absolutely requires it.

Not surprisingly, various mentoring activities were related to the opportunity for mentor reflection. These findings are important for various reasons. For one thing, they suggest, as was expected, that mentors do report gaining the opportunity to reflect from being a mentor. We certainly predicted that the kinds of activities mentors perform for their mentees would be related to reflection, for you could easily argue that mentors must examine themselves and their careers to engage in those activities effectively. The very notion of mentoring involves the mentor passing on to the mentee what he/she has learned through experience. When a mentee thinks about his/her experiences, that is a prime opportunity to reflect. These data support our assertion that serving the mentor role is an important part of the career life cycle because it allows the individual in later phases of the cycle to reflect and, thereby, grow and renew. This is very encouraging and supports thinking about this additional dimension of mentoring. It doesn’t just help the mentee grow. The mentor stands to learn about him/herself and has a prime
opportunity to reflect and grow. Administrators should encourage mentoring because both mentors and mentees stand to gain. But they should also teach mentors the mentoring activities that, while aimed at "showing the mentee the ropes," also provide the mentor an excellent opportunity to reflect and grow both personally and professionally. Activities such as articulating mentor and mentee roles and responsibilities, setting goals and developing mentoring action plans are essential to the maximization of mentor and mentee outcomes. Mentoring initiatives that incorporate these kinds of activities provide the framework and the expectations for mentors and mentees, demystifying what effective mentoring involves. According to Van Ast (1999), essential mentor functions include role modeling; assisting with a professional development plan; observation and feedback; demonstration, informal guidance; and direct performance assistance. And mentoring, as a vehicle for growth and reflection, may play a key role in the career life cycle. This is consistent with Steffy and Wolfe's (1997) LCCT model, which incorporates the themes of reflection, growth and renewal.

The limitations of this study should be recognized. First, self-report was utilized via a single means of data collection. Some biases may be inherent. Further, some items were developed for this study because of a lack of existing measures. These measures were piloted, but need further validation. The small size of the subsamples also presented a limitation, restricting the methods of analysis employed as well as the interpretations that could be made. Still, this is an important step toward greater understanding of the connection between mentoring and reflection on one's career.

Mentoring literature is in its infancy. This research examines relationships between mentoring activities and the opportunity for mentors to reflect, a central piece of the LCCT (Steffy & Wolfe, 1997). It builds on the body of knowledge related to outcomes for mentors, linking it to the LCCT model of career growth (Steffy & Wolfe). Much more ground needs to be covered, particularly where the mentor's perspective is concerned. In this study, we've found that there was a reported opportunity to reflect related to serving as mentors and that certain mentoring activities were related to that reflection. This will help to add depth to the LCCT model (Steffy & Wolfe, 1997). Future research should also take this line of inquiry into business and industry and examine the application of the LCCT model in that setting. It would seem that mentor reflection and the mentoring activities that lead to it should be universal, regardless of line of work. This needs to be tested. HRD professionals need to look at ways to maximize the opportunity for career reflection that serving as a mentor provides, since this reflection opportunity may be critical for continued growth. This work illustrates that we can identify mentoring activities that are related to the opportunity for career reflection. If HRD professionals can train mentors to engage in activities that not only enhance mentee growth, but provide career reflection opportunities for the mentors as well, then everyone, including the organization, stands to gain dramatically.

Functions Performed by Mentors that Assist in the Career Development of Women Managers

Rose Mary Wentling
University of Illinois

The purpose of this study was to investigate whether women managers had mentors and how the mentors assisted them in their career development. The researcher conducted in-person interviews with 30 women in middle-level management positions in 15 Fortune 500 companies. The study revealed that being an influential leader and willing to share knowledge and expertise were the characteristics the women managers most often wanted in their mentors. Also, revealed was that mentors were the most influential in the women managers' career development.

Keywords: Mentors, Career Development, Women Managers

During the past decade, business organizations have become increasingly concerned with the development of women managers. Some of the major factors which have caused this concern include the increasing number of women seeking management positions as a result of their greater participation in the labor force, expanded access to educational opportunities, and involvement in affirmative action programs (Costello, Stone, & Dooley, 1996; Frye, 1996). Women account for more than half of today's labor force and will constitute a large segment of the available management talent to draw on within the next decade (Herz & Wootton, 1996; Powell, 1999; U.S. Bureau of Labor Statistics, 1998). Carnevale and Stone (1995) indicated that by the year 2005, as many as 90 percent of all women between the ages of 25 and 40 will be working. The rising labor force participation of women has been the single biggest change in the American labor market in the past 30 years (Fagenson & Jackson, 1994). The female share of employment has risen from 29% in 1950 to 48% in 1996, and this trend is expected to continue (Blau, Ferber, Winkler, 1998; U.S. Bureau of Labor Statistics, 1998).

For the first time women constitute over half of university-level students. The courses they are enrolled in are increasingly career-oriented. For example, in 1996, women were over 37% of those obtaining MBA degrees and 49% of those enrolled in undergraduate business programs (National Center for Education Statistics, 1998). Over the past decade, the increase in the number of women graduating from leading universities has been much greater than the increase in the total number of graduates, and these women are well represented in the top 10 percent of their classes. (Costello & Krimgold, 1996; Schwartz, 1989). In 1996 women outnumbered men among the recipients of postsecondary degrees at every level, except the doctoral level (National Center for Education Statistics, 1998).

Despite increasing numbers of women in the workforce and in business, and their enhanced educational credentials, women's access to senior level management positions remain limited. (Fierman, 1990; Korn/Ferry International, 1993; Morrison, 1992; Powell, 1999). While women's numbers in management are increasing, they are still largely clustered in lower and, to a lesser extent, middle level management positions (Fagenson & Jackson, 1994). Women's progression to upper management levels has been very slow, currently representing only 5% of senior level executives (Korn/Ferry International, 1993; Powell, 1999).

Mentoring relationships have been found to be significant in the career development, advancement, organizational success, and job satisfaction of women managers (Corzine, Buntzman, & Busch, 1994; Dreher & Ash, 1990; Fagenson, 1989; Scandura, 1992; Schaubroeck, Cotton, Jennings, 1989; Wentling, 1996). Research shows that people who have mentors secure more promotions, have greater job mobility, recognition, satisfaction, and easier access to powerful individuals in the organization (Dreher & Ash, 1990; Fagenson, 1989; Jeruchim & Shapiro, 1992; Ragins & Cotton, 1991). A study of 205 working women found that mentored middle level managers were promoted an average of 2.3 times in a five-year period. Those who were not mentored averaged 1.7 promotions during that time period ("Mentors Big," 1994). Although mentoring relationships are important for all organizational members, they may be particularly important for women (Burke & McKeen, 1990; Noe, 1988; Ragins, 1989). Mentors can help women overcome barriers to advancement in organization (Morrison, 1992).

This suggest that advancement to powerful positions in organizations may be partially based upon the
successful development of mentoring relationships. Nevertheless, mentoring is an important training and development tool for upward professional progression in organizations for women managers. Mentors for the purpose of this study has been defined as higher ranking, influential, senior organizational members with advanced experience and knowledge who are committed to providing upward mobility and support to a protégé's professional career (Flanders, 1994; Kram, 1988). Mentoring can be either formal, that is, part of the formal organizational policy, or informal, a private arrangement between two individuals which does not necessarily have organizational approval (Davidson & Cooper, 1992).

Is a mentor a necessary ingredient for the career advancement of women managers? What are the characteristics mentors should possess in order to provide worthwhile and valuable assistance to those women managers aspiring advancement in their careers? What functions that mentors perform are most likely to enhance the career development of the women managers? These are some of the questions that guided this study. The literature offers much speculation concerning mentors functions and characteristics, but there is a lack of empirical research to verify these conclusions. This study was designed to contribute further knowledge in this area by determining the functions that mentors perform that assist in the career development of women managers. Career development for the purpose of this study was defined as the series of positions held over time and the factors influencing an individual's advancement through those positions (Peterson, Sampson, Reardon, & Lenz, 1996). Investigation in this area will assist aspiring women managers who seek help in career development and advancement.

Purpose of the Study

The purpose of this study was to investigate whether women managers had mentors and how the mentors assisted them in their career development. Specifically, this study addressed the following five research questions:

1. Have the women managers had mentors in their professional careers?
2. How were the mentor relationships established?
3. What are the functions performed by mentors that most effectively assist the career development of women managers?
4. What are the most beneficial lessons that the women managers learned from their mentors?
5. What are the major obstacles that were encountered during mentoring relationships?

Methodology

The major method of this research study was a series the individual case studies. Case studies that relied on face-to-face interviews with a sample of women middle managers were conducted by the researcher. Middle manager for the purpose of this study is defined as, "the group of managers extending from top management down to those immediately above first-line management. They implement the strategies or policies set by top managers and coordinate the work of lower-level managers" (Van Fleet, 1988, p. 33). The case studies required the collection of extensive data in order to produce an in-depth understanding of the role of mentoring in the career development of the women managers who were being studied.

An interview guide was developed to assist in collecting the data from the interviews. A study advisory committee, made up of three business educators and three people from business and industry, reviewed the interview guide and study procedures. Also, a pilot study, involving a sample of five women in middle-level management positions in business firms, was conducted to determine content validity and appropriateness of the interview guide. There was agreement by the study's advisory committee and the pilot test participants that the interview guide and the data being collected were appropriate for meeting the objectives of the study.

The researcher conducted in-person interviews with 30 women in middle-level management positions in 15 Fortune 500 companies. The companies were located in the midwest (Illinois, Missouri, and Indiana).

After reviewing the total number of Fortune 500 companies in the state of Illinois (50), Missouri (15), and Indiana (8), a proportional sample was randomly selected to reflect the number of companies in each of the states. A total of 15 companies were randomly selected, 10 from Illinois, 3 from Missouri, and 2 from Indiana.

The Placement Service Office at mid-west university was then contacted to assist in identifying the campus recruitment person for each of the companies. The campus recruitment person from each of the fifteen Fortune 500 companies was then contacted by telephone and was asked to assist in identifying two women in middle-level management positions in the company. Names, position titles, and telephone numbers of thirty women managers were then obtained. Initial contacts with the women managers were made over the telephone at which time dates, interview appointments, and arrangements were made. All thirty women managers who were contacted consented to
participate in the study.

Each interviewee received a letter confirming the interview appointment and a copy of the interview guide two weeks before the scheduled interview. The participants were able to examine the research questions prior to the interview. The interviews were conducted on-site in each participant’s corporate office. During the interview, the researcher used the guide to focus the interview process. Flexibility was retained to probe into each participant’s statements and replies and to pursue additional issues related to the focus of the study that were not included in the interview guide. The interviews focused on mentors and their role in the career development of the women managers. The interviews lasted from one and a half to two and a half hours, with an average of two hours. The interviewer/researcher took extensive shorthand notes during each interview, then the notes were transcribed after each interview.

Description of Study Participants

Thirty middle-level women managers who worked in Fortune 500 companies located in the mid-west were interviewed. They worked in industrial corporations with sales varying from $500 million to more than $20 billion, with assets from $600 million to more than $24 billion. The average number of employees in these companies is 35,000. The study participants are employed in a variety of industries including aerospace, chemicals, computer, electronics, food, petroleum refining, industrial and farm equipment, pharmaceutical, and publishing/printing.

The women managers range in age from 30 to 46 years, with an average age of 38.2 years. They hold positions in a variety of departmental areas including: human resources, management information systems, finance, marketing, accounting, engineering, and research.

The number of years of work experience acquired by participants range from 8 to 25 years, with an average of 15.1 years. The number of years of managerial experience (including all levels of management experience) that participants have had range from 3 to 17 years, with an average of 7.6 years of managerial experience. The number of years of experience that participants have had as middle managers range from 1 to 10 years, with an average of 4.5 years. The number of years that participants have been employed with their present company range from 1 to 22 years, with an average of 12.0 years. The number of years that it took participants to attain a middle level management position ranges from 1 to 20 years, with an average of 10.0 years.

Results

The results of this study are summarized in five major sections, which parallel the major research questions: (a) women managers’ mentors; (b) how mentor relationships were established; (c) functions performed by mentors that most effectively assist the career development of women managers; (d) most beneficial lessons women managers learned from mentors; and (e) obstacles encountered during mentoring relationship.

Women Managers' Mentors

Twenty-seven (90%) of the women managers in the study indicated having one or more mentors during their professional careers. Three (10%) of the women managers indicated that they had not had mentors during their professional careers. Of the 27 women managers who indicated having mentors, 18 (67%) had only male mentors; while eight (30%) had male and female mentors. It is significant to note that only one study participant had had only female mentors. Most often it was a boss or a top manager that served as a mentor for these women. It is also interesting to note that of the 54 mentors identified, 45 (83%) were male and only 9 (17%) were female. Five (19%) of the women managers had had only one mentor; 17 (63%) had had two mentors; two (7%) had had three mentors; and 3 (11%) had had more than three mentors. It is important to note that more than three-quarters of the women managers had had more than one mentor.

How Mentor Relationships Were Established

Fifteen (56%) of the study participants indicated that their mentoring relationship was initiated mutually. Six (22%) indicated their mentoring relationship was initiated through their company's formal mentoring programs, while 3 (11%) had initiated the relationship themselves, and another 3 (11%) indicated that top management had initiated the mentoring relationship. Length of mentor relationships ranged from one to ten years, with an average of 4.5 years.
The study participants most frequently named commitment and dedication, hard work, demonstrated competency on the job (produced high quality work), leadership abilities, positive attitude, and self-confidence as the six most important factors that helped them gain a mentor.

Being an influential leader and willing to share knowledge and expertise were the characteristics the women managers most often wanted in their mentors. Other important attributes were: interest in the women manager's growth and development; willing to commit the time and energy required for the mentoring process/relationship; having established credibility and respect within the company; and possessing high standards of integrity and trustworthiness.

Functions Performed by Mentors that Most Effectively Assist the Career Development of Women Managers

Although a few women managers reported that they received an array of benefits from a single mentor, most of the women managers came to rely on several mentors, each for a different sort of help. The women managers indicated that their mentors were good role models, advocates, or instructors. A variety of functions were performed by mentor that assisted the women managers' career development, as illustrated by Table 1. The seven most frequently cited functions performed by mentors included the following: Provided them with job opportunities/challenges to demonstrate their skills and abilities, 20 (74%); offered them feedback on their performance, 19 (70%); gave them useful advice, 17 (63%); shared his/her expertise with them, 16 (59%);

Multiple responses were accepted.
encouraged them to meet high performance standards, 15 (56%); acknowledged their skills and talents and encouraged their career development, 15 (56%); and suggested strategies for advancing their careers, 15 (56%).

The majority (90%) of the women managers indicated that their mentors were the people they considered to have most significantly influenced their career development. They reported that their mentors had provided them with substantial help, which had assisted them in their career progression, and in more effectively dealing with barriers they encountered.

Most Beneficial Lessons Women Managers Learned From Mentors

The women managers reported a variety of lessons that they learned from their mentors. The ten most frequently cited lessons that they learned from their mentors that were most beneficial to their career development included the following: The importance of setting priorities and how to approach problems in a systematic way, 19 (70%); to deal and work with people from different backgrounds, level, and experiences to get things accomplished, 17 (63%); to be more adaptable and flexible, 15 (56%); to be more visionary and to be a better planner and organizer, 14 (52%); to manage and develop a team/group of people and how to pull together everyone's knowledge and skills to accomplish a task, 13 (48%); to work and deal with difficult people and make the best of every situation, 12 (44%); to be diplomatic and to negotiate more effectively, 11 (41%); to take risks and diversify their work experiences, 10 (37%); the importance of accuracy and high performance standards, 9 (33%); and how to modify behavior under certain circumstances and relate better to all types of people, 8 (30%).

The majority of the women believed that without the lessons learned from their mentors their career progression may have been hindered or made considerably more difficult. It is interesting to note that the majority of the lessons that the women managers learned from their mentors that were most beneficial to their career development were related to enhancing their interpersonal/people skills.

Obstacles Encountered During Mentoring Relationship

Although the women managers have received numerous benefits from their mentors, the majority 17 (63%) had encountered obstacles during their mentoring relationships. The following eight obstacles were mentioned by the women managers: Stayed with one mentor too long, 7 (41%); became too dependent on mentor and could not function properly without his/her support, 5 (29%); mentor did not have sufficient time to spend with me, 4 (24%); mentor was threatened by my talents and accomplishments, 3 (18%); mentor blocked my advancement because of a desire to retain my relationship and services, 3 (18%); jealous spouse created problems, 2 (12%); resentful co-workers created problems, 2 (12%); and mentor was not liked by senior management, 2 (12%).

All the women managers who had encountered obstacles agreed that the professional gains from mentors exceed the obstacles that they encountered during a mentoring relationship.

Discussion

The results of this study support other studies which indicate that functions performed by mentors are essential in the career development and progression of women managers in organizations (Burke & McKeen, 1994; Jeruchim & Shapiro, 1992; Morrison, 1992; Ragins & Scandura, 1994).

The results of this study clearly demonstrate that career development help does not come from only one mentor, but instead comes from many different mentors. Shapiro and Farrow (1988) suggest that it is more advantageous for women to seek help from a variety of mentors rather than from only one. Having multiple mentors may be a way for women managers to avoid the obstacles encountered during mentoring relationships. Some of the major obstacles mentioned by the women managers in this study were staying with one mentor too long, becoming too dependent on the mentor, and mentor not having sufficient time to spend on the relationship. The aspiring women manager can reduce the adversity of each of these problems, if she has more than one mentor. Having more than one mentor reduces the chances of staying with one mentor too long or becoming too dependent upon any one of them. Davidson and Cooper (1992) warn women managers not to expect a mentor to guide their careers forever, or to learn everything from a single mentor. To the extent that one has many mentors, the less time demands will be required from any one mentor, since there are others they can go to for assistance. In addition, the woman manager spending less time with any one mentor may also reduce the amount of gossip about the relationship, and the mentor spending less time with any one employee should reduce resentment from other employees. Hardesty and Jacobs
caution women against becoming overly dependent on one mentor, especially in later career stages. They speculate that women’s desire for connectedness and personal bonds lead to this overdependence.

Eighty-three percent of the individuals that served as mentors for the women in this study were men. Many authors have reported a shortage of female mentors (Morrison, 1992; Noe, 1998; Parker & Kram, 1993; Powell, 1999; Ragins, 1989). Since mentors are usually defined as high-ranking, influential member of an organization, the lack of women at high levels may certainly be one reason for the lack of female mentors (Noe, 1988; Ragins, 1989). According to Ragins and Cotton (1998), the shortage of women at upper levels of organizations creates a lack of potential female mentors, and the women in management who are available to form mentoring relationships are overburdened with requests from the large number of women at lower levels. This means like the women in this study, they usually have to approach men for mentor relationships.

The results of this study seem to indicate that increasing the access of women to successful mentoring relationships may not only assist in their career development, but also improve their organizational effectiveness. Therefore, it may be in the organization’s best interest to provide mentoring opportunities for women managers. Organizations can create conditions to encourage mentoring. For example, they can increase the formal and informal opportunities for women to meet potential mentors. Organizations may sponsor various events, such as networking luncheons and weekend retreats. By sponsoring these types of programs, the company can encourage social interaction between the potential mentors and the women who need mentors. In addition, organizations can promote the development of mentors for women by formally recognizing mentoring activities in performance appraisals and salary decisions. Also, women managers who have attained mentors successfully could share their strategies for finding a mentor, obstacles they encountered in their mentoring relationships and how to address them, and the benefits of having a mentors with women managers who currently need mentors. Overall, company leaders can promote the development of mentors by communicating the organizational and individual benefits of mentoring throughout the company.

Recently, recognition of mentoring as a management technique and career development method has been adopted by many companies (Flanders, 1994; Simonetti, Ariss, & Martinez, 1999). For example, McDonnell Douglas has a policy called “Career Counseling and Mentoring”. The objective of this policy is to "enable people to contribute fully over the course of their careers, by providing periodic formal reviews of their individual career objectives and by providing informal mentoring support. The policy describes mentoring as a two-way process that is important to career development" (Geiger, 1994, p. 65). Every employee is encouraged to be a mentor and to have one or more mentors.

In summary, this study adds to current knowledge by demonstrating the assistance in career development that is available for women managers from mentors, as well as the obstacles they may encounter in mentoring relationships. This study found that being mentored was advantageous to the career development of women managers. Mentoring is one way that companies can provide better opportunity for the advancement of women managers. It can also assist in assuring that organizations do not lose or underutilize the talents of the capable and educated women who now comprise a significant and vital portion of the workforce. Businesses today need all the leadership, expertise, and creativity possible as they face worldwide competition.

Analyzing and Solving Difficulties Experienced in Knowledge Management: The Case of a Knowledge Intensive Organization

Simone J. van Zolingen
Jan N. Streumer
Maaike Stooker
University of Twente

Knowledge management has become an important tool in staying ahead in the competition between companies. In this paper five different phases of the knowledge management process are distinguished. The occurrence of knowledge management problems has been studied in a case study in a knowledge intensive company. Most of the problems in this case occur in the first three phases of the knowledge management process: knowledge acquisition, knowledge codification and knowledge dissemination.

Key words: Knowledge Management, Knowledge Acquisition, Knowledge Codification, Knowledge Dissemination

In our time we live in a “knowledge society” in which knowledge is the most important means of production and not capital, raw materials or labour (Drucker, 1993). Growth of the service sector, automation, the development of new (information) technology, changes in structures and work processes of companies and globalisation and as a consequence growing competition are a few causes for this development (Castells, 1996; Rifkin, 1995, 2000; Zolingen, 1995). In a society based on knowledge, says Drucker, the knowledge worker is the single greatest asset. But survival and innovation of companies is nowadays not only dependent on the knowledge they have but on the creativity with which they apply knowledge upon knowledge (Weggeeman, 1997, 2000).

Knowledge can provide a sustainable advantage. According to Davenport & Prusak (1998): “Eventually competitors can almost always match the quality and price of a market leader’s current product or service. By the time that happens though, the knowledge rich, knowledge-managing company will have moved on to a new level of quality, creativity, or efficiency. The knowledge advantage is sustainable because it generates increasing returns and continuing advantages. Unlike material assets, which decrease as they are used, knowledge assets increase with use: ideas breed new ideas and shared knowledge stays with the giver while it enriches the receiver. The potential of new ideas arising from the stock of knowledge in any firm is practically limitless - particularly if the people in the firm are given opportunities to think, to learn, and to talk with another” (p 17). This is why knowledge management has become very important for companies. Further the growing interest in knowledge management is closely related to companies’ efforts to become learning organizations, in which managers strive to create a culture and a system for creating new knowledge and for capturing knowledge and getting it to the right place at the right time (Senge, 1990; Watkins & Marsick, 1993; Marsick & Watkins, 1999). Knowledge management aims to make knowledge explicit, codifies knowledge and experiences and develops knowledge that is essential for the realisation of the core competencies of a company (Davenport & Prusak, 1998). In this paper we pay attention to questions such as: what is knowledge, who uses it, where is it, how do you create it, how do organizations store it, what is knowledge management and what problems do organizations have with knowledge management?

Theoretical Background

Data, Information, Knowledge and Knowledge Management. When one talks about knowledge, the question arises how the difference between knowledge, information and data can be interpreted. Davenport & Prusak (1998) say: “data is a set of discrete, objective facts about events” (p. 2) and Peter Drucker (in Davenport & Prusak, 1998) once said that information is “data endowed with relevance and purpose”. Information comes into being when somebody attributes meaning to data. When that person communicates that meaning, from his point of view information is being transmitted. Davenport & Prusak (1998) say, “data becomes information when its creator adds meaning” (p 4). One talks about knowledge when information has acquired a place in the reference framework of the user and the user connects this with his own actions. Davenport & Prusak (1998) say about knowledge: “Knowledge is a fluid mix of framed experience, values, contextual information, and expert insight that provides a framework for evaluating and incorporating new experiences and information. It originates and is applied in the mind of those who know. In organizations, it often becomes embedded not only in documents or repositories but also in organizational routines, processes, practices and norms” (p 5). Davenport & Prusak describe knowledge as a socially constructed reality, influenced by personal beliefs and values, forged in the rhythms of daily work, and visible in a company’s products and services. Knowledge is complex because it is personalised. This makes it hard to standardise and to share effectively with others.

Knowledge management is about knowledge creation. Marsick & Watkins (1999) say "Its focus is releasing creativity and invention in people, who in turn can use what they know to develop the capacity of people, improve practices and processes,
and develop better products to serve the customer (p. 82).

In this paper knowledge management is being described as: listing the knowledge needs by examining what knowledge does an organization need and what knowledge is available among its employees. Knowledge management aims at systematically reducing the discrepancy between desired and available knowledge by acquiring, codifying, disseminating, developing and applying knowledge according to policy and plan on behalf of the strategic objectives of an organization.

Knowledge Management as Process. Sprenger (1995), Diepstraten (1996) Van der Spek and Spikervet (1996), Weggeman (1997) all distinguish several phases of knowledge management process. Van der Spek and Spikervet for example mention four phases in the knowledge management process: 1) New knowledge is being developed; 2) Knowledge is being distributed to those who need this knowledge in order to be able to execute their tasks well; 3) Knowledge is being made accessible for future use, also for the collective; 4) Knowledge fields are being combined.

From the foregoing it appears that various possibilities exist to describe the phases within the knowledge management process. In this research knowledge management is being characterised as a cyclical process consisting of five phases: Acquiring knowledge; codifying knowledge; dissemination of knowledge; developing knowledge and applying knowledge. Acquiring knowledge means incorporating new knowledge in the organization. For this only the strategic knowledge is important because it contributes to the execution of core activities and the development of the core competencies of the organization. Codifying knowledge means making knowledge explicit and making it accessible so that, if desired, other persons can acquire this knowledge at an arbitrary moment at an arbitrary place. The third phase of the knowledge management process is made up of the dissemination of knowledge to those for whom it is important for the execution of their tasks. In the fourth phase knowledge is being developed by means of existing knowledge. By combining elements of existing knowledge, new insights can be formed and thus new knowledge can be developed. The fifth phase of the knowledge-management process is the application of (newly developed) knowledge. This means that knowledge is being used on behalf of the organization.

Organizational Factors Influencing the Knowledge Management Process. Organization characteristics such as structure, culture, and strategy, and next to that knowledge systems, influence the progress of the knowledge management process. There exists a diversity of opinions about the ideal organization structure for the promotion of the process of knowledge management. Nonaka, & Takeuchi (1995) take the view that the hypertext organization has the ideal structure to promote knowledge creation. The hypertext organization is made up of three interconnected layers or contexts: the business system, the project team and the knowledge base. According to Nonaka, & Takeuchi (1995) “the central layer is the business-system layer in which normal, routine operations are carried out. Since a bureaucratic structure is suitable for conducting routine work efficiently, this layer is shaped like a hierarchical pyramid. The top layer is the project-team layer where multiple project-teams engage in knowledge creating activities such as new product development. The team members are brought together from a number of different units across the business system, and are assigned exclusively to a project team until the project is completed. At the bottom is the knowledge-base layer where organizational knowledge generated in the above two layers is recategorised and recontextualised. This layer does not exist as an actual organizational entity, but is embedded in corporate vision, organizational culture, or technology. Corporate vision provides the direction in which the company should develop technology or products, and clarifies the ‘field’ in which it wants to play. Organizational culture orients the mindset and action of every employee. While corporate vision and organizational culture provide the knowledge base to tap tacit knowledge, technology taps the explicit knowledge generated in the two other layers (p. 167). And “The key characteristic of the hypertext organization is the ability of its members to shift contexts. They can move among three contexts in order to accommodate the changing requirements of situations both inside and outside the organization” (169). This ability offers the organization great flexibility. In the hypertext organization the efficiency and stability of the bureaucracy is combined with the effectiveness and dynamism of the task force.

Several authors (Bertrams, 1999; Marsick & Watkins, 1999; Ostroff, 1999; Watkins & Marsick, 1993) take the view in order to create good conditions for the process of knowledge management it is best for an organization to switch from the widespread hierarchical task-oriented structure consisting of many layers to the much flatter horizontal or network structure. This process of decentralisation can extend over a group of businesses. Bertrams characterises the network organization as follows: “A network organization is a group of businesses usually supplying the same market or specific target group, and by means of working together they try to use each other’s strong points. With this it is important that various businesses actively work together in the exchange of clients and the offering of overall solutions” (p. 126,127). According to Bertrams (1999), within the structure of an organization communication along short communication lines, employing language comprehensible for everybody in the organization, good communication between the various departments because there is no competition and correct and easily accessible information about professionals and departments are essential requirements for the good progress of the process of knowledge management. Watkins & Marsick (1993) mention the importance of “a culture that is learning oriented, with beliefs, values, and policies that support learning; for example, tolerance for mistakes as opportunities for learning and problem solving; and policies that reward knowledge and the sharing of knowledge as well as rewards for performance” (p. 166). Davenport & Prusak (1998) say that these policies underline the value attached to sharing knowledge in the organization and that this motivates employees to share knowledge. The trust employees have in their organization is also essential for knowledge sharing (Watkins & Marsick, 1993). Davenport & Prusak (1998) say that trust must be visible (see people get credit for knowledge sharing) and trustworthiness must start at the top (if the top managers are trustworthy, trust will seep through and come to characterise the whole firm). These authors also point out the importance of providing time for learning and reflection. Factors from the culture of the organization strongly influencing the motivation for learning and giving feedback are, according to Bertrams (1999): feedback (what happens with my knowledge), the diversity of skills (do I get the chance to use that which I am learning), the recognisability of the task (does that which I am learning supply an added value to my ambition), the importance of
the task (do I help the organization with my behaviour) and autonomy (do I get enough freedom to learn). Next to that it is important that an organization rewards the correct behaviour. Not the amount of the knowledge a professional gives feedback upon must be a criterion, but the extent to which his feedback knowledge is being used.

Bertrams (1999) distinguishes two types of organizational cultures that can facilitate knowledge management: the enterprising culture and the group culture. Bertram says “An enterprising culture characterizes organizations taking a great extent of risk, dealing with a dynamic and complex environment, highly valuing creativity. Innovation, individual initiative and independence make up the standard. This is also the culture with which many businesses will identify themselves. Recruitment ads of almost all businesses will characterise their own organization with the described terms and will ask for professionals meeting those characteristics: enterprising, creative and full of initiative. Professionals in this organization want to score quickly and to climb at a high speed, their goal is to be able to start leading quickly, to get responsibility and finally to join the top of the organization. A group culture is characterised by tradition, loyalty, socialisation, lots of teamwork and social control. People enter into a long-lasting association with each other and they feel socially strongly connected. Although the organization aims at a good turnover, working together with each other in interesting fields gets priority. Communication, coordination and integration take place on the basis of shared goals. Innovation is possible in this organization but strongly depends on the standards in the organization. Because on the whole they are more aiming at the inside than at the outside not much external knowledge is brought inside” (Bertrams, p. 142). Bertrams (1999) takes the view that knowledge management stands the best chance in a mixture of an enterprising culture and a group culture.

Next to a certain structure and culture a strategy aimed at knowledge with a clear and detailed knowledge policy (Bertrams, 1999) aimed at innovation and learning (Watkins & Marsick, 1993) is essential for organization for their survival. Customer-orientation, product leadership or cost leadership, all three require a well running knowledge management process. Versatile and actual knowledge about the customer and his needs, good service and training when the products have been delivered and lasting contacts with the customer require that an organization must become a part of its environment. That environment must be mainly seen as the customers and suppliers of the organization. Knowledge coming from the environment must be easily picked up within the organization to be incorporated in the products and the services. Bertrams (1999) terms this a transition from internal to external orientation of organizations. Furthermore, the accessibility, the content and the feedback possibilities of the (electronic) knowledge systems of an organization influence the process of knowledge management (Stewart, 1997).

Research Question

At the moment the process of knowledge management receives much attention, but there has hardly been research into it. This is important because organizations, despite much good will, do not really know what they must do with knowledge management in real terms. Therefore, in this paper the following research theme is being explored: Knowledge intensive organizations experience difficulties in handling knowledge management. With which problems in the field of knowledge management are these organization being confronted? How do these organization handle these problems? And what recommendations can be made to prevent and solve problems in the field of knowledge management?

Methodology

Selection Case/Respondents/Functions. We have chosen to perform the research in knowledge intensive organizations employing professionals, because the acquiring, codifying, dissemination, development and application of knowledge is especially for these organizations of vital importance. For these organizations handling knowledge management well is essentially important for their survival. At the same time, professionals are the ones who find it hardest to share their knowledge. For they derive their value from the knowledge they ‘possess’.

Three organizations from a list of customers of a commercial consultancy for organization changes and management development were approached. All three organizations participated in the research project. The three participating organizations can be typified as customer oriented knowledge intensive organizations, also labeled as ‘heavy knowledge intensive organizations’. With these organizations the dominant influence on the functioning of the organizations is being exerted by the employees and the - direct - output is in the form of software, reports, drawings, formulas, programs and the like (Weggeman, 1997). In this paper only the research results of the organization with a prominent position in the field of automation are included because this organization is in a stable phase and has reasonable experience in the field of knowledge management. At the second company the process of knowledge management was being disturbed because this company was merging with another company and the third company was still in a starting up phase and consequently did not pay structured attention to knowledge management. In the case study applied in this study four respondents were involved, with the following jobs: the executive manager, the service line manager consultant (a specialist in the field of documentation); the knowledge manager and a (female) employee of the communication department. This organization will be referred to in this paper as ICT Ltd.

Procedure and Instruments. The data collection was being executed with a questionnaire followed by half structured interviews, going deeper into the subjects most relevant for this organization. The aim of the questionnaire was to get a quick image of that what is taking place in the organization in the field of knowledge management. Next to that the questionnaire served as preparation for the interviews. The questionnaire was filled in by four persons with diverse functions. The questionnaire contained 59 items. The literature was directive in the realization of the items. Each item represented a bottleneck in the field of knowledge management distinguished in the literature. The items were formulated in the form of propositions and were measured on a scale of six points with answer categories ranging from complete agreement to complete disagreement. The items were...
classified on the basis of the phases of the knowledge management process: acquiring knowledge, recording knowledge, dissemination of knowledge, development of knowledge and applying knowledge. Next to that questions were asked about the structure, the culture, the strategy and the knowledge systems of the organization. Next to the written questionnaire half structured interviews were being used. The aim of these interviews was to further examine the most relevant bottlenecks organizations experience in the field of knowledge management. At the same time it was examined which activities are being arranged in organizations to optimise the process of knowledge management. The subjects in the half-structured interview had been formulated beforehand in a topic-list.

Results

A Large Automation Company. The company is a part of ICT International, one of the biggest automation companies in the Netherlands. It is a combination of ten subsidiaries with their own expertise in their own domains and markets. ICT Ltd. is one of the subsidiaries of ICT International and an information and communication technology service provider from the very beginning. With its six hundred employees it extends service to the government. Public government is its field of activity. Its orders mostly deal with income processing, benefits, pensions, subsidies, finances, and document management. In the beginning of this year ICT Ltd. has started the project ‘Knowledge management ICT Ltd.’, because they realized that knowledge is the most important value in the organization.

The Knowledge Management Process at ICT Ltd. In this paragraph the results are structured on the basis of the various phases of the process of knowledge management: acquiring knowledge, codifying knowledge, dissemination of knowledge, development of knowledge and applying knowledge, and subsequently on the basis of the factors of the organization influencing the process of knowledge management: structure, culture, strategy and knowledge systems.

The Different Phases of the Process of Knowledge Management

Acquiring Knowledge. All four respondents experience it as a problem that ICT Ltd. has not or hardly not established which specific knowledge and skills its employees have at their disposal. Because of this it is not clear which knowledge is available within ICT Ltd. At the moment much time is being lost with the searching of the right people with the right qualities. "You really have to know people to find somebody", according to one of the respondents. The fact that ICT Ltd. is a big organization with different branches does not make it any easier. The head of the department covering knowledge management does not think that this is such a determining factor. He said: "If each department has established in its own way who has which knowledge and skills, then others can also retrieve this quickly with a phone call or an e-mail". All respondents see a solution for this problem in the form of Purple Pages, which are being organized at holding level. Each respondent takes the view that ICT Ltd. is actively gathering knowledge about the wishes and needs of its clients. According to the managing director this is being done in the form of so-called ‘fire place sessions’. During these rather informal meetings different subjects come up, but the outcomes of these meetings are not adequately being taken up by the organization. Within ICT Ltd. BV the account managers only spend one day per week with their (possible) clients. The remaining four days they occupy themselves with internal worries. The respondents see this as a problem because account managers are contracted for the acquisition of new clients and next to that to find out about the wishes and needs of the existing clients and not to solve internal problems. ICT Ltd. offers its employees enough possibilities to learn. However, the management does not stimulate the following of trainings and seminars. Employees themselves have to indicate that they want to follow a certain course or want to attend a seminar. One of the respondents says about this: “The management never tells you that it might be good to follow a training in this or that field. You really have to explain what purpose it serves for ICT Ltd.”. Thus the following of trainings and seminars takes place on one’s own initiative and usually ad hoc. One service line has been given time to assemble the whole department for one day per month. During this meeting experiences are being shared. Sometimes another service line or another subsidiary is being invited to tell about their activities.

Codifying Knowledge. All respondents except one do not know how they can get access to knowledge about activities in the past. Anyway the accessibility of information isn’t taken serious, not only the accessibility of knowledge from the past, but also the accessibility of current knowledge. The infrastructure of the Intranet is hampered by the dialectics of progress; it was very modern in the past, now it is outdated and not at all well-tended. The focus is very strongly externally. The internal organization of ICT Ltd., consequently the Intranet also, does not get enough attention. The employee of the department covering knowledge management expresses it as follows: “It’s the same as the house of the painter that is badly in need of paint”. The Intranet is a possible solution but also informal contacts — acquaintance management — are very important. Employees do not get enough time for this. There is too much a striving for maximum declarations. All respondents are of the opinion that the know-how knowledge, in other words the procedural knowledge, and the know-what knowledge, also called factual knowledge, has been reasonably well or well recorded. However with the procedural knowledge the comment is made that maybe too much is being casted in procedures. “The advantage of it is that everybody talks the same language, but the disadvantage is that suddenly everything has to be done in procedures. People handle this rather rigidly while the procedures are meant to be flexible”, according to a respondent. Which know-what knowledge is being recorded differs per service line. Some service lines lay down explicit knowledge about clients and markets, other service lines mainly record knowledge concerning content of projects. This knowledge is only accessible for the employees of the service line in question. The respondents are all of the opinion that within ICT Ltd. much information is already laid down in the form of e-mails, letters, faxes, documents and the like. But this information is left lying around the whole organization. “When this information is being stored and opened up in a structured way, this would be a considerable headway for ICT Ltd. in easily retrieving important information”, according to the head of the department covering knowledge management. About the stimulation of the management the respondents have different opinions. Two respondents are of the opinion that the management supports them sufficiently to record their knowledge. The other two respondents, one of them the head, say that the management ought to stimulate them more to record subject content knowledge. They are of the opinion that recording knowledge and skills must be extracted by means of a procedure or rule, because some people do not take that responsibility themselves. It is even being suggested to make the recording of knowledge and skills part of the assessment. There is no difference of opinion about the fact that colleagues hardly pay attention whether it is being set out according to which method one
works. This is in particular because of the culture of ICT Ltd. There is a very friendly atmosphere, this makes it very difficult to tell each other what could have been done better. The respondents regret this because at the moment ICT Ltd. has a high staff turnover and as a result much knowledge disappears from the organization. One of the respondents also experiences having own storage methods which are inaccessible for others and a lack of a convention about formats, as bottlenecks in the field of the recording of knowledge. There are no rules for assigning a name to a file. "Most of the time information is being put on one’s own laptop computer. There are hardly any common directories. When there are common directories these are only accessible in the office and not when you are at a client’s house or at home”, according to the employee of the department covering knowledge management.

**Dissemination of Knowledge.** With regards to the dissemination of knowledge the respondents experience only few bottlenecks. Much knowledge is being spread by means of the informal circuit. This is being experienced as pleasant, but the corridors also cause much ‘noise on the line’. The employee of the department covering knowledge management said about this: "If there is no communication, people will fill in the dots themselves. If they do no longer know it, they start pointing and usually the general manager is the fall guy". The head denominates the informal circuit ‘the place where you can do business quickly’. "It’s like ‘I am working on this, do you know someone who knows more about it?’. According to the respondents the informal circuit has advantages over the formal circuit. It is accessible, ‘safe’, easy and quick. A disadvantage is that it is more difficult to supervise, to control and to survey than the formal circuit. One respondent is of the opinion that maybe the informal circuit has become so big because of the lack of a good formal circuit. When it is being recorded in a user-friendly accessible system who works on what and who has which knowledge and skills, the informal circuit becomes less vital.

Nearly all respondents experience the fact that within ICT Ltd. much knowledge is inside the heads of the employees as a problem. One respondents does not consider it to be a problem that much knowledge is inside the heads of the employees, but the fact that this knowledge is not recorded is a problem. The head of the department covering knowledge management is of the opinion that “this implicit knowledge is a fortune, but it would be worth something if ICT Ltd. would be a little less dependent on the physical presence and effort of employees with a lot of implicit knowledge”. Much personal knowledge is being lost when an employee leaves the organization. It is also difficult to lay down this implicit knowledge in systems. There are different ways to solve this bottleneck. Good facilitation of knowledge management increases the chance that good employees do stay. Because of this the search for relevant information takes longer. This time and projects pass off more efficiently. A good knowledge management system also enlarges the pleasure in one’s work. In any case it expels a number of frustrations. A second solution is to link a senior with a junior. But within ICT Ltd. they do not have the nerve to give a senior each week a day off for this. With the issues of the day the external clients take precedence. Too much attention is being paid to the short-term results. The fact that ICT Ltd. is quoted on the stock exchange is being used as an excuse for this.

According to the director the implicit knowledge and the experience of the employee who leaves the organization is also being reflected in advice reports and products. According to him there is in this “an implicit knowledge transfer in the way in which the work has been done. Others can learn from this.”

Three of the four respondents take the view that sharing knowledge with colleagues strengthens the position in the organization. “For when you share your own knowledge, you are more likely to get knowledge back from others”, according to these respondents. Respondent number four states that many employees of ICT Ltd. find the sharing of knowledge with colleagues threatening. He says about this: “People are afraid to lose prestige when they yield up their knowledge”.

The fact that employees never change functions is being considered as a bottleneck in the field of the dissemination of knowledge. The respondents agree that function changes do not or hardly ever occur within the company. Function changes are also rather difficult because the roles and tasks of the different employees diverge too much. According to the director: "It is hardly possible for a programmer to carry out the tasks of an advisor during a month and vice versa". However, there are many different projects demanding various skills of the employees. Apart from the exchanges in the projects, within ICT Ltd. one works almost always with interdisciplinary team compositions. The respondents find this very worthwhile, because in this way much knowledge is being disseminated. Next to that because of this new knowledge is being developed since you learn from each other.

Only the director takes the view that the employees of ICT Ltd. provide each other with too little information about work experiences, courses they have taken and/or projects. Good methods within a project are not explicitly registered and disseminated. Sometimes this knowledge is being disseminated in an informal way, for instance in the corridors. One is reasonably open about problems and mistakes. The employee of the department covering knowledge management refutes this. There is more talk about others than with others. More is said about this under the heading ‘culture of the organization’.

**Development of Knowledge.** The head of the department covering knowledge management and also an employee of that department take the view that it happens within the company that the same knowledge is being developed at two different places in the organization. They say that this is caused by lack of information about the activities of colleagues. Both respondents experience this as a problem. It costs time and therefore money. The director of the organization also indicates that indeed it happens once in a while that the same knowledge is being developed at two different places in the organization but he does not consider this to be a problem. About this he says: "It’s better that the same knowledge is being developed at two places in the organization than that this knowledge is not being developed at all. Indeed it’s a pity about the time, but in any case the employees have learned".

ICT Ltd. has reasonable to good contacts with research institutions. Students frequently do a work placement or their subject for final project at ICT Ltd. Both parties profit from this. In this way both the student and Automatisering BV acquire and develop knowledge.

The respondents all take the view that ICT Ltd. offers them enough room to experiment with, for instance, new working methods. The development of new knowledge is even one of the items of the evaluation. The employee of the department covering knowledge management is of the opinion that within the company the work is primarily done by routine. But according to him this working by routine does not hinder the knowledge management process. "Certain activities have to be executed by means of certain fixed steps", according to this respondent.

**Application of Knowledge.** According to the respondents new knowledge and/or methods are well applied. Knowledge is being applied with the working for clients, the writing of articles and with internal consultation. For the execution of assignments knowledge acquired earlier is always being used to arrive at new understandings. The respondents do not experience any difficulty with the application of knowledge of colleagues. There is no fear that knowledge of colleagues is of insufficient quality. Everybody takes the
view that the application of new knowledge is important. The director says about this: "there is no culture 'I have always done it this way, it always worked, so why should I change'. Furthermore, according to the respondents, the employees for whom new developed methods are intended are sufficiently involved in this development.

Organizational Factors Influencing the Knowledge Management Process

Structure of the Organization. The opinions about the length of the communication lines of ICT Ltd. differ. Only the head of the department covering knowledge management says that the communication lines are short. "A culture of calling very quickly and walking into each other's room when you have a question is prevalent" according to the respondent. The communication lines to the management and the board could be shorter. The other three respondents share this view and experience it as a problem. Because of this the knowledge feedback is slower. In general employees find it difficult to walk into the room of the director. On the other hand the director is of the opinion that: "if I get an e-mail message or a phone call from an employee, I answer it the same day. Sometimes I do not succeed in answering it the same day, but then I always inform the person in question about this". The director also gives the following example that aptly expresses the situation with regards to this: "I heard from a colleague that person X wanted to ask me a question about a certain subject. He did not dare to call me, so my colleague advised him to send me an e-mail. It took a week before he had summoned up his courage to send me a mail message. I replied the same day, and he was so amazed that he went to my colleague to tell this remarkable news".

The same respondent who takes the view that the communication lines of ICT Ltd. are short, also says that the staff turnover within the company is relatively small, anyway when you compare it with the holding. The other three respondents take an opposite view. All three experience the big staff turnover as a problem. It happens regularly that employees with unique knowledge and experience, which in most cases has not been recorded, leave the company. According to the employee of the department covering knowledge management, the most important cause of this is the fact that employees are being hindered in executing their work properly. Too many internal matters have to be solved by the employees themselves.

Discussions of progress are regular agenda items according to the respondents. The employee of the department covering knowledge management takes the view that during meetings too much time is being spent on discussions of progress. He says about this: "let's stop that mattering and get to work!".

Culture of the Organization. According to the respondents the emphasis is mainly on the short-term results. This is so because ICT Ltd. is an organization quoted on the stock exchange. "Now and then you have to show quick wins, because otherwise you will not get any room to go on", according to a respondent. This short-term thinking adversely interferes with the process of knowledge management. Because of this one handles knowledge pragmatically. The result of knowledge management only becomes visible in the long-term, because of this it is difficult to indicate how much benefit one derives from an investment, for instance a database.

Three respondents take the view that within ICT Ltd. one can openly talk about mistakes and insecurities. Only the employee of the department covering knowledge management disagrees. They look at your mistakes when you are being squared up. In case of a mistake it is like 'what a failure' instead of 'I learned something from that'. One of the causes of this can be the fact that the company from time back stems from a government culture. The respondent is of the opinion that this bottleneck enormously obstructs the knowledge management process. "When there is no willingness to learn from one's own mistakes, possible other points of improvement are also not being passed on to others. Next to that within ICT Ltd. knowledge is still often considered to be power, because of this employees are often not willing to openly share knowledge at tactical and strategic level", according to this respondent.

About the question whether the management of ICT Ltd. gives the good example with regards to knowledge management, the opinions are divided. The director and the head of the department covering knowledge management take the view that the management not only promotes knowledge management but that it also applies knowledge management reasonably well. The other two respondents are of the opinion that more stimulation from the management is necessary.

Strategy of the Organization. All respondents agree, indeed to a greater or lesser degree, that knowledge management is a part of the strategic policy of the company. The respondents experience this as being important. In this way employees get the feeling that knowledge management takes priority. This can also be realized by incorporating knowledge management in the objectives of ICT Ltd. Because of this, employees are more inclined to acquire knowledge, to record, to disseminate, develop and apply it. A knowledge policy, describing how the phases of the management process can be interpreted, is considered to be less important.

The employee of the department covering knowledge management indicates that strategy is something very nice but it has to be converted into decisiveness. It not infrequently happens that ICT Ltd. is lacking in decisiveness. There is much talk, much is being written down, all kinds of plans are being made, but subsequently nothing is done with it. Employees themselves do no longer expect that the plans will be put into action. The decision-making is very slow as a result of the reigning hierarchy. Almost all decisions are being made by the general manager. As project manager you hardly have any elbow room.

Knowledge Systems of the Organization. Different service lines have their own knowledge system, mainly in the form of an Intranet, but the cohesion and the integral accessibility leave something to be desired. In most cases only employees of the different service lines have access to the knowledge system of their own service line. Next to that ICT Ltd. has an intranet exceeding the organization. Two of the four respondents, one of them the employee of the department covering knowledge management, take the view that this Intranet is not up-to-date and access is difficult. Next to that feedback of information takes a lot of time, because of this it often does not take place. One of the respondents describes the state of the Intranet as follows: "nothing at all happens on that Intranet, nobody looks at it, and if you do take the trouble to have a look at it you find dead links and references to people who no longer work for us, and in a few cases to someone who has already died". An outdated version of Microsoft Office is being used. This makes the exchange of data difficult not only with customers but also with sister companies, because the sister companies do not use the same standards.

Too often one thinks that a knowledge system is the solution for many problems. So for each problem a new system is being bought. One often forgets that knowledge management is more than an Intranet. The human factor, for example in the form of a knowledge broker is often forgotten. The head of the department covering knowledge management says about this: "when I have a problem in the issues of the day, my first thought is 'who can help me with this' and then I make one or two phone calls. Only when do not succeed I'll start looking in systems."
Within ICT Ltd. mail facilities are being used a lot. In that Internet certainly has a value.

Conclusion and Discussion

About the phase of knowledge acquisition three employees say that they have not enough time for knowledge acquisition and sharing. The management team of ICT Ltd. does not make time for the evaluation of projects, for knowledge exchange meetings, for writing short reports or giving short presentations about an attended course. Yet the director takes the view that he does stimulate his employees with regards to these points. It seems advisable to create more time for above mentioned activities.

There is no good insight into where knowledge is located in ICT Ltd. Nothing has been recorded about which specific knowledge and skills the different professionals have at their disposal. Because of this, it takes a lot of time to find the right employee with the right qualities. Both Bertram (1999) and Davenport & Prusak (1998) mention this problem. According to Davenport & Prusak (1998) knowledge mapping can be helpful to improve the matching of knowledge with people. The respondents mention this solution themselves. They consider Purple Pages to be a solution for this. In these it is being recorded which competencies each employee has at its disposal, in which projects he or she has participated and at which projects he or she is working now. ICT Ltd. does register what the market asks.

All the time and in different ways (formally and informally) knowledge about the needs of the clients is actively being gathered. It is remarkable that the respondents take the view that no active knowledge policy based on these data is being pursued.

The respondents are of the opinion that the management does not provide enough stimulation for attending courses or a seminar. They do remark that during projects much is being learned. It seems that these professionals do not know what they must learn. This problem is being mentioned by Bertram (1999) and he takes the view that there is a danger that because of this, the motivation to learn decreases. Bertram (1999) comes out with a solution: goal-oriented career planning and learning based on a good picture of the knowledge an employee ought to have at his disposal according to ICT Ltd. in order to be able to rise to a desired position and an intended competence level.

There is also dissatisfaction about the phase of codification. Three employees say that they have not enough time to codify knowledge. Moreover, access to knowledge and information is difficult at ICT Ltd. and to the extent knowledge is being recorded, it is not being kept up-to-date. Furthermore, employees are not being stimulated to lay down knowledge. It seems advisable that ICT Ltd. in the near future critically revises its use of information technology systems and decides which systems such as internet, EDI, intranet, MID, DSS, ERP and mechanisms such as data warehousing, data mining, knowledge mapping, electronic libraries, are most useful for the exchange of knowledge in ICT Ltd. and which persons will be responsible for keeping them up-to-date and running (Sprague, & Watsone, 1996).

There is also dissatisfaction about knowledge dissemination. Because explicit and tacit knowledge has not been adequately codified in a knowledge system, the informal circuit plays an important role in the dissemination of knowledge. The respondents say about the informal circuit that it is easily accessible, flexible, easy and quick. The importance of the informal circuit for the dissemination of knowledge is being endorsed by several authors (Nonaka & Takeuchi, 1999; Davenport, & Prusak, 1998) in particular for the exchange of tacit knowledge for which face-to-face contacts are essential. However, the respondents complain about poor knowledge exchange with regards to work experience. Much knowledge is inside the heads of the employees and because this is not being recorded this disappears as a result of a frequent considerable staff turnover out of the organization. Nonaka & Takeuchi (1995) and Davenport & Prusak (1998) mention approaches such as apprenticeships and mentoring and a method like videotaping as solution to make this tacit knowledge explicit. Bertram (1999) recommends passing on new knowledge already during the development of knowledge. Other methods to learn from experiences in projects are the creation of learning histories (Kleiner & Roth, 1997) and creating a favorable culture to stimulate communities of practice in which these experiences can be exchanged in a more informal way on a day-to-day basis (Wenger, 1999).

There is also dissatisfaction about knowledge development/creation. Within ICT Ltd. it happens that the same knowledge is being developed at two places. The employees especially experience the loss of time because of this as a problem. In the literature this problem has already been mentioned by Nonaka & Takeuchi (1995). A knowledge system with a good overview of where and with whom knowledge can be found within the organization and what each employee is doing at this moment could offer a way out. Although all respondents take the view that there is enough room to experiment in that the development of knowledge is even a part of the assessment at ICT Ltd., the knowledge manager says that there is relatively too little attention for the development of new knowledge. This problem has already been mentioned by Bertram (1999).

The employees of ICT Ltd. experience no problems with the application of new knowledge. Barriers for the use of new knowledge mentioned by Bertram, such as aversion to risk, fear for problems with colleagues who want to go on using older knowledge and insufficient support are not being mentioned by the respondents of ICT Ltd.

Structure. According to several authors (Bertram, 1999; Nonaka & Takeuchi, 1995) long communication lines, a high staff turnover, not having regular discussions of progress and not working in a project based way are bottlenecks negatively influencing the knowledge management process. The first two bottlenecks are being mentioned by the respondents. They experience communication lines to colleagues and communication lines to the management as long. The staff turnover at ICT Ltd. is high. As already has been noted, because of this, unique personal knowledge disappears out of the organization. The last two bottlenecks do not occur. There is regular discussion of progress and they work in a project based way in ICT Ltd. The company already has a characteristic of the hypertext organization mentioned by Nonaka & Takeuchi (1995): the project-team layer, the working in projects for which the right persons are being deployed per project. However, ICT Ltd. lacks a knowledge based layer where new generated organizational knowledge is recategorised and reconceptualised. Newly acquired knowledge remains for a large part in the heads of employees. Next to that ICT Ltd. has the characteristics of a flatter network structure which certainly has a positive influence on knowledge dissemination within the organization.

Culture. Of the culture mentioned by Watkins & Marsick (1993) that is learning oriented, with beliefs, values, and policies that support learning; for example, tolerance for mistakes as opportunities for learning and problem solving, and policies that reward knowledge and the sharing of knowledge as well as rewards for performance only a few traces can be found at ICT Ltd. Although much is being learned during the working in projects, no efforts are being undertaken to systematically lay down this knowledge or to share it
with others, and there is no aspiration to systematically gear the competencies of the individual employees to the (future) strategy of the company by means of courses or otherwise. Furthermore, the respondents have different opinions about being able to talk openly about mistakes and doubts. And ICT Ltd. does not have policies that reward knowledge and the sharing of knowledge and offers as well rewards for performance. The respondents also differ in opinion about the question whether the management sets a good example with regards to knowledge management. Trust is not visible in this organization. Of the essential variables from the organizational culture mentioned by Bertram (1999), such as: feedback (what happens with my knowledge), the variety of skills (do I get the chance to use that which I am learning), the recognisibility of the task (does that which I am learning add a surplus value to my ambition), the significance of the task (do I help the organization with my behaviour) and autonomy (do I get enough freedom to learn), the respondents only mention variety and autonomy. Furthermore, ICT Ltd. does exhibit the characteristics of an enterprising culture, in which innovation independent work and initiative is being expected from the employees and one works in a dynamic risky environment, but with the exception of working in teams, ICT Ltd. hardly displays characteristics of a group culture.

Strategy. ICT Ltd. has included knowledge management in its strategic policy, but the strategy is insufficiently converted into decisiveness, according to a respondent. Within ICT Ltd. there is no aspiration to systematically gear the competencies of the individual employees to the (future) strategy of the company by means of courses or otherwise.

Knowledge systems. It is important that the knowledge systems are up-to-date, well accessible and user friendly (Bertram, 1999 and Davenport & Prusak, 1998). The knowledge systems of ICT Ltd. are not being maintained properly, are not up-to-date and the information is incomplete. It is remarkable that the director is satisfied with the current knowledge systems. The fact that the different sister companies work with different standards is considered to be a big bottleneck within ICT Ltd. The respondents take the view that the value of electronic knowledge systems must not be overrated. Especially in small organizations a knowledge system on paper can also function excellently. In larger organizations and in organizations with several branches an electronic knowledge system is indispensable, according to the respondents. In these kinds of organizations it is impossible to know who has which knowledge and skills, who has executed which projects and who is currently working on which project. Davenport & Prusak (1998) are endorsing this view. Yet as already mentioned it seems advisable that ICT Ltd. in the near future critically revises its use of information technology systems and decides which systems such as internet, EDI, intranet, MID, DSS, ERP and mechanisms such as data warehousing, data mining, knowledge mapping, electronic libraries, are most useful for the exchange of knowledge in ICT Ltd. and which persons will be responsible for keeping them up-to-date and running (Sprague, & Watson, 1996).

Using a Human Capital Framework to Inform Human Capital Investment Decisions

Joanne Provo
Personnel Decisions International

This study analyzes organizational capabilities strategy from the human capital perspective. It includes the development and application of a methodology for utilizing a human capital framework to develop an organizational capabilities strategy, and an investigation into the resulting human capital implications.

Key Words: HR Strategy, Human Capital Investment, Organizational Capabilities

There has been an increased focus on human capital and the strategic management of an organization's talent pool in the past several years as organizations struggle to attract, develop, and retain the best and the brightest employees (Gubman, 1998). Unfortunately, strategies to analyze the capabilities needed to thrive in a knowledge economy and the accompanying organizational support systems are lacking. This study was intended to provide a vehicle that human resource professionals can use to increase their involvement in the development of organizational strategy.

In addition human resource strategies and initiatives can be more appropriately aligned around those capabilities that have the greatest impact on the success of the firm.

Theoretical Framework

Human resource professionals have been challenged to gain legitimacy in the strategic planning and thinking of their organizations and have been encouraged to do so through an understanding of the business implications of effective human resource practices (Ulrich, 1997). Other than training in business strategy and encouragement to view the firm through the eyes of the line managers they serve, there has not been a pragmatic way for human resource professionals to engage in strategy development for their firm (Torraco & Swanson, 1995). Human resource leaders do not often participate as full partners in strategy development, but instead are engaged in the deployment of a strategy developed by others in the hierarchy (Jarrell, 1993).

A number of economic, demographic, and technological factors are converging to increase the competitive advantage of including a human resource perspective in the strategy process. The last several years have produced a period of low unemployment throughout the United States (Branch, 1998; Fenn, 1997; Rifkin, 1995). The increasing demand for labor is coupled with a demographic phenomenon of an aging population and a shortage of new entrants to the workforce (Greco, 1998; Gubman, 1998; Working in America: A Chart Book, 1988). In addition to those factors, employers are seeing the application of technology and the need for knowledge workers reach an unprecedented peak (Bassi, Benson, & Cheney, 1996; Report on the American Workforce, 1994; Salamon, 1991).

The convergence of these trends provides an opportunity for human resource professionals to demonstrate the criticality of their role in the development and validation of organizational strategy. To engage the organization they will need to demonstrate value through the perspective of the asset they oversee, human capital. This role requires an understanding of how human capital contributes to the value of the firm and how that value can be measured and leveraged to gain competitive advantage in the marketplace.

There is an emerging approach to organizational strategy focused on an organization's capabilities as a source of competitive advantage. Capabilities involve the integration or linking of activities in the value chain, they represent the skills, resources, processes and technologies of a firm (Duncan, Ginter & Swayne, 1998). The key is in focusing a strategy around these "uniquely developed set of core intellectual and service capabilities important to customers" (Quinn, 1992, p. 50).

As human capital is increasingly being recognized as the most critical source of organizational capabilities (Stewart, 1997), it is imperative that this asset be leveraged to provide optimal value for the firm. Analyzing the value of human capital requires an examination of an organization's competitive positioning, and a fundamental understanding of how capabilities contribute to the value of the firm. Understanding the value of human capital

Copyright © 2001 Joanne Provo
requires a new and different analysis approach, one that can surface the sources of competitive advantage, propose a strategy for leveraging that advantage, and implement appropriate measurement system.

This study introduces an organizational capabilities strategy process that allows human resources professionals to develop and align human resource practices in a way that increases human capabilities. The framework and methodology engages senior human resource professionals and key line managers to examine their value chain, identify external and internal opportunities, and recognize constraints for the purpose of developing a capabilities strategy for an organization. This process will investigate how capabilities create value for the firm and examine the human resource implications that result from this strategic approach. The framework will be used to analyze the impact and effectiveness of investments in human capital and allows the organization to view strategic advantage through a human capital lens.

Research Questions

The fundamental question driving this study was: How does an organization develop an organizational capabilities strategy from the human capital perspective and what are the resulting human resource management and development implications? The research being reported in this paper focused on two sub-questions:

1. Can a human capital framework be used to develop a sound organizational capabilities strategy from the human capital perspective?
2. What human capital decisions emerge throughout the organization as a result of using the human capital protocol?

Research Methodology

The research followed the general guidelines for case study research put forward by Yin in his book, *Case Study Research: Design and Methods 2nd Edition* (1994). The subject of the case study was Select Comfort®, a rapidly growing company that went through an initial public offering in December of 1998. The company is a leader in sleep solutions focusing primarily on using air technology for beds and sofa sleepers. They currently manufacture and sell their products through retail channels and direct mail. The organization was selected because they have realized rapid growth in the few years since their inception, and with the recent IPO find themselves in a situation where their constraints are capabilities, not access to capital or customers. The organization presents a unique opportunity to investigate the applications and outcomes of a capabilities based strategy process.

Capabilities Strategy Protocol

The research questions were analyzed by probing into the human capital implications of the organizational capabilities strategy. These implications were examined through a series of working sessions in which the researcher worked with the organizational leaders and HR Team to facilitate the development of a human capital strategy using the People SCOPE™ framework. The PeopleSCOPE™ framework is introduced more fully below. The protocol used to guide the study is summarized in Table 1.

The research incorporated organizational data gathered through the fieldwork, interviews, and training experiences to examine the results of leveraging HR investments that support the organizational strategy. The research was not longitudinal and was not intended to examine the financial results of the implementation of a capabilities strategy. Instead the research was intended to look at how HR investments are positioned, what decisions can be made as a result of using a human capital framework, and to demonstrate how human capital investments can provide value for the firm. The research centered on how the HR leaders can present HR investments that contribute to the achievement of strategic organizational objectives.

Human Capital Framework

The framework used for this study has been proposed as a way to analyze the human capital implications of a firm's strategy, or to build an organizational strategy that leverages human capital. The framework first appeared in the literature as the PeopleVantage Model of Strategic Human Resource Management (Boudreau, 1998). The model was further developed and positioned primarily as a way to convey the synergy between organizational strategy and human capital investment (Boudreau & Ramstad, 1999a). The resulting framework, the PeopleSCOPE™ Human Capital Framework (Boudreau & Ramstad, 1999b) can be seen in Figure 1.

The framework presents a process whereby an organization can analyze the effective deployment of capital by looking at how investments in HR activities contribute to increased capabilities, opportunity or motivation.

Figure 1. The PeopleSCOPE™ Human Capital Framework
necessary for aligned action in pivotal roles. The investment is only truly strategic, if in addition to efficiency and effectiveness, the interventions are focused on improving the business processes that have an impact on sustainable strategic advantage.

To provide further insight into the potential applications of the PeopleSCOPE™ Human Capital Framework it is helpful to understand the intended use and also the process that a researcher or practitioner would undertake to uncover the key human capital implications. The framework is intended to build line of sight from an organization’s people to the specific elements of competitive advantage. The framework builds on business strategy, value creation, financial analysis and strategic human resource management to analyze economic value through the human capital lens (Boudreau & Ramstad, 1999b).

Questions are asked of the organization at each level of the framework that are intended to uncover the human capital implications of the strategic positioning. The key capability questions asked at each level of the framework are presented in Table 2.

These questions were developed to facilitate a discovery process that could be led by the Human Resource function or initiated at various levels within the organization where human capital constraints affect strategy execution. The first two elements are primarily focused on the organization strategy while the following five begin to delve into the human capital implications of the organizational strategy and key business processes.

This framework allows for an examination of the impact that capabilities can have on the accomplishment of strategic objectives. There is also an opportunity for HR leaders to analyze the human capital implications of a given organizational strategy. The framework can be used to move the HR focus from one of efficiency and effectiveness to a concentrated effort looking at HR investments that have a financial and strategic impact on the organization. The application of this framework to identify and analyze human capital issues that are affecting key business processes is fundamental to the ability of the organization to sustain strategic advantage. This perspective changes the approach that HR professionals use in proposing HR investments.

Results and Findings

The HR team, which included the Directors and VP, worked with the researcher to examine the human capital implications that emerged as a result of the data gathered for the first three steps of the human capital framework. The outcome was to develop a plan to leverage HR investments to create value for the firm. Examples of how human capital decisions can create value for the organization will be presented in the discussion below.
Organizational Capabilities Strategies from the Human Capital Perspective

An illustration provided by the researcher summarized the nature of the decisions that surfaced during the analysis. There was considerable interest in the financial and strategic impact of the current recruiting initiatives. The following example provides a baseline that the HR leaders could use for evaluating alternative human capital strategies and also provides the process steps around which all of the HR areas can be aligned to ensure organizational impact of HR investments.

The organization's strategy mandated a concentrated focus on the retail distribution channel as a source of competitive advantage. The constraints that challenged the retail value chain were sales professional dependent. For every retail employee hired:

- 20 Resumes/Applications are screened
- 10 Candidates are phone screened
- 4 Candidates are interviewed in person
- 1 Person is eventually hired
- The current turnover rate is 100%

Given this data, filling 2000 positions for the upcoming year will require 40,000 resumes/applications to be screened, 20,000 phone interviews, and 8,000 in person interviews. The issue is not only the magnitude, but the cost as well. The HR VP commented “We’re spending thousands of dollars in recruitment fees. For the dollars we have spent alone in recruitment fees in a year, you could hire six people.”

Once the magnitude was understood, the HR Team was in a position to start brainstorming how they might align their efforts, including adding regional recruiting centers, employee referral bonus programs and massive advertising campaigns. While these ideas had merit, the recruiting effort needed funding. This issue was addressed by reviewing the data gathered via the human capital framework and introducing the threshold ROI approach. The goal was to have the team understand the strategic and financial implications of their recommendations and also to understand how to present their human capital initiatives to the managers of the business units they support.

Using data gathered early in the protocol, it was determined that the district sales managers are spending at least 40% of their time recruiting and hiring. It was also stated that the median price for a bed was $1,200. Successful sales professionals sell three to four beds a week for an average of about twelve beds per store per week. With 332 stores currently open and the figure expected to rise to 345 stores by year end the impact of one more bed per store per year is $345 x $1,200 for a total of $414,000. The $414,000 is the amount available to be invested in recruiting and hiring if management believes that having their district sales managers in the stores two more days a week (40%) will help them sell one more bed per store per year. The threshold ROI approach incorporates financial data already known about the business and proposes the intervention in a way that allows the senior managers to make an informed investment decision. In this case, management had identified having the district sales manager visible and involved in the stores as a key success factor. Positioning the decision in a more compelling way makes the HR investment an easier sell. Such as "What is it worth to you to have your district sales managers in the stores two more days a week?" "Could you sell one more bed per store per year if the district sales manager were available to be in the stores two more days per week?" This discussion demonstrates the strategic perspective of human capital and lays the groundwork for investment in capabilities. In this particular case when the Director of Retail Human Resources presented this example to the Senior VP of Retail his response was “now you’re thinking”.

Analyzing the appropriate investment of resources in particular HR initiatives or bundles, the HR professionals are in a much better position to align their efforts. In this case there may be retention strategies, which include training, that ensures that the sales professional is more successful and thus stays longer with the organization. There may be an opportunity to provide bonuses based on tenure or to managers who are better able to retain their successful sales professionals. This analysis can also be used to determine the amount of investment in recruiting, and even to determine the financial impact of a change in the compensation structure.

The point for the HR Team and for others within the organization is that starting the analysis with an understanding of the sustainable strategic advantage and key business processes provides a “line of sight” to pivotal roles within the organization. Once the pivotal roles are understood from a strategic perspective, HR professionals are in a much better position to analyze the behaviors that most impact the business and determine whether the constraint is one of capability, opportunity, or motivation. This understanding provides the strategic context for recommending HR investments to build capabilities that will have the greatest impact on the organization. Using the sales professionals as a pivotal role, the following section will illustrate how this organization is using a strategic approach to building capabilities within their sales function and how these investments can create value for the organization.
Human Capital Decisions that Create Value for the Firm

The study resulted in the development of a five-year HR strategic plan. Of the initiatives outlined in the plan, the area that has received the greatest amount of management support and interest was in the attraction, motivation, and retention of sales professionals. The business strategy is dependent on a successful approach to recruiting and hiring these employees, and the senior management of the retail sales channel has acknowledged the importance of placing and keeping key people in these roles. Management has also shown a willingness to partner with the HR staff to develop solutions that are not only efficient, but that have the biggest impact on achieving the organization’s strategic and financial goals.

The sales professional role is critical for a number of reasons that need to be illustrated here. There are very few sales professionals in any one store. In fact stores with $1,000,000 in annual sales revenue operate with a sales force of three to four people. It should also be noted that there are large variances in performance between the high performers and the average performers, and a strong correlation between tenure and sales performance. There is great benefit to having a high performer in the store as evidenced from the sales figures, and those higher performers tend to have a longer tenure. While differences in performance for high and average performers can be illustrated, it is not known how much poor performers hurt potential sales and brand image beyond the fact that the sale was not made. In other words, there is a potential revenue loss that is not captured when poor to average performers are allowed to continue to work in the store. It is also important for the accomplishment of the organization’s growth strategy that potential district and regional sales managers be identified. While their performance may be evidenced in their sales figures there have been instances where a Sales Professional who was only rated as average in sales performance went on to become a highly effective District Sales Manager, managing high performing stores and sales professionals.

The question then posed to the HR leaders was how to develop strategies that allow them to attract and retain these key employees. They also needed to analyze and recommend practices that support high performance. In order to accomplish these objectives there has to be a focus on where to invest money, HR staff time and influence, employee time, and leadership attention. This determination needs to be based on a “line of sight” to the business drivers and how the role of the sales professionals contributes to organizational goal attainment. The questions that need to be answered start with what attracts potential candidates to this position, what they are looking for, and what motivates them to stay and perform well. There also needs to be a way to assess their potential and performance over time. Finally, there needs to be an understanding of the obstacles to their success and an examination of those work practices that inhibit their ability to achieve sales quotas.

In the examination of the sales professionals in this study, a number of HR strategies have been suggested. The hiring requirements present a significant challenge for HR given that they currently are managing the entire Retail side of the business with one director, two recruiters, and two generalists. The answer however, is not simply hiring more recruiters, but analyzing alternatives to managing the entire staffing process. The initiatives that have started as a result of this study include:

- Developing a competency model to include behavioral anchors and standards for all Store Managers and Sales Professionals.
- Creating a custom interview guide to help Sales Managers select Sales Professionals based on the competency model.
- Establishing a performance management system that rewards behaviors determined to be desirable.
- Establishing a measurement system that compares actual performance to predicted performance of Sales Professionals to validate the accuracy of the interview guide in predicting behavior.
- Comparing the predictor data for each Sales Manager to assess which managers are better at identifying successful Sales Professionals.

One of the first processes being initiated is an examination of the behavioral competencies needed to be successful in the sales professional role. While there is currently an interview guide available to the store managers, it is not being used consistently and in fact may not be providing insight into what makes a successful sales professional in this organization. The Sr. VP of Retail stated that in the past they have tended to hire high energy, gregarious people. “We were practically looking for the stand-up comedian.” In retrospect, customers may feel uncomfortable making an intimate purchase from a person hired for these characteristics. In addition these gregarious sales people need a great deal of interaction to be effective and there is not always enough traffic in the store to keep them motivated. The sales professionals spend a great deal of their time on the phone following-up on leads. This type of selling may not be all that appealing to the gregarious, high-energy sales people they have hired in the past. So, in order to enhance their ability to create value the organization needs to look at the competencies demonstrated to be correlated with success for this company. The Retail HR Director made it clear that they can not...
use a standard competency model for sales professionals since this type of selling is unlike traditional home furnishing selling. The store model is different with the single product and the amount of product knowledge that must be conveyed to the customer.

As a result of the strategic process initiated in this study the organization is now developing a competency based interviewing process that will allow them to maintain consistency in their hiring as well as allow them to increase their likelihood of selecting for success. The process involves understanding the correlation between sales performance and other variables, such as tenure, management influence, promotional activity, and location. Results of the interview guide can be compared at a later time to determine how that person performs against expectations. The data can also be used to evaluate the performance of the hiring manager. If for example, it is shown that a particular manager has no ability to predict future performance during an interview, they may need additional training or be removed from the hiring process. Conversely, if there are people who are particularly insightful they may be used to train other managers in what to look for and how to conduct the interview, or they may take a larger role in the hiring process beyond their region. Each of these alternatives creates value for the organization by increasing the likelihood of hiring candidates who have a high propensity to be successful in the organization.

The proposed competency model needs to be a component of a comprehensive staffing strategy built around the following initiatives:

- attract a larger pool of qualified candidates,
- provide an efficient method for screening out candidates who do not meet the criteria,
- land a high percentage of candidates to whom they have made offers,
- retain a high percentage of the best sales professionals,
- effectively identify sales professionals with the potential to be effective district and regional managers.

One of the underlying pressures is to accomplish all of these objectives while freeing up the managers from spending 40% of their time in the recruiting and hiring process.

Also under way are a number of discussions around the capability, opportunity, and motivation of the sales professionals. While there has been an effort underway to provide additional and better training for these employees, there has been limited analysis on whether the sales professionals have the opportunity to be successful. In other words, do they get the chance to be as successful as they can be? HR creates value for the organization by ensuring that organizational impediments to success are resolved. These impediments can be related to the system, the product, the management, and even the compensation system. HR's involvement in the resolution of any of these barriers creates value for the organization.

It is important that HR professionals analyze the motivational aspects of the job and the talent pool. What practices are in place to ensure that individuals can be successful? What stands in the way? The standard answer to this question usually includes compensation and benefits when motivational studies (Pritchard, 1995), point out that there are a number of factors which contribute to the valuation of rewards, including control systems, productivity, measurement and feedback, and contingent rewards. It is important to understand how the employee's behavior, results of that behavior, and performance contribute to the motivating value of intrinsic and extrinsic rewards.

Conclusions and Recommendations

The study focused on the central question of how an organization can develop a capabilities strategy and the resulting HRD implications. The question was divided into two sub-questions. The first focused on the human capital framework and analysis protocol that was used to provide insight into how the HR group could deploy an organizational capabilities strategy and be more proactive in initiating activities that contribute to organizational success. The HR team elevated their level of strategic understanding and positioning by evaluating HR investments in a strategic context. Looking at how human capital decisions create value for the firm this HR organization used the human capital framework to align their investments with the strategic direction of the business units. Human capital challenges are being addressed at every level and the HR professionals are better equipped to address these challenges and provide solutions that create value.

The second sub-question focused on the human capital decisions that emerged through the process. The first steps outlined in the PeopleSCOPE™ framework require an understanding of how sustainable strategic advantage and business process constraints provide direction for HR alignment. The findings raised questions about the focus on additional distribution sites, requiring additional sales professionals. The sales professional role was considered pivotal for a number of reasons, not the least of which was the sheer volume of sales people needed. Currently there are 1,200 sales professionals staffing 350 distribution sites. If distribution sites grow to 1,200 in five years there would need to be over 4,800 sales professionals by the end of 2004. The prospect of attracting and hiring an additional 3,600 sales professionals would be challenging enough, exacerbating the situation is the
organization's 100% turnover rate. Thus the number of people to be hired in the next five years would be closer to 10,000. Articulating these issues and providing a sound framework for evaluating alternatives was a key outcome.

Contribution to New Knowledge in HRD

HRD professionals are being challenged by their organizations to become more strategic in the alignment and deployment of HR investments. The human capital framework presented in this case study provides a vehicle for engaging in discussions centered on sustainable strategic advantage and key business processes. Evaluating HR investments with a line of sight to the impact these investments have on the strategic success of the organization increases the likelihood that these initiatives will be funded. Approaching investment decisions from the capabilities perspective provides HRD professionals with a position of leverage and increases the likelihood that HRD will be included in the development of organizational strategies, not simply their execution.

Human Capital, HRD and the Knowledge Organization

Oscar A. Aliaga
University of Minnesota

Using an economic approach this paper both explains the foundations of HRD and proposes a framework to understand the knowledge organization. The paper proposes economics as the primary theoretical influence of HRD. The theory of human capital and the theory of the firm are first reviewed in their relationship with training. From there it follows a discussion of the knowledge organization and the implications for organization development.

Keywords: Human Capital, Knowledge Organization, HRD Definitions

In recent years there has been a continuous debate about the theoretical foundations of HRD. The current drive originated with McLagan's (1989) and Gradous' (1989) works and was shaped with Swanson's (1995), who proposed systems theory, psychology and economic theory as the foundations of the discipline of HRD. Others, like McLean (1998), have argued if only those or any other theories are needed as foundations of HRD. The discussion has extended to other areas, as Hatcher (2000) recently explored how those foundations have impacted the research and practice of HRD professionals.

Since Gradous (1989) and McLagan (1989), recent literature addresses mostly systems theory (Ruona, 1998; Swanson, 1995, 1998), and less frequently the psychological foundation (e.g., Holton, 1998) or the economic foundation (e.g. Torraco, 1998). Other theories have been added afterwards, but always around the ones included in this debate, like the theory of performance (Weinberger, 1998), or ethics (Swanson, 1997). Notoriously, economics, and specially those economic theories reviewed in this paper, have only been obliquely examined as theoretical foundations of HRD. The few publications on economics as theoretical foundation of HRD either fail to give a comprehensive explanation about the relationship between these two disciplines, or invoke generic approaches to economics.

What we propose here is economics to be the primary or leading theoretical foundation of HRD. If systems theory explains the relationships within the organizations that are to be addressed by HRD, and if psychology provides an understanding of how interventions are to be made and the impact they will have, economic theory explains why investment decisions in developing human resources are made.

Problem Statement and Purpose

Economics has been proposed as one of the theoretical foundations of HRD, and there seems to be a general agreement around it. However, literature has not fully developed an explanation about the relationship between these two fields. A related issue is that whenever economics (i.e., the human capital theory) has been invoked, it has historically focused on training; no explanation has been made about the relationship between economics and organization development. A third problem is that there are critical HRD issues associated with the economic view that remain unseen, even though they have become widely recognized as important for organizations today. In particular, that is the case of knowledge in the organization.

The purpose of this paper is twofold: (a) to review and explain the economic theoretical underpinnings as they relate to HRD; and (b) to propose a framework to understand knowledge in the organization based on the economic theory of human capital. The paper will conclude with definitions of HRD and OD. These issues are crucial for HRD since HRD focuses on improving performance in the organization. Thus, HRD is unequivocally positioned and it is explained because of the economic context of the organization.

Theoretical Framework

Economic Theory as Theoretical Foundation of HRD

Economic theory, although recognized as an important theoretical foundation, has received little attention.
in the HRD literature. A recent survey reported by Hatcher (2000) indicates that in fact "psychology, followed by
genral systems theory, and ethics had the most influence on HRD theory and practice" (p. 44). However,
economics is always associated with the benefits of training, and financial and other models have been developed to
explain the return on investment provided by HRD interventions (Phillips, 1999; Swanson & Gradous, 1988).

Two major economic theories are here proposed as the leading foundations of human resource
development—human capital, and the theory of the firm. Other economic theories and areas are related to HRD as
well (Cho, 1998), but their contribution in terms of theoretical foundation are not as central. Therefore, we reduce
the scope of our explanation to those proposed above.

Our explanation of the HRD economic theoretical foundation (using the theories of human capital and the
firm) comes from the realization that they come to a point of convergence when the individual works in a firm. That
is, the theory of the firm and the human capital theory will jointly explain firm investments in training (and HRD
interventions in general) while the individual is in the workplace. The human capital and firm theories would not be
fully understood, had we not had a general context provided by the firm where training occurs. This common area
will be the focus of this paper.

The discussion undertaken in this paper is about the fundamental economic aspects that relate to HRD.
Therefore, it does not neglect the importance of other economic areas and theories like internal labor markets, the
principal/agent theory, transaction cost economics, vertical integration and the like. These latter, widely developed
in the field of industrial organization, are to further explain related issues, many of them linked to human resource
management instead. On the other hand, this paper's approach does not neglect the profound relationship of HRD
with adult education theories or other HRD theoretical foundations and their particular explanation of the field.

Therefore, our primary interest is in how the theory of the firm and the human capital theory inform us
about the behavior of the firm and why investments on human capital, or persons, should take place, and how
investments in human capital are to improve the productivity of the person and of the firm.

One of the central aspects in this discussion is the realization that there is one historical and exclusive trend
in explaining HRD from an economic perspective—the theoretical aspects of economics have been always related, in
the HRD discipline, to the training component. Therefore, there is a need to provide an explanation about
organization development from the economic perspective. The proposed framework of human capital and
knowledge developed in the second part of this paper aims at providing an understanding of the economics of the
organization development strand of HRD. To understand and develop that framework, we need to first review the
core literature on human capital theory and the theory of the firm vis-à-vis the training component of HRD.

**Human Capital and the Training Component of HRD. A Review of the Core Literature**

Economic theory as foundation of the human resource development discipline can be depicted as in Figure 1. The theory of human capital has been pointed out as the theory that better explains the gains of education and training. What Schultz (1961, 1962), Mincer (1958, 1962), and most notably Becker (1993) explained with this theory is the impact education and training have in a person's lifelong earnings and wages.

![Figure 1. Economic Theory as Foundation of the Human Resource Development Discipline](image-url)
The main proposition of the human capital theory is that human capital is considered a form of capital. Schultz (1961) stated that “skills and knowledge are a form of capital,” and that “this capital is in substantial part a product of deliberate investment” (p. 1). That is, education and training are processes of human capital formation of people resulting from deliberate investments—although education and training are not the only to account for human capital formation, since the concept of human capital also encompasses other activities that improve the human capabilities, mainly health facilities and services, study programs for adults, and migration (Schultz, 1961, 1962).

Education and training are the most notorious concept of the human capital theory, and certainly the concepts that have most direct linkage with HRD. Becker (1993) contends that “school and college education in the United States greatly raise a person’s income” (p. 17), and that “many workers increase their productivity by learning new skills and perfecting old ones while on the job” (p. 31). Education and schooling are seen as the activities that will prepare the labor force (Mincer, 1962), and account for the “otherwise unexplained rise in earnings” (Schultz, 1961, p. 10). In fact, “the earnings of more educated people are almost always well above average” (Becker, 1993, p. 17), a trend that has kept over the past decades and even increased: “Twenty years ago, the average college graduate earned 38 percent more than the average high-school graduate. Today, it is 71 percent more.” (U.S. Department of Labor, 1999, p. 18). Costs of education, including actual expenditures and foregone salaries are considered investments.

Similarly, training in any form is also a form of human capital formation. As in education, training has been singled out as explaining the variation in wages and earnings. If formal school instruction is not sufficient to prepare the labor force, the training process “is usually the end of a more general and preparatory stage, and the beginning of a more specialized and often prolonged process of acquisition of occupational skill, after entry into the labor force” (Mincer, 1962, p. 50). Looking at education and training this way, it can be said they represent mostly an individualized perspective of the theory of human capital.

The Firm as the Context for Training and HRD

The theory of the firm relates to the production theories. It explains the use of inputs to produce an output. It also explains how firms organize their production in an efficient way, and how the costs of production change due to changes in the prices of input and the output level. In the production process, firms use inputs or factors of production. Traditionally, those factors of production included raw materials, capital, and labor. This traditional definition considered labor as being the physical activity. Modern literature maintains that labor as a factor of production is not enough to describe the work of persons in organizations, and call it instead human capital, which is a form of capital as described above, but it is different from the financial capital. For an efficient management of the firm, the factor labor or human capital needs to be adequately combined with the other factors. One way of doing it is by optimizing the performance of human capital through training. The emphasis in the role of human resources is called the "human resource-based view of the firm."

Training occurs in the context of the firm, and it is usually provided by the firm. If so, the investment decision is explained by the firm positioning and interests. In that manner, the theory of the firm will explain when and under what conditions investment decisions are made.

We have talked about human capital as a form of capital. However, the concept of human capital clearly diverts from firm's classical conception and its three factors of production—raw materials, labor, and capital. The concept of human capital has forced to a redefinition of the concept of capital, and it is currently considered a form of capital. "The failure to treat human resources as a form of capital [...] fostered the retention of the classical notion of labor as a capacity to do manual work requiring little knowledge and skills" (Schultz, 1961, p. 3). Some authors have attempted to further clarify this point, and proposed that the human activity is present in the firm in two different factors of production—e.g., raw labor and human capital (Friedman, 1990), the former called “rivalous goods” and “non-rivalous” the latter (Bradley, 1997; Klenow, 1998).

In the context of the firm, then, the process of human capital formation occurs mainly through training—as explained historically. However, two main types of training can happen in the firm.

General Training. The theory of the firm allows us to understand the way organizations manage their human resources. Becker (1993) distinguished the two types of on-the-job training—general, and specific. The first one, general training, is simply characterized as the training that is "useful in many firms besides those providing it" (p. 33). That is, the learned skills and knowledge can be used in that firm as well as in others. The resulting effect is that knowledge and skills are transferable from organization to organization.

By providing this type of training the firm may capture some of the returns from its investment, but they also take the risk of other firms taking those returns when the employee decides to switch jobs. That is why many
firms would provide general training only if they do not pay for it. If workers pay for it, they are increasing their future wages—mostly in the form of working for another employer at a higher salary. The assumption here is that there are many buyers for those skills, so the employee can move in the labor market. General training allows the worker to increase his negotiation capability within the labor market—in terms of selecting a job in a different organization with a higher salary. It has been indicated that if a person with a general skill is needed, firms most likely will look for those skills outside the firm—e.g., through outsourcing (Lepak & Snell, 1999). What this reveals is that the firm may not be interested in paying for general training.

Firm-Specific Training. Specific training plays a different, opposite role of general training, and the consequences of specific training are different for both the employee and the firm. Specific training has been defined as training “that has no effect on the productivity of trainees that would be useful in other firms” (Becker, 1993, p. 40). That is, those skills and knowledge learned through specific training will most likely be used only in the firm providing the training. In this case, the organization pays for the training, but it will also collect the returns of that investment in the form of increased marginal productivity.

This is the reason why organizations will provide training, and by appropriating the returns in a sufficient manner, they will be covered if the employee decides to quit for a different job. However, if employers are interested in keeping those employees, the organization needs to share the rewards of the increased productivity with the employee, namely they have to increase his or her salary to an amount higher than the salary offered by any other employee (Flamholtz & Lacey, 1981). This condition will create a tie between the employer and the worker, and in times of downsizing “the probability of turnover for a specifically trained employee is lower than that of generally trained employees” (Flamholtz & Lacey, 1981, p. 33). In addition, the replacement cost of that employee with specific skills is high, in which case the employer will consider different alternatives to retain that employee before letting him or her go.

The purpose of specific training is to increase the employee’s marginal productivity—i.e., to improve performance. That is the goal of the firm, and both the employee and the firm will benefit from the increased marginal productivity—the increased performance. The employee will benefit from having a better salary, and the firm will benefit from appropriating the marginal productivity. Wages are to increase after specific training, but they will be set below the worker’s marginal productivity. The difference between the employee’s new marginal productivity (the improved performance) and the salary paid is the return that firms will collect (Flamholtz & Lacey, 1981).

Some implications derive from this. The first one is that human capital developed by specific training becomes unique. Outsourcing and alliances may be considered to manage the uniqueness of this type of human capital and the needs for additional human capital, but it is not strategic. Thus, organizations are willing to invest in this type of training. Second, employees trained this way become strategically important for the organization, and become integral part of the competitive advantage of the firm. Finally, firms will develop, in that sense, an internal labor market, and will choose people from there before outsourcing (Lepak & Snell, 1999).

The Knowledge Organization: Developing a Framework from the Human Capital Perspective

The Knowledge Organization

We have explained above how investments in training impact both the person and the organization. One very important result for the organization is the amount of knowledge and skills developed to increase organizational performance—which also means the firm benefits from the individual’s increase in marginal productivity. Training thus develops skills and knowledge in the individual. The employee will apply what she or he has learned to the job. The amount of knowledge actually applied will depend on each person, and in the organization’s capability to make it happen. This pattern is repeated for all workers. The organization will be interested in getting those skills and knowledge applied to the jobs at a maximum level, so as to increase the worker’s marginal productivity or performance, and therefore to increase the organization’s profit maximization. In this process, the organization realizes the best way of maximizing those recently developed skills and knowledge (in addition to all the existing knowledge and expertise) is by aligning them around the organization’s mission, goals and strategy. To accomplish this, the firm needs to organize those knowledge and skills. By doing so, it will increase the individual, team and organization performance.

What the firm does first is to articulate the acquired knowledge of the trained person with the knowledge acquired by other trained employees, and align the knowledge thus articulated with the organization strategy. Organizations do this to some extent, but only those that make that explicit perform better in business. But it is not
enough to articulate knowledge in such a way. In order to become truly competitive, the organization will also need to aggregate the existing knowledge of these employees for a better performance of both employees and the firm as organization. That gives the organization the capability of moving towards creating or innovating, not only developing, knowledge. These two facets are critical for the organization for its positioning in a competitive manner in the business environment. These two compounded facets make up the knowledge organization.

Defining the Framework: The Five Strands of the Knowledge Organization

To better understand the knowledge organization, five defining strands are here proposed. They form the initial framework that explain why the organization deals with the employees’ knowledge, and how human resource development efforts are meant to make that knowledge evident, improve its use, align it to the organization goals, and improve the firm’s performance through its use.

The framework five defining strands are: the framework is based on the individual’s own education, experience, and training; it implies the extensive use of knowledge, as opposed to physical labor; the knowledge is inter-related to others in the organization, and to the organization’s processes and goals; the knowledge is organized by the organization; and it allows the use of knowledge at different levels.

1. Education, Experience and Training. The first defining aspect is that human capital formation while in the firm happens primarily as result of on-the-job training. However, training is built upon, develops and unleashes other skills and knowledge gained through the individual’s education prior to or concurrent with entering the job market. In addition, persons will enter the firm with some experience gained in other settings. Finally, more experience is gained while in the firm. In fact, more people would be willing to give up earnings in exchange for experience that will also be part of the human capital formation process and that will result in improved performance. That is, the specialization of employees through training follows a built-upon model. The organization will identify the potential for specific training based on current performance, which in turn is based on education background, as well as experience. It is the human capital formation process that occurs in the organization primarily through training, but also through organization development (see below) that becomes the core of the knowledge organization.

2. Skills and Knowledge. The ultimate outcome of both education and training is the development of new skills and knowledge in the individual. Once the skills and knowledge have been identified, they are to be used by the organization to improve performance. In addition to personal growth, or consolidation of values and culture (both goals of adult education theories and philosophies), the organization will put emphasis in the use of knowledge. In other words, the emphasis is on the adequate use of the marginal productivity of the worker. There is no turning point so as to consider labor as a physical labor only like in the traditional concept of factors of production. There is a clear growth and change from the touch labor to the knowledge worker (Lepak & Snell, 1999).

3. Articulated Knowledge. Skills and knowledge are not used in an isolated manner and individually but in conjunction with other employees’ knowledge and in the context of the organization’s structure, policies and goals. There is an existing, actual knowledge that the organization needs to articulate, to organize. That knowledge comes from the individual’s education, experience and training, and from other organizational interventions that will develop it (see below). Without linking that knowledge, without making connection of existing knowledge at different levels, without articulating the knowledge towards the common goal of the organization, towards the mission of the organization, the existing knowledge of those employees will be underused, underestimated, and the capacity of the organization, including its strategic positioning, will be diminished.

The articulation of knowledge needs to be an explicit function of the organization. Otherwise, the survival of the organization is in jeopardy. Existing literature already provides different definitions, ways of understanding, and means to aligning existing knowledge in the organization (among many others, Demarest, 1997; Edvinsson & Sullivan, 1996; Nonaka, Reimmoeller, & Senoo, 1998; Stewart, 1999; Wiig, 1997a; Wilkins, van Wegen, & de Hoog, 1997).

4. Aggregating Knowledge: The Organization’s Potential. What distinguishes the knowledge organization is its capacity to organize the knowledge of its workers, but more importantly is its capacity to aggregate the existing knowledge, to transform it, and to use it in different forms. Innovation is clearly one of its main objectives and outcomes. Knowledge is then business arranged, strategically oriented, and profit maximizing. The knowledge
organization will process knowledge (internally developed or acquired from external sources) in order to transform it—which will occur only as a result of the aggregation process knowledge. The aggregated knowledge is then a product of the organization's internal learning and its absorptive capacity (McMillan & Hamilton, 2000). To some extent, this aggregate vision of human capital has been neglected, and a continued discussion is needed. Nevertheless, many authors will explain the way educated or trained workers increased their salaries; they will also explain how those workers in those companies are responsible for economic growth; and how this is a distinguishing characteristics of the US and industrialized economies vis-à-vis less industrialized economies. However, the success of an organization is not attributed to the individual training of the organization's workers, but to the strategic use of the aggregated knowledge in that organization.

5. Improvement Levels. Knowledge articulated and aggregated in the way described above, through human resource development interventions, make improvement at three main levels: a) it improves functions for each person, team or unit; b) it improves relationships among and between personnel, teams, units and the organization as a whole; and c) it improves flows at the systems level, so as to adjust all components according to the knowledge thus articulated and aggregated.

Contributions to New Knowledge, and Implications for HRD

Redefining the Conceptual Nature of Organization Development. Traditionally, one way the knowledge articulation and aggregation is made is through what is called “knowledge management”. (There are some authors that distinguish between knowledge management and intellectual capital, where the former is subordinate and supports the creativity of intellectual capital (Wiig, 1997b), but for purpose of this paper I will speak generally of knowledge management as encompassing both functions). As such, knowledge management is proposed as a specific function, translated most of times into a designated unit in the organization. In order to articulate and aggregate that knowledge within the organization, the organization follows at least seven distinctive steps: identifying, unleashing/creating, gathering, storing, managing, innovating and delivering.

What we propose here is that organization development, through all types of interventions, is about managing knowledge. That is, the main function of organization development is to articulate and aggregate knowledge. OD does that by unleashing knowledge and skills. Therefore, organization development is a major performer of knowledge management—although it has not always been understood that way. That is, from the human resource development perspective, knowledge management in the organization is performed through any organization development intervention. Existing literature does not make that explicit, nor practitioners are fully aware of this fact. By introducing changes in the organization with the purpose of improving performance, what organization development interventions are ultimately doing is identifying knowledge, unleashing/creating knowledge, gathering knowledge, managing knowledge, and certainly impacting in the storing, innovation and delivering of knowledge within and outside the organization.

Organization Development and Human Capital. If organization development is about articulating and aggregating knowledge, it follows that, as the training function, organization development is a form of the human capital formation process. That is, organization development, as training and in close interaction with it, makes possible the unleashing of knowledge in the organization to increase performance at different levels.

By understanding organization development this way there is a clear change in the understanding of its nature. But more importantly, there is a clear implication for the human capital theory that has been traditionally and exclusively related to training. In that sense, and although further work is needed in this area, human capital theory will need to be re-addressed so as to include organization development along with training to explain why investments in organization development interventions will also increase the individual's salary (by increasing its productivity or performance), and therefore the possibility of the firm to capture more returns due to increase of the individual's performance. Secondly, a formulation in that sense will also need to reconsider organization development in the same level as firm-specific training. Thirdly, organization development interventions, as in the case of training, will need to also be considered investments in human capital. The relationship between the human capital theory, the theory of the firm and the reformulated view of OD and training is depicted in Figure 2.

The Knowledge Organization, the Learning Organization, and the HRD Definition. The knowledge organization has here been described from the economic perspective, and HRD is responsible for fostering this function in the organization. Knowledge organization then becomes an overarching definition that is based on and goes beyond other definitions—e.g., the learning organization, the teaching organization—in the sense that
knowledge encompasses both learning and teaching. One clear implication is reflected in the understanding of the learning organization (Watkins & Marsick, 1995). Learning organization describes the organization in a permanent process—i.e., learning. The knowledge organization postulates that learning is indeed central for the knowledge organization, but there is the knowledge component—i.e., skills, data, experience—that needs to be organized and re-discovered to feedback the organization itself, in a continuous alignment with the organization’s mission and goals. As Cummings and Worley (2001) have suggested, the organization development profession needs to go beyond process measures and to increasingly rely on objective records of economic outcomes in doing its work.

![Figure 2. The Knowledge Organization](image)

From the economic perspective, the knowledge organization is then defined as the organization that has the capability to articulate and aggregate knowledge. That is, it is the organization that articulates and aggregates the knowledge of employees going through the process of human capital formation. Because it is in the firm’s economic interests to provide specific training to those employees, it is also in its interests to build on that knowledge to become even more competitive and be strategically aligned in its business environment.

Finally, based on the economic perspective, a new definition of HRD is proposed as follows: "HRD is a process of human capital formation through organization development, and training and development for the purpose of improving performance". The central aspect of this definition is the understanding of HRD as the process of human capital formation. It becomes a key element, since it encompasses the distinguishing function of both training and development, and organization development.

Institutionalizing Organizational Change through Cascade Training: Implications for HRD Research

Ronald L. Jacobs

Darlene Russ-Eft  
AchieveGlobal, Inc.

Suhail Zidan  
The Ohio State University

Why do some organizational change efforts persist and become institutionalized and why others are just temporary phenomena and eventually fail. This paper proposes that the institutionalization of change should be addressed as a major part of the change process. The paper suggests that cascade training be used to address institutionalization issues. Cascade training conjures the image of having critical information flow from one group to another until it reaches the final destination.

Keywords: Organizational change, Cascade training, Institutionalization of change

A major insurance company recently introduced a corporate-wide performance management appraisal system to help reward their best employees, reduce unnecessary salary costs, and ensure greater organizational competitiveness. Using an appraisal system based on performance outcomes represented a dramatic cultural shift for the organization, since the previous appraisal system focused more on behavioral indicators and it was used inconsistently throughout the organization. The human resource development function was assigned the responsibility of informing all employees, approximately 25,000 nationwide, about the system and ensuring that managers and supervisors had the competence to implement it within their business units.

The brief case study suggests two basic challenges for many organizations today. The first challenge is to determine what actions to take in response to emerging business needs. The second challenge, and perhaps the more difficult one, is to determine how to ensure that the change effort becomes part of the fabric of the organization over the long term. That is, after some initial period of success and interest, the question arises why do some organizational change efforts persist and become institutionalized and why others are just temporary phenomena and eventually fail. Indeed, the question might be asked whether most planned change efforts are doomed to fail?

The importance of this question to human resource development theory and practice should be apparent. If HRD scholars and practitioners are interested in bringing about long-term changes in organizations, then they must know more about what variables will ensure that those goals are achieved. This paper proposes that the institutionalization of change should be addressed as a major part of the change process. Further, the paper suggests an approach called cascade training to address institutionalization issues. Cascade training conjures the image of having critical information, similar to that of a waterfall, flow from one group to another until it reaches the final destination.

Specifically, this paper discusses a framework from the literature for institutionalizing organizational change. Second, the paper introduces the concept of cascade training and the four variations of its use. Finally, the paper proposes implications for human resource development research.

Institutionalization of Organizational Change

Researchers have long noted the unique difficulties of institutionalizing organizational change (Mirvis & Berg, 1977; Levine, 1980). Goodman and Dean (1983) examined the persistence of change in selected organizations in which change programs had been successfully introduced and where positive benefits had initially been identified. They interviewed participants four to five years after the projects had been implemented and showed that only one...
third of the projects remained to any discernible degree, while the others were in decline or non-existent.

Beer, Eisenstat, and Spector (1990) discuss the failure of organizational change in view of the need among most organizations to respond to increased challenges to their competitiveness and, eventually, their survival. Many have come to understand that the key for their future success is to transform the way the organization functions. Unfortunately, these efforts have generally not proven to be successful.

More recently, a research study conducted by the consulting firm, A. T. Kearney, reports that managers in 294 European medium-sized companies reported that only one in five change efforts were viewed as being successful. The remaining efforts either made some initial improvements, but had failed to sustain them, or made no improvements whatsoever (A. T. Kearney, 1999). Thus, there is compelling evidence to suggest the continuing uncertainty of maintaining organizational change over time, in spite of the ongoing need for managers to implement change as a means to remain productive and competitive.

As shown in Figure 1, Cummings and Worley (1997) propose a systems-based framework for institutionalizing organizational change, which shows how organization characteristics influence intervention characteristics and each of them in turn influences institutionalization processes, resulting in institutionalization outcomes. The outcomes show the extent to which the change has been taken hold and can, presumably, be sustained over time. The framework suggests that failure can occur because of inadequate attention to any one or a combination of the organization characteristics, the intervention characteristics, or the institutionalization processes. Thus, to ensure long-term success, the institutionalization processes require as much attention as the other parts of the framework, if not more so.

Cummings and Worley (1997) posit that institutionalization processes infer a developmental order, such that having competence related to the intervention is prerequisite to employee commitment, and employee commitment is prerequisite to the allocation of rewards, and the allocation of rewards is prerequisite to the diffusion of the change beyond the immediate setting, and so on. Logically, it follows that having the ability to meet new role expectations serves to reduce uncertainty, a primary barrier for accepting change.

Cascade Training

Given the foundational role of individual competence on successful organizational change, it follows that training be considered a key institutionalization process. Indeed, numerous authors have pointed out the importance of training to facilitate the organizational change process (Nadler & Gerstein, 1992; Jacobs, 1999). But, few if any of these references provide specific information on what outcomes the training should achieve or how the training should be done. It is suggested that when training is part of the institutionalization process, it should achieve the following goals:

A. Address the respective competence needs of the employees affected by the change, including the use of awareness, managerial, and technical training;
B. Use an array of training approaches that are best suited to meet those needs, including both training conducted on-the-job and off-the-job; and,
C. Be coordinated so that the training outcomes of one group are reconciled with the training outcomes of other groups.

Cascade training has been defined as the process of providing the competence required to ensure the institutionalization of organizational change. The first reported use of cascade training was to implement Job Instruction Training (JIT) programs as part of Training Within Industry (TWI) effort during WWII. As reported by Dooley (1945), plant managers were trained by the TWI staff on the need for effective technical training in their organizations. In turn, these individuals were expected to train their line managers on the issue, who in turn helped their supervisors become OJT trainers. In the end, supervisors were expected to deliver the technical training through OJT to production employees. The TWI used a deliberate approach to influence how individuals at each level of their client organizations viewed training and its importance for turning out quality products to support the war-production effort.

Cascade training again appeared in the early 1980s as several major organizations, most prominently was Xerox, relied upon integrated training programs to convey general concepts about total quality management (Galagan, 1990; Carnevale, 1991). Cascade training offered a logical approach to disseminate this information through the ranks of employees in a relatively short period of time.

Four types of cascade training have been identified: 1) hierarchical, 2) process, 3) employee role, and 4) project. Although these types will be discussed separately, they are most often used in combination and are selected based on considering the following questions:
A. What is the target level of the change? Organization? Workflow? Individual?
B. What is the purpose of the change? Improvement? Innovation? Transformation?
C. What are the training outcomes for each group of employees affected by the change?
D. Which organizational characteristics might affect the training, such as availability of employees, organizational structure, organizational culture, location of employees, or timeliness?
E. What intervention characteristics might affect the training, such as the specificity of the change goals, availability of consultants, and availability of change sponsors.

Hierarchical. Perhaps the most common type of cascade training whereby the training follows the vertical structure of the organization, usually starting with upper management levels and moving downward through the ranks of employees. For example, the insurance company used a hierarchical approach starting from the CEO and executive committee to senior managers to managers and supervisors to frontline employees. Another approach to hierarchical cascade training can proceed from the lower employee levels of the organization upward through to the executive levels. For instance, consider the case when a production team in a manufacturing plant implements an initiative on their own that results in improved performance, which is then recognized by senior management as something that should be adopted by others throughout the organization.

The hierarchical approach to cascade training ensures that everyone organization-wide understands the change and addresses three issues related to employee competence:
1) Which tasks to keep doing;
2) Which tasks to stop doing; and,
3) Which new tasks to begin doing.

Process. This type of cascade training follows the chain of cross-functional relationships of suppliers and customers on a business process. For example, if a corrective action team at one station of a hard-disk producer improves how an operation is done, then the stations before and after should be aware of the changes, so that they might make any required adjustments. It ensures that whenever change occurs in one part of the process, others become aware of it and acquire the areas of competence necessary to respond accordingly. Another example would be the product to market process, which encompasses researchers, engineers, and designers, as well as operations and marketing personnel.

Role. This type of cascade training follows peer relationships. For example, it might be advisable to have managers train other managers across the organization on how to deliver a performance appraisal interview to subordinates. Another example would involve team leaders training others who are about to lead teams in another part of the organization. Such an arrangement makes use of the particular insights that only those in a particular role might have in adjusting to the new task. It ensures that individuals understand the change from a credible source and have the competence to respond accordingly.

Project. This type of cascade training follows the interconnections of groups, both internal and external to the organization, who are working in achieving a goal. One common example involves the use of the same software package by all members of a project group. This situation requires all of the project team members to obtain and learn how to use that software. In another example, the various groups involved in the roll-out of a new product line need to know about changes occurring in one group, say, the restructuring of the marketing function. It ensures that the stakeholders understand the change, even though not all groups will be affected by it to the same extent.

Implications for Human Resource Development Research

Unfortunately, few if any research studies have studied the institutionalization of change process in general and its relationship with human resource development research. The convergence of the two lines of research — institutionalization of organizational change and human resource development — suggests four possible areas of future research.

First, given the proven efficiency of planned training in the workplace (Jacobs, Jones & Neil, 1992), research questions could be posed whether this efficiency extends to its use as part of cascade training as well and whether this efficiency results in more rapid change. The pace of organizational change dictates that critical change information be disseminated quickly. It could be hypothesized that through cascade training, change could be implemented more quickly. The rationale would be that more employees could be trained in a shorter period of
time, without the delays caused when waiting for groups of employees to be scheduled to come together at one location.

Second, research questions could be posed about the perceived relevance and quality of the change information to the trainees. It could be hypothesized that since cascade training focuses on the areas of competence for each employee level, employees would receive the information appropriate for them, since some of the information would be irrelevant and not related to their job expectations (Jacobs, 1994). The issue of how to connect employee expectations with broader organizational goals would be addressed in this way.

Third, research questions could be posed about the levels of employee commitment as a result of the cascade training. It could be hypothesized that since employees would have more relevant knowledge about the change, and that issues could be immediately addressed by a credible source through cascade training, there would be greater understanding of the change and, by extension, greater employee commitment to following it. The issue of employee commitment — that is, ensuring the match between employee intentions and actual behavior — has been a continuing issue of concern in the organizational change literature.

Finally, research questions could focus on the effectiveness and longevity of the change initiative. It would be hypothesized that with increased competence, more relevant knowledge, and greater commitment, the change initiative would become more institutionalized. Thus, studies such as the ones by A.T. Kearney (1999) would find an increased percentage of change efforts that were viewed as being successful.

Conclusion

How to ensure the long-term persistence of organizational change has become an issue of concern for many organizations. If the persistence of organizational change depends in large part on employee competence, then human resource development research would seem to play an important role in further understanding this phenomenon. Until now, the HRD literature has provided few if any studies focusing on the institutionalization of organizational change. Given the proven nature of human resource development to improve organizational performance, such attention now seems warranted.

Shock to the System: Analyzing Organizational Change Using the Construct of Awareness Development

Martin B. Kormanik
Annette K. Sturdevant
Organization Development Systems, Inc.

Awareness development is a construct for describing the changes that occur in an individual due to life transitions. The cycle of awareness development (CAD) model is helpful for analyzing an individual's awareness development regarding a transitional issue. This study shows that by using CAD to examine individual employees' awareness development around an organizational transition issue it may be possible to take a distributed view of organizational-level change.

Keywords: Organizational Change, Organization Development, Adult Development

Awareness development is a construct for describing the changes that occur in an individual as he or she is "shocked" by life transitions (Kormanik, 1999). The transitional issue inducing awareness development may be anticipated (e.g., marriage, graduation) or unanticipated (e.g., sudden illness, job layoff). It may be positive (e.g., adopting a child, starting a new job) or negative (e.g., substance abuse, death of a loved one). Regardless of the issue, the transitional change and its associated awareness development is an integral part of every adult's experience, yielding cognitive, psychosocial, and behavioral effects. Kormanik describes a five-stage cycle of awareness development (CAD) model drawing from multiple disciplines, including adult development and learning. The CAD model is helpful for analyzing an individual's awareness development regarding a transitional issue, understanding differences in individuals' reaction to the same transitional issue, and planning interventions that support individuals' awareness development through the cycle. Movement through the model is evidence of adult development and learning.

Similarly, through the course of any organization's existence it experiences various transitional issues that effect organization development and learning. Issues inducing a shock to the organizational system may include planned change initiatives (e.g., downsizing, reorganization) as well as unanticipated events (e.g., workplace violence, a class action lawsuit). The issue may be obvious and discrete (e.g., merger with another organization, new product launch) or subtle and chronic (e.g., attention to workforce diversity, process improvement). As with individuals, the CAD model may be helpful for analyzing organizational awareness of the transitional issue, understanding changes in reaction to the issue, and planning organizational interventions that support awareness development.

The purpose of this paper is two-fold. First, it describes application of the CAD model at both individual and organizational levels. Second, data collection and analysis from a training initiative provides empirical evidence demonstrating the practical utility of using the CAD model to take a distributed view of organization-level change.

Problem Statement

Indisputably, the contemporary work environment has experienced wrenching change in recent years. Many authors describe the deep and profound catharsis associated with organizational change (Abrahamson, 2000; Mishra, Spreitzer, & Mishra, 1998; Scanlon & Fredman, 2000; Volpe, 1999). Even organizations that have not gone through substantial planned changes such as downsizing or reorganization have been forced to adapt their mode of operation to a dynamic, ever-changing, unpredictable, and sometimes ambiguous external environment. In the effort to explain, predict, and control organizational behavior in response to organizational change, emphasis has been placed on critical reflection (Brooks, 1999), informal learning (Volpe, 1999), "tinkering" and "kludging" (Abrahamson, 2000), preserving morale (Mishra et al., 1998), using the manager-as-trainer approach (Watkins, Ellinger, & Valentine, 1999), developing emotional capability (Huy, 1999), and encouraging extrarole efforts (Morrison & Phelps, 1999). A consistent overarching theme has been the movement toward organizational learning that promotes successful navigation of change (Schwandt & Marquardt, 2000).

Organizational change theory generally reflects two conditions: steady progression through an organizational change effort, or failure of the change effort (i.e., this is what went well resulting in successful change or this is what went wrong resulting in failure). There is a paucity of theory addressing all aspects of the change process itself, particularly taking into account those organizations that stall in the change process; those that do not emerge triumphantly or fail miserably, but instead exist in an “encounter” stage of awareness confusion. The organization understands the transitional issue, has encountered the shock to the system, but has not yet developed strategies for navigating through the shock. Also, while assessing the amount of change has consistently been an area of focus in organization development (OD) interventions, the need for diagnostic tools and measures for assessing the amount of change remains an issue.

Research Question

The primary research question guiding this study was: What is the practical utility of using the CAD model for analyzing change at both the individual and organizational levels?

Theoretical Framework

The management literature provides many examples linking the individual and organizational levels of analysis. Robbins (2000) makes a fundamental case by defining organizational behavior as the study of individuals’ attitudes and actions so as to understand, predict, and control individuals’ behaviors in the organizational context. Huber (1991) provides a thorough discussion of the contributing processes and the literatures linking adult learning theory with organizational learning theory. Callahan (2000) demonstrates a linkage similar to that described in this paper in a study using emotion work actions by individuals to take a distributed view of organization-level phenomena.

Application of the process of awareness development at the organizational level emerges from the concept of organizations as social systems (Parsons, 1951), where making meaning tends to be done through the social interaction of individuals (Mezirow, 1985). The construct of awareness development parallels the process of making meaning, with the process yielding cognitive, psychosocial, and behavioral effects. At both levels of application, the focus is on change, evidenced by development and learning. The following section provides an overview of the construct of awareness development.

Awareness Development

The construct of awareness development is grounded in the adult development and psychology literature, particularly life transitions (Kormanik, 1999). Life transitions occur when “an event or non-event results in a change in assumptions about oneself and the world and thus requires a corresponding change in one’s behavior and relationships” (Schlossberg, 1981, p. 5). When two individuals are confronted by a transitional issue, they will likely differ in their perception of the issue based on their perspective or meaning schema (Schon, 1987). Central to the construct of awareness development is change in perspective or meaning schema. Awareness development reflects making new meaning or sense out of the transition experience because old mental models no longer apply.

Life transitions should be developmental. Similarly, awareness development comes from knowledge (i.e., learning) and experience (i.e., change). Depending on the specific issue, however, some individuals may progress rapidly in their awareness development and some might stagnate at an early stage. Schlossberg (1981) shows a life transition as a form of crisis and the concept of adaptation to the crisis is central to the transitions theoretical framework. “Every crisis presents both an opportunity for psychological growth and a danger of psychological deterioration” (Moos & Tsu, 1976, p. 13). Unless the crisis issue is addressed, awareness development may stagnate. Growth may be impeded. Deterioration may result.

The CAD model helps describe the transitional change process of awareness development through five stages: pre-encounter, intellectualization, encounter, empowerment, and integration. The cycle repeats for each transitional issue. Individuals generally progress through the stages of awareness in sequence, but progression may vary substantially from individual to individual even when both are confronted with the same transitional issue. Movement to the fifth stage in the CAD model does not mean the individual’s cognitive and psychosocial development are complete. The process of awareness development is not static. It is a dynamic, repeating cycle. The individual will remain at integration only until the next issue comes along. The individual may have already reentered the cycle around another transitional issue. The ideal is that progression through successive iterations would benefit from the cognitive and psychosocial effects gained in earlier awareness development cycles. The following five sections provide an overview of each stage in the CAD model, with theoretical foundations coupled
with practical examples. Each section begins with a discussion at the individual level and closes with a discussion at the organizational level. The examples are drawn from 20 years of practice in individual counseling and organizational consulting.

**Pre-encounter**

Rokeach (1968) defines attitude as “a relatively enduring organization of beliefs around an object or situation predisposing one to respond in some preferential manner” attached to cognitive, affective, and behavioral components (p. 112). When the individual has no cognitive, affective, or behavioral experience with the transitional issue, the individual is at the pre-encounter stage of awareness development. The individual has no attitude or perception of the issue in terms of self or others (e.g., a man gives a cursory glance at the newspaper headline reporting that a woman was assaulted in the neighborhood but does not read the article because it has no meaning for him). The individual has not actually experienced it or recognized it in relation to others. From an epistemological perspective, the issue is not a part of the individual’s world view (e.g., a White male who has no concept of racial discrimination). Given this state of awareness development, the individual would not be cognizant of the issue even though it may be quite evident to others. The pre-encounter stage is shown in the older gentleman who does not see the need for attending mandatory sexual harassment prevention training because, “There aren’t any women in my shop.” Sexual harassment has no relevance in his world.

An organization in the pre-encounter stage similarly has no awareness of or experience with the transitional issue. The public sector agency that historically did not have to respond to the market because its focus was not on a profit margin was in pre-encounter around customer service (e.g., pre-1990s Internal Revenue Service). The pre-IPO high-tech start-up that, in its preoccupation with developing a product, has no awareness of the need for developing and implementing policies and procedures for managing its human resources.

**Intellectualization**

Bronfenbrenner’s (1979) work on the effect of social and cultural factors on adult development suggests that those closest to the individual are going to have the most impact. The role of context literally forms you. Schon (1987) further suggests that the situation frames the learning. In a situation that does not present, focus on, or involve the individual with the issue, their stage of awareness development would be pre-encounter. Cognitive development starts as the situation begins reflecting the issue. In the CAD model, as the individual’s situation reflects the issue, the individual moves from pre-encounter into intellectualization.

The individual begins to recognize the issue, yet there is little or no emotional involvement. Intellectualization creates a sense of invulnerability. The White male moving into the intellectualization stage begins to understand that workplace discrimination occurs, yet thinks that if he works hard and keeps his nose clean he will steadily advance up the corporate ladder. The older gentleman intellectualizes that sexual harassment might become an issue if a woman were to enter his work group, but thinks he doesn’t need to worry about it till then.

The individual in intellectualization spends a great deal of time on mental gymnastics, repeating a pattern of single loop learning and enjoying the intellectual discourse on an issue that does not really affect them. Argyris’ (1982) description of single loop learning focuses on cognitive development using existing routines and mental models, causing self-reinforcing patterns rather than developing new solutions for presenting issues. The individual in intellectualization recognizes the issue as a function of what happens to others, often rationalizing the occurrence of the issue as warranted. After reading the newspaper article about the woman being raped, the man in intellectualization wonders why the woman was stupid enough to go out at a late hour by herself, then turns to thinking about the neighborhood property values going down because of the increase in crime.

Single-loop learning also plays out at the organizational level, in tandem with first-order organizational change. “First-order change is incremental and convergent. It helps firms maintain reliability; it may involve adjustments in systems, processes, or structures, but it does not involve fundamental change” (Newman, 2000, p. 604). Any organization operating with an "if-it-ain't-broke-don't-fix-it" or "we've-always-done-it-this-way" attitude is operating in the intellectualization stage. Existing mental schema and organizational routines remain unchallenged. This echoes Cook and Yannow’s (1996) view of change without learning. Organizational inertia impedes development (Newman, 2000). The intellectualization stage is evident in the rational cognitive approach to organizational learning (e.g., put out a new policy or procedure and the problem will be fixed, put the new organizational structure in a formal organization chart and the reorganization will be complete).

Intellectualization at the organization level reflects Huber’s (1991) stipulation that gaining knowledge does not necessarily imply learning. The organization that sees the experience of its competitor, yet the competitor’s
Encounter

Encounter, the third stage of awareness development, begins when the individual has the primary experience with the issue. This may be sudden or it might be a gradual slide. The earlier example of the man who intellectualized about property values declining because of neighborhood crime suddenly moved into encounter when his wife was forced to go out at night to get milk for their colic baby and was raped in the poorly-lighted store parking lot. The individual might slide into the encounter stage after an extended, low-level exposure to the issue. One woman, the first female engineer in the organization for which she worked, suggested, “It’s not the big things in life that get you down. It’s the constant barrage of little things that erode your confidence and make you wonder if it’s all worth it.” Pearlin, Lieberman, Menaghan, and Mullan (1981) stipulate:

“Hardships that are an enduring testimony to one’s lack of success or to the inadequacy of one’s efforts to avoid problems would seem to pose the most sustained affront to one’s conceptions of self-worth and of being in control over personal destiny....It is the abiding problems to which people can see no end, those that seem to become fixtures of their existence, that are intrinsically uncongenial with positive self-concept” (p. 346).

The individual in encounter has total and extended immersion in the issues, resulting in intense emotional involvement (i.e., “rage stage”). The individual often perceives his or her social power has been threatened, eroded, or taken away. The feeling of powerlessness and loss of control are paramount in the “valley of despair” of encounter. Gurin and Brim (1984) suggest the need for control is basic to self and describe research showing depressed individuals as hyper-realistic about their lack of personal efficacy. Personal efficacy means “judging the self as capable, as a person able to produce acts that should lead to desirable outcomes” (p. 283). Individuals in encounter perceive their capability is substantially diminished, with the cognitive and affective immersion in the transitional issue creating a blindness that inhibits further progression in awareness development and growth.

The organization in encounter might slide into that stage due to performance below aspiration level. Other negative (i.e., unanticipated, coercive) transitional issues include a critical incident of workplace violence or a class action lawsuit. The transitional issue inducing encounter in an organization can also be positive (i.e., anticipated, participative), such as a planned change, a merger or acquisition, or a new venture. An executive at NASA suggested that the agency was still in encounter 15 years after the Challenger explosion, with diminished capabilities rendering the agency unable to recover the risk-taking and cutting edge norms that had been integral to the agency’s culture. More recent examples of encounter at the organization level are shown by the recent Ford automotive and Firestone tire manufacturing debacle, the merger of Bell Atlantic and GTE into Verizon Wireless, and the expansion of Amazon.com into new business areas. In all instances, the encounter stage of the CAD model represents a substantial restraining factor (Lewin, 1951), impeding organizational growth and development.

Empowerment

The fourth stage of awareness development is empowerment. This stage includes seeking and finding strategies for securing enough power to make necessary changes while managing risk to self and others. Empowerment requires proactive reflection on experience, where negative judgment is suspended. The individual begins to use his or her discretion in a more rational manner. During the empowerment stage, the feelings of powerlessness and loss of control generated during the encounter stage are reconciled. Individuals begin to recognize the extent of power they have within their span of control and, even if that power is limited, use that power to regain a sense of control.

A significant aspect of the empowerment stage involves enlisting the aid of others through the development and maintenance of support systems (e.g., mentors, confidants, networks). The feedback learning loop that support systems provide fulfills the need for coaching the individual in the empowerment stage. Feedback as a strategy to use in the empowerment stage requires a discourse or dialogue. It serves as the making meaning piece for enabling the individual to move beyond the frustration, anger, and misperception of encounter. Mezirow (1985) suggests this tends to be done socially. Gurin and Brim (1984) identify “attention and processing of social information as the first step in change” (p. 312). Kram (1988) also notes the importance of workplace social systems for supporting individual development and reconnecting an individual experiencing the isolation of encounter.
Much of the research on organizational learning and change focuses on strategies that would be useful for facilitating movement out of encounter into the empowerment stage of the CAD model. These include critical reflection (Brooks, 1999), informal learning (Volpe, 1999), preserving morale (Mishra et al., 1998), using the manager-as-trainer approach (Watkins, Ellinger, & Valentine, 1999), developing emotional capability (Huy, 1999), and encouraging extrarole efforts (Morrison & Phelps, 1999). Hedberg (1981) highlights the need for the unlearning of existing cognitive maps and frames of reference that affect organizational routines before new learning can occur.

Integration

Integration, the fifth stage of awareness development, represents "being whole" (i.e., synergy, synthesis). The individual has regained his or her sense of control. The effects of the issue that precipitated encounter dissipate easily. The female engineer stating, "Like rain off a duck's back, I don't let the pettiness bother me anymore." The individual knows what they do and why they do it as a result of the cognitive and psychosocial development during the preceding stages. The individual is capable of helping himself or herself, as well as others, be effective and successful in their coping and adaptation efforts. For the individual, the cognitive and psychosocial development represented by moving through the empowerment stage into integration represents the growth piece. As the individual moves into integration, the individual has in place new and more effective ways to resolve or at least cope with the issue that precipitated the encounter stage. In integration there is practical application of strategies for moving beyond the crisis of encounter. Sternberg (1985) defines pragmatic intelligence that emphasizes experience and real-world context where problem solving in everyday life occurs naturally. Awareness development through integration is similar to the double loop learning suggested by Argyris (1982). The integration stage correlates to the Jungian (1983) concept of individuation; learning how to operate in alternative, non-preferred ways. Mezirow (1985) describes perspective transformation as a fundamental change in the way the individual views the world, revolution rather than evolution. Movement through the cycle of development to the stage of integration around a particular issue embodies the concept of perspective transformation.

Integration at the organization level represents ongoing adaptive organizational change (Brown & Eisenhardt, 1998) and organizational transformation (Newman, 2000) where change leaves the organization better able to compete in its changing environment. Strategies put in place during the empowerment stage enable the integration stage focus on second-order learning (Lant & Mezias, 1996) or double-loop learning (Argyris & Schon, 1978) involving the search for new routines and schemas. Argyris and Schon suggest double-loop learning is most beneficial when existing routines become ineffective or when new information cannot be understood within the currently accepted schema; conditions fundamental to the encounter stage of awareness development. A consistent theme has been the movement toward organizational learning to promote successful navigation of change (Schwandt & Marquardt, 2000). Second-order learning facilitates second-order organizational change (Newman, 2000).

The construct of awareness development is grounded in both change and learning. Organizational learning means "acquiring, sustaining, or changing of intersubjective meanings through the artificial vehicles of their expression and transmission and the collective actions of the group" (Cook & Yanow, 1996, p. 449). Huber (1991) qualifies that behaviors do not have to change to have organizational learning. Instead, a change in the range of potential behaviors represents learning. There is also much debate in the literature distinguishing between individual and organizational learning. We adopt Schwandt and Marquardt's (2000) distinction that organizational learning is more than the sum of individual learning, given our focus on both individual and organizational levels in the application of the CAD model.

Methods

Empirical application of the CAD model at the organizational level was demonstrated through a case study of a single entity bounded by time and activity. The site was a government agency responsible for all building and infrastructure maintenance functions of a large, multi-building office park setting. By all accounts, the agency had operated as a traditional hierarchal organization for more than 200 years. Stable, long-term leadership and ongoing funding meant first-order organizational change at best. Employee tenure averaged 26 years, leaving many employees in the aging workforce eligible for retirement. Suddenly in the mid-1990s, the agency had a major transition in senior leadership, compounded by increased questioning of the agency's budget and human resource management (HRM) practices. While serving the customer had always been a high part of the agency's informal culture, doing so within budget had not. A shift toward project management began. Generally accepted HRM policies and procedures were dated to the 1950s, and in some cases were nonexistent. The overhaul of 11 major HRM processes began within a six month time period.
To support the organizational changes, the agency undertook its first-ever basic supervisory skills training initiative. The training was mandatory for all the agency’s managers, supervisors, foremen, assistant foremen, and team leaders. This research was completed in conjunction with the three-year training initiative, begun in September 1997 and concluded in June 2000. Twenty-four sessions were conducted during this time period. The difficulty of coping with the multitude of changes occurring in the agency quickly emerged as a barrier to the supervisors’ effectiveness. After consultation with agency representatives the curriculum was modified to include a discussion of awareness development, with change itself as the transitional issue.

Subjects were the training participants. As part of each training session, the trainers provided an overview of the CAD model and applied it to several personal and workplace issues. After the overview, quantitative data was collected anonymously by each participant completing a form included in the training materials. The form asked each participant to identify where he or she perceived the organization as a whole, their specific organizational jurisdiction, and themselves in the CAD model around the issue of organizational change. Frequencies for response sets from all participants were tabulated using statistical software. Additionally, analysis of variance (ANOVA) was conducted to compare the means between the first three and last three training sessions. Qualitative data augmenting the quantitative data came from participants’ discussion of the agency’s level of awareness development around change, as compared to their own individual level. Qualitative data also came from conversations with the HRM division director, the training and development branch staff, other human resources practitioners, and senior management representatives. The qualitative data included first-hand observations from the authors’ meetings and telephone logs of conversations with agency representatives. Physical artifacts were examined, including the organization’s strategic plan, policy and procedures manual, internal memoranda, and other documents.

Results

Usable data was obtained from 229 participants during 18 of the training sessions. Frequencies of their responses are shown in Table 1. In every session, participants identified that individual employees exhibit all levels of awareness development around the issue of change. Participant responses indicate that there are those who are not aware and do not understand the need for change; those who can intellectualize and understand on an impersonal level the need for change; those who are in “rage stage” around the changes occurring in the organization; those who are developing strategies for adaptation and coping with the organizational changes; and, those who have developed their awareness level to where they can deal effectively with change situations and issues.

* Percentages do not total 100% because some respondents identified more than one stage.

In every session, participants also identified that the agency itself exhibits all levels of awareness development around the issue of change in the organization. Participant responses indicate that in some regards the agency does not understand the need for change; that in some regards (particularly mid and senior management) the agency “talks a good game” but really isn’t serious about making change; that the majority of the workforce is in encounter around the multitude of changes occurring in the organization; that in some regards the agency is making changes and developing adaptation and coping strategies; and, that in some regards the agency is effectively managing change without any problem.

At the same time, two trends emerge from the data. First, participants perceived themselves as significantly further along in their own awareness development than they perceived their jurisdiction and the organization. The majority of participants saw themselves at integration (47.6%), yet placed the majority of the organization at encounter (33.6%). Second, although not statistically significant, the ANOVA comparison between the data from the first three and last three training sessions showed a discrete overall shift in the means for each level of analysis. The data indicate that individuals, organizational jurisdictions, and the total organization had moved through the CAD; there was a change in awareness development over the three year duration of the training.
Discussion in each training session concluded with participants identifying strategies for moving individually and collectively beyond encounter to integration around the issue of change. Thematic analysis revealed six strategy themes, including: working the underlying issue (e.g., uncertainty, fear and anxiety about change) out internally, getting outside assistance from a third party, putting the issue on hold, taking training, gaining more experience in dealing with change, and taking action to change the situation. This data reinforced individual responsibility and accountability for moving through the CAD model to the integration stage around the issue of change. The data also emphasized the need for employees to provide assistance to, or seek assistance from, others in the workplace, to enable them to reach the integration stage of their awareness development.

Conclusions

This paper presented a model based on the construct of awareness development that was well-grounded in the existing adult development and psychology literatures. It proposed that the model can be applied at both individual and organizational levels. Application of the CAD model at the individual level is oriented toward examining changes (i.e., development and learning) precipitated by life transitions. Similarly, application at the organizational level is oriented toward change precipitated by organizational transitions and the social construction of meaning associated with the transitional change. The empirical results of the study demonstrated the practical utility of using the CAD model for analyzing change at the organizational level. Examination of individual employees' awareness development around the organizational transition issue provided a distributed view of organizational-level change.

Contributions and Implications for Practice

The CAD model provides a useful framework that helps predict, explain, and interpret attitudes and behaviors in application at both the individual and organizational levels. The framework provided by the CAD model may be helpful in a variety of organizational settings to analyze discrete perceptions about organizational transition issues, as well as assess progress made in transforming an organization toward a desired state through an OD intervention. The model may suffice as a diagnostic tool and measure for assessing development in certain OD interventions.

The CAD model also has utility for application as a diagnostic measure for practitioners. For example, the work group that goes into encounter when there is a critical incident of violence in the workplace, or the workforce that goes into encounter after. The practitioner can develop programs for increasing awareness about workplace violence to move people out of pre-encounter and assist in proactive intellectualization (i.e., promoting cognitive development). Critical incident teams can be set up to assist employees in encounter. A plan can be put in place with strategies for moving employees out of encounter, through empowerment, to integration.

Practitioners must be ready to assist employees and management in moving through the cycle, while recognizing that some work groups and individual employees will need additional help in moving beyond encounter. Diversity training programs, for instance, should focus on moving employees out of pre-encounter with workforce diversity issues by enhancing understanding of what coworkers might be going through as a result of their diversity. Practitioners should recognize that confrontational diversity awareness training may force individuals into encounter (e.g., White males). While this training method may be appropriate, the training design must also move the individuals out of encounter into the empowerment stage via skills building and development of support systems.

Limitations and Areas for Further Study

This study was limited in several ways. It was an analysis of one organization at one point in time. The self-reported data were derived from asking members of the organization about their perceptions. Although the responses were anonymous, the survey instrument was completed as part of a mandatory training initiative. Respondents were limited to one segment of the organization's population. Lastly, there was no distinction between ineffective and effective change or between planned versus unexpected change as the transitional issue.

The construct of awareness development is ripe for additional empirical study demonstrating transition through the cycle at the individual, group, and organizational levels of analysis. While this paper has shown that the CAD model provides practitioners with an organizational assessment tool, its utility should be explored further. Both qualitative and quantitative analyses of the stage of awareness development the organization is at in the CAD model can be determined through the collection of discrete and longitudinal data examining change in awareness development over time. Comparison of awareness development around the same issue in a variety of organizations would be beneficial. We need more compelling arguments regarding the cycle, particularly the variables that affect progression through the cycle. Cause/effect of awareness development should be explored (i.e., if an individual claims to be at integration, how has his/her behavior changed since being in encounter; if an organization claims to
be beyond intellectualization regarding the transitional issue, how is this manifested in organizational performance?). A last suggestion for more research centers on the level of immersion in the encounter stage. One aspect of level of immersion is repetition of encounter around the same issue (e.g., examining the organizational stress of a constant state of change, upon change, upon change). Much remains to be done before the practical utility of the concepts presented in this paper can be fully realized.

Connotative Meanings of a Change Agenda

S. Ramnarayan
Indian Institute of Management, Ahmedabad

The corporate office of a large manufacturing organization had launched a major change program in its five plants. Though a common approach had been worked out, a study conducted eight months later showed that the different plants had followed different problem solving approaches, and reached different outcomes. The paper presents this case, and examines how units develop connotative meanings of a change agenda, and how these meanings influence the effectiveness of change implementation.

Key Words: Change Implementation, Organizational Decision Making, Internal Customer Satisfaction

We can understand some of the challenges in the effective implementation of organizational change by taking an example of a specific change program. Let us consider the introduction of a change program based on the Internal Customer Satisfaction (ICS) model. According to the ICS model, each department or section in an organization has some "internal customers" to be satisfied. For example, in a steel plant, the blast furnace supplies pig iron to steel-melting shop, or the outputs of the hot rolling mill constitute the raw material supplies for the cold rolling mill. In a steel plant, therefore, steel-melting shop is an important internal customer of the blast furnace. In a similar vein, the hot rolling mill is responsible for keeping the cold rolling mill, one of its key internal customers satisfied with regard to quantity, quality, and timeliness of supplies. A service function like the accounts department would have several internal customers like the top managers, different line managers, and so on. It has the responsibility to meet, for example, the line managers' expectation of accurate and timely cost information on important organizational aspects.

The ICS model aims at getting each department to identify all its key internal customers, understand their requirements, views and ideas by effectively negotiating with them, and then work out departmental goals and actions to enhance the satisfaction of internal customers. The ICS model states that in a large organization with several departments, this process enhances inter-group integration, and if actions are taken to satisfy internal customers, it would increase the satisfaction of the external customers. When it is applied properly, ICS is a major organizational change program or intervention to improve co-ordination and responsiveness within the organization.

Coping with Complex Problems

Implementation of organizational change agenda poses a number of problems to the managers, which have been variously described in literature as ill-structured, non-programmed, wicked, or complex (Ackoff, 1979; Dearborn & Simon, 1958; Doerner, 1996; Newell & Simon, 1972; Ungson, Braunstein & Hall, 1981). Such problems present several difficulties to decision-makers. There is, often, lack of consensus and clarity on what the problem is, what the preferences and goals are, and on the pathways to reach the destination. There are multiple stakeholders with conflicting interests, and changes tend to occur in different aspects of the problems, preferences and interests over time. Doerner (1996) outlines three key characteristics of these problems: complexity, uncertainty, and changes over time.

Complexity. A complex system has several interdependent elements. Given the multiple links in the system, the organization cannot afford to pay attention only to one or two aspects and ignore the others. Decisions and actions in one part affect other parts of the system, and so actions in complex systems have side effects and long-term repercussions that are important to anticipate and guard against. Level of engagement with the problem is an important determinant of complexity. Based on whether the problem evokes interest or whether actors give up trying to solve the problem, complexity perception goes down or up (Bronner, 1986). If the managers feel oppressed by being made to go through a change program that is not relevant at all to their needs, complexity perceived to be

Copyright © 2001 S. Ramnarayan
high. On the other hand, if a group of managers are attracted by the possibility of using the program to make improvements, it contributes to a reduction in the complexity.

Uncertainty. The decision-makers do not have the luxury of having all the information about the situation that they are confronted with. They cannot be sure of how their actions would influence the system. There is no way of precisely estimating the relative impact of each of their actions at the start. It is almost as if the managers have to develop a reasonable understanding of the system to be able to act, but have to develop that understanding by watching the situation, at best, through frosted glass. Bronner (1986) states that factors like non-transparency and information load present certain difficulties. The decision-makers may have limited information on the situation that they have to address. There may be a number of unanswered questions: Would a directive model be more appropriate for implementing change? In an ICS change program, what should be the nature and scope of interfunctional issues that should form the focus of negotiations? Should the exercise be restricted to the manufacturing departments? Would inclusion of service functions enrich the program, or would it complicate matters? The key actors are required to make decisions on these aspects on the basis of their vision of the future, which may be shadowy, blurred, partial, and unclear. Uncertainty also arises from imprecise and inadequate information. The expectations from the change agenda may be neither shared nor clear and consistent. Added to the problem of multiple preferences is the uncertainty of how to gain agreement on goals, and time frames for achieving intended priorities. Uncertainty also results from lack of clear criteria for assessing performance and the approaches available to deal with problem situations. This includes difficulties in assessing quality of solution, work satisfaction, and group satisfaction.

Changes Over Time. The decision-makers are not presented with static and secure reality. They confront a dynamic situation, in which preferences do not remain stable and unchanged. Preferences or choices of decision-makers are also affected by the choices they control. It is not sufficient, therefore, to analyze a situation just at a single point of time. Managers must attempt to determine where the whole system is heading over time. The decision-makers are preoccupied with several routine and non-routine matters. Implementation of a change program is just one of the several concerns of the key decision-makers. The limited attention and time available generates its own pressures and stress, as changes also occur in the larger context of the units.

As March (1988) points out, decision making in the domain of complex, uncertain and dynamic problems involves interpretive activity, where the concern of the managers is with examining how decisions fit into efforts to establish individual and social meaning. Research indicates that there are broadly six areas where this interpretive activity is critical for problem-solving effectiveness (Doerner, 1996; Doerner & Schaub, 1994; Doerner & Wearing, 1995).

Defining the Goals. Goal formation is not completed before problem-solving activity begins (March, 1988). Human choice behavior is at least as much a process for discovering goals as for acting on them. Even if the overall goal is set, say as effective implementation of the ICS change program, it still needs to be broken down into subgoals. This would involve identification of the factors that could influence the overall goal, and understanding how these factors fuse to help achieve the final goal.

Forming a Mental Map of the Situation. A clear mental image of the system to be managed will help estimate effects or outcomes of decisions. Decision-makers, therefore, have to develop a map of the different factors that make up the system, and collect information about the current state.

Predicting the Future Development. Decision-makers need to make interpretations of the possible future to take concrete measures and decisions in the present with a degree of confidence. This necessitates collecting adequate information on the present state of the system, and on significant external developments.

Planning Actions. Having developed some interpretations of the structure of the system and possible future developments, the next logical step is to plan the actions. The complexity of the planning process would depend on the number and nature of actions that influence the system.

Monitoring the Effects of Actions. When a certain course of action has been chosen and implemented, monitoring the effects becomes crucial. In complex systems, there could be considerable lead-time before the effects of an action may be apparent. This makes the task of interpreting the feedback a challenging one.
Monitoring Own Behavior. Complex problem solving is not just an intellectual process, but involves emotions, values and motivation. It is, therefore, important for decision-makers to reflect on their own processes of problem solving and working together. Without this self-reflection, there is a grave danger, for example, of the decision-makers remaining entrenched in a futile course of action without making mid-course corrections.

Research Problem

The manufacturing units in traditional industries are designed to perform largely structured tasks in a fairly stable environment. To achieve performance in a reliable and efficient way, they are built around clear lines of command, communication, co-ordination and control. For such organizations, the task of implementing an organizational change program is an ill-structured problem. It is, therefore, possible to study change implementation by using the complex problem solving perspective, and explore the following questions: How do such organizations handle the interpretive activity in the six areas outlined above? How do they make sense of the different elements of the change agenda? How do decisions emerge? What factors lead to effective or ineffective implementation of change? Can the evaluations of errors, pathologies, and failures in problem solving behavior be utilized to throw some light on organizational decision making?

Data Collection

An opportunity to explore the above research questions emerged after one of the largest manufacturing organizations of India with multi-unit operations spread across the country, had introduced a change program based on the ICS model. The change program had been introduced in five major plants located in different towns. Each unit was an integrated steel plant having 20,000 to 50,000 employees working in several departments and sections. The five units were largely similar in terms of technology and products. The units were government-owned traditional manufacturing organizations. Having functioned for long years in a regulated and protected environment, the organizations were quite bureaucratic in their approach, and had fairly centralized management control. An Executive Director headed each unit.

A staff function at the corporate office had taken the initiative to introduce the ICS change program. The staff function had done elaborate preparatory work to compile program-related materials, and had followed it up with workshops at the central management training facility. A cross section of senior managers from different units had attended the workshops before the formal launch of the change program.

Eight months had elapsed since the ICS program had been formally introduced. During this period, the corporate office had not really followed up the change program. But informal feedback had indicated that the five units had approached the change implementation very differently, and achieved very different outcomes. The organization agreed to have an outside researcher to conduct a study of the process of implementation followed by the different plants, and examine the results achieved by each plant. Two HRD specialists from the corporate office joined the research team.

The implementation of a common change agenda in five units, which were similar in many respects (similar technology, products & size, and same parent organization) provided a natural setting to make comparisons. It was decided to use the complex problem solving perspective to study the change implementation process, and explore the broad questions discussed in the earlier section.

While a number of frameworks are available for studying the change process, the present inquiry utilized the problem-solving framework to gain some insights on organizational decision-making. The weakness of the chosen methodology is that it does not lend itself to developing and testing hypotheses. It was, however, expected that the rich case descriptions would help in developing interesting insights that could be explored in future research to determine their validity and general application.

The research team initially collected all the relevant documents from the different units. This included: the memos/circulars sent by the corporate office on ICS model, readings handed out during the training workshops, minutes of meetings of ICS change program implementation, copies of presentations made within the plant, and the reports sent by the units to the corporate office. The review of documents was followed by interviews with key actors from different locations, functions, and levels. The interviewees included key departmental heads, and concerned managers from service functions and operational levels. A minimum of 16 and a maximum of 22 managers were interviewed from each plant. Each interview lasted an average of about 90 minutes, and tried to gain an understanding of what was done or not done at different units.
On the basis of interviews and study of relevant documents, a case description of the implementation process in each of the plants was put together. The researchers, then, identified certain themes or patterns underlying each plant's approach to ICS change implementation, with a view to examine the similarities and differences among the plants in their problem-solving behavior. Table 1 provides a summary description of the change implementation process in each of the five plants. The underlying patterns identified by the researchers have been presented in the third column.

Table 1. Description of the Change Implementation Process

<table>
<thead>

<tbody>
<tr>
<td>1</td>
<td>- No explicit process for identifying internal customers and suppliers. Only production linkages considered in identifying internal customers and suppliers. Service departments not considered for inclusion in change program. - The head of the unit (ED: Executive Director) actively involved in sorting out problems and differences between interacting departments. - A formal memorandum of understanding (MOU) worked out by departmental heads, and circulated up to middle management. - A few interesting and innovative initiatives emerged at departmental level, such as - (a) wider participation, (b) explicit linkage of agreements to key performance indicators and (c) initiation of monitoring systems to make mid-course corrections. But these were not diffused to other parts of the organization. - Attention restricted to obvious issues. Ambiguity inherent in change ignored. Assumptions not questioned. - No adaptation of change to fit specific requirements. Scant attention to details. - Excessive reliance on formal arrangements, hierarchical referral, signed agreements. - Change agenda seen as preparing &quot;summit agreements&quot;.</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>- Exercise restricted to the departmental heads and a few other key personnel. - After preliminary bilateral discussions, key managers met in the ED's office to arrive at the final decision. There were four factors that kept the level of differences low. (1) Customer kept their expectations/demands low keeping in mind supplier department's weaknesses and problems. (2) The directive to reach agreement was taken as a signal to compromise. (3) Departmental heads wished to avoid 'unpleasantness' in front of the ED. (4) Deliberations were kept at a general and conceptual level, and the difficulties in translating principles to practices were avoided. - Service departments were involved only when it was considered necessary. They exercised little or no influence. - Decisions written up as minutes of the meeting and circulated only to key managers. The other managers had no idea of what was discussed and agreed upon.</td>
<td>Change program seen as mechanism to reach agreements on inter-functional issues. The idea was to try whatever was possible, without pushing too hard. So demands were left at a general level. It was left to the key managers to follow up in a manner that they considered appropriate. - Articulation of demands/expectations, communication of change, formulation of action plans and monitoring were all done informally. - Change agenda intended to be a &quot;painless process&quot;.</td>
</tr>
<tr>
<td>3</td>
<td>- Managers with good process skills and credible image appointed as change facilitators. - A staff department was asked to prepare guidelines and formats, agenda to be covered during negotiation, aspects to be covered in presentations, nature of action planning process to follow, etc. Model recommended by the headquarters was extended and modified. Inputs from line departments were sought during this process. - Service departments and people at operations level were</td>
<td>The approach recognized the need to adapt change to plant's requirements and considered systematic reflection was necessary for the purpose. - Designs and processes were instituted to deal with ambiguity and uncertainty posed by change. Demands of the change were</td>
</tr>
</tbody>
</table>
actively involved.
- ED chaired the initial meetings with process facilitators and key managers to discuss overall priorities. There were also monthly review meetings for monitoring and mid-course corrections.
- Final action plans were widely circulated. A few departments obtained external help to sort out some persistent problems. The exercise led to some dramatic improvements.

4
- The change program was first discussed in the meeting of the heads of departments. There was confusion in formally defining "customers" and "suppliers". It was felt that every department was both a supplier and a customer in some sense. So it was finally decided to have a multi-lateral negotiation of all the departments in one forum.
- As the annual planning cycle had been completed, decision was taken not to re-open quantity and quality issues. The ED proposed that the group attend to cost reduction issues, and this theme was accepted.
- Two meetings of all the departmental heads were held, and some points were discussed for cost reduction. As the ICS guidelines prescribed the involvement of people at operational level, there was a large gathering of 200 people when a few departmental heads presented these points. There was no discussion after the presentations. Most of the people who attended the meeting considered it as "just another routine affair".
- Copies of the transparencies used for presentation were sent to the headquarters as outcome of the ICS exercise. There was no follow-up afterwards.

5
- The plant faced some serious business problems. There was a major resource crunch, and a number of projects and activities had been put on hold. So there was no enthusiasm for the change program.
- In the initial discussion, a member proposed that supplier departments could only give "conditional commitment" as necessary resources may not be made available to the concerned supplier department. The ED accepted this.
- As all the supplier departments faced problems of resource crunch and indicated that they could only give conditional commitment, no meaningful negotiations took place between departments.
- The final document was compiled by a staff department which listed all the requirements of the customer departments and the resource requirements of the supplier departments. There was nothing new in the document. It was sent to the headquarters and the chapter was closed.
- A manager's comment captured the underlying sentiment: "How can we talk of responsiveness to internal customers when we don't even know whether the unit is going to survive tomorrow?"

understood, and individuals and groups with relevant expertise were involved. Willingness to receive help indicated positive attitude to change.
- Change agenda seen as "opportunity for improvement and innovation"
Discussion and Conclusions

Factors Influencing Connotative Meanings

While ICS program had certain purposes and explicit meanings for those initiating the change agenda, it had inherent complexities and ambiguities for the plant decision-makers. A problem has a number of subordinate problems. For example, the problem of ICS program implementation has the subordinate problems of determining the scope of the program in a unit faced with severe business constraints, deciding on the appropriate mechanisms for involving people at operational level, or creating shared need for change among key actors. Each of these subordinate problems required a thoughtful interpretation and response.

Faced with the ambiguities and complexities of the change program, decision-makers in plants tend to arrive at different meanings based on three sets of factors. (1) To which field their vision was limited; (2) Which phenomena included in the field were actually perceived; and (3) Through which filter woven by cognitive base and values, are bits of information selected put through? (Hambrick & Mason, 1984). We may refer to these three factors as the mindset of the key managers, their control panel, and their processes. We discuss these aspects below.

Mindset of Key Managers. The mindset determines how attention is allocated. Plant 3 took efforts to ensure that it focused its energies on the appropriate fields of endeavor, and it planned to continue to focus on those aspects over time. But there was no such clear focus in Plants 1, 2 and 4, which exhibited low capacity to tolerate uncertainty. By restricting the exercise to certain levels and departments, these plants made it difficult for certain issues and concerns to receive attention.

Control Panel of Managers. The decision-makers seem to work with a 'control panel' with a number of dials, each providing signals from the system about developments in a given area (Ramnarayan, Strohschneider and Schaub, 1997). The control panel helps decision-makers in efficiently keeping track of different aspects. But once the control panel is in place, it influences not only what the group consistently pays attention to, but what it also consistently ignores. For example different plants considered different aspects of the system in their decision-making process. While ICS program was reduced to a multilateral negotiation on cost reduction in Plant 4, Plant 3 paid attention to the agenda to be covered, guidelines and formats, nature of action plans to be worked out, facilitation of meetings, monitoring, and so on.

Decision-making Processes. Decision-makers also differ in the ways that they deal with the signals that they pick up. Each unit develops its own decision making processes, and so differences develop, for example, in choosing actions or making mid-course corrections. Some decision-makers took different aspects of the change agenda at their face value. They asked very few 'why' questions to find out the causal links behind events. For example, the issue of including or excluding service or operations people was treated as an independent of other aspects of the change program. On the other hand, Plant 3 had a task force to prepare a rough blueprint for implementation, and discussed the key choice points in meetings. The task force was asked to propose some concrete measures, and the meetings explored the fit between these concrete measures and the abstract ideals of the ICS model.

A change agenda with inherent complexities and ambiguities, offers multiple pathways. Decision-makers with different mindsets, control-panels, and processes pursue their own unique run through the maze. Depending on the choices made and path traversed, decision-makers develop a sense of what the journey is about. Thus different connotative meanings emerge, and the meanings influence further behavior patterns. We can, therefore, conclude as follows:

The connotative meaning/s of a change agenda is contingent on the specific manner in which the central actors respond to ambiguities and complexities posed by the change.

Connotative Meanings and Effectiveness of Change Implementation

When the meaning develops, it structures the change agenda and reduces the ambiguity for decision-makers. Decision-makers are motivated to invest time, energy, and effort to search for information when the marginal utility of additional unit of information is greater than the marginal cost of gaining that information (Stigler, 1961). When there is image of certainty, the perceived marginal utility goes down substantially, and this introduces a severe disincentive for the search process.
In the following paragraphs, an attempt is made to trace the behavior patterns underlying change implementation in four of the five plants that ignored ambiguity and uncertainty inherent in the situation. This has been done to examine how meanings attributed to the change agenda influence the change implementation process. This is presented as a rough sequence of steps for ease of explanation.

1. Immediate issues defined the terms of the problem. At different points of time, though decision-makers confronted a range of issues, the immediate issues, often, tended to grab the attention. For example, involvement of operational levels was perceived in limited terms of merely conveying certain information. As such immediate issues took the center stage, the larger problem of mobilizing and energizing the skills and commitment of dispersed and diverse elements on interface issues faded into the background.

2. There was an implicit expectation that an immediate solution was possible for the problem, and this should be put in place. There was little or no exploration of choices with regard to identification of internal customers, mechanisms for interface management or monitoring.

3. With the above two behavior patterns, the scope of the problem was narrowed, and the temporal alignment of the problem and solution was ignored. For example, the objective of interface management was reduced to the task of arriving at a memorandum of understanding.

4. There was a tendency to focus on problems that could be solved, not the ones that need to be understood and then hopefully solved. Different plants concerned themselves with the task of having meetings of departmental heads or compiling lists of resource requirements without worrying about the long-term goals of the change agenda. The nature of accountability was experienced only for completing specific tasks or obtaining discrete outcomes, not for achievement of the overall objective. There was little or no reflection on how these tasks contributed to the strengthening of internal customer orientation.

5. The behavior patterns discussed above led to ritualization, and this pushed down the excitement for inquiry and action. When the approaches of problem solving and working together leaves the key actors with no sense of enthusiasm and motivation, the effectiveness of change implementation suffers. So we may conclude:

   The meanings attributed to the change agenda determines the degree to which change implementation becomes effective.

Influence of Rule Based Decision-making on Connotative Meanings

March (1988) states that decisions can be viewed as choice-based or rule-based. When it is choice-based, actors examine the logic of consequence, making choices among alternatives by evaluating their consequences in terms of prior preferences. When it is rule-based, actors look at the logic of appropriateness. They fulfill their roles by recognizing situations and searching for precedents or rules that match appropriate behavior to the situation they encounter.

There were some interesting patterns in the rule-based decision making that was followed in four of the five plants. These behaviors lent stability to the process. After initiating actions, decision-makers avoided taking stock of the consequences of these actions. This helped them maintain a pseudo sense of control and effectiveness. There was unwillingness to accept fail points. At no point of time, decision-makers examined the possible limitations of their approaches. Finally, there were unrealistic assumptions made: for example, all expertise can be brought to bear immediately; or there is no inertia, and things would take effect instantaneously. For instance, it was conveniently assumed in Plant 1 that once a memorandum of understanding has been worked out between departmental heads, changes would unfold and internal customer satisfaction would be achieved. By providing an image of certainty and control, rule-based decision-making prevented investments being made in the search process for understanding the problem complexity, and generating creative solutions. So we conclude:

   The more rule-centric the decision-makers are, the less they capture the richness in meanings that ambiguities inher.
over the situation or event; (c) They feel interested in doing something and committing resources; and (d) They believe that no ready-made solutions are known and that systematic reflection is necessary (Landry, 1995).

When rule-based approach is adopted in the early stages of change implementation, the likelihood of perceiving crisis or opportunity, experiencing control over the situation, and being interested in committing resources for problem solving, all go down substantially. These would require breaking the existing decision frameworks with the attendant risks. On the other hand, choice based decision making and logic of consequence followed in Plant 3 made it more likely for people at operational levels to perceive crisis or opportunity within the larger framework of choices made, experiencing control, and committing resources to problem solving. Logic of consequence makes case for systematic reflection, as ready-made solutions are not believed to be available. Thus ownership of problem at operational levels was more likely in Plant 3 situation.

In other words, with rule-based approach, organizational actors down the line are unlikely to perceive a problem or engage with it. So, no energy or effort is directed to problem solving. This is expressed below as our final conclusion:

Rule-based decision making in the early stages of change tends to lock the organization in rule-based approach in subsequent stages, and pushes down ownership of change.

The tentative conclusions of the present exploratory research need to be tested in future research programs to determine their validity and general application.

The age-old parable of the elephant and four blind men illustrates how different individuals derive connotative meanings of the elephant being a pillar, rope, wall, or snake. Organizational actors develop similar connotative meanings of a change agenda. It is important to understand how these meanings emerge, and how they influence behavior so that we can explore what can be done to influence the process of meaning making in organizations to achieve effective change implementation.

Mobilizing Illegitimate Movers: A Model for Transcending the Constraints of Potential

Joseph E. Sanders III  
Colorado State University

Gary D. Geroy  
Colorado State University

Evolving the capacity to find meaning in life optimizes an individual's ability to go beyond the environment's imposition of potential, and accomplish "outside the box." This paper presents and discusses a theoretical model which: 1) broadens the context for HRD social mandates and 2) provides a process model grounded in self-actualization awareness and thinking which facilitates the individual to go beyond the constraints of potential (as defined by the individual's environment).

Keywords: Social Stratification, Leadership, Existentialism

This paper presents and discusses a theoretical model (see figure 1) which: 1) broadens the context for HRD social mandates and 2) provides a process model grounded in self-actualization awareness and thinking which facilitates the individual to go beyond the constraints of potential (as defined by the individual's environment). The American ideology is that at birth's moment, all people are created equal. Unfortunately, from this point forward, the forces of life shape, label, and direct the opportunities and rights available - resulting in social stratification. According to Liska (1992), Mendoza (1995), and Napoli (1995), humans and their optimization capacity is directly linked to the class in which they exist, and effectively creates an inherent discrepancy in opportunity and process.

Why should HRD professionals be concerned about this inherent discrepancy in opportunity and process? At a social conscience level, it may be incumbent upon HRD professionals to be challenged by the question of whether we are really optimizing human development if we limit the expansive potential of any of our workforce through various strategic intervention strategies? Second, should enterprise continue to be a mirror of social phenomena, or do we have a social responsibility (even if only in the cause of profit maximization) to provide process and opportunity for all individuals that transcend the immediate strategic need of the organization?

HRD purports to maximize individual potential by educating, training, developing and ensuring equality within the workforce. Ruona (2000) highlights these notions in her discourse on the philosophical foundations of HRD. The problem is that we limit individuals to the environmentally defined notion of potential, as defined by the environmental context of the individual. Who creates the definition of the individual potential? It may be society as it addresses general workforce development through its structure and system. Alternately it may be enterprise. The question raised is whether or not in our HRD and structural efforts to improve individual, society, and enterprise capacity, we may be effectively limiting individual potential? The HRD goal should be to help individuals develop beyond the constraints of potential by allowing them to transcend societal derived and potentially limiting norms.

Discussing stratification forces, Liska (1992) suggests that society's and enterprise's power elite will continue control systems to protect themselves from threat-infusion by those outside their sphere. As an individual matures into adulthood, the societal class system increases its stronghold, by limiting the amount of legitimate movement between classes; because as a person matures they develop social consciousness and awareness making a person's relative place in society more salient (Taylor & Moghaddam, 1994). Defying this societal dynamic by moving out of their class presents unique challenges, in part because their behavior is viewed as illegitimate by two spheres of society which are outside their immediate context. The first sphere is the group they are leaving, and the second is the group of which they wish to be a part. We refer to the former as the "base group," and the latter as the "elite group." Brody (1970) refers to these groups in systems terms, using the terms "donor system" (base group) and the "host system" (elite group).

The U.S. prides itself on capitalistic-stratification, which in theory grants an "equal opportunity" and social mobility for everyone. For those Americans who are content with their current social class, this theory does not pose a problem.

Characteristics

Leadership Valued: Transactional
Motivation Orientation: Competition
Decision-Making Style: Authoritative

Leadership Valued: Transformational
Motivation Orientation: High Achievement
Decision-Making Style: Egalitarian

Leadership Valued: Pragmatic
Motivation Orientation: Low Achievement
Decision-Making Style: External Locus

Figure 1. Transcendental Accomplishment Model
However, those who try to put the theory into practice frequently can experience a rude awakening. They find themselves divorced from the base group, which they intentionally left behind, and may only be conditionally accepted by the elite group whom they are striving to be like.

Our model is grounded in two social principles, which extend to both cultural and economic movement. First is that society and its organizations are stratified. Second, is that upward mobility is an unbalancing dynamic. In our bipolar model, the base group (donor) represents the indigenous group from which the sojourner migrates. The elite group (host) represents the target group to which the sojourner intends to migrate. The illegitimate movers represent the sojourners trapped between two worlds - belonging to neither, unsuited to retreat, and unable to advance. Our model includes a fourth element. This is a characteristic profile of each stratification, to include their leadership preference, their motivation orientation, and their decision making style.

Profile of Model Elements

The Elite Group

Members of the elite prefer a transactional style of leadership where strategic social and sometimes even material exchange occurs. "The exchange is established and maintained if the benefit to both the leaders and the followers outweigh the costs" (Homans, 1961). Transactional leadership is most conducive to the elite for several reasons. The elite group and members have much larger economic and social "accounts," thus more resources and social capital to exchange (as compared to the base group). Further, "elites" remain in control since they generally are the sole proprietors of their economic and social "accounts." No member of the elite group will "write checks" that he or she doesn't have sufficient funds to cover. Thus, members of the elite group only facilitate exchanges or transactions that will maintain or benefit their "account." According to Paige (1977), transactional leaders try to maintain existing status quo political institutions and policies. As members of the elite group are at the top of the social framework, why would they want change?

The motivation orientation of the elite group is competitive. A competitive orientation is defined by Martens (1976) as "a disposition to strive for satisfaction when making comparisons with some standard of excellence in the presence of evaluative others." Individuals with this orientation are concerned with how they compare to those around them, and they often view someone else's victory as their loss. Within the Western social framework, the closer you are to the top the more you have won in comparison to those you have left behind. The elite group members have often experienced more than their fair share of victories, and are not accustomed to losing. Elite members also realize that every time someone takes a piece of the fixed-size apple pie that leaves less for them. The only way to win in this case is to get more pie than everyone else, and if you can't get to the piece of pie before them, take it from them.

Decision-making for the elite is a top-down process, which is best facilitated by an authoritative style of decision-making. The authoritarian decision-maker can also be described as directive (Heller, 1969), coercive and persuasive (Bass, 1960), primarily concerned with production (Blake & Mouton, 1964), or lone decision-makers (Vroom & Yetton, 1973). This decision style directly depends on the individual's official rank (Nelson, 1950). It is pretty hard to use this top down approach unless you are at the top like the members of the elite group. This style supports the elite group in maintaining control, and fuels its competitive orientation for success. According to Bartlett (1959), authoritative decision-makers maintain their success in complex social systems because of their prestige and position.

The Base Group

Members of the base group prefer a pragmatic style of leadership and followership. The pragmatic style is aligned with the base group for two reasons. First, those who are content with the way things are value the pragmatic style. Pragmatists learn not to make waves, because they do not want to stick out (Hughes, Gimmet, & Curphy, 1999). Like the elite group, the base group will favor the status quo; as they are often unwilling to exert the physical, mental, or emotional effort required to make a change (Taylor & Moghaddam, 1994). Secondly, the base group's relative position in the stratification structure suggests that they are not the critical decision-makers. Rather, the dominant societal group subordinates them (Tajfel & Turner, 1979).

Members of the base group (as compared to the elite) have a low achievement orientation having been conditioned to believe that 1) effort won't improve their conditions, and 2) that their course has been set, and that
they cannot override this "automated" system - therefore why bother (Biddle, 1993). According to McClelland (1965), the base group is very extrinsically motivated and lacks the initiative to attempt challenging or nontraditional tasks. In addition, members of the base group could suffer from the "fear of failure" (FOS) psychological construct (Horner 1968). The effect of a low achievement conditioning is that instead of focusing on moving upward towards success the individual moderates his or her fears by remaining stagnate.

Decision making for the base group is much more responsive than for the elite. Members of the base group believe that they are "pawns of fate," and prescribe to an external locus of control for making decisions. They prefer being directed as oppose to directing, thus infrequently initiating decisions. Individuals with an external locus of control do not believe that outcomes of tasks are a result of their decision. Also, believing they do not have legitimacy to execute decision-making, they defer to society and superiors to make decisions (Hughes, Ginnett, & Curphy 1999).

The Illegitimate Movers

These are people who have chosen to leave their base group. They have aspirations to attain membership in what they perceive to be an optimal group (the elite group as defined by the environment). The notion of illegitimacy is grounded in the perceptions held toward them by the base group and the elite group. Having chosen to leave their base group, they have socially, politically, and economically - if only in intent - ascribed their base group as not worthy of them. The base group diminishes the sojourner's legitimacy by suggesting the sojourner is no longer "one of us," but now "one of them." The elite group views sojourner as not having legitimacy by virtue of not possessing the same attributes (social, political, economic) that are valued by the elite group. The sojourner now has diminishing legitimacy in the perspective of both the base and elite group. Illegitimate movers are not satisfied with the status quo, and strive to be catalyst for change. They typically do not possess the same lofty economic accounts enjoyed by the elite group, thus they must focus more on the person to influence change rather than using the person in an exchange.

Illegitimate movers seem to prefer transformational leadership. Transformational leaders seek change for the improvement of those around them, even if it means changing the framework (Bass, 1990). According to Burns, transformational leadership is ultimately a moral exercise - serving to raise the standard of human conduct. Unlike the elite group, their motives often transcend their personal benefit, and unlike the base group, they are very active in their behavior and critical in their thought. Transformational leadership is afforded to the illegitimate mover, as it does not require special status, and can occur at any social level. Only those who manifest modal values, work to achieve end values, and have a positive impact on those whose lives they touched should be judged as transformational. Leaders who do not possess these three characteristics are usually transactional leaders (Burns, 1978).

The illegitimate movers' motivation orientation is high achievement. Achievement orientation represents an individual's intrinsic motivation, which is not primarily dictated by external forces, instead coming from within. Unlike a competitive orientation, an achievement orientation does not need a social component by which to be evaluated. They strive for excellence, persist in the face of failure, and experience pride in their accomplishments (Gill, 1980).

Decision-making preference for the illegitimate movers is a bottom-up or egalitarians approach. They believe involving more people in decision processes results in better and more equitable decisions. Their characteristics are described as democratic (Lewin & Lippitt, 1938), primarily concerned with people (Blake & Mouton, 1964), "theory Y" ideologists (McGregor, 1960), or oriented toward joint decision-making (Vroom & Yetton, 1973).

Achievement Decision

What environmental pressures define the potential - and its attendant possibilities and constraints - of the illegitimate mover? The first defining pressure of potential is the current attributes of the elite group. The second is the limiting pathway strategies available for moving toward membership in the elite group, or retreating to their base group. Thus potential is defined by the environment and not by the individual. With this said, what mechanisms can be encountered and utilized to facilitate the mobilization of the illegitimate movers, both within and outside the box of potential?
Sponsorship

Sponsorship mobilizes the illegitimate mover towards the elite group or back to the base group, within the box of potential. Sponsorship towards the elite occurs in two ways. The first is a legal process wherein government mandates that members from outside the elite group be allowed in - a form of "legal adoption." The second is via the emotional response by the elite group who may be overcome with feelings of guilt and bring the "less fortunate" into the elite fold - a form of "social charity." Tokenism occurs when the sojourner is made part of the group, but is not fully accepted as an integrated or embraced member. Like fourth string football players, they 1) are team members, 2) wear the same jersey, and 3) practice with the team, but don't get to play in any games that count. Tokenism as a social strategy accepts few capable illegitimate movers into the elite group, while systematically blocking the majority of the illegitimate movers (Laws, 1975). Tokenism is a subtle but powerful form of discrimination that can have a structural reality for the illegitimate movers. For the sojourner who has spent their life traveling towards the elite group, this token destiny creates and sustains a lingering frustration (Wright & Taylor, 1990).

Sponsorship back to the base group occurs a little differently, but has the same frustrating end. It can occur through strong social ties - such as family wherein illegitimate movers may feel obligated to support the social situation in the base group. This support may be financial, physical, social, or spiritual in form and process. When a dejected sojourner seeks return to the fold, sponsorship may require forgiveness by the base group. Forgiveness may not occur immediately, as it requires social re-norming for both the sojourner and the group. Regardless of the reason, when the illegitimate mover returns to the base group it is viewed as regression. Regression is a relative term, implying a person is returning to a place from which they were trying to leave. Alderfer's (1969) Existence-Relatedness-Growth (ERG) model offers a framework for understanding illegitimate movers' regression. In his model, existence represents the individual's motivation to meet basic physiological and security needs. Once needs are met, they seek relationships and acceptance. However, when the individual is unable to become part of or remain in groups they desire to be part of, they experience the frustration-regression hypotheses. The individual experiences frustration as they regress back to meeting basic needs. The illegitimate mover, who experiences this, becomes a prodigal sojourner whose destiny is his or her beginning.

Logos Progress

Reaching potential is laudable. Our model suggests another option - the achievement of transcendental accomplishment. In the model transcendental accomplishment occurs when the illegitimate mover goes outside the box of potential and rises to Maslow's complete self-actualization. Our treatise is supported by Frankl (1984), Phillips (1997), and Tessin (1997) who agree that capacity fulfillment is not defined by the constraining environmental variables, but is the unleashing of the power of persons to optimize accomplishment by transcending their constraints. It is not an either or path of choice. HRD may be able to help individuals and society in this accomplishment by engaging a process called "logos progress" to assist the illegitimate mover. Victor Frankl suggests that logo therapy will allow a person to remove the constraints of the environmental variable (in the model, potential) and find internal meaning, which would be Maslow's self-actualization. Logos denotes "meaning," while progress refers to "movement, advancement, and/or development." We suggest logos progress facilitates transcendental accomplishment by focuses on meaningful advancement in life, and by striving for meaning in life instead of trying to get meaning from life. Such progression better equips the sojourner to realize true meaning, by freeing him or her from the Freudian and Adlerian view that an individual's primary motivation is pleasure, power, and superiority. This realization redirects an individual's destination on an internal state of freedom as oppose to the traditional external focus (elite group status). Frankl (1984) says "To be sure, a human being is a finite thing, and his freedom is restricted. It is not freedom from conditions, but it is freedom to take a stand towards conditions." Such awareness empowers the illegitimate mover, and gives him or her back the potential that was "leased" by society. Striving for meaning in life places the element of an external environment in a non-dominant state. The locus of control for aspiration and value-based meaning is moved from the definition of potential (constructed by the elite or base group) to that of transcendental accomplishment as defined by the individual.

Summary

Wendy Ruona (2000) looked philosophically at the core beliefs underlying HRD and asserted our larger social mandate for responsibility to both society and the individual, to understand how they relate to each other and
enterprise. Our model supports her assertion that HRD can assist people in the social context. Our model allows HRD to transcend the traditional organizational focus and to impact and incorporate the larger social context. Evolving the capacity to transcend potential optimizes an individual's ability to move beyond the environment's imposition of potential, and accomplish "outside the box". The result is that the group or the entity that they represent (i.e. enterprise) can itself redefine a higher meaning of potential, and move to that accomplishment.

The model has multiple applications. At the enterprise level it can be used to help a mid-level supervisor (base group) who desires to move into a senior management position (elite group). This can apply to any member of enterprise who wishes to move to a different level. It can also be applied in a more global context, such as when an African-American family decides to leave their community (base group) and move uptown to live next to families with a higher socio-economic status (elite group). In both scenarios, HRD principles (self-actualization and capacity) can be applied to facilitate optimal development. We believe that all individuals - while equally created - do not have equally created potential, as defined by their environment. However, this environmentally created potential, by the elite group and the base group, should not serve to limit an individual's dreams, aspirations, or movement towards a more meaningful life. We truly believe that as HRD professionals, we can help transcend the inequality and constraints of potential. The model facilitates a view to achieve this outcome by helping individuals and organizations find meaning in life and moving them towards transcendental accomplishment.

## Volume 1

### From the Editor

Call for Papers – AHRD 2002 Conference
AHRD 2001 Conference Overview

### Conference Papers

#### Symposium 1: Action Learning

Action Learning: Case Studies of Most Valued Learning and Application .......................... 1

*Suauuue D. Butterfield*

Mapping Group Dynamics in an Action Learning Experience: The Global Team Process Questionnaire (GTPQ) ................................................................. 1

*Robert L. Dilworth*

Comparing the Learner's and Educator's Perspective on Conditions that Foster Transformative Learning in Action Learning Programs .............................................. 1

*Judy O'Neil and Sharon Lamm*

#### Symposium 2: Integrating University and Corporate Learning with Work

Workplace Application of HRD Concepts as Perceived by Non-Traditional Adult Students and their Workplace Supervisors ................................................................. 2

*Kit Brooks, Dale E. Thompson, and Elizabeth S. Lizárraga*

Tactical Management of Power: The Practical Work of Negotiating Stakeholder Interests in Planning Education Programs in A Corporate Context .............................. 2

*Christie Knittel Mabry and Arthur L. Wilson*

Understanding the Experience of College Graduates During their First Year of Employment .............................. 2

*Janet L. Polach*

#### Symposium 3: HRD in Asia

The Experience of HRD Professionals Participating in Continuing Professional Development in Taiwan ................................................................. 3

*Yu-Shu (Jason) Chen*

What Is It Like to Be A Taiwanese HR Practitioner Performing HRD Tasks? ........................................... 3

*Ya-Hui (Bella) Lien and Gary N. McLean*

A Study of Human Resource Development in Indigenous Firms and Multi-National Corporations in East And Southeast Asia ................................................................. 3

*Kenneth R. Bartlett, John J. Lawler, Johnseok Bae, Shyh-Jer Chen, and Tai Wai David Wan*

#### Symposium 4: Distance Learning

An Exploration of Perceived Differences in Teaching Roles Between On-Site and On-Line Instruction ........ 4

*James J. Kirk*

Factors Affecting Student Completion in a Distance Learning Mediated HRD Baccalaureate Program ........ 4

*Hui-Chin Chu and Barbara E. Hinton*

Experiences of Web-Based Instruction Among African-American Students Enrolled in Training and Development Graduate Courses .............................................. 4

*Sawndra Wall Williams*

Indigenizing Knowledge Transfer
Gary N. McLean
How to Develop Human Resources: Technical Rationality or Social Moral Responsibility? A Comparison of Western And Chinese Human Resource Theory and Practice
Baiyin Yang and De Zhang
Enhancing Commitment and Overcoming the Knowing-Doing Gap: A Case Study at the Technikon Northern Gauteng (TNG) in South Africa
Hilda Martens and Jan Verhagen

Innovative Session 2
Reframing Continuing Professional Education: Innovations in Theory and Practice
Barbara J. Daley, Vivian W. Mott, Ruth Craven, and Judith M. Ottoson

Symposium 13: Leadership Development
Organizational Performance: The Future Focus of Leadership Development Programs
Doris B. Collins
Hidden Dimension of Leadership Success: Implications for Building Effective Leaders
Anne Elizabeth Khoury
A Study of Leadership Roles, Styles, Delegation and Qualities of Indian CEO's
T. V. Rao, Raju Rao, and Soumya Dixit

Symposium 14: Transfer of Learning
The Influence of the Implementation of a Transfer Management Intervention on Transfer of Training
Patricia R. Saylor and Marijke T. Kehrhahn
Learning Strategies: A Key to Training Effectiveness
Paula Wilbyard and Gary J. Conti
An Examination of Learning Transfer System Characteristics Across Organizational Settings
Elwood F. Holton III, Hsin-Chih Chen, and Sharon S. Naquin
Symposium 15: HRD Theory
Wendy E.A. Ruona
Theorising Human Resource Development .......................................................... 15-2
Jim McGoldrick, Jim Stewart, and Sandra Watson
Human Resource Development as a Factor in the Inevitable Move to Globalization .................................. 15-3
Gary N. McLean

Symposium 16: Organization Development
A Study of Gender Management Preferences as Related to Predicted Organizational Management Paradigms for the Twenty-First Century .......................................................... 16-1
Cathy Bolton McCullough
Considering OD Theories from the Theoretical Foundations of HRD and Performance Improvement ...... 16-2
Thomas J. Chermack and Susan A. Lynham
Organization Development: An Examination of Definitions and Dependent Variables ...................... 16-3
T. Marshall Egan

Symposium 17: Role of HRD in Women’s Career Development
Career Goals of Non-Managerial Women: An Adaptive Approach .......................................................... 17-1
Linda M. Hite and Kimberly S. McDonald
The Career Life Cycle and Mentoring: The Opportunity for Reflection as an Outcome for Mentors ...... 17-2
Ellen J. Mullen, Betty E. Steffy, and John Van Ast
Functions Performed by Mentors that Assist in the Career Development of Women Managers .......... 17-3
Rose Mary Wentling

Symposium 18: Knowledge Management and Human Capital
Analyzing and Solving Difficulties Experienced in Knowledge Management: The Case of a Knowledge Intensive Organization .......................................................... 18-1
Simone J. van Zolingen, Jan N. Streumer, and Maaike Stooker
Joanne Provo
Human Capital, HRD and the Knowledge Organization .......................................................... 18-3
Oscar A. Aliaga

Symposium 19: Organizational Change
Institutionalizing Organizational Change through Cascade Training: Implications for HRD Research .... 19-1
Ronald L. Jacobs, Darlene Russ-Eft, and Suhail Zidan
Shock to the System: Analyzing Organizational Change Using the Construct of Awareness Development 19-2
Martin B. Kormanik and Annette K. Sturdevant
Connotative Meanings of a Change Agenda ...................................................................................... 19-3
S. Ramnarayan

Innovative Session 3
Mobilizing Illegitimate Movers: A Model for Transcending the Constraints of Potential .................. I-3
Joseph E. Sanders III and Gary D. Geroy

AHRD 2001 Conference Overview

Conference Papers

Symposium 20: University Programs
Institutional and Curricular Characteristics of Leading Graduate HRD Programs in the U.S. ........................................ 20-1
K. Peter Kuchinke
Assessment of a Graduate Program in Human Resource Development: Perceptions of Key Stakeholders ........................................ 20-2
Julie A. Furst-Bowe and Joseph Benkowski
Predicting Academic Performance in Management Education: An Empirical Investigation of MBA Success ........................................ 20-3
Baiyin Yang and Xiaoping Rosa Lu

Symposium 21: Theory Building
A Multilevel Theory of Organizational Performance: Seeing the Forest and the Trees ........................................ 21-1
Susan Reynolds Fisher
Is Knowledge in the Head or in the World? ........................................ 21-2
Richard J. Torraco
A Performance Perspective Synthesizing Intellectual Capital, Knowledge Management and Organizational Learning ........................................ 21-3
Carson R. Arnett

Work and Family Conflict: A Review of the Theory and Literature ........................................ 22-1
Susan R. Madsen
Behind the Badge: Implications for Employee Assistance Programs in Law Enforcement ........................................ 22-2
Lynn Atkinson-Tovar and Kathleen Kiernan
Employee Expectations, Characteristics, and Perceived Goal-Attainment of Tuition Assistance Program Participants ........................................ 22-3
Ronald L. Jacobs, Mark Skillings, and Angela Yu

Symposium 23: Workplace Learning
Beyond School-to-Work Initiatives: Does HRD Have a Role? ........................................ 23-1
Gene L. Roth and Laurel Jeris
The Concept of Common Sense in Workplace Learning: A Qualitative Study ........................................ 23-2
Robert W. Rowden
Job Analysis for Training: Examining the Holistic Nature of Work Requirements ........................................ 23-3
Donna H. Redmann, Judith J. Lambrecht, and Wanda L. Stitt-Gohdes

Symposium 24: Managerial Performance Issues
Managerial Skills Requirements: Evidence from the Scottish Visitor Attraction Industry ........................................ 24-1
Sandra Watson and Martin McCracken
An International Assignment and Managerial Performance: Job-related Variables Relative to Effective Performance of Japanese Expatriates ........................................ 24-2
Kiyoe Harada
Modeling the Impact of Managerial Behavior in a Store Environment ........................................ 24-3
Allan H. Church
Symposium 25: Improving Learning with Technology
The Benefits, Challenges, and Implications of Teleworking: A Literature Review
Susan R. Madsen
A Study of e-Learning Practices in Selected Fortune 100 Companies
Danielle Strazzo and Tim L. Wentling
Human Resource Development for International Technology Transfer within Multinational Enterprises in Singapore
Ahad M. Osman-Gani

Innovative Session 4
Increasing Capacity to Learn in the Learning Organization
Neal Chalofsky

Innovative Session 5
Layers of Learning: Promoting Performance Improvement and Action Learning in Higher Education
Diane Foucar-Szocki, Randy Mitchell, Rick Larson, Laurie Harris, and Nancy Sherman

Symposium 26: Professional Development
An Inquiry into the Continuing Professional Education of Information Technology Workers
David D. Branigan
The Relationship between Professional Learning and Continuing Professional Development in the UK: the Implications for a Research Design
Jean Woodall and Stephen Gourlay
A Comparative Analysis of Problem-based Approaches to Professional Development
Margaret C. Lohman

Symposium 27: Informal Learning
Workplace Learning Reviewed: Confronting the Rhetoric with Empirical Research
Rob F. Poell and Ferd J. Van der Krogt
A Study of Informal Learning in the Context of Decision-Making
Andy R. Walker and Victoria J. Marsick
Learning Beliefs And Strategies of Female Entrepreneurs: The Importance of Relational Context in informal and incidental Learning
H. Elizabeth Coyle and Andrea D. Ellinger

Symposium 28: Emotions and Behavior in the Workplace
Analyzing Training from an Emotions Perspective
Darren C. Short
The Planned and Unintended Emotions Generated by a Corporate Change Programme: Managing the Gaps and their Implications for HRD Practice
Sharon Turnbull
Conceptualizations of Emotional Behavior in Organizational Contexts: A Framework for Understanding the Implications of HRD Research and Practice
Jamie L. Callahan and Eric E. McCollum
Symposium 29: Evaluation in HRD
Utilization of Corporate University Training Program Evaluation .................................................. 29-1
Christopher F. Bober
Organizational Readiness for Learning and Evaluation ................................................................. 29-2
Hallie S. Preskill, Brenda Martinez-Papponi, and Rosalie T. Torres
Three Perspectives of Training Evaluation Based on Organizational Needs ................................. 29-3
Eul-Kyoo Bae and Ronald L. Jacobs

Symposium 30: Organizational Enhancement
Motivation to Improve Work Through Learning in Human Resource Development ....................... 30-1
Sharon Naquin and Elwood F. Holton III
Improving Performance through HRD: Towards a Multi-Level Model ........................................ 30-2
A. A. M. (Ida) Wognum
Exploring Organization Commitment in a Non-Profit Service Organization ...................................... 30-3
Constantine Kontoghiorghes and Nancy Bryant
Innovative Human Resource Practices and Organizational Commitment: An Empirical Investigation .... 30-4
Tanuja Agarwala

Innovative Session 6
A Model for Linking Organizational Culture and Performance ...................................................... 1-6
Cathy Bolton McCullough

Symposium 31: Workplace Learning Issues
The Impact of Self-Management on Training Participation .............................................................. 31-1
Jasper van Loo, Andries de Grip, and Jo G. L. Thijsen
Corporate Training as an Organization Subsystem ........................................................................... 31-2
Monica M. Tuttle
The Relationship between Workplace Training and Organizational Commitment in Australian Organizations: A Preliminary Analysis .......................................................... 31-3
Adela McMurray and Rae Dorai

Symposium 32: Managing the HRD Function
The Relationship between Factors Impacted by the Current Economic Crisis and Human Resource Development Roles and Functions in Thailand ...................................................... 32-1
Chirapratha Tan Akaraborworn and Gary N. McLean
Testing the Appropriateness of the Gap Service-Management Model to the HRD Function in Organizations ......................................................................................................................... 32-2
Shirine L. Mafi, Ronald L. Jacobs, and David A. Collier
A Study of HRD Concepts, Structure of HRD Departments and HRD Practices in India .................. 32-3
T. V. Rao and Raju Rao

Symposium 33: Career Development Issues
Career Development: What is its Role in Human Resource Development? ....................................... 33-1
Mary Allyn Boudreaux
Free Agent Learners: The New Career Model and its Impact on HRD ............................................... 33-2
Darren Short and Rose Opengart
Career Development through informal Learning: A Review of the Literature .................................. 33-3
Toni Powell, Betty Hubschman, and Madeleine Doran
Symposium 34: Research Issues in HRD
The Influence of Theories of Action on Action Research Initiatives: One Dying Division's Case .......... 34-1
  Linda Neavel Dickens
Women's Ways of Knowing: A Conceptual Framework for HRD Research ...................................................... 34-2
  Yvonne M. Johnson
  Heather A. Williams

Symposium 35: The Adult Learner
Bridging the Gap between Adult Education and Educational Psychology: Some Important Findings ....... 35-1
  Bryan W. Smith
Mary Parker Follett: Philosopher of Human Resource Development ................................................................. 35-2
  Leslie DeLaPena Wheelock and Jamie L. Callahan
The Human Resource Development Network as a Means for Adult Learning .................................................. 35-3
  Susan A. Huhta and John A Niemi

Symposium 36: Learning Organization
Perception of Learning Culture and Concerns about the Innovation on Use of Innovation: A Question of Level of Analysis ................................................................. 36-1
  Rebecca F. Sta. Maria and Karen E. Watkins
"Shared Vision": Are We at Risk of Creating Monochromatic Organizations? ....................................................... 36-2

CONFERENCE PAPERS
Institutional and Curricular Characteristics of Leading Graduate HRD Programs in the U.S.

K. Peter Kuchinke
University of Illinois

Focusing on three areas: Institutional arrangements, student enrollments, and core curriculum content, the study profiles 55 leading HRD programs. Findings include a large degree of heterogeneity among program names, departmental affiliations, and specializations. Compared to data from 1991, student enrollment has declined substantially at the master's level while part-time course taking has increased. The analysis of the core curriculum at these institutions showed a disparity between course offerings and much current writing in the field.

Keywords: HRD programs, HRD curriculum

Responding to the increasing demand for employee skills, expertise, and performance in rapidly changing economic and social environments, many universities have implemented academic programs to educate and train HRD practitioners over the past 15 years. Today, these programs are firmly established in professional schools and are in high demand among students from a variety of academic backgrounds. In U.S. Schools of Education, HRD enrollments are among the fastest growing and the “the training of … HRD practitioners is now the ‘bread and butter’ activity” (Gray, 1997, p. 80).

Little, however, is known about the departments and programs that educate and train future HRD practitioners. Increased knowledge about the characteristics of HRD programs is important because their roles are likely to increase in importance as the profession grows and matures. With increased significance and professional status of a field, as Abbot (1988) observed, formal education and training and the attainment of university degrees and professional credentials take on increasingly important roles in career preparation and advancement. The systematic study of HRD academic programs and departments, thus, is an important but largely overlooked area of scholarship in the field. The purpose of this study was to respond to the need to broaden the knowledge base related to the characteristics of HRD academic programs in the US by answering three questions:

- What are the institutional characteristics of HRD programs?
- How many students are enrolled in different HRD degree and certification tracks?
- What is the core body of knowledge taught in HRD programs?

Answers to these questions can serve several purposes: First, they build a foundation for describing the status of the field in an area where empirical research is lacking—many authors describe what HRD education and training should be but far fewer publications address the empirical reality of what is. Second, answers to these questions allow researchers to track the development of HRD education over time and assess the degree to which educational institutions adapt to the changing needs of their various stakeholders. Third, these answers lay the foundation for comparative research of systems of human resource education at the national level (the author is currently completing a similar study in the UK). Especially for a young field like HRD, institutional research is important and has been conducted fruitfully in other fields (for example: adult education: The University of Georgia, 1999; vocational education: Lynch, 1998; management education: Segev, Raveh, & Farjoun, 1999; and international MBA programs: Kaynack & Schermerhorn, Jr., 1999).

Review of Related Literature

Problems abound when trying to define the universe of HRD programs in the U.S. In the absence of a central accrediting body at the program level and institution-level professional organizations, little is known about the total number of programs in this country. This is in contrast to the United Kingdom where academic preparation for HRD is conducted by well-defined group of about 30 programs accredited by a national body that is also responsible for skill standards and professional certification. In the U.S., however, higher education is decentralized to a very high
degree and thus, reliable data on the number of HRD programs are not available. Of the 3,595 public and private institutions of higher learning catalogued by the Carnegie Foundation for the Advancement of Teaching (1994) some 1,400 offer 4-year (baccalaureate) degrees or higher. The most extensive listing of HRD programs was compiled by the American Society for Training and Development (ASTD, 1996) and lists more than 250 degree and certificate programs located in HRD and related programs in a variety of fields.

The ASTD directory presents the most comprehensive listing of programs available but is based on voluntary information provided by the units in response to a mail survey and is, thus, likely not to be exhaustive. Further, ASTD has decided not to update the directory, citing the reason that HRD programs are easy to find on the World-Wide Web and in college handbooks published annually in the U.S. with profiles and rankings of degree programs (ASTD, personal communication, November 1, 1999).

The most comprehensive survey of HRD academic programs was conducted by Gaudet and Vincent in 1993. Based on 1991 data, the authors surveyed universities listed in the 1990 ASTD directory and reported on 122 responding institutions. HRD was the program name used most frequently (n=42), followed by Adult Education (n=22), Instructional Technology (n=12), and Training and Development (N=7). The average program was reported to be 14.5 years old in 1991 and the majority of programs were implemented in the 1980s (Gaudet & Vincent, 1993). Although this study is well over 10 years old, it is surprising to see the total number of HRD programs listed in the 1990 and 1996 ASTD directories being quite similar (218 in 1990, 250 in 1997). While it is not possible to determine the overlap of institutions in the two directories, the similar size of the two suggests that the total number of institutions offering HRD degrees increased by less than 15% in the 1990s.

Enrollments

Accurate enrollment data of HRD programs are also difficult to obtain. The only available study is, again, Gaudet and Vincent's (1993) who reported—among the 113 HRD programs surveyed—41 bachelor's, 108 masters, and 45 doctoral programs with a total student enrollment about 12,200 full-time and 19,300 part-time students. Thus, virtually all programs offered Master's degrees, while some also had undergraduate programs, doctoral programs, or both. Among full-time students about 65% were working towards a Bachelor's, 29% towards a Master's, and 6% towards a doctoral degree. For part-time students the percentages were 49%, 41%, and 10% respectively. The average program graduated 54 Bachelor's, 20 Master's, and 4 Ph.D. students in the 1990/1991 school year resulting in an annual labor supply of about 2,200 Bachelor's, 2,160 Master's, and 180 doctoral degree holders.

Most studies on the curriculum of HRD academic programs use McLagan's (1983; 1989; 1996) research as a point of reference. While other competency frameworks exist, particularly for trainers (for example; Fulkert, 1997, Mager, 1996; Marquardt & Engel, 1993), MacLagan's work has been "adopted as a definitive model of competencies by the American Society for Training and Development [and] appears to continue to provide the basis for preparation of HRD professionals" (Dare & Leach, 1999, p. 2). In 1991, for example, Leach surveyed among 20 departments belonging to the University Council of Vocational Education (now named: University Council for Workforce and Human Resource Education). Faculty at those departments, all located in Ph.D. granting institutions, considered 21 of the 25 competencies for trainers described by McLagan as important for graduates of their programs, although more than one-half were deemed not to be adequately covered in the curriculum of the respective institution (Leach, 1993). A follow-up study (Dare & Leach, 1999) identified increased significance of research skills, electronic-systems skills, and visioning, but a decreased importance of competency identification and objective preparation skills. As in the original study, several competencies were judged not to be adequately covered in the curriculum, including career development theories and techniques, budget and resource management skills, organization development theories and techniques, and coaching and negotiation skills.

Baylen, Bailey, and Samardzija (1996) investigated HRD curricula at four research universities using, again, McLagan's framework and found that the six HRD roles most thoroughly addressed in HRD courses were, in rank order: Instructor, Program Designer, Manager (Training and Development/HRD), Needs Analyst, Organizational Change Agent, and Evaluator. Of the 35 HRD courses analyzed by Baylen et al. (1996), only two addressed the emerging HRD roles of budget/cost analyst and strategic planner, four addressed the role of Manager of Change, and six the role of Performance Technologist. Thus, the study, although restricted to only four programs, shows a relatively conservative picture of HRD curricula primarily focused on training roles with only minor coverage of broader professional roles and responsibilities.
Methodology

The purpose of this study was to investigate the institutional and curricular characteristics of U.S. HRD programs by focusing on institutional arrangements, enrollment, and curricula. Since previous research (Gaudet & Vincent, 1993) had shown that most HRD programs offered graduate education, the population for this study was defined as those programs that offer master's, doctoral, or graduate-level certificate programs, excluding undergraduate and undergraduate-level certificate programs. Beginning with the 120 graduate programs listed in last available ASTD (1996) directory, the researcher selected 67 gradient HRD programs with one or more faculty members having been, in any of the previous three years, members of the Academy of Human Resource Development (AHRD), the primary professional association. The rationale for this selection was those institutions with faculty active in the AHRD would best represent comprehensive programs focused on the entire field of HRD rather than those programs where HRD is a minor sequence of courses or a specialization within another field of study. The review of AHRD rosters showed that faculty membership was relatively stable between 1997 and 1999, with many members who also held office in the AHRD and actively participated as presenters in the annual conference and thus could be assumed to present the leading edge of the profession. Program administrators of the 67 programs were contacted and invited to participate in the study, and 55 (82%) agreed to do so. A document review of written program information, brochures, and syllabi as well as material available on the programs' web sites was conducted, and information recorded and coded. In a second step, this information was sent to the program administrators for validation, correction, and missing information. 41 administrators replied for a validation rate of 75 percent. Because the corrections were, in most cases, minor, the researcher decided to include the 14 programs where validation, despite several attempts, could not be obtained after a second thorough review of available materials and documents was conducted for these programs.

Results

The sample of 55 HRD graduate programs, listed in Appendix A, contained 44 Ph.D. granting and 11 master's programs. The sample included all but one of the 18 institutions that were also members of the University Council for Workforce and Human Resource Education, a professional organization with institutional membership of leading research universities. 21 of the universities in the sample were also listed in the Peterson guide of graduate programs as HRD programs, while 30 were listed in the same guide as vocational/technical graduate programs, with some programs being listed in both categories. Using the Carnegie classification of institutions of higher education, the sample consisted of programs located in the following categories: Research I: 27, Research II: 6, Doctoral I: 7, Doctoral II: 4, Masters I: 11.

Institutional Affiliation

To describe the institutional affiliation of the sample, the following data elements were coded and tabulated: program name, departmental and college/school affiliation, HRD specializations, and related programs offered in the same department or unit. Many program names showed multiple program emphases (for example: Adult instruction and performance technology, or Workforce education and lifelong learning). The majority of programs (31 of 55), however, carried the title HRD, either alone or in conjunction with related field (for example: Adult Learning and HRD). The second most frequent program category was Instructional/Performance Technology (9 programs), followed by Adult education and related fields (8 programs), Vocational/Technical and workforce education (5 programs), Training and Development, and Adult/Organizational Learning with 4 programs each. The 55 programs were located in departments or larger units that were very heterogeneous in name, ranging from Departments of Public Administration and Urban Studies, to Psychology, Leadership and Organization, Management, Human Services, Counseling, Curriculum and Instruction, and many others. In fact, there were no two departments with the same name and only a small number with similar names (those indicating emphases on counseling, educational leadership, and adult education. The large majority of HRD programs (42 of 55) were located in colleges and schools of education, some of which were also identified as: education and psychology, health and education, education and human development, teacher's college, and so on. Two programs were in schools of business administration, one of which was a joint program between business and education. One program was affiliated with the human resource education and training center at a school of labor and industrial relations. About one-half of the programs (26 of 55) also listed specializations within the HRD programs. Perhaps not surprising given the diversity of departmental affiliations, no clear categories emerged from the listing of 58
specializations. Seven programs offered specializations focused on adult learning, including adult development and adult literacy, six programs on instruction design, three on performance technology, and another three on international HRD and international education respectively. Two program each offered specializations in organization development, information technology, educational leadership, and assessment/evaluation. The remaining specialization covered a broad area, ranging from conflict management, counseling, distance education, and facilitation to gerontology, public policy, the not-for-profit sector, and organizational learning.

Asked for degree programs related to HRD that were offered in the same department or academic unit, 31 programs listed some 57 related programs. These clustered around vocational/technical education and specializations within it, such as marketing, family, industrial, and business education (17 programs offering degree programs in these areas); adult education (seven programs); curriculum and instruction (five programs), and miscellaneous others, including health management, public administration, counselor education, and social and organizational psychology.

Seventeen of the 55 programs also offered graduate-level certificate programs in HRD and related areas. These ranged from training and development, performance technology, web-based training, and instructional technology to vocational education and teacher licensure options.

**Enrollment**

Forty-two programs reported enrollment data, and these were broken down by full-time and part-time for masters and doctoral levels and non-degree certificate options. Three programs did not have separate counts available for part-time and full-time students but provided combined enrollment numbers. Several program administrators indicated that exact enrollment counts were not available and provided estimates instead. Table 1 shows the enrollment data for the Fall 1999 semester.

As the table shows, overall enrollment in graduate degree and certificate programs for the Fall of 1999 was close to 5,800 students, with an average enrollment in master's, doctoral, and certificate programs of 93, 51, and 36 students respectively. There was a wide range in enrollment counts as shown by the minimum/maximum numbers. The vast majority of HRD students attended on a part-time basis, and this was true for all three program categories.

**Curricula**

Tallying and comparing curricula across programs and institutions is difficult because of the wide variation in course titles and the fact that course names often reveal very little about actual course content. To address these difficulties, the researcher coded content areas covered in course rather than course titles and further focused on the core or required curriculum, ignoring elective courses. This information was obtained by analyzing course syllabi and through validation by the administrators. Where no required core curriculum existed, administrators were asked to indicate those content areas that the average student would learn over his or her course of study. From an initial review an initial listing of content areas was developed using 37 separate content areas that appeared to cover the content of the courses reviewed. This list was then sent to the program administrators with the request to validate the information, add content areas that were overlooked, and add areas not on the list. This resulted in a final list of 34 areas that appeared to circumscribe the universe of content covered in the core or required curriculum of the 55 HRD programs. The list excluded statistics and methods courses that were presumed to part of all doctoral students' preparation, and focused on HRD content areas only.
While other researchers used cluster analytic techniques to map like programs (for example: Segev, Raveh, & Farjoun, 1999), simple frequency distributions were calculated in this study because of the large number of programs and content areas and the focus on the study on describing curriculum rather than identifying clusters of programs. The 55 programs identified a total of 981 content areas, with the average program covering about one-half of the areas identified. After deleting two content areas that were judged to be too vague to add value to the analysis (HRD Trends and Issues, offered by 84% of the programs, and HRD Principles and Theories, offered by 53%), and merging one (adult learning theories and general learning theories) the final list consisted of 31 areas that were ranked in order of frequency and displayed in Table 2.

</table>

As the table shows, HRD graduate program curricula offer coverage of a variety of content areas but with few outliers. Even the least frequently addressed area, quality management, is still offered by one in five programs. Instructional design and delivery lead the list with evaluation being the third most frequently addressed topic. These three areas were covered in more than three-fourth of all programs. More than one-half (but fewer than three-quarter) of all programs taught organization development, organizational learning/learning organization, consulting, and learning theory related topics. Given the increased attention of strategic and economic issues in the HRD literature, surprisingly few programs addressed these topics, and this was also true for diversity and international HRD. Quality management and public/educational policy related topics trailed the list with fewer than one-fourth of programs addressing these topics in their core curriculum.
Conclusion

HRD graduate programs play an important role in the U.S. system of human resource development, educating and training future practitioners, researchers, and instructors. Little systematic knowledge, however, exists about these programs, and this gave rise to this study. While the universe of academic programs cannot be defined with certainty, the 55 graduate programs in this study are assumed to represent a major portion of the nation's leading institutions offering advanced education and training in HRD. The purpose of the study was to gain insight into three areas: institutional characteristics of those programs, student enrollments, and the HRD curriculum.

Related the first, the study found that only one-half of programs actually carried the name HRD in their titles, although, based on self-identification, listing in professional directories, and active membership in the primary professional association, all were actively engaged in educating and training HRD master's and doctoral students. Further, the 55 programs were located in departments and administrative units with a large array of different names, most of which gave little indication that they might be home to an HRD department or program of study. This finding might give the profession cause for concern because it calls into question its academic identity and might obscure the value associated with the academic provenance of its graduates. HRD differs from most other professions where academic departments are clearly labeled and transparent to the public, employers, and prospective students. Doctors, lawyers, teachers, and accountants, for example, have well-defined educational paths, and these are clearly recognized and recognizable. As HRD develops as a field, the preparatory paths of future practitioners might need to be explained more clearly, in particular with the majority of programs located in schools of education that are, in the public mind, first and foremost associated with public school teaching. Conceptual, definitional, and marketing work on part of the profession and individual programs is called for to argue and demonstrate the value and significance of HRD programs located in academic departments so seemingly disconnected from the world of business and industry. The value of even fields as closely related to HRD as vocational or adult education might not be immediately obvious to the business community, employers, or potential future HRD practitioners and thus needs to be explored and explained by the profession in order to broaden its recognition as a valued member of the business and organizational communities.

The second research question centered on enrollments and points to two major findings: First, the size of student enrollment in graduate programs appears to have grown compared to the findings of Gaudet and Vincent's (1993) study of HRD programs in 1991. While it was not possible to determine the identity of the sample of older study, there are indications that substantial overlap exists: both seemed to have drawn from the same universe using the ASTD directories. While the overall number of programs increased by about 15 percent between 1991 and 1996, the 1999 average master's level enrollment decreased by almost one-half (172 in 1991 vs. 93 in 1999) while the average student enrollment at the doctoral level remained essentially the same (45 in 1991 vs. 51 in 1999). Whether this indicates an overall decrease in interest in the field, the availability of work opportunities in a tight labor market, or a broadening of the supplier base of HRD programs is open to further research. It does call into question, however, the popular wisdom that the HRD field is expanding rapidly because of the increased demand for HRD services and provisions. At least for the population in this study, overall enrollment decreased.

A second insight related to student enrollment was the fact that eight out of ten students attended part-time, representing an increase of 15 percent for master's and 10 percent for doctoral students. Whether this is due to the increased availability of jobs for students, the fact that the student base is shifting towards mid-career practitioners, or other reasons is, again, open to further investigation. It should also be noted that part-time enrollment among doctoral students is rare among professional schools, although more prevalent in schools of education than in other units. The impact of part-time course taking on academic achievement and professional effectiveness also awaits further investigation.

When looking at the HRD curriculum, it becomes apparent that while much of the conceptual writing in the field, stressing organizational learning, strategic HRD, international issues, workforce diversity, change management, distance learning, and the economic impact of HRD has not yet been translated universally into core curriculum content. Fewer than one-half of these programs that can, after all, be considered among the leading edge degree programs in the country, have included these content areas into their curriculum, and this might imply that not all graduates are as well prepared as they should be. Since these programs can also be assumed to educate a sizeable portion of future HRD faculty, one might ask whether future faculty members are as prepared as they need to be given the new developments in the field. It appears that the majority of graduate programs remain focused on rather conventional training and development content areas but are, perhaps, not consistently up to date with leading developments in the field. In this respect, little progress seems to have been made since Leach's (1991) study that found more than one-half of HRD competencies were not adequately addressed by academic programs.
This study attempted to begin a systematic investigation into academic HRD programs, and, clearly, raised at least as many questions as it was able to answer. A few examples of the more pressing research needs are the following: How can the universe of HRD academic preparation be more accurately defined? What is the educational background of HRD practitioners and what percentage do get their education in HRD programs? What is the impact on professional effectiveness of different academic preparations? How much carry-over exists between academia and professional practice? How can supply and demand characteristics for HRD practice be more accurately identified?

Lastly, several limitations require mentioning that should be kept in mind when making sense of these findings. First, this article does not represent the universe of HRD programs but a purposefully selected volunteer sample. Thus, the findings do not generalize beyond the 55 programs. Second, the comparisons to the earlier study by Gaudet and Vincent (1993) are subject to distortions, any differences, thus, might be the results of different populations. Finally, curriculum information provided by the programs is likely subject to differences in interpretation and likely over reporting; reported differences in content area coverage, thus, might be explained with real differences or with different interpretations of the content area labels. Finally, no attempt was made to quantify how much of a content area was covered, merely whether or not it was addressed. The survey also asked for core or required subject matter only, and this might have been interpreted differently by the respondents.

The study of academic HRD programs is in its infancy but has the potential to contribute to a clearer, more consistent, and reasoned definition of the field and the knowledge, skills, and competencies for effective HRD practice.

Assessment of a Graduate Program in Human Resource Development: Perceptions of Key Stakeholders

Julie A. Furst-Bowe
Joseph Benkowski
University of Wisconsin-Stout

In 1995, a new master’s degree program in training and HRD was implemented at a mid-sized public university. When the program had been offered for approximately four years, a systematic assessment was conducted to obtain feedback from multiple sources and to determine whether the program was meeting the needs of key stakeholders. Identified key stakeholders for this program included the program director, current students, program graduates, faculty members, and members of the program’s advisory committee.

Keywords: Academic Programs in HRD, Program Evaluation, 360-Degree Feedback

In 1995, a mid-sized public state University located in the Midwestern United States was authorized by the state university system to offer a Master of Science degree program in Training and Development. This program was developed in response to a need for training and human resource development professionals in the geographic area served by the University and an interest expressed by students and alumni who had completed undergraduate courses in this area.

Enrollment in this new program has steadily increased from 35 students in the fall of 1995 to 84 students in the spring of 1999. As of May 1999, 76 students had graduated from this program. In addition to campus-based offerings, courses for the program are now offered on weekends and via distance learning technologies, including video-based courses and web-based courses, to multiple sites within the state.

In the fall of 1999, when the program had been offered for approximately four years, a systematic assessment of the program was conducted to obtain feedback on the program from multiple sources and to determine whether the program was meeting the needs of key stakeholders. Identified key stakeholders for this program included the program director, current students, program graduates, faculty members, and members of the program’s advisory committee.

Theoretical Framework

In recent years, multi-source or multi-rater assessment methods have evolved from an innovative technique used only by senior managers in select organizations to an essential management tool used in a wide variety of organizational settings (Church and Bracken, 1997). An estimated 90 percent of Fortune 1000 firms use some form of multi-source assessment to evaluate employees, products, services and programs (Atwater & Waldman, 1998).

In higher education, program evaluation often continues to be conducted with obsolete methods and models which impede comprehensive improvement efforts (Jasperro, 1998). According to the Education Criteria for Performance Excellence set forth by the Malcolm Baldrige National Quality Award Program (1999), educational programs and offerings should be continually evaluated and improved using multi-source evaluation techniques. This evaluation process should include information from students, faculty, employers and other key stakeholders; comparative data on other similar programs offered by other institutions; and use of assessment results.

Using multi-source assessment techniques may be particularly appropriate for assessing an academic HRD program. Collecting data from multiple sources allows for the collection of richer data and allows cross-validation of findings from different groups (Willis & Kahnweiler, 1995). Sources consulted in the evaluation should be those individuals or groups that are in the best position to provide accurate feedback on the program (Atwater and Waldman, 1998). These individuals or groups that have been identified as key stakeholders need to be informed of the evaluation process and how their input will be utilized and integrated into the process (Martin, 1998). For educational programs, key stakeholders may include potential students, current students, former students, parents, instructors, administrators, employers and funders (Mirabella & Wish, 2000).
Statement of the Problem

Reports on the creation and evolution of academic degree programs in HRD are largely missing from the research literature (Willis and Kahnweiler, 1995). Little information was available on the quality and effectiveness of the Master of Science degree program in Training and Development at a mid-sized public university. The purpose of the study was to assess the quality and effectiveness of the program as perceived by key stakeholder groups. This study sought to answer the following questions:

1. What are the strengths and weaknesses of the M.S. degree in Training and Development as perceived by current students?
2. What are the strengths and weaknesses of the M.S. degree in Training and Development as perceived by graduates of the program?
3. What are the strengths and weaknesses of the M.S. degree in Training and Development as perceived by faculty members associated with the program?
4. What are the strengths and weaknesses of the M.S. degree in Training and Development as perceived by advisory committee members?
5. What recommendations from the above stakeholder groups can be implemented to improve the program?

Methodology

The process used to collect data for this study included a self-study report generated by the current program director. This self-study report included comparative data from other universities with master's level programs in human resource development. In addition to the self study, surveys were distributed to four key stakeholder groups: students, graduates, faculty, and advisory committee members to collect information of their attitudes and perspectives (Mirabella and Wish, 2000). The program director’s self-study and survey results were then reviewed by the researcher and the institution’s research coordinator and a report containing several recommendations was generated.

The self study report included seven major sections (Planning and Review Committee, 1999). The first section included information on how the program relates to the University’s mission and goals. The second section included a description of the general and specific objectives of the program, the design of the curriculum, the teaching and learning methods used in the program and the nature of the student research requirement. The third section included a list of the primary instructors involved in the program and their associated areas of knowledge, skills and expertise.

The fourth section of the self study contained an explanation of the process for assessing student outcomes and how information resulting from student assessments is incorporated into the program. The fifth section included a description of the facilities, library, information and technology resources utilized by the program, and the sixth section included information on the demands for graduates and anticipated trends in the nature of positions in the field. The report concluded with a listing of the top five similar programs in the United States and included comparative information on each of these programs.

In addition to the self study, primary data were collected from four key stakeholder groups: current students, program graduates, faculty members, and advisory committee members. The survey instruments used to collect data from each of these groups were developed by the campus Program Planning and Review Committee for the purpose of program assessment. These instruments have been used to review a number of graduate programs at the University.

The faculty member and advisory committee member surveys were administered by mail to the various stakeholder groups. The student survey was distributed in classes by the researcher and the institution’s research coordinator. The alumni survey was administered by the University’s Office of Budget, Planning and Analysis as part of a university-wide graduate follow-up study. Four of the surveys were administered during the fall of 1999. However, the alumni survey was conducted in the spring of 1998. The results of the study were analyzed by the researcher, with the assistance of a program assistant.

Results

The results of the study can be divided into five sections: results of the self-study, results of the student surveys, results of the faculty surveys, results of the graduate surveys and results of the advisory committee surveys. A summary of the results by section is presented below.
Self Study Results

The self study included a description of the program, including the objectives of the program, the curriculum, the research requirements and methods used to assess student outcomes. In the self-study, the program director had identified five high quality graduate programs in training and development. Comparative data were provided for each of these programs in relationship to the program being evaluated.

Strengths of the program, as identified by the program director, include student enrollment, experienced faculty, and offerings to off campus and distance education students. Weaknesses of the program, as identified by the program director, include the need for additional faculty expertise and additional coursework in areas such as emerging technologies, organizational change and global HRD issues. The program director also expressed concern regarding the outdated classroom facilities and equipment. There was also concern regarding the lack of on-line support services for off campus and distance education students.

Student Survey Results

The student survey consisted of three sections: a section that included 9 demographic items, a section that included 18 statements for students to rate on a 5-point Likert-type scale and a third section that included 5 open-ended questions regarding the strengths and weaknesses of the program. Surveys were administered in classes by the researcher and the institution’s research coordinator. Surveys were also mailed to off campus students. A total of 73 students completed the surveys. Results of the survey are as follows:

The strengths that were most commonly listed by students included knowledgeable and experienced faculty members, the accessibility of instructors, the applied nature of the courses, and the variety of ways in which the courses were delivered (evenings, weekends, internet-based and via interactive television). The weaknesses that were most commonly listed by students included a lack of entry-level employment opportunities for program graduates, duplication of content among courses, insufficient content on emerging technologies and inadequate administrative and support services for off campus and distance education students.
Alumni Surveys

The alumni survey was divided into five areas: improved competencies, satisfaction with education, satisfaction with employment, overall satisfaction with program and an open-ended question regarding suggested improvements. A total of nine students who graduated from the Training and Development program were surveyed and five students responded to the survey. At the time of this study, spring 1998, only a small number of students had graduated from the program and current addresses were not available for many students. The small number of respondents makes it difficult to identify specific strengths and weaknesses and does not allow for the results to be generalized among all program graduates.

In the first section, respondents were to rate their level of competency improvement in 13 competency areas on a scale of one to five. In 12 of the areas, speaking, writing, problem solving, organizing information, analyzing information, providing leadership, making decisions, conducting research, working in teams, thinking creatively, understanding other cultures and using computers, students rated themselves 3.5 or higher. Only one area, using math and statistics, received a lower rating (2.8). Eighty percent of the respondents were either satisfied or very satisfied with the overall quality of instruction and the availability of faculty members. This same percentage rated the value of the education they received as very good or exceptional. However, 40 percent (two of the five) respondents indicated they would not enroll in this same program again.

Sixty percent of the alumni surveyed indicated that they had received “good” or “very good” preparation for employment and for career development; and this same number were satisfied or very satisfied with their rate of professional advancement. One hundred percent of the respondents were employed; however only one graduate reported that he was working directly in the training and development field. The average salary of the graduates was $30,815. Recommendations from alumni included updating curriculum, requiring currency and consistency among instructors, increasing job placement efforts and offering more computer-based courses.

Faculty Survey Results

Six faculty members were identified as “primary instructors” in the program by the program director. These individuals teach required courses in the program and serve as advisors for student research papers. The faculty survey consisted of two sections: the first section included 16 statements regarding the program that faculty was asked to rate on a five-point Likert-type scale and the second section contained a series of open-ended questions regarding the program. The results of the faculty survey are presented below:

According to the faculty members, strengths of the program include course quality and strong leadership of the program director. Weaknesses of the program included inadequate number of faculty members to serve off-campus and distance education students, lack of entry-level jobs for graduates, quality of the student research papers, content overlap among some of the required courses and variation in how research courses are taught.

Advisory Committee Survey Results

The program's advisory committee consisted of five faculty members, one administrator, one student and six human resource development professionals. The average length of time a member had served on the program committee was 3.6 years. Each advisory committee member was asked to complete a questionnaire that included a series of open-ended questions regarding the strengths and weaknesses of the program.

The major strengths of the program, as identified by the advisory committee members, included "hands-on experience" provided through internships, the program's focus on performance, the program's applicability to the corporate world and the dedication and experience levels of the faculty involved in the program. The weaknesses identified by the program committee included turnover in key faculty positions (including program director), insufficient number of faculty members to continue offering the program at multiple locations and the need for greater emphasis on web-based instructional design.

Conclusions and Recommendations

The following conclusions have been drawn based on the findings from this study. Recommendations based on these conclusions are as follows:

Data from multiple sources indicate that there is overlap among the courses in the program. It is recommended that the program director, with the assistance of faculty members and the advisory committee, review the courses in the program and attempt to eliminate unnecessary duplication of content among courses. It is also recommended that the curriculum be examined in light of current trends in the field to ensure courses continue to include relevant content.

Over the past five years, the program has expanded rapidly from a small, campus-based program to a program that serves students throughout the state. Although the courses have been made available to students through a variety of delivery methods, the number of faculty members has not increased. It also appears as though the campus is having difficulty providing administrative and student services to these students. It is recommended that additional staffing, both permanent and adjunct, be added to better serve the number of students in the program. It is also recommended that the program director work with the offices that provide administrative and support services to students to make these offices aware of the unique needs of students studying at a distance.

Of major concern to the program director and faculty members were the lack of quality classrooms and instructional facilities for the program. It is recommended that the program director and department chair work with the campus planner to discuss possibilities for locating or developing better facilities for the program.

The faculty members were also concerned about the quality and level of research and scholarship among themselves and their students. It is recommended that more emphasis be placed on the value of research by faculty and administrators. If additional staff members can be hired, the existing faculty members may have a greater amount of time to work on collaborative research projects with students.

Data from students, alumni and faculty members indicate that it is difficult for students to obtain entry-level positions in the field of human resource development. In order to increase the number of students placed in positions related to their field of study, several recommendations were made including increasing the number of students who complete internships. Internships are critical for students who lack previous work experience in HRD (Schwindt, 1995). The program director, faculty members and advisory committee members are encouraged to increase networking efforts with organizations and to work the university's placement office in identifying job opportunities for graduates.

Finally it is recommended that multi-source assessment be conducted on a regular basis to ensure the program is meeting the needs and expectations of key stakeholders. It is recommended that additional input from program graduates be sought and that employers be added to the list of key stakeholders. It is also recommended that interviews with alumni, employers and advisory committee members be utilized in addition to surveys.
Knowledge Contribution to HRD

Educators are increasingly faced with an every-growing body of literature focused on the strengths and weaknesses of diverse program evaluation approaches (Schnoes, 2000). This study provides a framework for an assessment model that can be applied to other academic programs in Human Resource Development. Identifying key stakeholders and developing systematic methods of collecting and analyzing input from these individuals and groups is essential for program improvement. Ratings from various groups provide different, relatively unique perspectives and these perspectives, when taken together, are more valid than that of a single evaluator (Borman, 1997). Programs are strengthened as stakeholder expectations are included in defining the direction of the program (Freed, 1997; Obrecht, 1999).

Although all of the data presented in this study were collected from one academic program, findings from this study could provide information for universities desiring to implement or expand an academic program in Human Resource Development (Henschke, 1995). The data from this study may also provide some important clues that may be considered by other university programs desiring to improve programs that prepare HRD professionals.

Predicting Academic Performance in Management Education: An Empirical Investigation of MBA Success

Baiyin Yang
University of Idaho

Xiaoping Rosa Lu
Adecco/TAD

Master of Business Administration (MBA) program is one of the most popular approaches to management education. This study investigates the impacts of several precedent variables on the academic performance in an accredited MBA program. A prediction model was developed with multiple regression and the results showed significant impacts of undergraduate grade point average (GPA) and Graduate Management Admissions Test (GMAT). Implications for management education are discussed.

Keywords: Management Education, Academic Performance, Evaluation

Graduate study in Master of Business Administration (MBA) is one of the major approaches to management education (DeSimone, & Harris, 1998). The benefits of developing managerial skills through MBA program have been well documented. Sunoo (1999) comments that an MBA degree provides an opportunity for human resource professionals to enhance their competencies and boost their chances for career development. Messmer (1998) suggests that certified management accountants can benefit significantly from an MBA that offers the growing need for expertise in areas beyond the accounting department. Perry (1995) observes that many food scientists cannot advance to management positions because they get mainly technical training and very little of management education. He advises food scientists to take up MBA degrees in reputable universities in order to advance professionally in the food industry toward executive and management positions. Recent technology development has put MBAs with technology concentration in big demand. Those techno-MBA graduates not only have excellent technology skills, but also understand the strategic, business application of technology. Computerworld (1999) surveyed 63 techno-MBA programs and found that graduates of the best techno-MBA programs normally received multiple job offers and landed positions that pay $80,000 to $100,000 per year or more and offer perks such as lucrative stock options. Although graduate study no longer guarantees prestige, the MBA degree seems to retain its glamorous reputation (Shelley, 1997).

On the other hand, demand for admission to the top MBA programs has been particularly strong and the cost of this type of management education is high. During the academic year of 1996-1997, American universities award more than 96,000 master's degrees in business management and administrative services and that figure accounted for nearly one quarter of all master's degrees conferred (Morgan, 1999). The total cost for the top executive MBA program reaches $37, 500 (Industry Week, 1999). Admission to the top MBA programs is very competitive. In 1999, the acceptance rate to Stanford University's MBA program was 7% with 6,606 applicants and the acceptance rate in Columbia University was 11% with 6,406 applicants (Business Week Online, 2000). Given the highly competitive nature of MBA admission, one cannot help asking the question if the criteria commonly used in the admission decisions are predictable for the success in graduate management education.

Similarly, management educators and administrators may also want to understand the factors that determine MBA students' academic performance. On one hand, a good understanding of the factors influence students' academic performance will help related parties to design appropriate academic program and supporting activities. On the other hand, a good knowledge of MBA students' academic performance and its relation with major precedent variables will enhance the decision making in admission process.

The purpose of this study was two fold: (1) to investigate the major precedent variables that significantly influence MBA students' academic performance; and (2) to determine the extent to which a group of precedent

Copyright © 2001 Baiyin Yang and Xiaoping R. Lu
variables can successfully predict MBA students' academic performance.

Theoretical Framework

The theoretical framework guided this study was based on evaluation model of human resource development interventions. Specifically, Holton's (1996) conceptual model of evaluation outlines factors that determine individual performance and organizational results. Based upon existing evaluation models and research, Holton (1996) proposes causal relationships among motivation elements, environmental elements, ability/enabling elements, and outcomes. It is posited that individual performance is a function of learning outcome which, in turn, is influenced by motivation to learn and individual ability. In the context of management education, academic performance can be viewed as an immediate learning outcome and thus can be predicted by several precedent variables such as prior academic performance, motivation, and ability to learn.

Related Literature

Most graduate schools of management use some type of formula score that combines undergraduate grade point average (GPA), Graduate Management Admission Test (GMAT) and other quantifiable factors for admission to MBA (Carver & King, 1994). Underlying such common practice is the assumption that MBA students' academic performance can be well explained by the precedent variables such as undergraduate academic performance and standardized test score (e.g., GMAT and MAT). Consequently, there has been always a concern whether such practice is theoretically justifiable and empirically valid (Carver & King, 1994; Schwan, 1988). A literature review suggests that there are a lot of studies devoted to investigated the relationship between MBA students' academic performance (usually defined and measured by GPA) with some precedent variables. However, the literature on the prediction of academic performance in graduate management education is not conclusive and the empirical evidences are actually quite different. Hecht and Power (1982) report that the multiple correlation of undergraduate GPA and GMAT scores with first year MBA grade ranged from .12 to .67. Wright and Palmer (1994) used a sample of 86 MBA students at a small midwestern university to determine if GMAT scores and undergraduate GPA were better predictors of graduate performance for some groups of students than for others. It was hypothesized that these precedent measures were adequate predictors of low graduate performance. The results indicated that, although undergraduate GPA and GMAT scores were modestly associated with graduate performance across the full range of students, they did not discriminate between moderately low and very lower performers in the program. Multiple R-square was estimated as .212.

The explanatory and predictive power of the certain precedent variables commonly used in graduate admission practice has been studied, but different results were yielded. Carver and King (1994) investigated the MBA admission criteria for nontraditional students. The researchers explored a number of precedent variables including: age, gender, undergraduate major, work experience, lapse of formal education, competitiveness of undergraduate institution, undergraduate GPA, and GMAT verbal (GMATV) and GMAT quantitative (GMATQ) scores. Nevertheless, they found that only three variables were the best predictors of success for the nontraditional students: GMAT score, undergraduate GPA and work experience (R² = .220). Paolillo (1982) reported that undergraduate GPAs and GMAT scores explained slightly less than 17% of variance in graduate GPA. Likewise, Deckro and Woundenberg (1977) reported that GMAT score and undergraduate GPA accounted for less than 15% of the variance in academic performance of graduate management education. Hancock (1999) confirmed previous finding that there is no gender difference in MBA academic performance, but also revealed that males achieved higher scores on GMAT.

Although it has been recognized the both undergraduate GPA and GMAT scores are needed as key admission criteria, previous studies revealed mixed results in terms of the relative impacts of these two variables on the graduate academic performance. Zwick (1993) conducted a study involved 90 schools in the United States and Canada to investigate the validity of the GMAT for the prediction of grades in doctoral study in business and management. It was found that the prediction achieved using undergraduate GPA alone as a predictor tended to be more accurate than that obtained using GMATV and GMATQ together. Including all three predictors was more effective than using only undergraduate GPA. In a series of bivariate regression analyses for the data set collected from a southeast university, Ahmadi, Raiszadeh and Helms (1997) reported that undergraduate GPA accounted for more than 27% of the variability in graduate GPA and GMAT explained only 18% of the variability. In a recent study of predicting MBA academic performance, Hoefer and Gould (2000) revealed similar finding to that of Zwick and found that GMATV, GMATQ and undergraduate GPA were strong predictors. Moreover, GMAT scores had higher correlation with the graduate GPA than undergraduate GPA. Nevertheless, Carver and King (1994) report
that GMAT is stronger predictor than undergraduate GPA in predicting MBA academic performance (standardized regression coefficient was .354 and .256 respectively for these two predictors).

Research Questions

Because the literature on the predictive power of those variables commonly used in graduate management admission is not conclusive, this study was designed to answer the following research question:

1. What is the extent to which the academic performance in graduate management program can be explained by certain precedent variables?
2. What is the relative importance of a group of precedent variables in explaining and predicting the academic performance?

Methods

Sample and Data Collection

Files of all MBA graduates at Auburn University were sought and a total number of 543 subjects served the sample of this study. The MBA program is accredited by the AACSB. Among 543 subjects, 148 of them had missing information on at least one variable (27.3%) and thus were not entered into the data analysis. Consequently, the remaining 395 subjects were used as the valid sample of this investigation.

Variable Selection

It has been a common practice to use Grade Average Point (GPA) as an indicator of students' academic performance. Following this tradition, MBA students' academic performance was measured on the overall GPA (on a 4.0 scale) in the present study. Therefore, MBA students' overall GPA was treated as dependent variable. Several precedent factors were included to determine their influence on the dependent variable and these factors are generally terms as independent variables or predictors. Students' gender was included in the study to see if sex have significant impact on students' academic performance. There might a gender gap on standardized test such as GMAT and academic performance (Hirschelf, 1995; Johnson & McLaughlin, 1993). Students' native language was another independent variable included in the study. It was reasoned that international students might have language barriers that ultimately affect their academic performance. Previous studies have shown that foreign students' English fluency and country of origin affect academic performance (Stolzenberg & Relles, 1991). Students' undergraduate GPA was included in the study as it was reasoned that prior academic performance might hold continuos impact on the academic performance at graduate level. Finally, GMAT total score (GMAT), GMATQ and GMATV are used in this project because they are normally used as the important admission criteria in most graduate management education programs. The GMAT is designed to measure general ability and knowledge of the student.

Data Analysis

Multiple regression analysis is the analysis technique used in the study. This technique examines the multiple correlation between a dependent variable and a set of independent variables. Several analysis stages were involved in the data analysis in order to build a robust prediction model and to determine the generalizability of the model (Stevens, 1996). First, the whole sample was randomly split into two approximately equal number groups. One group served as model building sample used to establish a prediction model for MBA's academic performance. The other group served as holding sample used to validate the model established for the model building sample. Second, a series of multiple regression analyses were conducted for the model building sample to establish a prediction model with best predictors. The regression assumptions were examined to see if they have been met in order to conduct the analysis. Thirds, the regression model established in the second stage was validated for the holding sample and the final model was built when validation evidence was sought. Fourth, the final model was applied to the whole sample to estimate relevant parameters in the model. All data analyses were conducted with JMP IN software program that was developed by SAS Institute (Sall & Lehman, 1996).
Table 1 presents the demographic information for each of the samples. Both male and female MBAs are almost equally represented in the building and holding samples. Female MBAs represent about one quarter of the student body. Only about 5% of the sample came from foreign countries. Furthermore, international students are not quite equally represented in the building and holding samples (3.96% and 5.71% respectively).

Table 2 reports means and standard deviations of continuous variables across different samples. As it can be seen, all these continuous variables have by and large same means and SDs between the building and the holding samples. For the total sample, GMAT score ranged from 340 to 770, GMAT verbal scores ranged from 11 to 65, and GMAT quantitative scores ranged from 14 to 49. GPA scores in the MBA program ranged from 2.43 to 4.0 and the undergraduate GPA ranged from 2.13 to 4.0.

All predictors were entered into regression analyses for the building sample first. Different combinations of predictors were examined to find the best multiple correlation with graduate GPA. It was found that students' age and gender had no significant predictability for the academic performance. Language showed somewhat significant prediction, while GMATQ, GMATV, and UGPA presented very strong prediction power. Then a final model was built based on predictors of language, GMATQ, GMATV, and undergraduate GPA. The model explains nearly 25% variation of the academic performance for the building sample. This model was then applied into holding sample and it accounted for about 26% variation of MBAs' GPA. All regression estimates from the two samples were then compared and they are very close. The cross-validated R (between the observed GPA scores for the holding sample and the predicted ones based on the model developed from the building sample) was .51 (p < .001). It was then concluded that the model built for the building sample was reasonably applicable to the holding sample.

Based on the above results, the regression model was used for the whole sample to get the regression estimates. Table 3 reports estimated parameters and associated statistical tests. The results of this study suggested that language was somewhat significantly predictable for the MBA students' academic performance. GMAT Quantitative and Verbal, and undergraduate GPA were very significant in the prediction. R-square of the regression is .26. That is, more than one quarter variation of the MBA academic performance can be explained by the regression model.

The relevant Ts, p-values, and standardized regression coefficients in the Table 3 provide information about the relative importance of the predictors. The larger the T and standardized regression coefficient and the smaller the p-value, the more important the predictor is. This study suggested that undergraduate GPA was the most important predictor for the graduate academic performance, followed by GMATQ and GMATV, while language made little contribution.

Conclusions and Limitations of the Study

Overall, this study confirms the findings revealed in the literature. It is a positive result that about one quarter variation of MBAs' academic performance can be explained by only four precedent variables. This result tends to support the utility of GMAT and undergraduate GPA. It appears that undergraduate performance is the most important prediction for the graduate academic performance. The study discovered that age and gender had no predictive utility in explaining the academic performance. Clearly, admission decision and any other selection process should not be based on age or gender.

Nevertheless, the predictive utility of precedent variables commonly used in graduate management education is limited. The study calls for further research in this area. Particularly, it is important to investigate other important variables such as learning motivation and working experience. Only about one quarter of the variance of MBA's academic performance could be accounted for by several selective variables. Several authors have correctly noted that there are far more important variables that determine the MBA's academic performance than those ones used in common admission practice (Ahmadi, Raiszadeh & Helms, 1997; Baldwin, Bedell, & Johnson, 1997; Wright & Palmer, 1994). It would be inaccurate to assume that prior academic performance is the single best predictor for the performance in management education program. This study reveals that only one quarter of the variations of academic performance can be attributed to some precedent variables. Baldwin et al. (1997) find that centrality in friendship, communication, and adversarial network affect both MBA students attitudes and grades. Management educators should pay more attention to the learning contexts that determine learning and transfer. Admission decisions should be made incorporating other evidences such as writing samples, career statement, personal interview and reference.

There are certainly a number of limitations of this study that constrain the generalizability of this study and warrant some caution in the interpretation of results. First, only few predictors were sought due to limited time and resources. Had other important variables been included in the project, the prediction might have been improved to a greater extent. Second, there is considerable amount of missing data and thus the valid sample size has been considerably reduced. So far, we do not have enough information to infer how these MBAs would perform in relation with their backgrounds. Third, few international students are included in the study. Thus, it should be careful to generalize the conclusion to a larger population with regard to the admission practice.

Implications for Management Education

DeSimone and Harris (1998) comment that management education is one of the most common human resource development activities. Keys and Wolfe (1988) define management education as “the acquisition of a broad range of conceptual knowledge and skills in formal classroom situations in degree-granting institutions” (p. 205). This study contributes to the literature by examining several precedent variables that significantly influence academic performance in popular MBA program. Although the predictive power for the academic performance in graduate management education from prior performance and standardized test scores is limited, several precedent variables still explained a considerable variations of the academic performance. Management educators and administrators should carefully examine the impacts of prior academic performance on the performance of graduate management education. They should work with test developers to ensure adequate validity and reliability of the standardized examination such as GMAT. Overall, this study supports the continuous use of undergraduate GPA.
and GMAT score in admission decision-making process. However, other factors should be taken into account such as motivation to learn, working experience, and career plan.

In addition to the information from standardized tests and prior academic performance, other screening methods should be employed in graduate management admission. Tarr (1986) observed that business schools have allowed concern for human skills to slip in their effort to strengthen technical scholarship. He emphasizes leadership skills in screening applicants. Assessment on applicants' motivation to learn, communication and leadership skills can be obtained through personal interview or other authentic assessment methods.

This study has implications for management education not only in the area of admission decision but also in areas of content and teaching methods. Just like a limited percentage of variance of academic performance is attributed to those tangible previous learning outcomes such as undergraduate GPA and GMAT scores, MBA graduates' management performance in practice and career success cannot be explained solely by their academic performance. O'Reilly and Chatman (1994) studied the effects of motivation and ability on the early career success of a sample of MBA graduates in the early years of their careers. It was found that it was the interaction of motivation and general cognitive ability that most strongly predicted early career success. Nevertheless, the predictive power of these two variables was limited in terms of R² in multiple regression. After controlling several demographic variables (e.g., age, sex, years of graduation) and working settings (e.g., types of working organization), motivation and general ability accounted for only 4% variance of reported salary and 16% variance of promotion. The present study appears to concur with this finding and suggests that formal learning is not the most important determinant for individual performance. Recent arguments have suggested that learning from practice or informal learning is as vital as formal learning of formal technical knowledge (Lave & Wenger, 1991; Yang, 1999).

Traditional management education emphasizes theory rather than practice, and it normally values formal rather informal learning. This type of management education places much emphasis on rational, scientific, systematic and formal knowledge base as its major content. Raelin (1993) posits that advanced management education programs should include both theory and practice. Theory-based programs might cause students to think that management problems can be nested into neat technical packages. In the light of holistic perspective of knowledge and learning, practice should be an essential component of management education.

This study demonstrates that business education needs to be enhanced with international perspective. The results of this study suggest that students' native language had moderate influence on the academic performance. The factor of students' native language should be taken into account in graduate management education. As the world economy is experiencing rapid process of globalization and American firms are facing the challenge of international competition, universities are receiving more and more international students. According to the statistics of National Center for Education Statistics, a total of 14,389 master's degrees in the field of business management were conferred by American universities to "non-resident alien" and this figure accounted for almost 15% of the degrees awarded in this field. The presence of foreign students can be a very positive force to graduate management education because they can share different cultural and social understandings about management and international backgrounds. Kedia and Harveston (1998) posit that management education needs to change to prepare business leaders with a worldview. Obviously, international students can be a valuable asset for any program of graduate management education. They can help faculty members to enhance awareness of international implications and global perspectives. However, they might have language barrier to overcome. As international students who have studied business management in two American universities, our experience showed that few faculty members have paid special attention to international students. Most faculty members tend to treat international students the same as American students and fail to consider their special needs and use this type of valuable asset. If we think that the concept of globalization is real, educators of business management should take a proactive role in increasing international perspective and examining global implications of their business.

A Multilevel Theory of Organizational Performance: Seeing the Forest and the Trees

Susan Reynolds Fisher
Barry University

The process used to develop "A Multilevel Theory of Organizational Performance" is presented and emergent insights analyzed. Expert reviewers found the theory to be provocative and useful in examining holistic performance systems. The theory succeeds in mapping relationships across aspects and levels of performance that have previously been isolated by level. It also enhances current levels models by using a social collective perspective to operationalize performance capacities arising from the uniquely human aspects of organizations.

Keywords: Performance, Theory, Multilevel

Human resource development (HRD) scholars have been on the cutting edge in their use of systems theory as a tool for understanding organizational phenomena (Sleezer, Gradous, & Maile, 1999). HRD professionals have effectively used this perspective to contribute to the body of knowledge related to individual, team, and organizational learning and performance. However, our knowledge of the complex relationships that link these processes across organizational levels remains limited. Although we know a great deal about the "trees" and even the isolated groves of trees in the organizational "forest," we have yet to capture the complex whole of the forest itself. To capture the whole, we must consider the myriad relationships that link organizational levels.

This gap in knowledge related to levels issues in organizations is not unique to HRD. The study of organizations by scholars in numerous fields has long been fragmented along lines roughly equivalent to levels of analysis (Behling, 1978; Klein, Tosi, & Canella, 1999; Rousseau, 1985). This situation has encouraged narrowly defined studies that focus on one level at a time and are dominated by a focus on the individual and organizational levels of analysis (Klein, et al., 1999). The "meso" area in between, where components and subsystems interact in complex ways, has been relatively unexplored (Glick 1985; Holton, 1999; Roberts, Hulin, & Rousseau, 1978). Many are now calling for organizational scholars to confront the complexities of multilevel theory-building and research (e.g., Chan, 1998; House, Rousseau, & Thomas-Hunt, 1995; Morgeson & Hofmann, 1999).

Currently, there is also a convergence of ideas from diverse fields indicating that scholars may now be ready to address this meso gap. Those in micro-oriented fields, such as HRD and organizational behavior, are encouraging their peers to broaden their perspectives by considering organization level effects (e.g., Holton, 1999; Mowday & Sutton, 1993; Passmore, 1997; Swanson, 1999). At the same time, researchers in the macro-oriented field of business policy and strategy have begun to see value in the resources embedded in individuals and groups in organizations. Proponents of the resource-based view of the firm (e.g., Barney, 1991; Wernerfelt, 1984) now acknowledge that the idiosyncratic human capital of a firm may represent valuable resources that contribute to a firm's sustainable competitive advantage. The convergence of these ideas creates an incentive to integrate previously competing approaches to the study of performance.

Because multilevel theory provides the means to integrate and explore the dynamic complexities of the meso region, a true multilevel theory of organizational performance should also help us to reconcile previously fragmented views of performance. This paper offers a brief description of one such a theory.

Foundational Concepts from the Literature

A Multilevel Theory of Organizational Performance (Fisher, 2000) was developed using foundational concepts established by early multilevel thinkers who viewed the organization from a social collective perspective (e.g., Behling, 1978; Coleman, 1986). The social collective view of organizational levels focuses on the interaction and affiliation characteristics of the organizational members rather than the task and technical configurations that have characterized the levels models familiar to HRD scholars (e.g., Rummler & Brache, 1995; Swanson, 1996). In addition, the theory draws on ideas advanced by scholars of complexity and systems theory (e.g., Bertalanffy, 1962;
Senge, 1990; Stacey, 1995); organizational learning (e.g., Argyris & Schon, 1996; Daft & Huber, 1987; Walsh & Ungson, 1991; Watkins & Marsick, 1993), and the resource-based view of the firm (e.g., Barney, 1991). The resource-based view holds that firms that develop valuable, rare, inimitable rent-producing resources may outperform their competitors (Reed & DeFillipi, 1990). Many of these types of resources are embedded in the human capital of the firm and are the direct result of organizational learning (Conner, 1991).

Dubin's (1978) seminal work on theory-building was used as a guide to the theory-building process and was supplemented by the work of more contemporary multilevel theorists. The methodology of the theory-building process is traced in the following section.

**Methodology**

First, to provide the structural foundation for the theory, a multilevel theory building model (MLTB) was developed. The first five steps of Dubin's (1978) theory-building template were used as a framework and augmented with insights of contemporary multilevel theorists who share the social collective view of organizational levels.

Rousseau's (1985) taxonomy of mixed-level models was used to describe functional relationships among levels; the work of Klein, et al. (1994) was used to consider the sources of variability among constructs at multiple levels; and the ideas of Morgeson and Hofmann (1999) and Chan (1998) were used to consider structural, functional, and process characteristics of collective constructs. The resulting MLTB model is summarized in Table 1.

Second, to survey the current body of performance research, a sample of 34 performance studies from micro and macro fields published from 1984 to 1998 was examined for areas of convergence. The studies were found to converge in their use of systems theory and their inclusion of concepts related to organizational learning. The resource-based view emerged as a conceptual frame linking systems theory and learning. Third, to test the relevance of the MLTB, the model was used to examine the nine studies from the sample that were determined to be multilevel. The MLTB proved to be useful for examining the multilevel aspects of these nine performance studies.

In the fourth step of the methodology, a multilevel theory of organizational performance was developed by systematically addressing the eight elements in the MLTB model. Because this is the heart of the study, this phase is described in more detail in the following section.

### Building the Theory

In keeping with the social collective view of organizational levels, three theoretical units representing levels were identified: *individual, group*, and *organization*. The *individual* level is the most subordinate and has an unambiguous boundary. In the space between the individual and the organization levels, there are numerous interacting collectives—both formal and informal—including dyads, work teams, informal groups, departments, and business units. Because interaction is a fundamental component of collective action (Weick, 1995a), any collective of individuals that does not include all organizational members and in which social interaction takes place is considered part of the *group* level. This level is complex and characterized by multiple, overlapping memberships, ambiguous boundaries, and partial inclusion. The *organization* is viewed as the formally structured social entity with identifiable boundaries (Katz & Kahn, 1966) that includes all elements of the individual and group levels.
The theory also incorporates a fourth level—industry—borrowed from the strategy literature (Porter, 1980). This level includes all organizations competing in the same marketplace. The focal level of the theory is the organization, and "sustained competitive advantage" at the industry level is used as the performance criterion.

Theoretical units representing aspects of performance also were developed. These performance aspects—capacity, process, and accomplishment—were based on the generic systems view (Katz & Kahn, 1966) and terminology developed by Sleezer et al. (1999). When relationships were teased out of this traditional model at the organizational level, it became evident that process not only serves the traditional, feed-forward production role, but also takes on a separate role in learning. Learning process operates in the feedback direction from market experience and production process to organizational memory—a subset of capacity. This conception is supported by the organizational learning literature (Argyris & Schon, 1996; Walsh & Ungson, 1991; Watkins & Marsick, 1993). Based on the generic systems model, both production and learning processes operate as mediators between capacity and accomplishment. Theoretical units for external resource and product markets were also established based on the strategy literature. Figure 1 illustrates the performance aspects and the relationships that link them at the organization level. The complete model contains 15 theoretical units: four performance aspects at three levels, two markets at the industry level, and one unit representing organizational memory.

![Figure 1. Systems Model of Performance Aspects and Markets at the Organization Level](image)

Following the specification of theoretical units and boundaries, the theorist focused on two types of relationships among the theoretical units: (1) the intra-level relationships linking performance aspects within the individual, group, and organization levels and (2) the inter-level relationships that cross levels. The inter-level relationships may either link levels within performance aspects (such as the link between the individual and group levels of learning process) or cross both aspects and levels (such as the link between group production process and organizational accomplishment). In Figure 1, those relationships shown within the dotted line are all intra-level relationships at the organizational level, while those relationships indicated by arrows crossing the dotted line are inter-level relationships linking performance aspects at the organization and industry levels. Note that the direction of intra-level relationships is constrained by the generic systems model and the mediating role of process, both learning and production. Thus, there are no direct relationships joining capacity and accomplishment.

Twenty-one intra-level relationships were defined. Upward relationships within performance aspects took the form of Rousseau's (1985) compositional type. Compositional relationships allow collective action to emerge from the individual and group levels to the organization level by focusing on the functional similarities between variables at progressively more complex levels. For example, learning at the group and organizational levels is structurally different from learning at the individual level but fulfills a similar function. Compositional relationships are critical aspects of the meso space in organizations. Twelve compositional relationships were defined for the four performance aspects. Figure 2 depicts compositional relationships among levels using the capacity aspect as an example.
When the relationships that cross both levels and aspects of performance were considered, some potential links were found to be redundant. (Figure 3 depicts the potential links crossing levels between the capacity and production process aspects that were examined.) As a result, several relationships that initially appeared to be cross-level, multi-aspect links were actually determined to be combinations of compositional and *intra*-level links. An example of such hybrid links is shown in Figure 4.

![Figure 2. Compositional Links within Performance Aspects](image)

![Figure 3. Possible Cross-level, Multi-aspect Links](image)

![Figure 4. Hybrid Links Involving Composition](image)

Overall, 24 potential relationships crossing both levels and aspects of performance were examined. Nine of these were discovered to be hybrids composed of combinations of compositional, *intra*-level, and cross-level links.
previously identified; and two were described by previous relationships. Thus, 13 discrete cross-level, multi-aspect links were defined. Figure 5 depicts the 15 theoretical units and 32 of the 47 relationships defined by the theory. (Because of the complexity of the figure, the relationships that cross both levels and aspects and two relationships defined as managerial links are not shown.)

The 47 relationships among units defined by the theory were all determined to be categoric and directional. This precluded any consideration of system states as defined by Dubin (1978). The complexity of the theoretical system also impacted the proposition step of theory-building. Because the number of potential propositions emanating from 47 relationships is huge, the theorist elected to develop but a sample to demonstrate how falsifiable and useful truth statements may be drawn from the theory. The following are examples of two.

**Proposition A:** The cycle time of subsystems at lower levels (individuals, dyads, and small groups) within the organization will be shorter than that of higher level subsystems (large groups) and that of the organization as a whole due to increasing complexity.

**Proposition B:** Groups and organizations that acquire and use knowledge obtained from production process, learning process, and the evaluation of accomplishment make continuing adaptations to production process that result in accomplishments of higher quality and/or greater quantity than those groups and organizational that acquire and use knowledge learned from fewer sources.

Finally, the theory was submitted to outside experts in relevant fields of study to evaluate its usefulness and the magnitude of its contribution to the study of organizational performance. The results of this assessment are described in the following section.

**Expert Opinions**

Among the group of experts asked to provide feedback were multilevel theorists, researchers who have conducted multilevel studies, HRD scholars and practitioners, and strategy scholars. Four of five experts who participated were satisfied that the model developed in the study is a theory. The fifth reviewer believed that a theory should be a more simplified view of reality. This expert felt that the model presented is not parsimonious enough to qualify as theory. Four reviewers acknowledged that the theory offers a holistic frame for examining performance that reveals synergies among previously fragmented concepts. Thus, the theory may be useful in bridging disciplinary gaps and expanding our vision of organizational performance.

In its present form, the theory was generally considered to be too cumbersome to be easily accessible. Although it is highly unlikely that a theory of this scope could be tested as a whole, one reviewer observed that the propositions presented demonstrate that the theory is testable and thus falsifiable. Further development of propositions should point the way toward combinations of relationships that may be empirically tested.

**Strengths and Limitations**

Several insights emerged as this theory was developed that constitute contributions to the field of HRD. The first relates to organizational learning. The theory provides a new conceptual space for organizational learning in an organizational performance model by depicting learning process as parallel to production process at three levels but operating in the opposite direction—feedback rather than feed-forward. The views of several prominent multilevel scholars were applied to this conceptual frame to capture many of the social interaction effects that take place in the meso space between the individual and organizational levels. The explication of these meso level activities suggests ways in which previously ambiguous concepts related to organizational learning actually take shape.

Another contribution is the use of a comparative measure of performance—sustained competitive advantage—at the industry level. Using a measure at this level represents a paradigm shift for the micro-oriented disciplines. The field of HRD, in particular, has been focused primarily on *intra*-level performance measures over time. This practice can be misleading when measuring performance at the organizational level. Although organizations may experience performance improvements at individual and group levels, if these improvements fail to bring the organization to a competitive position at the industry level, the organization will ultimately fail despite these improvements.

A third contribution relates to the essence of HRD as a scholarly discipline. To date, the levels models most widely used in our field (e.g. Rummler & Brache, 1995; Swanson, 1996) have been focused on process. In these
Figure 5. A Partial Model of Organizational Performance
models, organizations are viewed as collections of functions; individuals are addressed primarily by the
organizational roles they play or the jobs they occupy; and the space in between is defined as process. These models
guide the performance analyst to identify which job is responsible for what is done and when and how these tasks
are interlinked in production process. To facilitate this approach, the “doing” is considered a generic function that
can be accomplished in much the same way by anyone. Although these models have been effective in helping
scholars and practitioners frame performance issues in a manner that renders them highly accessible, they may also
have obscured our recognition of some of the most unique, human aspects of performance.

By contrast, A Multilevel Theory of Organizational Performance, operationalizes a social collective view of
organizations by defining the space between the individual and organizational levels in terms of social interaction.
When one considers the impact of social interaction, any combination of interacting individuals holds the power to
create unique collective capacities and create accomplishments in different ways. These collectives may also learn
and affect processes, outcomes, and capacities at supraordinate as well as individual levels. However, because
social interaction is based in time, is often unpredictable, and is characterized by ambiguous boundaries, it is
difficult to capture in theory and even more difficult to study empirically. This results in a highly complex theory
that is more difficult to test and put into practice than those founded in task and process.

The limitations of the current study are those inherent in theory-building in general. The basis for these
limitations was aptly described by Sutton and Staw (1995) who observed that organizational scholars engaged in
theory-building “are forced to make tradeoffs between generality, simplicity, and accuracy” (p. 372). These
tradeoffs leave the theory vulnerable to criticism. For example, establishing boundaries necessarily limits scope and
thus generalizability. Overall, theories must be evaluated based on their ability to increase our understanding of a
complex reality. But theories can never be more than “approximations” of reality, and “most verbally expressed
theory leaves tacit some key portions of the originating insight” (Weick, 1995b, p. 387). Because any multilevel
theory is necessarily more complex than theories that focus on one level at a time, the tension between scope and
parsimony is a constant challenge. The question remains as to whether this theory achieves the appropriate balance
between these essential elements.

Conclusion

The theoretical units representing performance aspects and levels developed for this theory were founded on
traditional concepts, and, therefore, are not new. The contribution of this study lies in the inclusion of all relevant
interrelationships. This is the multilevel dimension of the theory and the source of its complexity. The theory was
developed with the intent of transforming traditional concepts of performance using contemporary multilevel
thinking based on a social collective perspective. The result is a theory of questionable parsimony. Although some
experts viewed the theory as integrating and holistic, others cautioned that its complexity may create an
insurmountable barrier to research and application. The first view was more prevalent in the small group of experts
participating in this study. However, if the latter view becomes dominant, the utility of the approach as conceived
by contemporary multilevel scholars must be seriously questioned. This outcome is significant in itself and may
indicate that this highly anticipated path to understanding is not a feasible one.

The development of A Multilevel Theory of Organizational Performance was guided by a desire to serve an
integrative purpose that grows out of the holistic philosophy of systems thinking. The essence of this philosophy
was most eloquently captured by an ancient Sufi teaching: “You think because you understand one you must
understand two, because one and one makes two. But you must also understand and” (Meadows as cited by
Wheatley, 1996, p. 241). The hope remains that multilevel theories such as this one will help illuminate both the
forest and the trees of organizational performance.

Is Knowledge in the Head or in the World?

Richard J. Torraco
University of Nebraska

Despite the greater challenges to learning posed in demanding work environments, few studies examine the full range of factors needed to broaden our understanding of this important type of learning. This paucity of studies is due, in part, to an inadequate theory base for examining how skilled workers, technicians, professionals, managers and others attain competence in dealing with rapidly changing work situations. This paper begins to lay a theoretical foundation for this research using Dubin's theory building methodology.

Keywords: Theory Building, Work Activities, Work Skills

Working

Working consumes about three-quarters of our waking hours. Next to close social relationships nothing is more influential in our lives. For those who are challenged by their work, it can be a mixed bag of routine and novelty, rewards and disappointments, of fun and monotony. Some define success at work as simply learning to cope. For others acquiring fulfillment and expertise through work is a necessity that sustains career exploration until fulfilling work is found. Consider the following personal vignettes from the world of work:

Sam is a 39-year-old control room operator on "Usra," a deep-sea petroleum production and drilling platform 65 miles offshore in the Gulf of Mexico. Sam's work schedule requires 14 days on the job followed by 14 days off. As deep-water drillers, Sam and others are involved with work that is enormously complex, with a number of workplace constraints—some technological, some human. The challenge, of course, is for everything and everybody (250 people) on this oil-and-gas platform to function smoothly. One mistake, and Usra could join the Exxon Valdez in the oil-and-environment-disaster history books. (from Lieber, (2000), Platform for Excellence).

Software support technicians who provide direct customer service through hot lines face major challenges related to locating the sources of error underlying customer problems. Sifting through information from customers, technicians must decide what is and is not relevant to problems. Compounding the challenge, computer problems frequently interrupt customers' key business operations. Under the pressure of deadlines, customers are anxious to regain their lost computer capabilities. In addition, customers have diverse software and hardware configurations. The customer problems that technicians encounter are poorly defined and often conflict with the belief that software programs do exactly the same thing every time you run them. If a customer has encountered a problem since the last time a program was successfully run, something must have changed. Lacking a definitive diagnosis of the problem, the preferred solution is to tell customers to remove all unfamiliar system features until the software works again. The overriding principle is that anything that resolves the problem is justified and acceptable, as long as it works. Thus, the precision and logic suggested in theory are replaced by behaviors that are far more contingent and difficult to anticipate in practice. (from Brian T. Pentland (1997), Bleeding Edge Epistemology: Practical Problem Solving in Software Support Lines).

"So you want to understand our work on an aircraft carrier? Well, just imagine that it's a busy day and you shrink San Francisco Airport to only one short runway and one ramp and gate. Make planes take off and land at the same time, at half the present time interval, rock the runway from side-to-side, and require that everyone who leaves in the morning returns the same day. Make sure that equipment is so close to the edge of the envelope that it's fragile. Then turn off the radar to avoid detection, impose strict controls on radios, fuel the aircraft in place with their engines running, put an enemy in the air, and scatter live bombs and rockets around. Now wet the whole thing down with salt water and oil, and man it with 20-year-old's, half of whom have never seen an aircraft close up. Oh, and by the way, try not to kill anyone." Senior Air Operations Officer, USS Carl Vinson. (from Rochlin, LaPorte, and Roberts (1987), The Self-designing High-reliability Organization: Aircraft Carrier Flight Operations at Sea).

"My job as a reservationist is like being on a production line, only I work at a computer on the Astrojet Desk. This is our airline service is for commercial and business customers. They're all frequent flyers who know they're supposed to be getting premium service. So they request things no one's ever heard of before, and they get them! And they want them now! One crazy request after another—like a production line. They monitor our calls and listen to some of our conversations, to improve customer satisfaction, they say. I'm never bored, but this sure is hectic—like a production line. I can hardly learn new things fast enough to keep up." Carol Gleason, 27, works for a major airline.

On any given day work involves activities that may range from dealing with routines to reacting to emergencies. The passages from the work vignettes above demonstrate expertise in action. While these accounts are, first and foremost, about work, they illustrate situations in which learning is closely enmeshed with the conduct of work itself.

Problem Statement

In many cases, learning and working are indistinguishable. Each of the passages above was elicited by a simple inquiry about the type of work these people do all day. When asked about their work, most people including those in complex work environments, relate what they do in terms of the activities and tasks they perform without mentioning the learning that is inevitably needed to acquire their skills. Unfortunately, however, many skilled workers, technicians, and professionals appear to be on their own in dealing with these situations. In many cases they must devise their own learning experiences, which frequently include trial and error. Today's work environments increasingly demand "thinking on one's feet"—learning that is tightly interwoven with the temporal and technical constraints of the work itself. What are the implications of this reality for education and training? Does this type of learning require more attention to the technical and environmental aspects of learning? At present little is known about the successful integration of learning and working.

Recent research in activity theory and cognitive science suggests that physical and environmental factors in the workplace influence how expertise is acquired and demonstrated on-the-job (Hutchins, 1995; Scribner, 1984; Suchman, 1987). This research emphasizes the need for a clearer understanding of how discrimination occurs between internal and external sources of knowledge, that is, knowledge in the head and knowledge in the world. Knowledge in the world represents knowledge that does not require encoding in long-term memory because it is readily available "in the world." That is, this knowledge resides within work activities as environmental artifacts such as operating instructions, job aids, and software programs designed to reduce the representational and computational load placed on the human agent (Norman, 1988; 1997). This perspective suggests that both knowledge in the head and in the world are essential for the development of the sophisticated expertise demanded in many of today's work environments.

Given the influence of physical and environmental factors in the workplace, how complete an understanding of work activities themselves must we have to fully harvest these potential advancements in our understanding of work-related learning? Frameworks and taxonomies have been developed to examine different types of work and their components. Taxonomies of work activities (Gagne, 1962; McCall, 1988; Swanson, 1994; Winter, 1987) and taxonomies of learned capabilities (Gagne, Briggs and Wager, 1988; McLagan, 1989) are considered individually later in this paper.

Several learning theories are also reviewed (experiential learning, situated cognition, and activity theory). Although these theories specifically address developmental processes, they were not designed to explicitly relate to various kinds of work activities. They do not address the influence the work itself has on this type of learning. Thus, our present theory base remains inadequate for providing a full understanding of how people interact with work activities, especially in today's rapidly changing work environments. New and better theoretical understandings in this area are needed.

Research Design

This paper has two purposes. First, it is intended to expand our present theoretical knowledge base to support future studies of this type of learning. Second, this paper is intended to contribute to advancing our knowledge of how to develop conceptual systems and, ultimately, how to build formal theory itself. Scholarly work in this area is necessarily guided by conventions that are appropriate for theory development in applied domains. The research design of this paper follows the theory building methodology of Dubin (1978). Dubin's philosophy and methodology for theorizing was developed for theory building in the behavioral sciences. The theoretical products of Dubin and others who have used this methodology demonstrate the value of this methodology for building theory.
in applied fields such as human resource development. Specifically, this paper will select, justify, and develop the conceptual elements and relationships that provide the basis for a theoretical system to support research on the type of work-related learning of interest here. The theoretical product will then be compared with taxonomies of work and present theories of learning to demonstrate the product's contribution to our knowledge of this type of learning.

Theoretical Formulations

Dubin's methodology for theory building requires attention to a pivotal task at the outset—specifying the major concepts and relationships that provide the basis for the theoretical system (Dubin, 1978). These components of theory building require the specification of the units of the theory—stating the key concepts or building blocks around which the theory will be developed, and developing the laws of interaction—the relationships among the units (concepts) of the theory that show the associations and the sequential or determinate relationships between and among the concepts. Brief descriptions of these elements follow as the basis of the proposed theoretical system.

Units of the Theory

The units of the theory are the concepts or building blocks around which the theory is developed. The central elements of concern for examining work and learning in today's work environments are the worker and the work to be done. The essence of a system for understanding this phenomenon is the subject and object of the phenomenon—the worker and his or her work. The human agent and the work activities performed are two basic elements that form the basis for a carefully developed system of concepts and relationships to advance our understanding of this type of learning. These two units of the theory are briefly described next.

The Human Agent (Worker). The human agent possesses the knowledge and skills to perform various types of work. More important for work activity, the agent possesses the cognitive capabilities to process information and to assimilate new knowledge. These capabilities allow the agent to integrate existing knowledge with new knowledge as it is generated and needed to undertake new work activities. Cognitive processing allows existing knowledge and new knowledge to be reconciled and incorporated into a growing repertoire of expertise (Anderson, 1988). The human agent also demonstrates affective capacities at work—motives, aspirations, feelings, and anticipation of consequences of actions at work. A classification of affective behaviors was developed by Krathwohl, Bloom and Masia (1964). The psychomotor dimension of work behavior has been represented by Harrow (1972) as a taxonomy of psychomotor learning. Human cognitive, affective, and psychomotor capabilities constitute the potential of human agents for learning about and performing work activities.

Work Activity (Task). The work activity itself is central to the understanding of work-related learning. According to activity theorists, whose interests include but are not limited to work activities, the starting point and primary object of analysis is the actual process of interaction in which humans engage the world and each other. Sequences of work organized around motives constitute work activities. These activities are always part of a social system that has been culturally developed and that continues to change. The concrete contents of work activities include the tools, symbols, material resources, and procedural information that distinguish work activities from one another. The also includes the dynamics of the work activity (the process and modes of action through which it unfolds and its interaction with related work activities). Finally, all work activities occur in the larger context (that is, environment, organization, system) in which they are carried out. All work activities, in the abstract, are constituted by these elements. A specific component of a work activity is identified as a task. Thus, the nature of a work activity is conceptualized as having the following elements:

- **Contents** of work activity—the tools, symbols, materials, and procedural information of the work or task.
- **Dynamics** of work activity—the processes and modes of action through which it unfolds and its interaction with related work activities.
- **Context** of work activity—the environment, system, or other relevant context in which they are carried out.

The two main conceptual elements (units of the theory) whose interaction constitutes work performance are represented in Figure 1. (See Figure 1, Agent-Work Activity Interaction).

![Figure 1. Agent—Work Activity Interaction](image-url)
Conceptual Relationships Among the Concepts

The relationships among the concepts (units) of a theory are described in the theory’s laws of interaction (Dubin, 1978). There are three general types of laws of interaction. These types of laws—categoric, sequential, and determinance—encompass all forms for expressing relationships among the concepts of a theory. Categoric laws state that values of a unit of the theory are associated with values of another unit. Sequential laws use a time dimension to describe the temporal relationships among two or more units. A determinative law of interaction is one that relates determinate values of one unit of the theory with determinate values of another unit. Since determinative laws of interaction describe specific relationships among units with determinate values, they are used in the physical sciences where such precise relationships are more common than in the behavioral sciences. The relationships among agents work activities are categoric laws since each specifies a relationship in which one or more conceptual elements are associated with (versus determined by) other elements of the theory. These conceptual relationships are described next.

Interaction of Agent and Work Activity. The interaction of agents with work activities may involve the movement of agents from one job (or work role) to another. Work is frequently a stimulus for novelty and innovation. Many are drawn to certain types of work because the nature of the work invites human creativity and innovation. Work that ceases to provide this type of stimulation (e.g., a once-innovative product or service that reaches maturity) can no longer engage those who are attracted by creativity, innovation, and entrepreneurship. Workers who remain with this type of work experience stagnation. Stasis in agent-work activity interactions necessitates movement among jobs if worker growth is to continue. Conversely, agent-work activity interactions involving learning are those in which the work activity and agent are both dynamic. There are multiple manifestations of dynamic agent-work activity interactions. These are classified in two categories: (a) the rates of change between and among agents and work activities, and (b) the types and combinations of change involving agents and work activity. Each of these agent-work activity dynamics is briefly described next.

First, the rates of change may vary between one or both of the constructs (the agent and/or the work activity). With the ever-increasing influence of technical innovations, the rate of change in work processes is increasing due to the integration of technology. Change is manifested in many human agents as their motives, aspirations, expertise and other work-related characteristics continuously grow and change over time. With respect to the possible effects of these changes, it is often the relative rates of change between and among agents and work activities that are of particular interest. That is,

Second, various types and combinations of change are possible among the two concepts. The constituent elements of the agent (human capabilities) and of work activity (its content, dynamics, and context) interact in different combinations as various types of change occur. A simple combination of change types might involve both the agent and the work activity as would occur with an ergonomic modification of the workplace after a worker illness or injury. A complex combination of change types might involve fundamental work process redesign that includes new materials and process dynamics. This would require more sophisticated change in the effected agents, who would need retraining and new skills.

Learning as change

The rates of change and the types and combinations of change among agents and work activity provide the basis for examining changes involving the phenomenon of primary interest—learning at work. Among the various types of change, we would expect some to involve greater opportunities for learning than others. For example, a simple change in work content may require little or no learning (e.g., a change in product packaging). On the other hand, change involving the type of work process redesign mentioned above affords a greater opportunity for learning, as it requires the acquisition of new skills.

Variability in learning opportunities is also associated with different rates of change among agents and work activities. Rapid change in work processes is fast becoming the norm in many work settings. A high degree of change in work is associated with a greater demand for agent expertise. As stated above, the relative rates of change between agents and work activities are of concern when change in one outstrips the capacity for change in the other. For example, internet-based innovations in commercial and business transactions are multiple examples of the changing context and dynamics of work activities. Many workers have anticipated these developments and have upgraded their work skills accordingly. For others, these developments reveal their inability to keep pace with the accelerated rate of technological change in how work is accomplished. The agent-work activity interactions that have potential for learning are those in which the rates and combinations of change between agent and work activity can be determined and related. These are the work situations of primary interest in this paper.
Work Activities and Learning

It is possible that the degree of change, and of learning, required by agents is related to whether change involves the contents, dynamics, and/or context of work activities. For example, it is likely that simple changes in work contents require less learning than more complex changes involving the context and dynamics of work activities. The latter changes in work activities involve the processes through which work activity unfolds and change in how the work and the agent(s) who perform(s) it interact(s) with other related work activities. Clearly, these are sophisticated changes that involve other agents and work processes. They would seem to place greater demands on the agent's capacity for learning than a simple change involving new materials only.

This relationship is expressed in Figure 2. (See Figure 2, Work Activities and their Dynamics). The circular figures in the model represent the nature of work activities. The vertical and horizontal axes that bound the model represent the major dynamics in the work activities discussed in this paper—the change in work activities accounted for by their levels of complexity and degrees of integration.

Figure 2. Work Activities and their Dynamics

The level of complexity of work activities varies from high to low and is represented in Figure 2 by the vertical axis. Work activity contents, dynamics, and context are each characterized by their own levels of complexity. For example, the contents of an airline baggage handler's work activities may be quite straightforward, yet the context of this work, a busy international airline terminal, may be complex. Conversely, the contents of a college professor's work activities may be complex, yet the context of this work, especially if it is devoted primarily to classroom teaching, is fairly straightforward. While the levels of complexity of work activity contents, dynamics, and context are clearly interrelated in most work environments, the concept of complexity is conceptualized here as having independent as well as interdependent effects on the three components of work activity.

The degree of integration can also vary within and among the components of work activities. This is represented in Figure 2 by the horizontal axis. Low integration among the contents, dynamics, and context of work activity means that there is little relationship between these components of work activity. The comparison of two different kinds of work activity helps distinguish low from high degrees of integration in these components. The work of an interagency courier demands competence in the contents and, to a lesser degree, dynamics of this work. However, it requires little or no expertise in the context of this work (i.e., interagency systems). The courier simply delivers materials to the right place at the right time. Conversely, the work of an information systems director
requires a great deal of integration among the contents, dynamics, and context of work. The competence of the information systems professional not only includes the technical aspects of information technology, that is, the contents (the tools, symbols, materials, procedures) and dynamics (the processes and modes of action) of this work, but also knowledge of the larger contextual issues required for successfully integrating information systems among diverse departments and functions of the organization's sub-systems. Since the degree of integration in work activities applies across the components of contents, dynamics, and context, this construct is conceptualized as having interdependent effects on the components of work activity.

The Dynamics of Work Activities

The dynamics of work activities represented in Figure 2 suggest that important contrasts exist between different types of work. These contrasts illustrate the potential importance of the nature of work activities to our understanding of agent-work activity interactions and, ultimately, to the phenomenon of work-related learning. Consider a hypothetical continuum represented in Figure 2 by the dotted diagonal line Z. The point at the upper right end of line Z designated as point A represents a work situation characterized by both a high level of work complexity and a high degree of work integration. In contrast, the point at the lower left end of line Z represented by point B is a work situation characterized by both a low level of complexity and a low degree of integration in the work activities. These points in Figure 2 represent two types of work activities with distinctive features that relate both to the nature of work and to work-related learning. An example of the contrast between these types of work will illustrate the potential importance work activity has to our understanding of agent-work activity interactions and, ultimately, to the phenomenon of work-related learning.

An example of contrasting work activities. The worldwide shipping business has grown into a huge industry that has undergone a fundamental transformation since its inception as a critical business function after World War II. Shipping packages to locations in distant countries used to be a gamble involving questionable arrival at the right location and even greater concerns about the timeliness of deliveries. Actual confirmation of delivery by the sender could only occur through written or verbal contact with the receiving party. Personnel working for shipping companies were concerned primarily with the physical movement of packages. The tracking of packages moving throughout the company's shipping system was not yet an important concern. Contact by a customer with a shipping company representative to determine the location of a shipped package might yield information only that a given package had not yet arrived and was likely still in transit.

Today, uncertainty regarding the tracking of packages is no longer tolerated by either customers or shipping companies themselves. Comparing the work activities of the former company representative with today's practices that yield precise shipping locations and timetables serves as a useful contrast in work activities that illustrates the different levels of complexity and integration among their components. The shipping worker in the earlier example was focused on a narrow portion of a linear shipping process in which the functions of materials handling, pricing and labeling, and providing the transportation (i.e., delivery driver) accounted for a vast majority of shipping services. The work activities followed basic procedures composed of relatively simple tasks. Representing point B in Figure 2, the work of service representatives, materials handlers, or delivery drivers required little awareness of the larger work context, as long as they performed their particular tasks, however narrow in focus, reliably and efficiently. Tracking package locations, if done at all, was someone else's job.

In contrast, working knowledge of shipping timeframes and locations is now required of a majority of shipping company job categories. Representing point A in Figure 2, today's work activities are likely to require the use of computers, the handling of both packages and information from shipping databases, and broad contextual knowledge of the shipping business that includes the nuances of shipping practices in foreign locations and diverse cultures. This work is both more complex and fully integrated than the work activities of traditional employees.

Discussion—The Nature of Work Activities and their Implications for Learning

Any given work task, including those represented by points A and B in Figure 2, exists apart from the person(s) who might perform the task. Work activities (tasks) are conceptually distinct from human agents (workers). Each of these key concepts brings distinctive features to agent-work activity interactions. Agent-work activity interactions provide the context for the phenomenon of interest—work-related learning. The nature of work activity itself contributes a substantial measure to the dynamics of this interaction. The contrast between the two types of work shown in Figure 2 was intentionally drawn as a simple and straightforward example. Yet in today's rapidly changing world of work, countless situations exist that illustrate starker contrasts in the nature of work activities themselves. The contrasting work of the grocery bagger and the research scientist is one of an infinite number of such examples. The nature of work activities provides the content of work performance, the substrate within which the agent and work activity react. Examining the nature of the work to be performed and how the agent experiences and, ultimately, learns to conduct such work activities holds great promise for advancing our understanding of work-related learning.

Accounts of the influence of the work itself on this type of learning, however, are missing altogether in most theories of learning. Experiential learning theory, the theory of situated cognition, and activity theory are briefly reviewed next. After the review of theories, several taxonomies of work activities are then explored to examine how well these theories and taxonomies account for the character and dynamics of work activity.

Experiential and Situated Theories of Learning

The experiential learning model offered by Kolb (1984) frames learning as a process based in experience in which a person encounters a new idea, reflects upon it, compares it to what else he or she knows, tests it in a real situation, reflects on the
meaning of the consequences of the action, and then formulates a new theory of action or revises an existing one. Schon (1983) described the pragmatic use of knowledge and problem solving used by professionals on the job in the reflection-in-action model. Reflection-in-action model is an iterative process that moves through (a) assessment of the situation, (b) testing of one's preliminary sense of the problem through experiments, (c) examination of results, and (d) reassessment leading to another cycle of problem reformulation (Schon, 1983, 1987). One's preliminary assessment of a unique and uncertain situation is tested to see if a plan based on the assessment will lead to progress in resolving the problem. One conducts an experiment to examine the validity of one's preliminary assessment. The consequences may include unintended changes which give the situation new meanings. According to Schon (1983), "the situation talks back, the practitioner listens, and as he appreciates what he hears, he reframes the situation once again" (p. 131). Learning occurs through an iterative process of purposeful actions, discovered consequences, implications, reassessments, and further actions.

**Situated Cognition**

Unlike conventional theories of how learning occurs in formal structured settings, situated cognition starts with activity the activity itself—a position fully consistent with activity theory. Situated cognition views learning through an "activity—perception—representation" model, in which the cognitive dynamics of learning appear less open to the preconceived knowledge schemas that are dominant in formal instruction (Brown, Collins and Duguid, 1989). When people lack experience with a situation or are introduced to a new concept, providing them with a model or description of the new situation or concept is a useful catalyst for forming mental representations of what is learned. While inexperienced people may accept such a model, they will try to integrate it with new activities and perceptions, and any past experiences that they may consider relevant. The model will become part of the present context for learning, in which the learner's activities and perceptions precede mental representation.

**Activity Theory**

Activity theory attempts to explain purposeful behavior by focusing on the structure of the activity itself. Leont'ev (1981), a development psychologist and colleague of Vygotsky, developed the activity theory as reviewed here. For Leont'ev, the appropriate unit of analysis for studying purposeful behavior in the workplace is the activity itself—the task. If we are interested in accomplishing real world tasks, the task should be the unit of analysis, not isolated, abstracted components of the task. According to Leont'ev, an activity can be analyzed at three levels. First, the motivation of the activity, at the highest level of organization, provides coherence to the other levels. At the next level are goal-directed actions, carried out in the service of the activity. At the third level are operations, or the specific conditions under which actions are carried out. For example, if our action is travelling from point A to point B in the service of some activity, whether we walk or drive is an operation that depends on the distance and availability of a car. Operations, which depend on the circumstances, refer to how an action is done.

**Schemes for Classifying Work Activities**

Roughly forty years ago, Gagne first noted that the issue of highest priority for users, designers, and scholars of training and education for work is the specification of what is to be learned. As a scholar of instructional systems himself, Gagne's (1962) seminal treatise in American Psychologist alerted us to the importance of first examining the tasks to be learned in order to specifically address the issue of what the training program is intended to accomplish. Later, he developed a taxonomy of capabilities to be learned that still serves as a starting point for the design of work-related instruction (Gagne, Briggs and Wager, 1988).

Winter (1987) described the taxonomic dimensions of work expertise as a way of assessing its strategic value to organizations. Winter used several dimensions of knowledge and work tasks to develop several continua along which various types of work expertise could be described and classified. These dimensions of work expertise include their observability, complexity, articulability, a procedural-conceptual continuum, and an independent-systems element continuum. McCall's (1988), who studied experiential learning, produced a taxonomy of events from the work experiences of subjects that consistently provided opportunities for their learning. These events were classified as (a) work assignments (for example, initiating or fixing a project, line to staff assignment), (b) hardships (for example, business failures, personnel performance problems), (c) key interactions with people, (for example, role models), and (d) other events (for example, first supervisory experience). These events (17 in total) were integrated with 34 areas of learning content to produce an experiential learning matrix.

Swanson's (1994) taxonomy of performance specifies five levels of work performance in the context of two broader systems goals: maintaining a system or changing a system. Within the systems maintenance category are the levels—understand, operate, and troubleshoot. Within the systems change category are the levels—improve and invent. Each of these five performance levels is associated with a distinct set of work objectives and outcomes. This taxonomy of performance effectively addresses the perennial confusion associated with acquiring the expertise to maintain systems versus the expertise needed to change or improve them.

McLagan, who directed the seminal ASTD project that produced the Models for HRD Practice, developed a classification of specific competencies derived from four general categories of work—technical, business, intellectual, and interpersonal (McLagan, 1989). These categories provide the framework for a roles-competencies matrix that includes more than two dozen skills derived from work activities such as electronic systems skill, performance observation skill, computer skill, and cost-benefit analysis skill.

These taxonomies of work activities (Gagne, 1962; McCall, 1988; Swanson, 1994; Winter, 1987) and taxonomies of learned capabilities (Davenport and Prusak, 1998; Gagne, Briggs and Wager, 1988; McLagan, 1989) examine different types of
work and their components. While they provide useful schemes for classifying the various types of work activities that frequently constitute the content work-related learning programs, they do not address directly the processes for learning about these work activities and acquiring the skills to perform them.

Conclusions and Implications for Further Research

A central question, and perhaps the most important question for educators at this point, is how complete an understanding of work activities themselves, beyond the theories and taxonomies discussed above, must we have to fully harvest these potential advancements in our understanding of this type of learning? In a word the answer is, a much fuller understanding of work activities is needed than currently exists. Present studies of workplace learning focus primarily on the learner and context variables related to the learner. New insights into individual learning variables have come without a corresponding increase in our understanding of the work activities themselves. Few studies contain the rich description of work activities needed for a greater understanding of work-related learning. Only the studies of Scribner (1984), Suchman (1987), and Hutchins (1995) seem to adequately address both the characteristics of the agent and of the work activity that is needed for a balanced understanding of this phenomenon.

Further research is needed to examine the source of expertise on work activities. If greater understanding of work activities is needed, then where does this expertise come from? The traditional source of work expertise is the subject matter expert (SME). The SME has been used by educators seeking to design learning experiences in specific areas of work content. However, SMEs are conspicuously absent from much of recent literature on work-related learning. Their absence reflects the changing nature of the work itself. Work activities now evolve more quickly than in the past. Fewer SMEs exist since less time is available for gaining the experience needed to achieve this status. Instead, employees who are confronted with changing work activities become in situ learners, and by default, acquire the responsibilities formerly held by SMEs. Thus, increasingly the learner is the work activities "expert." This is clearly inconsistent with present theories and models of education for work.

Today's work environments demand greater flexibility for learning and working that enables workers to meet changing conditions. Our present theory base is inadequate for addressing this situation. Scholars who value this type of learning cannot afford to remain disengaged from the theoretical and research challenges posed by today's work environments. New and better theory in this area is needed. This will require further research on both the content and process of theorizing.

A Performance Perspective Synthesizing Intellectual Capital, Knowledge Management and Organizational Learning

Carson R. Arnett
Louisiana State University

The purpose of this paper is to advance the discussion of theory building aimed at improving "knowledge worker productivity". The article presents the topic in two parts: 1) revised definitions of the constructs intellectual capital, knowledge management and organizational learning; which are used to expand the definition of human capital; 2) a systems view of the components of human capital.

Keywords: Intellectual Capital, Knowledge Management, Organizational Learning

Importance of Knowledge

Ever since pioneering work on human capital in the 1960's, the organizational value of employees' knowledge and skills has received increased attention. As the economic emphasis has shifted from production/manufacturing to service and information, "knowledge and human expertise are increasingly recognized for what they are: the source of value creation" (Lank, 1997, p. 306). A number of socio-economic theorists have echoed this attention to the increasing importance of human mental capabilities and their relationship to organizational survival and advancement. Drucker (1993) describes the "knowledge society" as a shift from emphasis on capital and production resources to emphasis on "knowledge" resources. He differentiates a "knowledge society" from an industrial society, by stating, "knowledge has become the resource, not just another resource alongside the traditional factors of production - labor, capital and land." Quinn, Anderson, and Finkelstein (1996) reinforce Drucker (1993) when they recommend, "leveraging the organization's intellectual capital" and cite US government reports showing software, medicine, communications, and education (knowledge work) provide 79 percent of all jobs and 76 percent of all U.S. GNP. Romer (1993) points out the primary difference between industrial capital and human capital, calling "knowledge", the only unlimited resource and the one asset that grows with use. Stewart (1994) warns companies to focus less on what they own and more on what they know: their IC. (Drucker, 1999) summarizes the importance of humans in organizations with the following statement (p. 79)

"the most important contribution of management in the 21st century is increasing the productivity of knowledge work and knowledge workers" (highly qualified and educated professionals converting information into knowledge largely through their own competencies. (Svieby, 1997).

Accepting Drucker's (1999) statement creates urgency for organizational researchers (themselves knowledge workers) to develop theory for describing, predicting and explaining "knowledge worker productivity." Consequently, an increasing number of scholars in the fields of economics, information technology, human resource development, management, psychology, organizational behavior, organizational theory, sociology, and strategy have begun theorizing about "knowledge worker productivity" and its importance to organizations.

Most organizational researchers agree on the importance of humans to organizations and that the knowledge bases mentioned earlier share common themes. Crossan et. 1. (1999) reinforces this assertion by noting that the fields of intellectual capital (Edvinsson and Malone, 1997; Quinn, Anderson and Finkelstein, 1996; Stewart, 1997), knowledge
creation (Nonaka and Takeuchi, 1995) and management (Conner and Prahalad, 1996; Davenport and Prusak, 1997; Grant, 1996; Kogut and Zander, 1992; Svieby, 1997; Torraco, 2000), and organizational learning (Cangelosi and Dill, 1965; Daft and Weick, 1984; Dixon, 1993; Fiol and Lyles, 1985; Huber, 1991; Crossan, Lane and White, 1999), share common ground, namely, "recognizing the importance of knowledge to the success of the enterprise (p. 524)." Despite this acknowledged importance and research attention from such diverse perspectives, there is a scarcity of useful language for discussing the subject "knowledge worker productivity". Winter (1987, p. 184) summarizes this dilemma, "Within each microcosm of expertise or skill, there is of course, a specialized language in which that particular subject can be discussed. At the opposite extreme there is terminology that is very broad in scope, such as information, innovation, skill, technology transfer, diffusion, learning and of course, knowledge and competence."

**Research Question**

How can these related but diverse knowledge bases inform each other to produce theory about the role of knowledge in organizations and organizational performance?

Two major tasks seem necessary to answering this question. First, is to define the phenomena of interest with sufficient clarity and a high enough level of abstraction to reduce some of the confusion generated by the many different perspectives and terminology. Since, concepts are the building blocks of science (Dubin, 1978; Klomoski, 1991), Osigweh (1989) notes that the need for developing precise concepts cannot be overstated. Furthermore, ill-defined concepts produce imprecise research results making it difficult to produce cumulative knowledge that is (Achinstein, 1968). Second, is postulate a theoretical relationship among these concepts, which points researchers towards the questions requiring research into improving "knowledge worker productivity".

Accordingly, the purpose of this paper is to advance the discussion of theory building aimed at improving "knowledge worker productivity". The article addresses the topic in two parts: 1) revised definitions of the constructs IC, KM and OL; which are used to expand the definition of human capital; and 2) a systems view of the components of human capital.

**Knowledge Bases Related to Human Capital**

**Intellectual Capital**

Table 1 details the variety of definitions of the concept. An analysis of these definitions reveals areas of both agreement and disagreement among the selected authors. Klein and Prusack, Stewart and Quinn fail to capture the importance of organizations as "collectors" and "amplifiers" of knowledge and lack the depth of definitions proposed by Brooking, Edvinsson and Malone and Sveiby. Furthermore, while Brooking, Edvinsson and Malone and Sveiby's definitions present a number of common elements and even use common terms, they disagree about categories or classification of the various products derived from IC. For example, Brooking's Market Assets (repeat business percentage, branding, market dominance) and Sveiby's External Structure (brand names, trademarks, reputation and image) contain many of the same elements, but mix different levels of tangibility. It also seems necessary to recognize the differences between those IC assets represented by individuals (knowledge, expertise) and the synthesis of those qualities represented in the collective (processes, methods). The three areas of agreement among the more authoritative definitions are the importance of individual knowledge; the collective results of human expertise enable the organization to perform and the combination of these two elements results in output that both increases in value and is transferable.

Blending these definitions produces three elements of IC:

*Human asset* represents the capacity, inseparably embedded in the nervous system of a specific individual, to act in a wide variety of situations in fulfilling the organization's mission. This asset forms the foundation for the accomplishment of work in an organization. Examples include intellect, know what, know how, know why, care why, knowledge, skills, competence, expertise and experience.

*Structural assets* embody both intangible (often tacit) and tangible, collective outputs of human cognitive work essential to accomplishing work in an organization. This definition emphasizes the group/process, and organization levels, as well as the combination and synthesis of many human assets represents the capacity to perform tasks too complicated or too large for individuals (Dixon, 1993). This concept does not include physical assets such as computer systems or databases, because they are tangible assets and thus quantifiable and transferable. Examples include organizational culture, concepts, models, processes and operating technologies.

*Intellectual property assets* created as output of human cognition are a discrete bundle of legally defined and enforceable property rights (Winter, 1987, p. 165), which can be given a relatively precise economic value and can be
conveyed from one owner to another. Examples include patents, copyrights, trademarks, brand names and "goodwill (customer capital)."

Based on these elements, this article defines intellectual capital as the unique combination of human, structural, and intellectual property assets, which constitute an organization's capability to perform in the current environment and position the organization for future performance.

Knowledge Management

Before defining knowledge management, it seems necessary to recognize the complexity of the concept and the resulting controversy about "managing knowledge." This complexity arises from the fact that knowledge is uniquely human and therefore subject to the complexities of individuals and the context in which it is embedded. Another level of complexity concerns the two knowledge types generally accepted by many theorists from applied fields and described by Polanyi (1962) as tacit and explicit. According to Polanyi, tacit knowledge comprises intuition, unarticulated mental models and embodied technical skills that are personal and context specific and therefore hard to formalize and communicate. Whereas, explicit knowledge is codified and transmittable in formal systematic language or symbols. Both types of knowledge are context specific and relational in that they depend on the situation and are created dynamically in social interaction (Tonaka and Takeuchi, 1995). There is general agreement among epistemologists that the majority of individual human knowledge is tacit. This characteristic makes knowledge difficult or some would say impossible to "manage" as a supervisor would to ensure completion of a manual task or as information technology professionals conceive of managing information.

Without minimizing the cogency of either side of this disagreement, this article accepts this controversy and chooses to move past it to advance theory discussion concerning "knowledge worker productivity". Like IC, definitions of KM from a variety of sources (Table 2) were examined for similarities and differences to craft a more comprehensive and coherent definition.

Torraco's proposed theory of knowledge management uses Dubin's (1978) theory building methodology and combines many of the common elements found in the definitions in Table 2, such as capturing and using knowledge and expertise and improving organizational performance and creating value. But, his specification of a complete theory extends and surpasses these definitions and forms the basis for this author's definition of knowledge management.

Based on Torraco's (2000) theory, knowledge management is a dynamic transformation process supported by an appropriate organizational culture through which individual, group and organizational knowledge is accessed and codified to produce organizational learning. The next section addresses the definition of organizational learning.

Organizational Learning

Organizational learning has been a research subject more often and for a longer period of time than the other two constructs. It has been defined in a number of ways. An analysis of these definitions reveals a broad range of perspectives and little apparent consensus. Only Argyris and Schon and Miller directly address the role of individuals in their definitions of OL. Despite this lack of specific mention, the implication remains in every definition of organizational learning that organizational learning begins with individuals. With the exception of Huber, who describes more the state of OL, most of these authors stress action as the crucible that signifies OL has occurred. All of these authors stress that OL is an organization level phenomena and represents a change in the "system state". Daft and Weick (1984) express this succinctly, "organizations represent patterns of interactions among individuals, especially through communication, and therefore learning in organizations to a large extent depends largely on the ability to exploit shared common understandings. Clearly, there is agreement that organizational learning is a multi-level phenomenon (individual, group, enterprise). Finally, although only Dixon, Fiol and Lyles, and Nevis, et. al. directly address performance and effectiveness, a close examination of the majority of the definitions reveals the implication that OL produces survival and enhanced success. Torraco's KM theory indirectly summarizes these areas of agreement concerning OL.

Torraco (2000) describes three processes, which form the KM system output--learning (individual and collective), knowledge creation and knowledge use. This author asserts that these are the components of OL and agree, that they are the output from the KM process. Earlier, the definition intellectual capital incorporated both individual and collective learning, therefore in this description; IC replaces learning. Knowledge creation is a process through which new ideas and information are created and synthesized into knowledge "from the inside out, in order to redefine both problems and solutions and in the process, recreate the environment (Tonaka and Takeuchi, 1995). Knowledge use refers to the speed and methods by which organizations bring knowledge to product and process development (Fiol, 1996).
Consequently, organizational learning is the multilevel output from a knowledge management transformation process consisting of three elements: knowledge creation, knowledge use and enhanced IC, which combined, improve the enterprise's capacity to act in pursuing survival and success. Using these three components, "human capital" can be redefined.

Human Capital

Human capital theory (HCT) (Becker, 1993) indicates that individuals, organizations and society benefit from investments in training, educating and developing people. While HCT is a well specified, but limited economics theory, Sweetland (1996) suggests researchers use HCT to evaluate and synthesize studies from "diverse disciplines and specializations such as economics, sociology, psychology, human development and business [management and organizational behavior]." This view coincides with the steady rise in interest from both organizational researchers and practitioners regarding the use of "human capital" to improve organizational performance.

Originally formulated to facilitate organizational comparison decisions between investing in "human capital" and investing in other forms of capital, the analogy between human and real capital breaks down in one important respect. Whereas, human capital is inseparable from a specific individual and thus cannot be owned except by that individual, property rights over tangible capital are readily transferable from one owner to another.

The need for theory to "improve knowledge worker productivity", Sweetland's suggestion and the redefined constructs of IC, knowledge management and organizational learning suggest an expanded view of organizational human capital:

- **Intellectual capital** is the unique combination of human, structural, and intellectual property assets, which constitute an organization's capability to perform in the current environment and position the organization for future performance.

- **Knowledge management** is a dynamic transformation process supported by an appropriate organizational culture through which individual, group and organizational knowledge is accessed and codified to produce organizational learning.

- **Organizational learning** is the multilevel output from a knowledge management transformation process consisting of three elements; knowledge creation, knowledge use and enhanced IC, which combined, improve the enterprise's capacity to act in pursuing survival and success.

Using these three components, the redefined Human Capital represents the capability embodied in IC transformed through a knowledge management process to produce organizational learning for the purpose of ensuring enterprise survival and success. Based on these definitions, one potential view of the relationships can be examined.

Human Capital Through Systems Theory

Using systems theory at the firm level, many disciplines previously viewed organizations as "black boxes", focusing on the resources going into the box, the products and services being output and the effects of the external environment. The rise in the importance of knowledge and knowledge work forces the theorist to focus on the organization's internal components. Figure 1 conceptualizes the three components of human capital defined earlier as a system. IC serves as the input to the KM transformation process, which produces OL. OL balances the tension between creating new knowledge and using existing knowledge to ensure organizational performance and survival. As Figure 1 shows, OL enhances IC, informs the KM process and by so doing, assumes continuous development of the firm's core competencies leading to improved performance.

Implications for Human Resource Development
