This proceedings contains papers from the 2001 Society for Information Technology & Teacher Education (SITE) conference. Papers are organized in the following sections: (1) Concepts and Procedures (24 papers); (2) Distance Education (42 papers); (3) Diversity and International (15 papers); (4) Educational Computing Course (19 papers); (5) Educational Leadership (24 papers); (6) Electronic Portfolios (12 papers); (7) Faculty Development (41 papers); (8) Graduate and Inservice (52 papers); (9) Instructional Design (50 papers); (10) International (13 papers); (11) Mathematics (25 papers); (12) New Media (28 papers); (13) Preservice Teacher Education (73 papers); (14) PT3 (Preparing Tomorrow's Teachers To Use Technology) Papers (82 papers); (15) Reading, Language Arts, and Literacy (16 papers); (16) Research (51 papers); (17) Science (18 papers); (18) Simulations (3 papers); (19) Social Studies (9 papers); (20) Special Needs (11 papers); (21) Technology Diffusion (37 papers); (22) Telecommunications: Graduate and Inservice (32 papers); (23) Telecommunications: Preservice Applications (14 papers); (24) Telecommunications: Systems and Services (13 papers); (25) Theory (12 papers); and (26) Young Child (6 papers). Abstracts of the papers and an author index are included. (MES)
Proceedings of Society for Information Technology & Teacher Education (SITE)  
2001 International Conference  
(12th, Orlando, Florida, March 5-10, 2001)

Jerry Price, Dee Anna Willis, Niki Davis, and Jerry Willis, Editors
Proceedings of SITE 2001–March 5-10, 2001
Orlando, Florida

General Editors –
Jerry Price
DeeAnna Willis

Jerry Willis
2001 General Editors

Jerry Price, University of Houston, USA
Dee Anna Willis, Northwestern State University of Louisiana
Niki Davis, Iowa State University, USA
Jerry Willis, Iowa State University, USA

2001 Section Editors

Trudy Abramson, Nova Southeastern University, USA
Angelle Adams, University of Houston, USA
Deborah Y. Bauder, Rome City School District, USA
Evelyn Beyer, University of Houston, USA
Stephanie Boger, University of Houston, USA
Ray Braswell, University of Alabama - Montgomery, USA
Wren Bump, University of Houston, USA
Ruth S. Burkett, University of South Florida, USA
Saru Cheriyan, University of Houston, USA
Paula Christensen, Northwestern State University of Louisiana, USA
Michael L. Connell, University of Houston, USA
Caroline M. Crawford, University of Houston - Clear Lake, USA
Reagan Curtis, Northwestern State University of Louisiana, USA
Glenn DeVoogd, University of California at Fresno, USA
Sue Espinosa, Texas A&M University - Commerce, USA
Carine M. Feyten, University of South Florida, USA
Frank Fuller, Northwestern State University of Louisiana, USA
Bob Gillan, Northwestern State University of Louisiana, USA
Delwyn L. Harnisch, University of Nebraska-Lincoln, USA
Madeline Justice, Texas A&M University-Commerce, USA
Norene Vail Lowery, University of Houston, USA
Michelle Macy, University of South Florida, USA
Kathy Matthew, Louisiana Tech University, USA
Kim McAlister, Northwestern State University of Louisiana, USA
Ron McBride, Northwestern State University of Louisiana, USA
Karen McFerrin, Northwestern State University of Louisiana, USA
Sara McNeil, University of Houston, USA
Rosemary Mullick, SUNY Institute of Technology at Utica/Rome, USA
Polly Mumma, Iowa State University, USA
Dale S. Niederhauser, University of Utah, USA
Melissa Pierson, University of Houston, USA
Linda E. Roach, Northwestern State University of Louisiana, USA
Ronald Sarner, SUNY Institute of Technology at Utica/Rome, USA
Cathy R. Seymour, Northwestern State University of Louisiana, USA
Leslie Starke, University of Houston, USA
Neal Strudler, University of Nevada, Las Vegas, USA
Mary Thompson, University of Houston, USA
John R. Tollett, Northwestern State University of Louisiana, USA
Cameron White, University of Houston, USA
James A. White, University of South Florida, USA
Dee Anna Willis, Northwestern State University of Louisiana, USA
Nicola Yelland, RMIT University, Australia
# TABLE OF CONTENTS

## CONCEPT AND PROCEDURES .................................................................................................................. 1
Deborah Y. Bauder, Rome City School District; Rosemary Mullick, SUNY Institute of Technology at Utica/Rome; Ronald Sarner, SUNY Institute of Technology at Utica/Rome

Using School District Standards to Develop Thematic Lessons for Electronic Portfolios ........................................... 3
Cindy L. Anderson, National-Louis Univ., USA, Kevin M. Anderson, Kenosha Unified School District, USA; Joan Briscoe, National-Louis Univ., USA; Beth Ann Smith, National-Louis Univ., USA

Using Adobe Acrobat for Electronic Portfolio Development ................................................................................. 9
Helen Barrett, Univ. of Alaska Anchorage, USA

Discotech: Advanced Training on Technologies and Didactic for Italian Teachers ............................................. 15
Mario A. Bochicchio, Univ. of Lecce, Italy; Roberto Palano, Univ. of Lecce, Italy; Giuseppina Marselli, Univ. of Lecce, Italy; Paolo Paolini, Politecnico di Milano, Italy

Online Portfolios vs. Traditional Portfolios ......................................................................................................... 20
Renee’ L. Cambiano, Northeastern State University, Tahlequah, Oklahoma, USA; Alejandro Fernandez, Universidad Central de Venezuela, Venezuela; Ana Beatriz Martinez, Universidad Central de Venezuela, Venezuela

Instructional Strategies for Adobe Photoshop: Developing Teacher Training that Works ...................................... 26
Barbara Chamberlin, University of Virginia, USA

Teaching & Technology: A Natural Integration ..................................................................................................... 31
Carole Cobb, Bellarmine Univ., USA; Ivan Baugh, Bellarmine Univ., USA; Jan Goings, Bellarmine Univ., USA

An N-dimensional Model for Digital Resources .................................................................................................... 37
Charles Dickens, Tennessee State Univ., USA

Cyber Spaces and Learning Places: The Role of Technology in Inquiry ............................................................. 39
Julii D. Dixon, Univ. of Central Florida, USA; Judith Johnson, Univ. of Central Florida, USA

Audio on the Web: Enhance On-line Instruction with Digital Audio ................................................................. 45
Brenda J. Gerth, University of Victoria, Canada

The Role of Assessment in Online Instruction ...................................................................................................... 51
Robert J. Hall, Texas A&M Univ., USA; G. Donald Allen, Texas A&M Univ., USA; Michael S. Pilant, Texas A&M Univ., USA; R. Arlen Strader, Texas A&M Univ., USA

TRES FACIUNT COLLEGIUM - Paderborn's Collaboration Centred Approach for New Forms of Learning ................................................................................................................................. 52
Thorsten Hampel, University of Paderborn, Germany

Using student projects to meet the information needs of teachers on the Internet ........................................... 58
Danielle Heyns, Teacher Training College, South Africa

Developing and Teaching a Computer-Mediated Second Language Course in Academic Reading .......... 60
Esther Klein-Wohl, Open Univ. of Israel, Israel; Gila Haimovic, Open Univ. of Israel, Israel

Lessons Learned: School based Reform and its Impact on the Restructuring of a Teacher Preparation Program ................................................................................................................................. 63
Jan Martin, Univ. of Missouri-St. Louis, USA; Joseph Polman, Univ. of Missouri-St. Louis, USA; Kathleen Beyer, Educational Visions, USA

Putting the Instructor in Charge: Component Architecture and the Design of a Course Web Site .............. 68
Punyashloke Mishra & Matthew J. Koehler, Michigan State University, USA

Troubleshooting Windows .................................................................................................................................. 70
Sharon Reynolds, Des Moines Public Schools, United States

Dancing with Technology to Teach Technology .................................................................................................. 76
Tweed Ross, Kansas State Univ., USA

Development of English Department of Computer Information Systems as a Way of Worldwide Educational Integration ................................................................................................................................. 78
Anatoly Sachenko, Ternopil Academy of National Economy, Ukraine; Hrygory Hlady, Ternopil Academy of National Economy, Ukraine; Igor Vasiltsov, Ternopil Academy of National Economy, Ukraine; Andrij Vivchar, Ternopil Academy of National Economy, Ukraine

Applying Social Learning Theory to the Teaching of Technology Skills: An Interactive Approach .......... 80
Eric Seemann, Louisiana Tech Univ., USA; Walt Buboltz, Louisiana Tech Univ., USA; Lamar Wilkinson, Louisiana Tech Univ., USA; Sonia Beaty, Louisiana Tech University, USA
Perceived Versus Real Self: Applying Rogerian Theory to Technology Resistant Students ......................... 86
Eric Seemann, Louisiana Tech Univ., USA; Lamar Wilkinson, Louisiana Tech Univ., USA; Walter Buboltz, Louisiana Tech Univ., USA; Sonia Beaty, Louisiana Tech Univ., USA

Remote-Control Computing .................................................................................................................. 88
Mark Smith, Purdue Univ., USA

The use of Instructional Technology to enhance teaching outcomes on site and at a distance ............... 94
Dr Armand St-Pierre, Royal Military College, Canada

How on-line collaborative Study improve human cognition: A perspective on the evolution of modern education .......................................................................................................................... 101
James T.J. Wang, National Taipei Univ. of Technology, Taiwan; David C.Y. Lin, National Taipei Univ. of Technology, Taiwan; Richard Wang, Chinese Culture University

Impact of Technology on Student Socialization in the Classroom ................................................................................. 103
Lamar Wilkinson, Louisiana Tech Univ., USA; Walter Buboltz, Louisiana Tech Univ., USA; Adrian Thomas, Louisiana Tech Univ., USA; Eric Seemann, Louisiana Tech Univ., USA

DISTANCE EDUCATION .................................................................................................................. 108
Frank Fuller, Northwestern State University of Louisiana; Ron McBride, Northwestern State University of Louisiana

The Distance Education Degree Program for The Master of Mathematics with a Teaching Option at Texas A&M University ........................................................................................................... 111
G. Donald Allen, Texas A&M University, USA; Michael Pfaltz, Texas A&M University, USA

The Road Ahead: The Evolution of Online Learning .................................................................................. 117
Alicia F. Balsara, Univ. of South Florida, USA

A Summary Look at Internet Based Distance Education .............................................................................. 123
Emad Bataineh, Zayed Univ., College of Information Systems, United Arab Emirates

Teaching & Learning Online: Lessons Learned .......................................................................................... 129
Donna Baumbach, Univ. of Central Florida, USA; Mary Bird, Univ. of Central Florida, USA; Janet Eastman, Univ. of Central Florida, USA; Kathy Katz, Univ. of Central Florida, USA

A Hybrid Online Course to Enhance Technology Competencies of School Principals ................................ 131
Sally Beisser, Drake Univ., USA; Peggy Steinbronn, Drake Univ., USA

Exploiting and Evaluating A Web-based Learning System: Six Days and Seven Nights in the Basement ........................................................................................................................... 136
Bob Bermant, Univ. of Wisconsin, USA; John Knight, Univ. of Wisconsin, USA

Using Constructionist Principals In Designing And Integrating Online Collaborative Interactions ........ 138
J. Michael Blocher, Northern Arizona Univ., USA; Gary Tucker, Northern Arizona Univ., USA

Learning Styles and Potential Relations to Distance Education .................................................................. 144
Walter Buboltz, Louisiana Tech Univ., USA; Lamar Wilkinson, Louisiana Tech Univ., USA; Adrian Thomas, Louisiana Tech Univ., USA; Steve Jenkins, Louisiana Tech Univ., USA

Using Electronic Portfolios to Support Accountability and Preservice Teacher Preparation ..................... 149
Gerald W. Burgess & Barbara D. Holmes, Albany State University, USA

Distance Education and What is Coming Next ......................................................................................... 153
Kemal Cakici, The George Washington University, United States

The Challenges of Interfacing Between Face-To-Face and Online Instruction ........................................ 155
Nada Dabbagh, George Mason Univ., USA

Establishing a New Paradigm for On-line Education ............................................................................... 161
Anthony R. Davidson, Anne Stanton & Steve Albanese, New York University, USA

Cost Effectiveness and Distance Education: A Perspective .................................................................... 167
Steven Dickey, Eastern Kentucky Univ., USA; JoAnna Dickey, Eastern Kentucky Univ., USA

A comparative project: web-based faculty development versus print-based faculty development ............ 169
Melissa Diers, University of Nebraska Medical Center, USA

Assessing Best Practices in Online Learning: A Review of the Literature ............................................... 175
William Dwyer, Univ. of Alabama, USA; Dennis Sunal, Univ. of Alabama, USA; Judy Giesen, Univ. of Alabama, USA; Cynthia Sunal, Univ. of Alabama, USA; Kathy Trundle, Univ. of Alabama, USA

Distance Learning: An Examination of Perceived Effectiveness and Student Satisfaction in Higher Education ................................................................................................................................. 183
Donna M. Gabrielle, The Florida State University, USA

Online Personal Learning in Teacher Preparation .................................................................................. 189
David Gibson, National Institute for Community Innovations, USA, dgibson@nici-mc2.org
Developing Standards of Quality for Online Courses ................................................................. 195
   Kendall Hartley, Univ. of Nevada, Las Vegas, USA; Teresa Gilney, Univ. of Nevada, Las Vegas, USA; David Heflich, Univ. of Nevada, Las Vegas, USA; Neal Studier, Univ. of Nevada, Las Vegas, USA
Reflections of reality: Online conversation in a teacher education seminar .................................. 197
   David Heflich, Univ. of Nevada, Las Vegas, USA; LeAnn Putney, Univ. of Nevada, Las Vegas, USA
How Information Technology Can Help Education, Distance Learning ............................................... 203
   Hossein Jahankhani, Univ. of East London, UK
Matching Distance Education with Cognitive Styles in Various Levels of Higher Education ............... 208
   Steve Jenkins, Louisiana Tech Univ., USA; Walter Buboltz, Louisiana Tech Univ., USA; Lamar Wilkinson, Louisiana Tech Univ., USA; Sonia Beatty, Louisiana Tech Univ., USA
Is A Paradigm Shift Required In Order to Effectively Teach Web Based Instruction? ....................... 213
   Michael G. Kadlubowski, Northern Illinois University, USA
Kaleidoscope of Designing, Administering and Teaching Distance Education .................................... 219
   Shaila Kieran-Greenbush, Teachers College, Columbia Univ., USA; Victor Aluise, Scholastic.com, USA; Pamela Furline, Hempstead High School, USA; Elsie Szecsy, Concorida New York, USA
Exploiting and Evaluating A Web-based Learning System: Six Days and Seven Nights in the Basement ................................................................. 227
   John Knight, Univ. of Wisconsin, USA; Bob Bermant, Univ. of Wisconsin, USA
Are We There Yet? A journey through distance learning ................................................................. 229
   Jean Kueker, Our Lady of the Lake U., USA; Jerrie Jackson, Our Lady of the Lake U., USA; Scott Walker, Our Lady of the Lake U., USA
Benefits and Problems of Asynchronous Online Electronic Mail Forums .......................................... 232
   Kevin C. Lee, West Virginia Wesleyan College, USA
The Distance Teacher: The Ultimate Distance Learner ........................................................................ 234
   Karen Lemone, WPI, USA
Videoconferencing in practicum of educational studies ................................................................. 240
   Jukka Mäki, University of Oulu, Finland
Desktop Video Conferencing: The Optimum Solution for Synchronous Distance Learning ............... 245
   Ron McBride, Northwestern State Univ., USA; Frank Fuller, Northwestern State Univ., USA; Robert Gillan, Northwestern State Univ., USA
One Size Does Not Fit All: Designing Distance Education Support ................................................. 251
   Eunice Marideth, Drake Univ., USA; Peggy Steinbrom, Drake Univ., USA
Academic Staff Development Course for Coordinators of Distance Education: Russian Experience ................................................................. 257
   Marina Moisseeva, Russian Academy of Education, Russia; Victor Krivoschokov, Southern Ural State University, Russia
Distance Learning: Effective Strategies for the Information Highway ............................................. 263
   Sara Olin Zimmerman, Appalachian State Univ., USA; Melanie Greene, Appalachian State Univ., USA; John Tashmer, Appalachian State University, USA
Teacher and Developer: A Compromise for the Creation of CSCL Applications ................................. 268
   César Osuna, Universidad Autonoma de Guadalajara, México; Yannis Dimitriadis, Universidad de Valladolid, Spain; Alejandra Martinez, Universidad de Valladolid, España; Rocio Anguita, Universidad de Valladolid, España
Web-based Instruction: What should we know? .................................................................................. 270
   John R Ouyang, Kennesaw State University, USA; James E. Yao, Texas A&M University-Commerce, USA
Supporting and Evaluating Distance Learning Students' Use of an Electronic Discussion Board ......... 275
   Richard Pountney, Sheffield Hallam Univ., UK; Alice Oxholm, Sheffield Hallam Univ., UK
Access for all: Developing an online course about online courses ................................................. 277
   Loye Romereim-Holmes, South Dakota State Univ., USA; Denise Peterson, South Dakota State Univ., USA
Distance Education: An Ultimate Subject for Teachers and Students .......................................... 282
   Osama Shata, Athabasca Univ., Canada; Mahmoud Abaza, Athabasca Univ., Canada
Managing the Dark Side of Online Courses -- While Enlightening Your Online Students ................. 289
   Judith Smith, Ph.D., Vice President, Instructional Development, CertiLearn, Inc., USA
Reflections of K-12 Teachers on Graduate Education via Distance Learning ................................... 291
   Bill Stinson & Mark Stanbrough, Emporia State University, USA
From "Inches" to "Miles": Web-Enhanced Instruction Using WebCT (Version 3.1) ........................................... 294
Ingrid Thompson-Sellers, Georgia Perimeter College, USA
Real Concerns on Distance Education When Distances are Real .............................................................. 298
Leo Wells, Camel Research Associates, USA
Does Distance Education Resolve The Current Problems of Education? .................................................. 304
Ya-Ting Carolyn Yang, Purdue University, USA; Timothy J. Newby, Purdue University, USA

DIVERSITY & INTERNATIONAL ......................................................................................................................... 310
Madeline Justice, Texas A&M University-Commerce, USA
Using Technology to Support Teaching for Social Justice in a Preservice Program ..................................... 312
Barbara Beyerbach, SUNY Oswego, US; Pat Russo, SUNY Oswego, US
Integrating Technology into a Teacher Education Diversity Course ......................................................... 317
Ramona Mai le Cutri, Department of Teacher Education, Brigham Young University, USA
Is Anybody Listening? Inherent but Typically Ignored Problems in Distance Learning ......................... 319
Paula Furr, Northwestern State Univ., USA; Ron McBride, Northwestern State Univ., USA
The Development of a Web-based Multicultural Course for Teacher Education ........................................ 323
Viola Garcia, Univ. of Houston Downtown, USA; Linlin Irene Chen, Univ. of Houston Downtown, USA
Developing Intercultural Understanding Via the Internet: Canadian Student Teachers and English Students in China Study World Literature Together ................................................................. 328
Jim Greenlaw, St. Francis Xavier Univ., Canada
Using Internet Technology to Facilitate Anonymous Communication in World Wide Web Delivered Multiculturalism in Education Courseware ........................................................................... 334
James G. Iztz, West Texas A&M Univ., USA; Terry Hargrave, West Texas A&M Univ., USA; Robert D. Brammer, West Texas A&M Univ., USA; Gwen Williams, West Texas A&M Univ., USA
Diversity through Co-Operation: Creating and Delivering Content in In-service Teacher Education ...... 340
Monica Johannesen & Leikny Øgrim, Oslo University College, Norway
"WorldGate," An Attempt to Close the Digital Divide .................................................................................. 346
Richard Knecht, The Univ. of Toledo, USA
Technology and Social Change: Perceptions of Culturally Diverse University Students .......................... 349
Shane P. Martin, Loyola Marymount Univ., USA; Edmundo F. Litton, Loyola Marymount Univ., USA
Identifying School Conditions And Teacher Practices That Have Proven Effective In Increasing Mathematics And Reading Achievement For African American Students And Students In Schools With Substantial Minority Student Populations .............................................................. 354
Michael McFrazier, Prairie View A&M Univ., USA; Danita Bailey, Texas A&M Univ., USA
Using Technology in Early Childhood Environments to ............................................................................. 360
Mikki Meadows, Eastern Illinois Univ., USA
Where Is The Any Key Sir? Experiences Of An African Teacher-To-Be ................................................... 365
Guillaume Nel, Technikon Free State, South Africa; Liezel Wilkinson, Technikon Free State, South Africa
Digital Divide in Schools: We Can Make a Difference ................................................................................ 371
Tamara Pearson, Univ. of Florida, USA; Colleen Swain, Univ. of Florida, USA
Technology Empowers a Diverse Population of Students: Results From a Technology Professional Development School .................................................................................................................. 377
Carrie Thornthwaite, Lipscomb University, USA
Linking Up By Solar Energy: The Story Of The Gelukwaarts Farm School ............................................. 381
Fred Wilkinson, Free State Dept. of Education, South Africa; Annette Wilkinson, Vista University, South Africa

ELECTRONIC COMPUTING COURSE ........................................................................................................... 387
Wren Bump, University of Houston
Using a Flexible Format to Create a Constructivist Learning Environment in the Educational Computing Course ................................................................................................................................. 388
Wren M. Bump, University of Houston, USA
Technological Diversity: Managing Differing Technology Skills in the EdTech Course .......................... 393
David Byrum, Southwest Texas State Univ., USA
Contextual Experiences: The Revision and Implementation Process of an Information Technology Course
Wanda Carrasquillo, Westminster College, USA; David Stokes, Westminster College, USA
Comparison of face-to-face and online for introduction to educational technology courses for
preservice and inservice educators
Cathy Cavanaugh, Univ. of North Florida, USA; Terence Cavanaugh, Univ. of North Florida, USA;
Zella Boulware, Univ. of North Florida, USA
Redesigning an Educational Computing Course to Meet New State Technology Initiatives
Linlin Irene Chen, Univ. of Houston Downtown, USA
Technology -- Stand Alone or Integrated?
Sue Espinoza, Madeline Justice & Connie Greiner, Texas A&M University-Commerce, USA
The Anatomy of an Educational Technology Seminar
Sebastian Foti, School of Teaching and Learning, College of Education, University of Florida,
Gainesville, Florida USA
Technology education and integration: A position paper on attitude, perspective and commitment
Jerry Galloway, Indiana Univ. Northwest, USA
Traeger Technology Target: Completing the Circle of Community
Penny Garcia, Univ. of Wisconsin Oshkosh, USA
On-line Exams: Design, Development and Implementation
Taralynn Hartsell, The Univ. of Southern Mississippi, USA; Steve Chi-Yin Yuen, The Univ. of
Southern Mississippi, USA
Using Anchored Instruction to Teach Preservice Teachers to Integrate Technology in the
Curriculum
Mumbi Kariuki, Univ. College of Cape Breton, Canada; Mesut Duran, Univ. of Michigan, USA
Challenges to Currency in the Educational Computing Course
Sisk Kathy, North Georgia College & State Univ., USA
Architecture Of A Cooperative Hypermedia
Yacine Laffli, Département D'Informatique, Algeria
Freeing the Monkeys: Making the Ed Tech Course More than Learning to Push Buttons
Daniel Laughlin, American Univ., USA; Sarah Irvine-Belson, American Univ., USA
Surfing Safely with Social Navigation
Bruce Lewis, Freed-Hardeman University, USA
Web-Based Collaboration On Technology in Education: A successful constructivist course model
for pre-service teachers
Sharon Murray, St. Thomas Univ., Canada
Revising an educational computing course to meet the National Educational Technology
Standards (NETS): A process of reflective teaching
Aileen Nonis, Univ. of Tennessee, USA; Blanche O'Bannon, Univ. of Tennessee, USA
Enhancing Educators' Computer Learning with the Emerging Technology
Alex Pan, The College of New Jersey, USA
A Collaborative Course Portfolio
Catherine Schifter, Temple Univ., USA
Preparing Educational Leaders to Cultivate the Meaningful Use of Instructional Technology: Beyond Budgets and Basic Training
Margaret Cassidy, Adelphi Univ., USA

Leading Academic Change - Through Connective Leadership And Learning
Manj Chandra-Handa, Knox Grammar School, AUSTRALIA

Accountability, Technology, Flexibility: Ensuring Student Success
Kathryn Floyd, Ed.D, Pickens County Schools (Ret.), USA; John T. Moore, South Dakota Department of Education & Cultural Affairs, USA; Tony Bailey, Ball State Univ., USA; Cheryl Reed, Ph.D., EdVISION.com, USA

Community Innovations for SITE: Who is doing what with Clearinghouses and Online Tools Development?
David Gibson & Bob McLaughlin, National Interagency Civil-Military Institute (NICI), USA; Deborah Sprague, George Mason University, USA; Niki Davis & Mary Howard, Iowa State University, USA; Christina Preston, London University, UK; Gary Marks, Association for the Advancement of Computing in Education, USA

The role of school administrators in the process of effectively integrating educational technology into school learning environments: An evaluation in progress
Ian W. Gibson, Wichita State Univ., USA

Instructional Technology as a Support System for Principal Certification
Cathy Kaufman, Indiana Univ. of PA, USA

Managing Change To Flexible Learning Using Online Technologies: Bridges To Cross, Lessons To Learn
Marie Kavanagh, The University of Queensland (Ipswich Campus), Australia

Webfolios: Authentically Assessing Prospective Educational Leaders on the Web
Lori Kim, California State University, Los Angeles, USA

3 Roads Diverged and we took each to enhance teacher use of technology
Karen Korth, DIAL Corporation, USA; Belinda Engelhart, DIAL Corporation, USA; Hilairie Davis, Dial Corporation, USA

Software Agents for Distance Education and Institutional Support
Theresa Lang, Veridian Information Solutions, USA

System-wide Planning for Technology in Teacher Education: Lessons Learned at the University of Wisconsin System
Dana Nelson, Univ. of Wisconsin System, USA

The Relationship between Leadership, Self-efficacy, Computer Experience, Attitudes, and Teachers' Implementation of Computers in the Classroom
David Piper, Mount Union Area School District, USA; Wenfan Yan, Indiana Univ. of Pennsylvania, USA

A Multimedia Design for Leadership Training: From Process to Product
Hanadi Saleh & Roberta K. Weber, Florida Atlantic University, USA

Models of Instructional Technology Leadership In U.S. Schools
Mary B. Shoffner, Georgia State Univ., USA

Infusing Technology into Leadership Development
Helen Sobehart, Duquesne Univ., USA; Janet Armstrong, Central Instructional Support Center, USA; Lawrence Tomel, Duquesne Univ., USA

Move To The Top Of The Class: A Comprehensive Technology Staff Development Program
Connie Swiderski, Education Service Center, Region 11, USA

The Information Revolution and The Future Role of Educators
Michael Szabo, Univ. of Alberta, Canada

Wanted: A Miracle Worker - A Consideration Of Some Issues Arising From The Leadership of Entrepreneurial Activity in Information and Communications Technology in an Academic Setting
Lynne Walker, Univ. of the West of England, UK

Emerging Careers in Instructional Technology
Shirley Waterhouse, Embry-Riddle Aeronautical University, USA

ELECTRONIC PORTFOLIOS
Dee Anna Willis, Northwestern State University of Louisiana, USA
Portfolios: The Plan, The Purpose, A Preview
Val Christensen, Valley City State Univ., USA; Patricia Geggelman, Valley City State Univ., USA; Larry Grooters, Valley City State Univ., USA; Linda Holcomb, Valley City State Univ., USA
Electronic Portfolios: A How To Guide .................................................. 582
Jerry Galloway, Indiana Univ., Northwest, USA

Electronic Portfolios: A Glimpse into a Child’s Education .................. 588
Claire Smith Homung, Lehigh Univ., USA

Electronic Portfolios: Developed by Preservice Educators to Show Teaching Skills and Philosophies to be Used by Future Employers ........................................... 590
Roger L. Olsen & David H. Dimond, Brigham Young University, USA

Implementing Web-Based Portfolio Assessment in a Graduate Instructional Technology Program .................................................. 592
Melissa E. Priester & Michael Rapp, University of Houston, USA

Electronic Portfolios: Technology Integration and the Preservice Teacher .......................................................... 597
Beverly Ray, Univ. of Alabama, USA; Vivian Wright, Univ. of Alabama, USA; Stallworth Joyce, Univ. of Alabama, USA; Elizabeth Wilson, Univ. of Alabama, USA

The Implementation and Integration of Web-Based Portfolios into the ProTeach Program at the University of Florida .................. 601
Gail Ring, Univ. of Florida, USA

Easy methods and media for creating electronic CDROM portfolios ............................................. 605
Desmond Rodney, Florida Atlantic Univ., USA; Richard Klin, Florida Atlantic Univ., USA; Ann Musgrove, Florida Atlantic Univ., USA

Online Portfolios for Educational Technology Graduate Students: An Ongoing Capstone Project ............................................. 611
Jennifer Sparrow, Florida Gulf Coast Univ., USA

The Impact of Electronic Portfolios on Early Experience Preservice Elementary Teachers in Integrating Technology into their Instructional Process ............................................. 617
Jane Strickland, Idaho State Univ., USA; Chris Williams, Idaho State Univ., USA; Michael Jenks, Idaho State Univ., USA; Charles Zimmerly, Idaho State Univ., USA

Making the Case for Science Teacher Learning: An Analysis of Argument and Evidence in Electronic Portfolios ............................................................................. 622
Carla Zembal-Saul, Penn State University, USA; Tom Dana, Penn State University, USA; Leigh Ann Haefner, Penn State University, USA

A Pilot Project: Integrating Multimedia Portfolio Development Into The Preservice Teacher Education Program at Randolph-Macon College ............................................. 625
Zizi Zhang, Randolph-Macon College, USA

FACULTY DEVELOPMENT ................................................................ 627
Bob Gillan & Karen McFerrin, Northwestern State University of Louisiana, USA

A System of Faculty Development ............................................................................. 630
Harriett Bohannon, Florida Gulf Coast Univ., USA

Education and Technology - A Faculty Development Program for Medical Educators ............................................. 636
Margaret Burrows, Univ. of Manitoba, Canada; Margaret Ford, Univ. of Manitoba, Canada

Developing a Faculty of Education Technology Integration Plan: Initial Stages of a Large Scale Faculty Professional Development Program ............................................. 638
Mike Carbonaro, Fem Snart, Cheryl Goodale, University of Alberta, Canada

Supporting the Development of IT Skills of Education Faculty Staff: An Australian Case Study ............................................. 641
Dianne Chambers, The Univ. of Melbourne, Australia; Richard Holbeach, The Univ. of Melbourne, Australia

Supporting the Professional Development of Preservice and Inservice Instructors: Aspects Toward a Nurturing, Creative Learning Environment ............................................. 647
Caroline M. Crawford, Univ. of Houston - Clear Lake, USA; Terri Edwards, Univ. of Houston, USA

The JASON Academy: Explorations in Online Science for Middle School Teachers ............................................. 649
Mary DeWall, JASON Academy for Science Teaching and Learning, USA

The Challenge of Developing College Wide Technology Standards ............................................. 651
Karen Dutt-Doner, Univ. of Southern Maine, USA; Desi Larson, Univ. of Southern Maine, USA; India Broyles, Univ. of Southern Maine, USA

Problem-Based Learning Resources for College/University Professors ............................................. 657
Leticia Ekhaml & Virginia (Jan) Ruskell, State University of West Georgia, USA

Together and Alone: The Instructional, Technical, and Psychological Outcomes of Faculty Building Online Courses ............................................. 659
Teresa Franklin, College of Education, Ohio Univ., USA; Joseph Blankson, College of Education, Ohio Univ., USA

From the Outgoing President: We've come a long way!

As I step down from two very enjoyable years as president of SITE, I am once again reminded of the privilege involved in leading an organization that is growing and developing at an amazing rate. The number, breadth and depth of the articles in these Proceedings provides one more indication of the rapid and exciting development of this organization and the field of technology in teacher education.

The 2001 Society for Information Technology and Teacher Education Annual Proceedings marks the 12th set of SITE annual conference proceedings. Most readers probably know the story of the first SITE meeting in 1989. Under the leadership of Jerry and Dee Anna Willis, a small group of visionary educators interested in technology in teacher education gathered in Greensville, North Carolina and papers from that meeting were included in the first SITE Proceedings. In 1989, technology in teacher education as a field of study was a new idea to most educators and few individuals or programs identified this as their major field of study and development. Right from the beginning of SITE, there was a vision for the potential of technology to expand and enhance teacher education programs. In addition, the founders of SITE visioned a truly international organization where teacher educators from around the world could share their work and knowledge.

Since that 1989 meeting, both SITE and the Proceedings have continued to grow at an almost unbelievable rate. Technology in teacher education has moved into the national and international spotlight as an area of major emphasis. Colleges and universities around the country are seeking scholars in technology in teacher education and an increasing number of Ph.D. programs are working to prepare these scholars.

The research and development work reported in the 2001 Proceedings reflects the progress of our field and the increased emphasis on technology in teacher education. Our field has moved to a place where most of the scholarship involves using technology in meaningful ways to improve both learning and teaching in teacher education programs. Current work reflects the centrality of technology in teacher education programs and movement away from regarding technology as a separate subject of study.

The positive impact of the Department of Education PT3 initiative is clearly reflected in this annual. The first PT3 projects were funded in 1999, with more projects funded and 2000 and a third set in 2001. The annual serves as an important vehicle for dissemination of results from this important work.

As technology in teacher education continues to develop as a scholarly focus area, the international emphasis in SITE becomes even more important. As scholars around the world to use technology to strengthen teacher education it is important that we have the opportunity to share what we are learning. A quick review of authors of papers in the Proceedings indicates that this sharing is in fact happening and that the initial international vision of the founders of SITE is a reality.

I am honored to have had the opportunity to lead SITE for 2 years, and I look forward to continuing involvement in my favorite national organization.

Ann

Modeling Instruction with Modern Information and Communications Technology: the Mimic Project
Ronald Abate, Cleveland State University, USA; Jennifer Cutler-Merritt, John Carroll University, USA; James Meinke, Baldwin Wallace College, USA; Mary Jo Cherry, Ursuline College, USA; David Shutkin, John Carroll University, USA

This paper describes the MIMIC Project a U. S. Department of Education Preparing Tomorrow’s Teachers to Use Technology implementation grant. In this project colleges of education at five Ohio universities are collaborating to increase the modeling of technology in pre-service teacher education. The underlying premise of the partnership is that teachers teach as they were taught. As such, the partner institutions have developed a variety of processes where technology proficient educators mentor university faculty on the integration of technology into undergraduate teaching. The faculty in turn model best practice with technology in pre-service teacher education programs. Students enrolled in the pre-service teacher education programs encounter further technology modeling from cooperating teachers who have received technology training and the pre-service students are provided with opportunities to implement technology in field placements and student teaching.

Beyond the Status Quo in Preparing Tomorrow’s Teachers
Ronald J. Abate, Cleveland State University, USA

This paper presents a case for rethinking the existing paradigm of the personal computer in educational technology. In particular, it examines the nature of failure, the evolution of technology, and the general lack of acceptance of educational technology in today’s classrooms. The paper asks the question what is the role of teacher educators in the development of new technology implementation paradigm, and provides a rationale for a more critical analysis of existing educational technologies.

Practicing the Skills of Online Communication
Gertrude (Trudy) Abramson, Nova Southeastern University, USA; Shelley Bibeau, St. Paul Technical College, USA; Susan Birell, Lowell Public Schools, USA; Deborah Cohen, Freelance Instructional Designer, USA; Jo Lynne Lundy, Baptist Memorial Hospital, USA; Miava Norton, Lee University, USA; Lisa Star, South Dakota State University, USA; Pilar Toral, University of Puerto Rico at Carolina, Puerto Rico

Too much of what is considered conversation is little more than taking turns speaking. When this process is translated to a print medium, such as an electronic forum or bulletin board, it quickly becomes evident that keeping on track is very difficult. The current literature extols the virtues of collaborative learning and the Internet that makes possible collaborative learning across the miles. However, learning is much more than discussion and a good discussion is rare indeed. As part of a graduate course in online learning environments, distant students take turns mentoring and participating in online conversations that adhered to specific guidelines. This institutional session will be of great interest to everyone involved in online learning. Graduate students, who are actively employed in distance learning initiatives, will share lessons learned and skills mastered in the art of online communication in a learning environment. Each presenter will begin by describing the process of preparation, posting, and mentoring and will end by reflecting with an emphasis on sharing best practices.

Toward an Adaptive e-Framework for Teacher Training
Massimiliano Adamo, Italian National Research Council - IAC, Italy; Mario Giacomo Dutto, Italian Ministry of Education, Italy; Irene Gatti, Italian Ministry of Education, Italy; Maurizio Lancia, Italian National Research Council-CED, Italy; Gianfranco Mascari, Italian National Research Council- IAC, Italy

The Italian Ministry of Education in collaboration of the Italian National Research Council are engaged in joint activities concerning the modelling, design and prototype implementation of an adaptive e-framework supporting the interactions of the various actors of the national teacher training system.

Transforming the Face of Computer Coursework for Pre-Service Teachers - A Working Model
Angelle Adams, University of Houston, USA; Leslie Starcke, University of Houston, USA; Melissa Pierson, University of Houston, USA

Like most universities, prior to Fall 2000, the College of Education at the University of Houston, required its undergraduate education majors to enroll in a three-hour course, CUIN 3312, “Information Technology for Young Children.” The original one semester course was divided into three one-hour courses spanning three semesters. The elimination of prescribed assignments is a major change in the requirements for the newly structured technology course. In the new model, technology assignments support required education course activities, thereby demonstrating through practical applications how technology should be integrated into classrooms. The new class format is driven by students’ needs and is based on individualized learning activities. Education professors are beginning to restructure their course requirements to allow for increased technological use. Students are searching out ways to meet course requirements using technology even when they are not specifically required to do so by their professors. Early indications are that this model may in fact fulfill the intent of the restructuring effort. Future study of implementation and outcomes will continue to better determine the impact on the skills of pre-service teachers in the use of technology as an integrated instructional tool.

Trek 21: A PT3 Project to Facilitate Teachers’ Design Of Engaging Learning Environments
Laura Adams, West Virginia University, USA; Trey Dunham, West Virginia University, USA; John Wells, West Virginia University, USA; Neal Shambaugh, West Virginia University, USA

The goal of "Trek 21: Educating Teachers As Agents Of Technological Change," West Virginia University’s PT3 project, is to build within those educators participating in WVU’s teacher education program, the capacity to use and integrate instructional technologies (T) for teaching and learning. Trek 21 provides direction for capitalizing on WVU’s restructured 5-year teacher preparation program, consortia of Professional Development Schools, and Instructional Design and Technology program that works at integrating instructional technologies into the educational process. This session would brief participants on project design and outcomes through exchanges focused on: (1) visualizing the partnerships in the Trek 21 model - the collaborative process necessary for sustained, systemic
change in practice, (2) briefly describing the year-long cycle of activities involving these constituents - on-going professional development, and (3) initial findings - data analyses designed to inform the change process. Our presentation looks to inform others of the process Trek 21 employed for the integration of instructional technologies into the practice of those teachers responsible for preparing future educators. Through discussion and structured feedback, we look to share our approach to IT integration in teacher preparation and receive insight through audience participation that will inform and improve on the Trek 21 model of professional development.

Contextual Levers: An Embedded Approach to Faculty Technology Development
Peter Adamy, University of Rhode Island, USA; Ted Kellogg, University of Rhode Island, USA

While much has been written about the potential benefits of technology integration for teacher education, not all university faculty members embrace the process willingly. This paper describes efforts at the University of Rhode Island to create a unified approach to teacher education across disciplines that incorporates faculty technology development in routine practice. Through the use of standards of practice, an electronic student portfolio system, and the support of innovative practices through a PT3 implementation grant, the School of Education is attempting to integrate faculty technology training into the key aspects of regular operating procedures.

Teaching Technology with Technology
Michelle Adelman, New School University, USA; Susan Luftschein, New School University, USA

"Teaching Technology with Technology" provides an overview of an on-line course to teach practicing urban high school teachers to use computer technology in their own classrooms. A combination of theory and practice is delivered in an asynchronous environment.

Assessing the Integration of Technology into the Curriculum
Mac Adkins, Troy State University College of Education, USA

The online Technology Integration Assessment is a self-assessment which allows faculty members to quickly and conveniently report the integration of various technologies into each of their courses. The instrument not only measures what technology items are being used, but also how they are being used. The real data resulting from this authentic assessment has guided our data-driven decision process for future technology purchases and training. Several similar assessments currently exist which measure an individual's current technology competency levels. Assessments also exist which measure faculty and student perceptions of the impact which technology is making. But instruments designed to measure precisely which pieces of technology are being and how they are being used were lacking. This void led to the development of the Technology Integration Assessment. TSU identified the following twelve technology items for which we wanted to track integration: Internet, e-mail, discussion boards, listservs, chat, PowerPoint, word processing, spreadsheet, database, digital camera, video camera, and video tape. We also identified the following nine integration categories: instructor presentation, instructor administration, instructor research, instructor-instructor collaboration, instructor-student collaboration, student-student collaboration, student presentation, student administration, and student research.

Improving the Teaching of Reading, Language Arts and Literacy through WebCT: A Work in Progress
Linda Akanbi, Kennesaw State University, USA

This session will describe how WebCT technology is being used to enhance the professional development and literacy teaching strategies of PreK-12 teachers enrolled in a Reading Endorsement program.

Using Computer Simulation Before Dissection to Help Students Learn Anatomy
Joseph Akpan, Morehead State University, Department of Leadership and Secondary Education, USA

The scientific community and the nation's schools have been experiencing a self-declared ethical crisis over animal dissection in classrooms. While this issue involves intractable ethical and philosophical positions, one ethical implication of the debate is that if dissection is used in schools, it should be used for maximum educational benefit. One intriguing finding was that use of an interactive videodisc dissection learning from subsequent actual dissection. This study examined the prior use of simulation of frog dissection in improving students' learning of frog anatomy and morphology. There were four experimental conditions: simulation before dissection (SBD), dissection before simulation (DBS), simulation-only (SO), or dissection-only (DO). Results of the study indicated that students receiving SBD and SO learned significantly more anatomy than students receiving DBS, DO. The genders did not differ in achievement.

Interactive multimedia problem-based learning: Evaluating its use in pre-service teacher education
Peter Albion, University of Southern Queensland, Australia

Interactive multimedia (IMM) using problem-based learning (PBL) as a design framework has been developed for the purpose of enhancing pre-service teachers' self-efficacy for teaching with computers. Evaluation of the materials in use with a group of pre-service teachers (N = 24) has confirmed that users respond positively to both the content and the presentation of the IMM-PBL materials. Statistically significant increases in self-efficacy for teaching with computers were recorded for users who had initially low values of self-efficacy for teaching with computers. The study confirmed the potential of PBL as a design framework for development of multimedia.

Talking with teachers about computer use: Insights for pre-service teachers
Peter Albion, University of Southern Queensland, Australia

Teacher educators face the challenge of ensuring that pre-service teachers have access to appropriate models for the integration of information and communication technologies (ICTs) in teaching. Field experience in classrooms can be supplemented by presentations of models in interactive multimedia. The CD-ROM project on which this paper is based included materials prepared by and interviews with ICT-using teachers. Analysis of the interview transcripts and trials with the CD-ROM confirms that the interviews are likely to be effective in presenting pre-service teachers with appropriate messages about the use of ICTs in teaching.

2 — Proceedings of SITE 2001 / Orlando, Florida, USA
GIS (Geographic Information Systems) in Teacher Education

Marsha Alibrandi, North Carolina State University, USA; Shannon White, North Carolina State University, USA; Rita Hagevik, North Carolina State University, USA

In Spring 2000, we piloted an experimental preservice teacher education course based on integrating Geographic Information Systems (GIS) in interdisciplinary applications. Participants co-constructed the course by providing feedback via email, discussions, and evaluations. Collaborative instruction of the course included a university professor, an inservice teacher in Instructional Technology, graduate students and a middle school student. We report on this first of a kind, full semester course, sharing what we’ve learned, the products developed, and invite the audience to share the products and processes. GIS is a digital mapping software application that combines database information with spatial formats. You see GIS every day on TV weather forecasts. Our students developed social studies/interdisciplinary applications for both classroom and administrative uses.

The Distance Education Degree Program for The Master of Mathematics with a Teaching Option at Texas A&M University

G. Donald Allen, Texas A&M University, USA; Michael Pilant, Texas A&M University, USA

This paper is a report on the planning, development, and implementation of the online Masters degree program offered by the Mathematics Department at Texas A&M University. The degree, which is completely online, is targeted primarily to secondary high school teachers that desire to sharpen their mathematical skills or advance their overall learning, particularly to qualify for teaching positions in community colleges. The issues, far exceeding those of a new program in the traditional form, range from recruitment of students to negotiating intellectual property contracts.

Secondary Mathematics Methods Course With Technology Units - Encouraging Pre-Service Teachers to Use Technology

Rajee Amarasinghe, California State University Fresno, USA

Although technological tools that can be used in the mathematics classroom were introduced to prospective teachers at various stages in their undergraduate curriculum, they seldom use them in their actual teaching. This paper will describe efforts taken to encourage secondary mathematics teachers to use technology in their teaching by introducing highly structured, five technology units into the secondary method class. The five units were designed to use Internet, Graphing Calculators, Geometer’s Sketchpad, Computer Based Laboratories (CBL), and Spreadsheets. The intent of these units is to make students aware of the existing resources, provide hands on experience, look at the resources critically, and collectively develop ways to integrate these resources to mathematics teaching effectively.

Digital Cameras in Education

Valerie Amber, National University, USA; Sharon Thies, Shanden Middle School, USA

Intended for convenience, digital cameras are an inexpensive learning technology schools may easily benefit from. Once captured, digital photographs are already in a universal format that makes them exceedingly uncomplicated to distribute and use with PC or MAC computers. There versatile usage makes including visual images in word processing documents, e-mail, class projects or on web sites effortless. Digital camera technology brings about a totally new innovative and motivational approach to teaching and learning.

Teaching, Learning and Technology — Providing for Higher Education Faculty Professional Development

Valeria Amburgey, Northern Kentucky University, USA

This session will outline the activities involved in the implementation of our project goals for our Teaching, Learning and Technology (TLT) Project: (1) Technology-Rich Environments (2) Faculty Professional Development and (3) Student Professional Development. Access to technology, training on how to use the technology and time to redesign courses are needs that were identified by our faculty that affect their infusion of technology in their classes. This session will place primary emphasis on how we are addressing these needs.

Using School District Standards to Develop Thematic Lessons for Electronic Portfolios

Cindy L. Anderson, National-Louis University, USA; Kevin M. Anderson, Kenothe Unified School District, USA; Joan Britcoe, National-Louis University, USA; Beth Ann Smith, National-Louis University, USA

NCATE has adopted a list of minimum competencies for a preservice teacher that includes an ability to use technology effectively in teaching (NCATE, 2000). Most teacher education institutions are using preservice teacher portfolios to represent a student’s ability in this area, requiring artifacts as performance indicators for the various competencies recognized by NCATE. An artifact often included in the portfolio is the thematic lesson. Thematic lessons must reflect the ability of the preservice teacher to integrate technology in a lesson.

A Response to Technology Integration in Teacher Education for Merit, Tenure, and, Promotion

Cindy L. Anderson, National-Louis University, USA; David Starrett, Southeast Missouri State University, USA

At Southeast Missouri State University, an effort to reward the infusion of technology into the university and its teacher preparation program resulted in a document providing recommendations for individuals involved in the merit, tenure, and promotion process, the
Concerns of administrators and teachers in the diffusion of IT in schools: A case study from Turkey

Petek Askar, Hacettepe University, Turkey; Yasemin Usluel, Hacettepe University, Turkey

Use of information technology in schools for the purpose of teaching and learning is a kind of diffusion process in which IT is an innovation which is defined by Rogers (1995, p.11) as "any idea, practice or object that is perceived as new by an individual or other unit of adoption". In fact, IT as a relatively new building block in the educational system, causes innovations which ranges from way of communications, and interactions to teaching methods, and materials.

Electronic Curriculum Development and Assessment

Kevin Anderson, Kenosha Unified School District No. 1, USA; Cindy Anderson, National-Louis University, USA

This poster presentation by Kenosha (WI) Schools will show screen shots from a Filemaker Pro curriculum database representing the official academic curriculum of the district, provide samples of grade reporting formats using Easy Grade Pro, and demonstrate hands-on use of the programs through the use of two laptop computers. Visitors will be able to examine the formats and offer suggestions about future improvements to the system. The intent of this session is to provide K-12 schools and teacher education institutions with a look at how one public school district is developing electronic methods for developing curricula, assessing student performance, and reporting out to parents and the community.

Helping teachers and students use advanced technology in teaching high school science: A preliminary feasibility study of the use of a WWW-controlled atomic force microscope in high school science

Thomas Andre, Iowa State University, USA; Gail Jones, Richard Superfine & Russell M. Taylor II, University of North Carolina, USA

This exploratory study investigated the use of an Internet controlled nanoManipulator and atomic force microscope to allow students to explore properties of viruses. The activity was embedded in a week long learning experience in which students interacted with scientists. The study demonstrated the technical feasibility of using such advanced equipment in classrooms. It also demonstrated that students gained in the understanding of the structure and functioning of viruses and changed their conception of scientists as people and science as an activity. A majority of the students were excited about the activity.

CPR Lessons for Teachers: Current Trends, Practice, and Research in Educational Technology

James Ang, Cathy Matuszak, Terri Edwards, Steve Simmons, Heo-Young Kim, Samantha Stinson, Sue C. Little & Melissa E. Pierson, University of Houston, USA

Young scholars introduce a diverse selection of current trends, practices, and research findings A discussion of constructivist-oriented practices that support K-12 technology use is followed by discussions of the implications of technology integration and the cost-effectiveness of technology use in elementary and secondary settings. Technology application issues are addressed next, including the effectiveness of virtual field trips, instructional courseware, online discussion tools, and computerized tests. These areas represent just some of the research on educational technology that effective teachers must remain aware of.

CECI: A Computer-Assisted Coeducational and Transdisciplinary Experience

Rocio Anguita, Universidad de Valladolid, Spain; Cesar Osuna, Universidad Autonoma de Guadalajara, Mexico; Alejandro Martinez, Universidad de Valladolid, Spain; Yannis Dimitriadis, Universidad de Valladolid, Spain

This paper describes a CSCL application named CECI (Co-Edition de Cuentos en Ingles, Co-Edition of Tales in English), which assists would-be teachers in the development of multimedia educational resources aimed at learning the English language. These resources are used by students with a basic or elementary level and are accessed through a computer net. Those would-be teachers write a children's tale and then add a methodology and collaborative activities that describe the prospective use of that tale in the classroom.

Issues in structuring long-term electronic portfolios with web-based document management tools

Eric Aplyn & Carl Hoagland, University of Missouri - St. Louis, USA

As a way of overcoming these barriers, we are developing experimental portfolios with a web-based knowledge sharing technology developed by Xerox Corporation. Similar products are available from other software developers with varying costs and varying capabilities. We will provide an overview of our work to date, provide our research on other technologies with similar capabilities, and hope to launch a discussion that explores the broader issues associated with institutional and regional implementation of electronic portfolios using this strategy. One primary concern is the need to address inter-institutional standards, particularly for 2-year to 4-year college transitions and transitions to long-term professional development. Other key issues include student/faculty trust, usability and stability, long-term management, security, and ownership of portfolios.

Concerns of administrators and teachers in the diffusion of IT in schools: A case study from Turkey

Petek Askar, Hacettepe University, Turkey; Yasemin Usluel, Hacettepe University, Turkey

Use of information technology in schools for the purpose of teaching and learning is a kind of diffusion process in which IT is an innovation which is defined by Rogers (1995, p.11) as "any idea, practice or object that is perceived as new by an individual or other unit of adoption". In fact, IT as a relatively new building block in the educational system, causes innovations which ranges from way of communications, and interactions to teaching methods, and materials.
Comparing a Local School District’s Teacher Use of Computing With National Survey Results
Frances Bealin, Iona College, USA

Funded by the National Science Foundation and the U.S. Department of Education, the Center for Research on Information Technology and Organizations conducted a national survey of schools and teachers entitled, “Teaching, Learning, and Computing 1998.” More than 4,000 teachers in grades 4 through 12 in over 1,100 schools throughout the country completed the survey questionnaire. This national teacher survey posed questions on teaching philosophy, teaching practice in a single class, use of computers, general teaching experiences, and work environment. This paper will discuss a modified local version of this survey administered to a large diverse suburban school district. The purpose of this local survey was to provide a comprehensive needs assessment focusing on the usage patterns and opinions of teachers toward computing. This paper will summarize the local survey results from teachers in the high school, middle schools, and six elementary schools in the district and then go on to compare the local results with the national survey results drawn from selected reports posted on the Internet. The paper will conclude with the highlights of those areas where the local schools surpassed national results as well as those areas of concern where the local results fell short of the national results. An outline of district plans to use the survey results in guiding the implementation of its technology plan will also be presented.

Developing and Nurturing a Dynamic On-Line Learning Community
Kathleen Beaser, Ed.D., Azusa Pacific University, USA

Critical to on-line courses is the ability to create an environment that embraces the community of learners. Learn and experience effective strategies to enhance your on-line teaching. Outcome objectives: Participants will learn how to capitalize on the on-line environment and its wealth of resources in a way that will allow them to utilize more effective strategies in their on-line classes. The main focus will be on developing and nurturing a dynamic learning community. Issues such as face-to-face, feedback, community building, technology barriers, and the unique challenges surrounding teaching on-line classes will be discussed. Key components of an effective on-line learning environment will be discussed along with exploration and utilization of interactive technology tools and resources available. The interactive session will also include a look at effective interfaces for on-line classes and an interactive virtual classroom.

Intended Audience: Participants who have an active interest in creating and maintaining a unique environment for their on-line classes will benefit the most from this session.

EARTH2CLASS: A UNIQUE WORKSHOP/ON-LINE/DISTANCE-LEARNING TEACHER TRAINING PROJECT
Cristiana Assumpção, Frederico Baggio & Joseph Ortiz, Columbia University, USA; Michael J. Passow, White Plains Middle School, New York, USA; Kelly Corder, New Economy Networks, USA

“EARTH2CLASS” (E2C) is a unique science, math, and technology learning resource for K-12 students, teachers, and administrators created through the collaboration of researchers at the Lamont-Doherty Earth Observatory, curriculum and technology integration specialists at the Institute for Learning Technologies, a Maury Project Peer Trainer, and teachers from the New York City metropolitan area and rural upstate New York. During the winter and spring of 2000, E2C presented workshops for teachers at the Lamont-Doherty campus in Palisades NY that were transmitted live to others in Glen Falls. Before, during, and after each workshop, participants and others were able to utilize the resources available on the E2C Internet site, www.earth2class.org. E2C relies on a unique synergy of specialists in curriculum, educational technology, and scientific research, but the key feature is involvement of the Lamont scientists. Their availability through workshops, web site postings, and e-mail expose teachers to stimulating cutting-edge research that help the teachers develop K-12 curriculum activities linked directly to “real world questions.” Drawing on the scientists’ expertise, teachers can show students how the science they are learning applies outside the classroom, as well as to other aspects of their studies.

Attitudes of Malaysian Vocational Trainee Teachers Towards the Integration of Computers in Teaching
Ab. Rahim Bakar, Department of Education, University Putra Malaysia, Malaysia; Shamsiah Mohamed, Department of Mathematics, University Putra Malaysia, Malaysia

A descriptive correlational study was conducted using a sample of 200 vocational trainee teachers in Malaysia. The purpose of the study was to assess the vocational trainee teachers attitudes towards the integration of computers in teaching. The study also attempted to examine the relationships between their attitudes towards the integration of computers in teaching with selected independent variables such as: (a) level of confident, (b) level of knowledge about computers, (c) interest toward computers, (d) whether or not they own a computer, (e) whether or not they plan to integrate computers in their teaching.

Competency Exams in College Mathematics
Kathy Autrey, Northwestern State University of Louisiana, USA; Leigh Myers, Northwestern State University of Louisiana, USA

The idea of competency exams as an integral part of a college mathematics course started at Northwestern State University because of the move to reform based calculus. Further changes in our curriculum have led to a more widespread use of competency exams. While implementation of these exams has been successful in our calculus courses and a course for elementary education majors, we wish to expand our competency exams into developmental mathematics and College Algebra. These exams will ensure that our students have basic analytical skills, while allowing us to maintain reform based courses. We hope to use computer and internet based exams in order to manage a competency exam program throughout the department. We are currently testing a computer based, self-paced program in one developmental math class. We will report on the process we use for these exams and the results we have seen from competency exams across the mathematics curriculum.

Abstracts Book — 5
Integrating Technology into Courses for Pre-Service Teachers
Elizabeth Balser, Saint Vincent College

Using a multimedia format, the presenter will first describe a unique collaboration involving college faculty, in-service teachers, and student teachers. Demonstrations will include integrating appropriate technology applications and national standards into course syllabi and lesson plans and establishing electronic mentoring experiences that involve college faculty, in-service teachers, and education specialists.

The Road Ahead: The Evolution of Online Learning
Alisa F. Balsera, University of South Florida, USA

This paper will focus on the structural and interfacing mechanics of the software that will facilitate support efforts and minimize the frustrations encountered by new users whether they are students, faculty, or course creators. The course shell creation process, student enrollment, passwords, faculty loading, role definitions, reusability, reliability, scalability, all provide potential challenges—even for the best pedagogical designs. The goal is to define a comfortable environment for technology application to classes so that online instructional tools may be assumed as much a part of the academic environment as classrooms and chalkboards.

IT with Integrity
Savilla Banister, Indiana University, USA

In the past three decades, the use of computers in education has continued to grow and develop. With the introduction and expansion of the Internet, K-12 schools, as well as colleges and universities are tapping into the resources of the World Wide Web. “Technology” is the buzz word on the lips of educators across America and few seem to question its appropriateness. There are, however, signs that the manner in which technologies are impacting education is not always as positive as many claim (Olson, 2000; Stroh, 1999). It is time for teachers to critically examine the phenomenon of instructional technology with a commitment to honestly relating the shortcomings and dangers, as well as the benefits. Decisions based on such examination have the potential to focus the use of computers in education more productively (Bromley, 1998), Areas for consideration include an emphasis on teacher and learner needs, rather than computer system needs, an awareness of environmental consequences of our computer technology habits, and an acknowledgment of the economic factors that drive many of the choices being made today in the educational technology realm.

Eureka Science Academy: A 2 year progress report on technology integration in reading and science instruction
Dale Banks, Saint Mary's College, USA; MaryAnn Traxler, Saint Mary's College, USA

The Eureka Science Academy is in year 2 of a 3 year grant. This a report on the 2 groups of preservice teachers that have taught in the program and how they integrated reading, writing, science, and technology in the project. This paper is intended for an audience of education faculty who are interested in a program that has demonstrated an improvement in the attitude of the preservice teachers and the students they served.

Computer aided personality assessment of mathematics teachers
Pamela Barber-Freeman, Prairie View A&M University, USA; Cheryle Snead-Greene, Prairie View A&M University, USA; Michael McFrazier, Prairie View A&M University, USA

Mathematics teachers from the state of Mississippi were invited to participate in a training seminar, Technology, Reading, Riting, Arithmetic (TR3), during the month of July 2000. The overall purpose of TR3 was to provide mathematics teachers with effective teaching strategies for improving achievement of Mississippi students. In addition, teachers were provided intensive training with a "hands-on" curriculum, based on the belief that the learner must be an active participant in the learning process and must construct his/her own ideas through reflective thought. This objective was met through the utilization of personality assessments. Research suggests teachers realize that optimal learning is impacted by understanding personality preference (Alcock, 1998). Thus, the purpose of this research was to examine personality test that assessed personality, teaching and learning styles of middle school and secondary mathematics teachers.

Preservice Teachers' Experiences in a Technology-Rich Urban K-12 School Setting
Gina Berkeley-McLaughlin, University of Tennessee, USA; Aileen Nons, University of Tennessee, USA

This presentation will focus on the experiences of preservice teachers in a technology-rich magnet elementary school during their internship year. This program is part of a grant designed to better prepare preservice teachers to work in urban settings. This study is part of a larger research project designed to investigate the effectiveness of training and support for pre-service teachers and the extent to which various technology tools and applications are used in their assigned schools and classrooms. It is our expectation that this insight will improve teacher preparation at the University of Tennessee and reduce the growing exit of educators leaving urban settings. The current study is based on a series of focus groups that examine the perceptions of a group of students enrolled in a five-year teacher preparation program in the College of Education.

Designing Tasks for Networked Technologies using Intentional Acts
Michael Barner-Rasmussen, University of Aarhus, Denmark

Teachers all over are finding that designing tasks for networked technologies requires more than setting up a web-server with class schedules, a few links to related materials, e-mail, discussion areas and so on. All too often on-line-materials are not read, on-line-discussions die out and teacher-mailboxes remain empty. What is happening, when no mails to the teacher arrive? When a conference dies? When a carefully prepared volume of on-line-papers is not applied to the student-task at hand? We need a better way to model/understand/connect the various elements of the on-line learning experience to understand these failures in more detail. The theoretical framework described in this paper greatly expand the analytic understanding of student-student and student-teacher interaction in the educational context to allow for a better founded planning of these when designing online courses or course-support. From this outset a number of specific teaching situations using networked technologies are analyzed in order to show the depth and breadth of the frameworks capabilities.

6 — Proceedings of SITE 2001 / Orlando, Florida, USA
Infusing Authentic, Content-Based Technology During Teacher Preparation: A Team Approach

Steven Barnhart, Rutgers University, USA

Focused teams of professors, K-12 teachers, graduate students and educational technology staff help faculty and teacher candidates infuse technology into academic activities. The faculty integrate technology into instruction, use technology in mentoring teaching candidates in their disciplines, and collaborate with K-12 teachers in technology rich schools. A team is assigned to each certification subject area and has as a high priority the development of interdisciplinary partnerships among faculty in teacher preparation programs and the faculty of arts and sciences. Teaching candidates collaborate with teachers in public and private schools who have been identified for skills in integrating technology into learning. The goal is to ensure that all teaching candidates graduate with a demonstrated ability to provide innovative and authentic technological support for learning. A 3-year cross sequential design has been implemented to evaluate the influence of the project on the abilities and attitudes of teaching candidates.

Using Adobe Acrobat for Electronic Portfolio Development

Helen Barrett, University of Alaska Anchorage, USA

Learn how Adobe Acrobat's Portable Document Format can support the Electronic Portfolio Development Process and provide the ideal container for digital artifacts or performance assessments in many media types.

Teacher's Guide to the Holocaust: An Extensive Online Resource for Teachers

Ann Barron, University of South Florida, USA; Brendan Calandra, University of South Florida, USA; Kate Kemker, University of South Florida, USA

The Teacher's Guide to the Holocaust is a large, instructional website with over 7,000 HTML pages (650 megabytes). It was designed and developed by graduate students in the Instructional Technology program and the staff of the Florida Center for Instructional Technology, College of Education, at the University of South Florida. The site provides an overview of the Holocaust through text, original source documents, graphics, photographs, art, movies, and music. The primary audience of the Teacher's Guide to the Holocaust is preservice and inservice teachers. The site allows them to view the Holocaust through three different "lenses"—Timeline, People, and the Arts. Additional resources are provided in the Student Activities and Teacher Resources sections. Now in its 4th year, the site receives over two million hits per month from educators and students all over the world. This presentation will provide background information on the evolution of the project, design considerations, development issues, and research studies related to the site.

Magnetic Connections: Better Preparing Preservice Teachers to Use Technology in Teaching and Learning

Carol Bartell, California Lutheran University, USA; James Mehlert, California Lutheran University, USA; Beverly Byrne, California Lutheran University, USA; Midred Murray-Ward, California Lutheran University, USA; Paul Gathercoal, California Lutheran University, USA

Technology provides opportunities to link students, faculty, partners in education, and the wider communities together to expand, improve, develop, and enhance the learning experience for all. It is this challenge that has led California Lutheran University's (CLU) School of Education to conceive and implement Project MAGNETIC CONNECTIONS. Progress on the project can be measured through five major activities. These activities include development of a teacher/scholar in residence program, use of an electronic portfolio system and other distance learning technologies, faculty development workshops, and revision of the Teacher Preparation Program curriculum. Results indicate that CLU is better preparing preservice teachers to use technology in teaching and learning and they are provided with better models and mentors for integrating technology into the curriculum. As well, preservice teachers are held accountable for meeting state and CLU standards for beginning teachers through the use of a web-based electronic portfolio system and distance learning technologies.

A Summary Look at Internet Based Distance Education

Emad Bataineh, Zayed University, College of Information Systems, United Arab Emirates

The Internet has truly and significantly changed the way we live, learn, work, and communicate. In today's digital information age, electronic services are constantly growing and becoming an integral part of our daily life. One of these popular electronic services is e-education through distance learning, and in particular Internet-based learning, which uses the Internet technology as a medium to deliver instructions as well as a communication tool to support interaction between faculty and learners. Distance education is originally designed as a self-paced alternative to traditional classroom instructions and becoming a major trend in higher education. Community colleges seem to be leading the way in the application of Internet based distance education technology by providing more educational opportunities to adult learners than those in four-year institutions, should four-year universities pursue this trend? especially small and private liberal arts colleges who are suffering financially as a result of low students enrollment, should they consider investing in electronic instruction delivery methods to expand their classroom-based academic programs.

Digital Audio Production for the Web

Jeffrey Bauer, University of Northern Colorado, USA; Marianne Bauer, Weld County School District RE-1, USA

Examine most web-based courses and you will find that very few of them make use of audio support for instruction. Quality audio on the web once meant large files and clogged bandwidth. However, new data reduction formats such as MP3 make it possible to include quality audio support for instructional materials. Most computers come equipped with the necessary hardware and software for web developers to use their existing equipment to produce good quality audio programming. This paper presents a brief overview of the advantages of audio as an instructional medium. Information regarding basic audio capturing and editing on a typical PC is presented, followed by recommendations for processing audio for web and CD-ROM development. Samples of the author's work can be found at www.mp3.com/jeffreybauer.
Teaching & Learning Online: Lessons Learned
Donna Baumbach, University of Central Florida, USA; Mary Bird, University of Central Florida, USA; Janet Eastman, University of Central Florida, USA; Kathy Katz, University of Central Florida, USA

The Florida Instructional Technology Resource Center at the University of Central Florida has been supporting educators statewide for 18 years. Recent efforts have focused on web-based tools and staff development. The ITRC staff has developed online staff development components in integrating the instruction into the classroom, school library automation and national and state standards, online learning online, and web-based tools for teachers. As a result of developing and offering these components, our staff has learned a great deal about what leads to successful online teaching and learning in the context of staff development for professional educators.

A review of the literature and a survey of participants from a variety of online staff development programs resulted in a compilation of "lessons learned" in online staff development for professional educators. While not all "lessons" apply to all courses or components, educators involved—or contemplating involvement—in any way in online staff development should consider each lesson. As educators know, "learning never ends." And now, through online staff development, there are more and more opportunities for educators themselves to continue to learn and to grow.

Factors influencing technology integration: A quantitative nationwide study
Amy Baylor, Florida State University, USA; Dorn Ritchie, San Diego State University, USA;

Factors influencing technology integration: A quantitative nationwide study based on a comprehensive study of 94 classrooms nationwide, this quantitative study investigated the impact of several factors (planning, leadership, curriculum alignment, professional development, technology use, teacher openness to change, teacher non-school computer use) on five outcome measures in the areas of teacher skill, teacher morale, and perceived student learning (level of teacher technology competency, technology integration, level of teacher morale, impact on student content acquisition, impact on student higher order thinking skills). Through step-wise regression analyses, results indicated that teacher technology competency was predicted by teacher openness to change (R2 = .164). Technology integration was predicted by teacher openness to change and the percentage of technology use with others (R2 = .391). Teacher morale was predicted by professional development and constructivist use of technology (R2 = .559). Technology impact on content acquisition is predicted by the strength of leadership, teacher openness to change, and negatively influenced by teacher non-school computer use (R2 = .589). Technology impact on higher-order thinking skills was predicted by teacher openness to change, negatively influenced by percentage of technology use where students work alone, creating, and the constructivist use of technology (R2 = .608).

Promoting Instructional Planning: An Experiment
Amy L. Baylor & Anastasia Kitsantas, Florida State University, USA

This study investigated the impact of the Instructional Planning Self-Reflective Tool (IPSRT), on students' attitudes toward instructional planning with 114 pre-service teachers from seven sections of an introductory educational technology course. All participants in the experimental and control groups were taught how to develop an instructional plan as part of the course. For the intervention, the experimental group was provided with instruction on how to use the IPSRT while instructional planning, whereas the control group received a review of instructional planning. It was hypothesized that the IPSRT would positively affect students' performance, attitudes, and self-efficacy beliefs towards instructional planning. It was found that the experimental group showed greater skill acquisition, more positive attitudes and higher perceived importance of instructional planning. In terms of self-efficacy, participants who were initially high in self-efficacy reported significantly lower self-efficacy following the tool intervention. In contrast, participants initially low in self-efficacy showed significantly higher self-efficacy following the tool intervention. Findings are discussed from a social-cognitive perspective.

Using Technology to Help Strike a Blow for Education and the Environment—A Case Study in candy beal, North Carolina State University, USA

This paper presentation will address the importance of learning and using technology in the context of "real world" issues. It documents a service learning project that involved preservice teachers, classroom teachers, eighth grade students and university faculty. In an effort to save an inner city wetland, the team used computer technology to research the issue and built a case for preservation which they presented to at a university wide symposium. You will learn of the roles played by all participants as they became empowered by technology and action research to fight for environmental justice. This paper presentation is intended for the technology challenged, university professors and teachers alike, who need encouragement to begin using technology in the classroom. It shows the power of teaching and learning to use technology, especially when it is used to address "real world" issues.

Learning and Using Web Page Construction as a Vehicle to Teach Pre-Service Teachers How to Develop and Design Integrative Middle School Curricula Appropriate for Early Adolescents
Candy Beal, North Carolina State University, USA

This paper examines how one introduces web page construction in the context of an undergraduate teacher education foundations class on middle school education. Those attending the session will learn about the process used to teach web page construction that results in a product that is appropriate for early adolescent use. The paper suggests ways to use web page construction as a vehicle for developing and designing integrative curricula appropriate for middle school use. This paper is intended for novice technology educators who wish to integrate technology not just teach it for the sake of fulfilling a skill requirement needed by their students. This is NO FEAR technology integration at its best, by one who knows.
Preparing a Virtual Field Trip to Teach Value of Community and Sense of Place
Candy Beal, North Carolina State University, USA
This paper offers participants a chance to discover the value of engaging preservice teachers in the development of a virtual field trip. Research in psychology, sociology and education suggests the importance of engaging both teachers and students in “sense of place” building. The process for doing a virtual field trip as well as the justification for this activity will be thoroughly discussed. The paper is intended for novices in technology who want to incorporate a meaningful technology activity in their curriculum. It shows the value of technology when it is used in the context of a “real world” learning experience. In addition to technology, it addresses issues of character education, service learning and community building.

AnimalWatch: An intelligent computer tutor for elementary mathematics
Ceralee Beal, UMass Amherst, USA; Beverly Woolf, UMass Amherst, USA; Joseph Beck, UMass Amherst, USA; Ivon Arroyo, UMass Amherst, USA
The goal of this poster demonstration is to introduce teachers of elementary and middle school students to AnimalWatch, a computer-based tutor that incorporates artificial intelligence techniques to deliver effective, highly individualized math instruction to 10-12 year olds. With the support of the National Science Foundation, a team of computer scientists, child development researchers, and classroom teachers developed AnimalWatch to be an effective educational tool that would engage both girls and boys in mathematics learning, and increase their interest in pursuing mathematics training. The result of our 4 year project is a self-contained mathematics tutor that receives high ratings by teachers and students, and provides effective mathematics instruction for students with a wide range of skills.

Prospective K-6 Educators Attitudes about Technology
Brian Beaudrie, Northern Arizona University, USA
Since the late 1970’s, the use of technology in the classroom has been increasing at an almost exponential rate. The use of computers and calculators is so prevalent in the modern classroom that it is rarely challenged today, whereas twenty years ago the very idea was practically unthinkable. In that short time frame, most educators and parents have gone from asking themselves whether calculators and computers should be in the classrooms at all to how they may be best used to maximize the learning potential of students.

Preservice and Inservice Teachers Collaborate to Integrate Technology into K-8 Classroom.
E. Carol Beckett, Arizona State University West, USA; Keith Wetzel, Arizona State University West, USA; Ray Buss, Arizona State University West, USA; Eva Midobuche, Arizona State University West, USA
Preservice teachers are graduating from teacher training programs feeling unprepared to integrate technology into their classrooms. This hesitation of new teachers to integrate technology is due in part to a lack of modeling technology use by university and college faculty in preservice classes and limited opportunities for students to observe teachers using exemplary technology practices in internship classrooms. The Arizona State University West faculty, through a PT3 Grant, is addressing this issue by providing workshops on integration of technology in instructional planning for cohort teams made up of ASUW preservice teachers and mentor teachers from school districts working in partnership with the ASU West preservice-teacher-intern program. During the workshops cohort teams collaborated in development of curricular units of practice integrating technology that will be jointly implemented by the teams in field placement classrooms. During the workshops preservice and mentor teachers were exposed to a variety of technology and technology resources that can be incorporated into unit and lesson planning including use of the Internet, digital cameras, Inspiration software and Power Point applications. Preliminary results indicated participants benefited greatly from the information and practical applications of the workshops. Handouts will be provided.

Unique Collaborations in Preservice Teachers Programs
Bette Begeron, Arizona State University East College, USA; James Wenhart, ASUE, USA; Lee Ann Hopper, ASUE, USA; Brenda Larson, Chandler-Gilbert Community College, USA; Gina Vukovich, Chandler Unified School District, USA
In an effort to provide quality teacher training and help to ease the teacher shortage crisis, traditional teacher education classes need to be redeveloped. Collaboration between a local school district, community college and university education department has produced a new concept in preservice education. This program has advantages for the non-traditional student. Substitutes and teacher assistants for the district are encouraged to continue with their daytime profession and study in night and week-end classes to complete their teacher certification courses.

A Hybrid Online Course to Enhance Technology Competencies of School Principals
Sally Beissner, Drake University, USA; Peggy Steinbronn, Drake University, USA
Administrative leaders do not necessarily perceive themselves as leaders in technology in schools. Educational administration graduate students in this study acknowledged that their computer skills were often surpassed by their own faculty, staff, or students. This paper describes an online graduate level course for future administrators, “Principles of Curriculum” (EDUC 276), taught at Drake University. The course was developed with on-campus face-to-face classroom meetings to build future administrator’s skills and confidence followed by completion of the course using online web based instruction. Results suggest that administrators who completed the hybrid online course report lack of technology proficiency, have greater willingness to engage in distance learning, and provide technology leadership and support for teachers.

Young Children and Technology: Building Computer Literacy
Michael Bell, University of Houston - Clear Lake, USA; Caroline M. Crawford, University of Houston - Clear Lake, USA
Building upon the young child’s prior knowledge and developmental level, computer literacy must be addressed early in the child’s educational career. A comfort level is important to develop for both the young children as well as the instructor, which is why the importance of instructional technology is stressed within the preservice teacher’s educational experience.
Developing Communities of Learners in Distance Education Courses
Elizabeth Kirby Bennett, State University of West Georgia, USA; Leticia Ekham, State University of West Georgia, USA

This presentation describes and demonstrates strategies that contribute to the development of learning communities in distance education courses. These techniques have been used successfully in distance education courses to help students become active participants and contributors in online and mediated courses. Examples include online debates where students form teams to tackle the pros and cons of controversial issues and real world case study problems identified by student research and collaboratively solved through chat room interactions. Strategies for building camaraderie, collaboration, and mediated communication skills in distance settings are also shared.

Links to the Classroom: Technology in Early Field Experience for Elementary Social Studies
Linda Bennett, University of Missouri-Columbia, USA

This paper describes a model for integrating technology into early field experiences. The focus of the paper is on what technologies were used and how prospective teachers utilized technology in early field experience. Two recommendations are made for diverse models of integrating technology into field experience are developed and those diverse strategies for integrating technology into social studies be designed.

Exploiting and Evaluating A Web-based Learning System: Six Days and Seven Nights in the Basement
Bob Bernard, University of Wisconsin, USA; John Knight, University of Wisconsin, USA

To evaluate a web based learning system as an adjunct to traditional "live" instruction, sixty students participated in a new interdisciplinary course that required sending email, posting to a discussion forum, investigating web-sites, constructing a home page, and completing several web-based "projects." Each week's activities were documented in individual logs. We will share our students' perception of this experience and our own assessment of its pedagogical value.

Examining Technology Education and Practices of Preservice Teachers: Lessons Learned from a Large, Urban College of Education
Michael Berson, University of South Florida, USA; Robert Armstrong, University of South Florida, USA

Exiting seniors from a College of Education were administered a survey to assess their academic preparation and final internship experiences, technology preparation and perceptions, and research-related preparation and perceptions. Students completed the survey "on-line" during their final internship seminars. This presentation summarizes findings on student technology education, frequency of use, confidence using technology for teaching, and confidence in teaching technology content. The results suggest that those students who have the opportunity to apply technology during their internship are more confident in their ability to use technology in the future for instruction. Student-generated recommendations for enhancing technology training in teacher education will be discussed.

Hypergroups as a Community-Building Tool
Evelyn Beyer, University of Houston, USA; Mary Frances Thompson, University of Houston, USA; Melissa Pierson, PhD, University of Houston, USA

For anyone restructuring their undergraduate technology course for pre-service teachers, an important consideration should be the inclusion of a communication tool that promotes positive peer interactions. Using their recent award of a PT3 grant the University of Houston has implemented many changes in the teacher education core technology course including the offering of a hypergroup, a web-based communication tool. By the second month participation in the hypergroup was going strong with future teachers sharing ideas, posting resources, and communicating common concerns. The hypergroup, originally intended as an example of a mode for teacher communication, has turned into a true community-building tool. The hypergroup will stay intact for these pre-service teachers throughout their teacher education program and into their first year of teaching where it is hoped that these teachers will become a part of other online peer resource groups.

Using Technology to Support Teaching for Social Justice in a Preservice Program
Barbara Beyerbach, SUNY Oswego, US; Pat Russo, SUNY Oswego, USA

This paper will describe how we have attempted to use technology to support teaching for social justice in an educational foundations and in an elementary methods course in our teacher education program. Programs, class activities, and analysis of student work will be shared and implications for practice derived.

A Survey of Educational Software for Bilingual Educators and Hispanic Families
Maria Bhattacharjee, University of Houston Downtown, USA; Linlin Irene Chen, University of Houston Downtown, USA

This paper concerns computer software currently available in the market for bilingual children. The purpose is to survey the software options available to bilingual children, parents, and teachers. This paper will approach the topic from the following perspectives: Sources for Purchasing Software, Bilingual Reading and Writing Software, and Bilingual Educational Games/Tutorial/Drill, and Practice.

Innovative Course Design as Action Research: Instructional Technology for Teacher Education
Madhumita Bhattacharya & Cameron Richards, Nanyang Technological University, Singapore

This paper reports on an innovative approach adopted in the training of tertiary education teachers in instructional technology. An integrated approach was adopted to increase the motivation of teachers to use Information and Communication Technologies (ICTs) in their teaching-learning practices. The researchers describe their ‘action research’ efforts to design a course where participants learn and apply new ICT skills in a context of becoming ‘designers’ themselves of online learning resources. The notion of ‘course design as action research’ provided a focus for a flexibly structured course relevant to students needs and responsive to ongoing feedback in terms of a more proactive reflective practice. The paper argues that in the fast changing Internet age all teachers need to go beyond traditional approaches if they are to use ICTs well in their educational practices.
Using Constructionist Principals in Designing And Integrating Online Collaborative Interactions
J. Michael Blocher, Northern Arizona University, USA; Gary Tucker, Northern Arizona University, USA
This paper describes a study that took an action research approach to investigate learners’ experience using CMC to engage in a collaborative project in an online learning environment. Communication messages were archived for analysis and a post-questionnaire was administered to provide feedback on the students’ experience with the project. Findings from the study were then used by faculty at Northern Arizona University (NAU), a small institution that serves mostly rural students in Arizona, to design and implement one of the foundational web-based courses in their online Master’s of Education in Educational Technology degree. The course design for ETC 567: Technology, Society, and Education was based on findings from the described study investigating online collaborative interactions and founded on constructionist principals to enhance learner interaction through collaborative writing projects in the online learning environment. Furthermore this paper provides examples for practitioners desiring to integrate collaborative projects in online learning environments.

Discetech: Advanced Training on Technologies and Didactic for Italian Teachers
Mario A. Bochischio, University of Lecce, Italy; Roberto Palano, University of Lecce, Italy; Giuseppina Marselli, University of Lecce, Italy; Paolo Paolini, Politecnico di Milano, Italy, Italy
The Discetech project was born in 1996 at “Politecnico di Milano”; in the first year it was applied to the high schools of Como, then, in 1997 it was extended to the high schools of Lecce (in the South East of Italy) in collaboration with the University of Lecce. Discetech is an experimental project rather than a simple upgrading course, and it is conceived to observe different aspects of the Italian School. An original aspect of Discetech is in the coordinated application of technological training and didactic project at the same level. Concisely, in Discetech we train teachers on the use of computers (CD’s, Internet, ...), then we prepare it to design a didactic activity to be performed in their own classrooms. This didactic project is observed and measured by adopting a number of parameters (about the training process, the educational aspects, the knowledge acquisition and the contents selection). In the final phase of each year the results are evaluated and shared among all participants in order to gain the largest possible amount of knowledge about the adopted didactic modalities.

Factors That Promote and Inhibit Discourse With Preservice Teachers on a Non-Restrictive, Public Web-Based Forum
Alec Bodzin, Lehigh University, USA
This study investigated asynchronous communication factors that influence the discourse of preservice science teachers on a non-restrictive, public Web-based forum. Salient elements that promoted discourse among the participants included the level of interest in a topic, the immediate relevancy of a topic to a participant at a particular time, and interpersonal factors among participants. Limitations using asynchronous communication perceived by preservice teachers included receiving feedback too late to be of use and issues pertaining to the absence of visual cues during discourse exchanges. The linear, temporal interface of the Web-based forum appeared to be a factor that limited the depth of the discussion.

Designing Web-Based Inquiry Simulations: Carolina Coastal Science
Alec Bodzin, Lehigh University, USA
In this paper, the design of Web-based inquiry simulations used in science classrooms for students to explore coastal science issues is discussed. In response to the demand of reform efforts and the lack of an appropriate design model approach, the Carolina Coastal Science project commenced with an idea to develop a Web site that was an organized, non-linear information resource in the context of an inquiry-based constructivist learning environment. Several modes of learning and teaching strategies were developed to be available to the users, including a role-playing simulation-debate, open-ended inquiries, guided inquiries, independent research, and cooperative group learning. The paper concludes with the claim that creating an instructional system in an online environment promotes the use constructivist theories in student learning due to the nature of their engagement within a hypermedia environment.

A System of Faculty Development
Harriett Bohannon, Florida Gulf Coast University, USA
The goal of Course and Faculty Development at Florida Gulf Coast University is to promote and support the use of learning-centered teaching practices, integration of technology, and delivery of distance learning by removing barriers to teaching innovation. As one of the interdependent support units, Course and faculty development has contributed to the university-wide support system that allows faculty to achieve these goals. This model of faculty development uses ten distinct service strategies to accommodate the needs of a diverse, multicultural faculty. Having ten ways to access support allows faculty to engage in continuous learning in spite of equipment limitations, time constraints, preferred learning modalities, or technology skill limitations. As a result, during the first three years of operation 71% of the full-time faculty participated in one or more faculty development projects or activities, and 24% participated in six or more. The staff of one director, three instructional designers, and a part-time student worker has contributed to the design of 113 web-based or web-enhanced courses, and over 65% of the full-time faculty report that they use the key technology tools for teaching and learning - email, Internet resources, electronic message boards, classroom podiums, library databases, and presentation software. When asked if the instructional technology used in courses contributes to learning, 85% of the students agreed that it did.

Principles for Designing Online Instruction
Harriett Bohannon, Florida Gulf Coast University, USA; Peggy Bradley, Florida Gulf Coast University, USA; Joan Glacken, Florida Gulf Coast University, USA; Roberta McKnight, Florida Gulf Coast University, USA.
Integration of technology in teaching and learning is part of the unique mission of Florida Gulf Cost University to increase access to higher education, not only in Southwest Florida, but beyond. To gain a better understanding of the web in education, the University organized a study group to review learning theories and reflect on the courses designed and taught at FGCU. The group identified guiding principles and best practices for teaching, managing, and supporting web-based instruction at the university. This presentation will
share experiences by addressing issues in web course design and development, web course management and institutional support. The issues will be examined from the perspective of faculty, administrators, and support staff. The goal of this work was to bring a better understanding of the use of the web in higher education, its impact on teaching and learning, and implications for support staff, faculty, and administrators in the university.

THE DILEMMA OF TEACHER TRAINING
Alfred Bork, University of California, USA

In 1957 the Soviets put up the first earth satellite, Sputnik I. For education in the United States this was a traumatic event. Until that time, many (but not all) people, including the popular press commonly denounced Soviet science as ineffective. The fact that it achieved this major technological development, visible in many parts of the country, before we did led to much trauma about the quality of science education in the United States.

Helping third grade low achievers through dynamical modelling software: An experimental study
Xavier Bornas, University of the Balearic Islands, Spain; Jordi Llabres, University of the Balearic Islands, Spain

Low achieving students (LA) need an individualized instruction to learn what high achievers learn in the classroom through regular teaching. Computers can deliver such instruction if an appropriate software is used. The aim of our study was to evaluate the instructional effectiveness of a curriculum based software for LA students. In order to test the importance of the type of help, two versions of the same software were developed (static vs dynamic help). Furthermore, the dynamical version was used in two ways (computer alone vs computer and psychologist's support). Sixty students participated in the research. The results of our study clearly suggest that computer technology can help teachers to attend the LA students, at least when the instructional software has been developed regarding the school curriculum and the teaching style of the regular teacher. However, LA students working with the computer alone (without teacher assistance) did not learn the more advanced specific strategies that learned the LA students who, in addition to using the same software, got that assistance. Therefore, our results recommend to put computers into the regular classroom (instead of being located in a different one) so that teachers can “be there” if the student needs help.

Academic achievement problems: Developing curriculum based software to help low achievers
Xavier Bornas, University of the Balearic Islands, Spain; Jordi Llabres, University of the Balearic Islands, Spain

Low achieving children (LA) usually need a very individualized instruction. Teachers rarely can give them this kind of instruction because they have too many children in the classroom. Computer technology may be extremely helpful for those students. However instructional software is often independent of the school curriculum. The lack of contact between developers and school teachers leads to several problems: lack of motivation, cognitive confusion, and teachers’ resistance. If computer technology has to help LA, the instructional software must be based on the school curriculum. From our own experience in developing curriculum based software we can underline several guidelines: The LA students were selected not only because of their poor performance on the evaluation tests but also because their teachers considered them as LA. In the curriculum materials that students were using regularly in the school, and we took them as the base for the software we were going to develop. Teachers told us what specific contents they were going to teach, and these contents were the ones the software included. The curriculum based software we have developed proved to be useful to teach LA the selected academic contents and strategies.

Our Own Tower of Babel: Describing Instructional Technology or Educational Technology Doctoral Programs
Arlene Borthwick, National-Louis University, USA; Marianne Handler, National-Louis University, USA; Diane McGrath, Kansas State University, USA

Many of us who teach those who will become tomorrow’s professors have not found a way to clearly share what we do and find out what others are doing in their doctoral programs. Information the authors gathered about a variety of educational/instructional technology programs demonstrated the complexity and richness of doctoral programs in this area. This appears to be the right time for discussion of how we are alike and different and for the possible development of additional doctoral programs in the area. A better understanding of our missions, vision and language within this community will assist us in our conversations. Further, clarity in our program foci is reflected in program goals, university/grant-funded research opportunities for graduate students, employment options for graduates, and the hiring of appropriate faculty. This round table will discuss a project that aims to help build a common vocabulary and common understandings to encourage the conversation.

Teacher-Developed Video for Classroom Use: The Transition from VCR to Digital Format
Eugene Borzov, Iowa State University, USA

This presentation will examine the ways to integrate digital video technology into a language classroom. The process of shooting, editing and formatting educational video films for students learning English as a second language will be discussed. The focus will be on a comparative analysis of traditional VCR/Camcorder technology versus digital cameras and modern CD-ROM/DVD/Web technology for disseminating the resulting video. The examples of effective techniques and original QuickTime movie clips will be included in the presentation.

Using Databases in Teaching Advanced Mathematics Courses
Mikhail Bouniaev, Southern Utah University, USA

This paper is a follow up of the papers that discussed how information technologies could be used in teaching Advanced Mathematics (Bouniaev, 1995) and in developing general logic actions (Bouniaev, 1999). Here we discuss the possibility of using databases in teaching Advanced Calculus. The psychological foundations of our considerations are Stage-by-Stage Development of Mental Actions Theory and Constructivism.
Democracy in America: Rural America Takes an Adventure Through the American Mind
Beth Braboy, Montreat College, USA; Wendy Trivette, Montreat College, USA
The use of electronic primary sources provides authentic pieces of the past for students and teachers alike, but these primary sources pose a new challenge for teachers. Teachers need to be trained in techniques for analyzing historical documents and strategies for raising the intellectual and emotional questions that will draw the students’ interest. Misuse of electronic primary sources can create a greater distance between students and learning if the teacher is not prepared in both technology, primary source evaluation, and their integration into the curriculum. The “An Adventure of the American Mind” project is the first to meet this challenge head on. A major USA initiative in our field, “An Adventure of the American Mind” continues in rural western North Carolina. In October 1999, the project began recruitment of local area in-service teachers to participate in a graduate-level course in Spring 2000. Collaborating with Mars Hill and Brevard College, Montreat recruited 48 teachers to be the pilot group for the program. The graduate course began in January 2000 with 28 teachers traveling to Montreat College and 20 traveling to Mars Hill College. Laptops were given to each teacher to provide them with the basic technology resources they would need. The teachers were introduced to the Library of Congress’ website American Memory, which contains over three million digitized items from the Library’s collection, and built interactive lessons using these primary sources and Microsoft PowerPoint and FrontPage.

Technology and Pedagogy: The Evolution of A Curriculum
Kelvin Broad, Northern Arizona University, USA; George Labercane, University of Calgary, Canada
This paper reports an investigation into the use of web-based, interactive computer technologies in the achievement of curricular outcomes in reader response-based literature instruction. The primary purpose of the study was to explore the use of computers as tools for implementing classroom reader response instruction. Rosenblatt’s (1978) Transactional Theory of the Literary Work and pedagogical approaches developed from this theory were used as the basis for developing and implementing computer-based literature exploration. The study used a network-based software application called Zebu as a venue for conducting reader response-based instructional initiatives. A portrait of fifth grade student’s reading, writing and responding in computer environments is presented. The nature of students’ responses is discussed and key characteristics of effective web-based reader response environments are outlined. Findings suggest that computer environments represent one venue where students can engage in collaborative conversations about literature.

Advanced Technology Opportunities For Education Students: The SIMMS Example
Abbie Brown, Washington State University, USA; Bob Appelman, Indiana University, USA
In a department or school of education, how does one set up an environment that acknowledges the importance of developing instructional design solutions in the least obtrusive manner, while simultaneously offering students the opportunity to experiment with cutting-edge technologies? One approach is the creation of an extra-curricular organization that focuses on exploring technological innovations and the development of a supportive atmosphere for people interested in expanding their skills beyond those required for standard instructional design situations. The organization of Students in Multimedia Studies (SIMMS) at Indiana University is one example of this approach; the recent creation of the SIMMS “beta chapter” at Washington State University is a second example. Both groups face interesting challenges in administration of the organization, developing and maintaining activities of interest to the membership and bridging the gap between group members who are highly technologically proficient and those who aspire to greater technological proficiency. This paper should prove of interest to educators facing similar challenges in providing advanced “techno-geek” opportunities in environments that primarily focus on instructional design and basic tech skills.

Technology and Pedagogy: The Evolution of A Curriculum
Margaret Brown & Gregory MacKinnon, Acadia University, Canada
Acadia University was the first laptop university in Canada. Being first has had its challenges. This paper discusses how between 1996 and 2000 a School of Education has adapted to the new technologies and made efforts to incorporate them pedagogically in their two-year after-degree teacher education program. Data gathered from review of equipment and facility inventories, demographic and curriculum documents, and surveys of students and faculty regarding background computer knowledge, attitudes, skill development, application, and innovations have formed the basis for this analysis. An examination of the first four years since initial implementation
After the Pilots: Media Literacy Across the Curriculum
Gregg Brownell, Bowling Green State University, USA; Nancy Brownell, Bowling Green State University, USA
This paper traces experiences in the development of EDTL 630 Media Literacy Across the Curriculum through three pilot offerings. The course is now a part of an M.Ed. in Classroom Technology program and an elective in an M.Ed. in Teaching and Learning program. Differences in the two target populations are identified and discussed. A detailed schedule/activity-set for the course is presented.

A Field-Based Model for Integrating Technology into Preservice Teacher Education
Thomas Brush, Arizona State University, USA; Ann Igoe, Arizona State University, USA
The College of Education at Arizona State University is committed to providing future teachers with the most innovative and effective training possible. This commitment includes the belief that technology needs to be infused into all aspects of teacher preparation and applied in authentic situations. The purpose of this paper is to provide an overview of a field-based model for integrating technology into pre-service teacher education; a model that provides pre-service teachers with opportunities to develop and implement technology-rich instructional activities in authentic teaching situations, and provides these individuals with guidance, support, and critical formative evaluation during their experiences so that they leave ASU with the ability to integrate appropriate technologies in their future professional placements.

Using Excel to Explore a Thematic Mathematics Unit
Dolores Brzycki, Indiana University of Pennsylvania, USA; Judi Hechtman, Indiana University of Pennsylvania, USA
Fifth-graders can "Excel" at spending a million dollars! The fifth grade mathematics curriculum at the University School of Indiana University of Pennsylvania contained a long-term project to enable students to experience the real world concept of budgeting. Students were to develop a budget to spend $1 million on a specific interest. Combining this project with learning how to track expenditures on a spreadsheet was a natural pairing. Using PowerPoint to communicate the results to classmates added yet another technological dimension as well as language arts integration. Along the way, students learned a variety of lessons. They learned or reviewed financial concepts such as budget and unit price. They reviewed percentages, means, and other mathematical concepts in a way that supports NCTM standards, and applied them in the real-world context of budgeting. As they gained confidence with Excel, students went beyond what was taught and made and shared their own discoveries about how to do things. The instructors gained valuable reflections about what works in infusing technology into the curriculum, and the project proved the efficacy of Donald Schoen's model of the reflective practitioner.

Learning Styles and Potential Relations to Distance Education
Walter Buboltz, Louisiana Tech University, USA; Lamar Wilkinson, Louisiana Tech University, USA; Adrian Thomas, Louisiana Tech University, USA
Distance education is becoming a force in the educational realm and appears to be increasing at an astonishing rate as a viable form of education. With this quick to adopt philosophy that appears to sweeping the educational community many important variables in this new form of education are being overlooked. By focusing on these variables, especially learner characteristics (cognitive/learning styles) we can develop and implement distance education in a format and form that appeals and accomplishes its goal, namely the education of students. Without focusing on these variables, students may be disenchanted with this educational format and feel that they are not getting the education that they deserve and may seek fulfillment through other methods of education or not seek to advance their knowledge at all.

Using a Flexible Format to Create a Constructivist Learning Environment in the Educational Computing Course
Wren M. Bump, University of Houston, USA
This paper describes the restructuring of the Educational Computing Course CUIN 6320 Technology in the Classroom, a graduate class at the University of Houston. The purpose of the restructuring was to model to the students appropriate, constructivist teaching methods and activities in the integration of technology for instructional purposes. By experiencing a constructivist approach, the students were able to make their own connections between technology and its use in the classroom and reflectively evaluate their progress.
and growth. It is hoped, since there was much growth and improvement in their knowledge of technology and its applications, that they will use these strategies and activities in their own classrooms.

Using Electronic Portfolios to Support Accountability and Preservice Teacher Preparation
Gerald W. Burgess & Barbara D. Holmes, Albany State University, USA
The demand for accountability establishes the framework for educational reform in the new millennium. The portfolio process represents a more authentic form of assessment in that it allows the teacher to judiciously select those work products and artifacts that portray the full range of the teacher's work. In an interactive discussion, participants will identify standards, course competencies, develop rubrics, and determine quality statements that support the evaluation and assessment of the electronic portfolio. The result constitutes not the "how to" develop an electronic portfolio but an understanding of the importance of integrating this strategy into the preparation of teachers who are more proficient in using technology to improve student learning.

Contextual Learning: Learning About Information Technology through Information Technology
Kathleen Burnett, Laurie Bonnici, Eliza T. Dresang & Margie Thomas, Florida State University, USA
The purpose of this institutional session is to acquaint the audience with the opportunities for contextual learning through web-based instruction for school library media specialists by the Florida State University School of Information Studies. It includes a justification of need and an overview of the certificate and degree programs that meet these needs. The web-based interface and tools employed are demonstrated and their pedagogical framework is discussed. Finally, specific examples of the ways that contextual learning principles are incorporated into a sampling of four of the courses included in the program is provided.

Education and Technology - A Faculty Development Program for Medical Educators
Margaret Burrows, University of Manitoba, Canada; Margaret Ford, University of Manitoba, Canada
A faculty development model for the integration of education and technology was designed and implemented to enhance teaching and learning. There is a great need to assist and provide support to medical faculty who wish to integrate technology into the learning environment. The Faculty of Medicine TIPs Group (Teaching Improvement Programs) proposed to enhance the skills of their TIPs faculty developers in the use of educational technology with the goal of subsequently transferring these same skills to the broader faculty at the Bannatyne Campus of the University of Manitoba. A consortium was formed and included TIPs faculty as well as representatives from the Academic Computing Network (ACN), the Neil John McLean Library and Educational Support Services. The educational framework for the Education and Technology Workshop was the Seven Principles for Good Practice in Undergraduate Education (Chickering and Gamson, 1987). Experiential learning theory provided the framework for understanding how technology can be integrated with the principles of teaching and learning (Kolb, 1994, 1971). The workshop model was thus based on a "train the trainer" concept. We will discuss the successes and failures of this model and supply some reflection on future interventions and support strategies.

Multiple Delivery Systems—A New Approach to Education Courses
Henri Sue Bynum, Indian River Community College, USA; Raymond Considine, Indian River Community College, USA
Indian River Community College (IRCC) is addressing the needs of non-traditional pre-service education students by developing multimedia Internet-based courses in education. These courses are learner-centered and combine the synchronous format required to develop social interaction skills with the asynchronous access to information and to assignments. We also address multiple learning styles and promote active student learning, while facilitating student success by providing web-based college support services online. An example of the courses developed, "Introduction to Education," features instructional lesson summaries and lectures using streaming video and graphics, graphic support materials, e-mail, chat rooms, message boards, and multi-media technology to address auditory, visual, and kinesthetic learning styles. Technology is used to promote synchronous and asynchronous active student learning and to support effective teacher facilitation. Our presentation will include a demonstration of the web-based course and an introduction to the student support services available to students. We will present the rationale for the course components along with a description of the learning styles addressed. We will also address the development of additional courses and staff development programs.

Technological Diversity: Managing Differing Technology Skills in the EdTech Course
David Byrum, Southwest Texas State University, USA
Students are coming to EdTech classes with more diverse technology skills than ever before. This presentation/paper will discuss varying ways to structure courses or instruction to work with these varying groups. The author will detail several of the strategies used in past classes, the results, and other methods the instructor may wish to consider depending on the situation. This paper/presentation will discuss strategies such as: student as expert/assistant, student as teacher, differentiated assignments, multiple paths, testing out, independent study, and technology portfolios.

Technology Standards for Preservice Teachers: Where are We Headed?
Edward P. Caffarella, University of Northern Colorado, USA
This presentation is a discussion of the implications for preservice teacher education programs of (a) the new National Educational Technology Standards for Teachers (NETS), (b) the Commitment to Technology indicator within the NCATE 2000 Standards, and (c) the new Colorado Technology Standards for Preservice Teacher Education Students. The standards will be discussed from the national perspective and from the perspective of the responses of one institution to the standards through a Preparing Tomorrow's Teachers to Use Technology (PT3) grant.
Implementing an Instructional Management System: Final Report
Ralph Catella, Ft. USA; Perry Schoon, Florida Atlantic University, USA
The national trend toward the use of high-stakes testing to make schools accountable for the standards students have mastered has forced school district to make sure that the curriculum taught in the schools is based upon the standards the students will be tested on. This paper discusses the results of implementing a sophisticated Instructional Management System (IMS) to help accomplish this task. IMS is a sophisticated relational database that was implemented to change the paradigm of how teachers think about the lesson planning process. Rather than concentrating on what the students will do, this project encouraged teachers to begin by thinking about what the students will learn. By using this system, teachers were able to track which standards mastered by each of their students and design their lessons based on objectives each student's needs. This paper presents an overview of this three year project in the hope that the lessons learned will be beneficial to other districts interested in exploring using computer systems to support instructional decisions.

Distance Education and What is Coming Next.
Kemal Cakici, The George Washington University, United States
In the last decade distance education has gained more importance and attention in its century long history. The more technology and society develops, the greater need for qualified and educated people exist. In order to support this demand for education, schools at all levels started developing and implementing distance education programs. Distance education helps people to work and complete their degrees anywhere while supporting them to become more qualified. As the technology is evolving everyday, the way these programs are delivered change and become more sophisticated. This paper will give a brief history of distance education and try to explain the latest developments in higher education institutions.

IT in Teacher Education
Sama Cakula, Vidzeme University College, Latvia
We have idea for further education of teachers using new informatic technologies as a complex course in combination with attitudes and values and teaching methods.

A Holocaust Web Site: Effects on Preservice Teachers’ Factual Knowledge and Attitudes Toward Traditionally Marginalized Groups
Brendan Calandra, University of South Florida, USA; John Fitzpatrick, University of South Florida, USA;
The Holocaust remains one of the most effective and extensively documented subjects for an examination of basic humanitarian issues. Knowledge is the key to an intelligent understanding of such a tragic passage in human history, the key to a wisdom that will never let it happen again. To address the need for quality, accessible information about the Holocaust, the Florida Center for Instructional Technology developed an extensive website titled The Teacher’s Guide to the Holocaust. This study was designed to investigate the effectiveness of the website. Specifically, data were collected via pre and posttest measures to determine if access to The Teacher’s Guide to the Holocaust significantly impacted the knowledge level or attitudes of pre-service teachers.

Online Portfolios vs. Traditional Portfolios
Renee L. Cambiano, Northeastern State University, Tahlequah, Oklahoma, USA; Alejandro Fernandez, Universidad Central de Venezuela, Venezuela; Ana Beatriz Martinez, Universidad Central de Venezuela, Venezuela;
Portfolio is a methodology for teaching and evaluation. A certain time and requirement must be followed when developing a portfolios must. It implies different activities such as: homework, presentations, research, projects, interviews, comments and others. This methodology demands students to compromise the process of learning, being the ultimate goal to fulfillment the program objectives. For this study, two groups were compared using online portfolios and traditional portfolios. The populations were composed of 58 college students from two different universities. Data were collected from September 1999 to January 2000.

Developing a Faculty of Education Technology Integration Plan: Initial Stages of a Large Scale Faculty Professional Development Program
Mike Carbonaro, Fern Snart & Cheryl Goodale, University of Alberta, Canada
There is a strong consensus among many educators that the teaching of technology should be incorporated across the curriculum at the earliest levels of education (Logan, 1995). Although Faculties of Education tend to realize the importance of technology, they have been slow to respond to the needs of the field (Barksdale, 1996). Thus schools have been forced to compensate for this lack of leadership by developing their own in-service technology programs for teachers. There are a number of reasons why Faculties of Education have been slow to respond to the impact of technology. First, many faculty members require extensive professional development in the area of technology integration so that they can model appropriate uses of technology (Rogers, 2000). Second, faculty professional development programs must be designed so that these programs fit into a Faculty’s overall Technology Integration Plan (TIP)—the development of a Faculty TIP is a difficult process, especially given the complex political nature of any university environment. Finally, regardless of the TIP, each Faculty must find the resources to carry out the action items defined in the TIP in order to achieve the goals of the TIP. This paper will describe the University of Alberta’s Faculty of Education TIP and its importance in a comprehensive effort to foster Faculty Professional Development. It will also discuss a newly funded research study of our 120 faculty members with respect to technology integration for teaching, learning, and research.

E3-Learning: More Than On-line Education
Roger “Bucky” Carlsen, Bonnie Mathies, Steve Hawley & Maggie Veres, Wright State University, USA
This paper describes the decisions and procedures that occurred when a traditional graduate level technology course was moved from the classroom lab setting to a partially on-line course with web enhancements. What we developed was an expansion of our initial plan.
and something quite different, far more complex, and more labor intensive. We knew that if we wanted schools to be different, we must prepare teachers differently ... significantly differently (Carroll, 2000). Our web enhancement efforts quickly triggered the development of an on-line educational support hub and the establishment of several on-line communities. Our on-line hub “E3-Learning” quickly expanded to provide resources and discussion boards for faculty, students, along with technology directors, library and media directors, and classroom teachers from 35 school districts. Within six weeks of the decision to initially “take one course on-line” the enhancement site e3-learning agreed to provide statewide technology standards discussion boards for 13 participating universities, Ohio SchoolNet, Ohio Board of Regents, and the Ohio Board of Education.

PT3: Changing the Climate for Technology in an EdSchool
Randal D. Carlson, Georgia Southern University, USA; Gene Franks, Georgia Southern University, USA; Kenneth Clark, Georgia Southern University, USA; Alice Hosticka, Georgia Southern University, USA; Mark Kostin, Georgia Southern University, USA
This paper describes the results of efforts to enhance the technology components of the undergraduate teacher education program at Georgia Southern University. Preparing Tomorrow’s Teachers to Use Technology (PT3) provided incentive to faculty through increased access to hardware and software, faculty support and mentorship by technology proficient teachers, release time to assist in the course and curriculum development process, technology training for pre-service teacher education faculty and demonstration teachers in K-12 schools, and mini-grants to pre-service teacher education faculty to enable significant change to the pre-service curriculum. Results showed that these efforts could increase the quantity and quality of the technology use in pre-service teacher training.

Field Experiences at a Distance: Virtual Internships
Randal D. Carlson, Georgia Southern University, USA; Judi Repman, Georgia Southern University, USA; Elizabeth Downs, Georgia Southern University, USA
Online instructors face the dilemma of providing meaningful field experiences for learners. In the Social Life of Information, John Seely Brown and Paul Duguid revisit Jerome Bruner’s distinction between “learning about” and “learning to be.” Brown and Duguid state (p. 128) “In the age of the web, learning about is easier than ever before.” The real challenge for internet-based education is to help students learn how “to be.” Field experiences and internships move students away from focusing solely on information toward an understanding of how knowledge informs practice. This paper explores creative ways to facilitate meaningful experiences in the field of practice for students-at-a-distance.

Working Side-by-Side: Preservice Teachers & Children Meet at the Computer
Nancy Casey, St. Bonaventure University, USA; Lisa Sartin, St. Bonaventure University, USA
This paper describes the effects of an after-school program where preservice teachers and elementary school children play and work together using computer games and other technologies and then complete activities based on those games. The program, based on the 5th Dimension, a project developed at the University of California, San Diego, is designed to give preservice teachers experiences using and evaluating a variety of technologies. It also, of course provides preservice teachers with opportunities to get to know children, learn to interact with them and guide their learning. The enthusiasm of the children often helps sometimes technologically-reticent college students. The paper will describe the project and highlight how this experience can help preservice teachers begin to meet national standards for new teachers.

Online Discussion as Catalyst for Metacognition by Students and Professors
Nancy Casey, St. Bonaventure University, USA; Philip Payne, St. Bonaventure University, USA; Patrick Casey, St. Bonaventure University, USA
This session will discuss a variety of online discussion “settings” and present preliminary analyses of discussions in terms of what they tell us about student thinking and professors’ responses. We will discuss how the use of online discussion can influence what and how we teach, and how that, in the long run, can affect preservice teachers’ development.

Creating Collegial Networks
Mick M. Caskey, Portland State University, USA; Susan M. Bert, Portland State University, USA; David Bullock, Portland State University, USA
This paper examines how web-based educational environments were used to foster collegial conversations in three case studies conducted in the Graduate School of Education at Portland State University. The cases describe instructors’ and graduate students’ experiences with interactive, online discussions. Two cases center on interactions in cohorts (groups) of preservice teachers, while the third case highlights the course-based exchanges of inservice and preservice teachers. Reactions to online interactions are analyzed. Several important considerations are shared about how to cultivate peer collaboration and encounter success when teaching and learning with web-based environments.

Historical Perspectives on Teachers, Technology, and American Public Education
Margaret Cassidy, Adelphi University, USA
New technology is one of the most frequently named components in, or rationales for, school reform. Many of the hopes expressed today for educational technology sound reasonable and desirable, but history suggests that integrating technology into classroom practice is a very complex process, profoundly affected by trends in educational policy, curriculum theory, and pedagogy. In particular, inadequate attention has been given to the ways in which debates over the use of educational technology are grounded in debates about the purposes and priorities of public education, and the role and status of teachers. This presentation will examine some of the common themes that run through the history of educational technology, with particular attention given to overlaps with trends in educational policy and theories about curriculum, teaching, and learning.
Preparation of Educational Leaders to Cultivate the Meaningful Use of Instructional Technology: Beyond Budgets and Basic Training
Margaret Cassidy, Adelphi University, USA

Bringing new technology into schools is a complex, challenging process for teachers and administrators alike. There is an overwhelming volume of literature on issues like selecting hardware and software, planning budgets, and providing teachers with the basic technology training they need to get started. However, effective leadership requires a sophisticated knowledge of, and sensitivity to, a myriad of other issues, such as the privacy and First Amendment rights of teachers and students, questions of unequal student access to technology outside the home, potential gender inequalities in technology use, and the proper role of commercial and corporate entities in public schools. This presentation will explore some of those issues, and suggest ways for educational leaders to consider them in their day-to-day decisionmaking.

Comparison of face-to-face and online for introduction to educational technology courses for preservice and inservice educators
Cathy Cavanaugh, University of North Florida, USA; Terence Cavanaugh, University of North Florida, USA; Zella Boulware, University of North Florida, USA

An important experience for educators is learning to use computer technology as a teaching and learning tool. A requirement in many education programs is a course in educational technology. In Florida, a course for undergraduates and a similar graduate class fulfill that requirement. The courses include an overview of educational hardware, software, multimedia, Internet, and ethical and legal issues. Both courses have two main goals: building technology skills, and background for students to become integrators of technology into teaching. This year, six simultaneous sections of the courses were offered using a range of approaches. Two course sections were taught fully face-to-face. Three course sections were taught with students meeting in person for 50% of the time, and working in a web-based environment the rest of the time. One course section met only online. Surveys of all students were conducted at the beginning and the end of the course, and student performance on class activities and assessments was tracked. Comparisons were made on student attitudes and self-reported technology abilities, as well as course grades. The results of the comparisons will be used to determine the most effective teaching approach, and to incorporate that knowledge into planning for future semesters.

Online Technical Support Database for Educators
Cathy Cavanaugh, University of North Florida, USA

As educators depend more on technology, demand has grown for school technical support. Timely, convenient support is needed for schools to most effectively use technology. An online database was developed to provide immediate easy access to technical assistance. Developed for Florida educators, TLC: Tech Links for Classrooms, is a searchable web archive of assistance. TLC offers troubleshooting tips for hardware, software, operating systems and networking; steps for performing hardware upgrades; multimedia tutorials; and access to updates from vendors. Existing web resources were linked from the database and additional materials such as tip sheets and help files were created. Presentations related to using school computer networks, and tools to streamline the work of school technology coordinators were developed. Users may view all resources, or search the database by selecting from a list of six broad categories of resources: hardware, software, networks, general technology information, technology management, or technology training. Keyword searching locates specific topics. Search results list the resources with a link to the full resource, and a link to more detail about the resource. Resources are available as web pages, PDF files, PowerPoint presentations, database files, spreadsheets, word processing files, or multimedia SMIL presentations.

Standards of Practice: Online Educator Inservice Workshop
Cathy Cavanaugh, University of North Florida, USA; Terry Cavanaugh, University of North Florida, USA

“Standards of Practice” is a 10-hour, asynchronous web-based workshop designed for a broad range of educators. The workshop provides an overview of national and state curriculum standards and educational technology standards, and practice with choosing and integrating effective technology into standards-based teaching. Topics include effective searching, how to evaluate web sites, and how to do research on the web. The workshop was developed by university education faculty under a professional development schools grant to meet specific needs of area schools. “Standards of Practice” was offered free of charge to any teacher in the university’s professional development schools, and teachers earned a stipend during the grant period upon completion of the workshop. After completing the workshop, teachers received an automatically generated certificate that they submitted for school district inservice credit toward renewing their teaching certificates. The workshop was delivered using WebCT, and is composed of six one to two hour modules: Introduction to Technology Standards, Sunshine State Standards, Searching the Web, Evaluating Web Resources, Research using the Web, Best Practices in Integrating Technology into Standards-Based Instruction. Each module includes instructional information on the topic, links to web materials, self-paced practice activities, and suggestions for finding further information on the topic.

The Need for Assistive Technology in Educational Technology
Terence Cavanaugh, University of North Florida, USA

This paper will address definitions, services, levels of technology and application of assistive technology concepts as they relate to education. An overview of the NCATE and ISTE guidelines concerning assistive technology, and the current elements of the graduate educational degrees concerning assistive technology is provided. Federal legislation concerns the application of assistive technology in an educational setting and its possible impact on educational technologists. A model is proposed for a course concerning assistive technology and universal design to better prepare instructional technology graduates to enhance the performance of students with disabilities and design educational materials for increased accessibility. This session is intended for educators in instructional technology and exceptional education programs.

18 — Proceedings of SITE 2001 / Orlando, Florida, USA
Effective Presentation Design
Terence Cavanaugh, University of North Florida, USA; Cathy Cavanaugh, University of North Florida, USA
Increasing use of desktop presentation software has created the need for understanding basic concepts of presentation design. Software such as web page editors, Inspiration and PowerPoint now support branching navigation, custom buttons, interactive menus, program control, and web interactions. These features can make a presentation software tool powerful and adaptable for custom lesson and presentations. It is easy to incorporate multimedia elements such as sound, graphics, animation, photos, and movies into a presentation. In addition, a presentation can include Web links, and files created in other programs, such as databases, spreadsheets, and charts. This session will provide an overview of design guidelines to enhance the use of text, sound, images, video, and slide layout. Suggestions for optimizing the display of the presentation will be addressed, along with ideas for testing presentations before delivery with a variety of equipment. This information is useful for beginning and experienced presentation developers who are interested in proven principles of effective visual and multimedia design.

Mathematics Teachers on Track with Technology
Laurie Cavey, North Carolina State University, USA; Tiffany Barnes, North Carolina State University, USA
Participants will actively engage in mathematical investigations that integrate information technologies into the teaching and learning of mathematics, with the goal of maximizing the learner experience and minimizing the difficulty of its implementation. The investigations you will experience were developed for Algebra I students, but can be modified to other levels of mathematics. Discussion time will address some of the important issues in training teachers in this technology-rich instructional technique. By the end of the session, participants will be able to formulate similar instructional techniques using technology that is available to their local schools.

Modeling and Implementing Effective Technology Practices
María Victoria Pérez Cereijo, University of North Texas, USA; Mark Mortensen, University of North Texas, USA; Terry Holcomb, University of North Texas, USA
Faculty in the department of Technology and Cognition at the University of North Texas have identified several strategies to enhance students' use of technology and students' level of technology proficiency. In our instructional technology classes, future teachers are being introduced to the effective use of old and new technologies to deliver their lessons. In other courses in the department, innovations in the faster delivery of video on the Internet have allowed department faculty to store portions of videotaped class lectures on the department's server and make a sample of these available to prospective students. Thus, students may read about a class and also view a lecture before deciding whether or not to enroll in a course. Distributed learning models being used in the department make use of multiple platforms. One approach the department has developed is a program for the delivery of asynchronous and synchronous class-lecture videos with the use of streaming media and the Internet.

Letting teachers interact with the idea of “Interactivity”: What is “Interactive?”
Ozlem Cezikturk, University at Albany, USA; Gulcin Onir, San Diego State University, USA; Murat Kahveci, Florida State University, USA
This report is the findings of the research on Interactivity, to find the possible characteristics, contexts, limitations, and ideals, of Interactive Learning Environments for future mathematics and science education areas respectively. A web-based survey was used to gather data on diverse views of the academicians, researchers, and teachers. With the help of their answers and our own questioning, we were able to come up with a four-leave model for Interactivity, with social, intellectual, technical, and physical dimensions constituting the four leaves. We hope that this research would give an idea to teachers for what they should expect from “Interactivity” or not.

Instructional Strategies for Adobe Photoshop: Developing Teacher Training that Works
Barbara Chamberlin, University of Virginia, USA
Adobe Photoshop is a powerful image-editing program with extended capabilities. Unfortunately, the power and versatility of the program can result in teacher training that is too broad, difficult to apply immediately to classroom resource development, and overwhelming to those new to image editing. Instructional conditions often place additional constraints on Photoshop instruction, such as lack of adequate lab facilities and short training periods. Skill-based training in Photoshop should be relevant, easy to learn and implement, well documented with tutorials for further exploration, and should build confidence and develop problem-solving capabilities.

Supporting the Development of IT Skills of Education Faculty Staff: An Australian Case Study
Dianne Chambers, The University of Melbourne, AUSTRALIA; Richard Holbeck, The University of Melbourne, AUSTRALIA
This paper will explore the ways one Faculty of Education has approached the challenge of increasing the uses, in particular the more advanced uses, of information technology (IT) to support teaching through the professional development (PD) of staff. A range of models of professional development (such as individual consultations, group workshops, paying to attend external training) was offered to staff to assist in developing IT skills. The uptake of these different PD models is investigated, and the staff members’ perceptions of the development of IT skills, and the preferred PD models for developing IT skills are explored.

Predictive Relationships Among Certain Personality Factors and Novice Teachers’ Use of the Newer Technologies
Sharon Chambers, Texas A&M University-Commerce, USA; Brenda Smith, Texas A&M University-Commerce, USA; Sarah Sienty, Texas A&M University-Commerce, USA; Jim Hardy, Texas A&M University-Commerce, USA
Because of the emerging demand for teachers, the research data may add to the body of knowledge on professional development and be used by teacher educators and staff development programs to modify and adapt curriculum through the identification and individualization of the different personality types. Based on a better understanding of personality differences and their use or disuse

Abstracts Book — 19
of technology in the classroom, educators may be better equipped to understand how each individual approaches technology, understand students who are reluctant to learn and provide assistance to those individuals so they may better utilize technology in their teaching process.

LEADING ACADEMIC CHANGE - Through Connective Leadership and Learning

Manoj Chandra-Handa, Knox Grammar School, AUSTRALIA

Leading academic change in our educational organisations requires a paradigm shift at two levels - both in learning as well as educational leadership. The learning paradigm needs to shift from teacher-centred, "broadcast" learning to interactive, connective learning. It is an environment that focuses on learner-centred education; and the educational institution becoming a learning organisation where teachers share learning with students; and students are exposed to a curriculum infused with technology rich learning programs. To reach that colourful, compelling dream of learner-centred education, we need visionary, connective leadership in our educational institutions - a leadership that connects by two-way arrows, with a paradigm shift from independence to interdependence, from control to connection, from individual to group.

Student Satisfaction with Online Math Courses and Its Impact on Enrollments

Faith Chao, Golden Gate University, USA; Jim Davis, Golden Gate University, USA

Convenience is the most important benefit perceived by online students of the asynchronous online delivery format. Students appreciate the flexibility of course access at any time and in the comfort of their homes or at the office. That online courses are well received by Golden Gate University students is not surprising, as our student body is predominately composed of part-time students who work full-time. Three years ago the math faculty was asked to put a number of courses online. Anticipating difficulties, the math faculty worked hard to design courses that somehow transcend these problems. In the initial stages of development we feared that the online popularity would not extend to graphics-based courses such as those typically taught in the Math department. How would the student draw a graph or write a formula over the Internet without first learning sophisticated software packages? How would they communicate with faculty and classmates other without this capability? In this paper we will present enrollment trends of online math classes verses traditionally delivered classes in relationship to enrollment trends university-wide. In addition, we will present an overview of the characteristics of our online courses and present findings from recent research on online instruction.

Teacher's stages of development in using visualization tools for inquiry-based science: The case of Project VISM

Michael T. Charles, Eastern Michigan University, USA; Robert A. Kolvoord, James Madison University, USA

Scientific visualization tools have shown tremendous promise in drawing today's increasingly visual learners into in-depth inquiries in mathematics and science. One of the critical questions surrounding the use of these relatively advanced tools is the stages which teachers go through in moving these tools into their own practice. In this paper we examine existing schemas for these stages of development. Then we relate one of those schemas to Project VISM, an ongoing NSF-funded project intended to help middle school and high school math and science teachers learn the techniques and application of data visualization for their own classroom. We describe these stages of development for each of four different scientific visualization tools. Then we conclude the paper by proposing some further development of the models based on our experience followed by a brief discussion of related issues.

Technology and Teacher Preparation: A Case Study

Regina Chatel, Saint Joseph College, USA

Over the past several years, I have attempted to raise both the computer knowledge level and the computer comfort level of preservice teachers by: 1) integrating technology into my own teaching, 2) using technology to foster preservice teacher inquiry and high level thinking, and 3) using technology to encourage preservice teachers to become educational leaders. However, I have found that many students in my literacy education classes are terrified at the mention of computers, and feel that they cannot master computer-related activities. This report describes several of the activities and assignments and their impact on preservice teachers' perceptions of the role, use and purpose of technology in the classroom. As a result of participation in this session, participants will (a) examine preservice teacher existing attitudes toward the use and role of technology in their own learning, (b) examine the effect of courses which have integrated technology into the teaching and learning processes on preservice teacher attitudes, (c) examine which instructional strategies appear to have a positive effect on these attitudes, (d) examine the extent to which preservice teachers can speculate on the use and role of technology in their future teaching.

Co-operative Teaching and Learning in Information Technology and Modern Foreign Languages

John Chatterton, Sheffield Hallam University, England; Christopher Willan, Sheffield Hallam University, England

This paper examines three years' experience of collaborative teaching and learning of ICT on a PGCE course leading to qualified Teacher Status. Groups of students intending to teach ICT as their subject specialism have worked with groups training to teach Modern Foreign Languages to develop MFL teaching and learning materials that make effective use of ICT. They have then worked together in local secondary schools, using the materials to teach pupils from across the secondary age range (11 - 19). This paper examines how these experiences change the attitudes to ICT of Modern Foreign Language students and how it affects their subsequent use of ICT to deliver MFL teaching and learning in the secondary school classroom.

Reform in graduate school technology program

Celestine Cheeks, Towson University, USA

This paper presented a summary of research that was collected over a two year period for the purpose of evaluating a graduate School Library Media Program. Reform in professional education programs that train school library media specialists provides opportunities to eliminate disparity between job competencies taught and job competencies required by school library media specialists in their jobs. Because school library media services radically changed its emphasis at the end of the second millennium, from focusing on resources
to students to creating a community of lifelong learners, it is essential that professional programs that train school library specialists keep pace with current job demands. Program evaluation that leads to a redesign model that prepares graduate students for their roles as leaders and directors in today’s technology-centered schools was needed. This process of evaluation and redesign was undertaken and will be highlighted. The results of this study is the basis for program reform.

Analyzing Bilingual Education Preservice Teachers' Learning Outcomes in a Computer Literacy Course; From the Technological Perspective and the Pedagogical Content Perspective

Irene Chen, University of Houston - Downtown, USA; Sandy Cmajdalka, University of Houston - Downtown, USA

This paper presents findings of a study designed to analyze student performance from two unique perspectives: the technological perspective and the pedagogical content perspective. The student population consisted of three separate cohort groups enrolled in a computer literacy course (CS 1105) and a bilingual instructional reading course (READ 3303) concurrently. Students were enrolled in the courses during the fall 1999, spring 2000, or summer 2000 semesters. All students were preservice teachers in the bilingual education program at the University of Houston-Downtown’s Department of Urban Education. During the semester enrolled, the students were required to complete several major assignments integrating technological content knowledge with pedagogical content knowledge. Assignments included the creation of an instructional lesson plan, a World Wide Web search for information to be used instructionally, and the production of a graphic organizer to present educational information. For each assignment, students were to show their mastery of the technological tool while also showing competence in a pedagogical content area. All student assignments were evaluated by both the technology professor and the bilingual teaching professor. This study collected information on the similarities and differences between the grade received and comments noted by the two professors, each from a different perspective.

Redesigning an Educational Computing Course to Meet New State Technology Initiatives

Linlin Irene Chen, University of Houston Downtown, USA

The Department of Urban Education (UE) at University of Houston-Downtown first began in the fall semester of 1995. It has just started along the technology trail to learn from other institutions that have already addressed some of the issues and found some answers. The shared goal of the faculty in the department is to offer an educational computing course that falls on the end of “teaching with technology across the curriculum”. The one credit hour educational computing class CS1105 is in the process of being redesigned by the UE faculty as a 3 credit hours class ETC 3301. The brand new ETC 3301 is proposed to open to all entering pre-service teachers starting spring 2001. Texas Education Agency, State Board for Educator Certification, and several other governing institutes of teacher education programs in Texas are raising standards for computer literacy for new teachers. It was suggested to all computer literacy courses to conform to the current versions of the national and state frameworks and guidelines. On the survey, the students were asked to evaluate their skill levels on using programs such as spreadsheet, database, and philosophy of using technology. This paper will also analyze results from student’s self-reports completed on the first day of class for three semesters. The students’ input will be implemented into the redesign of the CS1105 to ETC 3301. The paper will discuss the processes of redesigning the educational computing course to meet new state technology application initiatives.

The Great Digital Divide Found in American Education: The increasing technological disparity in America’s schools

Linlin Irene Chen, University of Houston Downtown, USA; Jane Thielemann, University of Houston Downtown, USA

Within the past decade, a growing body of evidence supports the ever-widening technological gap among American school children (U.S. Department of Commerce, 1998). The “Digital Divide,” a leading economic and civil rights issue, is defined as the divide between those with access to new technologies and those without. Disparity in computer use can be found among rural, urban and suburban students, with the division drawn upon socio-economic lines. This trend indicates that the “haves” possess increasingly more information and economic opportunity, while the “have-nots” are lagging even further behind. Groups that lack access to information resources include: minorities, low-income people, less education people, children of single parents, and residents of rural areas or inner-cities (http://www.ntia.doc.gov/ntiahome/fttn99/contents.html). Since many people do not have knowledge of technology to pass onto their children, schools will serve as the catalyst for preparing America’s youth for the age of technology. Data indicate that outside of work, schools are the second most frequent place where people access the Internet, 33% of access is made from schools (http://www.digitaldivide.gov). Since schools are so important for technological education and access, the U.S. Department of Commerce has arranged for additional funds to aid American schools in purchasing technology. These funds are now available for nonprofit educational organizations and public school districts. Educators must recognize the manifestations of the technical inequality as it affects the lives of America’s school children and must become aware of initiatives, both federal and private, that will provide the means and methods to narrow this gap. The purpose of this paper is to describe the “Digital Divide” and explain the steps needed to be taken by America’s educators to close this gap.

Project Learning Links: A Model for Integrating Technology into Teacher Education

Christine O. Cheney, University of Nevada, Reno, USA; Steven E. Cavote, University of Nevada, Reno, USA

“Learning Links” is a PT3 project housed at the University of Nevada, Reno. The project uses a four-component model to infuse technology in all aspects of the undergraduate teacher education program: (1) modeling, (2) integrating, (3) enhancing, and (4) applying. University faculty are given technological assistance and incentives to develop the skills and uses for technology within their existing education courses. Data describing the current level of technology use by the faculty, as well as their attitudes toward technology, will also be shared and the implications discussed.

The Technology in Education Competency Survey (TECS): A Self-Appraisal Instrument for NCATE Standards

Abstracts Book — 21
The Effects of Web Pages Design Instruction on Computer Self-Efficacy of Preservice Teachers

LiLi Chu, National College of Physical Education and Sports, Taiwan, R.O.C.

This study tested the effects of web pages design instruction on improving computer self-efficacy of preservice teachers. A sample of 206 preservice teachers who registered in five sections of a course related to computer network application in instruction participated in this research. Demographic data, prior computer experiences, and computer self-efficacy measure were collected in the first class section. Then a 14-week instruction of web pages design proceeded. Computer self-efficacy scale, computer network anxiety scale, and software self-efficacy measure were processed again at the end. The instruction of web pages design did significantly improve the computer self-efficacy of preservice teacher. Various computer experiences, including computer use time, internet link time, the use rate of word processor, e-mail, game, presentation software, were significantly related to computer self-efficacy. A negative relationship between computer self-efficacy and computer network anxiety was found. Generally, it is confirmed that most educators believe to increase the opportunities to learn and use computer may facilitate the confidence and competence of preservice teachers.

The role of teacher mediation in the development of hypertextual projects

Maria Vittoria Civiletti, Universidade Gama Filho and Universidade Federal Fluminense, Brazil; Ana Maria Santos, Universidade Gama Filho, Brazil; Luciane Santoro, Universidade Gama Filho, Brazil.

This research aims to investigate the role of teacher mediation in the development of cooperative learning and autonomy. It was based on the constructivist and social interactional learning teaching conception. In order to do that, we accomplished a longitudinal case study with genetic analysis of the occurrence of situations involving co-operation and autonomy among 8-10 year old children in the course of a work project using Micromundos software. The teacher organized a field journal and four categories were used in its analysis: “Cooperative learning”, “Autonomy”, “Non-existent cooperative learning” and “Heteronomy”. The increase of the two first categories and the extinction of the last ones were verified during the intervention, demonstrating the importance of teacher’s intervention in the development of those characteristics.

Brasillian National Computer Program for Education and its Contribution to a Constructivist Educational Process

Maria Vittoria Civiletti, Universidade Gama Filho and Universidade Federal Fluminense, Brazil; Maria das Graças Silva, Secretaria Municipal de Educação/RJ, Brazil.

The current study aimed to evaluate the teacher mediation in the development of cooperative learning and autonomy. It was based on the constructivist and social interactional learning teaching conception. In order to do that, we accomplished a longitudinal case study with genetic analysis of the occurrence of situations involving co-operation and autonomy among 8-10 year old children in the course of a work project using Micromundos software. The teacher organized a field journal and four categories were used in its analysis: “Cooperative learning”, “Autonomy”, “Non-existent cooperative learning” and “Heteronomy”. The increase of the two first categories and the extinction of the last ones were verified during the intervention, demonstrating the importance of teacher’s intervention in the development of those characteristics.

Teacher Created Virtual Field Trips

Kenneth Clark, Georgia Southern University, USA; Alice Hosticka, Georgia Southern University, USA; Marti Schriver, Georgia Southern University, USA; Jackie Bedell, Georgia Southern University, USA.

This paper will discuss the use of technologies, commonly found in schools, to develop and create virtual field trips. The discussion will focus on the advantages of both using and creating these field trips for instructional situations. A virtual field trip to Cumberland Island National Seashore, St. Mary’s, GA will be used to discuss the technologies involved and the value of their use for instruction in a science classroom. While this field trip is being used as a discussion point, the techniques and advantages identified can be applied over a P-16 grade range in all subject areas. This of creating a virtual field trip can be as simple as using digital pictures and text in Microsoft PowerPoint or Hyperstudio or as complex as using digital video and panoramas in MacroMedia Director. The level of complexity will depend on the technology available and skills of the developers.

Tech Ambassadors: The Next Generation of Professional Development
Qualitative Data Analysis to Ascertain the Benefits of a Web-Based, Teacher Oriented Project
April A. Cleveland & John Park, North Carolina State University, USA

Qualitative data is often overlooked when judging the success or failure of a web-based project, but can be a valuable resource in evaluating the potential needs and experiences of the participants. Research has determined that the use of both qualitative and quantitative data as an analysis tool to determine the success or failure of a venture provides a holistic look that provides insights that may not have been obvious in a quantitative only type evaluation. This paper will analyze the use of qualitative data to determine the benefit of a teacher oriented web-based project. The participants, who were upper level elementary, middle and high school teachers, participated in the web project in one of two ways. One, by attending a three-hour workshop in which they were introduced to the online project and instructed in its use. Secondly, they could participate online, by completing a registration form and receiving a password that allowed them to access a web tutorial as an introduction to the project. The purpose of this analysis is to determine if and to what extent peer-to-peer interaction and face-to-face interaction with a workshop leader affects the involvement and participation in a teacher oriented web-based project.

Teaching & Technology: A Natural Integration
Carole Cobb, Ph.D., Bellarmine University, Jefferson; Ivan Baugh, Bellarmine University, Jefferson; Jan Goings, Bellarmine University, Jefferson

In keeping with the School’s theme Teachers as Reflective Learners, the Middle/Secondary MAT Program’s aim is to produce forward-thinking professional educators who are culturally responsive, inclusive and reflective in their teaching. The Program provides high quality educational experiences which enable pre-service teachers to gain conceptual proficiencies for creating a secure, caring, learning environment that appeals to a wide variety of students; and that supports both a sense of collective purpose and individual construction of complex responses. This is achieved through the use of instruction and management tools; create activities used throughout the curriculum for teaching and learning and for assessing and evaluating student progress; and through use of on-line discussion group assignments. Our constructivist educational approach stresses teaching for meaning-making rather than memorization or practice of rote skills. It calls the MAT students to construct their knowledge as active inquirers into the subjects they are studying. Some memorization and rote-skill may be incorporated into their learning, but only to assist the overall goal of furthering their students’ active understanding.

Change as the Constant in Creating Technology Rich Learning Environments
Connie S. Collier & Theresa A. Minick, Kent State University, USA

As members of the implementation team for the Preparing Tomorrow’s Teachers to Use Technology (PT3), we regularly participate in meetings focused on strategies for intensifying and broadening the use of technology rich practices in teacher preparation. Essential to our successful experiences with technology and innovative teacher preparation has been our willingness to participate in ongoing change. This change is multidimensional as it relates to the nature of our classroom, course content, and technological strategies used to accomplish our goals for student learning. If we have come to know anything as a result of our participation with technology integration it is that change is the constant.

The role of IT in the classroom and its implications for pre-services teacher education.
Lorraine Connell, NTU, Australia

IT in the classroom and its implications for pre-service education. A return to the classroom to explore how IT can be used as an educational tool with a class of Yr1/2/3 children. What I discovered has implications for the content of the IT unit in the pre-service teacher education course.

Applications of Knowledge Based Evaluation in Educational Technology.
Michael Connell, University of Houston, USA

In an emerging system, one of the primary functions of the founders should be to explore acceptable justification systems. Consider, for example, intuition, logic, or causality. In doing this, it is helpful to recognize that each choice of systems—even if only made on a temporary basis—will have significant impacts on which true items may be proven and which false items may be disproved. When this is done if it is true that a meaningful evaluation is possible with only a shared justification system present. Items of truth and belief, although of extreme interest to the parties of most evaluations, are shown to be irrelevant to the advancement of knowledge that may come about as a result of the evaluation itself.

A Planning Model for Integrating Technology and Educational Methodologies in the Pre-Service Teacher Education Program
Pamela Cook, Notre Dame College, USA

The Modeling Instruction with Modern Information and Communication Technologies (MIMIC) Project involves a consortium of 5 Cleveland Area colleges, including Notre Dame College, which provides pre-service teacher education. MIMIC, funded by a US DOE Preparing Tomorrow’s Teachers to use Technology (PT3) grant, targets three populations as teaching models for pre-service teachers:
(1) Higher education faculty who deliver methods and foundations instruction; (2) K-12 teachers who supervise pre-service field experiences; and (3) Higher education Arts and Sciences faculty. As coordinator of the Notre Dame technology endorsement and the MIMIC project, my challenge is to help each of the target populations use a consistent, effective process when planning and revising their curricula to integrate technology. As such, I developed a 3-stage planning model to blend constructivist and directed teaching paradigms into pre-service teachers. The following benefits of using the model will be highlighted: (1) a clear starting point for planning; (2) a system for customizing individual components (content area, grade level, assessment methods, etc.); (3) ways of identifying choices made in each stage of planning; (4) a way of identifying technology skills needed for chosen components; and (5) a method for developing independence in planning.

Integrating ISTE & NCATE Standards into Educational Technology Masters Programs
Steven Coombs, Sonoma State University, USA

Educational Technology Masters programs are coming of age! The International Society for Technology in Education (ISTE) has published a five-step blueprint outlining the curriculum standards requirement for all advanced programs in educational computing and technology (ECT) leadership. This paper examines these standards and explains how they’ve been recently interpreted for all future Ed. Tech.-related Masters courses at Sonoma State University (SSU).

Growing the Learning Landscape: Experience in Environment and Process
Peter Cooper, Sam Houston State University, USA; Jeannine Hirtle, University of Texas-Arlington, USA;

Teachers are faced with implementing technology provided without consultation, often without consideration of the infrastructure, much less the technical or curricular training necessary to make full use of it. Too often we focus our attention on the Mountains of Technology forgetting that landscape is more than just the one prominent feature; it encompasses the Streams of Curriculum Change, the Evergreens of Knowledge, the High Plains of Critical Thinking, the Safe Arbors of the Community. Through all this rich environment blow winds of administrative, political, and social change that can make barren former gardens of thought and pile rich soil in new areas. Should we as teacher educators help them scale the mountain to obtain a different perspective or encourage them to skirt around, treating the intruder as a stumbling block to their journey and as eyesore that hides and overshadows part of the landscape? What follows is a descriptive case study that examines one university program’s attempt to resolve apparent disparities between the learning and integration of technology into K-12 environments.

Views from an Asian Bridge How International Students See Us and Still Survive
Richard Cornell, Corey Lee, Sam Pan Chang, Michael Tsai & Terry Tao, University of Central Florida, USA; Andy Ku, Arizona State University, USA

Increasing numbers of international students are entering the graduate programs in the area of Instructional Technology at the University of Central Florida. With this influx comes a series of communications and miscommunications between American faculty, staff, and students with their Asian and other international peers. This article and presentation describe the problems encountered and efforts being made to resolve them. It is our hope that other faculty, staff, and students from North America will benefit from our experiences.

Towards a reading and text production practice with FL learners: a collaborative text construction with FL groups of French, English, and Spanish in the Web via the EquiText
Janete Sander Costa, Joice Armani Galli, Lara Oleques de Almeida & Paulo Coimbra Guedes, Universidade Federal do Rio Grande do Sul, Brazil

An FL pedagogy, integrating reading and writing skills in foreign language teaching, associated with Web resources, may contribute to the development of those skills while producing collective texts. The EquiText, a collaborative writing tool, allows for innovations in text production either through teamwork or individually, mostly asynchronously. The readers/writers’ participation in text production may promote virtual interactions among the writers (FL learners), and their readers (the lecturer, the other fellow writers, researchers/observers). Another perspective of the current sole text reader, writer and evaluator is suggested. We propose to analyze the usefulness of the EquiText in significant written discourse as a result of the interactions in the tool. Three foreign language productions sustain our assumptions: texts produced by intermediate Brazilian college learners of French, English and Spanish as FLs, either individually, in paper, or in teams, using the EquiText, with significant results.

The Quest for scientific inquiry: A document analysis of Quest projects.
Gregory Coverdale, St. Cloud State University, USA

The 1996 release of the National Science Education Standards (NRC, 1996) energized the national focus on improving U.S. science education in K-12 schools. The standards provide a strong emphasis on inquiry as the primary pedagogical framework in promoting science literacy. Similarly, the recent release of the National Educational Technology Standards (ISTE, 2000) has catalyzed the process of integrating information technology across the curriculum. The ISTE standards provide a curricular framework for technology integration and correlate technology-rich learning activities to standards in several content areas. Thus, these two policy documents provide teachers and students a detailed roadmap for pursuing science and technology literacy; the cornerstone of both literacies being the inquiry process. This paper is a qualitative document analysis of one commercially produced Quest project: AsiaQuest. The paper also examines preservice teachers’ reflections on their participation in Quests as part of their professional preparation.

Developing an understanding of the social studies through technology-rich Quest projects
One of the difficulties of teaching and learning in K-12 social studies classrooms is the "fuzziness" of the discipline. What do we mean by social studies? The Curriculum Standards for Social Studies: Expectations of Excellence (NCSS 1994) provide a detailed framework for describing the curricular foci of the social studies by dividing the social studies into ten thematic organizational units. These themes are further delineated by performance standards for the early grades, middle grades, and high school. This paper is a qualitative document analysis of a technology-rich, interdisciplinary curriculum produced by Classroom Connect, a major producer of technology education products. This analysis focuses on the social studies themes present in one specific Quest project: AsiaQuest.

Welcome to the Virtual Library! Are You Prepared to Enter?
Fannie Cox, University of Louisville Libraries - Ekstrom Library, USA

Like so many other university libraries, the University of Louisville Libraries is creating an environment where the university community, its students, faculty and staff can access information from "virtually" anywhere in the universe. No longer does one have to physically go to a building and search the card catalog. One can search the University Libraries electronic resources from home as well. But, with this new level of access come pitfalls. Faculty and students were already amazed with the abundance of information available from the Internet and now the University Libraries has increased the level of access by making electronic resources (journals, books, and databases) accessible using Internet technology through the University Libraries gateway and online catalog. This paper will discuss the differences between the Internet, the University of Louisville's gateway and the online catalog, by demonstrating a few of the major electronic resources accessible through the Internet. And, it will enlighten faculty and graduate students on the differences and similarities of searching the Internet, the University Library's gateway and the online catalog to become knowledgeable and efficient searchers for information in today's virtual library.

The Integration of Assistive and Adaptive Technologies Into the Preservice and Advanced-Level Courses of Instructional Technology and Special Education
Caroline M. Crawford & Sylvia S. Martin, University of Houston-Clear Lake, USA

Instructional technology has become a tool that is integral to the preservice teacher educators' bag of tricks; however, the integration of assistive and adaptive technologies into the learning environment to meet the needs of special education learners is sometimes perceived as more cumbersome. The integration of assistive and adaptive technologies into the preservice and advanced-level instructional technology courses is discussed.

Supporting the Professional Development of Preservice and Inservice Instructors: Aspects Toward a Nurturing, Creative Learning Environment
Caroline M. Crawford, University of Houston - Clear Lake, USA; Terri Edwards, University of Houston, USA

Professional development opportunities must offer a learning environment that creates a nurturing, creative, successful atmosphere for the learners. Instructional design models, learning styles and technology implementation strategies impact this supportive environment.

Integrating Technology into the Young Child Lesson Plan
Michael Bell, University of Houston - Clear Lake, USA; Caroline M. Crawford, University of Houston - Clear Lake, USA

The support of the early childhood and instructional technology faculty members offer the teacher candidates a supportive environment through which to design, develop, discuss and revise a lesson plan. Such a learning experience offers the teacher candidate the opportunity to think through the real-world process of integrating instructional technologies in appropriate and successful student-centered manners.

Maryland Technology Outcomes and Performance Assessments for the Beginning Teacher
Marcia B. Cushall, Frostburg State University, USA

A Maryland task force consisting of K-12 teachers and coordinators, higher education faculty, Maryland State Department of Education personnel, and personnel from the Maryland Higher Education Commission convened in April 1998 to begin to develop technology outcomes and performance assessment tasks for beginning teachers in Maryland. The draft outcomes developed by this task force were distributed to schools and professional organizations for feedback. The task force, lead by the Maryland State Department of Education, applied for and received a PT3 Catalyst Grant to continue its work. Supported by funding from the grant, the outcomes were revised and draft performance assessment tasks were developed for three of the seven outcomes. In fall 2000, these tasks were piloted on several campuses and work began on the assessments for the remaining four outcomes. Participants will be encouraged to offer feedback on the content and form of the outcomes and assessments.

Integrating Technology into a Teacher Education Diversity Course
Ramona Maile Cutri, Department of Teacher Education, Brigham Young University, USA

This paper presents initial insights gained from integrating technology into a required multicultural education course. Students were required to include sources from the Internet in an assignment where they explored how a cultural group other than their own was represented in the media, curriculum, and policy. The range of Internet sources students found included easy to locate sites such as the state department of education site to highly specialized sites focused on a particular cultural group. Students' ability to critically analyze the on-line content they found greatly varied. Some students merely summarized content. Others students applied terms and concepts from multicultural education to identify the messages conveyed through the sites and the potential impact of these messages on students and teachers. Greater attention must be devoted to teaching students how to critically analyze on-line material if the Internet is to serve as a teaching tool for diversity.

The Challenges of Interfacing Between Face-To-Face and Online Instruction

Abstracts Book — 25
Nada Dabbagh, George Mason University, USA

The use of the Web for instructional purposes at higher education institutions has crossed the spectrum of distance education delivery contexts, ranging from the Web being used to supplement face-to-face instruction to a primary delivery mechanism for instruction. This article discusses the migration from face-to-face classroom instruction to Web-Based Instruction (WBI) through the experience of a faculty member in the creation and teaching of Web-based courses at a higher education institution. Specifically, four areas which represent challenges for faculty will be discussed: issues surrounding course content; technological assumptions; logistical and implementation challenges; and interfacing between face-to-face and online learning environments. Guidelines for effectively integrating components of a WBI system to support the teaching and learning process in each of these areas will be provided.

Developing Professional Development Schools: An Integrated Model
Evelyn M. Dailey, Towson University, USA; Sally McNeils, Towson University, USA; Robert Wall, Towson University, USA; Miriam Struck, Towson University, USA

The creation of Professional Development Schools (PDS) is a key component of the Conceptual Framework for Professional Education at Towson University and the Redesign of Teacher Education (MHEC, 1995). Since 1994 Towson University has been committed to the development of the PDS. Although the PDS model occurs at the elementary and secondary levels, for the most part it has been limited to general education environments (Berry & Cotoe, 1994). The PDS movement has invigorated teacher education programs across the country, but as yet its effectiveness is in doubt (Byrd & McIntyre, 1999). Similarly, most of the PDS information is acquired from general education classrooms. The effectiveness of the PDS model has not been validated for special education. The purpose of this paper will be to present preliminary findings validating an integrated PDS model for secondary level students with special needs.

A Partnership for Training Teachers: Using Technology-Rich Cohorts
Daniel Ryan, National-Louis University, USA; Kathy Onarheim, Milwaukee Public Schools, USA; Cindy L. Anderson, National-Louis University, USA

Today’s preservice teachers will be teaching the workers of tomorrow. These future workers must be trained for a world where projections indicate that five of the ten fastest growing job areas will be computer related (College Planning Network 1996). In response to the need for training technology-adept teachers, a partnership between National-Louis University and the Milwaukee Public Schools in Wisconsin, Prince George’s County Schools in Maryland, and Prince William’s County Schools in Virginia was made with the goal of combining their efforts to train teachers who will be fluent in technology integration for the participating schools districts. Funded by a PT3 grant, Transforming Learning and Teacher Preparation through Technology-Rich Cohorts, National-Louis University (NLU) is providing the faculty to teach the courses and is recruiting the preservice teachers who each have a laptop computer to use. The participating school districts are providing the location for the teacher education classes, the necessary computer labs for the training, and the clinical placements in technology-rich classrooms for the preservice teachers. This presentation will be a report on the current progress of the grant. During this first year, the grant actively involves the Milwaukee Public Schools. Representatives from both the district and National-Louis will describe the part that each institution has played to begin the training of technology-proficient preservice teachers. Samples of selected student electronic portfolio artifacts developed as part of the program will be demonstrated also.

Creating Virtual Learning Communities in Africa: Issues and Challenges
Osei K. Darkwa, University of Illinois at Chicago, USA

This paper discusses the growing application of information communications technologies in Africa and other parts of the world. It examines the growing global information technology revolution and how it is transforming educational institutions. It then discusses the state of distance education in Africa, identifying the institutions offering distance education and the nature of the delivery platform used. The prospects and challenges in introducing distance education to tertiary institutions in Africa is discussed. Finally, it offers suggestions to overcome the challenges confronting technology-based education in Africa.

Establishing a New Paradigm for On-line Education
Anthony R. Davidson, Anne Stanton & Steve Albanese, New York University, USA

The steady evolution of communications technology (radio, television, interactive video, audio-graphics, electronic mail, Internet, intranet) has considerably influenced the development of distance learning. This third generation of distance education, which includes interactive video, email, Internet, intranet, and audio graphics technologies, learning activities via these distance education systems has been redefined to include and focus on teacher-student interaction. This paper examines technology, student lifestyles, faculty characteristics and continuity, quality and quantity of courses, quality and quantity of students, and interactivity as the primary ingredients of a successful and effective on-line education program. In particular, the program at the Information Technologies Institute in the School of Continuing and Professional Studies at New York University, an asynchronous education programs, is demonstrated and evaluated. Instructional design principles and novel authoring concepts are introduced to the online course environment.

Dilemma Analysis of Constructive Case-based Approach to Distance Learning
Niki Davis, Qian Li & Rema Nilakanta, Iowa State University, USA

This study explores the dilemmas faced while teaching a course on distance learning based on constructivist learning principles using case studies. The course is open to undergraduate as well as graduate students. It is a hybrid course. The class meets once a week for two hours and the remaining time interacts online using WebCT, an online course management software. The course design draws on constructivist learning theories of Vygotsky and Lave and Wenger’s theory of authentic learning. The students are introduced to concepts of distance learning by studying real-life cases and also developing and analyzing their own cases of distance learning. Such an approach presents dilemmas at every stage of its development, for example, the need to strike a balance between breadth and depth of content.
to be covered. The authors continue to struggle with similar issues causing them to constantly review and revise their design leading to a fuller, richer learning experience.

Infusing technology in K-12 classrooms: A study of one method used to evaluate the impact of a teacher-focused technology integration program

David Dean, Eastern Washington University, USA

The purpose of this presentation is to describe one method used to evaluate a program designed to prepare teachers to integrate technology into the classroom so that children will become capable and confident users of technology. A quasi-experimental evaluation method, which was used to evaluate the Gates Foundation’s Teacher Leadership Project in Washington state, will be presented and discussed. Goals of this presentation include: (a) describe one method to evaluate technology infusion efforts; (b) demonstrate the kinds of findings which can result from this evaluation method; (c) describe some of the logistics associated with administration of technology infusion efforts.

Curriculum Models for Computing and Information Technology: Are We Keeping Up with The Changes?

Fadi P. Deek, New Jersey Institute of Technology, USA; Howard Kimmel, New Jersey Institute of Technology, USA

Recent efforts in the development of national and state curriculum standards focus mostly on the content taught in each discipline and are meant to define the skills and knowledge of the discipline to be acquired by every student. For this to happen, school curricula must be aligned with these standards. In order for the students to gain these skills and knowledge, teachers must acquire a body of knowledge that encompasses what is defined by content standards plus the pedagogical skills that will allow teachers to guide their students in the acquisition of the discipline’s skills and knowledge. This paper focuses on the current state of teacher preparation programs and the requirements needed to teach computing and information technology.

Teachers’ perceptions of self efficacy and beliefs regarding information and communication technology (ICT)

Francine deMontigny, University of Quebec in Hull, Canada; Lyne Cloutier, University of Quebec in Trois-Rivieres, Canada; Nicole Ouellet, University of Quebec in Rimouski, Canada; Françoise Courville, University of Quebec in Chicoutimi, Canada; Ginette Rondeau, University of Quebec in Abitibi-Témiscamingue, Canada

Since September 2000, five universities spread out across the Quebec province (Canada) are working together as networked learning environments (Chute, Sayers, Gardner, 1997), offering a joint master’s degree in nursing. This geographic layout represents a big challenge in terms of allowing a specific teacher’s expertise to be available to students from all five institutions. Integrating information and communication technology (ICT) in the program appears to present interesting possibilities in terms of enhancing access to knowledge but also in terms of promoting networking activities. In order to implement technologies into this graduate program a three year project aimed to develop ICT competencies in both students and teaching staff. Other colleagues’ experience and the literature has taught us that actors’ motivation is essential for the success of such projects. It thus appeared obvious that our first step had to be the proper identification of teachers’ perceptions of efficacy and beliefs. An exploratory research with a mixed research design examined both concepts with twenty four nursing professors as participants. We will present nursing teachers’ self-efficacy perceptions (Bandura, 1996) and beliefs (Wright, Watson & Bell, 1996) in regards to information technology and recommendations for education, research and practice.

Scoring for Preservice Teachers’ Electronic Portfolios: Issues of Feasibility and Reliability

Carol Derham, Lehigh University, USA; Alec Bodzin, Lehigh University, USA

Electronic portfolios are becoming popular tools in teacher education programs across the country. Little research exists, however, on the reliability of attempts at scoring electronic portfolios. This paper will share results of a study investigating the feasibility and reliability of scoring preservice teachers’ electronic portfolios. Using a well-defined rubric, specific portfolio guidelines, and multiple raters, the researchers examined the extent to which electronic portfolios can be reliability assessed. Collected data include inter-rater reliabilities, rater agreement percentages, and perceptions of both participants and scorers regarding the process. Implications for electronic portfolio development in teacher education programs will be discussed.

The JASON Academy: Explorations in Online Science for Middle School Teachers

Marilyn DeWall, JASON Academy for Science Teaching and Learning, USA

The JASON Foundation for Education supports the award-winning JASON Project, a year-long, multimedia, interdisciplinary program involving students and teachers in real-time science expeditions and exciting interactive curricula linked to the national geography and science standards. The JASON Academy, the Foundation’s newest initiative, will offer online science content courses to middle level teachers, beginning in Fall 2001, for graduate credit and advanced certification. Intended audience: middle school teachers, administrators, and teacher educators.

APPLICATIONS OF A BEST PRACTICE STUDY: IMPLICATIONS FOR TECHNOLOGY INTEGRATION IN THE ELEMENTARY CLASSROOM

Laurie Dias, Georgia State University, USA

Best practice literature asserts that both the social aspect of learning by collaboration and an individual’s need to explore and experiment are best directed through pedagogies based on constructivist theory. Leaders in the field of instructional technology also recognize that an instructional context based on these principles has significant implications for use of technology that promote meaningful learning. Nevertheless, it is not media that influences learning; rather, it is the instructional design that employs effective teaching strategies that makes an impact. With the emphasis on National Educational Technology Standards for Teachers (NETS-T) and its performance indicators, it will be important for school administrators and others in leadership roles to understand what constitutes best practice.
in technology integration. When administrators evaluate teachers using technology, it is imperative that they know what to look for. They should not be overly impressed by the mere use of technology. They should be discerning about the pedagogy that accompanies its integration. This paper presents the results of a study on four teachers’ technology integration practices. It concludes by calling for informed appraisals of teachers as they diffuse technology into their curriculum.

An N-dimensional Model for Digital Resources
Charles Dickens, Tennessee State University, USA

Information technologies currently available to our teachers have the power to transform the nature of the communication process for instruction. This paper explores an n-dimensional concept model for meaningful classroom instruction. The n-dimensional concept for instructional communication is developed and examples presented which demonstrate ways in which teachers can model knowledge creation appropriate to a digitally mediated information environment. Combining constructivist learning theory, multiple modes of knowledge representation, visual thinking, and the mathematical concept of multiple dimensionality (i.e., n-dimensional or hyperspace) the theoretical foundations and classroom application of these principles with examples for elementary and middle grade curriculum content are presented.

Economics, Information Literacy, and Teacher Education
JoAnna Dickey, Eastern Kentucky University, USA; Steven W. Dickey, Eastern Kentucky University, USA

When preparing future educators to teach the concepts and principles of economics to K-12 students, it is recommended that not only should these preservice teachers be provided with experiences in economic theory and thinking skills, but also be provided with skills in the area of information literacy. Information literacy skills include reading, evaluating, etc. data from print and non-print sources. The use of computers, networks, and other technologies is essential in the development of this type of literacy. A brief presentation of information concerning the basic economic concepts and principles recommended for K-12 study in the state of Kentucky will be provided. A demonstration of classroom applications of economic concepts and the use of information literacy will be given. And, an explanation of how economic theory can be presented to preservice teachers through the use of information technology.

Cost Effectiveness and Distance Education: A Perspective
Steven Dickey, Eastern Kentucky University, USA; JoAnna Dickey, Eastern Kentucky University, USA

This paper begins by examining the possible motivations for distance education as a prelude to considerations of cost effectiveness. Alternate methods for delivering distance education are compared in terms of perceived needs and cost effectiveness. Problems associated with on-campus versus off-campus courses are also discussed.

Yekioyd Statistics and Their Interpretation
Steven Dickey, Eastern Kentucky University, USA; Kevin Zachary, Eastern Kentucky University, USA

This paper introduces three new statistics for item analysis. The statistics are presented at the level of their construction with numerical examples. They are then compared to other statistics that are commonly used for assessment design. Their advantages as diagnostic tools are discussed. Free software for implementing these statistics is discussed and offered to participants in the session.

A comparative project: web-based faculty development versus print-based faculty development.
Melissa Diers, University of Nebraska Medical Center, USA

This presentation reports the findings, research methodologies, and lessons learned of a Master of Arts in Education: Instructional Technology Thesis research project. The research determined whether randomly selected University of Nebraska Medical Center faculty who completed a web-based faculty development tutorial performed equal or better on an awareness questionnaire than faculty who completed a print-based faculty development tutorial and awareness questionnaire.

Teaching Mathematics by Means of MathTrainer
Fernando Diez, Universidad Antonio de Nebrija & Universidad Autónoma de Madrid, Spain; Roberto Mariyón, Universidad Autónoma de Madrid, Spain

This paper describes MathTrainer, a system that guides the student while learning mathematical concepts that involve symbolic manipulation, like the resolution of Ordinary Differential Equations. MathTrainer shows students the steps that are required to solve exercises with symbolic calculations. The exercises are posed by the system. The student can also modify some of the formulae that appear in a statement and ask MathTrainer how to solve it. MathTrainer identifies the type of exercise by means of a pattern matching mechanism and then it shows successively the tasks that have to be accomplished in order to solve the exercise. MathTrainer has been integrated in the MathEdu teaching environment which includes an authoring tool for the design and interactive resolution of exercises of mathematics. Thanks to this integration, MathEdu allows the student to learn first how to solve problems of different types; after this, s/he can practice and get feedback about his/her actions.

MU Partnership for Preparing Tomorrow’s Teachers to Use Technology
Laura Diggs, Ph.D., University of Missouri-Columbia, USA; Judy wedman, Ph.D., University of Missouri-Columbia, USA; Rose Marra, Ph.D., University of Missouri-Columbia, USA; Herbert Remidez, University of Missouri-Columbia, USA; Linda Lynch, University of Missouri-Columbia, USA

This interactive session will describe the processes, instruments, and data collected from the University of Missouri-Columbia College of Education Preparing Tomorrow’s Teachers to Use Technology (PT3) grant. The goals of the grant include: Faculty fluency with technology as a tool for themselves as instructors and as a subject for improving and changing methods of teaching in K-12; A revised curriculum for teacher education that utilizes technology (ISTE NETS Standards) and prepares future teachers to be technology users; A set of internet-based tools for enabling the teaching and learning processes of teacher education (ShadowPD netWorkspace); A total quality management (TQM) process modeled after continuous improvement processes that are proving effective in sustaining change.
and improvements in business and industry. The expected outcomes of this project are: faculty and teacher education students who are fluent in the use of technology in teaching, high quality experiences with technology in teacher education curriculum, tight integration of the curriculum with exemplary technology-using practices of K-12 teachers, and a program that is sustainable, owned by faculty, and continuously improving.

Constructivist Use of Technology: Encouraging Preservice Teachers to Construct an Understanding of their Leadership Role in Promoting Reading Outside the Classroom
Keith Dils, King's College, USA; Laurie Ayre, King's College, USA
In order to facilitate preservice teachers' understanding of the importance of reading aloud to children and of their role as educators of parents and community members, a project utilizing the constructivist use of technology was undertaken. Preservice students were presented with research concerning the correlation between the amount of reading done at home and reading achievement in school (Anderson, Hiebert, Scott, and Wilkinson, 1985). These preservice students were then asked to formulate their own understanding of how they could educate parents about their role in the educational process. The students then converted their ideas into a digital video public service announcement to be run on the local media. This paper/presentation will share how this project was undertaken and will model the use of the digital technology.

Cyber Spaces and Learning Places: The Role of Technology in Inquiry
Julie K. Dixon, University of Central Florida, USA; Judith Johnson, University of Central Florida, USA
This paper describes a course designed for K-8 science and mathematics teachers to learn how to teach using an inquiry approach within a technology-rich environment. The World Wide Web and calculator-based data collection devices are the primary sources of inquiry-based technology we will share. We will describe the World Wide Web as a resource for assisting teachers to learn the art of problem posing, to increase their repertoire of problem solving strategies, and to enrich their sources for data collection. The calculator-based data collection devices are useful tools for generating real data from natural phenomena. Elementary and middle level teachers are often unfamiliar with the use of these tools much less their effectiveness as tools for inquiry. Our research in using technology to assist teachers to learn the inquiry approach is helping us uncover the relationship between finding patterns and posing problems in the process of designing authentic investigations and reaching logical conclusions. Using technology that is available to these teachers, but has not previously been used in these ways, has opened new avenues for assisting teachers to become more effective in the teaching of science and mathematics in their own classrooms.

The Internet as a tool for a revolution in education in Africa: A dream or reality
Nomusa Dlodlo, National University of Science and Technology, Zimbabwe; Nompilo Sthole, Solusi University, Zimbabwe
In this paper the author looks at how the Internet can help Africa develop educationally. The research highlights the benefits that can be derived from access to the Internet for educational purposes in Africa and the problems which have caused the slow growth of Internet access in education in Africa. The author then suggests solutions to these problems in an effort to bring full Internet access to Africa as quickly as possible, thereby improving the quality of education.

Impact of Asynchronous Discussion on a Preservice Teacher Education Practicum Experiences
Aaron Doering, University of MN, USA; Marc Johnson, University of MN, USA; Sara Dexter, University of MN, USA
Teacher education programs have long recognized that in order to develop their pedagogical capacity, pre-service teachers must have teaching experiences and interactions with students during their program of preparation. At the University of Minnesota we implemented the use of web-based asynchronous discussion areas to increase the quality and quantity of English education initial licensure program students' interactions with middle school students during a practicum experience. We describe here the necessary coordination and communication among methods and technology course faculty, technical support personnel, and the cooperating middle school teacher in identifying and implementing this technological support to a collaborative project. We also describe the preservice teachers' positive and negative impressions of this mode of communication.

gLearning: The New e-Learning Frontier
Steven Donohue, 10Tongues, Inc., USA
Emerging technologies have always had an innovative impact upon the language: horse-less carriage became car; steamship became ship; wireless cell phone is becoming just phone. Eventually the "distance" portion of distance learning will also fall away and become just "learning". But, will e-learning be the same mode of learning? Or will it necessarily take on a new meaning; hence, a new linguistic form?

Real-time Learning in a Virtual World
Patricia Donohue, Dakota Science Center, USA; Coy Ison, Southeastern Education Service Center, USA
Using a powerful, proprietary internet software for creating instructional materials on-line, session participants will generate multimedia slide shows in 10 minutes or less, create an interactive quiz in under five minutes, and learn how to build a curriculum unit on-line. The software is easy to learn, has how-to tutorials, and links to a powerful dynamic database of instructional resources covering a variety of topics. Session participants will become proficient in each of the four on-line tools available in the software: Resource Collections, Media Shows, Tests, and Learning Segments. Participants will: select a topic for instruction from among the resource collections, create their own slide show and on-line quiz, then construct a web-based learning unit based upon a learning objective and a set of standards. Resources and interactive curriculum from the companion website of the NatureShift-Linking Learning to Life project are available for innovative instruction ideas and examples. The software can be used easily by students to create digital portfolios or write their own teaching units. Participants need not be proficient in web-based instructional technologies and need only minimum of basic computer skills. However, advanced technology users will find a ripe field for development of their ideas.
The Challenge of Developing College Wide Technology Standards
Mesut Duran, The University of Michigan-Dearborn, USA

This article reviews current literature on the technical know-how of teachers working with Distance Education (DE) and presents an argument for the importance teacher training. Based on research being conducted at the Distance Education Laboratory (LED) of the Federal University of Santa Catarina (UFSC), in Brazil, the authors show that there is a shortage of teachers with knowledge of educational technology and the background needed to work as distance educators.

Science Investigations: Onsite - Online - On the Mark!
Marianne Dove, Youngstown State University, USA; Joyce Zitkovich, Boardman Local Schools, USA

The evolution of Internet-based communications and capabilities of mobile digital technologies have empowered teachers and students to move beyond “click and learn” science classroom environments to one whereby learners can conduct onsite science expeditions and showcase their investigations online. This paper documents the collaborative efforts of a public school system, a county joint vocational school, a non-profit outdoor learning organization, telecom corporations, a state park system, a state division of wildlife, and universities to launch a digital expedition to study environmental conditions. The paper examines the opportunities related to these emergent technologies and elementary students’ abilities to engage in onsite group investigations at the Lake Erie shoreline. The Our Lake Online project involved more than a year of collaborative planning and was funded by a foundation grant, telecom corporate financial support, and non-profit organizational sponsorship. The expedition can be viewed at [http://www.digitalexplorers.tzo.com/eric/default.htm].

Beliefs, experiences, and reflections that affect the development of techno-mathematical knowledge
Hollylynne Drier, North Carolina State University, USA

The purpose of this paper is twofold. First, the author discusses her views on teachers' development of techno-mathematical knowledge. Second, the author presents key elements from a course and key course experiences that appear to impact preservice teachers' beliefs about teaching and learning with technology, including those activities that allowed preservice teachers to gain a deeper understanding of mathematics using technology tools.

Evaluating the Incorporation of Technology in Higher Education in Western PA
Kurt Dudt & William F. Barker, Indiana University of Pennsylvania, USA

Three Pennsylvania state universities (Indiana, Clarion and Edinboro) successfully obtained a 1.73 million PT3 grant. We developed a plan to infuse technology into teacher education programs. We present the evaluation plan for review and comment. The audience consists of people who have a PT3 grant and/or those who are interested.

Technology Integration into Preservice Teacher Preparation: Recommendations for Practice
Mesut Duran, The University of Michigan-Dearborn, USA

The purpose of this paper is to provide recommendations for practice to integrate information technology into teacher preparation programs. The author describes a model for technology integration into teacher preparation programs. This model is based on what he has learned in his recent studies and his beliefs about the things that teacher preparation institutions must do in order to increase the level of technology integration in their own programs. Based on the integration model discussed, the author provides specific recommendations for practice.

The Challenge of Developing College Wide Technology Standards
Karen Dutt-Doner, University of Southern Maine, USA; Dasi Larson, University of Southern Maine, USA; India Broyles, University of Southern Maine, USA

The technology requirements prescribed by NCATE for teacher education programs pose unique challenges when all programs within a college of education and human development enter the self-examination process together. As technology competencies become
integrated within the curriculum, faculty and student proficiency becomes an immediate rather than long-term necessity. Moreover, professors of education must model the use of technology throughout the curriculum. At the University of Southern Maine, the College of Education and Human Development enrollment shows that 80% of the students are in graduate programs and 25% are in non-teacher education programs including school counseling, clinical counseling, school psychologist, school administration, and adult education. Many graduate students do not have a technology rich background and, as commuting students, have little opportunity to use the university resources. Both students and faculty struggle with the technological changes in curriculum and instruction. This case study examines the growing pains of one university/college of education in designing and implementing technology standards.

Standards Based Reflection: The Virtual Teacher Project
Karen Dutt-Doner, University of Southern Maine, US; Susan Powers, Indiana State University, US

In Indiana, the current dilemma facing teacher education programs is how to best teach about and assess students on the standards adopted by the Indiana Professional Standards Board (IPSB), and in particular, the dispositional component found in those standards. The Virtual Teacher Project combined over 32 inservice teachers representing 30 different schools, 170 preservice teachers representing six teacher preparation programs and 8 teacher educators representing 4 universities in an electronic discussion group that focused on connecting standards adopted by the IPSB and INTASC.

Assessing Best Practices in Online Learning: A Review of the Literature
William Dwyer, University of Alabama, USA; Dennis Sunal, University of Alabama, USA; Judy Giessen, University of Alabama, USA; Valesca Lopez, The Capitol School, USA; Cynthia Sunal, University of Alabama, USA; Kathy Trundle, University of Alabama, USA

This literature review provides an overview of research that has been conducted on online learning, as well as indicating the extent and type of research being carried out. The review focuses on recent research at a time when online learning has become a common part of the use and development of the Internet. From a list of 400 citations, 25 representative studies were selected and categorized by type of study and comparison basis; number of subjects; data collection instruments; outcome variables measured; courses studied; and results and conclusions based on evidence obtained from student outcomes. Addressing four questions can best summarize the review of research on online learning. They are: 1) What scientific research design criteria and types of theory can be applied to evaluate the quality of research on online learning environments? 2) How do the online learning research examples that have been sampled meet the criteria for scientific research? 3) What can we learn from the results of the review of research on online learning based on the type of research performed? 4) What can we conclude from the results of research on online learning environments to date?

Simulations in the Learning Cycle: A Case Study Involving
Karen Dutt-Doner, University of Southern Maine, US; Susan Powers, Indiana State University, US

This study of involved students using simulation software in all phases of the learning cycle. Research on the use of simulations in science education has shown that the simulations can be used effectively in preinstructional (Hargrave & Kenton, 2000; Gokhale, 1996) and exploratory activities (De Jong & van Joolingen, 1998). Preinstructional and exploratory activities elicit and challenge students’ alternative conceptions. Having set the context for formal instruction, simulations then can be used to learn new concepts in the invention phase of the learning cycle. With the specific guidance in simulations such as Exploring the Nardoo (Harper, n.d.; Harper & Hedberg, 1996), students perform better (Lee, 1999). Simulations can be used again to apply newly learned concepts in different contexts in the expansion phase of the learning cycle. In this study, middle school science students were observed using the simulations as they engaged in a learning cycle lesson on environmental systems. The students were tested for their understanding of the concepts before and after completing the learning cycle lesson. Interviews also were made of the students and the instructor.

The Interactive Classroom
Richard Eckert, SUNY Binghamton, USA

Computer programs have been developed that enable students in a classroom to interact with and take control of the computer the instructor is using to present the class material. From their seats students can request to connect their laptop computers over the network to the main computer that is being used to project the course material. Once connected, at any time they can send messages to the instructor and request control of the main computer’s mouse and/or keyboard. This enables students do perform actions such as: unobtrusively ask questions, move to another slide in the presentation, make annotations on the main screen to help clarify their questions, participate actively in online simulations, type in answers to questions, and an almost endless number of other tasks that require remote manipulation of the computer the instructor is using. At all times the instructor determines whether a student is permitted to take control of the system and can override that control as needed. The server program running on the main computer also allows the instructor to easily perform administrative tasks such as maintaining a list of authorized students, their logon Ids and passwords, as well as the IP addresses to be used.

Problem-Based Learning Resources for College/University Professors
Leticia Ekhame, Professor of Education, Department of Media and Instructional Technology, State University of West Georgia, Carrollton, GA 30118 lekhamel@westga.edu; Virginia (Jan) Ruskell, Professor/Reference Librarian, Ingram Library, State University of West Georgia, Carrollton, GA 30118 jruskell@westga.edu

The authors define problem-based learning (PBL), an instructional method used by teachers and professors to teach problem solving and to replace rote memorization and passive learning. PBL’s process is explained. The historic association with John Dewey’s progressive movement and constructivism are also included. Questions are answered that deal with the changes from a traditional classroom to problem-based learning. Academic achievement, the roles of teacher and student, generating problems and assessment tools are covered. Examples are given for further study.
Academic Product Assessment: A tool for graduate action research assessment
Charles Elliott & Florence Elliott, Gannon University, USA
This research project examines a systematic assessment process as part of the Educational System Design (ESD) model, derived from work at Vanderbilt University by the Cognition Research Team and by Charles Reigeluth at Indiana University at Bloomington. The ESD model outlines four principles of effective learning environments: Problem-Based Learning, Scaffolding, Deepening Learning, and Collaboration. The research will explore the use of a formative assessment tool within this educational model. As part of Gannon University’s M.Ed. Cohort program, academic portfolios are required as a final synthesizing activity. A part of this portfolio is the Applied Master’s Project (AMP), an ongoing action research project. Students in the cohort program are to design, construct, and implement a research project over the course of the 18 months of cohort coursework. The AMP project is to be incorporated as a component of each of the six core courses, advancing the project from design and construction, through implementation and culmination. Research indicates that feedback, provided at key stages in the portfolio development process, results in improved final products. Providing effective feedback during this course should contribute to product improvement. Questions are raised however, about the type of feedback provided and the mechanism for providing this feedback.

Orchestrating Virtual Learning
Charles Elliott, Gannon University, USA; Florence Elliott, Gannon University, USA; Yvonne Waern, Linköping University, Sweden; Tersa Cerratto, Royal Institute of Technology, Sweden
In this paper, one case study of instruction in a virtual learning environment (VLE) will be presented. The instruction is aimed at adult learning as part of a professional development initiative for practicing K-12 teachers. Further, it concerns using the Internet as a text medium for supporting synchronous communication and the coordination of learning activities between teacher and students. The aim is to provide some conclusions that are useful for the future as the Internet becomes a knowledge and learning resource. This paper focuses on the challenges that instructional designers must consider and teachers have to manage in order to make sure that their students get the benefits of learning in virtual environments.

Academic Product Assessment: A tool for graduate action research assessment
Charles Elliott, PhD, Gannon University, USA; Florence Elliott, Gannon University, USA
This research project examines a systematic assessment process as part of the Educational System Design (ESD) model, derived from work at Vanderbilt University by the Cognition Research Team and by Charles Reigeluth at Indiana University at Bloomington. The ESD model outlines four principles of effective learning environments: Problem-Based Learning, Scaffolding, Deepening Learning, and Collaboration. The research will explore the use of a formative assessment tool within this educational model. As part of Gannon University’s M.Ed. Cohort program, academic portfolios are required as a final synthesizing activity. A part of this portfolio is the Applied Master’s Project (AMP), an ongoing action research project. Students in the cohort program are to design, construct, and implement a research project over the course of the 18 months of cohort coursework. The AMP project is to be incorporated as a component of each of the six core courses, advancing the project from design and construction, through implementation and culmination. Research indicates that feedback, provided at key stages in the portfolio development process, results in improved final products. Providing effective feedback during this course should contribute to product improvement. Questions are raised however, about the type of feedback provided and the mechanism for providing this feedback.

VisionQuest©: Teacher Development Model for Scaffolding Technology Integration
Ertnor Peggy A., Purdue University, USA
The professional development model proposed here builds on, and extends, the use of VisionQuest©, a CD-ROM teacher development tool designed to help teachers envision and achieve technology integration. Responsive professional development is based on the assumption that teachers are more likely to embrace pedagogical and classroom change if these changes address the actual issues they face in practice. Teachers are challenged to reflect on their current knowledge and classroom practices, relative to technology integration, and then, after observing exemplary models included on VisionQuest©, develop and pilot their own solutions to relevant classroom issues. Through this process teachers gradually develop their own understandings about how to integrate technology in ways that address relevant curricular and pedagogical issues within their classrooms. The VisionQuest professional development model facilitates reflection on, and the transformation of, classroom practice. The six-step model facilitates the growth of teachers’ visions for teaching and learning with technology and engages them in reflective activities that nurture and sustain their professional development.

Technology — Stand Alone or Integrated?
Sue Espinoza, Madeline Justice & Connie Greiner, Texas A&M University-Commerce, USA
What technology should be included in teacher preparation programs, and where should it be taught and/or practiced? As states (and other entities) establish technology standards to be addressed in teacher education, programs are looking for the best way to integrate these standards into existing (or new) courses. Three faculty members share their recent experiences, from their examination of the Texas Technology Applications Standards, to a determination of where each is addressed in the professional development sequence of courses as well as in the technology courses, to the development of activities to assure that all students address all of the proficiencies that are included in the standards. Included are the standards, the procedures used to determine and/or add needed technologies, and student activities.

Using the Course Management System Blackboard 5 with the Computer Algebra System Maple in the Mathematics Classroom
Rosemary Farley, Manhattan College, USA; Patrice Tiffany, Manhattan College, USA
We propose to introduce the course management system Blackboard 5 at our session. This software allows faculty members to put course material online. For example, assignments can be created and updated, a grade book can be created, or students can participate
in an online discussion. Throughout the presentation, we will illustrate some of the difficulties we found while using this software and we will make suggestions as to how we managed to circumvent these problems. We will also discuss the very difficult problem associated with trying to communicate electronically in the language of mathematics. Although the present technology does not support interactive Maple worksheets, we will demonstrate how to upload Maple worksheets into Blackboard courses. The students will be able to view the worksheets and their output, including animation. We will not require previous knowledge of Maple, or of HTML. We are also assuming that this presentation is for people who have not used Blackboard.

**Infusing Technology into Preservice Teacher Education**

*Josephine Farrell & Barbara Beyerbach, State University of New York at Oswego, USA*

As Oswego State University education programs have worked closely with school districts over many years, it became evident that most preservice teachers were entering the workforce without adequate technology skills and without the ability to utilize technology as a teaching tool to enhance student learning. Likewise, further investigation uncovered the fact that most education faculty were neither updating their own instructional technology skills nor integrating technology into their courses as models for preservice teachers to follow. Consequently, a Technology Needs Assessment was administered to all education faculty. The assessment revealed that most faculty see a lack of time and knowledge of technology as the primary reasons for not integrating technology into their instruction. This project will help to address these faculty needs, as well as provide both education faculty and preservice teachers opportunities to observe exemplary technology-infused K-12 lessons so that they are better able to provide technology-infused instruction for their students.

**Anchored Instruction Using WebQuests in Post-Baccalaureate Teacher Educations Courses**

*Donna Ferguson, University of Northern Colorado, USA*

Teacher education coursework traditionally has required students to learn software tools that will support their future role in the K12 learning environment. These courses have usually been taught in a didactic manner where the instructor demonstrates the software and then asks students to replicate the product. A didactic approach is in contrast to the technology infusion model the instructor hoped to achieve in post-baccalaureate teacher education courses. The process of designing this class followed that advocated by Dodge (1997) in order to bridge the transition between the traditional didactic approach and the desired student-centered focus.

**Implementing a Pre-service Teacher Technology Infusion Model**

*Donna Ferguson, University of Northern Colorado, USA; Chris Mahoney, University of Northern Colorado, USA*

In June of 2000, the Department of Educational Technology at the University of Northern Colorado received a PT3 grant. One of the most difficult, crucial, and comprehensive aspects of the PT3 grant implementation at this university pivots on how well the university’s pre-service teachers are taught the fundamental concepts of technology have been integrated into the teacher’s thoughts and practices. The presentation will encompass the data collection and evaluation, the integration of CDE’s Standard 7, and one aspect of the PT3 grant implementation process. The presentation will illuminate the trials and tribulations of all aspects of the evaluation, course redesign, implementation, and field-testing processes.

**Computer Science Children**

*Claudia Santos Fernandes, UNOESTE - Universidade do Oeste Paulista, Brazil; Paulo Blauth Menezes, UFRGS- Universidade Federal do Rio Grande do Sul, Brazil*

This work shows a proposal of teaching computer science for children. It is intended that the “Information Technology Teaching” sharpens the critical sense and capacitate students to learn not only to use currents technologies, but to understand how they work. To find out which Computer Science Topics are more suitable to teach children, it was realized a quiz, answered by Computer Science and Information Technology teachers which thought disciplines. A solid basis to the practice of Computer Science has the objective to develop the demanded abilities to think, to express clearly and precisely, to answer problems and create concepts.

**Breaking Down the Walls in Teacher Education Programs**

*William R. Fisk, Clemson University, USA; Lynn Nolen, School District of Greenville County, USA*

Is your teacher preparation “program” really a team of education faculty, content faculty, and K-12 teachers? These groups face the same doubts, promises, and problems related to technology integration. Rather than a frontal assault on teaching technology usage to them, “Project Jericho: Breaking Down the Walls” took a back door approach, getting these groups talking, sharing, and cooperating with regards to technology. Results include professional development and program changes. English/Language Arts, Science, Math, and Social Studies Innovation Teams of nine K-12 teachers, three teacher educators, and three content faculty match up technology skills with state-mandated curriculum, then develop technology-rich units for integration in all parts of teacher preparation. Innovation Teams share on-line and meet monthly to analyze standards, develop a curriculum/technology matrix, work on lesson plans, and work in triads exploring and analyzing websites, lesson plans, and collaborations. Team members share and implement Innovation Team ideas and suggestions.

**Virtual Learning, Web Videos, and Elementary Mathematics Teacher Education**

*Janice Flake, Florida State University, USA*

The proposed presentation will illustrate the use of web-based videos of children illustrating their understanding of mathematics concepts and problems. Interviews with twenty-three children in grades K - 5 were video taped concerning their understandings of mathematics content identified in major state and national standards recommendations. These videos were placed on the web in approximately 5-minute segments and categorized according to the child’s pseudo name, grade level, and task/content area. Prospective teachers used the videotapes to analyze behaviors, illustrating certain theoretical concepts, such as scaffolding, visualization, and imagery development. Samples of the prospective teachers responses will be provided. The presentation will also discuss the design...
and the potential of such use of videos. By having the videos on the web users can watch them in their homes, or other places of convenience, as well as the videos can be used for distance learning.

**Comparison of Student Rating of Instruction in Distance Education and Traditional Courses**
Claudia Flowers, UNC Charlotte, USA; LuAnn Jordan, UNC Charlotte, USA; Bob Algozzine, UNC Charlotte, USA; Fred Spooner, UNC Charlotte, USA; Ashlee Fisher, UNC Charlotte, USA

This study examined differences in student perceptions of course and instructor effectiveness in distance education and traditional courses. The type of distance education examined was a two-way interactive TV. Three different modes of course delivery were studied: (1) distance education off-campus, (2) distance education on-campus, and (3) traditional on-campus. Eight instructors taught a course using each method of delivery. On-campus students in traditional courses perceived the course and the instructor as being more effective than their off-campus peers in distance education courses. The magnitude of difference between the means was large.

**Accountability, Technology, Flexibility: Ensuring Student Success**
Kathryn Floyd, Ed.D, Pickens County Schools (Ret), USA; John T. Moore, South Dakota Department of Education & Cultural Affairs, USA; Terry Bailey, Ball State University, USA; Cheryl Reed, Ph.D., EdVISION.com, USA

When school systems find they must adjust what they are delivering because their performance measures show they are "low performing," how can a system efficiently and effectively adjust the curriculum? Can the web help us test students more efficiently? How can teachers and administrators get meaningful, timely guidance so that they know what is expected, whether or not they are providing needed instruction, and which resources target those needs? This paper describes software applications that provide critical assistance to school systems in responding to the changing expectations being experienced in the emphasis on accountability and meeting "standards" or expectations.

**Why Technology is Being Integrated into the Classroom at Such a Slow Rate: A Discussion of Self-Efficacy, Motivation, and Utility**
Jesse J. Foster, II, University of Alabama, USA

In the past fifteen years, there has been much attention paid to the issue of integrating computers into the classrooms. The CEO Forum on Education Technology in Washington, D.C., polled nearly 80,000 public schools and found that only about 3 percent of the schools are successfully integrating technology into the curriculum. Why is the technology not being integrated at a faster pace? Researchers have seemingly asked every question but one; "Are teachers motivated to use technology in their classrooms?" I contend that the integration of technology is not an issue of the availability of resources or information. It is an issue of whether or not teachers motivation, and their belief that the integration of the technology into the curriculum will bring about a level of instruction and learning greater than otherwise possible. This is an issue about some teachers' need to avoid negative images. Consequently, too many teachers are struggling everyday, not to master the technology, but instead to invent ways to avoid failing at using the technology.

**The Anatomy of an Educational Technology Seminar**
Sebastian Foti, School of Teaching and Learning, College of Education, University of Florida, Gainesville, Florida USA

In this case study, a group of advanced educational technology students "invent" methods that infuse technology into a dry, research based history course. In the process, the students develop several products, and create educational software for other students to use.

**Teaching electronic information research skills to teachers**
Ina Fourie, University of South Africa, South Africa

In 1998 the Department of Information Science in collaboration with the Library Services of the University of South Africa (Unisa) - a distance education institution - introduced a module in Research Information Skills. The course is offered to master's students specializing in Chemistry Education and Environmental Education. The target group includes students who are highly computer literate, as well as students who have never touched a computer. The paper will deal with the course content, course outcomes, the learning events (including the use of computer-assisted instruction, workshops and a web-site), and the special problems experienced with distance education. Emphasis will also be on support to students who lack computer skills and the use of portfolio assessment. Student experiences as monitored through their feedback in their portfolios, focus group interviews and personal observation will also be dealt with, before making recommendations for further aspects to be addressed by the course.

**Constructing an Enhanced Instructional Presentation**
Leslee Francis Pelton, University of Victoria, Canada; Tim Pelton, Brigham Young University, USA

In this document we describe the development of an Enhanced Instructional Presentation (EIP). "If a good educational presentation is like a fine string of pearls, then an Enhanced Instructional Presentation puts that fine string of pearls, along with access to any supplementary information needed, into the hands of the learner in order to ensure full appreciation." (Pelton & Francis Pelton, 2000)

**Technology Integration: A Collaborative Model among the College of Education faculty, preservice teachers, and local K-8 teachers**
Cheryl Franklin, University of Virginia, USA; Betsy Kean, California State University, Sacramento, USA

The purpose of this project was to design and implement a collaborative model for technology integration. The teacher preparation program along with its school district partners redesigned existing curricula and field placements by simultaneously implementing technology-based lessons into preservice teacher education coursework and K-8 classrooms.

**MENTORING OVERCOMES BARRIERS TO TECHNOLOGY INTEGRATION**
Teresa Franklin, Ohio University, USA; Mesut Duran, The University of Michigan-Dearborn, USA; Mumbi Kanuki, Ohio University, USA

This paper examines the use of Instructional Technology graduate students as mentors to K-6 elementary teachers in a rural community in the use of technology and the integration of technology into the daily curriculum. Mentors were able to support the elementary teachers
in overcoming the barriers to technology use by modeling a vision for integration, just in time learning, access to equipment, professional development opportunities and methods for assessing student work involving technology use.

**Together and Alone: The Instructional, Technical, and Psychological Outcomes of Faculty Building Online Courses**

*Teresa Frankin, College of Education, Ohio University, USA; Joseph Blankson, College of Education, Ohio University, USA*

The College of Education and Music have developed online courses in support of their mission to provide ongoing opportunities to teachers for certification or renewed certification, to superintendents for administrative certification, to undergraduates for "high demand" courses, and to graduates in support of linkages with international universities. This proposal seeks to investigate the use of a cohort model in which faculty within a colleges work together to provide curriculum design and implementation support, online development expertise, shared technology skill improvement, and emotional support for the implementation of online courses. The instructional, technical and psychological support issues of online course development can be critical to the success or failure of courses.

**Teachers as Multimedia Authors: A Workshop Developer's Experience**

*Joseph Frantiska, Jr., University of Massachusetts, USA*

This paper describes the design and development of a workshop to instruct educators on the creation of educational hypermedia. Hard-don development techniques were combined with appropriate technical and pedagogical decision-making to provide educators with a basic ability to create substantive hypermedia-based teaching materials. The intended audience are K-12 educators who possess basic computer knowledge.

**ICTs for Learning. An International Perspective on the Irish Initiative**

*Eileen Freeman, University of Dublin, Trinity College, Ireland; Bryn Holmes, University of Dublin, Trinity College, Ireland; Brendan Tangney, University of Dublin, Trinity College, Ireland*

Around the world governments are investing heavily in promoting the use of ICTs within the school system. This research explores the Irish Policy Framework (IT 2000) and the National Action Strategies of two European countries, Finland and Sweden. The focus is on curriculum and assessment, and evaluation of the use of ICTs in the classroom, as these are key factors in forming policies to influence the use of ICTs as tools to reshape learning. An underlying aspect of the research is that, due the use of ICTs by governments for the dissemination of their national strategies, concerned individuals can be empowered to compare and contrast policies, identify best practices and make a contribution to the formation of the policies of their own nation by publishing in turn their research.

**The self learning system to support the teacher of Japanese language education**

*Makio Fukuda, Osaka International University for Women, Japan; Temiaki Nakamura, Tami Laboratory for Education of Information Technology, Japan*

In the countries except Japan, according to Japanese government investigation in 2000, learner of Japanese language are about 2,090,000 people. However, most of these learner are beginner grade. Middle grade learner are an extremely little. In a beginner grade, they learn the character of kind of "Hiragana" of a phonogram. It is easy to understand this Hiragana which is the simple character. Other way, middle grade learner must learn the character of kind of "Kanji". "Kanji" is the ideograph character. And it is a hieroglyph of one kind of Chinese. In Japan, the communication that we used only Hiragana for is difficult. In a field of Japanese business, people must use 2,000 kinds of Kanji characters. It is a big burden for the learner to memorize many complicated Kanji. In addition, Japanese language teacher oneself do not understand all Kanji characters, too. So we developed the Kanji learning systems which worked with the PC. We were able to do "Memorizing by Writing" not to use handwriting input device in this learning system. This learning system is a system for self-study, we think that we let Japanese language teacher reduce the burden of education.

**A Model for Courseware's Design (MCD)**

*David Fuller, Pontificia Universidad Catolica de Chile, College of Engineering, Chile; Sergio Ochoa, Pontificia Universidad Catolica de Chile, College of Engineering, Chile; Nelson Balario, Chile University, College of Engineering, Chile*

Today's educational requirements have forced the traditional institutions to introduce technology in the education and modify the teaching-learning process in order to maintain curricula updated and cope with the constant changes. Although this is a costly and time consuming task there is still not a proper methodology which would help authors to carry out this task. The model proposed in this paper (MCD) is a systematized way for designing/redesigning computer technology-based courses (coursewares), based on their learning goals. This model is a formalization of a set of successful strategies applied by the authors, in the design/redesign courses in the computer science area.

**Proactive Faculty Technology Training and Support**

*Kristy Funderburk, University of South Florida, USA; Shauna Schullo, University of South Florida, USA*

Faculty do not always get the luxury of time or money to attend professional computer training sessions and read computing trade publications cover to cover. Yet, there is an expectation for continued professional development, often beyond their area of expertise. Academic Computing at the University of South Florida will present the current best practices utilized for faculty training, support and professional development. This presentation will also cover an overview of how Academic Computing integrates into the VITAL consortium and an evolution of faculty computing services. IT support professionals, and faculty will leave this presentation with abundant and diverse ideas to make faculty learning tailored, yet quick and effective.

**Is Anybody Listening? Inherent but Typically Ignored Problems in Distance Learning**

*Paola Furr, Northwestern State University, USA; Ron McBride, Northwestern State University, USA*

Over the last fifteen years, higher education initiatives for distance learning have had profound effects. Years of research and practice have paved the way for expanding course offerings and, in some cases, degree programs to students at a distance. Yet, despite Herculean efforts to implement these programs, two vital components to ensure long-term success have largely been ignored: formalized faculty
feedback and formative evaluations. The focus of this research is to reassert a seemingly ignored obvious: Those who teach using technologies of the trade discover and identify the problems related to teaching students at a distance. They, and not technologists, are in a better position to observe and evaluate the process. A program's success or failure depends in large measure on their experiences while interacting with students and the technology. The purpose of the paper is to enlighten educators, including administrators, who currently provide or plan to offer courses at a distance about probable inherent problems that will arise if institutions do not incorporate faculty feedback into ongoing formative evaluations of distance learning programs.

Distance Learning: An Examination of Perceived Effectiveness and Student Satisfaction in Higher Education
Donna M. Gabrielle, The Florida State University, USA

Distance learning is a tremendous issue due to paradigm shifts in pedagogy and business. Data was collected from eight Florida postsecondary institutions, then multiple regression and conditional regression analyses were conducted. Findings indicated that technical quality and student interaction were significant predictors of effectiveness and satisfaction for distance students. When using personal characteristics as predictors, younger students, males, and students with higher levels of education were more likely to report higher levels of both instructional effectiveness and satisfaction. Finally, distance students indicated less satisfaction and effectiveness than traditional students. These differences, as well as student-material interaction, perceived quality, and prior distance experience, were found to be statistically significant using two-tailed t-tests. This research suggests that there are distinct factors that predict satisfaction levels and perceptions by distance students of the effectiveness of instruction they are receiving, stressing the importance of focusing on quality and interaction between students and instructors.

Electronic Portfolios: A How To Guide
Jenny Galloway, Indiana University Northwest, USA

This paper outlines a number of specific issues and procedures for the development and maintenance of electronic portfolios. It maintains a generic approach to portfolio content while addressing a myriad of portfolio components and multimedia technologies. This paper takes the position that virtually every pre and inservice teacher student should have an electronic portfolio. A guiding principle is suggested: Virtually anything can be represented electronically. The reader is guided to focus on methods and solutions on the basis of this principle. The paper further describes technology formats, hard and soft, for creating and managing portfolio entries. Details from file names to disk organization and more are discussed in detail.

Technology education and integration: A position paper on attitude, perspective and commitment
Jenny Galloway, Indiana University Northwest, USA

This paper outlines teachers' notions about and desires for educational computing courses. Teachers' perspectives skew their expectations and attitudes about computing experiences and limit if not preclude the achievement and acquisition of computing knowledge and problem solving skills. The paper suggests and discusses a relational link between (a) teachers' educational expectations, (b) computer educators' notions of how teachers learn computing, (c) what administrators believe teachers need, and (d) teachers' personal commitments to computing. It is suggested that this association of inter-related ideas and issues accounts for the 25 year failure of technology integration.

Metaphorical Representation Within a Distributed Learning Environment
Ruth Gannoncook, University of Houston Clear Lake, USA; Caroline Crawford, University of Houston Clear Lake, USA

The design and development of preservice and inservice teacher education distributed learning environments, specifically World Wide Web-based (Web-based) courses, emphasize the need to think through numerous issues that may not be apparent within traditional face-to-face environments. One such issue is the emphasis placed upon developing a conceptual framework through which the learners will begin to develop an understanding of the knowledge presented. A metaphorical representation that emphasizes the conceptual framework through out the Web-based course environment offers the preservice and inservice teacher educators a consistent with the knowledge being presented and based upon the prior knowledge of the learner.

Object: An important concept for preservice teachers to learn technology
Tianhang Gao, Purdue University, USA

This paper discusses an important concept in preservice teacher education, object. Five commonly used objects are discussed. The concept map of each kind of objects is illustrated and discussed. The benefits of employing object concept maps are listed in the last section.

problem-solving-based model of WBI
Tianhang Gao, Purdue University, USA

This article describes a project using problem-solving-based model of Web-based instruction to foster students' ability of solving problems and building models.

Sustainable Environmental Education for Brazilian Teachers
Lenise Aparecida Martins Garcia, Universidade de Brasilia, Brazil; Doris Santos Faro, Universidade de Brasilia, Brazil

Environmental Education (EE) is considered, in international declarations and in brazilian laws, as a dimension of the Education itself. In Brazil, only recently EE is reaching the schools. It is more given as isolated initiatives, by GNOs and other institutions, in informal education. Environmental Education National Policy is now regulated by 9795 law, April 27 1999. This law determines that all teachers have to study EE, when they are in graduation or - for whom that are already teachers - by inservice studies. But how can teachers from all the country take inservice studies? Thinking about that, we began at Brasilia University an online course in EE for teachers. The objective of this course is to capacitate teachers at any place in Brazil to insert EE in his own school discipline. Along the course teachers learn fundamentals in EE and in pedagogic methodology, making also practical exercises. At the end of the course, they have
Brenda J. Gerth, University of Victoria, Canada
Audio on the Web: Enhance Online Instruction with Digital Audio

Sheila Offman Gersh, Ed.D., City College of New York, School of Education, Center for School Development, New York, NY, USA
Using the Internet in the Classroom

David Georgi, California State University, Bakersfield, USA
Operationalizing a Technology Standards with Proficiency Skill Sets

Abigail Garthwait, University of Maine, USA
Integration or Innoculation?: Selected large-scale professional studies

JavaScript for Teachers
Stephen Gareau, North Carolina A&T State University, USA

Viola Garcia, University of Houston Downtown, USA; Linlin Irene Chen, University of Houston Downtown, USA
Penny Garcia, University of Wisconsin Oshkosh, USA
Traeger Technology Target: Completing the Circle of Community

Penny Garcia, University of Wisconsin Oshkosh, USA
The goal of the Traeger Technology Target project is to provide the opportunity for pre-service educators, K-12 faculty, and university faculty to form a learning community. The project facilitates the following objectives: university undergraduates will begin to bridge theory and practice through the authentic learning experiences afforded only through classroom practice; K-12 faculty will share their expertise in the areas of curriculum development, instructional strategies, and classroom management with pre-service teachers; and, university faculty will facilitate the interactions between the pre-service and in-service educators while providing appropriate technology skills in a just-in-time setting for both groups. The theoretical framework for this project is profoundly constructivist and supports the notion of service learning.

The Development of a Web-based Multicultural Course for Teacher Education
Viola Garcia, University of Houston Downtown, USA; Linlin Irene Chen, University of Houston Downtown, USA
Social Sciences-Education, SOSE 3306 Culture of the Urban School, is a prerequisite introductory course required of all students in the teacher preparation program at the Department of Urban Education (UE) at University of Houston Downtown (UHD). The course investigates urban culture as the dominant form of community life in contemporary schools. Students explore characteristics, unique properties, and problems of urban schools. The online course presents a unique opportunity for a more comprehensive investigation and understanding of urban culture and urban schools in training future teachers to facilitate the academic achievement of students from diverse racial, cultural, gender, and social-class groups. The purpose of the paper is to share the proposed instructional telecommunication (IT) format that would meet the same standards, prerequisites, and requirements of on-campus sections.

JavaScript for Teachers
Stephen Gareau, North Carolina A&T State University, USA
Increasingly, teachers at all levels are making use of the Internet—both as a source of instructional information, as well as a medium for instructional delivery. Some instructors develop their own Web pages, which are typically written in HyperText Markup Language (HTML). JavaScript™, a browser scripting language originally developed by Netscape Communications, is a valuable tool that can enhance the functionality of any Web page. This paper examines the nature of JavaScript, and investigates how it can be used to enhance education-oriented Web sites of today's teachers.

Integration or Innoculation?: Selected large-scale professional studies
Abigail Garthwait, University of Maine, USA
This paper highlights a selection of research studies on multi-district professional development projects producing a clear call for more long-term involvement on the part of administrators and the intellectual, social and philosophical benefits for educators when using a mentoring system.

Operationalizing a Technology Standards with Proficiency Skill Sets
David Georgi, California State University, Bakersfield, USA
The presentation of this interactive session will begin with an overview of the existing program which operationalizes the California technology standard for K-12 teachers with the California Technology Assistance Program (CTAP) Region 8 technology proficiency. Lecture will be supplemented by a PowerPoint presentation and demonstrations of the following web sites: 1) the CTAP Region 8 site (http://www.ctap.org/citc/) includes a rubric for three levels of certification and digitized video examples of exhibits at Levels 1 and 2; 2) the California technology standard (http://www.csusb.edu/~d-georgi/contents/techstand.htm); 3) the PT3 grant that helped coordinate these efforts (www.projecttnt.com). Next, a description of the process involved in coordinating this certification process with K-12 districts and teacher credential programs. To date, over 500 teachers have been certified including growing a cadre of Level 3 leader/mentors. An interactive discussion on implications for those present will conclude the session.

Using the Internet in the Classroom
Sheila Offman Gersh, Ed.D., City College of New York, School of Education, Center for School Development, New York, NY, USA
Learn to Integrate the Internet into classroom instruction. During this session, participants will learn how to "Internetize" their traditional classroom lessons, create online collaborative projects and create WebQuests that meet statewide learning standards and assessment criteria. Participants will also become familiar with the huge amount of resources on the Internet that are available for "Internetizing" classroom instruction. A website that has links to hundreds of resources has been created to be used during this session (and after). In addition, templates will be used to create the final products.

Audio on the Web: Enhance Online Instruction with Digital Audio
Brenda J. Gerth, University of Victoria, Canada
People only retain 20% of what they see and 30% of what they hear. But they remember 50% of what they see and hear, and as much as 80% of what they see, hear and do simultaneously (Computer Technology Research, 1993). Internet-based audio and video tools are now used by educators to support instructional, research and administrative activities. Incorporating Web-based multimedia elements such as video, animation and audio into the delivery of on-line course materials can enrich learning by facilitating and encouraging active student participation in the learning process. However, if not designed properly, the addition of audio and other multimedia elements will detract rather than enhance Web-based instruction. The focus of this paper details the design techniques and strategies educators can employ to record digital audio and add audio clips to their instructional Web pages to enhance their on-line course materials.
Infusing Technology into Pre-Service Teacher Education
Amy Gibbons & Kathy Burleson, West Texas A&M University, USA

Ensuring that pre-service teachers are prepared to integrate technology into their teaching is a top priority for teacher education programs today. One way to help achieve this goal is to model the integration of technology throughout the teacher preparation program. This pilot study examines the integration of technology into a language arts methods course and the effects of this integration on pre-service teachers.

Online Personal Learning in Teacher Preparation
David Gibson, National Institute for Community Innovations, USA

Work by the National Institute for Community Innovations (NICI at http://nici-mc2.org) is leading to new web-based tools for enhancing pre-service education and supporting increase use of technology, especially in Professional Development Schools. One of the tools, the NICI Online Personal Learning Plan (PLP) for preservice students, is intended to assist learners through the processes of: 1) Self-assessment of strengths, interests and aspirations; 2) Planning preservice education learning goals and projects; 3) Linking goals and projects to valued outcome standards; 4) Creating original work and sharing the work with others; 5) Receiving high quality feedback for the improvement of their work; 6) Documenting and validating the achievement of learning goals; and 7) Assisting in the selection and preparation of exhibits of learning. This paper discusses the roots and rationale of the project, and presents some of the details of the thinking that is guiding the web-tool development.

Ensuring Technology Leaders for Classrooms and Beyond: Technology Training in a Graduate Teacher Education Program
Key Gibson, Wichita State University, USA

This paper discusses the integration of the ISTE foundation standards into the Master of Education in Curriculum and Instruction teacher education program and the resulting impact on the teachers' acquisition of technology knowledge and skills, their classroom teaching, their students' learning, and in a broader sense their schools and districts. The program is described with particular attention given to the way in which students acquired and demonstrated technology knowledge and competencies. Successful integration of the ISTE standards into the program is viewed in terms of the quality and variety of products / assessment pieces using technology that have been generated by the students. Finally, the paper examines the resulting benefits to school districts that employ the teachers participating in this master of education program.

Educational leadership, community partnerships and 24/7 access to educational technology: Bridging the technology gap in small rural communities with anytime, anywhere learning.
Ian W. Gibson, Wichita State University, USA

This paper describes a project providing school children with 24/7 access to laptop computer technology in a small rural school community in western Kansas. Based upon the visionary leadership of school and community figures, this collaborative venture incorporates creative approaches to financing the project, a focus on actively changing approaches to pedagogy and the learning process, and an analysis of the impact of the project upon the school community. Key features of the project incorporate a focus on educational leadership, community partnerships, anytime anywhere learning, the digital divide in rural communities, 24/7 access to computers, and constructivist learning in a technology dependent learning environment.

What We Wish Our Teachers Knew
Molly Gibson, Stowe Middle School, USA; Hannah Marshall, Stowe Middle School, USA; George Bennum, Stowe Middle School, USA; Will Courtney, Stowe Middle School, USA

What do teachers need to know and be able to do with technology in a middle-grades classroom? This research project by four middle-grades students set out to accomplish two objectives: 1. Survey the staff of a middle school to develop a table of main themes taught during a school year, and 2. Find and organize outstanding resources from a student's point of view that would support learning across grades students set out to accomplish two objectives: 1. Survey the staff of a middle school to develop a table of main themes taught during a school year, and 2. Find and organize outstanding resources from a student's point of view that would support learning across the curriculum. Secondary objectives of the research included 1. Providing students with a chance to apply what they had recently learned in an online course "Introduction to html" and 2. Demonstrating that both students and teachers can learn something new about teaching with technology. Parents, working with online resources, have been the impetus and primary supports for the project. The school administration also assisted by making time and space for the activity to be included during the school day.

Community Innovations for SITE: Who is doing what with Clearinghouses and On-line Tools Development?
David Gibson & Bob McLaughlin, National Interagency Civil-Military Institute (NICI), USA; Deborah Sprague, George Mason University, USA; Niki Davis & Mary Howard, Iowa State University, USA; Christina Preston, London University, UK; Gary Marks, Association for the Advancement of Computing in Education, USA

This interactive panel session aims to inform the further creative development of SITE's web sites. It will be particularly relevant to groups within and beyond the USA who are developing "clearinghouses" and/or new "on-line tool sets" for technology in pre-service and graduate teacher education. The session will also consider ways in which SITE can collaborate with related on-line communities.

The role of school administrators in the process of effectively integrating educational technology into school learning environments: An evaluation in progress
Ian W. Gibson, Wichita State University, USA

The study reported in this paper examines the role of administrators in the integration of technology in three school districts. The outcome of the study provides information that will assist school district and building administrators in developing a greater awareness of their role in supporting the use of technology in the instructional environment. School administrators, instructional staff and technology coordinators participated in this qualitative study. Data collection strategies incorporated the use of focus groups and interviews.
Teachers, Technology, and Staff Development: Planning for Sustained Change
Victoria Giordano, Barry University, USA

Teacher staff development implies change. Staff development for teachers to incorporate a new technology into their classroom practice assumes that changes in student and teacher behaviors will occur in the form of teachers and students using technology in the teaching and learning process. Technology training for teachers often falls short of its anticipated outcomes. This paper will describe an instructional design model for teacher staff development to train teachers to integrate the Internet into their classroom routine. It is proposed that a staff development program designed to effect change in a participants’ values and beliefs, provide knowledge of skills and strategies for immediate application in the classroom, and acknowledge the stages of development in the adult learning process will result in sustained change in classroom activities. The instructional design for the teacher staff development delivered through Project REFLECT offers such a model.

Models, Mentors, and Mobility in the Teacher Education Program
Marsha Gladhart, Wichita State University, USA; Jed Carroll, Wichita State University, USA

Project M3 (Models, Mentors, and Mobility) is a PT3 Implementation Grant with three major goals. 1) To identify and develop model practitioners to work with teacher education students, 2) To develop a network of mentors to support and train students, faculty, and partner school teachers, and 3) To utilize laptop computers, personal digital assistants, and online support and instruction to improve student access to technology. For each of these goals, Project M3 reaches out to the university community, private and public schools, and private businesses to maintain a network of models and mentors and to support integration of technology in the college classroom and partner schools. Project M3 also uses new advances in mobile computing to improve accessibility to technology by creating and modeling the use of wireless laptops and personal digital assistants in the classrooms of the College of Education and in PreK-12 schools. On-line instruction and support are also used to provide better access to learning experiences, training, and support.

The Creation of a Nexus between Telelearning and Teleteaching
Marc Glassman, Faculty of Education, Memorial University of Newfoundland, Canada

This paper discusses the “links” between telelearning and teleteaching, and recounts the “rites of passage” in the creation and implementation of six university-level web-based courses. It is hoped that the participants to this presentation will become aware of the process involved in the creation of web-based courses, along with the benefits and problems associated with the implementation and delivery of this form of instruction. The intended audience would be those university-level professors teaching undergraduate and graduate level courses online. The focus of the courses are in the area of education, specifically pertaining to literacy. However, anyone involved in the creation of interactive text-based and multimedia web-based courses might find this presentation enlightening.

Teaching on the Web: A Constructivist Approach to Faculty Development
Sanford Gold, Columbia University, USA

One of the affordances of the new online learning movement is the opportunity it presents to reexamine the ways in which some aspects of traditional instruction can be re-conceived to operate effectively in the online asynchronous environment. This technological shift—from knowledge being fixed to a certain time and place, to knowledge being accessible at any time and at anyplace—creates the potential for a change in the way learning is transmitted from those who provide information (i.e. teachers or facilitators) to those who receive it (i.e. students).

Breaking Down Barriers: Integrating Technology in Teacher Education and Distributing it to K-12 Schools
Constance Golden, Marietta College, USA; Dorothy Erb, Marietta College, USA

Integrating technology into the Teacher Education program at Marietta College has been a priority for the last decade. However, while the college worked diligently to secure hardware, software, lab equipment, network services, course requirements, and pedagogical acceptance among faculty to facilitate this integration, our students failed to utilize their knowledge of technology in their K-12 fieldwork. Problems facing students were numerous: lack of equipment in the schools, lack of commitment to technology among local teachers, lack of knowledge of technology, mismatch of platform knowledge, and less than enthusiastic belief that technology could be integrated meaningfully into the K-12 curriculum. Because of these obstacles, the Education Department created new strategies, methods, and activities for addressing this lack of connection between higher education and K-12 educational technology. This presentation and paper will discuss the specific strategies used by the Marietta College Education Department to make meaningful the integration of technology into the teacher education curriculum and the K-12 curriculum. Additionally, methods and activities for distributing this integration to K-12 classrooms will be addressed. Activities, assignments, curriculum structure, and special projects from both higher education and K-12 education will be shared with the audience. Actual examples of student work created with such cross platform software as HyperStudio, SiteCentral, Kid Pix, and Amazing Writing Machine will be shown.

Making geometry on a virtual environment: a proposal of continuous distance education for teachers
Marcia Campos, Alex Sandra Gomes and Hermino Borges Neto, Universidade Federal do Ceara, Brazil

Tele-ambiente 1 is an environment composed of a virtual site linked to applications that favor the cooperative work, in which the interaction among participants is mediated by tele-conference resources (image, sound, text and mail) plus an efficient protocol of real-time file and software sharing among the the working group participants (for instance student-student and teacher-student).

Implementation of an Electronic Tutorship Support System in a School of Business Administration: a Case Study
Oscar M. Gonzalez, University of Valladolid, Spain; David Perez, University of Valladolid, Spain; F. Victoria Canovas, University of Valladolid, Spain

This paper analyses and describes the implementation of a tutorship system based on a telecommunication network that pays attention to the different interests and requirements of students and teachers of the School of Business Administration (University of Valladolid)
Electronic Portfolios as a Capstone Experience
Jeffy Gordon, University of Cincinnati, USA; Joyce Pittman, University of Cincinnati, USA; Danielle Dani, Univ of Cincinnati, USA
This Short Paper presentation will demonstrate examples of the digital portfolio created by students in our five year teacher education program. These portfolios include videoclips of their teaching, and demonstrate their philosophy of teaching. These portfolios will be contrasted with the paper portfolios which are currently required in the program. This session will also demonstrate representative examples of the technology plans of the college based faculty. These plans were created to demonstrate a commitment to infusing technology throughout the methods of teaching sequence.

The West Chester University Teaching and Learning with Technology Program: Aligning Graduate Credit Courses with NETS-T Standards
Marlene Goss, West Chester University, USA; John Kinslow, West Chester University, USA; Lesley Welsh, West Chester University, USA
NETS-T standards were the guiding principles we used as we structured and developed a graduate program at our university. The Teaching and Learning with Technology Program was created for educators to learn the dynamic relationship among teaching, learning, and technology integration. It is important to note that our program encourages teaching with technology rather than teaching about technology and is directly linked to classrooms in K-12 schools. Consistent with a Professional Development School initiative, and/or the teacher-scholar model, our graduate program will be offered through alternative delivery mechanisms such as use of the web, 2-way video and on-site classes in participating school sites. This presentation will lead others through the process we used, starting with creating a matrix aligning our course objectives and assessments with NETS-T standards to the implementation of the courses.

Focusing on the Learner: Interactive Environments for University Faculty, Inservice and Preservice Educators
Lee Gotcher, University of Houston - Clear Lake, USA; Caroline M. Crawford, University of Houston
The impact a World Wide Web (Web) site may have on any community may be either of two extremes, integrated into the daily activities or barely tolerated, or somewhere in between. The impact a Web site would have if focused specifically upon university faculty, inservice and preservice teacher educators could be beyond the hopes of the creators; however, the usefulness of the Web site must be extremely user-friendly and directly impact the user’s daily experiences.

Balancing on shifting sands: Teaching in the information age
Lisa Grable, NC State University, USA
Teachers trying the Internet for the first time can get the feeling that their career base is suddenly wildly shifting. Teachers adopting the Web into their teaching toolkit have a wide range of entry points for methodology and a large set of possible teaching techniques. Suggestions for helping teachers find a starting level within their comfort zone will be described, along with examples of classroom practice and ideas for workshop planning.

Ridges and Bridges: MentorNet Collaboration yields a watershed of preservice infusion
Lisa Grable, NC State University, USA; Hiller Spies, NC State University, USA; Judy Lambert, NC State University, USA; Candy Beal, NC State University, USA; John Park, NC State University, USA; Hollylynn Drier, NC State University, USA; Marsha Alibrandi, NC State University, USA
MentorNet is a consortium of current and future educators whose mission is to challenge and support each other in the creation and critical application of emerging technologies for 21st century classrooms. This panel discussion will show how NC State faculty in the College of Education are using technology in all levels of classes (foundations through clinical semester) and across disciplines. We will share a technology thread that runs through Content Area Reading, middle school interdisciplinary projects, a science education technology methods course, a mathematics education technology methods course, and a high school social studies professional semester.

Helping Elementary Education Majors Brush Up on Mathematical Modeling: Insights from a Field Test of a New Online Learning Prototype
Neal Grandgenett, University of Nebraska at Omaha, USA; Art Zygielbaum, Nebraska Educational Telecommunications, USA; Elliott Oetler, University of Nebraska at Omaha, USA; Steve Hamersky, Omaha Gross High School, USA; Bob Pawloski, University of Nebraska at Omaha, USA
This paper and corresponding presentation describes a field test of a new online learning module, developed within a National Science Foundation Proof-of-Concept project, with 40 elementary education pre-service teachers at the University of Nebraska at Omaha. Various studies and national reports have suggested that elementary education majors are often weak within academic content areas, and particularly mathematics and science. The approach of using online learning modules, may be particularly useful for filling this remedial content need. The module described in this project represents several innovations in such online instruction, and uses a node-based database structure for the instructional pieces. The paper is further supported by an extensive url address which includes notes, background documents, and various demonstration pieces of the prototype module.

40 — Proceedings of SITE 2001 / Orlando, Florida, USA
Subject-Specific Technology Integration Training: Lessons in Planning, Administering, and Follow-up
Regan Grandy, Idaho State University, USA; Jane Strickland, Idaho State University, USA; Dorothy Sammons, Idaho State University, USA; A.W. Strickland, Idaho State University, USA

Strickland (1999) reported the results of a Teacher Technology Mentor program in southeastern Idaho, which strongly indicated that the school mentors were not transferring their technology knowledge into classroom practice. Strickland recommended that subject-specific technology integration programs be developed to insure better integration of technology in the classroom. Based upon this recommendation, Idaho State University’s FOCUS program was developed, targeting three specific areas: fourth grade, secondary language arts, and junior high earth science. This research focuses on the planning, administering and follow-up of one of these programs—the junior high earth science program. The goal of this research was to determine if the subject-specific technology integration training of earth science educators makes a difference in teachers’ attitude and use of technology in classroom teaching practices. Data from attitude surveys of earth science educators involved in the FOCUS program suggest that teachers’ attitude and use of technology in the classroom increase when in-service technology training is subject-specific.

Regional list servers as a mean of peer support for an on-line learning community
John Green, The Open Polytechnic of New Zealand, New Zealand

This paper describes an on-going experience of using regional and national-ethnic list servers as a means of creating and providing peer support to an on-line learning community of 248 students already using an electronic forum to study by distance. A regional list server is defined as a list server that provides peer support to students in a specific geographic region. There are currently 13 regional list servers for the course. One of the problems of using a list server with a large number of students is that if even only a small number post messages and those messages are responded to the list participants have too many messages to digest. Students using an electronic forum in previous semesters had commented that they wanted to work in smaller groups. By providing regional list servers students were provided with a more intimate experience and reduced message load. The underlying principles behind this are discussed and an explanation is given of how the interactions on the 15 list servers are stimulated and monitored. An indication of the current success of the project is provided.

Developing Intercultural Understanding Via the Internet: Canadian Student Teachers and English Students in China Study World Literature Together
Jim Greenlaw, St. Francis Xavier University, Canada

In this project English students at a Chinese university and Secondary English Education student teachers at a Canadian University used e-mail to discuss with each other their interpretations of short stories from fifteen different countries. The purpose of this activity was to develop the participants’ intercultural understanding and literary critical skills through collaborative responses to world literature. At the same time the Canadian student teachers gained valuable experience at tutoring ESL students. Through the application of postcolonial pedagogical theory, I attempt in this paper to explain what the students have learned from each other.

Infusing Technology into the Teacher Education Program
Eileen Gregory, Rollins College, USA; Linda DeTure, Rollins College, USA

Success in the elementary classroom demands that teachers understand and have a working knowledge of educational technology. In 1999 the Education Department at Rollins College set the goal that all education students would graduate with the skills needed to effectively use technology in the K-12 classroom. Using the competencies as a guide, a new educational technology course was designed and implemented in Fall 2000. This paperless, self-paced course uses e-mail messages to guide the students through the basics of a specific software program such as Word, Internet and databases searches, Excel, PowerPoint, and Netscape Composer. These exercises are designed to develop the skills necessary for performing similar activities in their other education courses. Pre and post surveys are being used to measure student perception of changes in their computer skills and their confidence in using technology. Long-term assessment will involve evaluation of the students throughout their academic program and in post-graduation follow-up studies. The design of this course was intended to be dynamic in order to incorporate the latest technological advances as they occur and thus provide pre-service teachers with the foundation necessary to adapt their knowledge to new technology as it develops.

Faculty Development for ACTIVE Learning
Gail Gruber, Western New Mexico University, USA; Donna Rees, Western New Mexico University, USA; Deborah McCormick, New Mexico State University, USA

The ACTIVE project addresses the need to improve the preparation of preservice teachers by providing instruction that models the integration of technology into classroom delivery throughout the Teacher Education Program. The focus of this project is ACTIVE—Authentic, Competency-based, Technology-enhanced, Integrated, Versatile, and Evaluative—curriculum. ACTIVE teams include two faculty members and one preservice teacher who have come together for the purpose of necessary training and designing of curriculum. The teams are supported by university faculty/staff and advised by inservice teachers as the technology-rich curriculum is developed. This project was funded by a Title II Teacher Quality sub-grant and began in fall 2000. Teams develop their own training goals using twenty technology competencies New Mexico preservice teachers must possess in order to obtain licensure. The teams will also create rubrics for these twenty competencies, for the purpose of rating their own level of competency and for use by preservice teachers throughout the Teacher Education Program. Although this work is in progress and final products will not be available, examples will be available to share at the conference.
**WebSave - Archiving the Web for Scholar Work**

Christian, Guetl, Institute for Information processing and Computer supported new Media (IICM), Graz University of Technology, Austria, (cguetl@iicm.edu), Inhodelio Information Discovery, Co-Initiator of the xFIND Project and Member of the ACM, (cguetl@acm.org); Wilfried, Lackner, Institute for Information processing and Computer supported new Media (IICM), Graz University of Technology, Austria, (wlackner@iicm.edu)

The WWW provides a variety of scholar information, like theses, studies, etc., which may be valuable basics for further and new scholarly work. Referred information of the WWW has to be archived (at the time of writing) for further usage because Internet resources could be changed. The working prototype WebSave - described in this paper - support users in their research process. The advanced and novel system manages relevant information of the WWW by importing bookmark files from common browser clients. The system allows adding a wide range of local metadata, storing the referred resources and generates a literature list. Furthermore, it is capable of interfacing with other services like preparation for building a background library on CD ROM, building a document archive using Hyperwave, building a scholar dynamic Web library by quality metadata exchange to xFIND.

**ASTUDY OF SOCIAL AND ACADEMIC USES OF THE INTERNET BY HIGH SCHOOL STUDENTS**

Jenka Guevara, American School Foundation, Mexico City, MEXICO

This research studies how ninth-grade students in a fully computerized, K-12, affluent school use computers for educational purposes and in their personal lives. The target population for the study was the student body from the American School Foundation of Mexico City (ASF), a K to 12 American-type school with an American curriculum for over 100 years, and 2,400 students. The survey also included parents and teachers. The qualitative and quantitative surveys revealed that students use the Internet from one to three hours daily, and the predominant use is as a personal communications tool. Students are knowledgeable about precautionary measures that are required in conversations with strangers in the Internet social space. Parents believe computers and the Internet help their children with school assignments, and that the lack of Internet connection at home would put their teenagers at a disadvantage with their peers. The students' use of computers and the Internet at the ASF is meeting their parents' expectations. Most teachers give daily assignments to be done on the computer and require Internet searches for their assignments. The majority of the students say they use the Internet for research. Gender and nationality are not differentiating factors with respect to the use of computers and the Internet by high school students at the ASF for school-related work. However, there are some variations in other applications. For example, male students use the Internet more than females for games and for accessing sexually explicit images. The study sheds some light about the potential benefits of the introduction of computers and the Internet into U.S. classrooms. However, it also reveals that full integration of the technology into the curriculum is an elusive goal. Fundamental transformation in education, as in any major social change, certainly requires clear vision, hard work, and time.

**Analysis, Design, Implementation and Evaluation of Instructional Software by Computer Science Students and Public School Teachers**

Mario Guimaraes, Kennesaw State University, USA

This paper describes how computer science students of Texas A&M-CC (TAMUCC) and public school teachers benefited from an Eisenhower Funded Project "Training K-3 teachers on how to best use educational technology in the classroom" and were able to evaluate and construct educational software. During the first phase, teachers were exposed to educational technology. The next step was to evaluate educational software to teach science and rank the top software. They used a tool constructed by a computer science graduate student. In a third phase, they designed storyboards for computer science students from a Visual Programming Language Course to implement the software.

**Bilingual Web Based Learning: To know the world and to be known by the world**

Firman, Gunawan, Teleeducation Laboratory, Divisi RisTI PT TELKOM Indonesia

Web is a simplest and a cheapest technology to deliver a knowledge to all over the world. This presentation paper would tell you about our concept about bilingual web based learning (our way to know the world and to be known by the world), type of services, research and development steps in developing bilingual web based learning, development time-line, how the human resources organized in development and operational stage, collaborative work with other institutions, and our future plan in web based learning concept.

**Teachers Discovering and Integrating Technology: An National Online Success Story**

Glenda A. Gunter, University of Central Florida, USA

The purpose of this study was to determine if teachers could be taught to use and much more importantly integrate technology into their specific classroom curriculum in a national online graduate level educational technology course for K-12 teachers, Teachers Discovering Computers. Both quantitative and qualitative data were collected and analyzed. The pretest and posttest surveys included fourteen, five-point Likert items, and the posttest contained five open-ended questions. Analyst of quantitative data revealed there was a significant difference between the mean scores of the pretest and posttest scores, p = .000. Qualitative data revealed that 100% of the student had a positive experience in the class and learned how to use and integrate technology into their specific classroom curriculum. The combination of both the statistical and qualitative analysis lead the researcher to conclude that the impact of the course on the student's perception and integration of technology into the curriculum was dramatic.

**The Role of Assessment in Online Instruction**

Robert J. Hall, Texas A&M University, USA; G. Donald Allen, Texas A&M University, USA; Michael S. Pilant, Texas A&M University, USA; R. Arlen Strader, Texas A&M University, USA

The topic for this panel discussion is how assessment can be used to inform instruction in an asynchronous environment. We will explore how technology can add to our understanding of human learning and performance and how carefully designed web-based supplemental study-aids can impact the relationship between confidence and "classroom" performance as measured by course exams. In that regard,
we are interested in questions such as “How will performance and confidence metrics for a web-based course be assessed?” and “How can we determine the rate at which learning is taking place?” It is clear that some kind of assessment strategy is necessary in order to deliver material in the right sequence and at an appropriate rate. In this roundtable discussion, we will focus on four issues:

**Technology-Rich Education for Tomorrow’s Teachers**

Burnette Hamil, Mississippi State University, USA; Taha Mzoueghi, Mississippi State University, USA; Weber, James, Mississippi State University USA.

“Preparing Teachers to Deliver Technology-Rich, Problem-Based Learning Experiences” is a PT3 catalyst grant for the state of Mississippi. The project is a collaboration between the Mississippi Research Consortium members, partner community colleges, and school districts. It is funded through a grant by the US Department of Education, Preparing Tomorrow’s Teachers to Use Technology program and the various collaborating institutions. The main goal of the project is to infuse technology and hands on science practices in the Mississippi Education System. This is being accomplished by training Elementary Education candidates in a technology rich environment.

**TRES FACIUNT COLLEGIUM - Paderborn’s Collaboration Centred Approach for New Forms of Learning**

Thorsten Hampel, University of Paderborn, Germany;

This paper defines several key requirements for successful cooperative learning, which we have elaborated during the last years with goal to set up new forms of cooperative learning. Without bringing them into a special order, these main design criteria are the integration of synchronous and asynchronous forms of cooperation and the persistence of a learning process, the formation of a common group context or common information room, roles and access rights, annotations and structured chat as well as rooms as places for collaboration.

**iMovie and Educators: the Right Partnership for Making Digital Movies**

Marianne Handler, National-Louis University, USA; Otto Benavides, California State University, Fresno, USA; Kathryn Morgan, Bemidji State University, USA; Robert Houghton, Western Carolina University, USA.

The use of digital video and video desktop applications is spreading. So is the word about the ease of use of iMovie, the Macintosh software, used for creating finished digital video products. iMovie is a digital video editing application to help beginning users create digital movies from existing digital video footage. Beginning moviemakers can transfer clips from their digital camcorders, edit and arrange them into stories, add transitions, animated on-screen titles and publish them to the web.

**Assessing Distance Learning Tools and Techniques: A Case Study**

J. Christine Harmes, University of South Florida, USA; Ann E. Barron, University of South Florida, USA.

Most of the research on distance education has focused on its effectiveness, i.e. comparing student course grades or performance on exams between traditional on-campus and distance-based instruction. Little mention has been given in the literature to students’ attitudes and reactions after experiencing distance education. This study was designed to explore student reactions to a course delivered entirely on the World Wide Web, with the goal being to gather information for use in improving course design and delivery to help work toward improving distance education. Thus, objectives of this study were to investigate tools and techniques for the delivery of effective instruction via the Web.

**The Modern Classroom: Using Portable Wireless Computer Networking in the Classroom**

Virgil Varvel, University of Illinois at Urbana-Champaign, USA; Delwyn Hamisch, University of Nebraska at Lincoln, USA.

In the Spring semester of 2000, the College of Education at the University of Illinois sought to alleviate the lack of available class-time in a standard computer lab by implementing a laptop computer lab that could be transported throughout the building and connected to the World Wide Web via a wireless network connection. This paper reports on the usefulness of such a system in a higher education classroom and on the support aspects necessary to implement such a system and control for user needs. Views by our learners from a one-semester course in advanced statistics reveal that a wireless computer lab is effective in providing students with motivation, mobility, and learning while providing the instructor with increased pedagogical choices.

**Teacher Education Changes, Transitions, and Substitutions: Technology to the Rescue!**

Lynn Hartle, University of Central Florida, USA.

When, a new updated Early Childhood teacher education program with an entirely different set of courses had to be created to meet a new set of state competencies, a flexible course - Early Childhood Practicum was crafted to ease the transition and provide coursework for twenty-three students who needed a total of seven different courses in to graduate. The course individualized the learning so each student could complete the required competencies.

**Technologically Enhanced Cornerstone Courses: A High Impact Low Cost Approach to Modeling Technology for Pre-service Teachers**

Kendall Hartley, University of Nevada, Las Vegas, USA.

This paper reports on the project rationale and design of one initiative to better prepare preservice teachers to integrate technology into their future teaching. This project, technologically enhanced cornerstone courses, brings together teams of teacher educators to redesign large courses taken by most of our preservice teachers. These teams also worked to develop research questions related to the project. By focusing on the large courses taken by most of the preservice teachers the impact of the project is high.

**Developing Standards of Quality for Online Courses**

Kendall Hartley, University of Nevada, Las Vegas, USA; Teresa Gibney, University of Nevada, Las Vegas, USA; David Hellick, University of Nevada, Las Vegas, USA; Naes Strudler, University of Nevada, Las Vegas, USA.

This paper will report on the development of a “Standards of Quality” document for educational technology distance learning courses. This project resulted from a concern that the courses were viewed as less rigorous by other faculty and our own desire to insure quality in current and future course offerings.

Abstracts Book — 43
On-line Exams: Design, Development and Implementation
Talalyn Hartsell, The University of Southern Mississippi, USA; Steve Chi-Yin Yuen, The University of Southern Mississippi, USA
Testing has always been an important part of the instructional process in traditional classroom courses. However, testing is also an integral part for on-line learning. The goal of testing is to determine if learning objectives have been accomplished. The use of computers in teaching and learning has a considerable history within education. However, the rise of the Internet presents new opportunities for many aspects of education, particularly assessment. The presentation will provide information and resources concerning the development and implementation of on-line exams. Audience members attending this session should be familiar with the Internet and its educational implications as the presenters will discuss the benefits and drawbacks on using Web-based assessment in education. In addition, the presenters will compare various methods and development tools used for creating Web-based exams by offering samples to demonstrate the resources that are available to educators who plan to deliver on-line exams. Finally, the presenters will discuss the thrills and agonies that may accompany the implementation phase of on-line assessment in education.

Technology Strategies for the College Classroom - Preparing Teachers
Betty Hatcher, Gerald Burgess, K. C. Chan, Barbara Holmes, Reni George, Samuel Meish, Rosemary Mundy-Shephard, Chiou-Ping Wang, Onetta Williams, Carolyn Williams, Albany State University, USA
Technology in the College Classroom - Preparing Teachers to use Technology
The panel presentation herein shares strategies and outcomes of the implementation of the SOWEGA PT3 (Preparing Tomorrow's Teachers to use Technology) Project at Albany State University (ASU). The strategies are: (1) infusing technology into core courses that will serve as models for future teachers, (2) providing technology training to faculty in collaboration with the Education Technology Training Center to strengthen technology competence system-wide; (3) encouraging the development of technology intensive course materials, (4) awarding mini-grants to faculty members who will promote the interests of the SOWEGA PT3 project; (5) targeting pre-service teacher for Intensive Technology (InTech) training, and (6) collaborating with area schools to encourage student teachers utilizing technology at schools where they are doing student teaching. The PT3 project has fostered multi-disciplinary activities that promote active use of technology.

Technology and Character Education of the Younger Generation
Shujia He, Shanghai Qibao High School, P.R.China; Yuehua Zhang, Washburn University, USA
This presentation reports the results of a study of 800 university students who had been exposed to a technology-rich environment for their four years of college. Narrative comments were analyzed and synthesized to describe students' attitudes toward the influence of technology on the social and academic culture of the campus.

Applying Technology to Restructuring and Learning: An Analysis of A Professional Development Intervention
Marilyn Heath, Mary Burns & K. Victoria Dimock, Southwest Educational Development Laboratory, USA; Jason Ravitz, University of California at Berkeley, USA
The Applying Technology to Restructuring and Learning (ATRL) study was carried out over a two year period to document and assist 150 teachers in six schools during the process of creating constructivist learning environments (CLEs) supported by technology. The research component of this project involved an intervention study with a two-tiered research design. Tier One was a collective case study of the approximately 150 classrooms, located across six school sites, whose teachers participated in 72 hours of ATRL professional development. Tier Two consisted of six detailed case studies of individual teachers whose experiences represented the process and the practices they employed in creating a constructivist learning environment within their classrooms. This paper will summarize the findings from the Teaching, Learning, and Computing (Becker & Anderson, 1998) teacher survey regarding the impact of the professional development intervention that was provided for the teachers in the project.

South Central Regional Technology in Education Consortium
Marilyn Heath, K. Victoria Dimock & Jackie Burriske, Southwest Educational Development Laboratory, USA
The Regional Technology in Education Consortium (R*TEC) program was established by the US Department of Education to help states, local educational agencies, teachers, school library and media personnel, administrators, and other education entities successfully integrate technologies into K-12th grade classrooms, library media centers, and other educational settings, including adult literacy centers. To provide such help, the R*TEC establishes and funds several regional consortia that address professional development, technical assistance, and information resource dissemination. The 2000-2005 South Central Regional Technology in Education Consortium (SouthCentral R*TEC) serving Arkansas, Louisiana, New Mexico, Oklahoma, and Texas is now located at the Southwest Educational Development Laboratory in Austin, Texas. Through a program of focused professional development and information services for teachers and administrators, the South Central R*TEC will enable educational systems in its five state region to use technology to foster student success in achieving state content standards, particularly in schools serving high population of disadvantaged students.
Classrooms Under Construction: A Video Series
Marilyn Heath, K. Victoria Dimock & Jackie Burniske, Southwest Educational Development Laboratory, USA

Professional development that supports teachers as they create constructivist learning environments supported by technology allows them to construct professional knowledge about pedagogy, content, and technology, as well as strategies for managing a changing classroom environment. By providing the very experiences promoted for constructivist learning environments in the classroom, through professional development, it is possible that teachers will confront their “theories in use” to enable them to create learning experiences appropriate for the children of the Information Age. For this purpose, the Technology Assistance Group at the Southwest Educational Development Laboratory created six videos that portray several K-8 classroom teachers as they grew through the process of creating constructivist classrooms supported by technology. Featured in these videos are vignettes of students, teachers, and principals who share their experiences in learning, supporting, and the use technology to change teaching practices.

Creating a Web-Based Curriculum Tool: Helping K12 Teachers Harness the Potential of the World Wide Web
Lisa Heaton, Marshall University Graduate College, USA; LeAnn Putney, University of Nevada, Las Vegas, USA

The World Wide Web offers a great deal of potential for enriching the teaching and learning experience in the K-12 classroom. In many cases, however, teachers lack the time and skills to locate resources on their own. What can be done to help teachers and students take better advantage of the Web? Using the Algebra Resource Center (ARC) as an example, this paper will describe three areas of focus that can improve the effectiveness of sites designed as content area portals for classroom teachers—filtering, organizing, and correlating content to state standards; providing “real world” context for exploring content; and working to build a community of new and returning users.

Activities for Integrating the Internet in Teacher Education Classes
Marie Hegwer-DiVita, California State University, Long Beach, USA

This presentation will outline three categories of Internet activities: Direct, WebQuests, and Complex. Activities for K-12 students utilizing the Internet are featured in journal articles, websites, and books. Teacher education classes also increasingly use the Internet and can benefit from utilizing the same sort of activities. A taxonomy of number of Internet activities may be useful for teacher educators who are new to using the Internet in instruction. Instructors may begin with simpler activities and add more complex assignments as their own skills develop. Using different types of tasks increases motivation through variety and demonstrates variety in instructional planning. Tasks representing each of the category will be discussed, including examples and resources; examples from special education teacher education courses are emphasized. This taxonomy and the examples are being developed for use by a faculty “tech buddy” to aide in supporting colleagues participating in a PT3 Implementation Grant.

StarFestival: A Multilinear Approach to Cultural Identity
Kari Heistad, StarFestival, USA; Shigeru Miyagawa, MIT, USA

StarFestival is a multimedia K-12 educational package developed at the Massachusetts Institute of Technology that engages students and their teachers in the issues of diversity and cultural identity. It is based on the personal narrative of its developer, Shigeru Miyagawa, who returned to Japan after a 30 year absence, to answer his own personal question of Who Am I? StarFestival engages the students in answering their own questions of Who am I? Where did I come from? and Where do I fit in?

Workplace Literacy with Online Discussions
Heather, Hemming, School of Education, Acadia University, Canada; Sonya, Symons, Department of Psychology, Acadia University, Canada; Lisa Langille, School of Education, Acadia University, Canada

Many workplaces require individuals to collaborate electronically to solve on-the-job problems with others who may be down the hall, in a building close-by, or in another geographical place altogether. As a consequence, adult literacy programs need to be developed based on effective ways to teach individuals to use literacy skills in a technological context. This paper discusses the importance of integrating electronic writing into workplace literacy programs, describes an approach to instruction based on reciprocal teaching, situated learning and strategy instruction and offers some evaluative commentary on the effectiveness of the program.

Going the Distance: Developing Guidelines for the Creation of Online Courses
Norma Henderson, University of Nevada, Reno, USA; LaMont Johnson, University of Nevada, Reno, USA

This paper reports preliminary findings of a study assessing the quality of existing online courses at five Internet sites including three university institutions, and two commercial sites that provide software packages for educational online course development. This study was performed in two graduate-level information technology in education courses. Findings indicated that, overall, students were dissatisfied with the quality of online courses available. In fact, this study indicated that many of the purported online courses were merely traditional course syllabi placed online, or traditional correspondence courses where the study materials are obtained online. Suggested guidelines for the development of an online course include: a comprehensive description of the course, including purpose and objectives; time required to complete the course; tuition costs; grading policy; accreditation/degree fulfillment; prerequisites,
including technology skills; minimum system requirements; and testimonials. Also important is inclusion of a brief demonstration of a course module for student evaluation prior to registration.

**Graphic Representations for Learning: Developing a Learner’s Conceptual Framework**
Anne Henry, University of Houston - Clear Lake, USA; Caroline M. Crawford, University of Houston - Clear Lake, USA

The emphasis on knowledge attainment, higher order thinking skills and real-world learning opportunities within teacher education offers numerous opportunities for preservice teachers to develop a conceptual framework through which their future educational profession is viewed. The introduction of instructional technology into the educational environment offers the opportunity to represent such knowledge and understanding within a graphic format.

**Creating Multimedia Web Sites in a Flash**
Nanette Hert, Florida Atlantic University, USA; Ralph Cafolla, Florida Atlantic University, USA

This session will provide an overview of how to use Macromedia's Flash to develop engaging, interactive web sites. Flash makes it possible to develop fully animated web pages that allow learners to discover concepts that are not readily accessible on pages in a textbook or on static web pages. Educators can use Flash to create sophisticated presentations for the Web. For example, animation can be used to show water flowing into a beaker or to show shapes dividing to illustrate the concept of halves. With the help of Flash, web sites can contain interactive timelines and maps. Today’s teachers need to be trained how to create educational Web sites where users are able to interact with the information. Davitt (2000) states, “the use of Flash and other interactive animation software as a visual thinking tool looks set to take off in schools.” The session will provide a discussion of the advantages and disadvantages of Flash and provide participants with specific examples.

**Using student projects to meet the information needs of teachers on the Internet**
Danielle Heyns, Teacher Training College, South Africa

Teachers in South Africa are confronted with a new educational paradigm and rapid development in information communication technologies. In South Africa there is still a considerable lack of locally developed and relevant educational resources on the Internet. Students from the Teacher Training College in Pretoria were involved in a project to develop relevant online learning support material for Afrikaans First Language teachers. Their participation in this project not only empowered them with ICT skills, but also made them possible facilitators of change who can help to disseminate educational technology throughout the entire school system.

**Creating a Culture Shift: Establishing a Technology and Learning Center**
Carl Hoagland & Eric Aplyn, University of Missouri-St. Louis, USA

A culture shift is a change in the rules of conduct. The College of Education (COE) at the University of Missouri-St. Louis needed a cultural shift. With the university certifying over 500 teachers a year, these students need to be technologically literate. The evidence was that the students were not being adequately prepared to integrate technology into the curriculum. Pressure for technologically literate graduates was coming from the Missouri Department of Elementary and Secondary Education and from school districts. Students at the university also have practicums in technology rich classrooms and they may end up working in a technology rich classroom or MINTS * classroom. In the 21st Century, students hired from the University of Missouri-St. Louis must know how to integrate technology.

**Effective Technology Staff Development: A Grass-Roots Approach**
Mark Hofer, University of Virginia, USA

Training to support the integration of technology into the curriculum can be difficult. Research suggests that on-site, just-in-time instruction is more effective than one-time workshops in facilitating meaningful technology integration into the classroom. The Teacher Technology Leadership Academy in the Archdiocese of Indianapolis is a grass-roots approach to staff development in technology. It is a cost effective, train-the-trainer approach that provides research-based staff development in technology for classroom teachers. This model can be transferred to any school or district.

**Virtual Literature Circles: Message Board Discussions for**
David Hofmeister, Central Missouri State University, USA; Matt Thomas, Central Missouri State University, USA

This paper reports current findings from an ongoing research project that is an offshoot of a three-year, $155,000 “Best Practices in the Use of Technology” grant awarded to one of the co-authors, 1998-2000. The portion of the study reported here focuses on the cognitive complexity of student written responses in Virtual Literature Circles or electronic message boards utilized according to the structure of more traditional classroom literature circles. The ex-post-facto research question examined was: Did the cognitive complexity of student responses increase with continued use of Virtual Literature Circles? The findings of this simple study suggest that this research question is best answered in the negative, and shed light on existing higher-order literacy theory and on the effectiveness of Virtual Literature Circles in their current pilot state. Additionally, knowledge was gained in this study regarding new instrumentation being developed to help with the unique challenges of assessing student message board responses.

**Observations of the computer use of pre-service teachers**
Brad Hokanson, University of Minnesota, USA

The major portion of the impact of instructional designers will come through improved and continued education of in- and pre-service teachers through courses dealing with computers, technology, and the use of the internet. Understanding learners’ existing knowledge is an important aspect of education. Surveying learners at the beginning of class is a good means to understand their skills and experience. This study examines survey data from pre-service teachers and makes observations from that data regarding technology use which may help improve instruction in the use of technology.

46 — Proceedings of SITE 2001 / Orlando, Florida, USA
The Results of a Learning Software Competition
Brad Hokanson, University of Minnesota, USA; Simon Hooper, University of Minnesota, USA
This presentation will highlight the process, results and observations from the recent Learning Software Design Competition sponsored by the University of Minnesota. Winners of the competition will be demonstrated and observations from the process and the pool of winners will be presented.

Communal Constructivism: Students constructing learning for as well as with others.
Bryn Holmes, Brendan Tangney, Ann FitzGibbon, Tim Savage & Siobhan Mehan, Trinity College Dublin, Ireland
We believe there is a need for an expanded definition of social constructivism that takes into account the synergy between the more recent advances in information technology - which are increasing our potential for communication and the ability to store a variety of data types - and advances in virtual learning environments. In particular we are still at an early stage in trying to construct knowledge as to how to teach and learn effectively with ICTs. What we argue for is a communal constructivism where students and teachers are not simply engaged in developing their own information but actively involved in creating knowledge that will benefit other students. In this model students will not simply pass through a course like water through a sieve but instead leave their own imprint in the development of the course, their school or university, and ideally the discipline.

Using CD-ROM to Guide the Development of Professional Portfolios
Dennis Holt, University of North Florida, USA
The session will present an evaluation of the CD-ROM project, “Developing Your Professional Portfolio for Internship and Beyond”. It will include feedback from interns, supervising professors, directors teaching and education personnel from across the USA and abroad. The session will include the display of professional portfolios, electronic portfolios, K-12 electronic folders and multimedia portfolios.

Electronic Portfolios: A Glimpse into a Child’s Education
Claire Smith Hornung, Lehigh University, USA
Electronic portfolios use the purposeful collection of students’ work, progress and the achievements of the paper portfolio and puts them together using technology that enhances and expands the delivery of the portfolio. As one can only imagine, a collection of multimedia work is far easier to present electronically than to find the perfect container to hold a students artifacts from pre-K-5. Indeed, electronic portfolios can include graphics, video, and sound, in addition to all that is included in a paper portfolio. There is no limit to these portfolios. Its creation is guided by the imagination of the creator. Similar to the paper portfolio, students can often take a lead role in using technology to develop their own electronic portfolios. The Moravian Project involves incorporating electronic portfolios as an assessment tool for students and teachers alike.

LUMA: The Next Step in a Partnership to Enhance Technology Integration
Claire Smith Hornung, Lehigh University, USA; Steve Bronack, Lehigh University, USA
Technology enriched learning environments have a positive effect on the achievement of students. It would seem, therefore, that the environments of in-service educators must also be rich in technology and technology integration. After developing a partnership that focuses specifically on technology integration with pre-service and in-service educators, a second partnership developed to work with specific academic departments at the Upper School level integrating technology within an established curriculum. The goal of this partnership, LUMA (Lehigh University/Moravian Academy), was to give teachers in specific academic areas access to materials, plans, ideas, and support for integrating appropriate technologies into their class activities. From experience, the developers of this partnership know what doesn’t work—the one-day, one-shot, show-and-tell workshop developed by outside consultants and delivered to teachers. Instead, these workshops were designed to be spread out over an academic semester, involve the teachers in the design and development, and provide support for the teachers between workshops.

Integrating Mathematics Education Technologies into Teacher Education at the University of Colorado-Boulder
Jeffrey Hovermill, University of Colorado, USA; Michael Meloth, University of Colorado, USA
Technology is transforming the face of mathematics education. The National Council of Teachers of Mathematics’ Principles and Standards for School Mathematics (Standards) states “the existence, versatility, and power of technology make it possible and necessary to reexamine what mathematics students should learn as well as how they can best learn it” (NCTM, 2000). Furthermore, NCTM describes that the effective use of technology in the mathematics classroom depends on the teacher. Technology is not a panacea. As with any teaching tool, it can be used well or poorly” (NCTM, 2000). Evidence suggests that teachers frequently have difficulty aligning their practice with these Standards and that they need financial, cognitive and technical support in order to do so (OTA, 1995). This paper describes ways that the University of Colorado-Boulder has infused technology into their teacher education program in general, and their mathematics education program, in particular, in order to “prepare tomorrow’s teachers today” to effectively teach with mathematics education technology.

Ways to Integrate Technology in Your Classroom
Choong L. How, East Hartford Middle School, USA
This educational web site creates a framework for understanding technology tools and how they can be used for teaching different subjects in the classroom. The site provides links to general education, subject-specific and community sites. Its distinct features are the integrated language arts thematic units developed by teachers in a Connecticut school system to help their students meet the objectives of the Connecticut Achievement Performance Test (10th grade CAPT) and a template to submit your favorite lesson. The web site is organized into four sections: I. Technology Tools II. WWW Educational Resources III. Lessons Database IV. Reading Strategies.
Use of Development Teams in Problem Finding
Judith B. Howard & Deborah Thuilow, Elon College, USA

Educators emphasize unit construction as an important part of teacher preparation. Technology-enhanced problem-based learning units are particularly exciting because they have the potential to involve students in complex, realistic problems that are both engaging and cognitively challenging. These units are difficult to develop, however, particularly for elementary education teacher candidates who often have limited content knowledge. The authors have enlisted arts and science faculty experts to participate as members of “development teams” to assist in the design of problem-based units in science and social studies. This collaboration produced units in which content is richer, problems are more complex, and resources are more substantive.

Internet Uses by Senior High School Teachers: A Case Study
Ying-Shao Hsu, Yeong-Jing Cheng & Guey-Fa Chou, National Taiwan Normal University, Taiwan; Chi-Chuan Chen, ARGIS Company, U.S.A.

This research project employs the case study method to investigate the effects of instruction and learning with the Internet at the senior high school level. In the first year of this study, the main focus is to explore the current status of integrating the Internet into school management, teaching and learning. Some teachers were selected in six subjects, Chinese, Geology, English, Mathematics, Biology and Earth sciences, to use the Internet for their professional activities. The data collection instruments included the Teachers’ Professional Use questionnaire and The Students’ Computer Use questionnaire. The survey data showed that (a) more teachers and students knew how to access the Internet for instructional or learning purposes after the researchers intervened, and that (b) more teachers reported that they needed assistance for designing a web-based database and Instructional strategies for their Internet use.

Creating a Methodology for Using the Internet as a Source of Data for Qualitative Research in the Social Sciences
Malcolm Hughes, University of the West of England, UK

At a time of much increased use of the Internet as a source of data for research, there is concern about how best to do this. This short theoretical paper seeks to characterise some uses of web page data. Can the Internet deliver what we are looking for and how well do we know when we have found it? A methodology is suggested, drawing heavily upon ‘Grounded Theory’, and some principles of good practice are recommended.

ICT Training for Teachers: a University response to a National Training Initiative in the United Kingdom
Malcolm Hughes, University of the West of England, UK; Lynne Walker, University of the West of England, UK

This paper seeks to describe a national training scheme currently operating in the United Kingdom, the main aim of which is ‘To raise the standard of pupils’ achievements by increasing the expertise of serving teachers in the use of ICT in subject teaching, to the level expected of Newly Qualified Teachers who enter the profession, and by improving the competence and confidence of school librarians in their use of ICT’. An analysis of the requirements and learning intentions of the scheme are offered and examples shown of how one training provider has met the challenge using a combination of multimedia CD-ROMs, on-line training modules, in-school support and the development of a virtual learning community.

Just Another Evaluation Paper: Working Towards a Shared Methodology for Evaluation of Information Technology Courses in Teacher Education
Malcolm Hughes, University of the West of England, UK; Lynne Walker, University of the West of England, UK

In response to a perceived increase in the amount of course evaluations being presented at conferences and appearing in the journals, this short paper seeks to characterise the methodology adopted during the evaluation of information technology courses forming part of teacher pre-service education. An attempt is made to discover the strengths and weaknesses of the most common procedures by the review of course evaluations readily available in the public domain. Elements of course evaluation are described in a short taxonomy under the main headings of curriculum effectiveness, learning effectiveness and cost effectiveness.

Networked Learning: A Project-based Approach in building up the Working Knowledge of Multimedia Teaching Resource Bank
Vincent HK Hung & Winnie WM So, Hong Kong Institute of Education, Hong Kong; Jacky WC Pow, City University of Hong Kong, Hong Kong

This is a working paper describing a proposal for the development of a networked learning program for participants taking “General Studies” as their elective in the part-time Postgraduate Diploma in Education (PGDE) course offered by the Hong Kong Institute of Education. The objective of the networked learning program is to develop a local multimedia teaching resource bank for the subject “General Studies” in the primary curriculum through collaborative learning. The paper describes the rationale and concept of the networked learning program. The mechanism with 4 stages of development is outlined to illustrate how the networked learning program should be designed. The outcomes, and limitations of the use of the networked learning in developing multimedia teaching resource bank are discussed too.

Black Bear, Black Bear. What Do You See? We See Teacher Educators Integrating Technology
Cynthia J. Hutchinson, University of Central Florida, USA; Sherron Killingsworth Roberts, University of Central Florida, USA; J. Susan Lynch, University of Central Florida, USA; Mary Little, University of Central Florida, USA; Mary Palmer, University of Central Florida, USA, Sheila Smalley, University of Central Florida, USA

This paper describes a staff development process used to support technology development of both faculty and preservice teachers at a large state university. The authors explain the progressive and innovative slant of the integration model, the three-day training and writing workshop for faculty, and the description of a pilot project using a technology-rich, integrated curriculum on Florida Black Bears to train preservice teachers.
Wholetheme Learning in the Internet Virtual Community: Some Encouraging Preliminary Results

Asghar Iran-Nejad, University of Alabama, USA; Yuejun Xu, University of Alabama, USA; Gopakumar Venugopalan, University of Alabama

This study compares data from two different applications of a theoretically grounded wholetheme learning portfolio. The portfolios came from four different sections of the same undergraduate educational psychology course for teacher education students. All students wrote a critical reflection essay on three of their major insights in the course of the semester according to a common schedule and set of guidelines prescribed in their syllabus. Each of the students in two of the sections did and in the other two did not participate in the internet virtual community (IVC) we created. Qualitative results suggest that the IVC participants improved in critical reflection in the course of the semester. Qualitative analysis of the third insight data suggested a trend in favor of an interaction in which better students did better in IVC and poorer students did better in non-IVC conditions.

The R.O.A.D Learning System (Read, Own, Apply, Discuss) An On-line Method for Enhancing Teacher Pre-service and In-service Professional Growth

Geoff Irvine, NEWTcom, Canada

We (NEWTcom: a non-profit organization) have been developing a state of the art, Web-based, interactive, multimedia enhanced web-service to support the training and on-going development of teachers. The aim is to serve both in-service and pre-service educator needs. The service is being built in collaboration with the Ottawa Carleton District School Board, the Ottawa Center for Research and Innovation (OCRI) and the Communications Research Center of Canada (CRC). We would like to show the resource to staff-developers and teacher-trainers to get their feedback and advice for further development. The goal of this session is to introduce this type of training medium to leading educators.

Constructing Knowledge Networks: Integrating Science, Math, Language, and Technology in the Middle School Classroom

Sarah Irvine, American University, USA; Teresa Larkin-Hein, American University, USA; Andrea Prejean, American University, USA

This session will present how the use of the constructivist theory, national standards in Math, Science, and Language arts were into a technology-based workshop for in-service teachers in Washington, DC. Elements of the workshop will be presented, along with sample instruction web-sites designed by the teachers. Evaluation of this workshop provides recommendations for providing professional development for teachers already in the field.

Virtual Learning Center: Online Tools Support In-class Teaching

Barbara K. Iverson & Janell Baxter, Columbia College Chicago, USA

This interactive session presents "old teaching techniques in new packages." It presents an approach to transforming teaching activities, which is economical and does not require too much extra time on the teacher's part exceptions in the world of modern faculty development in technology use and application. It demonstrates how teachers can create a Virtual Learning Community of online tools and resources to provide an electronic infrastructure to support their in-class teaching. This Virtual Learning Community can be used by elementary, secondary and post-secondary teachers, as well as teacher educators to transform traditional teaching practices into more effective "asynchronous" online activities, that frees up valuable class time for higher order cognitive activities and for social learning experiences. The tools we demonstrate are low-cost, free, or widely available already in schools, so our Virtual Learning Communities approach can be implemented in almost any teaching setting by any teacher who uses email and the Internet on their own. This is a practical, no-frills approach to modernizing your teaching.

Using Internet Technology to Facilitate Anonymous Communication in World Wide Web Delivered Multiculturalism in Education Courseware

James G. Izat, West Texas A&M University, USA; Terry Hargrave, West Texas A&M University, USA; Robert D. Brammer, West Texas A&M University, USA; Gwan Williams, West Texas A&M University, USA

Between 1999 and 2000, a study was conducted at West Texas A&M University whose purpose was to design and utilize an anonymous communication technology through which graduate online Multiculturalism in Education students might answer challenging questions on issues that students are traditionally reticent to discuss in an open, identified forum. The anonymous comment box was introduced to online students and has been in use for three consecutive semesters in the 1999 and 2000 calendar year. Approximately 100 students have responded to the eight questions posted in the assignment pages of instructional units. These responses were archived, coded and analyzed to reveal the following preliminary conclusions: first, the utilization of the anonymous comments box technology allowed students to openly express their thoughts and opinions; second, the anonymous structure limits the instructor to a general knowledge about the class section.

How Information Technology Can Help Education, Distance Learning

Hossein Jahankhani, University of East London, UK

The aim of this paper is to review how information technology i.e. computer based studies can help education particularly in distance learning. Although this review will concentrate on distance learning it will also discuss and compare ideas such as open learning and flexible learning. The economy behind, and advantage, disadvantage of the distance learning will be analysed and compared between conventional, distance, open and flexible learning.

Computer Confidence and Attitudes of College Students Attending A Notebook or Traditional University

Kenneth Janz, Indiana State University, USA

This study attempts to determine how the use of a notebook computer impacts a student's computer confidence and attitude when compared to those of a traditional university student. This descriptive study used a survey research instrument to gather quantitative data concerning computer confidence and attitudes. Forty-six students at a notebook university and 64 students at a traditional university...
were surveyed during the summer semester of 1999. Data were collected on computer attitudes to determine students' perceptions of computer usefulness, and comfort or anxiety. The study found that notebook university students had significantly higher levels of computer usage, confidence, and positive attitudes than did students at a traditional university.

**An In-Service Program in Applied Linguistics for Language Teachers**

Diana Jenkins, National Autonomous University of Mexico, Mexico; Dulce Maria Gilbón, National Autonomous University of Mexico, Mexico; Carmen Confojo, National Autonomous University of Mexico, Mexico

Given the recent rapid changes in the educational field in Mexico many language teachers face new challenges for which even recent graduates of training programs may be ill-equipped to deal with effectively. Among other new challenges, teachers are being expected to take an ever more active role in syllabus, program and materials design. They are also increasingly expected to be able to manage new technologies. In order to participate they need to transform themselves from technicians to professionals and to do this they need updating in the theoretical and practical bases of their field. This project, sponsored by the National University’s Support Program for Institutional Projects for the Improvement of Teaching, hopes to address these needs through a model which combines the applied linguistic content with experience in the use of educational technology.

**Matching Distance Education with Cognitive Styles in Various Levels of Higher Education**

Steve Jenkins, Louisiana Tech University, USA; Watier Buboltz, Louisiana Tech University, USA; Lamar Wilkinson, Louisiana Tech University, USA; Sonia Beatty, Louisiana Tech University, USA; Soria Beatty, Louisiana Tech University, USA

With advances in computer and other technology it appears that we now have the capabilities to design and deliver distance education learning experiences that will allow students to maximize their potential and learning. However, as we implement these new technologies we can not lose sight of the individual learner. Students present with a variety of capabilities and preferences for learning (cognitive/learning styles), which appear to vary with age and previous learning. Based on this, distance education needs to be designed with this in mind in order to maximize its efficacy. Different cognitive/learning styles require different types of material presentation, format, evaluation and feedback for students to have the greatest chance to succeed. For distance education to be successful for the most number of student’s developers and designers of distance education need to meet the unique style and needs of each student. This article addresses the cognitive/learning styles of students at various educational levels and how these styles should be considered when designing and implementing distance education to help meet the uniqueness of each learner.

**Creating Technology Mentors for Rural School Districts: An Examination of the T.I.M.E. Mentor Program**

Michael Jenks, Idaho State University, USA; Jane Strickland, Idaho State University, USA

This study examines the strengths and difficulties of the Technology Integration Mentors in Education (T.I.M.E.) program through accounts given by participants. The T.I.M.E. program, at its peak in 97-98, included approximately 400 inservice teachers from 55 school districts in eastern Idaho. Several inservice teachers who have successfully completed two years of the program were asked to participate in an extensive online interview and survey format (via WebCT) designed to pinpoint major characteristics of the program as well as attitudes. This research explores three areas of the T.I.M.E. participants' experiences: Workshop training experience, implementation of technology into their own curriculum, and peer mentoring activities. The detailed perspectives of these participants are critical to understanding the successes and difficulties of the program. The results of this current research will inform improvements in the implementation of the T.I.M.E. program.

**Teaching Technology With Technology: A Case Study. How One Faculty Member is Integrating Technology Into His Pre-Service Mathematics Methods Classes.**

Ken Jensen, University of Nebraska, USA

This case study tracks a secondary mathematics pre-service class. The professor’s thoughts give insight into why he is incorporating technology into his curriculum. The pre-service mathematics class is also participating in a pilot project in which wireless Macintosh® iBook computers are put to use. Classroom observations, interviews and documentation of student feedback were used for analysis. This professor’s philosophy is that technology should be an instructional tool, a contribution to productivity. This faculty member is pleased with the results of technologies utilized in the course. Students reveal they benefits of technologies used in this methods course. The interesting concern of students was not the use of technology, but “which brand” would offer the best results.

**Beyond the workshop: Models of Professional IT Development for Practicing Teachers**

Jennifer Jenson, Brian Lewis & Richard Smith, Simon Fraser University, Canada

This study examines an often over-looked aspect of the implementation of computer technologies in schools, across Canada and elsewhere: we have sought to identify, describe and clarify “successful” models of teacher professional development.

**Mentoring Collaboration to Integrate Technology into Science Curriculum: A PT3 Project**

Seung H. Jin, Cleveland State University, USA

This paper describes an exemplary case in mentoring collaboration between the student teacher and cooperating teachers to integrate technology into the curriculum and discusses various activities that have occurred during the project. The educational technologist provided on-one-one and just-in-time coaching customized to needs in the context/placement classroom for a semester through the whole technology integration process. The project addresses three important problems/issues including: 1) collaboration between student teachers and cooperating teachers, 2) a model for integrating technology into the curriculum, and 3) communication among faculty in higher education, cooperating teachers, and student teachers.
Diversity through Co-Operation: Creating and Delivering Content in In-service Teacher Education
Monica Johannesen & Leikny Ogrim, Oslo University College, Norway
This paper describes some Norwegian experiences from the Co-operation Network project in teacher education. Through the network, students in the study programme "ICT for Teachers", are offered a diversity of web based optional subjects from several university colleges. Different forms of collaboration are applied in the network, and Tony Bates' three categories of inter-organisational co-operation are used to discuss the alternative forms. An organisational and economic model of co-operation is presented and discussed according to diversity.

VisionQuest©: Creating Visions and Strategies for Technology Integration
Tristan Johnson, Purdue University, USA; Peggy Eitner, Purdue University, USA; Molly Lane, Purdue University, USA
As the need for meaningful technology integration has increased, various programs have been developed to support and help pre-service teachers accomplish this complex task. Decisions-makers for teacher-education programs could benefit from instructional information that highlights the strengths of these various development programs. This paper describes VisionQuest©, a CD-ROM teacher development tool, designed specifically to help teachers gain the critical skills needed to effectively use technology in classroom learning environments. VisionQuest© uses an instructional method that focuses on creating a vision and developing a personalized implementation strategy to achieve sound technology integration. This tool helps users reflect on exemplary cases, thereby engendering thoughtful consideration of the visions and strategies that enable exemplary use.

Mentoring and Assessment: A Case Study of Initial Teacher Education and In-Service Development.
Chris Jones, University of Sunderland, United Kingdom
This paper concentrates on the issues pertaining to the determination and accreditation for Qualified Teacher Status in Information Technology in England and Wales, and the role that School Based Tutors have in this process. The major problem faced in initial teacher preparation is that while there is broad agreement that high levels of practicum are important, the lack of suitably qualified teacher mentors in Information Technology is hampering the effective preparation of newly qualified teachers. This paper looks at one model for effective mentor support.

USING AN ELECTRONIC DISCUSSION BOARD TO SUPPLEMENT CLASSROOM SESSIONS WITH POST GRADUATE TEACHEREDUCATION STUDENTS
DONALD JOYCE, CAROLYN NODDER & ALISON YOUNG, UNITEC INSTITUTE OF TECHNOLOGY, NEW ZEALAND
When the postgraduate computer education programme at UNITEC Institute of Technology was developed it was considered essential that it be accessible to students in full time employment. Consequently all classes are held at weekends and Blackboard Course Info is used to facilitate student-student and student-teacher interactions between classes. This paper outlines the structure of the programme, profiles the students, explains the approach taken by the lecturers, and reviews the learning experiences of staff and students in three classes.

Science Concepts, Technology, and Higher Order Thinking Skills- What's the Connection?
Margarete Juliana, Research Center for Educational Technology, USA
Using the scientific process involves ample opportunity for complex higher-level thinking. Integrating technology into the unit can support and enhance these same critical thinking skills. This qualitative study was designed to examine students' understanding of a science problem involving human habitation of wetlands, woodlands, and grasslands. Four fourth grade students and their teacher were observed during a six-week period in which they spent two hours a day in a technology immersed classroom. Researchers observed how students used technology to proceed through defining, investigating, and drawing conclusions about the problem. Student interviews revealed how useful they felt technology had been for completing each stage of the process. Teacher interviews revealed how she believed technology was supporting and enhancing students' complex thinking. For the purposes of this study, the scientific process has been limited to the following four main stages: identify the problem; collect information; analyze information; and draw/present conclusions.

Virtual Exchange Program: Coming to a Computer Near You?
Chris Junghans, Montana State University, USA
In the spring of 2000, a"Virtual Exchange Program" was piloted by the Koerber Foundation's Transatlantic Classroom project. The intent of the program, initiated by the author, was to allow American high school students of German to electronically correspond with Americans of the same age who were in Germany on a one-year, U.S. Congress-Bundestag Exchange Program.

Is A Paradigm Shift Required In Order to Effectively Teach Web Based Instruction?
Michael G. Kadlubowski, Northern Illinois University, USA
The hypothesis of this thesis is to present to the reader an argument as to whether existing educational paradigm's, philosophies, pedagogy, and practices require revision to effectively teach web based instruction. Due to the length restrictions of this paper the reader is advised that not all paradigm's, philosophies, and practices are included, and those that are evaluated as to their usefulness in web based instruction are very limited in scope, definition, and explanation. In all probability you will find that this paper will ask more questions than it answers, but in doing so will hopefully stimulate each of us to view and analyze the effectiveness of the current practices employed in web-based instruction.
The Integration of Technology into Classroom Lessons in the Teacher Preparation Program at the University of Houston-Clear Lake
Lawrence Kajs, University of Houston-Clear Lake, USA; David Underwood, University of Houston-Clear Lake, USA; Anne Coppenhaver, University of Houston-Clear Lake, USA; Trudy Driskell, University of Houston-Clear Lake, USA; Caroline M. Crawford, University of Houston-Clear Lake, USA

This session describes the qualitative and quantitative results of a one-year PT3 capacity building grant which focused on the preparation of teacher candidates to develop lesson plans that incorporated technology.

Peer status and self-efficacy: Effects on technology-based small group interactions
Rachel Kamb, University of Utah, USA; Dale Niederhauser, University of Utah, USA

The use of computers in schools is moving away from individual learning environments in lab settings, to group learning environments, as more computers are integrated into classrooms. This shift is causing teachers to reevaluate computer use as not just a tool for tutoring individual students, but as a potential medium for group-learning situations. This study looked at some of the factors that influence interactions in learning groups working on a computer-centered activity. Twelve groups of three high school students each worked together around one computer to solve a mystery presented in a problem-based learning program. Prior to the activity, all students were tested for prior knowledge, self-efficacy, and were ranked by academic and peer-status by the other members in their group. The results of this study indicate that high-ranking peer status of an individual group member positively influences that individual’s participation. However, unless the other members of the group had high self-efficacy and prior knowledge, the highest-ranking individual in a group would dominate the discussion and make most of the group’s decisions. The individual characteristics of students then, may be important for teachers to consider when trying to create effective technology-based group learning situations.

Influence of Computer Assisted Teaching on Development of Faculty Staff Members at Atatiirk University
Melih Karakuza, Atatürk University, Turkey

With the intention of determining the attitudes of faculty instructors to Computer Assisted Teaching (CAT) in their own major fields of study I attempted to carry out this survey. This study is based on the collected data via a questionnaire applied on 98 staff members currently teaching at Atatürk University, Erzurum, Turkey. The survey intends to determine and analyze various opinions of the staff members about the effects of Computer Assisted Teaching (CAT) on their development. Collected data from the replied questionnaire items were analyzed using frequency-per cent and a report of the study that investigated the effect of Computer Assisted Teaching (CAT) on the development of the staff members at the university. In conclusion, evidence based on the staff members’ opinions was found that Computer Assisted Teaching (CAT) has a significant effect on the development of staff members.

Using Anchored Instruction to Teach Preservice Teachers to Integrate Technology in the Curriculum
Mumbi Kariuki, University College of Cape Breton, Canada; Mesut Duran, University of Michigan, USA

Twenty-two preservice teachers involved in a cohort group were enrolled in both an educational computing class and a curriculum development class in the same academic quarter. The instructors for both courses collaborated their teaching efforts whereby the preservice teachers used the educational computing class to research, record, and document their experiences in the curriculum development course. The theme of the curriculum class was therefore used as an anchor for the educational computing class. This paper describes how the technology instructor structured the educational computing class around this anchor. It also describes the lessons learned from this collaborative experience. The paper includes some reflections from the preservice teachers that highlight some advantages of this collaborative process from the preservice teachers’ perspective. The paper concludes with suggestions for implementation of similar teaching designs to allow other technology instructors to take advantage of the benefits of anchored instruction in teaching technology to preservice teachers.

Instructional Technology as a Support System for Principal Certification
Cathy Kaufman, Indiana University of PA, USA

The session examines how establishing an electronic community of learners aided the professional development of veteran educators moving to the position of school administrator.

Managing Change To Flexible Learning Using Online Technologies: Bridges To Cross, Lessons To Learn
Marie Kavanagh, The University of Queensland (Ipwich Campus), Australia

Universities around the world are involved in dynamic change as they seek to take advantage of the potential of the internet and information technology to provide learning opportunities which are independent of time and location. They must develop creative solutions in order to cope with changing educational requirements in an increasingly demanding global market. Yet many of the early attempts to use information technology and the internet for teaching have been nothing more that unreflective rebadging of material or repackageing of the more traditional modes of learning. To be successful, effective educational methodologies need to be anchored to the diverse material circumstances characterising different groups of learners. The challenge for universities offering programs of study is to provide avenues for learning which are reflective of the needs of its ‘learning community’, take advantage of the benefits which information technology provides while keeping in mind the outcomes desired for programs.

A tutor’s advice trains a student’s self-regulation skill
Michiko Kayashima, Tamagawa University, Japan

We propose that a tutor’s appropriate advice trains a student’s self-regulation skill. Through analysis of the tutoring interaction between academic departments, we discovered that a tutor’s advice transformed a student’s questionings. Our hypothesis by the analysis is that this transformation indicates an appropriation by the student of the tutor’s self-regulation skill. We propose a training model of a student’s self-regulation skill, which is based on the appropriation by the student of the tutor’s self-regulation skill.

52 — Proceedings of SITE 2001 / Orlando, Florida, USA
Three Computers in the Back of the Classroom: Pre-Service Teacher's Conceptions of Technology Integration
Thomas Keating, Boston College, USA; Ellen Evans, Boston College, USA

Faced with a new generation of pre-service teachers, teacher educators may easily assume that these young men and women are technology savvy and have mastered the skills required to word process, create presentations, surf the web, email professors and friends, and conduct their research online. Nevertheless, these same pre-service teachers may express anxiety and doubt about their ability to incorporate technology into their future classrooms. Our study, based on interviews with pre-service teachers, looks at this disconnect between using technology with confidence for personal use and using technology as an educator. We consider possible sources for this disconnect, and offer an alternative conception of technology in education we call “technological pedagogical content knowledge” (TPCK) which extends beyond computer proficiency to understanding the effect technology may have on student’s conceptions of subject matter, the inevitable challenges that accompany technology, and the judicious use of technology when new forms of representation are most appropriate.

Using Dreamweaver 3 for generating preservice web-based teaching portfolios
Robert Keeley, Calvin College, USA; Ronald Sjoerdsma, Calvin College, USA;

One of the tasks that our students have in our Educational Psychology / Introduction to Teaching sequence is that of creating an assessment and professional portfolio. This assignment becomes the foundation for their continuing portfolio, which they build on in the remainder of their Education coursework, and becomes the basis for their professional portfolio. Last year, for the first time, we changed our format from a portfolio that was stored in a binder to one that is stored on the World Wide Web. We found that this allowed us to assess our students in a way that also gave them an important tool as they enter the teaching profession. Challenges that we faced in this having our students complete this assignment, responses to those challenges and outstanding questions are addressed.

Preparing Today's Faculty to Prepare Tomorrow's Teachers to Use Technology: Lessons from a PT3 Project
Mario Kelly, Hunter College of the City University of New York, USA; Sherryl Graves, Hunter College of the City University of New York, USA

This paper will provide a description of an ongoing PT3 project at a comprehensive teacher education institution. The primary focus of the project is to provide faculty development in knowledge and skills to infuse technology into courses across the teacher education curriculum. The paper will describe the steps that were taken to objectively identify faculty development needs, including equipment, the strategies developed to effectively respond to identified needs in a systemic and systematic manner, the obstacles encountered in the initial implementation of these strategies, and the solutions developed to overcome these obstacles. Finally, there will be recommendations for comparable institutions engaging in similar activities.

The Florida Center for Instructional Technology
Kate Kemker, Florida Center for Instructional Technology, USA; Shauna Schullo, Florida Center for Instructional Technology, USA; John Fitzpatrick, Florida Center for Instructional Technology, USA;

Technology preview centers are an avenue to provide in-service and pre-service teachers with the opportunity to preview software before purchasing it for their schools. A preview center can supply in-service teachers and administrators with training in the latest technology. The Florida Center for Instructional Technology (FCIT) is a preview center located at the University of South Florida and serves the ten county surrounding district. FCIT is equipped with thirty computers (Macintosh and Windows), thousands of donated software titles, and many other related hardware devices. As part of university wide consortium, FCIT supports training of faculty to integrate technology into their classroom and provides opportunities for education majors to visit the center to evaluate software as a part of their course of study. This session will focus on establishing and maintaining a preview center, including methods of building relationships with major software and hardware vendors to provide technology training for teachers. This session will also focus on the products that are produced at the Florida Center for Instructional Technology including “Teacher’s Guide to the Holocaust”, “FCAT 8 Grade Reading Tool”, “FCAT 4 Grade Reading Tool” and additional products.

Working Toward National Technology Standards: Teacher Use of Computers in the Classroom
Kate Kemker, University of South Florida, USA; J. Christine Hermes, University of South Florida, USA; Kimberly S. Kalaydjian, University of South Florida, USA; Ann E. Berton, University of South Florida, USA

Technology, when properly implemented, can bring a new dimension to education. In addition to automating some applications, it can be used “to help us do things in education that were heretofore impossible” (Thornburg, 1999, p.1). This paper focuses on the results of a survey of almost two thousand teachers. The survey focuses on the teachers' attitudes toward and use of computers in instruction, with specific emphasis on classroom uses. The study investigated the extent to which classroom teachers are prepared for meeting national standards through their use of technology for educational applications and instruction.

A Framework for Designing Professional Development Courses in Instructional Technology for Teachers
Colleen S. Kennedy, University of Utah, USA

How do faculty in colleges of education gear their instruction in Instructional Technology courses to accommodate the varying levels of knowledge, skills, and abilities of practicing teachers? This presentation provides a framework for designing professional development courses in IT to meet the needs of individual practitioners. Key features of the course development model include: assessing the entry level of participants, based on ISTE standards and their levels of proficiency in using technology; determining the availability of technology and support for using technology in participants' schools; and the development of individualized learning plans that are aligned with ISTE standards and based on principles of effective professional development. The intent of the presentation is to stimulate dialogue on designing and delivering effective graduate level coursework in IT to practicing teachers.
We created a tool to generate slides of a lecture (HTML pages) from a simple ASCII text file. Each line of the text file basically is a title of a new slide or a topics inside the slide. The tool can be accessed in http://www.pcs.usp.br/hjkinosh/lecture as a CGI-script.
metaphor helps teachers and administrators imagine locally appropriate models of technology support. In the context of pre-service and in-service teacher education, a heuristic we've developed encourages critical reflection by teachers as they learn and implement new technologies.

A professional development plan for integrating technology into the classroom
Andrew Kitchenham, Malaspina University-College, USA
This paper examines a project at a Network of Innovative Schools (NIS) in BC, Canada. The researcher will present his model of professional development that assisted the teachers in completing action plans that involved the integration of technology. The main three tenets of the project will be outlined: (1) autonomy of the teacher; (2) the technology continuum; (3) motivators and inhibitors for success.

Developing and Teaching a Computer-Mediated Second Language Course in Academic Reading
Esther Klein-Wohl, Open University of Israel, Israel; Gila Haimovic, Open University of Israel, Israel
This paper will describe a new endeavour in the area of distance education: the design and teaching of an e-mail supported academic second language reading comprehension course. CMC allows for the adoption of a learner-centred approach so suited to the nature of reading; reading instruction and distance education are particularly well-suited. The paper describes an e-mail mediated reading course implemented at the Open University at an intermediate level of proficiency. The course spans 15 weeks and comprises three kinds of student participation: face to face meetings, e-mail sessions and written assignments. The teaching materials are pre-prepared and include a collection of reading passages; workbooks dealing with nine texts that include approximately 20 questions and relevant teaching points. The course consists of three 3-hour f2f meetings and nine asynchronous e-mail sessions. Students have a week to complete each e-mail assignment and they receive the tutor's feedback within 3-4 days. The course described above was designed to suit the needs of mature adult learners. Student feedback on the course is obtained through a questionnaire. They are especially enthusiastic about the close contact they have with the tutors. The tutors seem to enjoy the course as much as the students do.

An In-Service Methodology Course via the Internet: A Designer's Perspective on the Learning Potential of the Delivery System
Esther Klein-Wohl, The Open University of Israel, Israel
This presentation describes a model of an in-service Methodology course for teachers through the Internet which not only aims at teaching a content area but also represents a model of instruction. While focusing on the content of the course, the participants are exposed to a delivery system which includes features they can easily adapt to their own teaching environment; while expanding their personal horizons regarding the use and potential of the technology. Knowing how to transfer pedagogical skills and strategies from one context to another is essential to help teachers solve problems and reach students more effectively. We intend our training programme to serve as a model of teaching which the participants may transfer to their own teaching contexts. The design of the course is based on a Presentation, Practice and Production (PPP) model.

PREPARING TEACHERS TO COMPLEMENT MIDDLE-SCHOOL CURRICULA WITH WEB-BASED ENVIRONMENTAL HEALTH RESOURCES
W. R. (Bill) Klemm, Texas A&M University, USA
The College of Veterinary Medicine at Texas A&M University has teamed with the Center for Rural Public Health and the College of Education to develop science curriculum and teacher training for middle-schools in rural and under-served parts of Texas. Our approach is to use the World Wide Web to provide environmental health information at a middle-school level and to train teachers to complement their regular teaching with the information, learning activities, and experiments developed by our scientists. The curriculum receives on-going evaluation and revision. The program also includes in-class visits by scientists to the schools.

"WorldGate": An Attempt to Close the Digital Divide
Richard Knecht, The University of Toledo, USA;
"WorldGate" offers the consumer a low-cost, simple to use means of connecting to the Internet, and sending and receiving email, without a PC or telephone line. All that "WorldGate" requires is a TV set, wireless keyboard and a set-top box connected to a cable TV system. This fall, fourth grade students from elementary schools in Connecticut, Illinois, Louisiana, Missouri and Ohio will be among the first to participate in the "WorldGate" Internet School To Home (WISHTV) Program. WISHTV is a public service initiative provided by "WorldGate," local cable operators and participating set-top manufacturers. The program provides participating elementary school children a full school year of free in-home Internet access. Home Internet access will enable them to do research on their homework, and gain access to school calendars, schedules and class information and extra curricular activities. The program expands existing school curriculum by linking students and parents directly to teachers. Students' Internet access to questionable Web sites will be restricted through current filtering technology.

Evolution of an online data acquisition system
Gerald Knezek, University of North Texas, USA; Rhonda Christensen, University of North Texas, USA
This interactive session will illustrate the evolution of online data collection systems implemented by the Preparing Tomorrow’s Teachers to Use Technology (PT3) Millennium Project team (Capacity Building Grant # P342A990474) during the 1999-2000 school year. The presentation will include examples of the software and survey instruments, database structures, and feedback systems that were initially developed as well as those which are now in place. The session will conclude by having participants access and complete surveys on an experimental system that provides immediate educator feedback by graphing profiles of their responses against the database norm. The intended audience is computer literate educators at any educational system level who are exploring alternatives for online data acquisition.

Abstracts Book — 55
Exploiting and Evaluating A Web-based Learning System: Six Days and Seven Nights in the Basement
John Knight, University of Wisconsin, USA; Bob Berman, University of Wisconsin, USA
To evaluate a web based learning system as an adjunct to traditional “live” instruction, sixty students participated in a new interdisciplinary course that required sending email, posting to a discussion forum, investigating web-sites, constructing a home page, and completing several web-based “projects.” Each week’s activities were documented in individual logs. We will share our students’ perception of this experience and our own assessment of its pedagogical value.

Using Intelligent Agent Tutors
Steve Knodel, Information Resources Management College (IRM C), USA; Jon-David W. Knodel, College of Notre Dame, USA
Intelligent agents are, in simplest terms, software programs built to perform certain specific tasks for the user. They are “autonomous” in the sense that they operate without specific user intervention. One form of intelligent agents, “chatterbots”, is beginning to provide the capability to have intelligent tutors available to students at all times.

Internet Filtering vs. Content Management in Schools
Steve Korin, BASCOM Global Internet Services, USA
Prospective participants should be familiar with Internet-based educational products and hold a teaching or administrative position. Persons who maintain or administer educational networks would also be welcome.

Teacher Reflections on Learning New Technologies
Karen Kortecamp, The George Washington University, USA
An experimental course offered at The George Washington University (GWU) is specifically designed to assist teachers in meeting the technology standards and performance indicators developed by the International Society for Technology in Education (ISTE, 2000). Eleven teachers representing three school systems participated in the first offering of the course in Fall 2000. Teacher reflection through journal writing focused on how teachers perceived themselves as learners of technology and the ways they were able to transfer those perceptions and new understandings to their instruction of secondary students. Several common themes emerged relative to learning and using technology to enhance student learning.

3 Roads Diverged and we took each to enhance teacher use of technology
Karen Korth, DIAL Corporation, USA; Belinda Engelhart, DIAL Corporation, USA; Hilarie devis, DIAL Corporation, USA
The panel members will discuss and demonstrate through interactive videos and ed-rom some of the experiences along the journey implementing the technology integration projects (TIPs) and utilizing educational integration approaches in both the LITE (Linking Interactive Technologies and Educators) Institute and the WebMaster Institutes to achieve the desired outcomes of the ILC (Interactive Learning Campus). The three roads taken by DIAL to enhance teacher use of technology are: Technology Integration Projects (TIPs), LITE Institute and the WebMaster Institute program. The WebMaster program is a skill-based program while the TIPs projects and the Master Teacher Cadre meet on demand needs for curriculum and professional development and the LITE Institute encompasses the entire program for longevity and sustainability of technology use in the schools and communities.

Perceptions of Preservice Teachers’ Technology Competency Skills in Arizona
Heng-Yu Ku, Arizona State University, USA; Lee Ann Hopper, Arizona State University, USA; Ann Igoe, Arizona State University, USA
This study investigated the perceptions of the education community in Arizona regarding technology competency skills for preservice teachers. The intended audiences are for all levels of preservice and inservice teachers. Participants included 67 preservice teachers, 67 inservice teachers, 45 school principals, and 21 human resource directors. Two sets of survey instruments were developed and used for this study. One survey containing 26 items of technology skills for preservice teachers was distributed to preservice teachers, inservice teachers, and principals. Another survey regarding hiring decisions was distributed to principals and human resource directors. The participants’ ratings on the five-point scale of first survey were converted to their numerical equivalents (5 = very important to 1 = not important). Mean scores were calculated to test for significant multivariate effects on items among three groups. Frequency and percentage were used for the second survey. Significant differences of overall mean scores by group were obtained in this study. Preservice teachers placed more emphasis on overall technology skills than inservice teachers and principals did. The results showed that there were significant differences by group in nine of 26 items. The opinions from principals and human resource directors regarding hiring decisions were also explored.

Are We There Yet? A journey through distance learning
Jean Kueker, Our Lady of the Lake U., USA; Jamie Jackson, Our Lady of the Lake U., USA; Scott Walker, Our Lady of the Lake U., USA
Three years ago, the journey of utilizing a distance-learning format for offering coursework began with a low-tech instructional arrangement which we termed “two cans and a string”. Technology has continued to be integrated in courses through software application such as PowerPoint, Internet sites and course management software such as Blackboard.com. We are now beginning to offer multiple point-to-point courses over ISDN lines using VCon videoequipment. This session will discuss key points to consider when making decisions about equipment, connectivity, infrastructure and money.

Scripting a lesson
Michel LABOUR, Université de Valenciennes, France; Laurent VERCLYITE, Université de Valenciennes, France; Nicolas VIEVILLE, Université de Valenciennes, France; Sylvie LELEU-MERVIEL, Université de Valenciennes, France;
The audiovisual approach in pedagogics, so closely associated with a lock-step view of teaching in the seventies, has undergone a revolution in recent years. By way of examining how a body of pedagogic sequences, or lesson, can be “scripted” by a teacher, we look at the different phases of the lesson planning process. This more recent “audiovisual method” proposes an approach that can include both a narrowly linear, and a broader non-linear style of teaching. The method allows teachers to combine different types of traditional

56 — Proceedings of SITE 2001 / Orlando, Florida, USA
and more recent (viz. electronic) teaching tools in their lesson plans. To do this, the paper examines the pedagogic approaches available de facto to teachers, the different learning styles observed regarding learners, the different phases of creating a lesson script, and finally the development of personalized learning situations. The paper is aimed at teachers seeking to increase the variety and efficiency of their lessons in combining both face-to-face interactions with teaching tools in a coherent way. The approach proposes a structure to explore different ways of presenting learning/teaching resources in an explicit way that can lead to collaborative "lesson" planning and feedback or about the instructional design of the lesson.

Designing Activities in Networked Classrooms at the Micro, Meso, and Macro Levels
Thérèse Lafeniére, Laval University, Canada; Alain Breuleux, McGill University, Canada; Mireia Montané, Universal Forum of Cultures, Canada

University- and school-based teacher educators, pre-service teachers, and educational researchers/learning scientists are seeking to develop thoughtful and effective uses of information and communication technologies (ICT) in networked classrooms across settings in Canada and elsewhere. At the micro level, they design creative, engaging, and productive online activities for collaborative learning and teaching purposes, ones increasingly focusing on knowledge building. At the meso level, they facilitate new adopters’ transition to networked classrooms; once technology is in place and working, the advancement of pedagogy tends to become the object of collaborative inquiry. At the macro level, the vision of interconnected learning communities is guiding the transformative process that is underway. Design principles that were found applicable across sites and levels, and which will guide participation in the Universal Forum of Cultures’ Educational Project (Barcelona, 2004), are presented.

Characteristics of support initiatives to stimulate professional development on ICT
Elisabeth Laga, University of Leuven, Belgium; Jan Elen, University of Leuven, Belgium

Educational institutions have to support their staff in their professional development on ICT. The innovation and professional development literature suggest some, be it vague, principles to realise this support. In line with these principles a support strategy has been developed at the University of Leuven. In this contribution, an analysis is made of the different initiatives, in order to detect effective and powerful factors. An analysis scheme was developed. Powerful features of professional development initiatives that may guide decisions on elaborating educational support strategies and professional development initiatives are identified.

Puzzling Over the Missing Pieces - The Real Practice of Technology Integration
Judy Lambert, North Carolina State University, USA

This paper is a report on the findings of a pilot study conducted on novice technology-using teachers. Although emerging technologies have significantly impacted much of society, they have not yet and to any large degree, transformed the practice of many educators in the classroom. Findings indicate that several strategies may assist these teachers in learning to use technology. Provide them with a logically sequenced curriculum guide that identifies specific computer objectives and methods of including these in content areas. Encourage administrators to establish concrete guidelines to promote teachers’ regular planning and practice of technology integration.

Preparation of Educators to Provide Effective Computer-Based Assistive Technology Accommodations for Students with Disabilities
Suzanne Lamorey, Arizona State University, USA; Ivana Bartarelo, Arizona State University, USA

As students with disabilities are mainstreamed into general education settings, teachers must be knowledgeable about appropriate accommodation formats and strategies as well as accessibility issues. Important areas in terms of accommodations currently include computer-based assistive technologies as well as Internet accessibility for students with disabilities. This presentation will describe the results of a qualitative study focused upon the experiences and needs of general educators in these areas. Implications for training will be discussed.

Website101: Creating Annotated Special Education Bibliotherapy with Children’s & Young Adult Books
Philip Lanasa, Cameron University, USA; Betty Criscoe, Cameron University, USA; Terry Lovelace, Cameron University, USA

The purpose of this project is to share the steps involved in creating and designing a specialized web site for viewers who either work with children and young adults who have special needs or those who have special needs. The web site will allow the viewers to apply the principles of bibliotherapy. Bibliotherapy is defined as healing through books, reading books to help solve and better understand personal problems, and/or mutual sharing of literature in order to structure interaction between a facilitator and a participant. The web site, designed to be interactive, becomes the facilitator and the viewers become the active participants. For example, people may log on and write reflections about their feelings toward the book listed on the web site. Participation in bibliotherapeutic intervention allows participants to hyperlink with other viewers, and therefore, make connections that encourage active problem solving related to special needs.

Software Agents for Distance Education and Institutional Support
Thresa Lang, Veridian Information Solutions, USA

In this paper the author explores the use of software agent technology to provide options and solutions for the challenges facing educational institutions that have limited or fixed resources. One of the challenges examined is that of providing quality instruction to increasing numbers of students, including those with non-traditional scheduling requirements without straining current resources. Other challenges include optimizing the existing network infrastructure and supporting institutional business goals.

The unique impact of internet instruction on future teachers: A qualitative study of delivery systems and their impact
Anderson, The Metropolitan State College of Denver, USA

Survivalist Guide to Online Course Development

Freeing the Monkeys: Making the Ed Tech Course More than Learning to Push Buttons

Douglas Lare, East Stroudsburg University, USA

An Overview of Information Technology on K-12 Education in Taiwan

Greg Lee, National Taiwan Normal University, Taiwan; Cheng-Chih Wu, National Taiwan Normal University, Taiwan

The use of structured listserv assignments is an effective means of generating quality on-line discussions regarding selected readings for text-based courses. Observed benefits of the listservs will be described by focusing on three representative cohorts of student communicators who participate in the forums. Building on the instructor’s experience of using listservs successfully for several years, this paper explains the how and why of structured listserv discussions and provides suggestions based on course experiences.

Survivalist Guide to Online Course Development

Douglas Lare, East Stroudsburg University, USA

Recent teacher shortages and the growing popularity of teaching as a viable career change has led to a blossoming of many graduate teacher education programs. Distance education is especially attractive to these students since many have families and must maintain jobs. However, many teacher educators are still suspicious. This paper summarizes a qualitative study which looked at two required courses in the graduate teacher certification program at a teacher training university. Two groups of students participated in these courses in the traditional manner of traveling to the university and attending classes. Two other groups of students took the identical courses over the internet. All four courses were instructed by the same two instructors. This study followed these students not only while they took the courses, but also as they continued their studies and in some cases, when they started teaching in their own classrooms. The results suggest that while the instructional delivery models may have impact on course objectives, the greater impact may be upon a future teacher’s attitude toward the effective use of technology in the classroom.

Freeing the Monkeys: Making the Ed Tech Course More than Learning to Push Buttons

Wes Leggett, The Metropolitan State College of Denver, USA; Debra Dirksen, The Metropolitan State College of Denver, USA; Peggy Anderson, The Metropolitan State College of Denver, USA

It’s a cyber-space jungle out there! Take the virtual classroom challenge and learn the ropes for successful course development from three online “survivors.” The objectives of this session include: 1) Briefly review the literature regarding online instruction; 2) Provide an evaluative framework for determining appropriate courses for online delivery; 3) Identify steps in analyzing course content with reference to online pedagogy; 4) Demonstrate technological options for course content; and 5) Address questions from participants that are specific to their course development needs. The cumulative experience of the three presenters will provide session participants with a broad and informed perspective on creating successful online courses.

An Overview of Information Technology on K-12 Education in Taiwan

Greg Lee, National Taiwan Normal University, Taiwan; Yu-Jen Lo, National Taiwan Normal University, Taiwan

Under the support of the government’s National Information Infrastructure project, ease of Internet access has increased dramatically at all levels of schools in Taiwan in recent years. In an effort to speed up preparation of tomorrow’s teachers to use technology (PT3), the Ministry of Education of Taiwan has launched several multi-million U.S. dollar projects to facilitate and to promote the use of information technologies in the classrooms and in teaching across all subject areas. Those national efforts are directed at improving networking infrastructure, the computing environments, the digital educational resources, and on teacher training. In this paper, we will report the endeavors undertaken, the accomplishments, the current and on-going PT3 related projects in Taiwan and discuss the issues that have emerged.

On Integrating IT into Teaching of English in Taiwan Junior High School

Greg Lee, National Taiwan Normal University, Taiwan; Yu-Jen Lo, National Taiwan Normal University, Taiwan

The goal of this study is to investigate the support and training needed in integrating teaching of English as a foreign language with information technology (IT). Two junior high school English language teachers were given 20 hours of basic information technology training along with 12 group discussions on how to integrate IT into classrooms. Teaching experiments were then conducted in 8 class periods. The major findings are: (1) training of computer skills is more important than enhancement of computer working knowledge; (2) software that facilitate IT-integration is yet unavailable; and (3) full support from the school, both administrative and technical personnel are necessary for the long term implementation of IT integration into classrooms.

Benefits and Problems of Asynchronous Online Electronic Mail Forums

Kevin C. Lee, West Virginia Wesleyan College, USA

The use of structured listserv assignments is an effective means of generating quality on-line discussions regarding selected readings for text-based courses. Observed benefits of the listservs will be described by focusing on three representative cohorts of student communicators who participate in the forums. Building on the instructor’s experience of using listservs successfully for several years, this paper explains the how and why of structured listserv discussions and provides suggestions based on course experiences.

with the knowledge and varied perspectives to begin the process of developing online courses. No prerequisite skills are needed to benefit from this session.

The Changing Role of the Teacher: Case Study
Amy S. C. Leh, California State University San Bernardino, USA

Modern technology is changing the role of the instructor from an information-giver to a facilitator. As facilitator, the teacher guides the learners through the learning process and encourages the students to be active in their learning. The experience of independent learning may encourage the students to continue the learning process on their own in other fields and in the future. This presentation reports how the author encouraged students to be resource providers and trained them to be self-learners and self-trainers in an educational multimedia course. Class observations and students' feedback revealed that the teaching methods and new role of the instructor had a positive impact on students' learning.

Computer Use in ESL: Case Studies and Action Research
Amy S. C. Leh, California State University San Bernardino, USA; Lori Ogata, Riverside Community College, USA

With the onset of the twenty-first century, utilizing computer technology in school curriculum has become not only a reality but a necessity in preparing students for effective transition into today's society. In addition, with the multicultural composition of today's student population, computer technology can become a facilitative force in teaching students who originate from culturally diverse homes. The purpose of this article is to provide a brief history of how computer technology has been used in ESL classrooms. Then, a few case studies and some action research are presented as a glimpse into current ESL classroom environments where technology is being used to varying degrees.

PLUG IN OR OUT: The Quintessential Question for Education/Learning Enhanced Through Technology!
Karen Lemone, WPI, USA

How do we know whether or not to Plug-in or out is the most important question educators must answer before the first dollar is spent on technology. And if money was spent on technology without improving learning, the plug should be pulled. Insights and criteria for such a decision are provided within this paper's analysis of brain operations, technology enhanced learning opportunities, research study comparing learning styles with technology self-efficacy, and a review of assessment strategies. The two guiding questions for this paper are: What technology-based activities are associated with brain-based learning and how is the effectiveness of technology enhanced learning opportunities?
assisted learning measured. The authors assert that technology can be a powerful tool for teaching and learning and more and different ways to assess technology's effectiveness are needed.

**Analysis of Large Web-Based Courses at the University of Central Florida**

*Kevin A. Lenhart, J. Stephen Lytle & Carol Cross, University of Central Florida, USA*

Distance education, as once described by a colleague, is sitting in the back row of a three hundred-seat auditorium. It has traditionally been thought that to successfully teach a large class, you needed to herd students into an auditorium, and proceed to lecture them for several hours. This provides the students with very little opportunity to interact with fellow students or the instructor.

**Museums Meeting Schools: Online and Right On the Mark**

*James S. Lenze, Indiana University of Pennsylvania, USA*

Schools, individual teachers, and students are entering museums through the World Wide Web instead of the entrance off Main Street. Museum directors are faced with the challenge of designing and using Internet based technologies to enhance the bond between students, schools and museums. This article discusses some of the technologies that museums are using based on an analysis of the Detroit Institute of Arts Education Department's internet site and like efforts around the world. Each discussion is followed by an example of a museum that is using a particular technology and information directing the reader to a web site with more information. Design considerations for museum based educational web sites are also briefly discussed.

**Using Presidential Candidate Web Sites for K-12 Lessons**

*James S. Lenze, Indiana University of Pennsylvania, USA*

The Bush and Gore web sites offer much in the way of resources for lessons in political science. This paper reviews the information available through these web sites. Then, these resources are tied directly to state standards to demonstrate how these resources can be used to meet benchmarks.

**Energizing Teaching To Empower Students Through Emerging Technologies**

*Margaret Lynn Lester, Clarke College, USA; Jan Taylor, Clarke College, USA*

This proposal presents strategies implemented through Clarke College PT3 grant. Exemplary faculty/student technology learning projects showcasing learning outcomes will be presented. Program activities serve as catalysts for processing “cultural change of mindset” into 21st century learning models. Results create a climate for college faculty, students, k-12 teachers and students to facilitate building collaborative models for exploring learning together through transparent use of information technologies. Our project creates a 21st century “school” environment in real and/or virtual space where students and teachers explore, discover, and create new knowledge together as a community of learners.

**Support for Models of Acceptance, Adoption, and Use of Distance Education Technologies**

*Joel Levine, Barry University, USA*

The information age has led to increased use of technologies for teaching and learning. Companies, corporations, and organizations are offering courses, seminars and workshops via distance technologies. Universities and colleges need to make significant changes if they want to compete for an increasing number of students who prefer learning via distance technologies. A critical success factor becomes the acceptance, adoption, and use of distance technologies by faculty members at universities and colleges. Planning and implementing change in these institutions must consider the important stages or levels faculty must move through in order to successfully accept, adopt, and use technologies, especially distance technologies. Levels and/or stages are identified from various models, and specific support strategies are recommended to complement these developmental stages leading to acceptance, adoption, and use.

**Surfing Safely with Social Navigation**

*Bruce Lewis, Freed-Hardeman University, USA*

This proposal relates to the use of instructional technology in undergraduate and graduate teacher education. It fits the topics of: The Educational Computing Course; Graduate & Inservice Education; Instructional Design; Preservice Teacher Education; Technology Diffusion; and Telecommunications.

**Developing a Foundation for Enhancing Modeling of Technology Integration**

*Deborah T. Clarke, School District of the City of Pontiac, USA; Marie Irons, School District of the City of Pontiac, USA*

An overview of key issues involved in the development of a collaborative project between two K-12 school districts, one urban and one suburban, and a university to enhance the modeling of classroom technology integration by K-12 and university faculty members for the benefit of preservice teacher education students.

**Learners' Perceived Differences in Learning and Application: Comparing Classroom and Distance Instruction**

*Doo Hun Lim, University of Tennessee, USA*

In an effort to compare the perceived degree of learning and application between different groups of students in terms of gender, instructional delivery formats, length of study time, and learner motivation level, an HRD course of a university was studied. Data analysis was conducted to compare the learning and application difference and the reasons for high or low learning and application were identified and categorized. From the findings, issues in distance learner, instructor, and instructional design to enhance learning and application were discussed.

**A Framework for Integrating Technologies in Teaching & Learning**

*Grace Lim, Temasek Polytechnic, Singapore*

Convergence of IT & communication technologies brings about greater potentials & possibilities in using technologies as a powerful medium of delivery, instruction & communication. Changes in student demographics generate a strong demand for international higher
education which can provide life-long, flexible learning programmes. Compelling change of skills needed at workplace drives education communities in all over the world to re-think about education requirements & processes. Combination of these factors set a scene of transformation in education causing a paradigm shift in teaching & learning, which poses new challenges to educators in acquiring skills & competencies not only in technology literacy but also in pedagogy. This paper aims at presenting a practical framework for integrating technologies in teaching and learning. The collective findings based on the author’s experience and that of other institutions of higher education can serve as a general roadmap for an educational institution in adopting innovative educational practice supported by technologies.

Does Technology Really Make a Difference? - Perspectives from Teacher Education Students
Edmundo F. Litton, Loyola Marymount University, USA
This study analyzes how computers can be used more effectively in teaching in learning. The purpose of this study is to find out how the use of technology makes a difference in learning in a class designed for teacher education students. Data was gathered through a survey that asked students to reflect on their learning experiences immediately after a lesson that utilized computers. The study shows that technology makes a difference in teaching and learning. The students reported that technology made the lesson for meaningful, allowed them to more creative, and they often learned a lot more than what was intended by the teacher. The use of computer technology in the class also gave the students an excellent way to experience true cooperative learning. The results can influence the design of future lessons that integrate technology in Teacher Education.

On-Line Delivery of Multimedia Courseware: Issues and Effects
Leping Liu, Towson University, USA
This paper introduced some methods of using the Web as a template to deliver multimedia courseware, including CBI (computer-based-instruction) applications created with multimedia authoring tools and tutorials accompanied with the applications. The author converted CBI applications created with ToolBook, HyperStudio, and Director into the Web version and then delivered them on the Web as an on-line courseware package. From the perspective of instruction, this project extended the concept of computer-based-instruction to a Web environment. From the perspective of technology integration, this project increased the uses of technology in school classrooms and, meanwhile, it reduced the equipment requirements to schools. From the perspective of information delivery, it used the Web as the template or organizer to deliver the courseware, instead of using certain particular software environment. Design details and feedback from schools will be presented.

Assessing Technology-Assisted Use of Information
Leping Liu, Towson University, USA; Cellestine Cheeks, Towson University, USA
This paper presented a two-year experience of assessing college students’ use of information from different resources, including the methods, processes, instruments, results and some issues of the assessment. The assessment processes started from analyzing the goals of learning, defining the outcomes, then selecting or developing instruments, and the last, collecting data and analyzing results. A “qualitative-and-quantitative” (Q-Q) assessment package was developed and used, where we used portfolios to record the learning process and quantitative scores to measure the learning of specific skills. The Q-Q assessment procedures were employed into six classes during the past two years. Some interesting findings from the assessment results would be discussed in detail. This experience suggested that assessing the use of information and technology related outcome was a process rather than some one-time tests. The Q-Q procedures also provided a structure to develop an assessment model that should apply to other fields of information technology assessment.

Teaching with Geographic Information Technology
Amy K. Lobben, Central Michigan University, USA
This paper highlights curriculum designed to train pre-service and in-service teachers to teach with geography technology. Because geography, like many disciplines, has evolved into a field that implements technology into many areas of research, teacher educators must incorporate the teaching of geographic technology into their education curriculum. One particular area of geography, which has developed over the past decade is known as Geographic Information Science (GISci) and involves the gathering, manipulation, analysis, and display of spatial information. The burgeoning of this new science presents geography educators with several challenges: how do we teach pre- and in-service teachers to implement the new technologies in their classrooms, can in-service teachers use the new technologies to help create educational materials for the changing geography curriculum, can new geography technologies help present and future educators better understand the field of geography, and can we help educators to use the new technologies to build geographic resources for their classrooms.

Integrating Technology in Classrooms with Learning Disabled Students: Teachers’ Needs and Professional Development Implications
Jean Loiselle, Université du Québec à Trois-Rivières, Canada; Nicole Royer, Université du Québec à Trois-Rivières, Canada; Denis Bédard, Université de Sherbrooke, Canada; Jean Chouinard, CEMIS (special education), Canada
Technology can provide potential benefits for students with learning disabilities. However, a survey we conducted in Quebec schools shows that teachers generally do not make intensive use of computers with learning disabled students. The presentation relates to a 3-year collaborative research project focusing on the integration of technology in classrooms with learning disabled students in Quebec. This presentation will highlight the main uses of computers in the classroom and will describe teachers needs in regard with technology integration. We will discuss implications of these results for professional development in order to help teachers integrate technology in their classroom. A model for instructional activities engaging learning disabled students in long-term projects will also be presented.
Learning with Internet Resources: Task Structure and Group Collaboration
Yiping Lou, Louisiana State University, USA; S. Kim MacGregor, Louisiana State University, USA

The Internet, with its vast array of information, offers students opportunities for learning from rich, up-to-date and authentic resources and for developing information-seeking skills. On the other hand, complaints are often heard from both teachers and students alike that it can be frustrating to find useful and relevant information on the Web. The purpose of this project was to study how task structure and group collaboration may influence the way children learn with Internet resources. A group of 27 elementary school children and two classes of preschool children participated in this study during the summer 2000. The children were assigned to work on a WebQuest designed by the preschool teachers either individually or in pairs. Data were collected throughout an observation scheme and journals. The results showed differential patterns of behaviours and emotions when children learned individually and in small groups. In addition, the differences were often related to the different characteristics of the learners and the task structure. The study also indicated that incorporating observation studies in teacher technology training courses can be a valuable experience for pre-service teachers.

Creative uses of digital technologies: developing literacy and capability
Avril Loveless, University of Brighton, UK; Terry Taylor, Artist, UK; Richard Millwood, Ultralab, UK

The panel addresses the progression in practice and understanding in the development of visual literacy and ICT capability using digital media in seven projects over a period of five years. These projects – The Glove Project, Bristol Internet Project, Brighton Access Project, Art on the Net, Genes and Makeup, Plume School VI Form Project and the MMM: Media & Message Multimedia Project – were conducted as collaborations between artists, teachers, pupils and university researchers working in primary and secondary schools within the core and extended curriculum. The participants explored the ways in which visual literacy and ICT capability could be supported and extended in a range of relevant and meaningful contexts. The work is analysed from two perspectives – the artist focusing on children’s learning and expression of visual literacy and the teacher educator focusing on the development of ICT capability. The session will use examples of pupils’ visual work to present and discuss some of the findings and recommendations from the projects. These will highlight key issues including the nature of visual literacy; the contribution ICT; the development of ICT capability; conceptual frameworks of subject knowledge in art and ICT; links with contemporary culture; interactions between artists and teachers; models of resource management and evaluation of children’s learning in art and with ICT.

Classroom Community in Post-Secondary Classes: An Examination of Traditional and Distance Learning Environments
Bob Lucking, Old Dominion University, USA; Fred Rovi, Regent University, USA; Michael Ireland, US Navy, USA

The purpose of this study was to determine how sense of classroom community develops in a higher education learning environment and to determine if there are differences based on type of learning environment (traditional or distance education), type of school (private or public), gender (male or female), type of course (education, leadership, or science), number of students in the class (small, medium, or large), and student academic standing (undergraduate or graduate). Three different types of distance education environments were examined: an asynchronous Blackboard-based integrated distributed learning environment, a synchronous two-way compressed video and audio teleconferencing environment, and a synchronous one-way satellite television with two-way audio teleconferencing environment. Principal components of the instrument designed to measure sense of community (Sense of Classroom Community Index) were as follows: (1) Spirit (lowest): feeling a sense of belonging to a group; (2) Trust: feeling that the group can be trusted and influenced; (3) Trade: feeling that the group is of mutual benefit to its members; and (4) Learning (highest): feeling that the group facilitates active construction of understanding.

Out of SITE and into Staff Development
Tim Lundy, Framingham Public Schools, USA; Liz Sheldon, Framingham Public Schools, USA; Mary Rastauskas, Framingham Public Schools, USA; Jim Woodell, School Change Network, USA

This presentation outlines a framework for transforming technology integration within a public school system from isolated success stories to a district-wide movement. This is accomplished in two phases: 1) A district staff development day based on the SITE conference model is used to expose educators to available resources and possibilities for curriculum/technology integration. 2) This day is followed by a yearlong focus on professional development and curriculum support utilizing online, interactive tools. Central to the entire process is encouraging educators to become leaders in their own development by taking advantage of online resources that encourage mentoring and collaboration.

The Internet science education environment (ROL)
Zdena Lustigova & Stanislav Zelenda, Charles University Prague, Czech Republic

Paper deals with the ROL (Remote and Open Laboratory) – a component of the open educational and informational electronic supportive environment for science education of a broad scale of target groups (from pupils and teachers to technicians). The ROL on the Internet contains different kinds of materials (experiments, models etc.) and tools for teaching and learning science via network. A brief description of the content and ways users can work with the ROL is given. Some examples starting from "sharing ROL environment via the Internet" to the Web delivery of online courses and learning environment are presented.

Middle School Education and CD ROM Technology
Gregory MacKinnon, Acadia University, Canada; Joseph Bellefontaine, Acadia University, Canada

While the internet has demonstrated great potential for technology enhanced instruction, CD ROM continues to be an appropriate pedagogical and pragmatic choice for instruction delivery. This paper briefly explores some of the innovative applications of this technology and presents a specific example of a CD ROM approach used in the delivery of a Middle School Teacher Education course.
Barriers to the Use of Computers in the Classroom: A Comparison of Teachers' and Principals' Perceptions
Angus J. MacNeil, University of Houston, USA; Doris Prater, University of Houston-Clear Lake, USA
Principals need to encourage the use of technology in learning. The barriers to the use of computers in the classroom as perceived by teachers and principals is important. This study found the rankings for teachers and principals on barriers were identical. The highest-ranking problems for both groups were lack of time and lack of computers. None of the barriers were seen as major problems. Results of a mixed design ANOVA indicated a significant main effect for barriers, no significant effects for either level of educator or interaction of level and barrier were found. Selected follow up post hoc comparisons using Tukey's HSD were used to identify significant differences among the barriers for each of the two groups. There were significant differences in the mean ratings for the "Lack of Time" and the "Lack of Administrative Support". Both groups rated the lack of time as significantly more of a problem than lack of administrative support.

Developing Web Pages to Supplement Courses in Higher Education
Cleborne Maddux, University of Nevada, Reno, USA; Marlowe H. Smaby, University of Nevada, Reno, USA
This presentation will focus on aids and cautions for higher education instructors who wish to develop web pages to supplement their traditional, on-campus courses. A sample of an extensive site developed by the presenter will be demonstrated.

A "Blended-Technology" Approach to Distance Education Course Delivery
Howard T. Major, Eastern Michigan University, USA
For several years Continuing Education and the Department of Education at Eastern Michigan University have used an Interactive Television (ITV) videoconferencing system to deliver a graduate course in Education. The course is "Educational Research Techniques" a graduate-level course required for students in several degree programs. Students are mostly teachers in K-12 systems located in or near three Michigan cities, Flint, Ypsilanti and Jackson. Initially, the ITV system (supplemented with printed materials) was the only distance learning technology deployed. However as the limitations of using a single technology became clear, a "blend" of delivery technologies were used. The additional technologies include online conferencing, occasional mailed videocassettes of course lectures, a PBS-produced telecourse, and printed coursepacks.

Implementations of Videoconferencing in in-service training
Jukka Maki, The Ziridis Schools, Greece
This paper presents the possibilities of VC in staff development and experiences that the Ziridis School has had when teachers took part in interactive lessons instructed via ISDN-videoconference. The results of the experiences are explained and some suggestions for the use of ISDN-videoconferencing are made for in-service training and staff development. The paper is presented with videotaped-material of distance lessons and interviews of staff in Greece and remote teachers in Finland.

Videoconferencing in practicum of educational studies
Jukka Maki, University of Oulu, Finland
This paper presents the use of ISDN-videoconferencing in practicum of teacher training at the University of Oulu in Finland. A special emphasis is given on music education explaining the problems and experiences of teaching music in VC-environment. Music lessons have more complicated difficulties than a normal VC-lesson, because for example a teacher cannot show the pupils from up close the instruments. But the ISDN-technology even helps the teacher in many ways. Experiences of a distance education project at Utsjoki School in Lapland are explained thoroughly and presented with videotaped-material of lessons.

Weaving a Collective Text: A Cooperative Experience
Cleci Maraschin, Carlos Ribeiro, Luciane Sayuri Seto, Débora Laurino Maçada, Mára Lúcia Fernandes Corneiro, Fábio Dal Molin, Rosaldisa Duarte Medina, Janete Sander Costa & Vladimir Stolenberg Torres, Universidade Federal do Rio Grande do Sul, Brazil
This paper is a report on the experiences of a post-graduate multidisciplinary team of students attending the Cognitive Ecology and the Technologies of Intelligence Course and their Lecturer, while working in a collective text construction and using a collaborative writing tool named The EquiText. It presents the analysis of the text construction as an end of semester extra-class asynchronous work, based on Varela's observer notion in the cognitive ecology field and in Maturana's concepts of organization and structure. At the same time the group was testing their own 'conivence' environment in this tool, which had recently been available for local use.

Collective Authoring in a Teachers Qualifying Course in Alphabetsization via Web
Cleci Maraschin, Daniel Vaz Smith, Fabricio Raupp Tanisuiunas, Janete Sander Costa & Simone Moschen Rickes, Universidade Federal do Rio Grande do Sul, Brazil
This paper describes a project in which a group of teachers and participants of a distance qualifying formation course, sponsored by the Brazilian Federal Government, discussed alphabetization concepts in the Seminar of Alphabetization. It aimed at giving support to the teachers in the construction of school learning projects. The main theme had to do with alphabetization and its subtopics ranged from technological alphabetization, to continuous education, teachers continuous qualifying education and the inclusion of teachers and pupils in the new communications net. Their written productions were displayed in different texts created in the domains of the EquiText, a collaborative writing tool via Web. The participants' collaborative text productions underwent interesting rewritings due to their own collective authoring experience. They could also share diverse reading possibilities of socio-constructionists authors who deal with alphabetization, such as Piaget, Vygostsky, Paulo Freire, Emilia Ferreiro, Maturana and others.

Networks as Professional Development: The Case of the Andalucian Network of Trainers
Carlos Marcelo, Pilar Mingorance & Araceli Estebaranz, University of Sevilla, Spain
This paper informs about the creation and development of the Andalusian Network of Trainers in Spain. The Network serves like support structure to professionals of the formation that develop their activity in Andalusia. The Network helps the trainers in their own professional development.

Abstracts Book — 63

131
development. It favors the innovation on themes thought and developed by the own trainers. The participants are professional of the vocational education field in working contexts little ruled and dispersed geographically.

**Multimedia in the Classroom With PowerPoint and VBA**

David Marcovitz, Loyola College in Maryland, USA

This paper describes the results of a pilot project to use PowerPoint and Visual Basic for Applications with a class of teachers taking Multimedia Design in the Classroom. Most participants in the class were enrolled in a masters program in Educational Technology and had completed Introduction to Educational Technology in which they learned basic multimedia functions of PowerPoint and HyperStudio. Few participants had more than beginner-level computer programming background but all were able to use and modify a limited number of Visual Basic for Applications tricks to create fully interactive multimedia projects.

**The Unit of Practice: A Roadmap for Technology Integrated Learning**

Ines Marquez Chisholm, Arizona State University West, USA; Carol Beckett, Arizona State University West, USA; Maria Cardelle-Elawar, Arizona State University West, USA

Teacher integration of technology in K-8 classroom teaching has remained limited despite increasing connectivity and increasing numbers of computers in classrooms. Few teachers use analytic and project-oriented software on a frequent basis and recent teacher education graduates report that they do not feel prepared to integrate technology in their curriculum. To address the issue of low technology integration in technology in classroom teaching, ASU West, through its PT3 grant, is introducing student teachers and their cooperating teachers to the Unit of Practice (UOP) as a way of planning for technology integrated learning. The UOP, a product of Apple's ACOT project, builds on several learning theories, addresses local, state and national standards, and provides a framework for organizing thought and integrating technology into classroom instruction. It helps classroom teachers to break out of the textbook dependency mode and to guide students' learning through multiple sources of information. The presenters will share the nature of the UOP, how teacher-student-teacher pairs develop their UOPs to reflect standards, and how the UOPs are evaluated. The presenters will provide examples of UOPs and the evaluation rubric. Handouts will be available for the participants.

**Smart Classrooms Led by Technology Using Teacher Educators**

Ines Marquez Chisholm, Arizona State University West, USA; Keith Wetzel, Arizona State University West, USA

The College of Education at a western upper division state university has two computer classrooms, called Smart Classrooms, that mirror the configuration found in many local schools where teachers have a limited number of computers. The presenters will share the results of a qualitative study in which the presenters explored the pedagogical beliefs of five teacher educators who used technology in their teaching. The researchers wished to know their reasons for booking the classroom and their cultural preferences in designing instructional activities. The researchers created a set of questions to guide interviews with these five subjects. The data consist of interview transcriptions and responses to written follow up questions. Using the constant comparative method, data analysis began as data were first collected and continued throughout the study. Each researcher independently read the transcripts and identified patterns and questions. The researchers found that the faculty chose to use a Smart Classroom because it matched their teaching methods. The faculty interviewed had developed a variety of meaningful technology uses for their students. And they addressed many elements of multicultural integration. The presenters will also share the implications of their study for faculty development and raise the questions for further study.

**Meeting the Need for Technology Integration: Math, Science and Technology Integration for Preservice Teachers**

Skip Marshall, University of Florida, USA; Rose Pringle, University of Florida, USA; Kara Dawson, University of Florida, USA; Alan Hochman, University of Florida, USA

Historically, teacher education programs offered methods courses offered in isolation, neglecting the integrated manner in which many elementary classes are taught. This presentation focuses on the importance of curriculum integration in the preservice teacher education programs. The presenters explore the Math, Science and Technology (MST) integration block developed by the School of Teaching and Learning at the University of Florida for its Proteach II teacher education program with a focus on the technology integration course. The MST program goal is to develop the skills required by teachers to effectively create and implement an integrated curriculum.

**Technology and Social Change: Perceptions of Culturally Diverse University Students**

Shane P. Martin, Loyola Marymount University, USA; Edmund F. Litton, Loyola Marymount University, USA

This paper is a report on the findings of a pilot study addressing the perceptions of culturally diverse university students and computer technology. A survey instrument was generated to assess differences in attitudes, background and usage of computer technology. Specifically, the study addressed three questions: How do female students and members of different ethnic groups view the importance of computer technology for themselves and for their families? What role do cultural traditions have in creating interest in using computer technology? How do female students and members of ethnic minority groups use computer technology? Results indicate the affects of gender bias in computer technology, and some differences between ethnic minority groups and European American students. Questions for further research on this topic are discussed.

**Toward an Adaptive e-Framework for Teacher Education**

Massimiliano Adamo, Italian National Research Council-IC, Italy; Mario Giacomo Dutto, Italian Ministry of Education, Italy; Irene Gatti, Italian Ministry of Education, Italy; Maurizio Lancia, Italian National Research Council-CED, Italy; Gianfranco Mascari, Italian National Research Council-IC, Italy

The Italian Ministry of Education in collaboration of the Italian National Research Council are engaged in joint activities concerning the modelling, design and prototype implementation of an adaptive e-framework supporting the interactions of the various actors of the national teacher training system.
Desktop Video Conferencing: The Optimum Solution for Synchronous Distance Learning
Ron McBride, Northwestern State University, USA; Frank Fuller, Northwestern State University, USA; Robert Gillan, Northwestern State University, USA

In the current world, where information technologies have an increasing influence in the individual training systems, as most of the daily situations are handled by teams, arises the necessity of training teams which collaborate in order to solve situations in complex time-pressure scenarios. This idea is expounded into a methodology based on the evolution of the training systems. Traditional trainings for individuals flow to Computer Based Trainings (CBT) and collaborative training systems using information technologies appear for team training. The integration of traditional trainings, CBTs, drills and collaborative trainings compensates and improves current team trainings. Training individuals and teams that must work in emergency situations is complex for several reasons; it may also be infrequent for similar reasons and also crucial information is usually lost with the existing training systems. In order to increase the effectiveness of systems which promote learning by individuals, teams and organisations involved in the emergency and raise the frequency and quality of training sessions, we present a training system which integrates Intelligent Agents, Virtual Reality and Shared Mental Models for learning from actions on equipment and management decisions to be performed in emergency scenarios. The system is being developed as part of the European project called ETOILE (Environment for Team Organisational and Individual Learning in Emergencies). It consists of an application based on the resolution of an underground fire emergency and another about an incident in a nuclear power plant. It is a European project called ETOILE. The system can be also applied to many other scenarios like laboratories, chemical plants, management, etc. where teams must collaborate, work together, act and take decisions.

Technology and Social Studies Teacher Education – Results from a National Survey
Cheryl Mason, University of Virginia, USA; Michael Berson, University of South Florida, USA; Walter Heinecke, University of Virginia, USA

The beliefs and practices of College and University Faculty Members (CUFA) of the National Council for the Social Studies Social technology integration into teacher education were investigated using a questionnaire. This presentation will present the survey results and highlight methods of integrating technology into social studies methods courses.

Lessons Learned: School based Reform and its Impact on the Restructuring of a Teacher Preparation Program
Jan Mastin, University of Missouri-St. Louis, USA; Joseph Polman, University of Missouri-St. Louis, USA; Kathleen Beyer, Educational Visions, USA

The reform in teacher technology integration at our university is based on a school reform project. Thirteen area classrooms were equipped with the latest technology. We were selected to train the teachers to use technology and inquiry-based, student-centered learning. Monthly meetings, training sessions, and classroom visits were instituted. Our teachers were eager to learn and returned to their classrooms ready to try the new technology-rich, inquiry-based projects with their students. The result: student scores improved, students’ projects became more professional, and the students became empowered by their success. We based our strategies on the success we had with our involvement in the aforementioned school reform and we relied heavily on the thirteen classrooms as observation sites for our preservice teachers. Our success during our first year far exceeded expectations. We are on our way to preparing our students to be the facilitators of technology-enriched, activity-based classrooms of the future.

Faculty Technology Coaches
Kathryn Matthew, Rebecca Callaway, Catherine Letendre & Kimberly Kimbell-Lopez, Louisiana Tech University, USA; Elizabeth Stephens, Southwest Texas State University, USA

The purpose of this research was to examine the benefits of one-on-one mentoring for technology coaches and teacher preparation faculty as they learned to use technology. Participants included 33 teacher preparation faculty and 14 technology coaches, teacher education majors. The technology coaches worked with the faculty members in their offices and classrooms as they learned to use technology for their personal benefit and to integrate technology into their teaching. Interviews and observations indicated that coaches as well as faculty members gained in their knowledge of technology.

Desktop Video Conferencing: The Optimum Solution for Synchronous Distance Learning
Ron McBride, Northwestern State University, USA; Frank Fuller, Northwestern State University, USA; Robert Gillan, Northwestern State University, USA

The technologies for teaching at a distance continue to proliferate. Though web-based delivery, using the computer and Internet, has attracted substantial interest recently, other technologies, like full motion video compression, continue to provide alternatives to the Internet. Factors such as quality of delivery, cost effectiveness and convenience of operation have shifted the emphasis away from high cost video compression systems. Nonetheless, web-based classes taught at a distance provide significant coverage but lack components such as full frame video that allow students see the teacher during synchronous delivery. The essence of “real-time” instruction is simulated with DVC, though at a fraction of the cost of video compression systems. Desktop video conferencing synthesizes the best features of all distance learning delivery systems, resulting in a technology that provides a variety of applications for the participating institutions. This paper explores desktop video conferencing as the “next generation” distance learning technology, comparing faculty and student preparation time, initial and maintenance cost, and effectiveness of instruction.
Umm...I Don't Think It's Working: Why our Class-to-Class E-mail Exchange Didn't Work (And What can be Done to Fix it)

Lauren McClanahan, The Ohio State University, USA; Linda Clady, Westerville City Schools, USA

Last spring, my teacher education students and I decided to partner with a local middle school via the Internet. Since my college students were in the process of learning how to be English teachers, and the middle school students needed help with their writing, the match seemed to be perfect and beneficial to both parts. However, the technology, rather than being an invisible vehicle for communication, got in the way. The middle school teacher and I, try as we might, had many difficulties with not only scheduling, but also utilizing the technology itself.

Culture Clash in the College Classroom: Changing the Work Teachers and Students Do

Averil E. McClelland, Kent State University, USA

This paper examines the experiences of beginning teacher education students in an inquiry-based, technology rich course that has been designed to change the work that both teachers and students do as they explore contemporary issues in the profession of teaching. Analysis of these experiences is framed by concepts from cross-cultural psychology, often used to understand experiences of individuals who abruptly find themselves living in a different culture. The premise is that classrooms characterized by changed teaching and learning design and activity are, in fact, “new cultures” to those who participate in them.

Robert James McClelland, Liverpool John Moores University, UK

One educational development approach at Liverpool John Moores University (LJMU) from its Business School (LBS) is that of supported web-based learning systems to complement traditional teaching. This paper focuses on recent work at LBS concerning the development of a Research Methods module, that has grown since 1998 to serve a range of Social Science Masters programmes across the university. The programmes include the MBA, the in-house Masters in Learning and Teaching for Higher Education (undertaken by academic staff of LJMU) and several overseas Masters programmes. The module is web-based and provides teaching, learning and support environment for academic staff and students. It is flexible in that it is variably credit rated and can be studied in full-time, part-time and distance modes. The approach used in the delivery of the module has enabled us to explore module programme support development possibilities on the web from academic, quality and commercial perspectives as well as the cybernetic and evolutionary nature of learning. It has also enabled us to explore student attitudes and perceptions to the technology, the learning strategies adopted by students, and relate it to student learning styles and their development as researchers. The emphasis in studying this system is appropriateness in terms of pedagogy, quality of content and presentation and technology fit. The development acts as an over-pinning in the LBS strategy of a web supported teaching and learning environment, coupled with an innovative support mechanism, for staff and students on Social Science Masters programmes at Liverpool John Moores University.

Lessons Learned

Ann H. McCoy & Helen C. Barrett, University of Alaska Anchorage, USA

Last year our School of Education received a PT3 Capacity Building grant. This year we received a PT3 Implementation Grant to continue our work with integration of technology into our teacher preparation program. In addition, last year we received a 5 year Title II Partnership for Teacher Enhancement grant to assist us redesign our teacher education program. The PT3 grants support this effort.

Ready or Not—Here They Come

Ann H. McCoy, University of Alaska Anchorage, USA

ISTE NETS for Students and the new NETS for Teachers raise expectations of what students and teachers should know and be able to do. Because of this, we sometimes assume that teacher candidates come with more technology experience than they actually do.

Multimedia Resource File: A Practical Project for Preservice Teachers

Leah P. McCoy, Wake Forest University, USA; Elizabeth M. Miller, Wake Forest University, USA; Nicholas J. Bender, Wake Forest University, USA

The Multimedia Resource File Project is used to allow students to practice and demonstrate integration of advanced technology and content skills in planning and organizing an instructional resource for high school teaching. The student will develop advanced skills in searching the web, evaluating and selecting resources, dealing with copyright issues, organizing resources, and producing a CD product.

Zones of comfort, proximal development and technology skills diffusion: A critical reflection on a curriculum-based approach to inservice teacher training

David McCurry, Monmouth University, USA

This paper explores the current practice of inservice teacher technology training through the lens of two theoretical constructs; Roger's Diffusion of Innovations theory as it relates to technology diffusion among select groups and Vygotsky's constructivist concept of Zones of Proximal Development as applied to practicing teacher's exposure to new tools in their working environment. The approach to training teachers in the context of their own workspace is directed at exploring situated experiences with new technological tools. The relationship between these tools and their patterns and habits of pedagogical practice are described through ethnographic and quantitative data collected during an inservice technology training for K-8 teachers.

66 — Proceedings of SITE 2001 / Orlando, Florida, USA
Bootstrapping Online Organizational Knowledge: Technologies and Practices from a PT3 Initiative.
John E. McEneaney, Oakland University, USA; Anne E. Porter, Oakland University, USA, Bryan R. Baroni, Oakland University, USA, Wendy M. Subin, Oakland University, USA, James Quinn, Oakland University, USA, Ledong Li, Oakland University, USA

Large-scale projects often depend in critical ways on points of leverage where modest effort has significant influence on outcomes. The purpose of this paper is to describe how a coordinated system of Web resources served as such a point of leverage in a federally-funded effort to promote technology in support of teaching and learning. We believe two other decisions were important in the success of our Web tools as a point of leverage. One decision was to avoid high-tech proprietary systems (i.e., “groupware”) in favor of a loose collection of relatively “low tech” tools. The second was that we sought to build on, rather than replace, existing workplace practices and protocols. We believe these decisions also significantly enhance the generalizability of the model we have developed for preparing teachers to teach in an information age.

IDENTIFYING SCHOOL CONDITIONS AND TEACHER PRACTICES THAT HAVE PROVEN EFFECTIVE IN INCREASING MATHEMATICS AND READING ACHIEVEMENT FOR AFRICAN AMERICAN STUDENTS AND STUDENTS IN SCHOOLS WITH SUBSTANTIAL MINORITY STUDENT POPULATIONS.
Michael McFrazier, Prairie View A&M University, USA; Danita Bailey, Texas A&M University, USA

Reading, Writing and Arithmetic finding ways to make them stick! The focus of this research was to identify those conditions and teacher practices that have been proven effective in increasing the academic performance of African-American students and students in schools with substantial minority populations. The targeted population for this research was reading and math teachers from schools whose Texas Assessment of Academic Skills (TAAS) performance was reportedly Exemplary, Recognized or Acceptable. Research participants must have been teaching in classrooms with at least a 50% minority population. They also must have had at least 70% of their students passing the TAAS exam. Research results indicated that over 90% of the respondents exhibited the following strategies in their classrooms in Reading and Mathematics: Believing in their own self-efficacy; Projecting a vision of excellence; Believing students can reach their potential; Encouraging students to ask questions; and Teaching students critical thinking strategies for solving math problems.

From Programs to Pedagogy: Professorial Change Through Technological Collaboration
Carol McGaughey, University of Houston, USA; Judy Radigan, University of Houston, USA; Nancy Searle, University of Houston, USA; Donna Smith, University of Houston, USA

The goal of the "Preparing Tomorrow's Teacher to Use Technology" grant awarded to the University of Houston College of education is to encourage the integration of technology into courses taught by education professors. This modeling of an appropriate use of technology by the university professors is intended to help pre-service teachers acquire proficiency in the use of technology for curricular purposes. To accomplish this goal, many changes had to be implemented, the most challenging of which was to assist professors to move toward pedagogical change through the fusing of technological resources and activities with their curricular objectives. Professors were paired with grant project members who assisted them to identify their personal needs concerning technology. Using an action research model, a collaborative community was developed between professors and the grant project members. The resulting increased interest and excitement of the professors was reflected in their communication with colleagues, their use of electronic communication with their students, and their growing integration of technology into their curriculum.

Students Perceptions of the Value of On-Line Instruction
Barbara McKenzie, State University of West Georgia, USA; Elizabeth Bennett, State University of West Georgia, USA; Nancy Mims, State University of West Georgia, USA; Tom Davidson, State University of West Georgia, USA

This paper explored college students’ basic perceptions of WebCT on-line instruction, focusing on why students chose or did not choose to use this format, tools and activities preferred, and if this format should be continued. The findings revealed that students did not use on-line instruction due to lack of computer access. Students who chose to use WebCT did so to access course materials and for e-mail connectivity reasons. Tools and activities preferred were accessing class materials and posting to the bulletin board. The majority of the participants indicated that on-line courses should be continued.

The Way We Were - Reflections on the Impact of ICTs on Teacher Education in Ireland
Deirdre McBrien, Trinity College Dublin, Ireland; Sharon MacDonald, Trinity College Dublin, Ireland; Brendan Tangney, Trinity College Dublin, Ireland

The attitude of the teacher has been identified as a crucial factor in the successful integration of formation and Communication Technologies (ICTs) in education. This paper reflects on the learning experiences of a group of teachers during the first year of a Masters programme in ICTs in education. Using logged information from the class mailing list, video taped reflection, face-to-face interviews and a class questionnaire data was gathered about student learning experiences. It was found that there was a marked contrast between the student perception of learning at undergraduate level and that on the Masters course. Different learning and teaching strategies facilitated by the use of ICTs characterised this contrast.

Collaborative Action Communities for Preservice Technology Integration
Sara McNeil & Melissa Pierson, University of Houston, USA

With a successful field-based preservice program aimed at effective strategies for teaching diverse urban youth, the University of Houston is implementing an action research process to actively collaborate with area school districts to establish networked learning communities of university faculty, preservice teachers, and school-based educators to support the development of future teachers. The College has restructured its required 1 semester, 3-credit-hour technology course to a series of 3, 1-credit-hour technology sections tied directly to methods courses to allow students to develop appropriate content methods-based technology proficiencies based on
Designing Constructivist Teaching and Learning Environments For Visual Learning
Sara McNeil, University of Houston, USA
This paper discusses the design of a graduate course in visual learning based on constructivist teaching principles. The conceptual framework is described, and guidelines for each project are presented. Innovative strategies that contribute to a constructivist teaching and learning environment are discussed. Student and instructor comments are also shared.

Training Tutors Online: Three Challenges, Three Solutions, and Voices from the Other Side of the Whiteboard
Kelly Marie McVeary & Christa Ehmann, Smarthinking, USA
If Socrates and Plato were alive today, would they still meet in the streets of Athens to probe topics with questions, or would they meet online to do so? Consider another legendary tutor Annie Sullivan, who held Helen Keller’s hand under a running faucet to teach the word “water”.

Using Technology in Early Childhood Environments to Designing Constructivist Teaching and Learning Environments For Visual Learning
Sandy Mills, WebCT, USA
The WebCT Certified Trainer Program: Modeling Online Teaching and Learning with Industry Driven Standards
Sara McNeil, University of Houston, USA
The WebCT Certified Trainer program goes beyond typical technical training and was designed for those who are tasked with teaching others how to use WebCT and how to create instructionally sound courses. This discussion-based program focuses on the techniques, strategies and methods for integrating teaching and learning principles, learning styles, building online communities, and includes discussion on other topics such as intellectual property, copyright, academic honesty, and accessibility. This paper explores the research and educational philosophies behind the program, and highlights why over 90 institutions around the world have become involved and what they are saying about the program. Also, a list of online teaching and learning competencies that will be helpful to anyone putting together educational programs for teachers will be shared.
Managing On-Line Courses Around the World
Nancy Mims, St University of West GA, USA; Barbara McKenzie, St University of West GA, USA

Bringing new ideas and cultural richness to our universities in partnership with other institutions in other countries is gaining popularity. Through the use of web-based or Online Learning, it is, for many universities, the way of the future. Teaching across the continents appears to be a simple solution for bringing cultural richness to life. This presentation will assist college instructors in planning delivery of courses in foreign countries, especially Third World Nations. Discussion focuses on some possible barriers, concerns, tips and the equipment needed in order to experience web-based learning with a minimum hassle.

Putting the Instructor in Charge: Component Architecture and the Design of a Course Web Site
Punyashloke Mishra & Matthew J. Koehler, Michigan State University, USA

This paper describes the "component architecture" of the web and how teachers can use various existing components of the web—plugins, websites, applets, web services etc., to develop complex applications with limited investment of resources. Furthermore, the pieces of independent software units can be coordinated towards a final product that effectively hides the "duct tape" that holds the pieces together. This "mix and match" approach towards developing educational software saves money and time and allows information sharing across activities in an integrated fashion which in turn.

Aiming a better understanding in science courses through mathematical reasoning
Simon Mochon, Math Education Department, CINVESTAV, Mexico

In this article we present a project which has the purpose of using mathematical based explanations to support the teaching of the sciences (chemistry, biology and physics) at the secondary level in Mexico. The article describes the structure of the worksheets developed and the pedagogical model followed within the classroom to ensure an efficient use of the activities. Spreadsheet models to be explored by the students accompany many of the worksheets. We will also show some of these spreadsheet models designed for this educational project.

Academic Staff Development Course for Coordinators of Distance Education: Russian Experience
Marina Moisseeva, Russian Academy of Education, Russia; Victor Krivoschukov, Southern Ural State University, Russia

The system of public education in Russia is in a process of reforming now. Most of the universities and colleges have recently opened the distance education faculties and departments, and developed their pilot distance courses organized on the basis of modern Internet technologies. But there is a contradiction between the urgent need in accelerated development of the Russian system of distance education and the lack of specialists to develop and manage it (i.e. coordinators of distance education). The report presents the Internet-based course for coordinators of distance education, developed by the Russian Academy of Education and South-Urals State University for academic staff development programs. The report is intended for those scientists and practitioners whose interests are focused on the problems of using Internet technologies and active methods of teaching for in-service training, or faculty and staff development.

Asynchronous Online Group Decision Making: A qualitative analysis
Deana Molinari, Brigham Young University, USA

A qualitative study of 1172 online messages suggests that online group processing is both similar and different from face-to-face problem solving. A comparison of findings between the least effective and most effective outcome product found that more communication, critical thinking, and relationship building occurred in the most effective group. The mostly female sample did not use conflict in their processing and other differences suggest that gender may affect online group processing. The study at Brigham Young University College of Nursing used basic face-to-face research methodologies to explore the functional communications of forty-eight students conducting an action research family nursing project and completing group papers about their process. The three phase analysis of online groups took place as part of a nursing course lasting fifteen weeks and identified (1) functional communication constructs, concepts, and categories (2) differences between the least and most effective groups, and (3) differences between online and face-to-face group decision making.

Innovative Teacher Education using the Web-based Integrated Science Environment (WISE)
James Monaghan, California State University, San Bernardino, USA; James Slotta, University of California, Berkeley, USA

We present the design, testing, and implementation of a professional development model that uses three essential components: a successful Web-based curriculum environment (the Web-based Integrated Science Environment: WISE); a virtual community of teachers and scientists who discuss pedagogy, collaborate on curriculum design, and offer continuing support for in-service members; and virtual mentoring between new community members and veterans. The Web-based Integrated Science Environment (WISE) builds on the successes of a decade's research on the Computer as Learning Partner project. In this professional development project, we sought to combine solid pedagogy that was the result of extensive funding by the National Science Foundation, with large-scale professional development in a large teacher training institution.

Connecting Trainee Teachers and School Mentors with University Educators via MultiPoint Desktop Video Conferencing (MDVC): The Singapore Experience
Swee-Ngoh MOO, National Inst. of Education, NANYANG TECHNOLOGICAL University, SINGAPORE; Angela Fooong-Lin WONG, National Inst. of Education, NANYANG TECHNOLOGICAL University, SINGAPORE; Leslie SHARPE, National Inst. of Education, NANYANG TECHNOLOGICAL University, SINGAPORE; Lachland CRAWFORD, National Institute of Education, NANYANG TECHNOLOGICAL University, SINGAPORE; Chun HU, National Inst. of Education, NANYANG TECHNOLOGICAL University, SINGAPORE

The focus of this paper is on the potential of MultiPoint Desktop Video Conferencing (MDVC) for adding value to the practicum component of the pre-service teacher education programme in Singapore. The spotlight is on the conference between trainee teachers

Abstracts Book — 69
and their university supervisors, and networking among school mentors and the university researchers via MDVC during the practicum. In essence, this means opening up to personnel involved in the practicum possibilities that have been unavailable to them till now. This paper presents an outline of the projects’ development: the technological issues and problems involved, the organizing and structuring of the MDVC conferencing, and the nature of the discussions. It also includes the preliminary findings of the MDVC research project and its current and future developments, and discusses the potential and implications these have for teacher preparation.

Findings from the Project for the Longitudinal Assessment of New Information Technologies (PLANIT): 2000-2001
Cesar Morales, Inst. of Latin American States for Education, Mexico; Charlotte Owens, University of Louisiana at Monroe, USA; Dale Mogoun, University of Louisiana at Monroe, USA; Rhonda Christensen, University of North Texas, USA; Gerald Knezek, University of North Texas, USA

Since 1995, researchers in several countries have been gathering data about the impact of information technology on teachers and learners using a common set of instruments. A preconference symposium was held at SITE 2000 to summarize findings in the international sector through the year 1999. For SITE 2001, a panel presentation featuring new findings is offered. This panel features teacher attitudes toward information technology in the nations of Brunei, Mexico, Thailand, and the United States of America (USA).

Developing a University-Wide Digital Portfolio System for Teacher Education
Laurie Mullen, Ball State University, USA; Bill Bauer, Ball State University, USA; Web Newbold, Ball State University, USA

This paper describes the collaborative process we’ve utilized in conceptualizing a digital portfolio requirement for all teacher education majors. We entail the philosophical, logistical, and infrastructure considerations that have been part of the process along with the portfolio model adopted. Finally, we discuss the assessment timeline for portfolio evaluation.

Instructional Staff Development Project: A Pre-Post-Post Follow-up Evaluation
Rosemary Mullick, SUNY Inst. of Technology at Utica/Rome, USA; Ron Sarner, SUNY Inst. of Technology at Utica/Rome, USA

The Staff Development Project was designed to facilitate integration of instructional technology in the classroom. The Project was first funded in 1999 and again in 2000. It involved a consortium of four local districts in a metropolitan area in Central New York. The overall effectiveness of each of the projects was determined using a Pre-Post Test Design. Responses to a General Pre-Test determined teachers’ knowledge of and experience with technology and the extent to which they employed technology in the classroom. A General Post-Test determined any changes that occurred. The findings of indicate that the Instructional Staff Development Projects for both 1999 and 2000 were highly successful. Positive changes in ratings occurred between the Pre- and Post Tests. Responses on a Post Follow-up questionnaire indicated that not only did positive changes occur between the Pre- and Post-Tests, but the changes remained relatively stable one year later. Therefore, the Targeted Instructional Staff Development Project was successful and had a lasting effect on the participants.

Scoring Activities on Integrating Technology into the Curriculum During Pre-Service Training Using Bloom/ACOT Scale
John Murphy, D’Youville College, USA; Jacqueline McFarland, Niagara University, USA

Pre-service Education students were observed as they integrated technology into elementary classroom activities. The authors created a special scoring tool by combining Bloom and ACOT (Apple Classroom of Tomorrow) scales to record cognitive and technology attributes. Data showed the relationship between Bloom and ACOT activities. Preliminary data pointed to a corresponding relationship between high scores on the Bloom scale and high scores on the ACOT scale. More work is needed to perfect the Bloom/ACOT model.

Problem-based learning using web-based discussions: A positive learning experience for undergraduate students.
Rene Murphy, Acadia University, Canada; Gary Ness, Acadia University, Canada; Joanne Pelletier, Acadia University, Canada

The purposes of this study were to incorporate computer technology to parts of an undergraduate exercise physiology course, to motivate students, to get them actively involved in the learning process and to enhance learning. Two classes of third year students were studied; the first was taught using problem-based learning (PBL) activities with on-line discussions on a course web page while the second was taught using traditional lectures. Student perceptions about the use of technology and PBL were collected using the Nominal Group Technique. Data related to student knowledge, comprehension, and application of course material, as well as retention over time (12 months) were collected. This teaching method resulted in similar grades on exam questions and final course marks with only one significant difference, that being a higher score (1.5%) in the PBL group’s answer to a question of “application of knowledge” (p=0.02, PBL vs traditional). Lastly, this pilot project verified the viability of these teaching methods and demonstrated their acceptance by undergraduate students. Therefore, it could provide a framework for the use of these teaching strategies for other courses, continuing and distance education.

Web-Based Collaboration On Technology in Education: A successful constructivist course model for pre-service teachers
Sharon Murray, St. Thomas University, Canada

A Technology in Education course model that focuses on helping pre-service teachers think about how they learn and how they can improve their learning as well as how they can learn from one another will be discussed. The course tasks have a real educational purpose and are not usually done for the sake of completing an assignment. Students construct activities or representations of their understanding; represented particularly in their electronic course web pages, which reflect their experiences and thought developments as well as a finished product. The course design supports a constructivist model of instruction, which seeks to create an environment that has learners construct understandings rather than regurgitate the instructors view. It is my hope to share, demonstrate and showcase examples of course web pages of pre-service teachers as a way of engaging you in a discussion of this model of course design.

70 — Proceedings of SITE 2001 / Orlando, Florida, USA
Using WebCT 3 to create web-based learning for multiple learning styles
Ann Musgrove, Florida Atlantic University, USA; Richard Knee, Florida Atlantic University, USA; Desmond Rodney, Florida Atlantic University, USA; Glenn Musgrove, Broward Community College, USA

Web-based learning (WBL) is rapidly becoming a staple at all levels of education. Statistics from a national study by the Department of Education in 1997-98 showed almost 44 percent of all higher education institutions offered distance-based courses, an increase of one-third since 1994-95. Estimates are that by the year 2002 there will be more than 2 million students in higher education participating in distance education. In this period of rapid change as education adapts to use the new tools of web-based learning, educators need to consider the foundational concepts of learning theories. Modern learning theories, based on constructivism, emphasize individual differences in learning styles. The most effective learning environments offer content that caters to these individual differences in learning styles. Focusing on how to use some of the information that learning theory offers can improve WBL just as it has helped with traditional educational environments. The focus of this paper is to show how WebCT3.0 can be used to make WBL appealing and effective for a variety of individual learning styles.

Investigating the Benefits of an Educational Technologist in Middle School Environments: A Qualitative Study
Janice Nath, University of Houston, USA; Helen Farran, University of Houston, USA

This paper is a report of a study conducted of a federally funded technology innovation grant, C*R*E*A*T*E for Mississippi. Qualitative techniques were used to examine the benefits of school based Educational Technologist in increasing teacher knowledge and integration of technology. Preliminary results indicate that teachers do benefit from the Educational Technologist. Teachers feel more confident in their use of technology, use more technological resources in planning and implementing their lessons, and are integrating technology into their lessons.

The Study of the Impact of Learners, Learning Interactions on Web-based Tutorial Program, to Satisfaction on the Use of Web for Educational Purposes and Academic Achievement
Jaitip Na-songkhla, Chulalongkorn University, Thailand

Web-based Tutorial program was developed with HTML language to serve as a supplementary classroom activities for freshman in Foundations of Computer for Education class. The program was distributed online, consisted of two types of learning interactions: human-to-computer interaction and human-to-human interaction via computer network. Online materials, lecture notes, recommended reading, and review tests were identified as human-to-computer learning interaction; whereas, human-to-human interaction was set up in form of learning activities for students via web-board, chat forum, and e-mail.

Adapting Critical Thinking Models to a Technological Approach
Janelle Nath, University of Houston, USA; Helen Farran, University of Houston, USA

Teachers must be prepared to teach higher-level thinking and incorporate technology so that students will have the proficiencies and skills needed to enter this new and creative era. The purpose of this paper is to present critical thinking models that have been researched and successfully used across the curriculum for all grade levels and are now being adapted to incorporate technology: concept attainment, Suchman inquiry, conflict resolution, and the memory model. Teacher educators and practitioners gain theory and insight on higher-level thinking models. Methods for construction and application of these models will be demonstrated including PowerPoint presentations, web-based presentations, directed Internet searches, and utilization of various graphics software.

WHERE IS THE ANY KEY SIR? EXPERIENCES OF AN AFRICAN TEACHER-TO-BE
Guillaume Nel, Technikon Free State, South Africa; Lietzel Wilkinson, Technikon Free State, South Africa

This presentation focuses on efforts to assist first-year students from developing communities in computer classes at the Free State Technikon in South Africa. As an example, the story is told of Thabo, a student teacher from a rural area who was willing to live in a squatter camp just to be able to attend an institution of higher education. The compulsory computer literacy classes posed a major problem because he had never touched a computer in his live. On his first day the class mocked him when he indicated that he could not find the "any key"! The pace was just too fast and he also did not have a computer of his own. He ultimately failed the course -a major financial blow to a very poor student. The question is asked whether other approaches would not have given him the opportunity to adapt more easily. In surveys undertaken at the Technikon, it was found that many students from rural areas live in similar conditions as Thabo and experience similar problems in their first-year computer classes. A study of the nature of these students' problems led to the introduction of new approaches where innovative "user-friendly" methods are used.

System-wide Planning for Technology in Teacher Education: Lessons Learned at the University of Wisconsin System
Dana Nelson, University of Wisconsin System, USA

This paper reports both the processes and outcomes of the University of Wisconsin System's effort to facilitate technology integration throughout its thirteen teacher preparation programs. The context and rationale for the effort, the change strategies employed, and the results of institutional and system planning are explained. The paper also reflects on lessons learned from the planning effort. The planning effort has been conducted within a context of organizational change characterized by facilitating, engagement, and decentralization.

Virtual Worlds, Real Minds: an investigation about children, videogames and cognition
Antonio Simão Neto, Pontifícia Universidade Católica do Paraná, Brazil

The Virtual Worlds, Real Minds project aims to investigate and understand the cognitive processes that take place when young people play videogames and to provide educators with some insights based on this understanding. Preliminary findings show that traditional, Cartesian ways of thinking can be perceived, along with new, more emotional and interactive forms of viewing and making sense of external stimuli.

Abstracts Book — 71
Forming a Cadre of Learners: Effective Educational Technology Integration in a Teacher Preparation Program
Ellen Newcombe, John Kinslow & Marlene Goss, West Chester University, USA

West Chester University's USE-Tech Partners (PT3) program has been a catalyst for increasing interest in and cooperation for preparing technology proficient teachers. Project activities during the capacity-building year included monthly participant meetings, development of integration strategies by faculty, consortia partnership development, completion of the university technology plan, and project evaluation activities. Nineteen participating faculty had released time during the Spring semester or Summer of 2000 to develop and test integration strategies in one or more of their courses. Faculty enhanced the learning of preservice teachers through: e-mail, the Internet and web-based learning applications (e.g., BlackBoard), content specific software, presentation software and other productivity tools, and video-conferencing.

How Can We Share Teaching Experiences in Different Countries through ICT? - Concepts, Models and Propositions for Instructional Design and Analysis -
Haruo Nishinosono, Bukkyo University, Japan

Information and Communication Technology (ICT) enables pre-service and in-service teachers to share their experiences with one another while in different places. In other professions such as architecture, medicine, engineering, etc, specific symbols and models are used to express ideas and inventions. In the educational profession, there are no common symbols or models for teachers to express their ideas or to share experiences. This paper proposes a procedure of instructional synthesis and analysis, concepts for teaching, graphic representation of models and logical expression of instructional propositions to enable teachers to share their experiences through ICT.

Art Responding Through Technology (http://www.vtartt.org)
Penny Nolte, VT ARTT Project, USA; Marty Leech, Missiquoi Valley Union High School, USA; Gracelisa Monteagudo, Bread and Puppet, USA

ARTT is a network and collaborative based learning approach to visual arts education that would be impossible to replicate in 'real time' alone given geographic and monetary constraints on today's classrooms. Most art teachers in Vermont find themselves the only teacher in their field in a school or even a district, making networking, collaborating, and seeking support from their peers difficult. With the advent of ARTT, Vermont's teachers in the arts have a portal through which they've found access not only to each other, but to working artists and arts organizations where professional interaction and personal friendships have blossomed and grown. The use of asynchronous threaded discussions for iterative critique of student work in progress has provided teachers with a resource that is there when they need it, and can use it, and students with a test ground and feedback on artistic, written, and verbal expression. (http://www.vtartt.org/jellyfish.html)

Revising an educational computing course to meet the National Educational Technology Standards (NETS): A process of reflective teaching.
Aileen Noffs, University of Tennessee, USA; Blanche O'Brien, University of Tennessee, USA

In our attempt to address National Educational Technology Standards (NETS) set forth by the International Society for Technology in Education, we have faced issues that impact the conditions of learning experienced by our students. As reflective practitioners, we have revisited the curriculum to make improvements based on our experiences and our students' experiences in the required educational computing course at our college of education. Our reflections have included conversations about the scope and sequence of the curriculum, pedagogical knowledge, instructional strategies, and procedures for assessment. This paper will highlight key points of our discussions, and describe interventions and their resulting consequences for our preservice teachers.

Bridging transformational geometry and matrix algebra with a spreadsheet-based tool kit
Anderson Norton, The University of Georgia, USA; Sergei Abramovich, State University of New York Potsdam, USA

This proposal stems from the authors' common interest of designing technology-enhanced activities within the context of matrix algebra, transformational geometry, and fractals for prospective high school teachers. It concerns the ways in which a spreadsheet can be used as a tool kit that enables one, through encoding and manipulating matrices, to create fractals with reliance upon "the chaos game." The authors argue that such use of a spreadsheet in the secondary classroom is conducive to linking properties of matrices and concepts of transformational geometry in a meaningful and representational manner.

When Attitudes Change, Do Changes in Practice Follow?
Priscilla Norton, George Mason University, USA; Nancy Farrell, George Mason University, USA

In order to meet the challenge of teacher education responsive to the integration of the newer electronic technologies, the Integrating Technology in Schools (ITS) Program leading to a Masters of Education in Curriculum and Instruction was developed. The ITS Program is structured around a cohort process that supports students finding common ground around a shared set of experiences, knowledge, readings, activities, and support systems. This paper presents a summary of data obtained during the 1999-2000 ITS Program and examines 1.) changes in participants' stages of concern, 2.) changes in participants' self-reported frequency of technology use, 3.) changes in participants' self-report concerning collegial interactions, 4.) changes in participants' summary of assigned technology use in their classrooms, and 5.) conversations with participants. Examining these changes enabled the authors to discuss the relationship between changes in attitude and classroom practice.

How Much is Enough?: Comparing Certificate and Degree Teacher Education Options
Priscilla Norton, George Mason University, USA; Georganna Schell, George Mason University, USA

Few would argue that teacher education is a central factor in realizing the potential of educational technology to influence teaching and learning. Understanding the impacts of a variety of teacher education options on teachers' concerns, self-reported uses, and self-reported collegial activities related to technology can play an important role in deciding what opportunities are most appropriate. This paper
examines two graduate level options: a 12 graduate credit hour certificate program and a 36 graduate hour Master’s of Education degree program. Using a three-part survey, 37 teachers who had completed the Master’s of Education degree program and 153 teachers who had completed the Certificate Program were surveyed. Teachers in the Master’s group were matched with teachers in the Certificate group using grade level/subject taught and years of experience. The resulting matched group of 37 Master’s and 37 Certificate teachers were compared. Results of the comparison in three areas (Stages of Concern, instructional uses of technology, and collegial interactions concerning technology) are presented followed by a discussion of the relationship between program and outcomes.

USING MULTIMEDIA AND TECHNOLOGY TO TEACH MATHEMATICS AND SCIENCE: RESEARCH-BASED PROFESSIONAL DEVELOPMENT MATERIALS
Karen Norwood, North Carolina State University, USA

The ultimate goal of this project was to have a new crop of teacher candidates finish their undergraduate teacher education programs with a full understanding of the interconnections between mathematical scientific principles. It is the intent of this project to supply preservice teachers with the equipment and knowledge of how to use the latest equipment that makes real-life data collecting and computational explorations routine. This was accomplished by incorporating the use of multimedia and technology in the classroom in an effort to actively involve students in an integrated, reformed, technology-based, visual instructional model. Through the use of mathematical modeling and scientific inquiry, the tendency to teach each of the disciplines in isolation will be removed. The preservice teachers will be prepared for effective instruction in the scientific/information based twenty-first century.

Building the Capacity to Infuse Technology in K-6 Classrooms: A Training Model
Blanche O'Bannon, The University of Tennessee, USA; Rachel Vannatta, Bowling Green State University, USA

A recent effort that enhanced university/K-12 school partnerships is Project PICT (Preservice Infusion of Computer Technology). This project, piloted in 1999-2000, and funded by the U.S. Department of Education, used a team approach to promote the infusion of technology in the teacher education and K-6 curricula. This paper will describe the Technology Training Model design, implementation and results collected from participants regarding their perceptions of the model. In addition, a lesson library of technology rich lesson plans, developed by K-6 teachers and preservice teacher teams, and artifacts will be shared. Findings from this pilot study determined the design of the Technology Training Model adopted for the three year Implementation Project, now underway.

Netseminars: A Strategy for Team-Based Action Research
Gary Obermeyer, Learning Options, USA; David Gibson, Vermont Institute for Math, Science, & Technology, USA

Professional Development School (PDS) partnerships offer a powerful leverage point for the improvement of student learning in the K-12 sector and a unique opportunity to experiment with new forms of online learning for the adults who work in and with schools. In this paper we present lessons learned in the design and delivery of online courses to teacher educators, classroom teachers, support personnel, and student teachers associated with the Virtual Professional Development School Consortium. We describe the NetSeminar model that is evolving through this work, and consider strategies and implications for replication.

Multi-media Approaches to Teacher Continuing Professional Development: Dealing with Disruptive Pupils
Jim O'Brien, The University of Edinburgh, UK; Tony van der Kuyl, The University of Edinburgh, UK

Concerns about how teachers deal with disruptive pupils led to the Scottish Executive funding the development of a CDRom to be used for teacher professional development. The Project involved literature searches, field research and dialogue with teachers in schools to identify a range of scenarios and how they were best dealt with practically. The results and optimum approaches suggested on the CDRom are treated as problematic with users being presented with a range of interactive situations in video/audio and text. Teachers are encouraged to review and develop their own skills and school policy and are provided with exemplars and additional references for consideration.

Distance Learning: Effective Strategies for the Information Highway
Sara Olin Zimmerman, Appalachian State University, USA; Melanie Greene, Appalachian State University, USA; John Tashner, Appalachian State University, USA

This study was created to fill a void in the knowledge of instructor behaviors, effective instructional strategies, assessment measures and the overall effectiveness of learning in the distance education classroom from the student’s perspective. Specifically, this study had graduate students evaluate three professors in three different courses during a fifteen-week semester while teaching in synchronous learning environments. Two of the instructors conducted classes at two sites simultaneously and the third conducted a three site class. At the end of the fifteen weeks, students in all classes were surveyed. All classes were comprised of graduate students who were practitioners in various fields of education. The most used strategies were lecture, group discussion, and cooperative learning. The most effective strategy was noted by students as cooperative learning, followed by group investigation, and presentation. On the open-ended questions, students concurred that a plethora of teaching strategies was employed to engage learners.

Continuous Zoom applied to texts
Francisco Oliveira, Universidade de Fortaleza, Brazil; José B. Silva, Universidade de Fortaleza, Brasil

The amount of text that we are required to read in the present days is amazing. One of the reasons for a poor performance of electronic text systems may result from the fact of users to avoid reading the whole text and make decisions mostly based on their headings (Fox, 1992). Aiming to minimize this problem, we have developed a computer-based tool for continuous zoom interfaces (graphic interface that allows a text to be continuously magnified or decreased). Prior to displaying the text, this tool performs a previous analysis of the text, taking into account its grammatical classification. Then, the text is displayed in its most condensed format and lowest zoom level, where only the most important words are shown. For that, the tool uses the artificial intelligence technique (pattern recognition). The text is then displayed in its most condensed format and lowest zoom level. As zoom increases, more elements of the text become...
The Identification of Opinion Leaders within the Elementary School

Susan O'Rourke, Carlow College, USA

This study focused on the identification of opinion leaders in the elementary school. The intent was to determine the extent to which opinion leaders exist in the elementary school. Three methods were utilized to identify opinion leaders within the school social network. They included self-designation, key-informant and sociometric techniques. Results of these methods were combined to identify teachers viewed as opinion leaders by their teacher peers. Fifteen of the 117 teachers included in this study were identified as opinion leaders. Three specific areas were addressed: 1) technology, 2) curriculum, and 3) school policy. Opinion leadership was compared across these areas to determine relationships. The findings reveal that teacher opinion leaders exist in the elementary schools included in this study.

Two of the fifteen teacher opinion leaders were part of the school's formal structure (department heads, head teacher). Conversely, thirteen of the fifteen teacher opinion leaders did not carry formal designation as a leader in the school system. These teachers seem to constitute an informal leadership structure within the elementary school studied. This presentation will explore the implications of these findings on the diffusion of innovative instructional technologies into the classroom.

Engaging Learners with Technology: An Innovative Professional Development Model

Richard Oostenink, Van Andel Education Inst., USA; Matthew Burns, Van Andel Education Inst., USA; Margot Williams, Van Andel Education Inst., USA

The goal of this learning experience is to share an instructional technology integration model designed to help educators develop and implement learning experiences that invite and engage students to construct knowledge and to make meaning of their world. Essential to ensuring the success of this professional development program is providing a cadre of foundational tools and strategies. Instructional technology, the digital medium, is one such tool that can provide students and teachers a powerful resource and support in the learning process.

Preparing Teachers to Succeed in Online Professional Development Courses

Susan O'Rourke, Carlow College, USA

Future teachers will be able to take advantage of professional development courses offered in an on-line format. Specific skills are necessary to learn effectively in this new environment. How can we prepare future educators to be successful with this innovative delivery of instruction?

Coexistence of Technology and Healthy Active Lifestyles

Judith Oslin, Kent State University, USA; Connie Collier, Kent State University, USA

Intended audience will be teacher educators or curriculum specialists with moderate technology expertise. A digital video case will be presented to illustrate the primary pedagogical strategy used to advance a healthy active lifestyle curriculum.

Examining pedagogical trends within a graphing calculator environment: An analysis of pre-service teacher perceptions

Elliott Ostler, University of Nebraska at Omaha, USA; Neal Grandgenett, University of Nebraska at Omaha, USA

This paper summarizes the findings of a research study designed to collect pre-service teacher perceptions on factors relating to the use of graphing calculators in the secondary math classroom. The study was designed as a way to help improve instruction in university mathematics methods courses. Data collected as part of the study addressed questions of how to overcome barriers of infusing graphing calculator technology in secondary math instruction, and how to create modeling and problem solving oriented activities that use graphing calculators, but still support a traditional textbook based curriculum. Results from the study suggest that greater emphasis on fostering creativity should considered in mathematics methods courses. The target audience for this research paper include pre-service teacher educators in mathematics and science.

Electronic Portfolios: Developed by Preservice Educators to Show Teaching Skills and Philosophies to be Used by Future Employers

Roger L. Olsen & David H. Dimond, Brigham Young University, USA

This paper is a report on the work that has been done by two undergraduate cohorts in the David O. McKay School of Education. Approximately thirty students are formed into a cohort at the beginning of their junior year and remain together while they complete their methods courses and teaching practicum. All students in the cohort begin creation of their electronic portfolio as they come into the program. Electronic portfolios have been created and analyzed for the purpose of helping preservice teachers formulate and articulate their beliefs regarding the education of elementary students, and to collect evidence of planning, management, teaching strategies, and assessment that would be in harmony with those beliefs. This departure from traditional paper portfolios utilizes video clips of students' teaching, other visuals, written plans, and assessment to show their teaching abilities.

Teacher and Developer: A Compromise for the Creation of CSCL Applications

César Osuna, Universidad Autonoma de Guadalajara, Mexico; Yarnis Dimitriadis, Universidad de Valladolid, Spain; Alejandro Martinez, Universidad de Valladolid, Spain; Rocío Anguile, Universidad de Valladolid, Spain

In this paper we present a methodology that reduces the level of complexity when analyzing, designing and evaluating technology-based collaborative learning applications. Its main characteristics are the agreement or compromise reached by teachers and developers in the creation of those applications and the interaction between both roles. The above-mentioned methodology is based on iterative and participative analysis, progressive design and collaborative evaluation. The analysis is performed by means of the presentation of a series of five templates that comprise and model the domain of a collaborative learning situation and Design is supported by a class
model. The validation process is attained through usability-based techniques. The methodology is part of the DELFOS project (A Description of tele-Educational Layer Framework Oriented to Learning Situations).

Web-based Instruction: What should we know?
John R Ouyang, Kennesaw State University, USA; James E. Yao, Texas A&M University-Commerce, USA
Web-based instruction is the latest development of distance education, which has become an extremely important part of instructional technology. Web-based instruction has commonly adopted by universities and schools to deliver courses on line. Challenged by this advanced instructional technology, teachers will ask what we should know about it. The answer is that he or she should be knowledgeable of this advanced delivery method. He or she must be a life-long learner and be willing to face the challenge of being accountable for student’s learning achievement. To obtain an effective web-based instruction, specific and clear instructional objectives are critical keys, strategic instructional time management and flexible collaborative learning environment lay down the foundation, and multiple means of evaluation guarantee the high quality of instruction and successful learning.

Multimedia in Chinese Elementary Schools
John Ronghua Ouyang, Kennesaw State University, USA; James E. Yao, Texas A&M University-Commerce, USA
Multimedia describes any system that unites two or more media into a single product or presentation. Along with the increasingly developed computer technology, it is believed that multimedia is the best single set of technologies to promote among teachers to improve the way they educate students. Facing the challenge of large-sized classes and lack of multimedia resources, Chinese teachers have made an impressive progress in using multimedia in their classrooms. They are taking the advantages of national centralized curriculum, design and develop multimedia courseware to accompany with the textbooks. Collaborating with media specialists, they have been directly involved in multimedia courseware development. Supported by administrative bodies, they participate in training, enrich their own technological skills, and utilize multimedia to improve teaching and learning. The schools, like Danyang Experimental Elementary School, Yangzhou International Elementary School and Nanjing’s Beijing East Road Elementary School are setting up a good start, although there still exists a great unbalance in utilizing advanced computer technology among Chinese schools and teachers.

Scientific and Technology Learning: Enhancing the Attitudes Toward Technology for Middle School Girls
Charlotte Owens, The University of Louisiana at Monroe, USA; Dale Magoun, The University of Louisiana at Monroe, USA; Virginia Eaton, The University of Louisiana at Monroe, USA; Kim Taylor, The University of Louisiana at Monroe, USA
Middle school girls, selected from several rural and urban school districts in northeast Louisiana, participated in a three-week program at The University of Louisiana at Monroe (ULM). Pre and post-attitude surveys as measured by the Computer Attitude Questionnaire were compared to assess the effectiveness of the program. The analysis measured the effects of attitude changes in the following categories: interacting with the WWW, a word processor, a database application, and e-mail. Significant changes in attitudes in three of the four categories were observed. Positive attitudinal changes were observed in the areas of the WWW, word processing, and e-mail.

Enhancing Educators’ Computer Learning with the Emerging Technology
Alex Pan, The College of New Jersey, USA
With the emerging technology highlighting hypermedia and the Internet, educators are finding ways to modify the traditional ways of teaching and learning. The need of infusing the Web in education is evident in two surveys of our college students and faculty members as well as a result of a national survey of teachers. To fully maximize the power of the Web to enhance instruction, this paper presents a working model detailing related issues and experiences in a few computer courses, based on a three-level Delta learning theory, containing: (a) technology used as originally intended; (b) technology applied in new ways; and (c) technology as a necessary component of any application. This paper also discusses the various ways in which technology can contribute to better instruction, inspiring students to learn through working cooperatively and collaboratively.

Teachers’ Perception about the Text-to-Speech Technology
Alex Pan, The College of New Jersey, USA
This paper will first describe the potential applications of the text-to-speech (or synthetic speech) technology. The paper will further explore the in-service and preservice teachers’ experiences with and perceptions about this technology. A study was conducted to investigate teachers’ use of this product, and their perceptions about this technology before and after they received some instruction of innovative ways of using it. The study also compare teacher’s attitudes about the usefulness of such a technology with other non-school people.

Preparing Teachers for the School of the Information Society in Greece
Giorgos Papadopoulos, Hellenic Pedagogical Inst., Greece; Michailas Karanaras, Hellenic Pedagogical Inst., Greece; Barbara Ioannou, Hellenic Pedagogical Inst., Greece; Eleni Houssou, Hellenic Pedagogical Institute, Greece
Hellenic Pedagogical Institute is implementing a large-scale national teacher-training project. The project aims to expand teachers’ understanding in Information and Communication Technologies (ICT) and to equip them with the necessary knowledge and skills in order to support their efforts in utilising ICT effectively to teach particular subjects. Central issue of the design of the project is its flexibility to accommodate the various professional needs, background knowledge and skills, learning styles and inclinations of the teachers. The training process is totally decentralised, transferring to the schools the responsibility for the selection of the training model and the training providers. Final target of the project is the establishment of a life-long training mechanism based on the operation of sustained learning communities around the country. In this paper the design principles as well as the implementation process of the project are presented.
IT Practice from Theory. The Need for a New Paradigm
Nigel Parton, University of Edinburgh, UK

IT is seen as having the power to transform teaching and learning. Extensive commitments have been made to its use throughout education. In some ways it has been successful but it has not always achieved its intended aims. It can be argued that this is because its introduction and implementation has not been based on an appropriate pedagogy. IT's power renders aspects of existing understandings obsolete. What is required before we can be truly successful is a new paradigm. Within the area of electronic communication and email a social constructivist position can illuminate our current position and help show how best to use the technology to support teaching and learning in undergraduate degree programmes in future. This paper is intended to be of interest to individuals involved in initial teacher education.

The Effect of Multimedia Training on Teacher-Centered Vs. Student-Centered Classroom Behaviors
Raymond Pastore, Bloomsburg University, USA

As we enter the 21st century, the questions remain: Are teachers creating active learning environments that enable student to become independent learners and creative problem solvers? One tool that helps teachers shift the control of learning from teacher to students is the use of multimedia in the classroom. Multimedia can motivate students to explore new learning environments through research, collaboration, and problem solving. Students can gather information from online resources and create interactive presentations that combine text, graphics, sound, and digital video. In order to integrate multimedia into classrooms, students and teachers must learn both the technical and application nature of multimedia programs. One of the problems with PowerPoint and other multimedia programs is that teachers have the tendency to use these programs to reinforce their presentations. The result is the reinforcement of teacher-centered behaviors. In this study, 15 teachers from one school district representing various levels from K to 12, enrolled in a one-credit graduate course titled "Instructional Applications of Multimedia Using PowerPoint." The question asked in this study was "Does the introduction of multimedia training to teachers and students help shift classroom learning from teacher-centered behaviors to student-centered behaviors?"

Virtual Facilitation: Developing and Managing Relationships in Virtual Teams
David J Paulsen, Victoria University of Wellington, New Zealand

The use of virtual teams in all areas of education is growing. They can form critical parts of distance education programs, collaborative research projects and joint-management schemes. Research shows that the development of personal relationships between team members is an important factor in effective working relationships in virtual teams. This paper reports part of a grounded action research study of seven virtual team facilitators in New Zealand. It will specifically look at how virtual team facilitators use electronic communication channels to build relationships with their virtual team members. The findings suggest that some electronic channels are more effective than others in building relationships and conclude that facilitators need to strategically use the channels available to them to effectively build relationships.

Digital Divide in Schools: We Can Make a Difference
Tamara Pearson, University of Florida, USA; Colleen Swain, University of Florida, USA

Overcoming the issues surrounding the Digital Divide often appears to be insurmountable. However, in our recent examination of 28 research studies and reports we found the emphasis to frequently be on matters of access and not equity in the learning environment. The studies dealing primarily with access show that the gap between socioeconomic groups is declining. Yet, access to computers does not provide equitable learning environments. Findings from the literature we examined indicated three primary areas that influence the digital divide in the school system. These areas are frequency of use, the computer experience of students, and technology training for teachers. This session will address, in detail, each of these specific areas. The encouraging aspect of our review of the literature is that teacher educators can have a positive influence on these areas. We can make a difference in the digital divide in the school systems.

Working with Urban Schools Across the Digital Divide
Alec F. Pack, Kate Bielaszyk & Melanie Goldman, Boston College, USA

This presentation addresses some of the issues which one university encountered when it collaborated with 3 disadvantaged urban schools as part of a P13 project. Using a case study format, we detail many of the obstacles which were faced by this partnership including hardware availability & maintenance, wiring in older buildings, threatened teacher strikes and work slowdowns, changes in delivery schedules, prioritization of schools within the district for various types of support, and levels of approval needed for changes to take place. What the university ultimately needed to supply and how this partnership became part of a larger outreach to the schools and community helps to describe the special challenges faced when working on technology partnership issues in social environments of this type.

The Enhanced Instructional Presentation (EIP) Model
Tim Pelton, Brigham Young University, USA; Leslee Francis Pelton, University of Victoria, Canada

In this document we describe the Enhanced Instructional Presentation (EIP) model for the development of educational hybrid linear/hypermedia presentations. Our proposed EIP model addresses the learners' needs for organized and synthesized content while providing for individual differences in background experience, learning orientation, and cognitive abilities. The EIP model is an instantiation of van Merrienboer's 4C/ID model (1997).

Effective Use of Technology in a Distance Education Program
Jane Pemberton, University of North Texas, USA; Maria Victoria Perez Cereijo, University of North Texas, USA; Tandra Tyler-Wood, University of North Texas; USA; Mark Mortensen, University of North Texas, USA

The University of North Texas Educational Diagnostician Program has implemented effective uses of technology to help address the critical need for diagnosticians in the Dallas/Ft. Worth Metroplex and surrounding rural areas. Students in the Metroplex often deal

76 — Proceedings of SITE 2001 / Orlando, Florida, USA
with traffic back up, while students in rural areas may need to drive long distances. Technology can assist in meeting the needs of these two distinct student populations. The challenge for instructors in the program became how to use technology to support student learning without compromising the requirements of a certification program that includes a rigorous state exit examination and a high level of expertise on the job.

**The Use of Two-Way Audio Video at the University of North Texas As a Tool for Practicum Supervision**

Jane Pemberton, University of North Texas, USA; Tandra Tyler-Wood, University of North Texas, USA; Marie Victoria Pérez Cereijo, University of North Texas, USA; Joyce Rademacher, University of North Texas, USA; Mark Mortensen, University of North Texas, USA

One of the challenges of course delivery at a distance is determining an effective method to conduct practicum supervision. In the past, educators have used a variety of strategies to observe practicum students completing their field work. On-site supervision often required extensive travel for faculty or hiring adjuncts to conduct supervision. The University of North Texas Educational Diagnostician Program is involved in a research study using EnVision, desktop conferencing software developed by Sorenson, Inc., to supervise graduate students enrolled in an advanced practicum. This paper assesses the effectiveness of the EnVision System as a tool for monitoring practicum students in the Educational Diagnostician Program.

**Implementing Web-Based Portfolio Assessment in a Graduate Instructional Technology Program**

Melissa E. Pierson & Michael Rapp, University of Houston, USA

Web-based portfolios are a solution to presenting learning in our Masters program because they allow students to play a key role in directing their own learning, to demonstrate creative design, and to conveniently access work on any platform. Students store learning artifacts on a department server, and confidentiality is guaranteed through a Web-based form that automatically enables password protection. New students take a required course to learn about technical procedures related to maintaining the portfolio, as well as strategies for selecting portfolio items and for composing personal reflections on their work. Students review and reflect on their own learning during each course so that they will have a clear timeline of their own learning. As students' understandings mature, they create connections among discrete learning artifacts, designing various interfaces to customize the presentation for multiple audiences. During their final semester, students review the entire portfolio to select items that demonstrate achievement of program objectives and write reflections to accompany each item. Students will compose a summative "epilogue" as one part of their comprehensive exam. Despite some anticipated challenges, initial informal feedback from students is positive, so we remain committed to further developing our portfolio assessment process.

**A School-University Partnership Model for Developing Student Technology Leaders**

Melissa E. Pierson, Sara McNeil & Bernard Robin, University of Houston, USA; Kathy Booth, Spring Independent School District, Texas, USA

Multimedia Masters is unique a school-university partnership of student “consultants,” teacher “clients” and university “experts.” The year-long project begins with a development day to collaboratively set goals for the year, and four remaining sessions, two on the university campus and two at the district, assist students with meeting these goals. Each session focuses on developing technical, pedagogical, mentoring, and reflective skills. At the end of the project, students present their finished multimedia projects to parents and school administrators. Year 1 achievements include students learning to communicate more effectively, think critically, and reflect upon themselves as learners, in addition to increased technical skills. Teacher clients expressed increased interest in using technology both personally and within their curriculum. Challenges during Year 1 and areas to improve for Year 2 involve student time commitments, more effective teaching of the teacher clients, improved communication with the district technology team, and more effective structuring of session activities.

**Cognitive Design of Instructional Databases**

Michael S. Pilant, Texas A&M University, USA; Robert J. Hall, Texas A&M University, USA; R. Arian Strader, Texas A&M University, USA;

One of the fundamental problems in distance delivery of educational content is to determine the amount of learning that is taking place.

**The Relationship between Leadership, Self-efficacy, Computer Experience, Attitudes, and Teachers’ Implementation of Computers in the Classroom**

David Piper, Mount Union Area School District, USA; Wenfan Yan, Indiana University of Pennsylvania, USA

A study of 160 teachers from eleven school districts revealed that certain factors may influence their practices of using computers in the classroom. Three computer uses were identified by elementary and secondary teachers as ways computers might be used in the classroom. The variables, experience and knowledge, perception of leadership, self-efficacy, and attitudes toward computers were tested to determine if they had an influence and a relationship to teachers’ use of computers. Aspects of all four variables demonstrated significant positive influence on all three-computer uses. Significant relationships were found between the computer uses and self-efficacy, experience and knowledge, professional development, perception of leadership, and gender. Self-efficacy was found to have a significant relationship with clerical/management and academic use of computers, while experience and knowledge, professional
development, and perception of leadership demonstrated a significant relationship with advanced computer use. Hierarchical regression models demonstrated that in lower computer uses such as clerical/management use, self-efficacy was the variable of significance. As the computer uses moved to advanced use, the variables of experience and knowledge, professional development, and leadership demonstrated significance. This demonstrates that as teachers use of computers in the classroom changes the significance of experience, knowledge, professional development, leadership, and self-efficacy also changes.

**A GFearless Approach to Technology Integration in the Elementary Classroom**
*Joyce Pittman, The University of Cincinnati, USA; Sheila Seitz, The University of Cincinnati, USA*

Taking on this challenge, a professor and graduate student at a major urban university with over 40,000 students and 600 preservice teachers reorganized a traditional instructional technology course. The prevailing purpose of the course was not to have students become "technology proficient" in every application, but that preservice teachers in the class develop a "fearless approach" to learning new technology. Students observed the differences in learning with technology within both types of pedagogy. Students utilized the learning plan model called "ASSURE" to examine effective planning for integration of technology.

**Empowering teachers through cognitive literacy skills development: Implications for restructuring teacher education programs through technology infusion**
*Joyce Pittman, University of Cincinnati, USA*

Technology has opened Pandora's Box in many respects. Perhaps one of the greatest challenges is building college students' advanced literacy and technical skills, especially preservice teachers. This aspect of technology in education is raising unprecedented levels of new concerns for educators. It has presented educators and policymakers with problematic decision-making about how to attract, sustain, and prepare students for careers and living in an increasingly technological education society (Prager, 1993). The Comprehensive Educational Restructuring and Technology Infusion Initiative Pt3 Project is addressing the problem (CERTI2 2000). Educators need direction for retooling to restructure instructional approaches to help entering students construct new knowledge and skills. This PT3 project is developing new directions for a teacher education program by infusing an online and CD-ROM model for assessing and developing new technology skills (Lieberman & Linn, 1991).

**A New Approach - Situation Learning (SL)**
*Maja Pivec, Graz University of Technology, Austria; Hermann Maurer, Graz University of Technology, Austria*

The presented solution offers a new approach to knowledge module presentation that is different from the majority of presently used approaches. The interactive component of the SL approach increases students' involvement and motivation for learning. Learners can experiment and investigate within the 'virtual world' of the SL knowledge module. Such experimenting and interacting with different knowledge presentations makes it possible to construct own specific knowledge thus making the factual knowledge more permanent.

**InTime: A PT3 Catalyst Grant**
*Masha Plakhotnik, University of Northern Iowa, USA*

The purpose of InTime (Integrating New Technologies Into the Methods of Education) is to provide the necessary resources for methods faculty to revise their courses, model technology integration, and require preservice teachers to integrate technology, along with components of quality education, in their lessons and units. This project is developing online video case studies to be utilized in methods courses that include videos of best practices showing scenarios from PreK-12 classrooms where teachers are integrating technology in a robust educational environment. The participants will have a chance to view and critique one of the online case studies of best practice components of quality education, in their lessons and units. This project is developing online video case studies to be utilized in methods faculty to revise their courses, model technology integration, and require preservice teachers to integrate technology, along with components of quality education, in their lessons and units. This project is developing online video case studies to be utilized in methods courses that include videos of best practices showing scenarios from PreK-12 classrooms where teachers are integrating technology in a robust educational environment. The participants will have a chance to view and critique one of the online case studies of best practice.

**INTIME (Integrating New Technologies into the Methods of Education): A PT3 Catalyst Grant**
*Masha Plakhotnik, University of Northern Iowa, USA*

Reports from the National Council for Accreditation of Teacher Education (NCATE) and the Office of Technology Assessment (OTA) have called attention to existing deficiencies in teacher preparation programs in preparing preservice teachers to use technology effectively in the PreK-12 classrooms. Technology and the New Professional Teacher (NCATE, 1997) reports that preservice teachers should be required to apply technology in their courses and should see faculty model technology use in the classroom. In order for undergraduate students to learn to use technology when they teach, it is vital that university teacher education faculty change the way they prepare teachers to use technology.

** Changing with the Times • The Evolution of a Faculty and Staff Web Development Program**
*Elizabeth Poff, St. Philp's College, USA*

Educational institutions have a responsibility to provide faculty and staff adequate training in web development so that faculty, staff and the institutions they represent can communicate their ideas, information, course content and activities over the Internet. The key to successful implementation is to deliver the training in such a way as to make faculty and staff want to participate in the training, as well as to make the training relevant, and to encourage continual development once the training has been given. St. Philip's College has structured its curriculum to facilitate the adult learner in such a way as to remain flexible enough to meet the emerging needs of each individual interested in pursuing web development. Discover how the web development program at St. Philip's College has changed with the times, and has evolved to remain relevant and valuable to those it serves.

**78 — Proceedings of SITE 2001 / Orlando, Florida, USA**
Putting the Pieces Together: Systemic Change for Technology Integration in Teacher Education
Joseph L. Polman, University of Missouri-St. Louis, USA; Jan Mastin, University of Missouri-St. Louis, USA; Katherine Beyer, Educational Visions, USA; Virginia Navarro, University of Missouri-St. Louis, USA

Today's schools must prepare students to use computer-related technologies well in a range of tasks. For K12 schools to prepare their students, colleges and universities must prepare teachers to integrate technologies well for learning. Thus, reform in teacher preparation must become a high priority. Research has shown that lasting reform must be systemic—in other words, the parts of an educational system must synergistically support one another. In efforts to reform teacher education at an urban public university, we have tried to ensure that policy, curriculum, field experiences, and faculty teaching practices all support the meaningful integration of technology. Our efforts to sustain systemic change along these lines have been greatly enhanced by a "technology and learning center" and a Preparing Tomorrow's Teachers to Use Technology grant. We show through a case study and vignette how these pieces fit together for reform towards the integration of technology in teacher preparation.

TEACHING WITH TECHNOLOGY: STAFF DEVELOPMENT THROUGH A TURNKEY TRAINER MODEL
Carole Polney, West Babylon Schools, USA; Patricia Squiciarini, West Babylon Schools, USA; Richard Waller, West Babylon Schools, USA

Using a PowerPoint presentation, the Associate Superintendent, a fifth grade teacher and a high school English teacher will demonstrate the key ideas and themes of the staff development Turnkey Trainer Model and its applications and benefits within the school district. We will discuss the "administrative" role of the model (budget, implementation of the turnkey trainers—choosing the "Teacher Technologists") and will present the trainers in action. We will explain how the staff development sessions are conducted; how encouraging reluctant staff builds trust and willingness to try and learn; how continuous support and growth enable cooperation among faculty, as well as between buildings. All presenters will discuss obstacles, challenges and strengths of implementing technology into a school district. The discussion will be supported with handouts of successful staff development workshops. A question and answer period will follow the presentation.

Improving the Use of Media in the Classroom
Sal Marinello, West Babylon Schools, USA; Carole Polney, West Babylon Schools, USA

Emerging technologies continue to change and improve the landscapes of our classrooms. Computers, Internet, and video have played a large role in changing how students learn. One way to integrate the use of emerging technologies is to enhance older and proven methods of instruction. Schools have created video libraries to augment and improve student retention for years. Now, using a combination of computer software, high speed network access and large screen classroom monitors, teachers can quickly access and control a large cadre of video media, without the past burden of hardware set up and scheduling. ETR, Educational Technology Resources, Inc., provides a software product to assist teachers in using media in the classroom with ease—the product MediaMaster. Whether traditional media or digital media, MediaMaster allows teacher to rapidly deliver video content with ease and confidence.

Rethinking Teaching and Learning in the Age of the Virtual-Classroom
Pithamber R. Polsani, University of Arizona, USA

The objective of this paper is to address the question of the changing conception of knowledge at present and the need for institutions of higher learning and educators to reconceptualize the notion of knowledge and learning in order to keep in line with the changes in the society. Furthermore, I will argue that it is necessary to develop teaching methodology that can function effectively in the new technologically-grounded paradigm that is evolving in the realm of the social and the economical on a global scale today. This paper is based on my experience in developing, designing and delivering a web-based Spanish Civilization course at the University of Arizona, Tucson.

Developing Techno-Savvy English Language Arts Teachers: From Blank Screens to Full Directories
Carol Pope, NC State University, USA; Judy Lambert, NC State University, USA; Julie Weber, Wake County Schools & NC State University, USA; Amelia McLeod, NC State University, USA

This session will explain and demonstrate the ongoing process of infusing technology into an English language arts teacher preparation program, along with the research results of a longitudinal study of a cohort of undergraduate students' development as users and implementers of technology in their teaching an learning. The session will include a "model" of infusion as well as examples of the teachers' and students' work in technology.

A Technology Consultant Model Implemented In A Project-Based Pre-Service Teacher Education Program
Anna Porter, Maria Cseh, Ledong Li, John McEneaney & James Quinn, Oakland University, USA

A recent national survey on the preparation of new teachers to use information technology (Moursund, 1999) reports that most college and university faculty do not model the use of information technology skills and most student teachers do not routinely use technology during field experiences. Topp's (1996) also revealed that recent graduates of teacher education programs felt that their preparation for using technology was inadequate because their programs did not include modeling of technology usage in methods and general education classes. Almost certainly related to the problem of limited faculty modeling of information technology in the university setting is the fact that faculty who adhere to a traditional professorial role may intentionally avoid using technology, fearing that it will reveal their lack of expertise and undermine their instructional authority. Moreover, the fear of appearing technologically inept is magnified by the familiarity and experience students frequently have using technology in other settings. Ironically, the very technology skills we hope to develop in students may undermine efforts to introduce new teaching technologies to classrooms by intimidating teachers. The traditional professorial model simply will not work under these circumstances and that, in part, seems to be the reason there is such
widespread interest in alternative approaches to teaching with technology (Duffy, & Jonassen, 1992). The professor as a facilitator of learning is one particularly powerful example that has been used with technology-supported case analysis (Cognition and Technology Group, 1990; Risko, 1995) and problem-based learning (Savery, & Duffy, 1995; Barab, Hay, & Duffy, 1998).

Supporting and Evaluating Distance Learning Students' Use of an Electronic Discussion Board
Richard Pountney, Sheffield Hallam University, UK; Alice Oxholm, Sheffield Hallam University, UK

This paper deals with the introduction of an electronic discussion board into a paper-based distance learning phase of a post-graduate diploma in Teaching English to Speakers of Other languages (TESOL). It outlines the thinking behind the implementation of learner support through online discussion. The students' messages were analysed and a questionnaire used to examine and reflect on their contributions. Findings indicate that positive attitudes do not automatically result in high level of use and that the factors influencing this are varied. It goes on to describe a second, ongoing phase of implementation that is based on the lessons learned.

The Carrot or the Stick: The Development of Faculty Technology Competencies
Susan M. Powers & Kenneth Janz, Indiana State University, USA

The School of Education at Indiana State University put forth a requirement that all faculty who requested new desktop computers must meet a set of established technology competencies. The goals were to use a velvet glove in order to ensure that faculty can perform the same technology competencies as students, ensure new technologies are used to their fullest, identify those persons who needed training and assistance, and build departmental awareness of potential technology mentors. The competencies are a work in progress that have been ratified by SOE governing bodies, but are still working toward true implementation.

The Uses of Computers For Instruction in the Classroom: A Comparison of Teachers' and Principals' Perceptions
Doris Prater, University of Houston-Clear Lake, USA; Angus J. MacNeil, University of Houston, USA

This study surveyed teachers and administrators in 50 schools in a large school district in South East Texas. The purpose of this study was to compare teachers and principals in their perceived uses of technology for instructional purposes in the classroom. The teachers and principals were asked to rate the extent to which technology is used in their classrooms for the following purposes: a) drill and practice b) problem solving c) world wide web searches d) compositions e) newsletters or desktop publishing. They were also asked to indicate the frequency a typical student uses the computer in their classrooms. The computer was used significantly more often for the lower level skill of drill and practice than for worldwide web and desktop publishing. The principals perceived that students were using the computers more frequently for the higher-level skill of worldwide web use than the teachers reported.

Empowerment of personnel to survive in an IT-enabled organisation and an e-world
Boeta Pretorius, University of Potchefstroom, South Africa

One of the most important success factors of the e-enabled university is IT-skilled faculty and staff. IT alone won't do the job. It needs to be placed in the hands of knowledgeable, skilled and creative people with a clear focus on their job. This applies to both faculty and staff, and not only to IT staff. Personnel need to have general as well as specialist skills, appropriate to their specific roles in the enterprise. Without these skills, technology is often blamed for failures, and the enormous investment in IT will be wasted. Without a paradigm shift in the appreciation and role of technology, it will simply become part of the problem of rising costs, instead of becoming part of the solution.

Designing Accessible Web Sites for People with Disabilities
Robert V. Price, Texas Tech University, USA

In order to make the Worldwide Web accessible to individuals with disabilities and also more accessible for everyone, web developers can follow 14 guidelines provided by the W3C group. This paper summarizes these guidelines and provides suggestions for compliance. Levels of compliance, benefits of compliance, examples of accessible web sites, and an accessible web site template are described.

Extending the learning environment: Potentials and possibilities in web mediated courses
Rose Pringle, University of Florida, USA

Asynchronous learning network utilizes different tools for computer mediated communication. It employs the integration of these tools as a means of slowing down the dynamic face-to-face interactions, characteristic of the traditional classrooms (Nulden & Hardless, 1999), while creating opportunities for the incorporation of a wide range of learning styles. This presentation will include a description of the internet application known as Connecting Communities of Learning (CCL), one program that employed the asynchronous learning tool. I will also share my experiences with the program from the perspective of a learner in a graduate course and as an instructor of two sections of an undergraduate teaching and learning course. Embracing the notions of interaction and co-participation the CCL as a teaching and learning tool offers potentials for changes in education and how we conceptualize learning communities. However, issues such as access, learner-responsiveness to the changes, institutional support and the emerging role of the instructors will need to be addressed.

New Teachers And New Technologies
Zoran Putnik, University of Novi Sad, Faculty of Science, Yugoslavia

A key moment in emancipating the teacher from the physical limitations of the classroom and encouraging a sense of collaboration, cooperation and collegiality would be introduction of principles and responsibilities of electronic collaboration. Teachers have to be introduced to Internet, electronic mail, news-groups, list-servers, bulletin boards and other means. By those, they can act jointly and communicate with colleagues near and far. They should be acquainted to online resources and the means of connecting and using them as well as contributing to them. In this paper, I will try to outline a learning model that will succeed in such education of a teacher.
Effective Online Learning at Western Governor’s University
Ian J. Quitadamo & Abbie Brown, Washington State University, USA

Internet-based, distance learning solutions may prove effective in facilitating advanced study coursework for remotely located, place-bound students. However, the conditions for promoting online learning success have not been entirely defined. We present as an example the teaching challenges and benefits of an online graduate-level Instructional Design course for in-service teachers taught through Western Governors University and Washington State University. This paper addresses some of the teaching challenges for this online instructional experience, focusing specifically on how teaching styles were used to build online learning community, to effectively promote productive and satisfying learning interactions, and develop student problem-solving and critical thinking abilities. Also discussed are those instructional design strategies that were repeatedly employed in multiple course sections to increase online student engagement, critical thinking, and enhance student learning. This paper should prove of interest to anyone currently developing or delivering online instruction.

Technology in Early Childhood: A Model for Teacher Training
Patricia E. Ragan, Arthur Lacey & Theodor Korithoski, University of Wisconsin-Green Bay, USA

Changing perspectives for the use of technology in early childhood education lack explicit standards, based on a sound theoretical and empirical foundation, to generate changes in teacher practice and student learning. Funded by the university system and working in partnership with PK-16 area school districts and community-based childcare centers, this project developed technology standards for young children and the teachers who work with them and used those standards to define competencies that define what young children and their teachers need to know and be able to do. These competencies were then integrated into pre-service teacher coursework and piloted in a workshop series offered at a local childcare center. The data collected from this pilot is now being used to develop a workshop series for early childhood professionals in the region to be applied collaboratively in early childhood settings. Anticipated outcomes include changes in teacher beliefs about and skills in technology, technology-enriched early childhood classrooms, more equitable access to technology for all young children, greater continuity between the preschool and elementary years, and enhanced student achievement.

Teacher Preparation and Online Learning: Is It Working?
Patricia E. Ragan, Arthur Lacey & Theodor Korithoski, University of Wisconsin-Green Bay, USA

The collaborative exploration, development and implementation of the use of web technology in the UW-Green Bay Professional Program in Education for early childhood students is discussed. This paper begins with a discussion of the origins of this innovative response to the process of teacher preparation, beginning with the award of a 3-year FIPSE Grant to support the vision and ending with the incorporation of distance learning to deliver course content and class contact hours. An overview of the technological issues, problems and glitches is shared, from institutional resistance to software incompatibility to instructional design, as well as the solutions that were used to address them. A summary of what is working, what is not, and why is presented and recommendations for what needs to be done next are made.

First Things First: Addressing Teacher Concerns Toward Technology
Glenda C. Rakes, The University of Louisiana at Monroe, US; Holly B. Casey, The University of Louisiana at Monroe, US

Teacher technology training frequently produces less than desirable effects in part because training is often viewed as the presentation and/or demonstration of new skills rather than as a behavior change process. As a result, the effect of technology on classroom instruction frequently fails to live up to its potential. This presentation will present the results of a study which investigated the concerns toward the use of instructional technology of 659 purposively selected PK-12 teachers using the Stages of Concern Questionnaire. Results indicate a high Stage 2 for the group profile which indicates an intense personal concern about instructional technology and its consequences for the respondents on a personal level. Though these concerns reflect uneasiness regarding technology, they do not necessarily indicate resistance to technology. The second highest concern was Stage 5, reflecting a desire to learn from what other teachers know and are doing. The low stage of concern for the aggregate data was Stage 4 which indicates the respondents have minimal to no concerns about the relationship of students to the use of the innovation. The presentation will be of interest to teacher education faculty and PK-12 faculty who provide technology training and support for PK-12 teachers.

Articulating Technology Needs To Administrators And Policy Makers
Thomas Rakes, The University of Louisiana at Monroe, USA; Glenda Rakes, The University of Louisiana at Monroe, USA

There is a continuing disconnect among those who recognize the value and growing needs associated with technology-related innovation and campus administrators and policy makers who are in charge of overall budgeting and resource allocation. How does one communicate effectively within the context of the administrative framework of a college or university? When making funding requests to those who may be less familiar with specific aspects of information technology issues, one should 1) make data-based requests, 2) speak from a global perspective, and 3) consider administrators’ priorities.

Technological Tools and Mathematical Guided Discovery
Oiga M. Ramirez, University of Texas - Pan American, USA; John E. Bernard, University of Texas - Pan American, USA

Teaching by discovery is probably as old as formal education itself given that its origins can be traced back as far as 430 - 320 B.C. to Socrates and Plato. Nonetheless, teaching by discovery using technological tools such as graphing calculators, spreadsheets, or computer software is a relatively new adventure! The position here, furthermore, is that the process of discovery, guided or otherwise, is just as important as what is to be discovered because learning by discovery promotes learning to discover. The mathematical activity that will be modeled emphasizes the use of technology and promotes active participation in naturally occurring exploratory stages. During the latter phases of the activity, notions of relations (e.g., independent variable, dependent variable, function) begin to become
A comparison of preservice, inservice, and non-teacher education majors on technology confidence, ability, and use

Sue P. Reehm, Eastern Kentucky University, USA; Shirley Long, Eastern Kentucky University, USA; JoAnna Dickey, Eastern Kentucky University, USA

This paper describes the findings from a study based on a newly enacted state technology standard for new and experienced teachers. Teacher education students rated their confidence level, ability, and usage on technology areas. A control group of non-education majors was used to determine whether the technology competencies were acquired within the teacher education program or general university requirements. The results of the study were also examined to determine whether there is a progression from juniors to seniors to graduate students, and whether there are specific criteria of the new standard that students have not met.

Open Source and the Diffusion of Teacher Education Software

Herbert Remidez, University of Missouri - Columbia, USA; James Laffey, University of Missouri - Columbia, USA; Dale Musser, University of Missouri - Columbia, USA

Three recent reports, one from the U.S. government and two from European Union related groups, indicate that the open-source software development model is gaining worldwide acceptance. This model provides a means for teacher educators to create software that is sustainable, continuously improving, and shareable. As a result, it can reduce duplicated efforts among PT3 grant recipients and reduce the risk that a project's work efforts will go unutilized when a grant's funding ends. The paper gives a brief overview of what the open-source model is, explains how it can be used to benefit the different stakeholders in a grant funded project, and discusses how it can support the diffusion of technology innovations. The paper concludes with the recommendation that the U.S. Department of Education should encourage the use of the open-source model in all department-funded projects that have a software development component.

Teachers' Perceptions of Technology In-Service: A Case Study

Carl Reynolds, University of Wyoming, USA; Bruce Morgan, University of Wyoming, USA

A series of case study-type interviews were conducted with selected K-12 teachers on their perceptions of technology integration in-service activities in which they had participated. Teachers were selected to represent rural and urban, small to large schools, and a variety of disciplines. The primary goals were to determine the depth and breadth of in-service activities teachers experienced such as variety of computer applications, utility applications versus instructional applications, Internet usage, degree of expertise, and degree of successful implementation developed from the experiences. Teachers reported positive results of in-service in terms of awareness of the technologies available. Often, recent in-service activities were focused on administrative/utility functions rather than instructional.
Taking Language Arts Instruction to the Applied Level Through Integration of Graphic Arts Technology

Cameron Richards & Mita Bhattacharya, Nanyang Technological University, Singapore

In order to meet a documented need for more advanced ELA (English Language Arts) electives, the secondary ELA teacher integrated graphic arts technology in a new course, Literary Desktop Publishing, to meet advanced students' needs. Students acquired graphic arts communication skills that are currently used in local businesses, and met district ELA standards and benchmarks as well. The course was taught to motivate students to think for themselves, to solve problems, and to read, interpret and apply complex operations in computer applications.

Troubleshooting Windows

Sharon Reynolds, Des Moines Public Schools, United States

This is written to help teachers understand steps which they can take to keep their equipment running longer and better. It will walk them through steps to see if they can troubleshoot their problem on their own or need to send for more help.

Looking Out, Looking In: Technology's Impact on Teaching and Learning

Carole S. Rhodes, Adelphi University, USA

The use of technological advances has been an easy accommodation for some educators. For others, this is not the case. This paper presents the findings of three year research project which explored the integration of technology in graduate teacher education classes and the impact of that on the K-12 classrooms in which these graduate students teach. Some of the issues to be explored are: Does the integration of technology in graduate teacher education classes impact on students practice in K-12 classrooms? How is technology most effectively integrated in teacher education university classes? How is technology being integrated in the K-12 classroom? In what ways can teacher education programs facilitate the integration of technology in K-12 classrooms?

An introductory internet skills program for teacher education: or from practice to theory: a case study

Cameron Richards & Mita Bhattacharya, Nanyang Technological University, Singapore

This case study presentation will report on how the presenters successfully responded to the 'just-in-time' challenge of putting together an inservice 'introductory technological skills' course for a 'difficult' group of teachers. The particular course which will be the focus of the presentation provided the specific opportunity for the two presenters to bring together their convergent but differing international experiences in teacher education to try and distil the key principles and practical requirements for developing an effective introductory internet skills program. Although many of the students undertaking this course began with little knowledge of computers let alone the internet, they all achieved in a short time (2 hours X 14 weeks) a basic and convergent competency in a range of generic internet skills: internet communications, online information literacy using browsers and search engines, developing animated powerpoint presentations and webpage learning resources, and other associated skills like FTPing and scanning graphics. Indeed, some of the initially less confident and even reluctant teacher-learners quickly became adept at using what for them was a completely new medium.

Silk Purses out of Pigs' Ears: The Conversion of Reluctant or Intimidated Students (Especially Teachers) into Keen Users of The Internet in Education

Cameron Richards & Mita Bhattacharya, Nanyang Technological University, Singapore

If 'the internet in education' is framed and conducted strategically with at least a little insight rather than in an ad hoc way, then learners will be more likely to not only forgive you but even thank you for guiding them through the inevitable stage of temporary frustration to the initial steps of self-empowerment. The paper outlines an integrated approach which would not only encourage but actually serve to 'convert' reluctant learners into active keen users: (a) as a theorization of the presenters' own experiences with teacher education courses; (b) in terms of simple activities involving, say, information literacy and web design linked together to produce an initiatory 'aha' effect of seeing underlying or generic connections between a variety of internet skills, processes and potential educational applications; and (c) with an appreciation of how even 'difficult' students can be most impressive if allowed initiative with their own learning. The paper will further discuss three practical stages in the process of 'internet in education' conversion which also constitute key principles of an integrated theoretical framework.

Integrating Videos Into A Business Calculus Class

Bob Richardson, Appalachian State University, USA; Brian Felkel, Appalachian State University, USA

The idea involves producing videos that are made available to the students through the Internet. This affords the opportunity of unlimited access. The videos must show the students how to use the technology (for example Excel and/or Maple) within the course. The students can view the videos as often as they wish and then practice the concepts on their own. The advantages to course content and time management are obvious. In our presentation we will connect to our web site and show organization of the site. We will also create a video and show how to play it and "hint" it for streaming.

Sequence Independent Structure in Distance Learning

Richard Riedl, Appalachian State University, USA; Theresa Barrett, Appalachian State University, USA; Janice Rowe, Appalachian State University, USA; Rick Smith, Appalachian State University, USA; William Varson, Appalachian State University, USA

Teacher schedules and commitments make it difficult for them to pursue long term learning environments that help them develop the skills and understandings necessary to exploit the use of technology in their own classes. Therefore, there is a need to understand the role various technologies and formats play in distance learning environments for training and supporting teachers in the field. To explore this issue a 3-D virtual world environment was developed in which to deliver a graduate course on the integration of computer technology
into instruction. A study of student participation in this world and their progress toward the stated learning goals was conducted to better understand the potentials of such an environment for the delivery of distance education for teachers and graduate students in education. The context of this study and the initial findings will be presented.

The Implementation and Integration of Web-Based Portfolios into the Proteach Program at the University of Florida
Gail Ring, University of Florida, USA

This paper describes the development and implementation of the electronic portfolio program in the College of Education at the University of Florida. Beginning in the fall of 2000 all students entering the Proteach Program were required to develop electronic portfolios. Prior to this initiative an elaborate infrastructure was designed to support both the students and faculty involved with this innovation. Each student’s electronic portfolio is viewed as a dynamic, interactive document that is developed over the student’s entire college experience and may continue to develop indefinitely. It will contain illustrations of how the student has met Florida’s Accomplished Practices, the student’s professional goals and achievements, biographical information, and a personal teaching philosophy. Methods of developing electronic (online) portfolios are shared, ways of integrating these portfolios into practice are discussed, and an illustration of sample contents is reviewed.

Faculty Development - A Comparison of Two Models
Gail Ring, University of Florida, USA; Melissa McCallister, University of Florida, USA; Nagia Ali, University of Florida, USA;

Faculty development in the college of education has changed and evolved over the last several years. In the beginning, faculty received technical help from the technical support staff, but had little support at the curriculum integration level. In the fall of 1999 the College of Education embarked on a technology training program. This program was offered to all faculty and after completing 16 hours of training the participating faculty members received a laptop computer. This training program was offered through the central academic computing center, a university-wide agency. This program was deemed a great success and the faculty left happily with their new computers. But, what really happened? We found that the faculty did not learn as much as we thought and they thought. A second program was developed. Similarities and differences between the two programs are discussed. Hopefully the experiences and development in this program will help others in the area of faculty development to better train and educate their faculty in technology and enable faculty to embrace technology in new ways.

Instructional Technology: Practical Application Alignment with Theory in Student Teaching Field Placements
Carole Robinson, University of Montana, USA

This case study explores what student teachers learn about practical classroom instructional technology applications within their elementary field placement and any underlying influences on student teachers implementing instructional technologies in the elementary are described along with their cooperating teachers’ accounts of factors in the school that either promote or inhibit professional technological growth. Student teacher/cooperating teacher participants were placed into buddy system configurations. These pairings served to investigate a) What effects do instructional technology using educators have on non-instructional technology using educators? And, b) What effects do non-instructional technology using educators have on instructional technology using educators? When looking for ways schools of education can successfully merge instructional technology theory with classroom practice, three themes emerged: a) collaboration and rapport; b) self-directed learning; c) equipment: time and availability. This case study explores what student teachers learn about practical classroom instructional technology applications within their elementary field placement and any underlying influences on student teachers implementing instructional technologies in the elementary are described along with their cooperating teachers’ accounts of factors in the school that either promote or inhibit professional technological growth.

A Rubric for Assessing the Interactive Qualities of Distance Learning Courses: Results from Faculty and Student Feedback
M. D. Roblyer, University of West Georgia, USA; Leticia Ekhani, University of West Georgia, USA

Results of studies of distance learning courses indicate that interactive qualities seem to be a major factor in determining course quality as reflected in student performance, grades, and course satisfaction. That is, the more interactive the course, the more effective it is. However, the field reflects considerable disagreement on what these interactive qualities are and how they should be assessed. This paper offers a rubric to help instructors begin to identify and self-assess these qualities in ways that assist them in improving their distance courses. Included in this paper are: an explanation of rubrics and their uses; a review of literature related to interactive qualities that led to identifying elements for the rubric; a discussion of methods used to gather feedback and revise the interactive qualities rubric draft; and a copy of the revised rubric itself.

Visualize This: PT3 Project InSight Develops Three Resources to Promote Visual Communications
M. D. Roblyer, University of West Georgia, USA; William R. Wiencek, University of West Georgia, USA

As part of its activities funded by the U. S. DOE as a PT3 Implementation Grant, Project InSight, led by a consortium at the University of West Georgia, has three objectives to promote more visual communication of ideas and skill training among preservice students and faculty. These objectives include: (1) expanding a video-based school-to-university network link among six partner school districts and the university; (2) developing a series of video demos illustrating effective instructional uses of adaptive/assistive technologies; and (3) developing virtual reality and 3D environment examples to illustrate diagnostic applications and instructional uses of these emerging technologies in meeting special needs of students with disabilities. This presentation will describe the Year 2000-2001 activities and progress on accomplishing these objectives, and demonstrate the products developed to date for each.

Easy methods and media for creating electronic CDROM portfolios
Dancing with Technology to Teach Technology

University, USA; James Ban-, Nicholls State University, USA; Gary Rosenthal, Nicholls State University, USA; Barlow Soper, Louisiana Tech University, USA; Lamar Wilkinson, Louisiana Tech University, USA;

Compressed Video Technology, Innovative Teaching and Realistic Experiences: Recommendations for CVT Usage

Dina Rosen, Montclair University, USA; Adene Bloom, New Jersey City University, USA

Suzanne Rose, Robert Morris College, USA; Linda Runyon, Robert Morris College, USA

Building a Professional Cyberspace Community

Stephen Rose, University of Wisconsin Oshkosh, USA; Henry Winterfeldt, University of Wisconsin Oshkosh, USA

This paper describes how the UW-Oshkosh Teacher Education Program prepares pre-service teachers to integrate technology into instruction. Specifically, how the social studies methods and instructional technology courses are: using a framework for authentic instruction and assessment to help students develop and refine their pedagogical knowledge; using interdisciplinary teams to help students reflect on content, teaching methodologies, and appropriate use of technology; and having students develop and demonstrate technology-based teaching materials.

Preparing Pre-service Teachers to Use Technology

Loye Romereim-Holmes, South Dakota State University, USA; Denise Peterson, South Dakota State University, USA

This paper seeks to outline a practical solution to creating electronic portfolios using the CDROM, which has traditionally been expensive and inaccessible in educational environments (Barrett: 1994). The process of creating CDROM portfolios was also complex and difficult to learn and to teach. The methods outlined here are in effect easy to learn and to teach. Importantly too, the methods make portability, replication, and updating CDROM portfolios easier for students and educators alike. In an educational context CDROM media is preferable because of their low cost. It however means that there needs to be a CDROM creation process that is error free, or at least where errors are kept at a minimum. The process we will outline will eliminate, or at least offset many of the technical problems associated with creating CDROM portfolios. Creating a CD image or ISO 9660 reduces error considerably. Also this approach allows for faster creation of a CDROM portfolio since burning the image to disk is faster than organizing, assembling and burning the files through the CDR software. To make a CD image we use a demo version of CDEveryWhere. Allows you to read the same CD-ROM whether you are on a PC, Mac, or other major computer platform. Almost all computers with CD-ROM drives can read files from an ISO 9660 file.

Implementing a Web-based Middle School Science Curriculum: An Evaluation Report

Stephen Rodriguez & JoAnn McDonald, Texas A&M University - Corpus Christi, USA

The Internet and its associated World Wide Web (WWW) have been marked by phenomenal growth and use in seemingly every aspect of life. The WWW has emerged as an area ripe for development of products that can support educational efforts at all levels. As a case in point, Active Ink Incorporated—a Texas-based firm specializing in development of web-based learning materials—has developed the eeZone Project. This project is a Science/Technology/Society (STS) on-line, web-based interdisciplinary curriculum. The intended audience is middle-school students.

Access for all: Developing an online course about online courses

Desmond Rodney, Florida Atlantic University, USA; Richard Kee, Florida Atlantic University, USA; Ann Musgrove, Florida Atlantic University, USA

This paper discusses the development and delivery of a course that focuses on online instructional design that provides accessible resources for diverse learners.

Preparing Pre-service Teachers to Use Technology

Loye Romereim-Holmes, South Dakota State University, USA; Denise Peterson, South Dakota State University, USA

This paper describes how the UW-Oshkosh Teacher Education Program prepares pre-service teachers to integrate technology into instruction. Specifically, how the social studies methods and instructional technology courses are: using a framework for authentic instruction and assessment to help students develop and refine their pedagogical knowledge; using interdisciplinary teams to help students reflect on content, teaching methodologies, and appropriate use of technology; and having students develop and demonstrate technology-based teaching materials.

Building a Professional Cyberspace Community

Suzanne Rose, Robert Morris College, USA; Linda Runyon, Robert Morris College, USA

This paper describes how the UW-Oshkosh Teacher Education Program prepares pre-service teachers to integrate technology into instruction. Specifically, how the social studies methods and instructional technology courses are: using a framework for authentic instruction and assessment to help students develop and refine their pedagogical knowledge; using interdisciplinary teams to help students reflect on content, teaching methodologies, and appropriate use of technology; and having students develop and demonstrate technology-based teaching materials.

Preparing Teachers To Use Assistive Technology In Inclusive Settings

Dina Rosen, Montclair University, USA; Arlene Bloom, New Jersey City University, USA

With the passage of special legislation for the education of children with disabilities, educators are required to provide services to children with disabilities and consider the appropriateness of new technologies as a tool or intervention. This article considers what teacher educators can do to familiarize their preservice teachers with options in assistive technology and prepare them to work with assistive technology. Preservice teachers need minimum competencies in technology and assistive technology. Teacher educators by providing three-prong instruction may play an important role in awakening in each prospective teacher the desire and ability to be the conduit for using assistive technology to develop the potential of each student with special needs.

Compressed Video Technology, Innovative Teaching and Realistic Experiences: Recommendations for CVT Usage

Gary Rosenthal, Nicholls State University, USA; Barlow Soper, Louisiana Tech University, USA; Lamar Wilkinson, Louisiana Tech University, USA

Compressed video teaching with the VTEL TC2000©, teleteaching system, is a promising new technology that offers the opportunity to effectively teach a large number of students at both local and remote sites. With compressed video technology, the televised image and sound of an on-campus course (lecture, discussion, and audio-visual teaching aids) are sent to compressed video classrooms at other locations, while the images and sounds of remote students simultaneously return to the on-campus classroom. Image and sound quality with this technology are excellent but (as with any new technology) effective pedagogy requires understanding the medium, prediction of pitfalls, and modifications in teaching techniques. The presentation will offer insights into effective compressed video teaching based upon the first-hand experiences of teachers who have presented compressed video.

Dancing with Technology to Teach Technology

Desmond Rodney, Florida Atlantic University, USA; Richard Kee, Florida Atlantic University, USA; Ann Musgrove, Florida Atlantic University, USA
Technology in Arizona: A Summary of the Report to the
Arizona Board of Regents
Paul Rowland, Jennifer LeCrone, Gary Tucker, Elizabeth M. Willis & Penelope Wong, Northern Arizona University, USA

The significance of technology in today’s society is self-evident. What is less clear is how to ensure that today’s children, the workforce of the future, will have the technological literacy and skills to successfully function and support our highly technological society. Public education is charged with the mission of providing the foundation in not only the basic workplace and personal skills of reading, writing, numeracy, language, and communication, but also, “a high level of competence with computers, telecommunications…and the ability to quickly adapt to new technologies and new ways of working” (National Governor’s Association, 1999). In considering the charge to prepare a future technological workforce the school’s role is to demonstrate technology as an object that is to be used and manipulated. On the other hand, the school’s role as society’s institution of cultural perpetuation emphasizes the use of technology as a tool for learning. These two roles are not necessarily mutually exclusive but they are distinct and schools must have an idea of which role they play—where, when, and how. It is this situation which shaped the Technology in Arizona study—an overview of the state of technology in Arizona’s schools at all levels.

Use of Telecollaboration to Develop Authentic Learning Experiences
Regina Royer, Salisbury State University, USA

Participation in a telecollaborative project with K-12 students can provide authentic learning experiences for teacher candidates that connect theory with practice. This paper discusses how teacher candidates in a preservice teacher education class moderated a K-12 global telecollaborative writing project. As a result of the candidates’ participation as moderators, the candidates gained an understanding of how to integrate technology into the classroom to achieve curricular objectives and became motivated to use technology in their own teaching.

How We Integrated Technology Throughout Our Education Program
Reuben Rubio, Albion College, USA; Dana Sedersten, Albion College, USA

In this paper, we would like to describe the technology integration efforts of the past four years, with the hope of providing a vision to programs that are both similar and dissimilar to us. Of particular interest is our successful integration into methods courses, and the way that we used our diverse strengths and worked as a team to accomplish all of this.

Cyber Space Communities for Pre Service Teachers
Linda Runyon, Robert Morris College, USA; Suzanne Rose, Robert Morris College, USA

Technology impacts our professional lives in many ways. Instead of a disconnected voice over the PA system, classrooms are now invaded by the sounds of “You’ve got mail.” Teachers record attendance and grades “on line.” We teach our students how to conduct Internet research. We send students on “virtual field trips” and plan simulations. Instead of asking for home addresses, we ask for e-mail addresses. We have begun, albeit slowly in many cases, to integrate technology into our classrooms and profession. As a profession, we are learning to use technology to build a sense of community among our members. At Robert Morris College, we plan to concentrate on the ways in which a virtual community can be built using technology, specifically e-mail and electronic bulletin boards, might be used as a way to keep student teachers connected to one another in addition to providing information on current issues as they complete their field work.

Development of English Department of Computer Information Systems as a Way of Worldwide Educational Integration
Anatoly Sachenko, Ternopil Academy of National Economy, Ukraine; Hrygory Hladiy, Ternopil Academy of National Economy, Ukraine; Igor Vasiltsov, Ternopil Academy of National Economy, Ukraine; Andrij Vivchar, Ternopil Academy of National Economy, Ukraine

The Institute of Computer Information Technologies of Ternopil Academy of National Economy has started with some universities from West Europe together to develop new Business Information Systems curriculum. The main result of collaboration, which can be obtain, lies in the developing new Faculty, “English Department of Computer Information Systems” consisting of ICIT where all subjects will taught in English. There is a number of potential results, which possible to obtain, including assisting to reform system of Higher education in Ukraine; increasing the co-operation of workers of higher school with universities of different World regions etc. The results of the proposal faculty development may be used by higher schools of Ukraine (and other countries, which are going to integrate in the World community) as a basis for curricula development for Business Information Systems as well as for other similar specialties and branches.

A Multimedia Design for Leadership Training: From Process to Product
Hanacli Saleh & Roberta K. Weber, Florida Atlantic University, USA

Training future educational leaders utilizing a variety of multimedia produced modules provides an excellent opportunity for introducing the benefits of well-designed courseware and the possibilities of exploring interactive computer-based instruction. This paper discusses the development of a software program that will be used at the graduate level by current and prospective leaders in the educational environment. This unit of instruction consists of content delivered in an educational organization course dealing with administrative theory developed with the Authorware program.

86 — Proceedings of SITE 2001 / Orlando, Florida, USA
Introducing Tutor Professor to Online Distance Education: By Online course
Verónica Salinas Urbina & Rosa Maria Garza, Virtual University, ITESM, México

This paper discusses the development of tutoring guidelines for tutor-professors in the Virtual University of Monterrey Institute of Technology (ITESM). The purpose in discussing these guidelines is that they may be relevant to teaching in any online environment. We also developed an online course for tutor professors considering these guidelines.

Multimodal distance learning: A personal cooperative video on-line asynchronous experience.
Dorothy Sammons, Idaho State University, USA; Albert Strickland, Idaho State University, USA; Charles Zimmerly, Idaho State University,

In order to serve its 40,000 square mile area, ISU's College of Education seeks innovative means of delivering graduate courses to a large population of in-service teachers and administrators. This paper describes one distance learning class that utilized compressed video and supplemental web-based material to reach students at six different cities and towns. The primary means of delivery was a weekly 3-hour broadcast from Pocatello to the other six sites. During the weekly broadcast, the instructor and students delivered presentations which incorporated computer, videotape, and Elmo technologies. Outside of class, students utilized on-line components of WebCT to access additional information and to communicate. A survey of the 81 students was conducted to determine which technology components were the most frequently used and the most effective in meeting class objectives. Weston (et al.,1999) identify nine important constructs that must be considered when delivering on-line instruction, including: impact on learning, student computer literacy, student computer access, infrastructure, interactivity, navigation, evaluation, accuracy and recency, and loading speed. The survey also queried students as to whether these considerations were met in the course design and delivery.

Futuristic Strategies for Designing and Implementing World Wide Web
Presentations
Ruby Sanders, Lander University, USA

This presentation is designed for people who intend to create and implement pages for the World Wide Web. The techniques and methods presented can be applied not only to create an informative, engaging presentation but also to maintain such a presentation. Emphasis will be placed on four key players involved in the design process: presenters, information stewards, designers, and Web site users. Techniques and methods that lead participants step by step from conception of a project through successful design will be presented.

THE OBSERVATORY OF THE ICT IN HIGH SCHOOL CENTRES
Albert Sangrà & Andreu Bellot, Universitat Oberta de Catalunya, Spain

The observatory of ICT in non-university schools is a project implemented by Jaume Bofill Foundation and the Edu Lab of the Universitat Oberta de Catalunya, whose purpose is to analyse the use of information and communication technologies (ICT) in the non-university education.

Hypertext flexibility in a web learning environment to promote extensive reading activities in school learning
Luisa Santos, Secondary School Alexandre Herculano, Portugal; Paulo Dias, University of Minho, Portugal

Poetry has been a challenge for English as a Second Language (ESL) teachers and students. The former evaded the issue by simply not using poetry in their classes and the latter were quite content in not having to deal with texts that they considered "difficult". The aim of this in progress study is to understand the importance of the hypertext flexibility in the design of web based learning environment to the literary text and mainly the use of poetry in the second language learning process in every level of teaching as a possibility to be taken into account in the domain of extensive reading activities.

A Pilot Study of the Web-based Environmental Simulation
Tego Sarapuu & Margus Pedaste, University of Tartu, Estonia

Nine groups of students (total 36) from three different schools participated in a three-week pilot study and passed five virtual communities of the web-based simulation "Hiking Across Estonia". The members of hiking teams had to solve 35 different educational tasks. The analyses of students' answers in the pre- and post-tests and also in the semi-structured group interviews proved the program to be applicable for developing students' environmental problem solving and decision-making abilities. Students demonstrated the improvement of their skills in analyzing texts, drawings and graphs of the sub-tasks. Moreover, the participation in the virtual hike promoted students' involvement in cooperative learning and it also increased their interest in environmental problems.

Faculty Development as an Agent of Technology Change: Implementing a Shared Vision
Charles Savitt, Virginia Commonwealth University, USA

This paper will describe first year efforts in reference to a PT3 Implementation grant. The grant promotes an alliance between two very diverse institutions of higher education. One university is a historically white public institution while the other is a small historically black private institution. Both institutions are implementing a series of initiatives to transform their respective teacher preparation programs. Using shared resources, these initiatives include an extensive program of faculty development in instructional technology for both arts and sciences and teacher education faculty. Significant changes to both institutions technology infrastructure provide faculty, preservice teachers, and classroom teachers with significant technology support, including individual assistance and a lending library of software and portable technologies. Using these support services, university faculty are modeling the use of instructional technology in their courses and increasing the use of technology into course assignments.

Web Library
Norma Scagnoli, University of Illinois at Urbana Champaign, USA; Pedro Wilging, University of Illinois at Urbana Champaign, USA
This paper presents an effective use of the World Wide Web by schools. This is a multidisciplinary proposal intended to integrate disciplines from the school curriculum in a common project. A description of the steps to develop this virtual school library for its use as a tool in the everyday process of teaching and learning is provided. School teachers have tested this Web-library and their comments greatly contributed to the paper.

A Collaborative Course Portfolio
Catherine Schifter, Temple University, USA

Core courses are those which are deemed to be essential to a major, whether in Teacher Education, History or English. Typically there are several sections of core courses, not all taught by the same persons. How do we engage faculty in the process of ensuring equality across faculty and sections of core courses? Indeed, how do we ensure equality across sections of core courses? This paper presents a model to ensure coherence and continuity across sections of a core course on the infusion of technology in education through a case study of one technology course at one large urban university.

Domains of Adaptation in Technologically Mediated Classrooms: An Ethnographic Report
Lorraine Schmertzing, Valdosta State University, USA; Richard Schmertzing, Valdosta State University, USA

An inductive analysis of the adaptation of graduate education students to an interactive televised (ITV) classroom generated four primary domains within which much of their adaptation occurred. These emically-derived categories – student relations, technological aspects, instructor’s role, and content/class participation – provided a framework within which to assess the complex social and cultural aspects that influence student adaptation and consequent learning in ITV classes. The paper draws on analysis of hundreds of hours of observations, interviews and informal conversations with students, teachers and staff.

Student Expectations of Distance Educators: Instructor Roles in an Interactive Televised Classroom
Richard Schmertzing, Valdosta State University, USA; Lorraine Schmertzing, Valdosta State University, USA

An ethnography of graduate education students in interactive video-based classrooms provided the data for the exploration of student perceptions of the instructor’s role in the technologically mediated learning environment that is set forth in this paper. Data suggest students assigned new responsibilities to the instructor and expected the instructor to bridge the distance gap between the classrooms, clarify new rules for classroom behavior, and maintain a focus on course content despite of the instructor’s added technology related duties.

Simultaneous Renewal in Teacher Education: Strategies for Success
Denise A. Schmidt, Ann E. Thompson & Ciclyane Michelini, Iowa State University, USA

To adequately prepare preservice teachers to use technology in their own classrooms, teacher education programs must develop comprehensive models for technology integration that include meaningful uses of technology to improve and renew the teacher education curriculum. In addition, model K-12 sites must be fostered where preservice teachers can practice using technology to create active learning environments for students. Integrating technology effectively into teacher education courses and working collaboratively to create rich technology field experiences are both tremendous challenges for teacher education programs. Given the needs and challenges that both K-12 schools and teacher education programs face with respect to effective use of technology, it appears that both entities would benefit from collaborative work to address these needs. John Goodlad’s theory of simultaneous renewal for colleges of education and K-12 schools provides a useful framework for this type of collaboration. This paper describes several strategies that faculty at Iowa State University have used to successfully integrate technology throughout the teacher education program and in K-12 classrooms.

Internet use in teacher education: what are the foundations in determining learner outcomes
Donna Schnorr, California State University, San Bernardino, USA; Angela Burnell, California State University, San Bernardino, USA; Sylvester Robertson, California State University, San Bernardino, USA

This descriptive case study is the continuation of research done at the time of design and implementation studies using this interactive web module design as an instructional tool in a teacher education course. The implications of this study range from how to integrate instructional technology within a teacher education course to the development of an instrument to assess module components aligned with learning theories. This presentation will describe the outcomes and observations found.

Student Teacher Educational Technology Use
Allen Sew, Northern Kentucky University, USA

This paper deals with the use of instructional technology by student teachers. According to the results of three years of surveys, student teachers at our university are reporting limited use of instructional technology during this experience. Data from the surveys illustrate the restricted use of instructional technology, which technologies are being utilized, and some of the causes for concern.

Perceived Versus Real Self: Applying Rogerian Theory to Technology Resistant Students
Eric Seemann, Louisiana Tech University, USA; Lamar Wilkinson, Louisiana Tech University, USA; Walter Buboltz, Louisiana Tech University, USA; Sonia Beaty, Louisiana Tech University, USA

This paper proposes ways of helping technology resistant (TR) students in terms of Carl Rogers’ theories. In this view, students are motivated by the single, unitary motive of actualizing—maintaining or enhancing their lives to their fullest potential. Resistance to technology is defined in terms of incongruence among the Real Self, the Ideal Self, and the technological task to be learned. Suggestions using Rogerian principles are given to assist educators in working with technology resistant students.

Applying Social Learning Theory to the Teaching of Technology Skills: An Interactive Approach

88 — Proceedings of SITE 2001 / Orlando, Florida, USA
Advanced technology has a relatively short life span before it substantially changes; this is especially true of computers and information technology. Acquiring skills that are well developed and flexible will allow students to adapt to the rapid changes and innovations in technologically advanced environments. As the demands of teaching have changed over time educators have examined a variety of approaches in order to make the process of computer and technology education as efficient as possible. Albert Bandura’s Social Learning Theory offers both concepts and techniques which could aid the professional educator in optimizing classroom instruction in technology and computer skills. Bandura’s descriptions of the learning process and mechanisms by which they operate are especially well suited to the teaching of computer and technology skills. Techniques and theory from this approach are applicable to almost any level of education from grade school to college.

**Assistive Learning Within a Special Needs Environment**

Randy Seemans, University of Houston - Clear Lake, USA; Sylvia Martin, University of Houston - Clear Lake, USA; Caroline M. Crawford, University of Houston - Clear Lake, USA

The potential value and importance of assistive and adaptive technologies within the learning environment of special needs students must be emphasized. Students with exceptionalities can be aided through the thoughtful and successful integration of instructionally appropriate technological tools. The potential significance of instructional technologies within a special needs environment is imperative towards the success of the student learners.

**MINDS - The Learning Environment of the Future, Today**

Kari Seiler, The MINDS Institute and DeltiServ, Inc., USA

Come Join Us for a Lesson in Interactive Learning - Addressing the needs of those seeking knowledge is a timeless call for educators, administrators, and all those involved with the knowledge experience. Exploring resources via multimedia is the way that your learners want to learn. The MINDS Institute, a Learning Portal to Rich Worlds of Information, offers multimedia resources, video conference database, professional development, interactive events calendar, web board/collaboration tools and so much more. We bring you the content and resources that invites you to fully participate in next generation learning.

**The Imfundo Project: ICT in teacher education in developing countries**

Michelle Selinger, Cisco Systems, UK

Currently 130 million children across the world do not go to school. In many developing countries those that do attend school often leave functionally illiterate. Many teachers on sub-Saharan Africa are dying of HIV/AIDS, and in the worst cases more teachers are dying than are being trained and recruited. UK Prime Minister, Tony Blair launched the Imfundo project in April 2000 and gave the team six months to find ways to support the international quest for universal primary education by 2015 using educational technology. The decision was taken to focus on teacher education as the most effective way to improve both access to education and the quality of that education. This paper describes the project’s findings to date and describes one of the pilot projects.

**Online Resources for ESL/EFL Teachers and Students: An Approach to Organization and Structure**

Peter Serdiukov, University of Utah, USA

This paper discusses the structure and organization of ESL websites and online educational resources. The design, implementation and initial evaluation of the online teaching/learning resource system that is provided through the Distance Education ESL Endorsement Program’s (DEEEP) website is presented here.

**Telementoring Beginning Teacher Researchers**

Lynn Shafer, George Mason University, USA

This study looks at the daily processes that might impact developing an effective online mentoring relationship with beginning teacher researchers. Specific online facilitation techniques and approaches will be discussed. Its intended audience are those interested in facilitating online teacher professional development activities.

**Using Information Technology Applications to Support Distance Learner Services**

Dennis B. Sharpe, Memorial University of Newfoundland, Canada

This paper presents a brief summary of a comprehensive report that documents the results of a needs assessment of a sample of university distance education students engaged in degree courses during the 1999-2000 academic year. The intent was to examine the current use of available student services and to determine, based on the expressed needs of distance learners, the kinds of multimedia, interactive support services that should be developed to enhance student success and retention in an increasingly competitive market.

**Distance Education: An Ultimate Subject for Teachers and Students**

Osama Shata, Athabasca University, Canada; Mahmoud Abaza, Athabasca University, Canada

Distance education, as a learning technique, has been in use for several decades. The word “distance” is used to indicate that the teacher and the student are geographically separated. New technology, such as video conferencing, teleconferencing and the Internet, have virtually united the teacher and the students. As a result, the word “distance” may be replaced by other words such as “virtual”, “flexible”, or “computer mediated.” Recent advances in computer technology have made the Internet the main delivering media for teaching courses at distance. In this paper, we use the term “distance education” to refer to the situation where computer-mediated technology is used as the main delivering media of courses of study, and where the teacher and the student are physically in two different locations. Many research papers discuss the reform of high school education and deal with issues such as the new technology and computer mediated curricula without discussing the role that distance education may play in this reform. Other papers discuss how to improve teachers’...
knowledge of certain subject areas and only address distance education as a way to make teachers’ professional development more flexible in terms of time and space. This paper takes a different approach in claiming and justifying that taking a course at distance should be part of the high school curriculum, and that students need to experience a form of distance education even if they plan to continue their study at traditional institutions. Moreover, this paper also claims and justifies that distance education is a key factor in teachers’ good teaching at traditional schools.

**Project Sun: A Collaborative Teacher Preparation Technology Project**

Blanche Sheinkopf, Florida Solar Energy Center, USA; Linda Krupp, Brevard Community College, USA

Brevard Community College (BCC), in partnership with the Florida Solar Energy Center (FSEC), the School District of Brevard County, the Astronauts Memorial Foundation (AMF), and the University of Central Florida (UCF), has submitted a proposal to the National Science Foundation, Advanced Technological Education Program called Project Sun to provide pre-service (BCC teacher education students) and in-service (Brevard County certified teachers) an exciting array of curriculum opportunities and technical experiences to enhance their scientific and technical instructional skills. Project Sun is a comprehensive plan that addresses an ATE project in the Technical Experiences program track with objectives that will provide 1) technical experiences for pre-service (PS) and in-service (IS) teachers, 2) a thematic approach to science instruction, 3) a method of scientific investigation, scientific practice, and thought, 4) exposure to working scientists and educators, 5) recruitment and articulation activities between all institutions involved, and 6) business partnership connections.

**Meeting the Accountability Challenge—Electrically**

Tracey Shelley, EdVISION Corporation/Fort Osage Schools, Independence, MO, USA

The teachers who graduate from our nation’s teacher education programs will face an increasing professional challenge of accountability in their classrooms. Public schools are hearing an escalating call to arms to raise the standards of the performance of our students. Raising the standards for our students translates directly into raising the bar for our teachers. High stakes tests for college admissions of high school students are not the only major benchmark of student success nowadays. Middle and even elementary school teachers are preparing their students for high stakes benchmark exams. Under the microscope of political and public scrutiny, teachers are being held directly accountable for their students’ performance in ways that did not previously exist. Pre-service teachers need the immediate attention and support of the mentors who are preparing them to enter this high stakes arena. How do technology and accountability intersect teacher education?

**The impact of instructional technology on student achievement**

Lorraine Sherry & Shelley H. Billig, RMC Research Corporation, USA

For the evaluation of The WEB Project, a Technology Innovation Challenge Grant (TICG), RMC Research Corporation developed a conceptual framework to measure the impact of instructional technology on student achievement, based on an extension of Sternberg’s (1998) Developing Expertise Model. Structural equation modeling, using student surveys, teacher observations of student learning processes, and teacher-scored student products, revealed paths that correlated motivation -> metacognition -> learning processes -> student achievement. This model may be replicable for evaluators who must report impact on student achievement for TICG or PT3 grants using assessments other than standardized test scores.

**System Development and Fundamental Design of Interactive Mathematical CAI System**

Masanori Shibata, Tokai University, Japan

Computer provide opportunities for its users including both teachers and students to make knowledge, to gain access to knowledge, and to share knowledge with one another that are not possible before. Our projects consider system environments and minimum requirements for interactive Math CAI systems that must support to assist building students’ preparation for the college-level mathematics, and set three basics for Math CAI system such as to keep track of study process, have the exact interpretation for math symbols, and construct the dynamic curriculum organization.

**Course Design Overview of a Web-Based M.S. Program**

Ching-Chun Shih & Connie McLaughlin, Iowa State University, USA

This poster presentation will provide an overview of the course design of the Master of Science in Agronomy Distance Education Program at Iowa State University. The presentation will share experiences of the course design and formative evaluations of the courses provided by the program. In the fall of 1998, the Masters of Science in Agronomy Distance Education Program at Iowa State University (ISU) started providing interactive multimedia courses in which most course materials and resources were accessed and delivered through the WWW and CD-ROM. Most of the students enrolled in this program were professionals working in industry and government. Several interactive multimedia activities were developed in the courses. Those activities included Study Questions, In Detail, Try This, Check This Out, and FYI. Various formative evaluation activities related to the course design have been conducted and actions have been taken to improve the courses and program. Lesson maps, glossaries, and calculation examples have been added to the courses. Additional multimedia presentations have been developed. Links to previous and subsequent lessons have been added with navigation. A search function for topics and words within each course has also been tested.

**Web Sites Usability Evaluation Guidelines for Teachers: A Case of CikguNet On-line Environment**

Norshuhada Shiratuddin, Universiti Utara Malaysia, Malaysia; Shahizan Hassan, Universiti Utara Malaysia, Malaysia

Web usability is one of the important factors that determine the success of a web site of any type, especially web learning environment sites. Teachers, who have the intention of developing on-line teaching materials, must take into consideration the issue of usability not only during the development process but also when the web site is being implemented. This paper describes a usability-testing model,
which is then applied to evaluate CikguNet web site. CikguNet (at http://www.cikgu.net.my), is one of the well-known web sites for teachers in Malaysia maintained by a governmental agent MIMOS and is designed as an environment to assist teachers in producing quality teaching and learning materials especially materials that are technology based, for teachers to exchange their educational ideas or materials and serve as a resource centre for academics and teachers. CikguNet proves to exhibit a high usability level with only few usability problems. The usability-testing model proposed in this paper is intended as a guideline for teachers to adopt.

Models of Instructional Technology Leadership in U.S. Schools
Mary B. Shoffner, Georgia State University, USA

Recent studies indicate that half of all teachers who have access to technology in their schools do not make use of it in their instruction. The time has come for states and school districts to examine the potential of instructional technology leadership in the schools to address teacher training and support needs. In considering what type of roles instructional technology leaders might play in the schools, it is prudent to examine what models are already in place. An exploratory national survey was conducted to determine the presence of licensed IT professionals in school-based settings. Results were gathered through multiple channels: via the Internet, e-mail, and telephone interviews. Results and implications of the study are presented.

Use of Nvivo for Classifying Synchronous Dialogue Resulting from Web-based Professional Development
Paul Shotsberger, University of North Carolina at Wilmington, USA

A SITE 99 paper by the author (Shotsberger, 1999) extended the work of (Blanton, Moorman & Trathen, 1998) to generate a framework for analyzing synchronous dialogue generated from a Web-based professional development program. The current study attempts to further refine the framework through the use of qualitative analysis software called Nvivo (Corlairi Software, 1999). The Nvivo program was used to analyze chat transcripts from two different years of a Web-based inservice program for mathematics teachers. The 1997 transcripts from the previous study were re-analyzed using the Nvivo program. Then transcripts from 1998 were analyzed using Nvivo to attempt to validate the new classifications suggested by the re-analysis.

The Handheld Web: Using Mobile Wireless Technologies to Enhance Teacher Professional Development
Paul Shotsberger, University of North Carolina at Wilmington, USA

The project described in this paper represents an effort to more thoroughly infuse technology into the undergraduate curriculum for prospective mathematics teachers, while strengthening the relationships that already exist between the author’s university and its partnership public schools. A key component of the project involves the use of Jornada 690 Pocket PC devices and supporting equipment/access, including a cell phone. This technology adds a new dimension to just-in-time training and support by allowing preservice and inservice mathematics teachers to be literally anywhere and receive information, collaboration and support using Web resources. This initiative represents a unique field application of mobile technology that has the potential to benefit not only universities and their students, but regional schools, teachers and their students as well.

Revolution of the Pedagogical Use of ICT by Influencing the Whole School Community
Maija Kylarna & Pasi Slander, University of Helsinki, Finland

The only way to make changes in the pedagogical practices of teacher’s work is to influence the whole school community in collaborative way. Also, the background organizations like the whole commune should actively give the frame of reference and financial resources to make it possible to all students to participate in the information society. Based on these findings ICT Learning Centre of Helsinki University has been developing the practices for in-service training that includes methods like collaborative learning, research based learning, computer assisted team work and distance learning on the net. It is easier to make a change in a school community when there is a team of teachers to adapt new pedagogical skills to use. In this article we present the authentic case: Information Strategy for the Educational Use – Done by Collaborative Work.

Challenges to Currency in the Educational Computing Course
Sisk Kathy, North Georgia College & State University, USA

This short paper is an initial report on the challenges facing the instructor of the educational computing course as colleges and universities strive to prepare technology-capable teachers who in turn can produce technology-capable students. These challenges include the changes in entry-level computing skills for preservice teachers, along with the many new innovations in hardware, software, and course delivery tools. These dramatic changes pose wonderful opportunities and demanding challenges for the instructor of the educational computing course and for teacher education programs.

Mining for Problem-solving Styles in a Virtual World
Brian M. Slator, North Dakota State University, USA; Donald P. Schwert, North Dakota State University, USA; Bernhardt Saini-Eidukat, North Dakota State University, USA

The Geology Explorer provides a multi-modal virtual environment that implements an educational game for teaching principles of geology. The game is a networked, multi-player, simulation-based, educational environment that illustrates our role-based pedagogical approach. This takes the form of a synthetic, virtual world (Planet Ori) where students are given an authentic experience and the means and equipment to explore a planet as a geologist would. Each student’s experience includes elements of exploration of a spatially-oriented, virtual, world; practical, field oriented, expedition planning and decision making; and scientific problem solving (i.e. a "hands on" approach to the scientific method). Students assume a role and learn about real science by exploring in a goal-directed way and by competing with themselves and with other players. In this paper, data are reported from a 1999 study, in which students enrolled in a freshman-level Physical Geology course explored the planet for credit. These data were collected in two forms: 1) a survey of student responses to the game; and 2) transcripts of student interviews conducted after the game. Results and implications of the study are presented.
perceptions, positive and negative; and 2) a data mining analysis of student histories which reveals apparent categories of student problem-solving style. Planet Oit can be visited at http://oit.cs.ndsu.nodak.edu/

**Movies in English for Specific Purposes: From Entertainment to Excellence**
Tatiana Slobodina, Northern International University, Magadan, Russia

Being instrumental within the global business community, English, in the format of English for Specific Purposes, has taken a firm position in the university curricula outside the English-speaking world. However, the technology-based learning materials used in teaching Business English are limited to numerous audio, several video courses, and a few computer programs. This reflects the tendency in teaching English as a Second Language in general, depicted by P. Delclocque (1997): “Linguists... have made full use of audio, little use of video, and have been very slow to adapt to the computer revolution.” Thus, only a small portion of the immense potential of video has been employed in language learning. The work presented on the poster aims in increasing the use of video in TESL/TESP and is an example of incorporating video materials in Business English university-level courses.

**GETTING REAL IN TESP: OPERATIONAL TECHNOLOGY AT BUSINESS ENGLISH CLASSES**
Tatiana Slobodina, Northern International University, Magadan, Russia

In the age of information, a university graduate has to be competent not only in his major field. The world business community, traditionally communicating in English as lingua franca and well advanced in using modern technologies to manipulate information, requires both language proficiency and technology skills as mandatory for a business executive from outside the English-speaking world. Using the English-based operational software at Business English classes is the efficient way to develop the students’ command of the language as well as that of technology, thus raising the quality of higher education. The paper presents the basic ideas for integrating operational technology in the Business English course and discusses the necessary competencies of an ESP (English for Specific Purposes) practitioner.

**Integrating Mathematics, Science, and Technology Goals: An Interdisciplinary Approach**
Scott Slough, University of Houston - Downtown, USA; Gregory Chamblee, Georgia Southern University, USA; Jon Aull, Georgia Southern University, USA

The infusion of technology in today’s mathematics and science classrooms is a top priority of many school districts. This presentation will discuss how mathematics, science, and technology education national standards documents and state standards provide rich opportunities for interdisciplinary planning, teaching, and learning. The explicit and implicit relationships between the mathematics, science, and technology education disciplines and the enhancement in learning via the World Wide Web are examined in an eighth-grade weather unit. Other areas for interdisciplinary explorations also are discussed.

**Edu-Effectiveness and Distance Education: How to Measure Success in the Online Classroom**
Judith Smith, Ph.D., CertiLearn, Inc., USA

How we determine the quality of online education in the classroom is of primary concern for all institutions and organizations providing continuing education via new technologies. Why? Recent statistics from the National Center for Educational Statistics reveals that enrollment in distance learning courses roughly doubled in two years from 754,000 to 1.6 million. With heightened enrollments come heightened expectations from adult learners that the quality of their online instruction will be (at minimum) equivalent to that which they can obtain in traditional learning environments. Despite the lack of national standards (at present) for delivering online educational courses, there are effective (and peer-reviewed) strategies that online faculty can use to measure and ensure an effective online classroom experience for the learner. This session will explain (and demonstrate) those strategies, and provide models for other faculty to use in their online classroom experiences.

**Managing the Dark Side of Online Courses — While Enlightening Your Online Students**
Judith Smith, Ph.D., Vice President, Instructional Development, CertiLearn, Inc., USA

For every online distance education program launched, there have been five online distance education programs that have either failed outright, or have been deemed unprofitable, because they were launched without benefit prior research. This is what we term the “dark side” of online education — for every success, there are numerous failures that provide strategic (and important) learning lessons for us all, as we move towards a more technologically enhanced world of education.

**Remote-Control Computing**
Mark Smith, Purdue University, USA

If you have ever taught a class where your students use software that they run at home or in a lab remote from you, or have ever had the need to access your office computer files from home, then remote-control computing is for you. Remote-control computing software allows you to connect to remote computers from your computer, and control those systems as if you were right there in front of them. You can take over the remote system and provide problem solving assistance, upload and download files, or even change system parameters and re-boot.

**Preparing Tomorrow’s Teachers to Use Technology: Developments and Strategies of Ten Grantees**
T. Colette Smith, Arizona State University, USA

There is a substantial demand to integrate technology into teacher education programs. Future teachers are not prepared to effectively integrate technology into the classroom. Emphasis is placed on the concept that effective programs are needed in order to produce technology-adept teachers. This paper describes project activities from 10 Preparing Tomorrow’s Teachers to Use Technology (PT3) grantees. Information was gathered from the PT3 web site, grantee web sites, and project members via electronic mail. Developments focus on revamping teacher education programs. Strategies include facilitating teacher and methods faculty workshops, and building interactive web sites and video based web instruction.

92 — Proceedings of SITE 2001 / Orlando, Florida, USA
Planning Makes “Perfect?” - A Comprehensive Look at Successful Implementation of Technology and Teaching at a Major University
Glenn Snelbecker, Ph.D., Temple University, USA; Graciela Stesaransky-Poe, Ph.D., Temple University, USA; David Fitt, Ph.D., Temple University, USA; Susan Miller, Ph.D., Temple University, USA; Gail Gallo, M.Ed., Temple University, USA

Temple University has demonstrated success at infusing technology and at implementing innovative approaches to teacher education. This presentation is comprised in five segments that address successful strategies and programs at different university levels: university, college, department, course, and community/school district collaboration. Each segment will address specific topics such as Preservice Teacher Education, technology diffusion, faculty development, and diversity. One of the primary goals of this presentation is to connect strategic planning at the university and college levels with successful implementation of innovative programming at the program, course, and community/school district levels. Presenters include faculty, professional staff, and graduate students.

Learning to Integrate New Knowledge and Skills (LINKS): First Year Results of a Systemic Infusion of Technology into a Field-Based Teacher Education Program
Sheila Snider, Texas Woman’s University, USA; Vera Gershner, Texas Woman’s University, USA

This ongoing research study examines the changes in technology proficiencies of future teachers as they progress through the three-semester teacher preparation program implemented at Texas Woman’s University. The systemic integration of technology into this foundation teacher education program is called Learning and Integrating New Knowledge and Skills (LINKS). This report addresses the first semester of implementation under the three-year grant for Preparing Tomorrow’s Teachers to Use Technology (PT3). Three population groups were studied: all future teachers enrolled in beginning coursework as Cohort 1, a volunteer sample of university instructors teaching coursework supporting teacher education, and classroom Mentor teachers from two of the rural school districts. The evaluation is grounded in the Concerns Based Adoption Model (CBAM) which monitors changes as an innovation is implemented. In addition to the CBAM measures, the increasing technology proficiencies are assessed as they change over time. Additional qualitative data were collected to assess program support over the semester and to design management matrices appropriate to implementation of LINKS with each population. Data collection methodology included anonymous electronic collection of quantitative data, individual interviews of university instructors, evaluations of each training session, and review of each support activity provided by LINKS personnel. Implementation recommendations and educational significance are discussed.

Infusing Technology into Leadership Development
Helen Sobehart, Duquesne University, USA; Janet Armstrong, Central Instructional Support Center, USA; Lawrence Tomei, Duquesne University, USA

As we prepare teachers for technological competence necessary in this new century, we must assure that those who administer the educational systems in which teachers work also have the technological competence to support the work of the educators. This paper discusses how technological competence has been infused into the context of the curriculum of a doctoral program which prepares superintendents and other leaders based on AASA and Pennsylvania standards. The curriculum consists of eight domain areas, plus research skills. Technological competencies have been infused into the leadership curriculum. This paper describes those competencies, with descriptive examples of technological infusion.

Organizational Learning: The Venue for Institutional Change with Online Technologies
Barbara Solberg, WebCT, USA

As educational institutions envelop technologies to include online course components from the distributed model to complete anywhere/anytime online programs, faculty and student mental models of teaching/learning must change. The change can be slow as the face-to-face model of teaching/learning evolves into with the new model. How can institutional professional development programs provide the new teaching model for faculty with no experience using online technologies? Faculty need to know both how these new technologies work and how they might implement these technologies to facilitate learning. How does the institution ensure that its professional development programs are not individually targeted but rather grow individual learning into organizational learning? Daniel Kim, of the Senge Learning Organization, has provided a model for linking individual change to organization change. This paper will present the rationale and the model to effectively link individual learning to organizational learning. In addition, two case studies will be provided during the face to face presentation.

Communication Technologies: Post-industrial Infrastructure
Tatiana Solovieva, West Virginia University, USA

This session addresses the complex relationship between the post-industrial society and communication technologies. This interaction results in the acquisition and the codification of theoretical knowledge and information that influences the key aspects in the social and technological development, namely: social, political, economic changes. A model was developed to represent the balanced coexistence of technical and human infrastructures in our information era. As a result of the interactive presentation of this model, the conference participants will gain a new perspective on their position within the multi-level human-technology infrastructure.

Development of an ePortfolio builder for teacher education
Steve Soulier, Utah State University, USA; Mimi Recker, Utah State University, USA

The paper describes and discusses designing and developing a system to help pre-service teachers document and track how they meet technology standards throughout their teacher preparation program. We describe a prototype ePortfolio building system called ePort that supports the online assessment and tracking of pre-service teachers’ ability to meet technology standards throughout their teacher education program.

Abstracts Book — 93
Online Portfolios for Educational Technology Graduate Students: An Ongoing Capstone Project

Jennifer Sparrow, Florida Gulf Coast University, USA

Students in the Curriculum and Instruction Master’s Degree Program at Florida Gulf Coast University are required to create and maintain an online portfolio as an alternative to traditional comprehensive examinations. The program is delivered in an online format, and students are located around the world. The development of the online portfolios allows students to showcase their technology and curriculum knowledge. Additionally, professors have instant access to student portfolios to assess learning and growth. Portfolio assessment is an attractive alternative to exams by offering an authentic assessment of student knowledge in the quickly changing world of educational technology.

EdTech Online: A 16 Month Online Master’s Degree

Jennifer Sparrow, University of Central Florida, USA; Bill Engel, Florida Gulf Coast University, USA

Florida Gulf Coast University is offering a Master’s Degree in Curriculum and Instruction with a concentration in Educational Technology. The degree is delivered online with optional drop-in tech-in sessions available throughout the program. This program is designed to meet the needs of K-12 educators and individuals interested in teaching at the community college level. Courses prepare students to incorporate technology in their classrooms, become school-based technology specialists, or community college instructors.

Literacy Junction: Exploring Narrative Theory and Books for Youth in a Cyberworld

Hiller A. Spires, Pru Cuper & Cris Crissman, North Carolina State University, USA

This paper describes the development of Literacy Junction, which is an interactive web site for teachers and students in grades 5-8. Using an interdisciplinary approach to learning, Literacy Junction offers two distinct features: technology-enhanced experiences with outstanding young adult literature and cybercharacters who serve as both academic models and technology guides. A pilot study was conducted in which 8 students created their own cybercharacters after interacting with the site’s cybercharacters as well as text-based literary characters. Through qualitative analysis of students’ character drawings and oral and written discourse, several themes emerged depicting the role of cybercharacters in conjunction with students’ aesthetic responses to narrative texts. Based on these preliminary findings we anticipate that future studies will contribute to narrative transactional theory as it is recontextualized from print-based to web-based learning environments.

High Touch Mentoring for High Tech Integration

Debra Sprague, George Mason University, USA; C. Steve White, George Mason University, USA

The Graduate School of Education (GSE) at George Mason University (GMU) is committed to developing new teachers who not only have the skills they need to develop and teach lessons with technology, but who also have the knowledge needed to distinguish between effective and ineffective uses of technology. In order to help the faculty achieve this goal, a concerted effort was needed to ensure that faculty’s use of technology included a variety of advanced learning applications. We submitted a proposal and were awarded a Preparing Tomorrow’s Teachers to Use Technology (PT3) Implementation Grant. This project involves pairing GSE faculty with K-12 teachers already proficient in technology for one-to-one mentoring. The K-12 teachers are helping the faculty redesign the teacher education curriculum to include technology, providing models for effective technology use, and demonstrating instructional software programs. The one-to-one support is being supplemented with Webcasts and “best practices” videos on integrating technology.

Summer Technology Institutes: Overcoming Barriers to Technology Integration in Higher Education

Denise Staudt, University of the Incarnate Word, USA

In recent years there has been a growing recognition that teacher preparation programs must prepare their preservice teachers to teach in tomorrow’s classrooms. The vision of faculty involved in teacher preparation at the University of the Incarnate Word is to produce quality teachers who are well-versed in innovative instruction, skilled in technology and prepared to serve the multicultural and diverse student populations of South Texas. The future teachers should learn with modern technologies integrated into the postsecondary curriculum by faculty who are modeling technology-proficient instruction, particularly in courses where they acquire subject area expertise. In order to adequately train future teachers to use technology, the teacher educators realized that they needed to be retooled and retained. Three Summer Technology Institutes were conducted to help faculty develop their technology skills to aid in the improvement of their classroom teaching.

Using Technology Camps as Catalysts for Increased Technology Integration

Mary Stephen, St. Louis University, USA; Gayle Evans, St. Louis Public Schools, USA

A major challenge in engaging faculty members and K-12 teachers in in-service technology activities is the many demands and constraints on their time during the school year. A summer technology camp offers one approach for addressing this challenge by providing time for participants to interact and focus on technology in a relaxed atmosphere. This paper describes a technology camp that brought faculty members, K-12 teachers, and teacher candidates together for three days of technology related activities. A sampling of participants has been surveyed now that they are back in the classroom to determine the ways and amount they have used information and skills obtained in the camp. Practical suggestions based on the evaluations and the implementation of the camp will be described at the session to assist other educators interested in creating a similar camp.

Faculty Teaching Faculty: A Matter of Trust

Elizabeth Stephens, Southwest Texas State University, USA; Kathryn Matthew, Louisiana Tech University, USA

The primary aim of the Viewing and Doing Technology (VDT) Project was to situate field-based secondary preservice teachers in a learning environment in which university faculty demonstrated skillful teaching with technology and offered students rich opportunities for visualizing and infusing technology in teaching. This project involved 10 secondary teacher preparation faculty who developed and conducted professional development workshops for each other. Workshops included developing online course materials, creating...
Reflections of K-12 Teachers on Graduate Education via Distance Learning
Bill Stinson & Mark Stanbrough, Emporia State University, USA
This presentation will describe a recently NCA approved online delivery of a graduate teacher education that has been developed to accommodate the needs and interests of K-12 teachers in the field. The surveyed needs and technological capabilities of these teachers will be discussed along with the reflections of their experiences with receiving professional information in a distance learning delivery system. Also, the structure and functioning of these courses will be highlighted along with how they are used to foster ideas among K-12 teachers for using this approach in their own classroom settings.

Preparing Pre-service Teachers for Integrating Technology into Science Instruction: A PT3 Project
David Stokes, Westminster College, USA; Sonia Woodbury, University of Utah, USA; Carolyn Jenkins, Westminster College, USA
This paper reports on a Preparing Tomorrow’s Teachers to use Technology Capacity Grant Project designed to provide preservice teachers greater exposure to the instructional uses of technology. Goals for the project include: curriculum revision for college science methods courses to integrate more use of technology, providing hands-on training and mentoring for college teacher education faculty and participating public school teachers, and enhanced experiences for pre-service teachers in teaching with technology in the classroom. The opportunity to participate in a coordinated experience with using technology between their methods course and their field placement allowed pre-service teachers to focus on the issues of teaching with technology rather than just becoming familiar with the technology. Pre-service teachers found the experience of first learning with and then teaching with the same technologies to be an important influence on their thinking about integrating technology into the curriculum. While levels of previous experience with technology varied, initial enthusiasm for teaching with technology and a more effective delivery of the curriculum influence the use of IT in academic institutions. The author of this article will present a practical framework to help faculty and academic staff to incorporate IT into the teaching process.

Use of FrontPage 2000 to Develop and Manage a Teacher’s Educational Web Site
Armand St-Pierre, Royal Military College, Canada
FrontPage 2000 is a very popular tool that will be used by teachers to develop their own teaching web sites to enhance learning outcomes in the classroom. In this session, I will describe and show briefly the necessary steps to build a simple Web site to support the teaching process.

Assessing Student Statistical Problem-Solving Skills Using Interactive Java Applets
Arlen Strader, Texas A&M University, USA; Robert Hall, Texas A&M University, USA; Michael Plant, Texas A&M University, USA
Problem-solving instruction is a growing field within education. However, for distance education and other Web-mediated courses the traditional methods of assessment, namely multiple choice and short answer, are not sufficient. Although these formats can record final answers they cannot assess detailed aspects of the problem-solving process without becoming intrusive. A better assessment strategy is to use simulations and other highly interactive systems. Such tools can discreetly track student performance data without interfering with the problem-solving process. This paper will explore the use of interactive environments as an assessment technique of the problem-solving processes within Web-mediated courses and will focus on an example developed by the authors for use in an applied statistics course.

The LPII Simulation: A Lesson-planning Tool for Preservice Teachers
Harold Strang, University of Virginia, USA; Ronald Clark, University of Virginia, USA
This paper describes the key features of a Visual Basic simulation that is designed to help preservice teachers to gain insights in planning effective lessons for both motivated and unmotivated students. The tool’s four-step decision-making sequence will be demonstrated and the post-participation debriefing phase will be discussed. Finally, initial field testing results and projected future applications will be presented.

The Formative Evaluation of a Computer-Managed Instruction Module: Metric Instruction for Pre-Service Elementary Teachers
A.W. Strickland, Idaho State University, USA; John Springer, Idaho State University, USA; Martin Horejsi, Idaho State University, USA; Jane Strickland, Idaho State University, USA
A Computer-Managed Metric Instruction Program (CMIP) providing instructional units on basic metric concepts has been developed. A blending of Gagne, et al. (1992) and the developmental theories of Bruner (1966) provides the pedagogical basis for the instructional
design. The instructional design model used to create each metric lesson utilizes a system of "branches" allowing a student who has difficulty with a specific lesson to be routed to a review section or attend to remedial exercises. This research concentrated on the design and development of the metric area module as the first module of the entire metric system course, and to act as a prototype for the remainder of the modules. Each unit has a companion review module for those students who obtained a score that met the pre-test criterion for that particular unit. The pre-test data for the metric area module consisted of 15 questions, 3 each on the following square unit segments: Kilometer, meter, decimeter, centimeter, and millimeter. Test results indicate that the use of concrete materials adds a learning dimension to those students who need a transition between the "hands-on" learning modality and the more abstract learning module presented in the computer software.

The Impact of Electronic Portfolios on Early Experience Preservice Elementary Teachers in Integrating Technology into their Instructional Process

Jane Strickland, Idaho State University, USA; Chris Williams, Idaho State University, USA; Michael Jenks, Idaho State University, USA; Charles Zimmerly, Idaho State University, USA

The State of Idaho has mandated evidence of technology integration within the instructional practices of certificated personnel. The Idaho State University College of Education created a portfolio assessment process for certificated personnel in the schools as well as preservice students within their teacher education program. The resultant Instructional Technology course (EDUC3111) is constructed around the portfolio process. Evidence comprising the portfolio include tool software integration, educational software evaluation, and foundational standards regarding adaptations for special needs, basic computer/technical concepts and operation, equitable, ethical and legal use of technology, and the application of technology into instructional planning and delivery. During academic year 1999-2000, there were 291 preservice elementary teachers enrolled in the fall semester and 124 enrolled in the spring semester. Each student submitted an electronic portfolio for assessment by the ITPA (Idaho Technology Portfolio Assessment) assessors. The students, during the fall semester, had a 97.5% success rate, and those in the second (spring) semester, 95.2%. At present, the process of developing learning activity plans that include technology integration (EDUC3111), coupled with the requirement for a minimum of two integration lessons taught during the corequisite early field experience (EDUC309), has resulted in a heightened awareness and use of technology in instruction.

Faculty Mini-Grants: A Key Piece of our PT3 Puzzle

Neal Strudler & Risa Weiss, University of Nevada, Las Vegas, USA

The mini-grant concept, used at many universities, was identified as a "best practice" in a study of teacher education programs deemed exemplary in their integration of technology (Strudler & Wetzel, 1999). It is designed to address the obstacle identified by faculty as the biggest impediment to technology integration—time for professional development. Planned in collaboration with UNLV's Teaching and Learning Center, our mini-grant program provides faculty time outside of their normal work schedule to gain new skills and plan and develop technology-enhanced learning activities for their classes. Ten mini-grants were awarded last summer as part of our PT3 Capacity-building grant. Now, our Implementation grant includes 36 mini-grants per year for three years—24 within the College of Education and 12 to faculty in other colleges across campus. Overall, we feel that the mini-grants offer a wonderful "next step" as a follow-up to the faculty workshops that we've offered. This paper will document the process and outcomes of our mini-grant program to date. For more information and examples of faculty projects please see: http://www.unlv.edu/projects/THREAD/.

Stage Struck - Exploring Technology for the Performing Arts

Bronwyn Stuckey, University of Wollongong, Australia; John Hedberg, University of Wollongong, Australia

The session will involve demonstration and hands-on activity with the Stage Struck CD-ROM and web site. An accompanying poster session and paper have been presented for this conference. The paper allows teachers to see the theoretical background to the CD-ROM and the web site. The poster session will allow teachers to further explore both media products and to order or purchase copies of the software.

Professional Development On-line - Doing IT Pedagogically

Bronwyn Stuckey, Faculty of Education University of Wollongong,Australia; John Hedberg, Faculty of Education University of Wollongong,Australia; Lon Lockyer, Faculty of Education University of Wollongong,Australia

This paper describes the first phase of a research study to examine the role played by Internet-based teacher professional development in the implementation of an innovation. The innovation in this study is the software application (StageStruck) for the performing arts. The professional development web site has been developed to support inservice teachers in best practice use of the software. The cases investigate the effect of this on-line professional development strategy and teacher implementation of the software with elementary and secondary inservice teachers. In this first phase the web site portal (http://www.stagestruck.uow.edu.au) has been established to build and support a community of practice in the performing arts areas of learning. The web site development has been an iterative process based on an understanding of best practice in professional development, a review of the literature and exploration of cases available in and about on-line communities, and the contributions and ongoing evaluation of our community members (teachers and students). The current phase of the research begins the data collection of data on the efficacy of the on-line professional development strategy employed.

An instrument to assess Malaysian teachers' IT preparedness

Wong Su Luan, Faculty of Educational Studies, Universiti Putra Malaysia, Malaysia; Kamariah Abu Baker, Faculty of Educational Studies, Universiti Putra Malaysia, Malaysia; Rohan Ahmad Termitzi, Faculty of Educational Studies, Universiti Putra Malaysia, Malaysia; Ramiah Hamzah, Faculty of Educational Studies, Universiti Putra Malaysia, Malaysia

The Malaysian Ministry of Education plans to turn approximately 10,000 primary and secondary schools into Smart Schools by the year 2010. This means that in the next decade, all teachers must be fully prepared to teach in all the Smart Schools nation-wide. The
pressure on teachers to be IT prepared has, therefore, become urgent. For this reason, there is a growing educational interest in the
assessment of teachers' IT preparedness. In this paper, we examine the need to develop an instrument that is able to assess teachers'
IT preparedness. IT preparedness in this study is measured in three domains: the teachers' actual IT skills, their knowledge about IT
and their attitudes toward IT. We also describe what the instrument attempts to measure, how it is administered and present results
of phases one and two of the study.

Collaborative university-public school partnerships: Development of an online network for School of Education
faculty and public schools
William Sugar, East Carolina University, USA; Helen Parke, East Carolina University, USA; Jon Pedersen, University of Oklahoma
This presentation details the development of a collaborative network that supports a university-school partnership. The intention of
this proposed network is to help School of Education faculty develop and maintain collaborative relationships with their public school
counterparts. During this presentation, the initial design phase and subsequent design phase will be discussed. Illustrative descriptions
of this final network, as well as an analysis of features available in existing online teacher networks will take place. Issues related to
developing effective university-school partnerships will take place in the context of this proposed collaborative network. School of
Education faculty and public school teachers are encouraged to attend this presentation. Their immediate feedback and insight will be
incorporated in the continual evaluation of this network.

The Design of Instructional Technology to Help Students Connect Phenomena to Scientific Principles
Jerry Suits, McNeese State University, USA
This paper describes how instructional technology can be designed to help students make meaningful connections between phenomena
and scientific principles. Conversely, traditional instruction in the sciences separates the study of phenomena—in the laboratory—
from the study of the underlying scientific principles—in the lecture room. Three types of technology can help students bridge their
way across this large curricular gap: (1) Microcomputer-based laboratory (MBL) experiments give them the opportunity to predict,
observe, and explore the effects of experimental parameters (e.g., temperature, pressure, pH, etc.) upon the outcome of an experiment
(i.e., the dependent variable). (2) Computer-simulated experiments (CSE) allow them to extend the MBL learning opportunities to
include a wider range of phenomena (e.g., rapid chemical reactions or larger scale models of industrial processes). (3) Multimedia learning
modules (MLM) can be used to help students practice their problem-solving skills within a real world context that serve as applications
of scientific principles. Students need help in building procedural/conceptual bridges that connect a phenomenon (e.g., an acid-base
chemical reaction) to its pictorial/iconic representation (e.g., a graph of pH on the y-axis versus volume of base added on the x-axis)
and its symbolic representation (e.g., mathematical equations needed to calculate pH). Technology can help students build these bridges
by providing the scaffolded instructional resources that they need to design experiments and discover the underlying scientific principles.
Initially, they receive full support (e.g., help, cues, and feedback) from these resources as they engage in the decision-making processes;
however, support is gradually faded as they make progress through the instructional sequence.

From Email to Virtual Reality: An Online Master's of Education in Educational Technology that Models Interaction
Laura Sujo de Montes, Northern Arizona University, USA; Michael J. Blocher, Northern Arizona University, USA
This paper addresses how Northern Arizona University (NAU), an institution that serves mostly rural students in Arizona, created
and implemented a totally online Master's of Education in Educational Technology degree that is based on the constructivist theory,
promotes and fosters interaction among students, between student and instructor, and between student and content. A discussion of
the fourth type of interaction, interaction with the technology interface, is also addressed. Finally, the authors talk about how Active
Worlds, a three-dimensional, virtual reality environment that allows interaction, is built into the master's program.

Educational Technology at the University of Florida
Colleen Swain, University of Florida, USA; Sebastian Foti, University of Florida, USA; Kara Dawson, University of Florida, USA
A metamorphosis has been occurring in the teacher education program at the University of Florida in recent years. The PROTEACH
program, as our teacher education program is known, has a national reputation for innovation and collaboration. Technology has been
a major component in the evolution of PROTEACH and in this institutional session we will discuss and demonstrate many of the ways
that technology is integrated in the preparation of teachers. In addition, the integration of technology in our PROTEACH program has
simultaneously contributed to other changes and innovations in our College that we will also discuss and demonstrate in our session.
Students and faculty will be on hand during this institutional session to discuss and demonstrate the various components mentioned
above. The session is designed to facilitate dialogue among professionals interested in the integration of technology in teacher education.

Move To The Top Of The Class: A Comprehensive Technology Staff Development Program
Connie Swiderski, Education Service Center, Region 11, USA
Teachers have increasing demands on their time and energy and need a staff development program that offers flexibly and a "just-in-
time" approach that provides the skills they need when they need to acquire them. In order to offer this level of staff development,
the Move To The Top of the Class, a series of classes will combine 45-minute mini classes delivered during the teacher's conference
period in conjunction with on-line courses. The program provides for district teachers not only ways to build the knowledge and skills
needed to be proficient in the use of technology, to use technology in curriculum planning, and designing student learning activities that
integrate technology, to engage students in "student centered" learning experiences, and to communicate and collaborate to promote
the use of technology to improve teaching and learning but delivers this training in smart ways to allow the participant flexibility to
fit course work among other demands of their time. This is offered as on-campus classes with a consultant for each campus, and on-
line versions of the on-campus classes and an on-line instructor for each class. The hope is to offer non-threatening training and support
for all participants.

Abstracts Book — 97
Online Teaching Tools: Early Results from an International Survey of Online Instructors

Gerlinde Teixeira, Universidade Federal Fluminense, Brasil

In this paper, we present preliminary results from a research in progress which studies the use of instructional tools by online instructors. We are collecting data on the most used tools, the tasks they accomplish, and on the impact of their use as reported by instructors. The research focus is on instructor tasks which are facilitated by online tools, as online learning becomes increasingly common and an integral part of our educational system. It is important to investigate how instructors value the use of tools for online teaching, and on the impact of their use as reported by instructors. The research focus is on instructor tasks which are facilitated by online tools, as online learning becomes increasingly common and an integral part of our educational system.

LIFE AND DEATH OF THE LYMPHOCYTES: A DIDACTIC-PEDAGOGIC GAME FOR TEACHING IMMUNOGENETICS

Roy Tamashiro, Webster University, USA; Julie Reitinger, Webster University, USA; Virginia Lewis, Webster University, USA

This paper presents an innovative pedagogic game for teaching immunogenetics, which is named Life and Death of the Lymphocytes. This game is based on a role-playing game format, where each player participates as an actor. The game follows some rules of Role Playing Games, and the presence of immunoglobulins during maturation will determine the fate of the lymphocyte we elaborated the game. The game is designed to promote inquiry-based learning and effectively integrate the use of technology into existing curriculum thus increasing teacher-student learning and achievements. Assessment will follow Project for the Longitudinal Assessment of New Information Technologies in Education coordinated by Professors Gerald Knezek and Rhonda Christensen of University of Texas- TECET translated into Portuguese.

Innovative Program Design & Instructional Methods for Online Teacher Education

Roy Tamashiro, Webster University, USA; Julie Reitinger, Webster University, USA; Virginia Lewis, Webster University, USA

Can faculty views about internet-based online courses and degree programs change from skepticism to acceptance, and from opposition to cooperation in less than two years? This paper reviews the development and institutionalization of two 100% online teacher education degree programs at Webster University (St. Louis, MO, USA). The number of course offerings grew from one pilot online course in Spring 1999 to 14 in Spring 2001. This success is attributed to program developers' efforts to understand the institutional climate, select suitable program directions, and design online instructional methods congruent with those program priorities. The applicability of Webster University's solutions to online program development efforts at other colleges and universities are discussed.

The Information Revolution and The Future Role of Educators

Michael Szabo, University of Alberta, Canada

We are embroiled in one of the world's major social revolutions which has been spawned by technology; the Information Communications Technology (ICT) revolution and its subset, the Instructional Technology revolution (IT). IT is slowly changing the way instructors and education institutions carry out their day to day activities. The purpose of this paper is to identify trends in the ICT and IT revolutions and implications for educators. Because predicting the future beyond lunch is frustrating and unrealistic, an alternative considers different plausible scenarios (Schwartz, 1996).

Work-in-progress project aiming at assessing the Faculty Attitudes Toward Information Technology of Universidade Paulista (UNIP) Post Graduation Course in Brazil

Sandra Monica Szwarc, Universidade Paulista, Brazil

This small paper is a report of the work-in-progress project aiming at assessing the Faculty Attitudes Toward Information Technology of Universidade Paulista Post Graduation Course in Brazil leading to taylor-made training suggestion at identified areas in order to promote inquiry-based learning and effectively integrate the use of technology into existing curriculum thus increasing teacher-student learning and achievements. Assessment will follow Project for the Longitudinal Assessment of New Information Technologies in Education coordinated by Professors Gerald Knezek and Rhonda Christensen of University of Texas- TECET translated into Portuguese.

Instructional Technology Age: A Change Model Based on Professional Development and Innovation Diffusion

Michael Szabo, University of Alberta, Canada

We are in the beginning stages of another one of the world's major social revolutions which has been spawned by technology; the Instructional Technology revolution. A subset of this is the instructional technology revolution. History shows that once a revolution is established, things go rather smoothly. During the revolution, however, there is chaos, dislocation and tremendous social and economic upheaval. This paper hypothesizes that educators can take certain actions to minimize the shock and turmoil we face in the coming IT revolution. The actions are based on a study of the history of successful and unsuccessful innovations and their diffusion into our everyday world. From ten lessons to be derived from innovation diffusion, we can draw inferences for educational actions. These lessons have been developed into a system for renewal through change and professional development. The system, known as TIES, emphasizes professional development, ownership of change through empowerment, multipliers to meet the demand of massive training, support in a timely and understandable fashion, high credibility, embedded expertise, and leverage of renewal. This paper will describe TIES, its 3 year application in an educational setting, and lessons learned.

The Information Revolution and The Future Role of Educators

Michael Szabo, University of Alberta, Canada

We are embroiled in one of the world's major social revolutions; the Information Communications Technology (ICT) revolution and its subset, the Instructional Technology revolution (IT). IT is slowly changing the way instructors and education institutions carry out their day to day activities. A Collaborative Approach to Integrating Technology and Information Literacy in Preservice Teacher Education
Lolly Templeton, Westfield State College, USA; Signia Warner, Westfield State College, USA; Richard Frank, Westfield State College, USA

The current focus on technology and Information Literacy (IL) represents an important shift in preservice teacher education from basic skills, which are necessary but not sufficient for students today, toward evaluation, analysis, synthesis, and production to provide students who can demonstrate understanding as well as knowledge and skill (Lieberman & Miller, 2000). The National Council for Accreditation of Teacher Education (NCATE) recommends infusing "information literacy requirements into undergraduate and graduate programs in teacher education." NCATE standards specify that candidates preparing to work in schools must be "able to appropriately and effectively integrate technology and information literacy in instruction to support student learning" and "understand the importance of using research in teaching . . . "(NCATE 2000 Standards). The Intent of this study is to observe the complexity of preservice Information Literacy (IL) processes as they occur in one teacher education program and to describe how one education resource librarian and one professor of education collaborated to provide IL instruction to preservice educators that went beyond the traditional bibliographic instruction lecture format, using active learning methods to encourage lifelong information literacy skills.

Creation of a new paradigm for the roll of educators through in service training that facilitates innovation and improves the process of imperfectly seeking emerging technology in tandem with the evolving market place.
Gopakumaratt Thampi, SPCE, Mumbai, India; Shankar Mantha, VJTI, Mumbai, India

Change is the name of game in the hyper - competitive international market place - radical, unrelenting and ever accelerating change. It is not an event. On the contrary, it is a journey that has no end. In this whirlwind of change, only such educational institutions of higher learning that are prepared to make the leap beyond the traditional hierarchies would thrive and survive. Educators should understand the deeper forces that operate on the Teaching Learning process and the market place. The paper attempts to find this synergy through a case study. A technique like ABC analysis in the realm of inventory control is to be discussed in the paper at large. Most importantly the paper address the pedagogy involved in the Teaching-Learning process of computer programming languages such as Object Oriented Programming in C++, JAVA and other Internet technologies and methodology to innovate to understand and follow the technology, with out a time lag, so that state of art technology can be offered to trainees and students.

A graduate track in learning technologies
M.O. Thinmarayanan, Florida International University,

A graduate level specialty track in learning technologies was approved in 1998 in the College of Education at Florida International University. It is offered as a track under the Master of Science in Urban Education degree program. The first group of students enrolled in the program during the Spring 1999 semester. This paper provides an overview of the program, including comments made by students who will have graduated by the time this paper is published.

A Web-based Precision Teaching Approach to Undergraduate Physics
Adrien Thomas, Louisiana Tech University, USA; Lamar Wilkinson, Louisiana Tech University, USA; Jack Marr, Georgia Tech, USA; Edward Thomas, Georgia Tech, USA; Walter Buboltz, Louisiana Tech University, USA

The current research was aimed at improving performance in an undergraduate electromagnetism course at a reputable engineering university with a history of high attrition. In particular, a team of physicists, psychologists, and computer scientists engaged in a five year project to develop an improved instructional approach. Based on an extensive task analysis, the underlying reason for poor performance in the course was found to be lack of fluency on lower-level skills involved in solving physics problems (i.e. basic math skills, basic units knowledge, etc.). Subsequently, an extensive series of web-based materials were developed based on the principles of precision teaching (Lindsley, 1972). The current research reviews the precision teaching approach in general. Then, in turn, the paper discusses the year-long process of the development of the materials, discusses how the web-based materials should be presented, and presents results for several independent implementations of the materials at our university. Finally, the advantages of using the web-based materials over a traditional paper and pencil approach are discussed. In total, the current project shows that not only was web-based precision teaching very effective in the current research, but that such an approach may be much more cost effective and teacher friendly than traditional approaches to instruction.

Integrating Technology into the K-6 Classroom
Gary Thompson, Valley City State University, USA; Dale Haskisson, Valley City State University, USA; Dave Bass, Valley City State University, USA; Larry Groeters, Valley City State University, USA

To respond to this need to produce technology proficient teachers, the VCSU Elementary Education Department has formed a partnership with six other educational entities to strengthen and improve learning with technology and to ensure that there is a continuity between the VCSU Elementary Education technology requirements and K-6 needs. To help achieve this continuity, the VCSU Elementary Education Department applied for and received an implementation grant from the U.S. Department of Education (PT3 Grant). One of the main goals of the grant is to provide opportunities for VCSU Elementary Education faculty, preservice teachers and inservice teachers from the consortium to work together to integrate technology into their courses and to create a learning community among themselves for the purpose of using technology to improve learning and develop complex reasoning and problem solving skills.

Pre-service Teacher Responses to the Restructuring of the Traditional Educational Computing Course
Mary Thompson, University of Houston, USA; Saru Chariy, University of Houston, USA; Angelie Adams, University of Houston, USA; Evelyn Beyer, University of Houston, USA; Leslie Starkke, University of Houston, USA; Melissa Pierson, University of Houston, USA

The primary focus of this paper is the perceptions of currently enrolled students regarding a new course format. Data has been gathered from students currently participating in CUIN 3111, Technology in the Classroom, through a qualitative ethnographic interview process.
and through the medium of a web-based newsgroup application. Through this data we will understand the perceptions of our pre-service teacher students regarding their experience of the new computer course and will then be able to incorporate any changes necessitated by these observations into designs for future classes in the upcoming Spring semester.

From "Inches" to "Miles": Web-Enhanced Instruction Using WebCT (Version 3.1)
Ingrid Thompson-Sellers, Georgia Perimeter College, USA
This workshop will introduce the participant to the WebCT software program, which can be used as an additional instructional delivery tool to complement in-class meetings, as well as to develop distance learning classes. The emphasis is on getting a general concept of how to include this program as a part of your teaching tools as well as the possibility of creating an on-line version of your face-to-face classes.

Making Sense of Number: a Resource for Pre-service and In-service Education
David Thomson, University of Edinburgh, Scotland; Tony van der Kuyl, University of Edinburgh, Scotland
This paper reports on the development of a multimedia/web/cd package which provides users with opportunities to consider issues in the teaching and learning of numeracy in the early years of elementary school. By viewing exemplifications of classroom activities and listening to commentaries from teachers, children, school managers and parents, users are invited to reflect on and critically evaluate their own practices and contexts. The package also provides a basis for the establishment of an on-line learning community where ideas and resources can be shared and issues discussed.

Technology Empowers a Diverse Population of Students: Results From a Technology Professional Development School
Carrie Thornthwaite, Lipscomb University, USA
This study documents the experiences of a school-university partnership initiated in January, 1998, between Lipscomb University and Glencliff High School, both of Nashville, TN. The partnership was established with a focus on the pre-service training of university students and the professional development of in-service personnel, with a particular focus on technology. The partnership sought to follow guidelines for professional development schools (PDS) as established in research. Unique characteristics of this PDS developed as a result of the facts that Lipscomb is a small, private university with limited diversity and Glencliff is an inner-city school with tremendous diversity. Annual studies have been conducted using qualitative research methodologies. Although the research indicates success in several areas, the valuing of diversity and community has evolved as the outstanding hallmark of this partnership.

Successful Multidisciplinary, Thematic Curriculum Activities: Development, Implementation, and Impact
Neal Topp, University of Nebraska at Omaha, USA; Cecil Doshier, Morrill Schools, USA; Carolyn Schlager, Scottsbluff Schools, USA
This paper will focus on multidisciplinary, integrated, thematic curriculum units as developed and taught by teachers from three Nebraska school districts who are involved in a U.S. Department of Education Challenge grant. The teachers from these three schools designed the units using an on-line form and database developed by the grant project's staff. The project teachers received staff development training on several aspects of effective teaching/learning, such as multi-intelligences, brain research, multi-disciplinary strategies, efficient assessment, and the importance of connecting learning to community and real world situations. The paper will explain the process of curriculum development, the on-line availability of the units, the training for teachers, the local school support to make the units successful, lessons learned, and the impact of this type of activity on student learning, teacher growth and attitudes, school climate, and community connection to student learning and the school in general. In addition, the benefits to undergraduate and graduate education in a college of education will be discussed.

A model to design technology for teacher training program
Dogan Tozoglu, Florida State University, USA; Ilhan Varank, Florida State University, USA
Teacher training is one of the most important factors that determines teachers' use of educational computing in classroom. On Average five to seven-years of training is necessary for a teacher to become a confident user of educational technology (Hardy, 98). However, most teachers do not have enough computer skills (Dupagne, 92) and feel they have not taken adequate training to integrate computer in their classroom. The purpose of this paper is to describe a teacher technology-training model for a private high school in Turkey that incorporates the notion of instructional design and systems thinking. The training model is structured around the generic ADDIE model, which is Analyze, Design, Development, Implementation and Evaluation. However, the model provided in this paper is situation-specific and has additional elements to satisfy the need for in-service technology teacher training.

Using Communities Of Practice Strategy To Enhance Mentoring
Chih-Hsiung Tu, The George Washington University, USA; Marina McIsaac, Arizona State University, USA
The current model for mentoring doctoral students is based on apprenticeship; but this process may result in the insufficient development, application and spread of knowledge. Other mentoring models have been proposed, but none have addressed online professional development. Communities of practice (CoP) have the potential to be conducive to mastery of new knowledge. Several successful reform projects have supported this concept. This paper describes a CoP model that combines on-line and face-to-face (FTF) elements designed to enhance mentoring and professional development strategies. The goal is to evolve a sustainable CoP for the graduate education of professionals, learning the intricacies of their profession, implement practices, and apply new content knowledge. This study demonstrates how a CoP model supports doctoral students' learning. It concludes with a discussion of the attributes of CoPs and guidelines for construction of effective mentoring models for learning reforms.
A Study of Faculty Perceptions to the Integration of Systems Thinking in the Teacher Preparation Program at Northern Arizona University
Gary Tucker, Northern Arizona University, USA; Laura Sujo de Montes, Northern Arizona University, USA; Becky Willis, Northern Arizona University, USA; Michael Blocher, Northern Arizona University, USA
This paper is a report on a study done at the Center for Excellence in Education at Northern Arizona University. In 1984, the Center was created on a concept of moving away from the typical hierarchical structure of a college of education toward a matrix. The matrix was designed to help create a community of people in a diverse organization and move away from the "turf" concept of departmentalization. A concept that was to be verbalized by Peter Senge (1990) in his book on learning organizations. By the fall of 2000, the Center has deteriorated back to a hierarchical, departmentalized college of education. Senge (1990) identifies 7 organizational learning disabilities that are typical in organizations that are not learning organizations. This study was a survey of the faculty of the Center to help gain a better understanding of where we are in terms of suffering from these 7 learning disabilities.

The Learning Lab: Teaching and Learning In An Online Information Technology Environment
Jesper Tuinman, Open Learning Agency, Canada; Erland McCauley, Open Learning Agency, Canada; David Porter, Open Learning Agency, Canada; Peter Donkers, Open Learning Agency, Canada
This paper will discuss the Learnware funded program for teachers - The Learning Lab. The Learning Lab is an online professional development program for teachers who want to upgrade their information technology skills and learn more about integrating technology into teaching and learning. The program is based on self-directed learning. It includes prior learning assessment and development of personalized learning plans as core components of the program. A wide range of learning paths, modules, learning objects, and resources are provided to meet the needs of teachers whose skill levels range from emergent technology learners to education technology leaders. The Learning Lab provides opportunities for teachers to work at their own pace, in the curriculum area of their choice, and to apply their research and their learning into the classroom. Offered as both a non-credit and credit program, The Learning Lab provides an easily accessible, media-resource rich, mediated model for teacher professional development programs that meets international standards and strives to address key issues in ITC training.

THE FACULTY RETREAT— A TOOL FOR TECHNOLOGY ENHANCEMENT AND TEAM BUILDING
Cordelia R. Twomey & Gertrude Abramson, Nova Southeastern University, USA
Explore innovative methods to advance your program's technology initiative and staff development for all faculty— full-time and adjunct, on-campus and on-line.

TECHNOLOGY STAFF DEVELOPMENT AT AN URBAN PUBLIC UNIVERSITY
Cordelia R. Twomey & Gertrude Abramson, Nova Southeastern University, USA
The Instruction and Technology Initiative at New Jersey City University, an Hispanic Serving Institution, was designed to increase the capacity of faculty to foster instructional innovation via educational technology, both within the University and to reach teachers on the local and the statewide level. The Initiative is designed to infuse technology education with the specific learning needs of students through one-to-one and small group faculty training, and that full-time personnel staff the Center, serving as in-house consultants to the faculty.

Implementing Technology into PreService Teacher Education Courses: PT3 First Year Accomplishments
Tendra Tyler-Wood, University of North Texas, USA; Dana Arrowood, University of North Texas, USA; Rhonda Christensen, University of North Texas, USA; Jeff Allen, University of North Texas, USA; Michele Maldonado, University of North Texas, USA
The University of North Texas received a Capacity Building Grant from the U.S. Department of Education’s Preparing Tomorrow’s Teachers Fund. One of the goals of the grant was, “To enhance technological knowledge and skills of future teachers to that they can infuse technology into learner-centered classrooms.” This session presents the results of four initiatives funded by the grant.

The Education Technology Revolution Challenge
Timothy Tyndall, Camp Internet, USA
The American education system is in the midst of a challenging revolution as it steps from the 20th century chalk and blackboard environment to the 21st century multi-media electronic networking environment. This transformation has created new teacher professional development needs, and presents new innovative content delivery opportunities. To successfully make this transformation from the blackboard to the electronic classroom, the national education community must now challenge technology to deliver on its promise of redefining American education practices.

Learner Self-efficacy, Attitude, and Utilization Patterns of an Electronic Textbook
David Unfried & Steve Crooks, Texas Tech University, USA
The use of electronic textbooks is increasing. The spectacular growth of the electronic learning space that is accessible through the computer, CD-ROM, DVD, Internet and World Wide Web has impacted a traditional form of mediated instruction, the expository printed textbook. With the digitization of information has come an evolutionary societal change where electronic publishing increasingly supplements (and some would argue eventually supplants) the printed text. A pilot study of learner self-efficacy, attitudes, and access and utilization patterns are addressed using graduate students in instructional technology. This pilot study was initiated to discover areas that could impact an expanded study on factors influencing the use of electronic textbooks.

Faculty Training - Lessons in a “Flash”
Michael Uttendorfer, New York Inst. of Technology, USA
This interactive session will provide hands-ons on experience with creating interactive instructional materials using Macromedia’s Flash which can be used as “standalone” files or “published” to the web. Examples of several of the presenter’s online web-based lessons
created for faculty development workshops will be demonstrated. Participants will then have an opportunity to create their own
interactive class with materials provided by the instructor. Models, templates and media libraries will be used to facilitate the creation
process. Session attendees will receive a CD-ROM containing samples and template files. This session requires no special HTML or
web experience. Participants may have little or no experience with Macromedia Flash.

An In-Service Program for Ecuadorian Teachers. The Innovation of Elementary Education in the Santa Elena
Peninsula Project
Martin Valcke, University of Ghent, Belgium; Katherine Chiluza, Escuela Superior Politecnica del Litoral, Ecuador;
Karen Verkler, University of Central Florida, USA
It's a Small University After All - Reducing Distances Between Colleges via Web CT
Maria J. Verdes, University of Valladolid, Spain; Juan P. de Castro, University of Valladolid, Spain; Rafael Mompo, University of
Electronic Tutorship Support in an Educational Intranet
Ilhan Varank, Florida State Un., USA; Dogan Tozoglu, Florida State Un., USA
Pilot Results of a Teacher Education Technology Infusion Model
Rachel Vannatta, Bowling Green State University, USA; Blanche O'Bannon, University of Tennessee-Knoxville, USA
Funded through a PT3 Capacity Building Grant, Bowling Green State University piloted a technology infusion model in its elementary
education program. Project PICT (Preserve Infusion of Computer Technology) was initiated during the 1999-2000 academic year
and sought to prepare technology-using preservice teachers by: 1) increasing faculty/teacher technology access through laptops and
classrooms; 2) implementing an extensive technology training program for education faculty, arts & sciences faculty, and
area K-6 teachers who work with teacher candidates; 3) initiating a curriculum restructuring process to align with NETS-teachers; and,
4) beginning the infusion of technology in the elementary classroom. Results of this pilot will be presented.

Justification of Technology Teacher Training From Human Performance Perspective
Ilhan Varank, Florida State Un., USA; Dogan Tozoglu, Florida State Un., USA
Technology teacher training is one of the most preferred methods in schools and other educational institutions to close the gap between
students' expected level and current level of technology use in the classroom. The purpose of this paper is to investigate, based on Magur
and Pipe's (1997) performance analysis model, if technology teacher training is the only solution to improve teachers' performance
in using technology in the classroom. First, a literature review on technology teacher training will be provided and then the performance
analysis model will be used to evaluate the necessity of the training.

Electronic Tutorship Support in an Educational Intranet
Maria J. Verdú, University of Valladolid, Spain; Juan P. de Castro, University of Valladolid, Spain; Rafael Mompo, University of
Valladolid, Spain; Ricardo López, University of Salamanca, Spain; Joaquin García, University of Salamanca, Spain;
Information and Communication Technologies have changed the way we work, the way we live and the way we learn. One of the things
that should be updated regarding the new educational context is the tutorship support, that is specially important in a learning
environment. In this communication a definition of the educational system of the Information Society for primary and secondary
education is proposed, what is called Educational Intranet. Next, it focus on how should the tutorship support be offered by such
Educational Intranet. So, this document describes and proposes an original tutorship support system to be incorporated to an educational
intranet for primary and secondary education. The tutorship support can be performed face-to-face, that is to say, in real time using
a video-conference system (Synchronous Tutorship Support) or it can be carried out by means of a text-based messages or queries
 electronic mailbox (Asynchronous Tutorship Support).

It's a Small University After All - Reducing Distances Between Colleges via Web CT
Karen Verkler, University of Central Florida, USA
This paper describes a Web CT-based project by which a collaborative relationship was effected between foreign language education
majors in the College of Education and foreign language majors in the College of Arts and Sciences at a large metropolitan university.

102 — Proceedings of SITE 2001 / Orlando, Florida, USA
Using Information and Communication Technologies to develop a learner-centered approach with pre-service elementary school teachers: An exploratory research.

Jacques Viens, University of Montreal, Canada; Genevieve Légaré, Concordia University, Canada

This paper presents the preliminary results of our exploratory research concerning students’ perceptions about their role as future elementary school teachers and the educational practice they integrate in the development of an integrative scenario. We have noticed that when a socio-constructivist teaching/learning approach is used, many students still have problems assuming more freedom over their own learning experience. Indeed, they tend to fall back on their old ways of learning and they plan their lesson accordingly. We will present instructional strategies that are likely to facilitate the shift from a teacher-centred approach to a more genuine learner approach. We will shortly describe a Web site providing scaffolding tools to help students and teachers through the whole process of scenario production. In order to stimulate metacognitive processes and collective knowledge construction about the new roles of teachers, we use telodiscussions in an electronic forum.

CRACTIC: towards a model for the implementation of socio-constructivists principles in multiple classrooms collaborative projects using the Web

Jacques Viens, Université de Montréal, Canada; Alain Breuleux, McGill University, Canada; Pierre Bordeleau, Université de Montréal, Canada; Allen Istvanfly, McGill University, Canada; Sonia Rioux, Université de Montréal, Canada

CRACTIC stands for “Research Community on Collaborative Learning with Information and Communication Technologies”. It is a collaborative research involving university professors, teachers and domain experts in the development and implementation of collaborative learning activities based on socio-constructivist principles. Our pedagogical model builds on having students from different schools along the St-Laurence River to exchange questions and answers about the impact that the River have on their respective economical, social and geographical environment. Each school answering questions raised by another school and doing so, contributing to the construction of collective knowledge expressed in a community Web site. Six classrooms, matched in pairs, participate to our community. Each classroom developed a Web site presenting itself and the work done locally. We will present the theoretical foundations, the emerging model, the implementation conditions, the process of appropriation of the model by teachers and students and the outcomes of our three cycles of experimentation.

Active Server Page Programming Tutorial

Joaquin Vila, Illinois State University, USA; Barbara Becque, Illinois State University, USA; David Doss, Illinois State University, USA

This paper describes a web-based Active Server Page (ASP) Tutorial that provides an interactive online guide for ASP programming. The application was created using a variety of technologies including ASP and Macromedia Flash to implement the interactive segments of the tutorial. All the sample codes written in ASP can be demonstrated online. Flash movies are used to provide online, side-by-side ASP code interpretation. This site is intended to provide an easy-to-follow, step-by-step tutorial for inexperienced ASP programmers. The ASP Tutorial introduces ASP syntax and the basics of ASP programming. Using an interactive style, this tutorial provides fully commented easy to follow examples, programming techniques, and quizzes. Both linear and random navigation are provided on every page so the user can easily find topics of interest.

Technology Chalkboard: Building a Collaborative Model to Integrate Technology in the Classroom

Jeanne Vilberg, Clarion University of Pennsylvania, USA; Darla Ausel, Clarion University of Pennsylvania, USA

Integrating technology into the classroom is an evolutionary (if not revolutionary) process for most educational institutions. In rural Western Pennsylvania three State System of Higher Education universities (Clarion, Edinboro, Indiana) formed a consortium to address the need to increase faculty understanding of the advantages of using technologies in teaching, their competencies in specific technological applications, and their level of comfort in using them. The universities created learning and technology centers to provide technology-rich learning environments for university faculty and K-12 teachers. A $1.7 million Preparing Tomorrow’s Teachers to Use Technology (PT3) implementation grant provided funding for new methodologies for infusing technology in the classroom. A “technology chalkboard” model was developed by Clarion University to provide diverse classroom learning opportunities. Technology modules incorporated training on specific software or technologies, application training on how the technology is applied in the classroom and integration training on how the technology enhances student-centered learning. To augment the classroom experience, participants were enrolled in “Technology Chalkboard”, a specially created online course using Blackboard’s CourseInfo software. Due to the success of the “technology chalkboard” model, the consortium is transforming the nine modules into supplemental online course components or as online courses for in-service teachers.

Guiding Collaboration to Enhance Procedural Learning

Aurora Vizcaino, Escuela Superior de Informatica, Spain; Jesus Favela, CICESE, Mexico; Manuel Prieto, Escuela Superior de Informatica, Spain

Learning is a process which involves many activities such as: memorisation, establishing relations between ideas or concepts, reflection, observation, etc. The activities involved in the learning-teaching processes depend on the topic that a student is trying to learn. For instance, when a person studies history he/she should use processes of relation, understanding, and memorisation. On the other hand, if a student is learning to program, memorisation becomes less important. On some occasions, students do not know how to study neither what kind of activities they must perform as part of their learning process, so they usually try to memorise contents and
procedures without reflecting when and why it is convenient to use those knowledge. On the other hand, procedural learning is generally more difficult than declarative learning. We have observed that the disciplines with most failures at our university, are procedural disciplines, such as: mathematics, statistics, or programming where students must use activities such as: observation, reflection, or comparison.

**WANTED: A MIRACLE WORKER - a Consideration of Some Issues Arising From the Leadership of Entrepreneurial Activity in Information and Communications Technology in an Academic Setting**

_Lynne Walker, University of the West of England, UK_

This paper seeks to explore notions of leadership in relation to the role of the Project Director of a nation-wide in-service ICT training and development for teachers provided by a University Faculty of Education. In examining leadership and the management of change the paper seeks to focus upon the dilemmas inherent in managers leading entrepreneurial activity in an academic environment. The paper also attempts to highlight some lessons learned, key issues requiring resolution and future papers to be written.

**A Faculty Development Plan For The Successful Integration Of Technology Into Teacher Preparation Courses**

_Joseph Walsh, University of Montevallo, USA; Lauren McCay, University of Montevallo, USA; Jack Riley, University of Montevallo, USA_

With unprecedented emphasis being placed on preparing pre- and inservice teachers to integrate technology into their classrooms, schools of education are facing increasing pressure to provide students with experiences and faculty who can adequately prepare them for this task. This session will provide details on how one college of education in a small liberal arts university is meeting this challenge. Using the National Educational Technology Standards for Teachers(NETS-T) as a basis, education faculty worked together to implement a faculty development program that culminated in the measurable integration and utilization of technology in the program’s professional studies classes. The outcome of this semester-long collaboration was that the methods faculty involved were better prepared to (a) utilize technology as a tool for instruction, (b) train their students/preservice teachers to utilize technology in the classroom, and (c) serve as technology mentors to other methods faculty. Through this project, participating faculty were able to document a planned and systematic method of transparently integrating technology into teacher education courses that may prove beneficial to similar schools of education.

**How on-line collaborative Study improve human cognition: A perspective on the evolution of modern education**

_James T.J. Wang, National Taipei University of Technology, Taiwan; David C.Y. Lin, National Taipei University of Technology, Taiwan; Richard Wang, Chinese Culture University_

This paper is a research to investigate the growth of Internet which will give rise to new adventure of teaching and learning strategies in the decade to come. A series of more recent education approaches that come into play will be examined by addressing their advantages versus shortcomings to identifying why they have come to contribute the collaborative study method and how they are taking shape in the new education trend. The principle of “Collaborative Study” and how it fits appropriately and closely into the modern network media revolution will be demonstrated and explained. Virtual Learning and developing highly effective human cognition techniques through investigative problem solving, thinking and creativity are the major components that will assist the success of Collaborative Study and in fact new ideas in education. This research also brings teaching and learning to a higher level by exploring collaborative study and modeling it as the future education template to be deployed countrywide in Taiwan.

**Teachers’ Roles in Classrooms with and without Computers**

_Yu-mei Wang, University of Guam, USA_

Literature indicates that teaching with computers requires a shift from the traditional teaching practice. For technology to transform teaching and learning, there is a need to redefine the teachers’ role and change existing teaching practice. Technology-rich classrooms tend to be more student-centered rather than teacher-centered. This study was designed to investigate whether preservice teachers are shifting their perceptions of the teachers’ role when teaching in the classroom with computers. The research questions are (1) What are the preservice teachers’ perceptions of the teachers’ role in the classroom without computers? (2) What are the preservice teachers’ perception of the teachers’ role in the classroom with computers? (3) Do the preservice teachers’ perceptions of the teachers’ role in classrooms with computers differ from their perceptions of the teachers’ role in the classroom without computers? The preservice teachers’ perception of the teachers’ role is to be measured as teacher-centeredness versus student-centeredness.

**Computer Assisted Mathematics Learning Environment- A Study on the Computer, Math and Human Interaction**

_Yu-mei Wang, University of Guam, USA; Carl Swanson, Jr., University of Guam, USA; Steve Lam, Guam Community College, USA_

Integrating CAI into the math curriculum is a challenging process. Computers change the way teachers teach and the way students learn. The learning process is affected by a combination of factors; for example, learners’ attitudes toward math and computers, learners’ computer skills, learners’ confidence level in learning math and computers, learners’ learning styles, the quality and the suitability of the computer learning system, and the way the instructor conducts the course and interacts with the student. This study is designed to explore factors affecting the Guam Community College students’ math learning experiences via CAI interactive learning system. The primary instrument for this study was a modified survey questionnaire. In order to gain a fuller insight into the students learning process, the data for this study were also drawn from other sources: (1) student interview; (2) faculty interview; (3) classroom observation; (4) documentation such as student drop-out rate and grades.

**Emerging Careers in Instructional Technology**

_Shirley Waterhouse, Embry-Riddle Aeronautical University, USA_

The implementation of instructional technologies is creating a number of new careers in education. Three are instructional technology director, instructional technologist, and instructional technology technician. Also, numerous positions are required when institutions...
develop instructional technology modules in-house. This paper provides a brief overview of the major instructional technology
positions, as well as a description of a faculty technology liaison and the details of an instructional technology director job description.

Overview of Web-Based Pedagogical Strategies
Shirley Waterhouse, Embry-Riddle Aeronautical University, USA

Preparing teachers to utilize Web-based instruction requires a focus on Web-based pedagogy, not just Web-based technology. Teachers
must understand that technology should be utilized as the enabling factor, not the primary factor if Web-based instruction is to be effective
in enhancing teaching and learning. The Web provides an array of teaching strategies that can be added to those commonly utilized in
traditional instruction; and today’s teachers must understand both. Recommended Web-based pedagogical strategies are addressed in
this paper as well as how they relate to Gagne’s Nine Events of Instruction as well as the American Association of Higher Education’s
Seven Principles for Good Practices in education.

Internet based learning environments in higher education: Experiences from the HALÜBO-Project
Peter J. Weber, University of Hamburg, Germany; Hornberg Sabine, Ruhr-University of Bochum, Germany

The European process of integration is steadily moving forward, since 1993 and the coming into force of the Maastricht contract also
with a greater effect on the national general education systems. This development is by no means a topic for future teachers and others
in higher education, even though it will clearly affect their professional and personal future. Another worldwide rapidly developing
movement takes place within the new media, especially in the area of internet based teaching and learning. In our paper we will present
a joint Project of the University of Hamburg, Lüneburg and Bochum (HALÜBO)(GER), which was realized by adapting traditional
working techniques as well as new tools, like the internet.

Special Educators’ Technology Literacy: Identifying the Void.
Roberta K. Weber, Florida Atlantic University, USA; Peny L. Schoon, Florida Atlantic University, USA; Jim Forgan, Florida Atlantic
University, USA

This study was initiated to investigate the technological knowledge and skill level of special education teachers and their use of
technologies in special education classrooms. The study was conducted in two Florida school districts and included a sample of 210
teachers with a response rate of 69%. The results of this research will discuss the correlation between teacher skill level and the use
or non-use of computers and other technologies for instruction. Additionally, the analysis of data shows the interest level of these special
educators towards learning more about technologies that could be utilized in their classroom.

Real Concerns on Distance Education When Distances are Real
Leo Wells, Camel Research Associates, USA

The study from which this report was derived explored concerns of school change facilitators (superintendents, principals, and
technology coordinators) as they implemented new curricular requirements for instructional technology. This present report focused
on one strand of concerns: distance education. Six informants expressed hesitation over the impending interactive video labs which were
to be installed in their school districts, primarily over bad experiences from previous efforts in distance learning. Each informant expressed
hope that the new systems would be useful. There appears to be the need for balance as the positive aspects of distance systems (service,
teaching) are implemented against the negative aspects of distance systems (teaching changes, impersonality).

Technology and Problem-Based Learning: Connecting Students, Teachers, and Student Teachers
Nancy Wentworth, Brigham Young University, USA; Eula Monroe, Brigham Young University, USA

The investigation reported in this paper strives to bring technology and problem-based learning into the student teaching experience
through an integrated, collaborative mathematics task. The project presented is based in data collection and analysis. It supports the
National Educational Technology Standards (International Society for Technology in Education [ISTE], 2000) and the latest standards
for school mathematics (National Council of Teachers of Mathematics [NCTM], 2000). Students from several schools collected and
analyzed data for a task on an 2000 Summer Olympic project. Technology was vital to data collection, data sharing among schools,
and data analysis. This project served as a stimulus and prototype for projects for the 2002 Winter Olympics.

State-wide Collaboration among Three PT3 Grant Recipients
Nancy Wentworth, Brigham Young University, USA; Rodney Earle, Brigham Young University, USA; Steven Soulier, Utah State
University, USA; Tim Smith, Utah State University, USA; David Stokes, Westminster College, USA; Wanda Carrasquillo-Gomes,
Westminster College, USA

The PT3 Utah consortium includes Brigham Young University, Utah State University, and Westminster College. It provides members
with unique advantages: opportunity to be informed of each other’s projects to the subsequent benefit of all; to share resources of local
expertise and material assets; to strengthen inter-college activities through joint publications and presentations; and to help each other
out when moments of challenge arise. The leaders hope to impact teacher preparation and technology use in schools across the state
of Utah. This panel discussion will focus on areas of common interest, and how the collaboration has strengthened their work.

The Implementation of Change in Technology Rich K-8 Classrooms
Keith Welzel, Arizona State University West, USA; Ron Zembo, Arizona State University West, USA; Ray Buss, Arizona State University
West, USA; Helen Padgett, Manager PT3 Project, Arizona State University West, USA

This qualitative study reports on Arizona Classrooms of Tomorrow Today (AZCOTT), a component of a Preparing Tomorrow’s
Teachers to Use Technology project. In conjunction with five partner school districts, Arizona State University West developed five
technology-rich K-8 classrooms that serve as models for preservice students and university instructors. This study reports on the
changes occurring as the AZCOTT teachers learn to teach in technology rich classrooms. Changes were described in teacher practices,
student attitudes, and classroom management. Generally, the researchers found that technology has become an integral part of each classroom. Factors contributing to implementing change in these classrooms are discussed. The researchers also discuss the progress made toward using these classrooms as models for preservice students.

Increasing the Use of Computers in Early Childhood Teacher Education: Psychological Factors and Developmental Appropriateness

Karl F. Wheatley, Cleveland State University, USA

This paper examines the case of one urban early childhood teacher educator’s increasing use of computers in early childhood (PK-3) curriculum courses, over a period of one year. The paper describes the both the obstacles to such increased computer use and the factors related to this increasing integration of computers. The paper is analyzed from the perspective of the early childhood concept of developmental appropriateness, and with respect to the motivation and learning required of the teacher educator.

Learning to Learn in Online Courses

Joan Whipp, Marquette University, USA; Heidi Schweizer, Marquette University, USA

This presentation will display results of a study conducted of online learners at a large midwestern university during the summer of 2000. The study posed these questions: What unique challenges do students find in the online learning environment (comparing to face to face)? What specific strategies do students use to cope with these challenges and achieve academic success in this environment? Primary data sources included: anonymously written surveys of 94 students (in seven sections with 13-15 students each) who successfully completed an online instructional technology course designed for practicing teachers and verbatim transcripts of face to face interviews conducted with 14 students in one section of the course after they completed the course. Besides technical issues, the greatest challenges cited by these students in their online course in order of frequency were: procrastination and time management issues, the slow pace and asynchronous nature of discussions, feelings of isolation, work overload, and writing anxiety. Strategies to address these challenges most often cited included strategies for time management and pacing, previewing and planning offline reading and notetaking, alternative planning used in anticipation of technical problems and server delays, and summarizing. Students also described a number of motivational strategies that focused largely on their beliefs about themselves as competent online learners. Finally, these students spoke of networking, help-seeking, and personalizing strategies.

Helping Higher Education Faculty Model Use and Integration of Technology for Future Teachers

Joan Whipp, Marquette University, USA; Heidi Schweizer, Marquette University, USA; Nereus Dooley, Marquette University, USA

Those who attend this session will: 1) Gain information about how a midwestern university’s PT3 (Preparing Tomorrow’s Teachers in Technology) project is helping higher education faculty in English, History, Mathematics, Biology, Chemistry, Physics, Spanish, French, Communications, and Education use a variety of technological tools to create constructivist learning environments through “just in time” tutorials, small group support, mini-grants, online training modules, workshops and a newly developed faculty website and online conferencing center 2) See a demonstration of web-based faculty training modules that are currently being used to increase faculty members’ use of technology that supports active student-centered learning environments 3) Share successes, challenges and concerns with others who are engaged in similar higher education faculty development projects.

Collaboration and Integration: Technology in a Pre-Service Elementary Education Foundations Course

C. Stephen White, George Mason University, USA; Debra Sprague, George Mason University, USA

Changes in State regulations and National Standards have resulted in Colleges of Education redesigning their teacher preparation programs. During this redesign, many programs are eliminating their “technology course” in favor of integrating technology throughout all teacher preparation courses. This redesign has often resulted in concerns that many education faculty are ill-equipped to provide teacher candidates with the technology skills and knowledge needed to insure the effective integration of technology into K-12 curriculum. This paper focuses on one teacher preparation program’s efforts to address this concern. Faculty members in the Elementary and Instructional Technology Programs paired up and team-taught an Introductory to Elementary Curriculum course, providing students with the needed foundational knowledge and technology skills.

Critical Kiwi Chronicles: Technology and Teacher Education in New Zealand

Cameron White, University of Houston, USA

This paper provides a critical analysis of the integration of technology in pre-service teacher education in New Zealand. New Zealand has made great strides in reforming curriculum both at the pre-college and teacher education levels. As a result, the country has decided that technology has a vital role to play in the teaching and learning process. As a result teacher education institutions have made great strides in course development, online offerings, and internet resources for prospective teachers. The issue is the continued professional development of teachers and actual application of technology in the schools.

Electronic/Distance Preservice Teacher Education – an example

Leon Wickham, Massey University, New Zealand

This paper and presentation will review how Massey University College of Education went about meeting the challenge of delivering preservice teacher education to those who, for a number of reasons, could not attend an on campus programme. Programme delivery will be outlined demonstrating the linkages between traditional extramural delivery and the use of WebCT for web based delivery. The results of surveys and studies of the students involved in the programme in the first four years of course delivery will be presented within the discussion. Over the past ten years there has been a growing demand from the New Zealand Ministry of Education, the schools and the client base of teacher education to have preservice teacher education programmes delivered extramurally. Massey University has met this challenge. The advent of the Internet and the merger of Palmerston North College of Education and Massey University

106 — Proceedings of SITE 2001 / Orlando, Florida, USA
The need for teachers who are proficient in the use of technology in the classroom has increased dramatically over the past few years. Professional and regulatory organizations with direct and indirect influence on teacher education programs have issued reports, recommendations, standards, and accreditation criteria all aimed at increasing the technology competencies of beginning teachers. The College of Education at the State University of West Georgia established an introductory technology course for all teacher education majors to meet this demand. This survey course provides students with a background in various instructional technologies as well as classroom integration strategies. At the time the course was created, many of the faculty involved believed that many students entering the program would be sufficiently competent in technology to enable them to exempt the course. Those exempting the course would be able to take an additional class in their content area. This presentation will provide an overview on how the exemption exam was created and implemented, as well as a measure of its effectiveness in identifying technology competent students. Additionally, the results of the exam will be viewed in relation to the students beginning the course perceived level of technology expertise.

**Effectiveness of an Exemption Exam for an Introductory Educational Technology Course**

*William Wiencke, State University of West Georgia, College of Education, USA*

The existence of farm schools is a very unique characteristic of the South African school system. In the Free State, a predominantly rural province in the Republic of South Africa, some 1600 out of 2525 schools are farm schools. Unfortunately, the remoteness of the schools, as well as the absence of basic facilities like dwellings, electricity and water supply within walking distance, only attracted teachers with low qualifications, and in many cases a low quality education is offered. Despite recent developments, many of the farm schools still lack essential facilities. Gelukwaarts Farm School took the bold step to emerge from the typical farm school set-up by utilizing modern information communication technology driven by solar power. The solar energy generated is utilized for TV reception and getting computers connected to the worldwide web. New communication and education channels have opened, and teachers and learners are no longer confined to the radio and out-of-date newspapers. The presentation will focus on how the school succeeded to emerge from a half-forgotten farm school in the bundus to a school with informed teachers, learners and parents. These are all due to the presence of lots of sunshine in the country!

**LINKING UP BY SOLAR ENERGY: THE STORY OF THE GELUKWAARTS FARM SCHOOL**

*Fred Wilkinson, Free State Dept. of Education, South Africa; Annette Wilkinson, Vista University, South Africa*

The use of technology and computer mediated communication is changing the lives of students in the classroom. Research is beginning to emerge examining the effects of technology on the social behavior and adjustment of students. Computers and technology are influencing the interactions between teachers and students, as well as other interactions in a student’s life. Research is sparse at this time as to the effects of this new form of communicating, however, it appears that it can have many positive as well as negative impacts on students development and adjustment. The use of technology appears to down play the importance of social contact and may lead many students to not develop the necessary social skills to function in the world. This article examines the impact that technology may have on student development and adjustment in the technology rich classroom. It is hoped that educators will be cognizant of the potential social and developmental pitfalls that can occur when blindly implementing technology into the educational process.

**Impact of Technology on Student Socialization in the Classroom**

*Lamar Wilkinson, Louisiana Tech University, USA; Wellei Buboltz, Louisiana Tech University, USA; Adrian Thomas, Louisiana Tech University, USA*

To adopt a school has enabled extramural delivery of the Bachelor of Education (Teaching) Primary degree. Massey University bought its expertise in extramural delivery of degree programmes and the College of Education its expertise in teacher education.

**ADOPT-A-SCHOOL**

*Liezel Wilkinson, Technikon Free State, South Africa; Guillaume Nel, Technikon Free State, South Africa*

With the aim to play an active role in the community and in support of the national education department’s Tirisano Project 2000-2004, the Technikon Free State (TFS) in Bloemfontein launched its Adopt-a-School program in September 2000. The program, in which the school will be assisted in various ways, is a collaborative adoption between the TFS and a disadvantaged secondary school in the Free State province (Lereko Senior Secondary School). The vision of Tirisano is of a South Africa in which all inhabitants have access to lifelong education and training opportunities. The development of the professional quality of the country’s teaching force is stated as one of the major strategic priorities of the five-year plan. In the first phase of the program, the emphasis is on the professional and personal growth of Lereko’s teachers, with computer literacy as one of the main objectives. The TFS equipped a computer laboratory
with Internet facilities at the school, and the training of teachers have just started. The discussion of the progress of the project presents a preview of what can be achieved when the more advantaged reaches out to the less advantaged in this country with its unhappy past.

**Tomorrow's Teachers and Tomorrow's Technology—The T4 Project**
Linda Wilson, Langston University / Tulsa, USA

Educators in northeastern Oklahoma have collaborated on a special three-year project entitled “Tomorrow’s Teachers and Tomorrow’s Technology (T4 Project)." The focus of the project will be to deliver a three-year comprehensive professional preparation program for prospective teachers from the northeastern region of Oklahoma for the purpose of empowering these future educators with the technological skills necessary for effectively teaching in twenty-first century schools. The purpose of this paper is to document the goals and objectives of the T4 Project, the elements involved in Phase I, and detail the benefits of this project to Langston University / Tulsa elementary education majors.

**Mission Possible: Project-Based Learning Preparing Graduate Students for Technology**
Harrison Hao Yang, State University of New York at Oswego, USA

This paper addresses how the project-based learning was designed and then implemented in a graduate applied technology course at State University of New York at Oswego. The focus of the course was to engage students to produce projects that were authentic,
Does Distance Education Resolve The Current Problems of Education?
Ya-Ting Carolyn Yang, School of Education, Purdue University, USA; Timothy J. Newby, School of Education, Purdue University, USA

Distance education has come of age. Its foundations have become firmer, its applications have grown in number and variety, and its influence has become more visible and more substantive. Yet, one question is still frequently raised: “Does distance education resolve the current problems of education?” This paper aims at giving some answers to this question by investigating the benefits and challenges of distance education. What follows is a thorough discussion of the question. Finally, suggestions are made for further research in the field of distance education to improve the current educational system.

Digital Video: What Should Teachers Know?
James E. Yao, Texas A&M University-Commerce, USA; John R. Ouyang, Kennesaw State University, USA

Texas State Board for Educator Certification has published new technology application standards for teachers who want to be certified, including teachers of technology. The standards require that teachers should know how to create digital video products for a variety of purposes and audiences and use them in multimedia applications. Other states may follow soon. This paper discusses the difference between traditional video and today’s digital video, including streaming video; examine the current technology in digital video; provides a step-by-step guide on how to create digital video; provides teachers with practical suggestions of how to create digital video economically and effectively.

Can we address learning styles of students in traditional and web-based courses: Perceptions of faculty members and preservice teachers
Yasemin Gulbahar Yigit, Middle East Technical University, Turkey; Soner Yildirim, Middle East Technical University, Turkey

The present study explored faculty members’ and preservice teachers’ perceptions on addressing learning styles in different instructional environments, namely in traditional classroom and web-based instruction. This study used data from faculty members and preservice teachers at a state university in Turkey. This study reports both faculty members’ and preservice teachers’ perceptions on considering individual differences while designing a course for both traditional setting and web-based instruction.

COMPUTERS ARE READY BUT HOW ABOUT TEACHERS: AN ASSESSMENT OF TURKISH BASIC EDUCATION TEACHERS’ INSERVICE TRAINING NEEDS
Soner Yildirim, Middle East Technical University, Turkey; Settar Kocak, Middle East Technical University, Turkey; Sadettin Kirazci, Middle East Technical University, Turkey

Recently, the Turkish government has started a new project for Basic Education Schools (partially financed by the World Bank) in order to take a major step for Turkey to leap to an information society. The purpose of this study is to investigate 592 basic education schools teachers’ competency on computers and training needs. Analysis of data indicated that teachers do not feel competent on and ready for computer. Finally, this study offers recommendations for effective inservice training programs and technology integration strategies for the teachers.

Lights, Camera, Action: Videoconferencing in Kindergarten
Nancy Yost, Indiana University of PA, USA

This paper explains a kindergarten project that uses multiple technologies, culminating in daily videoconferencing with another kindergarten. This project took place at a university laboratory school as a demonstration of appropriate use of technology, including videoconferencing, for preschool teachers. As the students prepared for the daily videoconferences, they were engaged in dramatic play activities, Internet activities, and a field trip to a television station. The project proved to be an exciting experience for the children, extending their understanding of technology and the world.

The Computer Endorsement Program: Examining Expectations as a Catalyst for Change
Linda Young, Indiana University South Bend, USA

This paper examines attitudes and perceptions associated with the instructional technology programs offered by the School of Education at Indiana University South Bend (IUSB). The IUSB School of Education is constantly evaluating and adjusting programs to meet the changing needs of the schools we serve. I chose to examine the instructional technology programs offered by the School of Education. The School of Education currently offers a computer endorsement, which may be added to a primary area of certification. It is expected that teachers holding this endorsement will be sufficiently competent to incorporate computers into instruction in a variety of contexts. It was therefore my intent to conduct a survey of school corporations in the IUSB service area to determine the level to which our students are meeting school expectations. An appropriate instrument was developed to investigate prevailing attitudes and expectations, and the survey was conducted. While technological skill expectations were quite similar, disparity was found to exist in two other areas. The results of this survey will be used as a catalyst for change in the School of Education’s instructional technology programs.

Technology Integration in K-12 Classrooms: Evaluating teachers’ dispositions, knowledge, and abilities
Ron Zamba, Arizona State University West, USA; Ray Buss, Arizona State University West, USA; Keith Wetzel, Arizona State University West, USA

As part of the evaluation of PT3 sponsored technology integration workshops conducted at Arizona State University West, a Likert-type questionnaire was developed to collect information about teachers’ beliefs and skill levels related to technology integration. This presentation will include a description of the questionnaire that is being used to collect pre-test and post-test data from preservice and
inservice teachers. The instrument contains several subscales targeting teachers' perceptions of their confidence and skill level for using technology, knowledge of technology standards and the Unit of Practice (UOP), and beliefs about the best use and effects of technology integration. The focus of the presentation will then shift to the results obtained from its first administration. Quantitative results and conclusions about the effects of the technology training are presented.

**CHANGING INTERPERSONAL RELATIONSHIP BETWEEN TEACHERS AND STUDENTS USING TUTITION**

Viadan Zdravkovic, University of Gävle, Sweden

In this work we are proposed relocation of teacher's time during process of education. We have analyzed mutual student teacher relationship and proposed relocation of teacher's time as well as combination between tuition and classical teaching. The most common problem in relationship is insufficient experience or knowledge of teachers but as well learners (changing of learning paradigm form secondary school to higher education, or change in level from graduate studies till postgraduate studies). We have proposed different practical approaches and techniques for solving problems in teacher – learner relationship. Results have been obtained in both introspective form and testing form - student's evaluation of courses and marks.

**Solving educational problems during learning computer visualization applications and raising students’ creativity**

Viadan Zdravkovic, University of Gävle, Sweden; Boris Vian

**VR LAB — AFPC, Netherlands**

Learning visual based application has been one of the biggest problems for most of students. Both in art and technical education. One of the reasons is that education in computer visualization, especially in area of 3D modeling, 3D animation, computer-generated special effects and programming for multimedia and VR applications are not same as education for standard computer application. But any way teachers have been trying to implement standard educational techniques. The solution is in changing learning paradigm and tries in more flexible and differential approach. In this work we are presented combination of project based learning and teaching have been implemented in different proportion and sequence.

**Numeracy CD - Whole Number Concepts & Operations Numeracy II - Understanding, Using & Applying Fractions**

Audrey Zelenski, Saskatchewan Inst. of Applied Science and Technology, Canada

Numeracy & Numeracy II are interactive multimedia CDs that enable learners to improve their numeracy skills. In the Numeracy CD, the learner accompanies George on a journey through the jungle to help save a village from grave peril. To complete his journey, George must understand whole number concepts and learn the operations of addition, subtraction, multiplication, and division. In Numeracy II, the learner accompanies a young Aboriginal woman on a journey of discovery through the North where she experiences the beauty of the country, learns about native plants and animals, and discovers ways to overcome obstacles she faces along the way. In the same way that she learns the ways of nature, she comes to understand fractions, learns how to work with them and applies her knowledge to solve problems involving fractions. The CDs provides a stimulating and motivational learning environment for learners who may not have been successful with traditional methods of learning math. The learners increase their self-esteem by developing math skills that have eluded them in the past. The multimedia approach will accommodate the diverse needs of learners in school and in alternate settings, such as home, communities, and the workplace.

**Making the Case for Science Teacher Learning: An Analysis of Argument and Evidence in Electronic Portfolios**

Carla Zembal-Saul, Penn State University, USA; Tom Dana, Penn State University, USA; Leigh Ann Haefner, Penn State University, USA

This interpretive case study explores the nature of prospective elementary teachers' evidence-based philosophy statements for science teaching and learning, as portrayed in web-based science teaching portfolios. Evidence-based philosophy statements are explicit articulations of beliefs related to learning and teaching science. The 32 participants authored the portfolios in a web-based environment, allowing them to connect claims in their philosophies with evidence from their work as teachers. In addition to the electronic portfolios, exit interview transcripts were inductively analyzed. Based on the data, the claims in the prospective elementary teachers' philosophies became more science-specific and learner-sensitive over time. Supporting evidence was increasingly drawn from classroom-based experiences, requiring connections among theory and practice. In addition, there was evidence that the technology facilitated substantive reflection by (a) providing a simple means of making explicit connections between evidence and claims; (b) allowing prospective teachers to express themselves creatively without diminishing an emphasis on substance; and (c) providing a means of saving multiple versions (track changes over time).

**Learning to Teach with Technology — From Integration to Actualization**

Carla Zembal-Saul, The Pennsylvania State University, USA; Belinda Gimbert, The Pennsylvania State University, USA

The purpose of this proposed session is to highlight technology integration within a unique PDS setting. Emphasis will be placed on teaching interns (prospective elementary teachers in their final year of preparation) who were introduced through their university coursework to applications of technology designed to support student learning. Opportunities to explore technology use in the classroom were afforded through a year-long, school-based internship experience.

**An On-Line Math Problem Solving Program that Stimulates Mathematical Thinking**

Joanne Yaping Zhang, Hollywood Elementary, USA; Leping Liu, Towson University, USA

This paper presents a case study in which the authors developed a Web-based instruction (WBI) unit — an on-line interactive math problem-solving program, and explored the means of using this WBI program to stimulate young children's mathematical thinking and develop their skills of and interests in solving mathematics problems. 100 word problems were developed and divided into the four basic operations, and further sorted into 11 semantic structures at three difficulty levels. The KWIL (I know, I want to find, how to find, I've learned) format was used to teach children how to organize and analyze the data. The program is designed in a non-linear...
approach, navigating by categories and difficulty levels. Learners/teachers can select appropriate problems for their learning/teaching purposes. Ten children used this program to enhance their mathematics problem solving skills. Their performances were observed and the program was helpful in leading them through the mathematical thinking processes.

**Innovative Software-based Strategies for Reading/Listening Comprehension: Information Technology is Reforming Foreign Language Acquisition**

Sanquan Zhang, University of Ottawa, Canada

Mastering the IT media, both hardware and software, is one of the challenges of language teacher training. The session introduces an interactive IT software tool for comprehension of foreign language text in electronic format, at the example of Chinese web text. Among the software programs available for writing/reading of Chinese texts in electronic format, the KEY software (www.cjkware.com) stands out for its unique design as a multimedia reading comprehension tool. In the hands of the modern language teacher who makes full use of today's information technology, this software enables even beginners to independently develop a reading and listening comprehension of Chinese texts.

**Teaching Mathematics with Technology**

Yuehua Zhang, Washburn University, USA; Michael Patzer, USD 501, USA

This paper intends to report on a variety of innovative ways to utilize technology in teaching basic math skills and to motivate students in mastering the basic skills. Teachers will be able to turn so-called boring practice routines into interactive enjoyable learning experience for students to learn the basic concepts necessary for further exploration in the depth of mathematics, therefore to pay a solid foundation. Our experience also showed us that using technology in teaching does not mean simply putting students in front of the computer. The instructional materials have to be carefully designed which will provide opportunities for authentic learning, hence to achieve the outcomes that are expected.

**The Role of Internet in the Technology Training of Teachers**

Yuehua Zhang, Washburn University, USA; Tom Sextro, USD 336, USA

Educators continue to experiment with different technology training of teachers for more effective models, turning to the internet and instructional software tools in order to create an educational environment that supports the knowledge and skill-building approaches to learning. This paper intends to share the successful technology training experience of inservice teachers and educators of preservice teachers using video instruction and Internet as delivery tools. We intend to share our resources for those who are interested in self training and those who are in charge of technology training in their staff development program.

**A Pilot Project: Integrating Multimedia Portfolio Development Into The Preservice Teacher Education Program at Randolph-Macon College**

Zizi Zhang, Randolph-Macon College, USA

Randolph-Macon College offers teacher education as a minor program. To fulfill the requirements for teacher education, and to comply with the state regulations, instructional technology has not been taught as a course. Instead, it is integrated into the Foundation course, Educational Psychology, and Senior Seminar. Although this method has been relatively successful, preservice teachers request more opportunities be provided for applying technology skills for teaching and professional use. Creating multimedia portfolio appears to meet the needs. In this pilot project, four volunteer preservice teachers use and will learn various instructional technology skills for the development of their portfolios.

**Putting Assessment in Perspective: Successful Implementation in Educational Technology and Curriculum Integration**

Robert Zheng, Marian College, USA; Kris M. Giese, Chegwin Elem School, USA

This paper focuses on how to use assessment tool to effectively integrate educational technology into curriculum. The author examines the current practices in educational technology and curriculum integration and points out that successful integration of educational technology and curriculum depends on a sound system of quality assessment. An assessment model is proposed with an focus on the various stages of designing, developing and implementing the model that will enhance the integration of educational technology and curriculum in schools. Examples and case studies are discussed to illustrate how to use this model for K-12 educational technology integration. Limitations and suggestions will be included for further study.

**From Theory To Practice - Practical Use of Classroom Technology**

Woody Ziegler, Doane College, USA; Rob Ziegler, Madison Public Schools, USA; Sue Burch, Grand Island Public Schools, USA

The educators of today face multiple learning models: Bernice McCarthy's 4MAT Learning, Bloom's Taxonomy, Multiple Intelligences, and the SCANS Document are a few. Educators frequently hear how technology can and should enhance the learning of individuals. However transfer to the classroom and learning environment comes about slowly. This workshop seeks to review the practical of each model and present how technology coordinates with each model. By using a concrete model, the Technology Pyramid, becomes the tool to demonstrate the connectivity of each abstract model and clarifies the performance level of the learner as the teachers use technology in their instruction. Theory is not enough! The educator needs "access to" and "know how" to use planning tools in creating/coordinating integrated learning units and activities meeting local and national learning standards and technology standards. The planning tool presented in this workshop helps educators maximize their time by guiding students as they produce technology based learning presentations. The planning tool facilitates monitoring of student performance by the student, the teacher and the parent Rubrics facilitate the assessment of technology-integrated units and the performance of the students. Rubrics are the final piece of the workshop, setting the standards and opportunities.
This presentation will outline the challenges encountered by the project director of a PT3 grant in bringing together educators from higher education and the public schools to work on digital video units, obtaining release statements from parents whose children will appear in the units, encouraging educators to view assessment as a positive aspect of instructional design, administrative requirements (I call them speed bumps rather than road blocks) and production problems associated with the use of technology in the elementary classroom.

188
This year's papers Concepts and Procedures section are considerably more diverse than in previous years both in terms of topical coverage and the greater international flavor of the submissions. Geographically, almost all continents (with the exception of Africa and Antarctica) are represented with submissions from close to a dozen countries in addition to the United States.

The first grouping, dealing with areas of pre-service and in-service teacher training, attracted fewer submissions than in prior years. In Disitech: Advanced Training on Technologies and Didactic for Italian Teachers, Mario Bochicchio and his colleagues from the University of Lecce, Italy note that the "...teacher's role must be reinvented; its primary goal is not to be well programmed schoolbook explainers, but to supply students the ability to manage the primary keys..." Jan Mastin, Joseph Polman, and Kathleen Beyer from the University of Missouri-St. Louis report on the impact of school-based reforms on their teacher preparation program. Tweed Ross from Kansas State University describes the evolution of instructional technology in the College of Education from PowerPoint enhanced lectures to learning support. Barbara Chamberlain from the University of Virginia has a selection on the use of training teachers to use Photoshop and Sharon Reynolds from the Des Moines Public Schools provides insight on training teachers to troubleshoot Windows. Finally Juli Dixon and Judith Johnson from the University of Central Florida describe a course designed to train teachers in the “art of problem posing” in a high tech environment.

The second cluster of papers deal with issues of performance assessment with respect to teaching performance and learning. Cindy Anderson, Elizabeth Smith, and Joan Briscoe of National-Louis University together with Kevin Anderson from the Kenosha Unified School District report on the development of teaching portfolios. Alejandra Fernandez and Ana Beatriz Martinez from Universidad Central de Venezuela and Renee Cambiano from the University of Arkansas take portfolio development one step further examining the differences between an online portfolio and a traditional portfolio. Helen Barrett from the University of Alaska-Anchorage reports on the use of Adobe Acrobat for portfolio development.

Several of the submissions deal with knowledge representation and learning theory. Charles Dickens from Tennessee State University presents a paper that considers several facets of knowledge representation including constructivist theory, visual thinking, and the mathematical notion of hyperspace. Thorsten Hampel from the University of Paderborn in Germany describes a project in which students use document management systems to represent the current state of their knowledge. Eric Seemann, Walt Buboltz, Lamar Wilkinson, and Sonia Beaty - all from Louisiana Tech University have a presentation on the application of social learning theory to the teaching of technology skills, and the same group of authors also have a paper on the application of Rogerian Theory.

The next selection of papers deal with issues attendant to Distance Learning and Course Management Systems (CMS). The first paper by Brenda Gerth from the University of Victoria in Canada is a primer on the incorporation of digital audio in web-based instruction. Another approach to the CMS is presented by Punyashloke Mishra and Matthew Koehler from Michigan State University who describe the use of modular components in the development of web-enhanced coursework. Esther Klein-Wohl and Gila Haimovic from the Open University of Israel describe teaching in a second language employing CMS technology. Armand St.Pierre from the Royal Military College in Canada has a selection that examines the Web-based Instructional Model (WBIM) to enhance distance education. Mark Smith from Purdue University North Central has a paper that evaluates various software packages to enable an instructor at a distance to take control of a student's computer. Finally, James T.J. Wang
and David C.Y. Lin, both from National Taipei University of Technology in Taiwan, examine the intersection of virtual learning and human cognition.

The last group of selections deal with ethical, social, and legal issues. Lamar Wilkinson, Walter Buboltz, Adrian Thomas, and Eric Seemann, all of Louisiana Tech University examine the impact of technology on the socialization of students. Anatoly Sachenko and Hrygoriy Hladiy from Ternopil Academy of National Economy in Ukraine explain how they use the Internet as a means of enhancing a world view of their students. In the same vein, Carol Cobb from Bellarmine University describes her institution’s measures to produce “culturally responsive, inclusive, and reflective” teachers.

The greater breadth of issues in the section this year as well as the increased geographic diversity speak well to the maturation of the discipline beyond the earlier emphasis on technical issues.

Abstract: The National Council for the Accreditation of Teacher Education (NCATE) suggests that teacher education institutions require portfolios as a method for demonstrating that their preservice teachers have mastered NCATE standards including those technology standards recognized by the International Society for Technology in Education (ISTE). At the same time, school districts are requiring their teachers to demonstrate how their K-12 students have mastered the academic standards of that school district. This paper presents an electronic portfolio template that blends these standards, providing the opportunity to demonstrate how one artifact, in this case, a thematic lesson, acts as a performance indicator of mastery for each of these standards.

The National Council for Accreditation of Teacher Education (NCATE), in cooperation with the International Society for Technology in Education (ISTE), has developed a list of minimum competencies for beginning level teachers in technology (NCATE, 2000). This list is known as the National Educational Technology Standards for Teachers (ISTE, 2000). These competencies were developed from a list representing minimum competencies that ISTE has determined as being necessary for today's public school children to know. This list will help teachers prepare their students to be ready for tomorrow's jobs where projections indicate that five out of the ten fastest growing job areas will be computer related (College Planning Network 1996). To remain accredited through NCATE, teacher education institutions must demonstrate that they are addressing this area, that is, they must be training preservice teachers in the use of technology (NCATE, 1997), so that, in turn, their public school students will be able to meet their minimum technology standards.

At the same time that NCATE is emphasizing the infusion of technology in teacher education, NCATE is suggesting teacher education institutions demonstrate that their graduates have mastered these technology competencies through performance-based artifacts found in preservice teacher portfolios. The portfolios developed by preservice teachers can then be used as part of the teacher education accreditation process by NCATE. These portfolios provide evidence ensuring that preservice teachers have mastery of NCATE performance standards including the National Educational Technology Standards for Teachers (NETS) developed by ISTE. These portfolios can be either print-based or digital, saved on paper or saved on disk.
Preservice teacher work samples or artifacts within these portfolios are chosen by the preservice teacher to serve as a representation of the preservice teacher's mastery of the NCATE performance standards.

As teacher education institutions are addressing these NCATE requirements, they are exploring the professional literature in their search for programmatic changes that will result in effective technology-using teachers. In particular, a study by the International Society for Technology in Education (ISTE, 1999) explored several methods that teacher education institutions use to train their preservice teachers in the use of technology. This research concluded that technology infusion into the education courses of preservice teachers was more successful than separate technology training classes. One of the frequent requirements of these education courses is a lesson or unit plan. As teacher education institutions are attempting to respond to NCATE directives, many teacher education programs are requiring that their students develop these thematic units or lessons, frequently suggesting that the preservice teacher include a technology-infused lesson. These thematic lessons then are added to either the print-based or the electronic portfolio as a demonstration of the preservice teacher's mastery of the NCATE performance standards including NETS technology standards.

While preservice education is emphasizing technology integration and performance standards, inservice education is also emphasizing technology integration and student performance standards (NCREL, 2000). Increasingly, public school teachers are being asked to integrate technology into their classroom instruction (U.S. Dept. of Education, 1994). At the same time, these teachers are being asked to demonstrate the mastery level of their own K-12 students on state and national academic performance standards (NCREL, 2000). Reflecting these standards, many school districts have developed benchmarks for mastery and are asking their teachers to assess their students according to these benchmarks. The inservice teachers are then required to demonstrate through the use of performance-based assessments that their students have mastered these benchmarks. It follows that these K-12 standards or benchmarks and their assessments should be reflected in the artifacts that are included in the preservice teacher education portfolios. Indeed, NCATE is recommending that teacher education institutions begin to require the inclusion of K-12 student assessment samples with portfolio artifacts to function as a measure of the success of the students being taught by the preservice teacher (NCATE, 1999).

As part of the NCATE accreditation process, preservice teachers are asked to use these portfolios to demonstrate their expertise in teaching and learning through performance-based evidence in the form of artifacts. A logical blending in this portfolio is to develop artifacts that not only reflect these NCATE standards but also the academic standards of the school district where the field experience associated with the artifact takes place. Two preservice teachers from National-Louis University, using an electronic portfolio template developed to demonstrate mastery of the NCATE standards, as well as the ISTE standards, produced thematic lessons that combine these national standards with the local standards of the two districts where they did their field experiences. The software used for the template is an HTML template developed by the teacher education faculty member responsible for the technology integration of preservice teachers. The template includes links from the NCATE standards, the ISTE standards, and the district standards to the appropriate artifact, in this case a thematic lesson. The first page of the template presents a concept map that has branches labeled according to each of these standards. These branches act as a linking image map, allowing entrance into the portfolio by each of the different lists of standards. One branch enters the template through the NCATE standards while another enters the template through the ISTE standards. A third branch enters the template through a simple listing of artifacts while a fourth branch enters through one of four practicums that occur each term of the MAT program. Finally, the template can be entered through the appropriate K-12 school district standards. Figure 1 shows the illustration of the entrance page with the concept map for one of the two preservice teachers.
Each of the entrance points or buttons leads to a listing of the standards that are in turn linked to the artifact that functions as the performance indicator reflecting that standard. Figure 2 illustrates the link page of district standards from one sample portfolio while Figure 3 illustrates the link page from the ISTE standards to the artifact.
The electronic portfolio template provides a place for the preservice teacher to represent himself or herself in resume format. On the same page, the template provides a listing of NCATE performance standards that act as links to pages describing that appropriate NCATE standard. Figure 4 illustrates this page.

Each of the pages that are linked to the page in Figure 4 describe the appropriate NCATE standard. They also contain links to the artifacts selected by the preservice teacher to represent their mastery of this standard. Figure 5 is an illustration of one of these pages.
Assessment

| Evidence |

Standard 14: Assessment of Student Learning

The teacher understands and uses formal and informal assessment strategies to secure the continuous intellectual, social, and physical development of the learner.

Figure 5: NCArTE standard page and link to artifact

The template page that displays the artifact selected by the student is a framed page. This framed page has five frames. One frame includes the appropriate district standards that are covered in the thematic lesson. Another frame lists the appropriate NCATE and ISTE standards. A third frame includes the artifact itself, in this case, the thematic lesson. A fourth frame displays the reflection paper written by the student about the artifact. Finally, a fifth frame includes the teacher education instructor’s comments concerning the artifact or the thematic lesson. Figure 6 is an illustration of a framed page that includes these items.

Figure 6: Framed page with the artifact

The use of standards as a measurement of preservice teacher success is recognized by many institutions that have an impact on teacher education programs and teacher education candidates. The International Society for Technology in Education has developed a list of standards composed of technology skills that are expected to be met by beginning level teachers, NETS. The National Council for the Accreditation of Teacher Education recognizes this list of standards, but has their own list of standards, as a measure of competency for the beginning teacher. A suggested measure of this competency has been the production by the teacher candidate of a portfolio, in some cases, an electronic portfolio, that contains artifacts reflecting mastery of each of these standards.

At the same time, states and districts have developed lists of academic standards for their public school students. All these lists of standards can be reflected in the artifacts contained in a preservice teacher’s...
portfolio. Using links from these standards in an electronic portfolio, preservice teachers can select artifacts that demonstrate their mastery of these teacher education standards and their students' mastery of K-12 district standards. Thus, their artifact, in this case, a thematic lesson, reflects mastery of NCATE standards, NETS standards, and school district standards.

Using Adobe Acrobat for Electronic Portfolio Development

Helen C. Barrett
School of Education
University of Alaska Anchorage
United States
helen.barrett@uaa.alaska.edu

Abstract: Adobe's Portable Document Format is the ideal container for electronic portfolio reflections connected to digital artifacts. This paper describes the software environment, and then describes the process for converting digital artifacts from many applications into the Portable Document Format, and maintaining a cross-platform, web-accessible, hyperlinked digital portfolio.

Introduction

There are many tools and strategies that can be used for Electronic Portfolio Development. In the SITE 2000 Conference Proceedings, I outlined a five-stage, five-level model of electronic portfolio development, using off-the-shelf software. In addition to the stages of portfolio development, there appear to be at least five levels of electronic portfolio development, each with its own levels of expectation and suggested software strategies at each stage depending on technology skills of the student or teacher portfolio developer (Barrett, 2000). There are several commercial templates for creating electronic portfolios using PowerPoint and Hyperstudio, books and resources for creating digital portfolios in HTML, and a variety of proprietary software packages. However, there are few resources available on how to publish an electronic portfolios using Adobe Acrobat. This paper outlines strategies for using this software to create an electronic portfolio.

Adobe Acrobat and the Portable Document Format: the Universal Container

Acrobat has been branded as ePaper by Adobe, with the following description on their website:

Adobe® Portable Document Format (PDF) is the open de facto standard for electronic document distribution worldwide. Adobe PDF is a universal file format that preserves all of the fonts, formatting, colors, and graphics of any source document, regardless of the application and platform used to create it. PDF files are compact and can be shared, viewed, navigated, and printed exactly as intended by anyone with a free Adobe Acrobat® Reader™. You can convert any document to Adobe PDF, even scanned paper, using Adobe Acrobat 4.0 software.

Adobe PDF is the ideal format for electronic document distribution because it transcends the problems commonly encountered in electronic file sharing. Anyone, anywhere can open a PDF file. All you need is the free Acrobat Reader. PDF files always display exactly as created, regardless of fonts, software, and operating systems. PDF files always print correctly on any printing device.

Adobe PDF also offers the following benefits:
- PDF files can be published and distributed anywhere: in print, attached to e-mail, on corporate servers, posted on Web sites, or on CD-ROM.
- The free Acrobat Reader is easy to download from our Web site and can be freely distributed by anyone. More than 110 million copies have been downloaded or preloaded onto PCs.
- Compact PDF files are smaller than their source files and download a page at a time for fast display on the Web.
- Using Acrobat 4.0 software, bookmarks, cross-document links, Web links, live forms, security options, sound, and video can be added to PDF files for enhanced online viewing. (Adobe, 2000)

Adobe Acrobat is based on the PostScript, a device independent page description language, introduced by Adobe in 1985 to control printing documents to laser printers. The Portable Document Format (PDF), introduced in 1993, is an advanced version of the PostScript file format, which saves each page is an individual item, incorporating fonts within the document while creating a file that is usually smaller than the originating document. The underlying concept of creating a PDF document is printing to a file (Andersson et, al., 1997).
Creating a PDF file makes it portable across all computer platforms, using the free Reader that can be downloaded from the Adobe web site. Adobe grants permission to publish the Reader Installer on a CD-ROM without written permission from Adobe. There is even a version of the Acrobat Reader that can be pre-installed on a CD-ROM, although most computers are being shipped today with the Acrobat Reader pre-installed on the hard drive. PDF files are WWW compatible, with the PDFViewer plug-in for most web browsers. The latest version of Acrobat can even download web pages with fully functional web links.

Electronic Portfolios published in Acrobat

An electronic portfolio includes technologies that allow the portfolio developer to collect and organize artifacts in many media types (audio, video, graphics, and text). A standards-based electronic portfolio uses hypertext links to organize the material, connecting artifacts to appropriate goals or standards. Often, the terms "electronic portfolio" and "digital portfolio" are used interchangeably. However, I make a distinction: an electronic portfolio contains artifacts that may be in analog (e.g., videotape) or computer-readable form. In a digital portfolio, all artifacts have been transformed into computer-readable form. (Barrett, 2000)

In my opinion, Adobe Acrobat is the most versatile and appropriate tool to publish an electronic portfolios because this software most closely emulates the 3-ring binder most often used in paper-based portfolios. In my opinion, PDF files are the ideal universal container for digital portfolios. In fact, here is how John Warnock, Co-founder and CEO of Adobe Systems, Inc. defined the Adobe Acrobat Portable Document Format:

PDF is an extensible form of paper, a hypermedia that is device independent, platform independent, color consistent and it is the best universal transmission media for creative and intellectual assets.

What else is a portfolio but a container for our creative and intellectual efforts? If Adobe Acrobat is chosen as the development software, here are the skills I have found to be important:

1. Convert files from any application to PDF using PDFWriter or Acrobat Distiller
2. Scan/capture and edit graphic images
3. Digitize and edit sound files
4. Digitize and edit video files (VCR -> computer)
5. Organize portfolio artifacts with Acrobat Exchange, creating links & buttons
6. Organize multimedia files and pre-mastering a CD-ROM
7. Write CD-Recordable disc using appropriate CD mastering software OR
8. Post PDF files to a web server
Structure of my Electronic Portfolio

Here is the process I use to create and then update my electronic portfolio every year. I maintain two separate PDF files: The Portfolio.PDF file is organized by the major sections as outlined in my table of contents:

**INTRODUCTION**
- Table of Contents
- Introduction to the Reader
- Workload Agreement
- Annual Activity Report
- Self-Review and Standards Achievement
- Vita

**TEACHING SUMMARY**
- Curriculum Development
- Course Syllabi

**RESEARCH & CREATIVE ACTIVITY SUMMARY**
- Publications
- Grants
- Conference Presentations

**SERVICE SUMMARY**
- University Service
- Community & Professional Service
- Summary of Professional Development
- Supporting Correspondence

The Artifacts.PDF file contains copies of each artifact I might want to include, organized chronologically with all of the artifacts together for each year. The order of each year’s files follows:
- Annual Activity Report
- Syllabi for the year for all courses taught
- Course Content Guides for all new courses developed or revised
- Grants written/received during the year – full text
- Publications for the year – full text

**How I Create and Update my Electronic Portfolio using Adobe Acrobat**

1. **Organizing files and folders** - My hard disk drive is really my working portfolio. Once a year, I “mine” my hard drive for those “gems” that I want to include in my artifacts file.

   1.1. During the year, collect appropriate artifacts in a folder called, “new items” or in a folder named for the year. I keep a “Working Folder” to store all of the artifacts for inclusion in the portfolio that have been converted into Acrobat format. Sometimes I add contemporaneous reflections to the artifacts using the Notes tools in Acrobat.

   1.2. Set up a new folder for the working files for the new year. Save all of the new summary files in the new current year folder if you want to maintain source documents for prior years (the prior year folders can be tossed later, if hard disk space is an issue). Once a PDF file is inserted into the main Portfolio.PDF or Artifacts.PDF document, I store them into a folder that I call “PDF files” inside the current year’s folder.

2. **Contents of portfolio pages**

   2.1. At the end of the summer, I write up my Annual Activity Report (AAR). Each component of the report becomes the foundation for updating the separate sections of the portfolio. The formatting of each section matches each section of my Vita.

   2.2. From my Annual Activity Report (AAR), copy the publications, conference presentations, and any other appropriate information into my Vita. Print the Vita to PDF.

   2.3. Update major section summary pages (Teaching, Research, Service)
2.4. From my Annual Activity Report (AAR), copy the contents of each section to the Summaries of each type of activity (i.e., classes taught, different types of service, publications, conference presentations, etc.) after adding a heading for the current year. This results in a summary of the different aspects of my work for all years. I recommend organizing these summaries in chronological order, adding the current year's record at the end. That way, if links have been made to artifacts, those links would remain in the same place when the new information is added at the end.

2.5. Convert these summary pages to PDF (all of these items are drawn from the AAR):
- Summary of Courses Taught
- Overview of Curriculum Development
- Summary of Research & Creative Activity
- Summary of Publications
- Summary of Grants Received including paragraph Abstracts
- Conference Presentations
- University Service
- Professional Service and Affiliations
- Community Service Summary (including School District In-Services)
- Paid Consulting
- Summary of Professional Development
- Supporting Correspondence (see description #3.6)

3. Organizing the PDF files

3.1. Take last year's PDF portfolio, save with another name. Create a new folder to hold the new portfolio and place this new file into that folder.

3.2. I maintain my artifacts in a separate PDF file. Make a copy of that file, but keep the same name if you want the old links to that file to work. Move that new file to the new portfolio folder.

3.3. Replace the appropriate pages in the portfolio, updating them with the new versions. This will leave the links intact. Don't Delete Pages and Insert Pages; the links will disappear. The only pages to insert should be those where the page counts exceed the previous year when the additional information is added.

3.4. Review the artifacts that might be included in the portfolio file (in my case, the current year’s syllabi), and copy those pages to the end of the Artifacts file. From prior experience, the cross-document links from the Portfolio PDF file to individual pages in the Artifacts PDF file will be correct only if pages are not inserted in the middle, but rather at the end of the document. I insert a divider page before the beginning of the new year's files.

3.5. While the Artifacts file may be filed in chronological order, the Bookmarks can be organized by artifact type, so that each major heading can have sub-headings that link to individual documents.

3.6. An important component at the end of my portfolio is a collection of correspondence that I have received during the year that support my portfolio. Many of these items are e-mails and have been converted to PDF at the time they were received, and are stored in the folder described in Step 1. I create a summary list of these pieces, convert that document to PDF, and insert into the portfolio. This is the only page that I delete and insert, and then need to update the links and the bookmarks. I also make links to each individual piece of correspondence.

4. Adding Reflections (Reflections turn artifacts into evidence of achievement)

4.1. When creating the PDF version of an artifact, sometimes I add a reflection to the file, using Acrobat's Annotations Tools.

4.2. Update the Introduction to the portfolio, convert to PDF, and replace the older version in the Portfolio file. If necessary, link from the Table of Contents and re-link Bookmark.
4.3. Write up my summary reflection for the year, convert to PDF and insert into the Portfolio file. If necessary, link from the Table of Contents and re-link Bookmark.

4.4. Review the document that contains the Standards I have chosen, and update the reflections from the prior year. I keep my ATE reflections in a FileMaker Pro database. Convert to PDF and replace the older version in the Portfolio file. If necessary, link from the Table of Contents and re-link Bookmark.

5. Fine-tuning the finished files before publication

5.1. Check all Bookmarks or make new ones.

5.2. Check all links or make new ones.

5.3. If file size is not an issue, create all Thumbnails.

5.4. If you want the PDF files to open with the Navigation Pane showing, select File Menu -> Document Info > Open and select the appropriate Initial View.

5.5. Before finalizing the PDF files, do a “Save As...” using the same name to compress the file. If saved too many times, the file becomes very large.

5.6. If the files are to be posted in a public space, such as a web server, I save the files with Normal Security, to prevent printing, copying, adding notes, making any changes or form fields. I also assign a password required to change those security provisions. Be sure to remember the password, or keep another version without the security provisions.

6. Adding Multimedia

6.1. I review the portfolio for standards or reflections that could benefit from a multimedia reflection. I also review the video clips that I have collected over the year. I create short video clips to illustrate a component of my portfolio (try to keep each clip less than 30 seconds).

6.2. Save the files in Quicktime cross-platform format or AVI format. Store in a “Movies” folder inside the current portfolio folder. Once stored in a place that will not change, create links from the Portfolio document to the appropriate video file.

6.3. If appropriate, I will create a tour of the portfolio using CameraMan or another Screen Recording software package, narrating the overview for a novice viewer, and saved in QuickTime or AVI format.

7. Publishing the Portfolio

7.1. Using a CD-mastering program, I set up a temporary 650 megabyte partition and copy the all appropriate files and folders in the current portfolio folder to that partition. Organize the windows the way they should appear when the CD is loaded in the CD drive (Macintosh only). Write the CD.

7.2. Post the appropriate files to a web server. I post only the Portfolio.PDF file, not the Artifacts.PDF file to a web server. I also use the Normal Security so that the document cannot be printed, pages or text/graphics copied, etc. I do not include the video clips with the online PDF files, since the links to video do not work over the Internet.

Discetech: Advanced Training on Technologies and Didactic for Italian Teachers

Mario Bochicchio°, Roberto Paiano°, Paolo Paolini*, Giuseppina Marselli
SET-Lab, Università degli Studi di Lecce, Via per Monteroni, 73100 Lecce
mario.bochicchio@ingle01.unile.it, roberto.paiano@ingle01.unile.it
* Hypermedia Open Center, Politecnico di Milano, Via Ponzio 34, 20133 Milano, paolini@elet.polimi.it

Abstract: The Discetech project was conceived in 1996 at Politecnico di Milano (Italy) to integrate technological training and educational practice. In Discetech, in fact, we train teachers on the use of computer applications (CD's, Internet, software, videoconference, ...), then we prepare it to design teaching experiences to be performed in their own classrooms. Each experience is observed and measured, from the didactic point of view, by adopting a number of parameters (about the training process, the educational aspects, the knowledge acquisition and the contents selection). In the final phase of each year the results are evaluated, compared and shared among all participants in order to gain the largest possible amount of knowledge about the adopted teaching modalities and the achieved results.

Discetech is an experimental project rather than a simple upgrading course; it is conceived to observe and to better understand different aspects of the Italian School.

Introduction.

The Discetech project was started in 1996 at Politecnico di Milano; in the first year it was performed in the high schools of Como, then, in 1997 it was extended to the high schools of Lecce (in the South East of Italy) in collaboration with the local University. This paper is about the Lecce branch of the project.

Discetech is an experimental project rather than a simple upgrading course. It is conceived to analyze different aspects of the Italian School:

- the first aspect is about the extraordinary spread of new technologies among the students in the last years: it is interesting to observe that, in most cases, the use of computers, Internet, CD/DVD-ROMs etc. is not pushed from School but from other factors (essentially computer games and the relatively low cost of the hardware).
- the second aspect is about the “embarrassment” of many teachers with respect to technological issues (“how to find something on Internet?”, “how to read a CD-ROM?” “how to insert an image in a composition written on the PC?” etc.): teachers need to be credible towards students without transforming itself in computer scientist. Teachers need to use (and to demythicize) technologies by using it, not to learn internal details about it.
- the third aspect is about the current learning process, primarily (almost exclusively) based on schoolbooks: teachers don’t know how to evaluate/use new media in their teaching practice.
- finally, we consider that today students may have several information sources, like CD’s or Web sites, so they can be more informed (in some case) and/or more updated (in most cases) than their teachers, nevertheless students need a method to organize this information and to transform it in knowledge.

For these reasons Discetech is above all directed to teachers, and not to students: the coordinated training on technological applications and didactic experimentation is the key point of the project (Henderson & Braidy, 1999) (Suen & Szabo, 1999).

This paper is about the experience acquired in last three years of the Discetech project in Lecce.
The project.

Concisely, in Discetech we train teachers on technologies and computer applications (CD-ROMs, DVDs, Internet, e-mail, software, videoconference ...), then we prepare it to plan a teaching experiment to be performed in their own classrooms. The technological training and the preparation of the experiments is carried out in the first semester of each year, while the experiments (the duration is on the order of 3 months) are performed in the second semester.

During each experiment, the whole class, and each student in it, are observed from the teacher(s), and a number of parameters are evaluated and registered, mainly about the training process, the educational aspects, the knowledge acquisition and the contents selection.

In the final phase of each year the results are evaluated and shared among all participants in order to gain the largest possible amount of knowledge about the adopted teaching modalities. A suitable didactic background is essential in this phase to compare the results coming from the various experiments and to extract from it a more global and reusable knowledge.

In more details, at its fourth year, the project is structured into 3 levels and each level is organized into 3 phases. Each phase is structured into modules with both theory and practice.

- The Base level is oriented to teachers approaching for the first time to Computer and multimedia technology (Sims 1999).
- The Advanced level is oriented to teachers coming from the base level or with previous experiences about multimedia technologies. The goal of this level is to learn an advanced use of Internet resources for both searching the Web and participating to virtual communities (Bennet 1999) (Harasim 1995) (Slavin 1995) (Hiltz 1994).
- The Experimental level is oriented to teachers coming from the previous levels. Here teachers learn how to evaluate existing CD-ROMs and Web Sites, how to conceive new hypermedia applications and how to develop it (Frohlich 1999) (Hackbarth 1996) (Garzotto et al. 1993).

Each level is structured in 3 phases with different contents according to the level, but with a common goal.

- In the first phase, technical tutors provide to teachers the needed know-how for that level.
- In the second phase, didactic tutors provide to teachers the knowledge needed to develop teaching experiments in which “normal” teaching aids and new technologies are jointly used to achieve specific didactic goals.
- In the third phase the teachers, in its own classrooms, performs the teaching experiment. A given number of parameters are measured during this phase in order to evaluate the results and to compare it with the results of their colleagues.

Base Level: Modules Structure.

The base level has the goal to quickly supply the teachers with the initial computer practice and the base principles to understand a multimedia application. This level is structured into the following modules:

- Module A: Introduction to the PC, the Windows Operating System, Word 2000;
- Module M: CD-ROM and multimedia application; introduction to the Hypermedia Design Model (HDM)(Garzotto et al. 1993); evaluation parameters for multimedia applications;
- Module MI: advanced topics on the evaluation of the hypermedia applications; presentation of the main criteria to select a CD-ROM as teaching-learning aid (a media library with more than 300 titles is used).

In this module are presented the best didactic projects of the past years;
- Module I: Introduction to the Internet, search engines, e-mail;
- Module W1: Didactic evaluation: parameters and tools
- Module W2: planning of the teaching experiments (individual meetings with didactic tutors);
- Module W3: results presentation and analysis.
Advanced level.

In the advanced level, teachers achieve to the ability to correctly use the Internet in their usual teaching-learning activities. This level is structured into the following modules:

- Module I1: Introduction, objectives and examples;
- Module I2: Internet Browsers: configuration and basic operations;
- Module I3: Internet communication: e-mail, newsgroups, chat, mailing list;
- Module I1: exploration and evaluation of about 100 Web sites selected for the purpose; in this module each teacher select one or more Web site to be used in its teaching experiment;
- Module C1: virtual communities; building a community with WebBoard;
- Module C2: collaboration tools and video-conferencing tools; MS Netmeeting;
- Module P1: issues and technical planning of a teaching experiment based on the above-described tools;
- Module W1: Didactic evaluation: parameters and tools;
- Module W2: didactic planning of the teaching experiments (individual meetings with didactic tutors);
- Module W3: presentation and evaluation of the results.

Experimental Level.

At this level the teachers are involved in the creation of an hypermedia application. The level is structured into the following modules:

- Module H1: the HDM methodology to evaluate Hypermedia Applications; (Garzotto et al. 1993);
- Module H2: the HDM methodology to model Hypermedia Applications;
- Module T1: tools for media authoring (Adobe Premiere, Adobe Photoshop, ...);
- Module T2: hypermedia authoring environments (Macromedia Director, Flash, DreamWeaver, ...);
- Module D1: design and development of a specific hypermedia application;
- Module E1: Evaluation of the efforts to develop the above application. Evaluations of the results.

In the last 3 years Discetech involved, in Lecce, about 100 teachers and 1700 students, participating to 75 different teaching experiments.

Didactic Project.

A synthetic example of teaching experiment is reported in the following. The project was developed for an history class in the first year of a professional high school, using a CD Rom about the Ancient Rome. Two kinds of goals (generic and specific) are defined:

- the generic goals, structured into 4 categories:
  1. training:
     - to enhance the student's interest for the History;
     - to enhance the class-group understanding;
  2. instrumental:
     - to correctly use the computer;
     - to acquire the ability to interact with different information sources;
  3. knowledge:
     - to understand texts of medium difficulty and to elaborate it;
     - to establish links between arguments and to compare them;
  4. content:
     - to grasp the fundamental concepts of the subject;
     - to grasp the links with other subject in a multi-disciplinary environment;
- the specific goals:
  - to correctly explain the arguments
  - to appropriately use of the vocabulary
  - to correctly evaluate the CD contents.
  - to place the historical events in the correct time/space dimension
  - to understand the political, social and economic situation in the ancient Rome.
The expected results are:
- To analyze and to list the main concepts
- To find the hot keys and to understand the links between arguments
- To verbally explain the acquired information
- To find/understand the implicit and explicit means in the non-verbal (multimedia) information;
- To enhance the motivation of students with low proficiency problems.

evaluation parameters.

The evaluation of the teaching experiments is based on the observation of different groups of parameters: two of this groups are reported in Tab. 1. Teachers fill the tables by observing each student, and the whole class in almost two different times: before and after the experiment. The normal scholastic tests performed during the experiment are also recorded and analyzed.
Tab. 1, as well as the other tables of parameters, has been designed specifically for the Discetech project from the didactic equipe of Lecce.

Final Considerations.

During the last 3 years we observed that the teachers, initially embarrassed in using the computer, and skeptical about the effective use of multimedia and Web applications into their lessons, changed radically their opinion when experimented the combined use of traditional and innovative media in their projects.
They generally become more able to select new CDs and new Web sites related to specific fields of interest.
The teachers well understood and interpreted their new role, becoming more and more a guide for the students, in a cooperative learning experience, and working with other teachers on similar projects.
Furthermore, teachers became more interested in this new way of teaching, as a consequence of the increased preparation and participation of the students.

In general, during the running phase of the projects, teachers observed the following points:
- The motivation and the interest of students with a good profit were enhanced and the project was a stimulus to consolidate their self-esteem.
The motivation and the interest of students with lower scholar profit were more oriented to the instruments than to the contents, but also this result is remarkable.

All the students well understood the structure of adopted CDs or Web sites. The final result of each student was generally better than before the experiment.

In general, all students participated to the experiment and cooperated with their colleagues independently from any previously established friendship relation. The project stimulated an effective exchange of information and experiences.

To sum up, in our opinion teacher's role must be reinvented; its primary goal is not to be a well programmed schoolbook explainers, but to supply to students the ability to manage the primary keys, the conceptual supporting structure and the principal concepts of a given subject, independently from the technical nature of the media (TV, CDs, Internet, Books, Computers, ...) used to teach.

Abstract: Portfolio is a methodology for teaching and evaluation. A certain time and requirement must be followed when developing a portfolios must. It implies different activities such as: homework, presentations, research, projects, interviews, comments and others. This methodology demands students to compromise the process of learning, being the ultimate goal to fulfill the program objectives. For this study, two groups were compared using online portfolios and traditional portfolios. The populations were composed of 58 college students from two different universities. Data were collected from September 1999 to January 2000.

Introduction

Education today is touched by diverse paradigms some of them are: the high develop of new technologies for communication and information, the cognitive science and its impact in teaching and learning and the continuing education. Based on this framework one of the most important issues to discuss is the learning evaluation. Today it is accepted that evaluation plays an important role for the process of learning to give meaningful feedback to the learner, to improve the learning process, and to teach practice and educational options (Gonzalez & Flores, 1998).

Education today is searching for new meaning for the teaching and evaluation process. It is looking for alternative ways to teach and evaluate. Today evaluation is more than asking students to select answers; it is asking students to generate questions and answers to situations related to the real life (Sacristan, 1988). Also, it is important to explore the meaning of knowledge and make it meaningful to the learner (Ausbuhl, Novak, Hannesian, 1983). Evaluation has to relate not only to the academic tasks, but also to the many possible answers the learner can create, based on creative and divergent characteristics (Lazear, 1991).

Alternative evaluation will require radical changes into the process of teaching and learning. In fact the evaluation process needs to be open, flexible, and diverse to related students performance with real life situations. Evaluation has to be a continuous
process, with permanent feedback. Finally, alternative evaluation has to consider mistakes as a method of learning.

Portfolios are a method that can be used as an alternative way to evaluate the process of learning. They offer many possibilities to enrich the teacher's work and student's possibilities to learn, but also its practice emphasizes the action and decision students have on their own learning. Portfolios can be used as a collaborative work that will help develop cognitive processes (Castelli, 1999).

Portfolios offer the learner opportunities to make decisions on their learning, and the opportunity to think about the process of learning. Using the portfolio method, allows students to be aware of their own learning and help them to develop cognitive process (Brien, 1994).

Portfolios are a method for teaching and learning. Portfolios can be a collection of many works, experiences, or assignments. Portfolios are a method of evaluation, referring to an authentic evaluation that puts students in relevant, and meaningful tasks (Perez Gomez, 1991) related to the real life.

Using portfolios, the learner will build their own progress to the expertise. Students are autonomous and responsible for their own learning. Its allow students to conform real criteria about the quality of their performance. Finally, portfolios permits learners visualize their own production and compare them with others to determine progress and weaknesses in the learning process. Portfolios can be used as formative or summative ways to evaluate learning.

New technologies of communication and information are affecting education. On this mediated environment portfolios can be developed online. It is possible to evaluate the process of learning based on electronic portfolios. Its represents dimensions, abilities, examples and answer to brainstorming. Portfolios have been used to make a search on the Internet, do assignments, and give feedback throughout e-mail. In the process of building portfolios online it is requires students to create lectures, use portfolios with other learners, and build a CD-ROM version.

Research Questions

1. Relating to the process of developing and conducting portfolios in the process of teaching and learning, how do students who develop traditional and online portfolios differ?
2. Relating to the evaluation of the portfolio as a tool for learning, how do students who develop traditional and online portfolios differ?
3. Relating to the portfolio as an evaluation methodology, how do students who develop traditional and online portfolios differ?

Methodology

A survey was developed by the researcher, and was used to gather the data. The survey was developed to measure three variables: (1) developing and conducting a class, (2) methodology and (3) evaluation. The survey consisted of 12 questions to be answered
on a scale of A = totally agree, B = partial agreement, and C = disagree. Items 1, 2, 3 and 4
pertained to criterion 1, items 5, 6, 7, 8, 9 and 10 pertained to criterion 2, and items 11 and
12 pertained to criterion 3. The Survey took approximately 20 minutes to complete.

The research was designed to acquire information on portfolios that are used in
instruction. The data was collected from twenty-nine participants that created a traditional
portfolio and twenty-nine participants that created an online portfolio.

T-tests were conducted in order to determine if there was a significant difference
between the students developing traditional and online portfolios. Descriptive statistics
were also utilized.

Findings

The sample consisted of 29 students developing a traditional portfolio and 29
students developing an online portfolio. Upon analysis, the t-test indicated that there was
a significant difference between the two groups. (t = 2.31 p = .03).

The t-test indicated that there was a significant difference between the students
who developed traditional portfolios and the students who developed online portfolios
concerning how a portfolio was developed in class (t = 3.12 p = .02). A t-test indicated
that there was no significant difference between the students who developed traditional
portfolios and the students who developed online portfolios the methodology of
developing the portfolios (t = .73 p = .47). A t-test indicated that there was no significant
difference between the students who developed traditional portfolios and the students
who developed online portfolios the methodology of developing the portfolios (t = .46 p = .69).

One hundred percent (n = 29) of the students that developed traditional portfolios and
100% (n = 29) of the students that developed online portfolios, agreed that the
professor was clear and precise with homework concerning the portfolios. One hundred
percent (n = 29) of the students that developed traditional portfolios and 100% (n = 29) of
the students that developed online portfolios, agreed that the answers were according to
the topic.

Ninety-six percent (n = 28) percent of the students that developed traditional
portfolios and 100 % (n = 29) of the students that developed online portfolios agreed that the
portfolios consisted of more effort and dedication in the class. One hundred percent (n =
29) of the students that developed traditional portfolios and 100% (n = 29) of the
students that developed online portfolios indicated that the portfolio demands pertained to
the class.

Ninety-seven percent (n = 28) percent of the students that developed traditional
portfolios and 100 % (n = 29) of the students that developed online portfolios indicated that
creativity and the portfolio were related. One hundred percent (n = 29) of the
students that developed traditional portfolios and 100% (n = 29) of the students that
developed online portfolios indicated the portfolios promoted cooperative learning.

One hundred percent (n = 29) percent of the students that developed traditional
portfolios and 100 % (n = 29) of the students that developed online portfolios indicated that
the demands were according to the students’ backgrounds. Ninety-three percent (n =
27) of the students that developed traditional portfolios and 93% (n = 27) of the students
that developed online portfolios indicated that the portfolios required extra time.
One hundred percent (n = 29) percent of the students that developed traditional portfolios and 97% (n = 28) of the students that developed online portfolios indicated that the assignments and activities were interesting and useful. One hundred percent (n = 29) of the students that developed traditional portfolios and 97% (n = 28) of the students that developed online portfolios indicated that the portfolios were relevant.

Ninety-three percent (n = 27) percent of the students that developed traditional portfolios and 100% (n = 29) of the students that developed online portfolios agreed with the professors’ evaluation of the portfolio. Forty-one percent (n = 12) of the students that developed traditional portfolios and 24% (n = 7) of the students that developed online portfolios indicated that they knew how to develop portfolios.

Conclusion

Knowing how students are using portfolios can be beneficial in several ways. First of all, knowing this information allows educators to incorporate it into curriculum in both traditional and online situations. This will in turn provide an opportunity to enrich the learning environment. Imagining the future, there will be more access to online learning. Educators can take this information to incorporate it into new courses and distance learning or Web-based environment.

Portfolios can be used to visualize students’ performance and to certify students progress. It can be utilized as a methodology for teaching and learning, a methodology for evaluation, and finally as a methodology to develop educational values. In higher education professors can use portfolio in a wide range that enrich the instructional process and to evaluate the performance. However the most important part is that the students have the opportunity to control their own process of learning and to value it and to compare their own criteria with professor’s criteria.

Instructional Strategies for Adobe Photoshop: 
Developing Teacher Training That Works

Barbara Chamberlin 
University of Virginia, United States 
bchamberlin@virginia.edu

Abstract: Adobe Photoshop is a powerful image-editing program with extended capabilities. Unfortunately, the power and versatility of the program can result in teacher training that is too broad, difficult to apply immediately to classroom resource development, and overwhelming to those new to image editing. Instructional conditions often place additional constraints on Photoshop instruction, such as lack of adequate lab facilities and short training periods. Skill-based training in Photoshop should be relevant, easy to learn and implement, well documented with tutorials for further exploration, and should build confidence and develop problem-solving capabilities.

Adobe Photoshop is a comprehensive graphics program - the industry standard in manipulating photographs and bitmap graphics. Technologists often fall in love with it because it is fun to use and teach and offers creative outlets rich in visual possibility.

The technical community is so enamored of Photoshop that instruction in its use often assumes an evangelical flavor: Instructors may emphasize the full range of its features, stressing that ‘anyone doing a website must learn Photoshop.’ Because Photoshop is so comprehensive, teachers could easily devote more time mastering this graphics tool than developing educational content.

Photoshop can be valuable to teachers and is a valid component of teacher education: however, teachers need instruction designed for K-12 use and applications. Teachers need Photoshop training that is applicable to their uses. While other instructional methods such as project-based learning may be an effective way to develop teachers' skill in Photoshop, hour-long workshops seem to be the norm. Educational technology specialists can employ this format effectively, provided they focus their workshop on the appropriate instructional objectives for teachers.

Teachers are now required to master a broad range of software. Photoshop instruction should draw correlations among the range of graphics programs that teachers may encounter, and specify how Photoshop is particularly geared to a specific task. Instruction should develop skill in the program while also developing skill in directing self-learning in the program.

Consider this possible scenario:

Mary is a 6th grade teacher who uses WebQuests regularly in her Life Science classroom. Though the WebQuests are effective and generally liked by her students, she wishes she could have more control over her images. She tries to make her web pages visually interesting, using clip art whenever possible. She knows her pages are slow to load because of the images, and wishes she could resize them to the correct size. She also thinks she could do a lot with a graphics program; such as separating some bones out of the human skeleton image for the "No Bones About It" lesson where her students make predictions on bone use based on structure.

Mary was enthusiastic about attending the Photoshop training Saturday morning. Photoshop was a great program. The trainer clearly loved the tool and showed a lot of what it could do. She loved how the trainer restored the old photo to
remove the fold line across the middle, and was impressed by the fancy borders he could make around the animal photos.

The best part of the workshop occurred when the instructor demonstrated how easy it was to use the selection tools. She took detailed notes as the trainer used the magic wand tool to select one sunflower from a field of flowers, and then pasted the flower into a graphic for a web page. She couldn't wait to get to her computer at school to tackle the bones image.

Mary's schedule was as busy as it usually was. During the first three-day weekend after the workshop (about 4 weeks later), she fished out her notes and opened Photoshop and her bones image. Wait a minute... Her notes weren't as clear as she thought they were. At the top she had scribbled something about 'check the resolution', but now that didn't make any sense to her. She was able to use the magic wand tool and select parts of the background around the bone in the photo. The background had a lot of different colors in it, so it was tricky. She was very careful, and spent about 45 minutes selecting exactly the background around the bone. She selected another part of the picture and -- oh no -- she just double clicked. She lost the selection she spent 45 minutes getting! "Forget it," she thought, and decided to crop the image close, leaving the background in the photo. She saved it as a JPEG (she remembered the trainer said jpeg was a good format for the web) and used Front Page to put it in her WebQuest. "That doesn't seem right", she muttered, the image was huge! "It was so much smaller on the screen," she thought to herself, "What am I doing wrong?" She opened the second bone image she wanted to work with. A friend had given her this photo she took at the museum. Mary opened it, made some changes and tried to save... Photoshop wouldn't save it as a JPEG... Why not? She had just done it successfully minutes earlier... "Why doesn't it work now?"

Over dinner, Mary was grumbling about her experience, saying she wasted her time even trying to learn the program. Her daughter, visiting for the weekend, tried to console her, "Mom, don't feel bad, I had to get a degree in graphic design before I started to really understand the program. Maybe you should leave Photoshop to the artists."

The instructor in this scenario was right in believing Photoshop could serve teacher's needs. The instructor was enthusiastic about the program, and was able to get the students excited. Several instructional strategies could have been implemented in the workshop that would have changed Mary's experience. These include:

**Instruction Should be Relevant**

All instruction in Photoshop should be placed within an educational context. Will teachers be restoring old photos? Will teachers need to add a third eye to the photo of a fashion model? Instruction should demonstrate real applications related to the classroom curriculum such as Mary's bones example.

Teachers frequently prepare images for the web; so any Photoshop instruction should include a demonstration of saving in web formats. When altering existing photos, most teachers need to highlight a certain area, add simple graphics such as an arrow or box, or include text in an image. Teachers also frequently handle several images in the same manner, such as preparing individual images from each student. When structuring a planning session, begin with a list of tasks teachers will need to perform using Photoshop, and teach software skill relating to those tasks.

For example, Photoshop's "Effects" feature applies drop shadows effortlessly to any layer, though drop shadows rarely enhance the educational power of a single image. Rather than emphasize this glamorous feature, emphasize the power of navigational graphics in the design of a web page. When developing buttons for navigation, users are more likely to differentiate navigational text buttons from traditional text if the buttons look like traditional, three-dimensional buttons. Using common WebQuest headings, create text over colored square blocks. Use the "Effects"
feature to bevel these square blocks, creating simulated buttons. In this manner, you have helped the teacher strengthen interface design skills, as well as demonstrate a simple component of the program. Additionally, the next time the teacher is making WebQuest buttons; they will remember this lesson, recalling a relevant, easy to apply Photoshop skill. In an extension of this skill, the teacher can explore the “Effects” options, learning that drop shadow is an option, should they choose to use it.

Additional relevant skills include:

- **GIF v. JPEG: When to Use Which for Web Images**
  Include a discussion of saving as any file type, as well as a conceptual overview of why we use different file types.

- **1001 Words: Adding Text to an Illustration**
  Text can be used many ways in Photoshop, including labeling parts of a specimen, ‘signing’ students’ names to work. Text is also a good way to demonstrate layers and how they work in Photoshop.

- **Getting What You Want: Selection Tools in Use**
  Frequently teachers wish to remove the subject of their photo from the background, most will find using a combination of Quick Mask mode, the magic wand, and other selection tools helpful. Remember to use a real example that could be used in an educational setting.

- **Size Does Matter**
  The most common mistake in web pages is resizing images in the web page, resulting in images that print too large, overprinting text on the page. When developing pages, specialists should resize images to the desired size in Photoshop, requiring a rudimentary understanding of pixels, resolution, file size and the “Image Size” dialog box. As an example, prepare snapshots of student work for a standard web size, approximately 250 pixels wide by 300 pixels tall. Remember to use a real example that could be used in an educational setting.

- **32 GIFs per Second: Batch Processing Your Class Images**
  The Actions palette allows for batch processing of several steps, including opening a file, resizing, and saving as a GIF or JPEG.

**Instruction Should be Easy to Learn and Implement**

In-service instruction is often delivered in short doses. Instructors can specify small parts of using Photoshop; such as “JPEG or GIF: when to use which” or “Five Ways to Select Items in Your Photos.” Instructors should remember that Photoshop is just a small part of each teacher’s collection of software skills. A teacher doesn’t have to understand how professional graphic artists use CMYK mode, or how alpha channels work to crop a simple image.

Successful strategies for keeping training digestible include the one-third, two-thirds rule: use one-third of your allotted time for demonstration, and two-thirds for hands-on practice. Consider this format:

- Provide a conceptual overview for what will happen, including a view of the ‘finished’ product.
- Clarify that you will demonstrate twice, once while they watch and once while they follow along.
- Provide extension activities in writing, so that quick learners will be able to move forward exploring the tools (“Once you have mastered the ‘bevel’ mode of the Effects feature, experiment with your text by applying a drop shadow, or embossing”).
- Provide sample images so that everyone is working with the same file on which you have worked.
- Teach no more than one conceptual idea (such as resolution or layers) per hour session.

**Workshops Should be Well-documented, with Tutorials for Further Exploration**
Teachers' schedules rarely allow for immediate practice of learned software skills: Mary's notes would have been well supplemented by an online tutorial, reviewing the sunflower example the trainer demonstrated. Mary could have downloaded the same flower the instructor used, developing her selection skills on an 'easier' image before tackling her own work. Unfortunately, preparing effective tutorials can be time consuming, so the wise trainer establishes a library of tutorials for multiple uses. Don't hesitate to use other's tutorials if you demonstrate them in training using those files. Effective tutorials:

- Replicate given training exercises. Learners may not remember that you were discussing selection techniques, but they may remember you were doing something useful with the bones photo.
- Provide sample files. At the beginning of the tutorial, include a beginning image for download.
- Include specific instructions, cross-platform commands (PC and Macintosh) and extensive images visually conveying the steps included.
- Encourage additional exploration and extension activities for the tools. These activities don't need to be explained step by step, but learners can be encouraged to explore in certain places within the menu.
- Provide additional resources. Remind learners of the resources available to them, the book, web, perhaps even your email for personal inquiries.
- Print well. Especially if you post your tutorials to the web, print the final product from a series of printers, making sure any colored text, images or headings print correctly. Learners will want to print the tutorial and follow it while working in Photoshop.
- Use the proper terminology. You may call the selection the 'marching ants', but a confused learner will come up empty handed when searching for this term in online help. Whenever possible, provide the terminology Photoshop uses in addition to your own lingo. This is especially important with tool names.
- Can be completed within an hour. Really, how much patience do you have with tutorials? Remember that the brain can only absorb what the seat will endure.

Instruction Should Emphasize Problem Solving

No instructor could prepare Mary for every problem she may possibly have in trying to save her image as a JPEG. How could Mary have investigated why the photo wouldn't save? How does online help work? What is the most efficient way to use the book? What other resources are available? Some of the most effective training begins with an exploration of the menu, emphasizing that savvy Photoshop users don't always know exactly where to go in the menus, but feel confident exploring until they find what they need.

Part of this problem solving is established in using the proper terminology, as addressed in developing tutorials. Learners need to be able to speak the language before effectively using help or search tools. Additionally, training can include an example of using the online help, the index, or the Adobe web site.

The most accessible problem-solving tool for most learners is are other learners. As much as possible, facilitate relationships between your learners. If possible, group learners of comparable skill together, and allow time for learners to get to know each other (over coffee and doughnuts after a session, if needed). Encourage learners to help each other in small groups. If training sessions are continued over a length of time, consider asking teachers to share a simple trick or tip in the program with others. In addition to building their own confidence, it helps teachers identify a resource for additional help. Finally, at the close of your training, consider asking teachers to sign an "I can help" list, giving their name, email, and phone, as well as one area they feel confident in. This can work will in many areas of technology training, not just in Photoshop.

Instruction Should Build Confidence

Few people, even graphics professionals, will master all the capabilities of Adobe Photoshop. The instructor in the scenario could have used hands-on lab time to reinforce Mary's newly gained knowledge. If lab time is not possible, several other techniques including self-paced tutorials, graduated training methods and question-answer time can be utilized. Effective trainers are able to demonstrate simple procedures, motivate learners to try the task at hand, and encourage learners that everyone learns by messing up a few times.
Build confidence for learners by drawing parallels between Photoshop and other programs, such as the save as, open, and even the marquee selection tool. If there is an image program at the school that most of your learners are familiar with, point out the similarities among all image tools such as file size, selection, and adjusting brightness and contrast.

Also, prepare your learners for frequent mistakes. Encourage saving multiple versions of documents and saving frequently, so that catastrophic errors won't cause a complete loss of data. Consider demonstrating the History Palette as a multiple undo mechanism. Demonstrate how to save documents with the layers intact as Photoshop .psd documents, before flattening into other formats like pict and .gif.

While Adobe Photoshop is considered a professional tool, it can greatly benefit teachers who prepare websites or develop other classroom materials. In conveying its power and enjoyment to use, demonstrate its effectiveness in the classroom. Finally, remember that your learners may also serve as trainers for others, so be sure to model effective instructional techniques.
TEACHING AND TECHNOLOGY: A NATURAL INTEGRATION

Carole A. Cobb, Ph.D.
Director, Middle/Secondary MAT Program
School of Education
Bellarmine University
United States
ccobb@bellarmine.edu

Abstract: In keeping with Bellarmine’s School of Education theme, Teachers as Reflective Learners, the Middle/Secondary MAT Program’s aim is to produce forward-thinking professional educators who are culturally responsive, inclusive and reflective in their teaching. The Program provides high quality educational experiences which enable pre-service teachers to gain conceptual proficiencies for creating a secure and nurturing learning environment that appeals to a wide variety of students; and that supports both a sense of collective purpose and individual construction of complex responses. This is achieved through the use of technology instruction and management tools; creative activities used throughout the curriculum for teaching and learning, and for assessing and evaluating student progress; and through use of on-line discussion group assignments. Our constructivist approach stresses teaching for meaning-making rather than memorization or practice of rote skills; thusly, calling for students to construct their knowledge as active inquirers into the subjects they are studying.

The Program

The original proposal I submitted and that was approved by the State in the Spring of 1999 was an accelerated five module (semester) secondary program. But because of the now critical shortage of both middle and secondary teachers in the Jefferson County School District, we combined our middle/secondary offerings and collapsed the program into four modules whereby student teaching would occur during Module IV: The Professional Semester. I then added a Primis Custom Built Case Study Book with content specific cases for each Module to promote discussion pedagogy.

The Middle/Secondary MAT Program provides high quality educational experiences which enable pre-service teachers to gain conceptual proficiencies for creating a secure and nurturing learning environment that appeals to a wide variety of students; and that supports both a sense of collective purpose and individual construction of complex responses. The following curriculum strands are intentionally integrated throughout each Module and delivered through constructivist teaching practices:

- Diversity – instruction and activities that intentional reflect a culturally responsive and relevant curriculum while providing the means for pre-service teachers to create bridges between home, school and community experiences, incorporate learning activities and assessments that address various learning styles.

Sample Activities:
- Make Philosophy of Education paper inclusive of a multicultural perspective and meeting the needs of special needs students. (Builds on Philosophy paper assigned in Module I).
Develop Cultural Autobiography that includes implications for effective teaching.

- **Special Needs** – collaboration between regular and special needs pre-service teachers that results in the careful and systemic interfacing of the regular education program and classroom; this includes skills and techniques in multilevel instruction.

  **Sample Activity:**
  - Unit Plan in content area, age level appropriate, using inclusive multi-tasking instruction consistent with Kentucky's Core Curriculum.

- **Technology** – used as an instruction and management tool; creates activities used throughout the curriculum for teaching and learning, and for assessing and evaluating student progress; use of on-line discussion groups and assignments.

  **Sample Activities:**
  - Developmental Theory Research Project (topical ideas expanded from Module I include Piaget Assessment; Learning Styles; Motivation.)
  - Summary Presentation of research project utilizing effective multimedia/technology, such as Power Point, Digit Cameras, Interactive Presentations, etc. (See Figure 1: Integrated Technology Schema).

In 1990 The Kentucky Department of Education, as a result of KERA (Kentucky Education Reform Act), created eight Kentucky New Teacher Standards for Preparation and Certification (KNTS). More than the demonstration of teaching competencies, these Standards imply a current and sufficient academic content that promotes consistent quality performance of authentic teaching tasks. Thusly, they describe what first year teachers should know and be able to do in authentic teaching situations i.e. the academic content, teaching behaviors, etc. that are necessary to connect prior knowledge to new knowledge.

- Standard I: Designs and Plans Instruction
- Standard II: Creates and Maintains Learning Climates
- Standard III: Implements and Manages Instruction
- Standard IV: Assesses and Communicates Learning
- Standard V: Reflects and Evaluates Teaching and Learning
- Standard VI: Collaborates with Colleagues/Parents/Others
- Standard VII: Engages in Professional Development
- Standard VIII: Knowledge of Content

In 1999 KDE added a ninth:

**Standard IX: Demonstrates Implementation of Technology** - The teacher uses technology to support instruction; access and manipulate data; enhance professional growth and productivity; communicate and collaborate with colleagues, parents and the community; and conduct research.

This Standard became our primary delivery mechanism for the other eight standards.

**An Integrated Technology Schema**

Our focus in developing this program has been the curriculum outcome, not the technology. It is through our instructional methods that Standard IX can be met while addressing district, state and national learner expectations. Our first Cohort will student teach Spring 2001. We will continue to monitor and evaluation their progress, gathering data for continuous program improvement.

Acknowledgements

Words can not appropriately express my degree of gratitude to my colleagues, who once the framework was in place, spend many hours collaborating with me putting the pieces together. Not only did they assist in the sequencing of this program but took the lead in their area of expertise: Professor Ivan Baugh, Ed.S. (technology), Professor Jan Goings, M.P.S. (special needs and diversity), and Professor Carrie Burton, M.S. (classroom management and learning theories)
An N-dimensional Model for Digital Resources

Charles Dickens
Department of Teaching & Learning
Tennessee State University
United States
cdickens@picard.tnstate.edu

Abstract: This short paper proposes an n-dimensional communications model for digital resources such as presentations and hypermedia projects. The model combines multidimensionality, use of visual tools, and constructivist views of knowledge.

- COMMUNICATION: an exchange of knowledge between individuals
- DIALOGUE: communications within a heterarchy.
- HETEROARCHY: a spontaneous lateral network of autonomous individuals; a system of authority based on the evolving performance of individuals; e.g., a cybernetic circus.
- NETWORK: an ephemeral, freely evolving, unpredictable dynamical four-dimensional pattern.
- CIRCUS: a cybernetic state of free interactions; a community of autonomous performers, continuously reformed by the independent choice of each; a feedback loop; a recursive mechanism.
- EXPERIENCE: an exchange of knowledge between individuals.
- MEANING: the free interaction of values.
- KNOWLEDGE: the invention of the world in all the complexity and multiplicity of its phenomena.
(Woods 1991)

The definitions above are from experimental architect, Lebbeus Woods from the book Lebbeus Woods: Terra Nova. They seem to fit quite well with the developing state of the contemporary constructivist learning theory and seem especially applicable for teachers in the electronic and information rich environment we are creating in schools today.

The purpose of this short paper is to propose a conceptual model for teachers and students to use in thinking about and presenting information in the digitally enhanced learning environment. As the title suggests, the model itself is “n-dimensional,” i.e., having dimensions above or beyond the limited one-, two-, and three-dimensional conceptions of Euclidean space referred to as hyperspace.

What is the value of such a reconceptualization of existing models of communication prevalent in educational practice? To begin with, by adding more directions of movement we increase the volume of ideas that can be contained. Consider a line of length a. Move the line in a perpendicular direct through distance a and a square of area a^2 is produced. Move the square a distance and you have a cube of volume a^3. Imagine if you could move the cube likewise in another perpendicular direction, i.e., through a fourth dimension, and the hypervolume becomes a^4. As the hypercube adds dimensions, its volume increases to the power of the dimension, e.g., a 20 dimensional hypercube of side a has a volume of a^20 (Pickover 1999).

Knowledge representation in the traditional classroom is overwhelmingly linear in nature, having only one degree of freedom. The text on this page is a linear representational form. Such meaning as can be communicated must be embodied in this one-dimensional, beginning to end progression. Thinking mathematically, as we add degrees of freedom to move, in this case additional directions of representational depth, we increase the volume of the communications space exponentially.

Constructing meaning and communicating that meaning through representational forms is one basis by which knowledge can be defined. Digital media, which allow flexible encoding of multiple representational forms, have become a dominant mode for information manipulation, storage, and retrieval for today’s society. The Internet is already such a multidimensional entity. The tools for access and creation of information to reside in whole or in part in that dynamic hyperspace are readily available and already widely used in classrooms.

There is a need, however, for a formal yet flexible model for this communication to prepare teachers and their students both to become adept at interpreting and building information constructs that have multidimensional features. Moving in that direction, Hysterle’s work with developing and using visual tools
(1996, 2000) moves knowledge construction into at least a two dimensional space with tools such as brainstorming webs, graphic organizers, and thinking-process maps. A recent addition to the Graphic Organizer web site is an article on “layering” which suggests creating linked layers of information (Freeman no date) adding another dimension to the visual tool schemata.

Notions about the nature of knowledge and information representation continue to change over time. Recently, cognitive psychology has taken a renewed interest in mental imagery and that information represented in both a verbal and an imaginal coding system produces stronger memory traces (Brunning, Schraw, & Ronning 1999). In the information and technology rich environment of the new century, teachers and students will need to modify their personal epistemologies to construct knowledge with and from more robust modes of representation.

In teacher education, we emphasize the teacher’s role as a facilitator of learning and the constructivist view of learners as knowledge creators, not simply information recipients. Integration of the multimedia and online technology with classroom practices requires the utilization of the technologies by both teachers and students. In my two graduate courses in technology for teachers, I have my students create presentations and Web based activities for their own students’ use as well as participate in the student role, taking part in the creation of a group thematic project. The n-dimensional model is used as they develop their products and to create the rubrics for assessing them.

Abstract: This paper describes a course designed for K-8 science and mathematics teachers to learn how to teach using an inquiry approach within a technology-rich environment. The World Wide Web and calculator-based data collection devices are the primary sources of inquiry-based technology we will share. We will describe the World Wide Web as a resource for assisting teachers to learn the art of problem posing, to increase their repertoire of problem solving strategies, and to enrich their sources for data collection. The calculator-based data collection devices are useful tools for generating real data from natural phenomena. Elementary and middle level teachers are often unfamiliar with the use of these tools much less their effectiveness as tools for inquiry.

Introduction

Throughout the country, there are many efforts to enhance effective science and mathematics teaching and learning in K-8 classrooms. Authentic and meaningful inquiry in mathematics and science depends on teachers, who themselves, have investigated their own questions. These experiences provide contexts for teachers to think critically, explore phenomena, and solve relevant problems. In order to do this they must have experiences in planning and conducting investigations in relevant settings, gathering and collecting information to construct reasonable explanations and solutions, and engaging in discourse about their ideas, explorations, and conclusions. The purpose of this paper is to describe the use of technological tools to initiate the posing and investigating of questions necessary for authentic inquiry-based learning of science and mathematics. Specific examples will be shared about how technology can be used, within the context of a graduate course for K-8 mathematics and science teachers, to provide teachers with experiences in an inquiry approach to learning. Without these kinds of experiences, it is unlikely that the teachers will orchestrate this approach in the learning environments they provide for their students.

Calculator-based data collection devices and the World Wide Web are the primary sources of inquiry-based technology used in this graduate inquiry course. Calculator-based data collection devices are useful tools for generating real data from natural phenomena. Elementary and middle level teachers are often unfamiliar with the use of these tools much less their effectiveness as tools for inquiry. The World Wide Web provides a plethora of data from which teachers and their students can pose problems and design investigations. Both types of technology are used to increase K-8 teachers' repertoires of strategies for implementing an inquiry approach by enriching their sources for data collection and analysis.

Our research in using technology to assist teachers to experience and learn more about the inquiry approach is helping us uncover the relationship between finding patterns and posing problems in the process of designing authentic investigations and reaching logical conclusions. Using technology that is available to these teachers, but has not previously been used in these ways, has opened new avenues for assisting teachers to become more effective in the teaching of science and mathematics in their own classrooms.
Background

A response to the calls for reform in mathematics, science and technology education resulted in the initiation of an innovative project at the University of Central Florida. The Lockheed Martin/University of Central Florida Academy for Mathematics and Science is an education/industry/community partnership aimed at improving mathematics, science, and technology education in Florida. Funding was initially provided by the National Science Foundation. Currently an endowment from Lockheed Martin Electronics, Inc., and a partnership between the University of Central Florida and five local school districts fund the program. The purpose of the Academy is to cultivate and support a qualified teacher workforce, which is a key to a nation’s educational welfare. The Academy supports and promotes quality education (K-8) in mathematics, science, and technology, with an ultimate goal to increase the number of students prepared for high school mathematics and science coursework leading to careers in mathematics, science and/or technology.

The Lockheed Martin/UCF Academy is a Master’s degree program for K-8 teachers who have had a minimum of three years of teaching experience. Upon completion of the program of study, the teachers receive a Masters of Education (with emphasis in science, mathematics and technology). The cohort groups of approximately 25 K-8 teachers are admitted to the Academy each spring, and complete their study in 24 months. The project began in 1992, there are now 305 Scholar graduates, and there are currently 38 teachers enrolled in the Academy. Both long-term and short-term quantitative and qualitative studies are sketching a picture of the significant impacts of this project in the diverse and complex public education environment of Florida.

The common threads woven throughout the program include emphases on teacher leadership, inquiry, and content updates in mathematics, science, and technology. Overlaying these threads is the ongoing inquiry into practice action research project conducted by each program participant. Teacher research has a powerful potential for educational reform because it allows teachers to view their teaching as research (Russell and Munby, 1992; Schon, 1983, 1987; Van Manen, 1977), it encourages teachers to accept and implement others’ research (Judd, in Grinder, 1981) and promotes a deeper understanding of practice and thus results in improvement (Carr and Kemmis, 1986; Elliott, 1976-77; Noffke, 1992). The Academy Scholars’ inquiries assist them to learn from what fails as well as from what works and to realize their own control over their professional lives as they examine the effects of schooling on themselves and their students. As they produce knowledge they reconstruct their professional lives and re-vision their worlds of expertise and voice.

General Description of Course and Population

The course that is the focus of this paper is called “Inquiry in Mathematics and Science”. While inquiry is suggested in national and state standards as a way to develop knowledge and understanding, in reality it is seldom observed in practice in classrooms. Teachers must be actively learning as they teach. Teachers must confront the dilemmas and create contexts so that teachers have the tools for self-renewal to make informed decisions about their actions in classrooms, and to be able to systematically address the preparation of students for the 21st century.

This course is designed to foster and enhance teacher development for K-8 teachers in mathematics, science, and technology. It is embedded within a Master’s degree program specifically aimed at school/teacher reform. Our goal is to bring about fundamental transformations of teaching practice within classrooms rather than the traditional staff development ‘innovations’ that “… have become . . . modest additions to existing practices or have slipped away leaving few traces of their presence” (Cuban, 1992, p.228). Furthermore if we hope to develop students who are critical and creative thinkers and problem-solvers who know how to get things done and are committed to making a better world, teacher development must be aimed at helping them to develop confidence in their own knowledge and judgement while recognizing the benefits that are to be gained from collaborating with others. Educational change implies that we must change the conditions and experiences of teachers in teacher development efforts. This includes giving teachers opportunities to develop their own expertise in planning and enacting the curriculum through critical inquiry and collaboration.
The Master's level course follows two courses - Curriculum Reform in Mathematics and Science and Technology in Education. The Lockheed Martin Academy Scholars who participated in the course are K-8 teachers who are in the first year of the two-year program. They teach in schools that are representative of the diversity of the Central Florida area. The course is team-taught by a mathematics educator and a science educator, the authors' of this paper.

Theoretical Framework for Course

This course emphasizes the constructive nature of learning where theory emerges from practice and the social nature of learning. The research on Complex Instruction demonstrates a positive and critical link between verbal interaction and learning. Groups can trigger multiple ways of interacting, thinking, and finding solutions. Working in groups, the inquiry focuses on the teachers' questions about the complex and problematic world of classroom teaching, as well as experiencing the inquiry approach to learning about mathematics, science, and technology. Our goal is not only to enhance the teaching and learning of mathematics and science but to assist teachers to experience the use of technology to generate real data, to find patterns, and uncover relationships.

The theoretical underpinnings of this course are informed by Dewey's and Piaget's emphases on 'learning by doing', and the active, inquiring kind of education through which students construct meaning in successive phases and develop scientific habits of mind. Our work is also informed by the work of Donald Schon (1987) on reflective practice, and Carr and Kemmis' (1983) work focusing on the action component of the process of teacher development through self-initiated classroom inquiry. Additionally, we rely on Vygotsky's (1978) idea that the most effective learning is that which is in the learner's 'zone of proximal development' or the space between what the learner can manage alone and what he or she can achieve with help.

This course is built upon the cyclic inquiry model. This model provides a framework for teachers to understand the cyclic nature of inquiry, and the importance of the student's role in learning. The inquiry approach is not a specific method, but rather a way of thinking about learning.

Our goal is to design a course to provide experiences and understandings that promote effective, relevant, and content-rich science and mathematics education in the schools. Therefore, emphasis was placed on the processes of inquiry as well as on inquiry into the attitudes and practices that promote student-centered curricula oriented to the construction of knowledge rather than the memorizing of facts. The inquiry cycle was also utilized to inquire about individual classroom practice through action research.

Technology supports the processes of wondering, exploring, and discovering which are central to the inquiry process. The desire and drive to answer questions and to solve problems are characteristic of students who are successfully prepared to enter the workforce of the future. Although learning is a dynamic process, students and teachers are often not afforded opportunities to experience learning in this way. As a result, the vast majority of students and teachers often view mathematics and science as static--a great wealth of facts known only by a few.

Technology affords learning opportunities that situate students in a context where authentic inquiry, investigation, and data collection can take place to provide students and teachers with a more accurate view of the inquiry process. Providing teachers with these authentic experiences has been shown to result in changes in learning environments in their classrooms.

Role of Technology in Inquiry

In designing the curriculum for the course, it was important to keep in mind that the answers to the questions we posed were not the teaching objectives, the teaching objective was to internalize the inquiry process. What teachers did with the questions that were posed was more important than the results of their investigations. To this end, teachers were provided with several opportunities to be engaged in authentic, technology-based, inquiry experiences.

Calculator-based Data Collection Devices
One investigation was to determine the effect of the container on the rate at which boiling water cooled. Students had access to calculator-based data collection devices with probes to measure temperature and graphing calculators to display the data. Students collected several different containers including Styrofoam cups, glass cups, metal pots, and waxed paper cups (which melted and leaked!). Other students compared glass containers of different shapes and sizes. The students placed probes in the containers and poured boiling water into each. The graphs produced from each set of data were compared. The students did not need to interpret all parts of the graphs; they just needed to be sure that they were comparing graphs with the same scale. The technology allowed for the students to collect data with relative ease and to organize the data for comparison. This made the investigations more accessible to students with varying mathematical abilities.

The calculator-based data collection devices were also used to determine the effectiveness of different types of antacids on acid. The students selected several brands of antacids and dropped them into mixtures of water and lemon juice. The students were able to use pH probes to collect data on the speed with which the antacid neutralized the acid using a commercially available calculator program and then compare the graphs displayed on the graphing calculators.

Students used heart rate probes to investigate the effects of exercise on heart rate and motion detectors to look at the height to which different balls bounce. In both cases, the design of the experiment was the focus of the activity. What types of exercise were investigated? Who did the exercising? Did the students compare different people doing the same exercise or the same person exercising in different ways? Were balls with different material make-up compared or were balls of different sizes and/or weight but similar material make-up compared? Once the experiments were designed the students used the calculator-based data collection devices to collect the data and the calculator to display the data. Depending on the type of data that were collected, some students compared graphs and others compared values entered in tables on the graphing calculators.

The calculator-based data collection devices and the graphing calculators were made available to the students, the ways the students chose to use them and the data that were collected were part of the investigation and were left to the discretion of the students.

The World Wide Web

The World Wide Web contains a tremendous amount of data. The Web is a valuable resource for topics to investigate. The students surf the Web looking for questions to pose. This is not the same as searching the Web for specific information. The students pose questions based on the data they happen upon. The topics of questions that have been posed from Web-based investigations have been as diverse as the number of visits to the Ty Beanie Baby site to the density of people viewed from the live camera on the University of Southern California (USC) campus to weather patterns on the NOAA Web site.

For example, the recorded number of visits to the Ty Beanie Baby site changes extremely quickly. One student noticed that in one 15-minute interval, 1500 more visits were recorded. The types of questions posed after visiting this site included: Is there a consistent rate of change in the number of visits over time? What happens when several people visit the site simultaneously? Do more people visit the site on weekends or holidays? Does the company use this data as an indicator of consumers' interest in new releases of Beanie Babies? The investigations of these questions were accessible to the students in the graduate inquiry class as well as to the students' students in grades K-8. The graduate students were able to compare the types of questions that were posed in the graduate course to the types of questions that were posed in K-8 classrooms. This provided a means for students to take the inquiry approach directly back to their schools.

The Web can also be the source of information from which a question may be posed and then other technology can be used to explore the question. For instance, the Nabisco site had a food guide pyramid giving suggested servings for the food groups. Students checked to see if a pyramid would be the most appropriate visual for displaying this information. They sketched and partitioned various polygons using dynamic drawing software. They used the software to determine the area of each of the sections and compared them to the proportions of the serving sizes on the partitioned pyramid. The dynamic nature of the software allowed students to explore several options for visuals of this food guide.

Wendy's Restaurant Web site had a list of its international restaurant locations. Students investigated where on the globe they would be the furthest from a country with a Wendy's restaurant. Other students
inquired whether the location would be in an ocean or on land and continued to investigate the question applying different constraints. This topic provided a nice connection to geography.

The live camera on the USC campus provided the basis for several different investigations. A new picture is taken of the same location on the USC campus every minute. Some students looked for trends in movement of people over time while other students looked at ways of measuring and describing the density of people seen in the live shots. While still other students looked at the groupings of the people and if the types of groupings were related to the time of day the picture was taken.

The dynamic nature of the Web makes it difficult to conduct the same investigation using the same data over time. Snapshots of rich sites can be taken so that the contents of the sites will continue to be available for future investigations. However, once the students become comfortable looking at Web sites as possible inquiry sites, they are able to find other sites to use with elementary or middle level students.

Conclusion

There are several important aspects of this course that are being shown to make a significant difference in teacher learning. First, the teachers are not learning just about using calculators and the Web, but rather they are 'learning by doing' and at the same time are being asked to implement their learning in their own classrooms. By embedding new learning into teaching practice and reflecting and dialoging about that learning collaboratively in a community of learners environment, these teachers are having the kinds of professional development experiences that are recommended by current research, and that is being shown to be effective by our own research. These are teachers that are teaching full time and the focus of the class is to translate their learning into their own classrooms, to reflect on what they learn on their experiences in our classroom, and to continue to make ongoing changes and improvements on what they do. In addition, these inquiry experiences are overlaid with their own action research projects based on inquiries into their own teaching practices. The technology-rich environment, which is an integral part of this graduate inquiry course, provides a setting in which teachers can participate in authentic inquiry, incorporate similar inquiry-based experiences in their teaching, and conduct their own research into the effectiveness of their teaching practices.

Audio on the Web:
Enhance On-line Instruction with Digital Audio

Brenda J. Gerth
Computing User Services
University of Victoria, Canada
bgerth@uvic.ca

Abstract: People only retain 20% of what they see and 30% of what they hear. But they remember 50% of what they see and hear, and as much as 80% of what they see, hear and do simultaneously (Computer Technology Research, 1993). Internet-based audio and video tools are now used by educators to support instructional, research and administrative activities. Incorporating Web-based multimedia elements such as video, animation and audio into the delivery of on-line course materials can enrich learning by facilitating and encouraging active student participation in the learning process. However, if not designed properly, the addition of audio and other multimedia elements will detract rather than enhance Web-based instruction.

The focus of this paper details the design techniques and strategies educators can employ to record digital audio and add audio clips to their instructional Web pages to enhance their on-line course materials.

Introduction

Adding audio and other multimedia elements such as animation and video to on-line course materials enriches the learning environment and ameliorates knowledge retention by involving students in the learning process. Adding interactive elements to on-line course materials can improve student motivation, promote active rather than passive student participation and increase learner control. Advocates of new multimedia and web-based technologies argue possible benefits of such technologies include increased intrinsic motivation, and the opportunity for students to learn in their own "style" and at their own "pace" (Weber et al. 1999). Effective design techniques and strategies should be employed to ensure digital audio elements enhance the delivery of on-line course materials. The foremost consideration of supplementing on-line course materials with digital audio is to fulfill the criteria of adding value to the content of the page. If the audio clip does not augment the content by some means, the audio file is burdening the Web page with additional bandwidth and should be excluded. Digital audio is successfully used to provide sample phonetic, language and music clips; explain examination questions and answers; provide instructions for assignments and supplementary messages to explain Web page content; and archive lecture notes.

Methods of Distributing Digital Audio

Audio files are distributed on the Internet by file downloading or by streaming audio. File downloading requires that the complete audio file is downloaded to the user's hard disk before playback can commence. Significant time delays void of user interaction are characteristic of the download method resulting in a potentially higher incidence of aborted user requests. Streaming audio differs from downloading in that small packets of the audio file are delivered over the connection with playback commencing as just enough information is received by the browser to keep the download slightly ahead of playback, rather than after the complete file is downloaded.

Audio Server Distribution

Two types of servers distribute audio files on the Internet, a standard HTTP Web server or a special purpose media server. The HTTP protocol enables audio and video content to be streamed from a World Wide Web server. Although a standard HTTP Web server is not as robust or efficient as using a streaming media server, it provides an
adequate method for delivering small, short audio clips to a limited number of concurrent users. The preferred method of delivering audio content is to distribute audio files from a dedicated streaming media server. RealNetworks developed streaming media (audio and video) technology, introducing RealAudio in 1994 to address the inherent problems and inflexibility of distributing audio by HTTP Web servers:

1. The Transport Control Protocol (TCP) used by HTTP Web servers to distribute information to Web browsers in small units known as data packets, resends the packet if the server does not receive confirmation that the packet was received without error by the browser. Retransmission of even a small number of data packets significantly increases the download time of an audio file.

2. Web servers distributing audio files were unable to stream live audio broadcasts and did not support interactive user controls such as pause, rewind, or fast-forward through an audio file.

3. Web servers are limited to distributing audio files to a small number of concurrent users at a given time.

RealNetworks developed their own protocol, User Datagram Profile (UDP) and server software RealAudio, designed to address the limitations of distributing audio by HTTP Web servers. UDP resolved the problem of lengthy download times caused by ongoing packet retransmissions. The RealAudio protocol supports synchronous communication between the server and the browser, enabling the user to rewind or fast-forward playback of the audio clip. The RealAudio server was designed to deliver just enough information to keep the audio stream downloading with an additional amount as a buffer to compensate for delays resulting from network congestion. The ability to stream audio enables the server to distribute audio files to a greater number of concurrent users using less resources.

Streaming audio is either broadcast live or from a pre-recorded file. The RealNetworks dedicated media server, RealServer supports SureStream technology, the ability to detect and render the correctly encoded (converted and compressed) audio file based on the connection speed of the user. An audio file can be encoded for multiple connection speeds such 28K, 56K, or 112K, and the file distributed will depend on the available bandwidth based on the connection speed of the user. Although RealNetworks Server (http://realnetworks.com/) is probably the most popular dedicated media server, QuickTime by Apple (http://www.apple.com/quicktime/) and Windows Media Audio by Microsoft (http://www.microsoft.com/windows/windowsmedia) are other options for streaming audio over the Internet.

Considerations for Distributing Web-based Audio

Before adding audio to supplement on-line course materials, consider whether the sound elements support and enhance the content of the page. Audio requires additional bandwidth, hence it is critical to identify the types of connections of your target audience and design accordingly depending on the connection speed, file format, sound quality, compression scheme, and browser support required for the intended audience.

Connection Speed

The connection speed of your audience will ultimately define the quality, size and download time of the audio file created. Bandwidth, measured in Kilobits per second (Kbps), is the amount of data that can be sent through a network connection during a defined period of time. Connection speeds vary from slower speeds of 28.8 Kbps or less, 56 Kbps, to faster connections of 200 Kbps or greater. A compromise is necessary between reaching the largest target audience by creating a lesser quality audio file, or limiting the audience by creating a higher quality audio file. Audio files created for distribution on the Internet may require encoding to a lower sampling rate or bit depth to decrease sound quality and reduce file size and download time.

Digital Audio Formats

Historically, the file format chosen to distribute audio over the Internet depended on the computer platform generating the file. Apple developed AIFF for playback on Macintosh, NeXT Computer and Sun Microsystems jointly developed AU for UNIX, and Microsoft and IBM jointly developed WAV for Windows. There are a myriad
of file formats used to distribute audio over the Internet such as MIDI, QuickTime, MPEG, and RealAudio as well as newer media formats such as RealMedia, Shockwave Audio, Flash, and Windows Media.

MIME Support

To play a digital audio file, the appropriate plug-in or helper application that can play the format of the audio file must be installed on the user’s system. Helper and plug-in applications are external or internal applications to the browser that are executed as media elements are invoked from within the Web page. RealMedia, QuickTime, and Windows Media Player are three common applications that play audio files. The browser identifies the plug-in or helper application that can play the audio file based on the file extension such as AU, WAV, AIFF, RA, RM, QT, MOV, AVI, or MP3 by referring to the Multipurpose Internet Mail Extensions (MIME) configuration specified in the browser’s preferences settings. The browser and the server must be configured to support the MIME type of the audio element.

Audio Compression

To create an audio file for distribution on the Internet, analog audio data is recorded into a digital format, typically in an uncompressed format such as WAV, AU or AIFF. Before converting to a compressed audio format, it is preferable to start with the best quality “master copy” obtainable in an uncompressed format and then encode the file as RealAudio or RealMedia, QuickTime, MP3 or other compressed format. An audio codec (COder/DECoder) is a software scheme that encodes analog audio data and converts it to a binary format for processing on a computer and then decodes the data for playback on analog devices such as speakers or headphones. A number of compression methods are available to encode an audio file into a smaller file format suitable for distribution on the Internet. Lossy is a commonly used compression scheme that discards the high and low ends of the audio source file at the expense of quality to achieve a highly reduced file size. RealAudio, MEG Layer III (MP3), QuickTime Qdesign 2, and MS Audio are three popular audio products that provide a number of compression codecs designed for a variety of applications and connection speeds.

Distributing Digital Audio

Distributing digital audio for distribution on the Internet is a four-step process: (1) digitize sound from the source, (2) optimize audio file, (3) encode audio file, (4) publish to Internet.

Digitize Sound from the Source

Sound is recorded from an analog source such as speaking into a microphone, input from a previously recorded cassette or reel-to-reel tape, or from a digital source such as CD, hard disk, or digital audio tape (DAT) using a sound editor. The digital file format generated is typically WAV, AIFF or AU. Record using a high quality sampling rate and bit depth such as CD quality, 44.1 kHz, 16 bit audio, and decrease to a lower level during the encoding step. Keep a backup of all original high quality source recordings.

Tips for Recording Audio

To obtain a better sounding audio file, use a good quality microphone and digital interface sound card to help minimize hiss and distortion. Record using a high quality sampling rate, such as CD quality, 44.1 kHz with 16 bit depth resolution and encode to the lowest quality sound needed in the Web page. If using pre-recorded audio files, use the best quality source file available. Experiment using different audio codecs and settings. Reducing the sampling rate is more effective than reducing bit depth to achieving smaller, good quality audio files for Internet distribution. Record in a quiet environment, minimizing room reverberations or reflections by choosing a smaller room, with carpet and soft furniture.

If recording a single sound source such as spoken voice, keep the microphone close to the source and away from the sound of the computer fan. Avoid holding the microphone with your hand. Record speech in mono, and set the balance for all inputs to the center to prevent losing the right input channel frequently discarded by some sound cards when recording in mono mode. Use a pop screen to reduce plosive “P”s and “S”s. Decrease distortion by setting input levels to as close as possible to 0 dB without exceeding 0 dB during the loudest section of the file.
Avoid damaging the computer speakers during playback by setting the volume of the input device (tape recorder, CD player, etc.) to a low level and slowly increase the volume. Set the volume to the half way mark and then change the volume using the device’s volume control. If sound cannot be heard, check the operating system recording and playback levels and ensure the mute box is not marked for the master volume, line in, line out, microphone, CD and any other connections for the sound card.

Optimize Audio File

The audio file should be edited to improve the quality of the sound file. Empty space at the beginning or end of the file should be deleted to eliminate long pauses. Normalization balances the sound wave by maximizing the input level of the loudest peak of the file after recording and should be used if the sound level is too low. Normalize the audio file to -0.5 dB. Equalization (EQ) adjusts the high and low tones in the audio file so that bass and treble can be made less or more pronounced.

Encode Audio File

Due to the tremendous size of the sound file generated from recording at a higher quality level, the digital source file must be encoded to compress the file into the appropriate sampling rate and bit depth required to distribute audio over the Internet. The size of the audio file is significantly affected by the sampling rate, bit depth, and the number of channels (mono or stereo). The sampling rate is the number of samples or snapshots of sound taken per second. For example, the sampling rate for CD quality audio is 44,100 samples per second. Bit depth defines the dynamic resolution of the audio. The greater the number of bits that are used to represent the sampled value, the more accurate the sample will be with respect to the original analog sound wave. Decreasing bit depth to 8 kHz increases distortion and hiss, especially at higher sampling rates. Stereo requires two channels, doubling the file size required for recording in mono. The determining factor regarding the selection of these variables is based upon balancing the sound quality and storage requirement. File size can be decreased most effectively without compromising sound quality by reducing the sampling rate and using one mono channel. The disk space required for one minute of sound varies significantly from 10.5 MB for 16 bit, 2 channel (stereo) CD quality audio to .6 MB for 8 bit, 1 channel (mono) telephone quality audio (Tab. 1).

Table 1: Storage Requirements for One Minute of Audio

An encoding tool such as RealProducer (http://www.realnetworks.com/developers/index.html) is used to select a codec based on the bandwidth target (connection speed) and the audio content (music or voice) to compress the original sound file and create a new audio file. If you need a large dynamic range of sound, use 16 bit resolution. If all sounds are about the same volume, 8 bit may be suitable. Full-bodied vocal requires 16 bit resolution. RealNetworks’ RealAudio consistently rates highly at generating the best quality speech and music audio clips at various sampling rates (Tab. 2).

Publish to the Internet

Audio files are distributed over the Internet by file downloading or by streaming audio. Irrespective of the method chosen to incorporate an audio file for playback within a Web page, the user's system must have the appropriate plug-in application installed that can play the audio file format, and the server and browser must be configured to support the MIME type of the audio element. Assist users by including a link in your Web page to the vendor Web site where the player can be downloaded.

File Download

The simplest method of adding an audio file to a Web page is to create a link to an audio file. When the user clicks the link, the audio file is downloaded and the player configured to play the file type begins playback once the complete audio file is downloaded.

```
<A HREF="audioclips/filename.ext">Listen to Narrative Audio Clip</A>
```

Streaming Audio

An audio file can be streamed from an HTTP Web server. Within the Web page, a link is established to a text-based metafile with a RAM file extension containing the URL of the file. The user clicks on the link in the Web page and the browser downloads the RAM metafile, launches the player and starts streaming the audio file.

Link in Web page: `<A HREF="audioclips/audioclip.ram">Listen to Narrative Audio</A>`
RAM file contents: HTTP://web.uvic.ca/-bgerth/audioclips/audioclip.ram

Embedding the Player

A variation on streaming audio is to embed the player into the Web page rather than launching and opening a separate window for the player. The link in the Web page is established with the embed command. The noembed and href tag provide the alternate method for downloading the audio file if the browser does not support the embed tag. The type attribute specifies the type of plug-in player to embed in the page.

```
<EMBED SRC="audioclips/audioclip.rpm" type="audio/x-pn-realaudio-plugin" CONSOLE="Clipl" controls="All" height=125 width=275 AUTOSTART=false loop=false"></EMBED>

<NOEMBED><A HREF="audioclips/audioclip.rm">Listen to Narrative Audio Clip</A></NOEMBED>
```

The metafile is named with the file extension of RPM and contains the URL of the audio file:
http://web.uvic.ca/-bgerth/audioclips/audioclip.ram
Background Sound

Setting `autostart` to `true` forces the audio file to begin playing automatically when the page loads and setting `loop` to `true` forces the audio clip to repeat until terminated by the user (not recommended), or `loop` to `X` where `X` represents the integer specifying the number of times to repeat the audio clip.

Copyright Issues

Many Web pages provide sound clips that can be downloaded for use on a Web page, often illegally. Before downloading a sound clip to distribute on your Web page, ensure you are not contravening copyright laws by obtaining permission to use the audio file by the copyright owner. Otherwise, create your own audio clip, find a site that offers free sound clips and has the right to offer them, or obtain permission to use the audio file.

A simple method of protecting your own works is to indicate the intent to copyright by attaching a copyright symbol, the date, your name, and the term All Rights Reserved by the link within the Web page to load the file. Audio editing programs such as RealProducer enable the copyright information to be embedded within the audio file and the copyright information is displayed by the media player during playback.

Conclusions

This paper has explored some of the design techniques and strategies for incorporating digital audio into the delivery of on-line course materials. Factors such as the connection speed, the type of fidelity, the file format and the use of compression significantly affect the successful implementation of digital audio on the Internet. Digital audio when carefully prepared and judiciously added, will enrich learning and enhance the delivery of Web-based instruction.

References

Abstract: The topic for this panel discussion is how assessment can be used to inform instruction in an asynchronous environment. We will explore how technology can add to our understanding of human learning and performance and how carefully designed web-based supplemental study-aids can impact the relationship between confidence and "classroom" performance as measured by course exams. In that regard, we are interested in questions such as "How will performance and confidence metrics for a web-based course be assessed?" and "How can we determine the rate at which learning is taking place?" It is clear that some kind of assessment strategy is necessary in order to deliver material in the right sequence and at an appropriate rate. In this roundtable discussion, we will focus on four issues:

1) Assessment strategies.
2) Assessment of behavioral variables such as confidence, and motivation.
4) Practical aspects of implementing assessment strategies.
TRES FACIUNT COLLEGIUM – Paderborn's Collaboration Centred Approach for New Forms of Learning

Thorsten Hampel
Computers and Society, Heinz Nixdorf Institut, Fürstenallee 11, 33102 Paderborn, Germany, E-Mail: hampel@upb.de

Abstract: This paper defines several key requirements for successful cooperative learning, which we have elaborated during the last years with goal to set up new forms of cooperative learning. Without bringing them into a special order, these main design criteria are the integration of synchronous and asynchronous forms of cooperation and the persistence of a learning process, the formation of a common group context or common information room, roles and access rights, annotations and structured chat as well as rooms as places for collaboration.

Key requirements for successful computer supported learning

"My claim is simple: in order to make truly effective groupware, we will need new eyeglasses and methodologies for probing how and why collaborative tools work. Why? After all, isn't our natural tendency to collaborate rather than to work in isolation? Probably yes, but often the more natural something is, the more subtle or unnoticed the mechanisms are which make it fantastic." [1]

Since the beginning of the nineties, in Paderborn, we studied new concepts and solutions to enhance cooperative and active forms of human learning. Spanning from the design of so called learning supportive infrastructures which even includes the set up of learning theatres up to new understandings of human learning the bandwidth of our activities tries to bring new media and cooperative forms of learning into a form of every day viability. Therefore our goal is to develop tools and solutions not only to justify our concept and research goal, but to change our way of learning and teaching with lasting results.

For four years now, the development of our sTeam—"structuring information in a team" approach is in progress.[2] Our idea is to set up an open source project for a framework covering various tools and applications in the field of computer supported cooperative learning. To do so, it is of main importance to develop very detailed concepts and architectures and to get a clear understanding of the functionality and metaphors which might be applied to human forms of cooperative learning. With the aim of achieving a firm understanding of the odds and ends and limitations of computer support in group work, we continuously evaluated and adapted existing solutions out of the field of computer supported cooperative work systems for our particular needs.

Hundreds of software solutions have been developed in the last decades to enhance cooperative work and cooperative learning (for a early overview see (Mandviwalla & Olfman 1994)) but only a few have left the design labs for larger practical use. May be Greenberg is right, stating that the reason might be the concentration of the developers on technical more than on human factors when shaping such systems. "In summary, groupware for real time collaboration requires careful attention to both technical and human factors. The human factors should drive the design, for there are many requirements and nuances that determine whether a system will support collaboration effectively." [3]

The following article outlines several main criteria and design goals for our system which might hopefully serve as key requirements for successful computer supported learning and computer mediated communication. Other surely important criteria apply, such as the flexible support of attributes and various document formats, the allowance of user definable server objects and the overall extensibility and scalability of the server. These requirements will not be further discussed in the course of this article.

Here, we will mainly enlighten our theoretical concepts and design goals and not the selected technical architecture or its implementation. First prototypes exist now for three years and have constantly been redesigned. Currently we are in process of doing a complete technological redesign which facilitates the transformation of the whole project into an open source approach. The upper mentioned proceeding provides us with the time and the

chance to revise and enhance our fundamental conceptual ideas. The following main requirements reflect this process.

**Integration of synchronous and asynchronous forms of cooperation – persistence of the learning process**

When trying to categorize different computer supported cooperative work environments it is quite important to look both at technical features and at the even more important underlying concepts and metaphors for cooperative learning and working. During the process of the “proofing the concept” of our prototypes for the sTeam approach, we found ourselves confronted with a series of topics which serve as essential pre-conditions for later design of a successful co-operative learning environment.

Learning at university takes place at different locations such as lecture halls, tutorials, the library, at the students’ home, but as well in different learning situations, such as face-to-face meetings or synchronous virtual meetings and of course in asynchronous forms of cooperation. To be successful, tools have to support these different ways of working in groups, we call this a mixture between asynchronous and synchronous forms of cooperation. Another elementary factor for the integration of synchronous and asynchronous forms of communication is the persistence of artefacts, such as all forms of electronic documents and objects, during the process of cooperation. Meaning the environment has to provide persistency for all objects created by learners. Thus, as a basis for cognitive learning the learner must be enabled to create, rearrange, structure and transport learning objects. The abilities provided are called the basics functions of media, the media functions. [4]

Closely related to the media functions and an important aspect for a successful working with different media is the reduction of so called discontinuities in the use of electronic media. Discontinuities appear each time a learner has to switch to a different media while transporting information, e.g. they have to make personal (paper based) notes on an electronic presentation held by the lecturer. These discontinuities in the application of media naturally put an end to any consequent use of computer mediated learning supportive infrastructures. Therefore it seems to be fundamental when shaping infrastructures for cooperative structuring and building of knowledge to adapt learning supportive infrastructure to the behaviour of the learner and not the other way around.

**A common information room and group context**

When discussing basic concepts of cooperative learning it seems to be essential, that learners form a common information room for the group. Ellis defines this common information space as the common group context (Ellis et al. 1991)[5]. Most systems interpret the common group context as a space, a room. The definition of the metaphor room ranges from a room being a space to arrange documents over a social space for group interactions up to a virtual counterpart of the real world. The latter finds its expression in the so called CVEs (Collaborative Virtual Environments), such as the avatar worlds of DIVE or MASSIVE. [6] One good example for the idea of mapping natural understandings of our world into behaviours and laws of the virtual world is the structuring of conversations in MASSIVE, where “nimbus” and “focus” of an Avatar defines the range an direction (audience) of its chat.[7] Thus people grouped in geographical proximity form a local chat group. This spatial understanding of a virtual room partly allows learners to interact with objects like they do in the real world—closeness defines semantic relationships between objects, avatars must be in reach of objects when interacting with them. Awareness in all forms—from simple information about people joining a chat session up to complex Avatars (which sometimes have graphical representations) of virtual worlds plays an important role in forming a feeling of being part of a social environment.

Another phenomenon takes place when people interact in rooms, which Bly, Harrison and Irwin [8] experienced in their MediaSpace System. People develop a common feeling of being at home—a space develops into a place—people behave in the social and cultural pattern of the real world. Out of the same reasons players of most MUDs and MOOs develop a feeling of being a virtual community—they develop laws, netiquette and social forms of interaction for their world!

For the further exploration of the concept of learning supportive shared media spaces we set up a few prototypes providing virtual rooms. (Technically speaking we connected document management functionality and a highly

---

[5] “Many task require an even finer granularity of sharing: What is needed is needed are shared environments, that unobtrusively offer up-to-date group context and explicit notification of each user’s actions when appropriate.”

event-oriented communication server.) These rooms are both private working spaces for learners and public group work environments. Learners may easily create personal rooms and rooms are administrated by cooperating learners themselves. We call this idea the concept of self-administration. Our first experiences show, that through the metaphor of rooms learners develop a quite accepted and natural understanding for document- and learning spaces. Semantic relations to other rooms are expressed through doors and exits provide a real world understanding of the structure of the virtual. This does not mean that a door must be represented by an icon of a door or even has to be in three dimensional or virtual reality, just the expression “door to library” forms a correct understanding of the plan of entering a door, leaving the room and the need to have appropriate access rights to do so.

**Roles and access rights**

Another crucial characteristic for flexible forms of learning in session based environments are social roles. In nearly every of today’s learning situations social roles are a central form of structuring the learning process. Let’s imagine a typical tutorial situation, where a student presents some findings of a small group and therefore enters the role of a moderator. The moderator structures the flow of the communication, as he/she allows parts of the group to interfere or to suggest different topics to discuss. A moderator may also record or make notes of important contributions for the target discussion. Classical policy systems and access control lists normally comprise only a static definition of access rights and therefore support only static roles in group work. But it is a quite natural process of every face-to-face or virtual meeting situation that flexible changes of roles take place. So systems have to support an easy mechanism for the change of roles during an cooperative learning and working process. (See the concept of dynamic roles in [Edwards 1996]). Our prototypes accomplish this by a very flexible set of access rights which can be specified for every object (e.g. room or document) and can be inherited by parent objects or an master object within the room, or the room itself. Flexible temporal relations between learners and appertaining groups allow the adaptation to different learning situations and open forms of cooperation. A significant factor for people learning in such groups is that the participants in a discussions are aware of the persons joining the discussion and are also aware of the roles the different persons inhabit. For an computer mediated communication it seems essential to support such flexible forms of roles and access rights for documents and learning objects. Our approach of cooperative learning which aims to support face-to-face and all forms of tele-learning situations allows flexible roles through four key requirements: Firstly the easy attachment of person to roles, which is another form of self-administration as a room administrator gives other learners or colleagues temporally access to learning objects. Secondly, the flexible visualization of the roles a person inhabits at a certain time—which may be one form of awareness. And finally the free change of roles and therefore the flexible modification of access rights to documents and learning objects.

**Annotations and structured chat**

Another idea which smoothly fits into the concept of flexible roles is the flexible usage of annotations and a new form of chat that we call structured chat.

From the very beginning of hypertext and hypermedia systems[9] annotations played an important role in the research on cooperative group work. The simple concept of allowing learners to add personal notes to documents is a crucial pre-condition for the personal structuring of knowledge. Many closed hypertext systems supported various forms of annotations, including access rights on annotations and the differentiation between personal and annotations of the group. Surprisingly not one of the systems developed to be a common success and today's world wide web provides only browser bookmarks as marginal way to personally structure the web.

Our understanding annotations is two-dimensional: The ability to add personal or public information to internal and external resources and the ability to connect communication mechanisms and various media.

The first demand includes the challenging problem of allowing external annotations on every material found on the web. Closed hypertext systems usually provide for several forms of annotations, but the claim to do this also for every media on the web is hard to solve, because of the lack of WWW technology which is not prepared for any annotation mechanism.

Existing solutions use some sort of special annotation server which stores user annotations on web pages in a database modifying the pages on the fly while browsed by the user. (This is necessary out of several reasons, e.g. normal web users are not allowed to modify extraneous web servers.) Existing systems such as CritLink[10] are to be distinguished from our approach. Their software mediator implements the idea of web annotations for everyone but is not part of any cooperative work or learning environment. Out of this reason annotations are sepa-

---

[10] see the CritSuite website at [http://crit.org](http://crit.org). Refer this site also for links to other approaches such as Xanadu, CoNote, ComMentor.
structured from any learning scenario in which learners integrate personal learning materials with external web resources. Our demand goes far beyond this approaches: Annotations should be attachable to every page on the web (only a few restrictions apply e.g. when the pages are dynamically created) and annotations are part of the learners’ cooperative learning environment. For a period of two years we worked on solutions to implement systems which allow a free combination of internal and external annotations. Our latest prototype allows the learners to annotate most documents of the web. These annotations are integrated in our sTeam system for cooperative learning and are handled as “normal” steam objects. Therefore access rights, all sorts of properties and functionalities to rearrange objects within the learners context may be applied. Parallel, we developed a small prototype which explored concepts of connecting annotations and structured discussions—we call this concept structured chat.

**Structured chat—bringing chat into context**

The concept of structured chat aims at the scenario of small groups of learners discussing and working with learning materials. This may take place in a virtual meeting, but also as part of an face-to-face situation during tutorials or lectures. Looking at such a scenario typically several discussion topics appear in parallel during a conversation. Sometimes smaller groups of learners work on a different topic than the rest of the group. Often, chat-statements refer to a much earlier contribution of another learner. In productive sessions, chat contributions refer directly to objects in the context of the group, e.g. documents or web pages. Our experiences show that out of this reasons a classical chat does not work properly. Another reason is, that in traditional chat communication every chat line must follow the earlier statement of another learner.

The concept of structured chat is a combination of classical synchronous chat and a tree widget. Here chat lines may be attached to every object within the learning environment. Every object in the learners context is represented by a branch in the structured chat. In a special area below the tree section learners may enter contributions to previously selected topics of the chat. Simultaneously, chat annotations may be attached to every object and appear in the tree at the section of the corresponding item. In this way each branch of the tree represents related objects and corresponding chat entries and annotations. It generates a persistent collection of related contributions which may be also used by learners who are not engaged in the entire discussion as a repository for questions and answers. If learning objects are grouped or linked (a simple relation may be defined by dragging one object very close beside another one) these objects are arranged on one level within the structured chat. Accordingly, documents representing a common learning subject (e.g. documents and web pages describing a criteria of software design) are grouped in spatial proximity, which complements our human capacity for manipulating spatial memories.

Our initial goal regarding the concept of combining chat and annotations is two dimensional: On one hand chat conversation somehow develops the structural quality of an annotation and on the other hand annotations simultaneously inherit the flexibility of an chat. Important for the idea is, that the creation of objects in a room (comparable to a cooperative whiteboard) automatically generates a new subject within the structured chat. This entry may later be deleted, but learners are directly able to contribute to each others actions. (A concept which may also be described as a new form of workspace awareness.) Actions of learners create anchors for the annotation of relevant contributions of other learners. Analogous chat lines within the tree are visualized as annotations on the corresponding objects (may be viewed by the learners by pressing the right mouse button, or used as a tool tip by placing the cursor over the object for a while). In further developments different forms of chat persistency may be implemented. May be it would be a good strategy just to store annotations directly made on objects on the cooperative workspace and not to record every chat statement. It could be also necessary to provide a very informal not persistent chat as a second instrument for learners to communicate.

In addition, we experimented with different design solutions for the visualization of the learners’ awareness of each other and their actions. In cooperation with the project group for media design at the University of Münster, we developed a form of awareness visualization which is specially shaped for rather small groups of learners. Here, in a kind of circle, members of a chat are visualized as small coloured dots. The names (or nicknames) of the group members are shown right beside these dots. To illustrate the group activity the distance between the centre of the circle and a learners dot is proportional to their chat activity (e.g. chat statements per ten minutes).

With the help of this simple approach we become aware of members actively working on a special subject and it seems easier to contact them or to integrate less involved learners into the conversation. One example for the importance of such information awareness might be that the silence of an online interlocutor may be interpreted as him/her not attending the monitor. A similar "Babble" approach by Erickson (see Erickson et. al. 1999) calls this...
A graphical representation of users and their activities a "social proxy". Their system integrates elements of bulletin board systems and chat. A topics list provides an overview about the ongoing conversation, and a social proxy creates a view on human activity on different channels. The research prototype from Rodenstein and Donath (see Rodenstein & Donath 2000) takes the same direction: A representation of coloured circles in a two-dimensional space provides awareness of users’ actions over various audio-channels.

**Rooms - Private and public boundaries – modes of cooperation – access rights and self-administration**

Another crucial design issue when discussing the design of a computer supported cooperative learning space is the interrelations between personal and group/public workspace. Working with documents means to arrange them. This well known personal process of structuring the document world around us is one of the main forms of building personal cognitive structures and relations between things—just remember the typical “chaotic” forms of working which means arranging documents on everybody’s personal desktop at home or office. (Büsch et al. 2000) describes this process quite well: “We found that manipulating the presence and absence of materials, bringing them into dynamic spatial relations, and referring between them, are not just context or prerequisite for doing the work; rather, they are an integral part of accomplishing the work itself.” When transporting this form of individual work into the scenario of group learning our findings of setting up learning supportive infrastructures show that both different modes of cooperation and different boundaries of a working space are necessary to be designed.

Haake and Wilson distinguished three main modes of cooperation: individual mode, loosely coupled mode and tightly coupled mode. These forms of cooperation were first explored and defined by (Haake & Wilson 1992) working on a collaborative writing tool and we adapted them for the scenario of cooperative learning. The notion of a loosely coupled mode may be described as a form of cooperative working and learning where learners access a common document space, but an appropriate locking of the learning objects takes place when a person makes modifications. This implies that the environment has to provide a form of activity or workspace awareness to recognize the actions of other learners. Tightly coupled modes of cooperation are characterized by their all synchronous, active forms of cooperative learning. Our approach prefers a mixture of individual mode and loosely coupled modes of interaction. In our first prototype individual working and learning is supported through personal workspaces which allow to structure and arrange documents individually. These personal workspaces may be expressed through the metaphor of a learner’s private room or in form of a personal workspace beside the group workspace/room.

The public or group workspace adopts the concept of the relaxed “What You See Is What I See (WYSIWIS)” (Stefik et al. 1983) version. Learners do not share a strict meaning an identical view on artefacts and actions of other learners, but a individually generated, relaxed perspective. Note that the separation between individual and group workspace does not intend restriction on interactions between these two spaces. Learners should be able to freely transport objects from their personal working space to group working spaces and vice versa. Therefore a tight coupling between these two spaces is initiated. Taking a more detailed look at the concept of rooms, the metaphor room concerning our approach serves many different functions. First, as mentioned before, it is a natural metaphor for the arrangement and storage of learning artefacts. A room is therefore a space to store, arrange and transport artefacts. Thus rooms define boundaries for the accessibility of the cooperative learning artefacts. Normally access rights for learning objects are derived from the accompanied access rights of the room. A simple metaphor could be a closed room door excluding people who do not belong to a particular group of learners. Secondly also the spatial layout of a room works as a natural boundary for social interactions.

This quality of virtual rooms was shown the first time by various studies about the social interactions in MUDs and MOOs (Becker & Mark 1998). People develop a feeling of being at “their place” within the MUD and thus develop complex rules for social interactions (e.g. netiquette) in the virtual world. Consequently, our prototypes limit a chat to the participants which are virtually present in one room and is even more structured through its content (learning artefacts) regarding our concept of structured chat. As a result, rooms define areas which support different social groupings and simultaneously are boundaries for co-presence of other learners. Thirdly, in comparison to the real physical world, a room can unite both functionality and tools. In such a grouping functionality stands for different activities the room is place and stage for. A room may be described as a discussion or brainstorming room, holding special tools to record a conversation or graphical whiteboard systems to support a creative design process. Other rooms may contain tools for cooperative browsing and for the search of electronic libraries and may therefore be called a library. And last but not least a room could function as a lecture room sharing cooperative presentation- and protocol tools for the learners.

Indeed connections between rooms (called exits in our approach) allow to built semantic structures of rooms. Analogously they represent the social structure of the learning community and should be arranged in a layout reflecting courses and groups of learners.
In summary, one can say, rooms containing tools and persistent learning artefacts may be one of the key concepts for successful cooperative learning processes. Combining our interpretation of necessary access rights and social roles, we came to the logical conclusion of self-administration of these learning rooms. We developed a system of access rights which explicitly defines rights to give away/handle over rights to other learners within the system.

Starting at the point a new learner wants to join a learning group up to the specific adapting of a social role in a discussion process self-administration means that administration is a distributed and constantly applied process of changing access rights and group memberships.

The quality “distributed” serves our demand for social places and boundaries for documents that are administrated completely by the group itself. (This does not imply that there must not be a person in the group holding the predicate of the room administrator, which e.g. could be a tutor or lecturer. However, administration is a distributed process over several persons and groups of learners.)

Conclusions
Research on computer supported co-operation in learning processes is now conducted for more than twenty years. Unfortunately, only a few applications out of the field of computer supported cooperative work made their way into our offices. Today at the universities and schools only common standard web-technology is used to place learning materials (courseware) onto web servers—a one way road of co-operation which leads to isolation. Some people think this isolated learning situation could be eased just by providing bulletin board systems and e-mail to guide a learning process and establish successful connections between learners and teachers. This may be right to a certain degree, but lacks persistency, as long term learning processes as well as the every day viability of the learning materials is not guaranteed. In this article we have intended to elaborate why this deficit can only be solved by the combination of various key concepts, such as the metaphor of places and rooms, awareness components, the integration of synchronous and asynchronous forms of cooperation and communication, and new methods of structuring and through the annotation of learning materials. Therefore the selected infrastructures aim at both situations of cooperation and learning—the support of unanticipated group activities and all the forms of long-term participation.

The system which is currently under development does not claim to solve all existing deficits—it is rather an “open” approach regarding both the concepts and the implementation (source) allowing people to easily join our initiative. We, the developers, will hopefully benefit from the prolific and creative process of the co-operative improvement of concepts and applications.

Abstract: Teachers in South Africa are confronted with a new educational paradigm and rapid development in information communication technologies. In South Africa there is still a considerable lack of locally developed and relevant educational resources on the Internet. Students from the Teacher Training College in Pretoria were involved in a project to develop relevant online learning support material for Afrikaans First Language teachers. Their participation in this project not only empowered them with ICT skills, but also made them possible facilitators of change who can help to disseminate educational technology throughout the entire school system.

The South African education system has changed twice since 1995 from a conventional to a learner-centered outcomes based curriculum. The changing education paradigm created new information needs amongst teachers. Textbooks are outdated and teachers have to implement a new curriculum and adopt new teaching strategies without sufficient learning support materials (Chisholm et al 2000).

The Internet can be a solution to many of the problems educators experience. It can be utilized as an information resource and a tool towards teacher development (Jackson 2000). But, with the South African curriculum still in flux, there is not yet sufficient learning support material for the South African curriculum available on the Internet.

There are only a few initiatives in place online to support educators in South Africa. These are all in English - one of the eleven official languages of the country. There is a considerable lack of relevant, locally developed material on the Internet - such as learning support materials and opportunities for teacher development. There is even less information available for teachers of the other minority language groups and subject-specific information for the mother tongue speakers.

At the Pretoria Teacher Training College this huge gap in information provision for Afrikaans First Language Teachers led to a project with benefits for both the students training to become teachers and current teachers of this subject. A web site for Afrikaans First Language teachers was started late in 1999 with translations of the new curriculum policy regarding the learning area Language, Literacy and Communication; including descriptions and explanations of the specific outcomes, range statements, performance indicators and assessment criteria for the learning area. The web site was expanded with links to relevant sites, a calendar of activities/ seminars for these teachers and room for contributions from the teachers themselves.

Second year students at the College were given an assignment to prepare outcomes based Afrikaans lessons on an electronic template. They had to save their lesson plans in HTML format. It was edited and hyperlinks to the descriptions of the specific outcomes were made. The first 12 lessons were published in November 1999 on the WWW.

During the 2000 academic year the project was expanded to include more good quality lessons and final year students had to use the Internet as information resource for their lesson plans. They could use any theme/ topic and wonderful language lessons on Aliens, Star Wars and an
Olympic Games for Fairy Tale characters were added to the website! The students had to activate the URL(s) they used by themselves. Up to November 2000 36 lesson plans were added to the website.

A questionnaire was given to the participating students to evaluate the strengths and weaknesses of the project. 78.9% of the survey group mentioned that the assignment improved their computer skills. They felt very positive about the fact that their work was published on the Internet and 84% said they would definitely tell others of the project. Of the group that had to use the Internet as an information resource, all said that they would use the Internet again for preparing lessons.

Another project was that of the 3rd year Academic students. They had to research the status quo of Afrikaans on the Internet and did a thorough analysis of the current situation of Afrikaans Literature on the Internet. They had to identify an Afrikaans artist or author of their choice and search for information on them. Their findings made it clear that there is not much information available in this field. For example, a prize-winning South African author - Riana Scheepers - who published ALL nine novels in Afrikaans, was only referred to in a short biography on her publisher's website - and this in English!

The students were then given an assignment to create a web-based biography with a photograph of their chosen celebrity. The results were amazing. One student claimed to be computer illiterate. Four weeks later she delivered an ultra-modern, high-tech product on CD-ROM! She downloaded Hot Metal 5 from the Internet, mastered it and I quote: "When everything was done and the CD-ROM produced, I felt very proud of myself and my work. I really learnt a lot... This assignment wasn’t just another assignment, but an eye-opener to the world of computers and the Internet" (Van Schalkwyk 2000).

The benefits of this young project far outweigh the problems encountered. Problems were more of an infrastructural kind that can be solved with better planning in future. To involve student teachers in creating relevant, up-to-date learning support material for teachers on the Internet empowers them with ICT skills. They are investing in their own future as the teachers of tomorrow. They become facilitators of change who can help to disseminate educational technology throughout the entire school system.

For the Afrikaans First Language teachers, there is up-to-date information on the new curriculum and examples of lesson plans in a ready-to-use format. They can download worksheets and access Internet resources with a click of the mouse. Afrikaans language teachers who attended a seminar at the University of Pretoria in September 2000, rated their most important information needs as lesson plans and information on implementing outcomes based education in the classroom. As the website endeavours to provide in these needs, this project can only benefit all the stakeholders.

Abstract: This paper will describe a new endeavour in the area of distance education: the design and teaching of an e-mail supported academic second language reading comprehension course. The intermediate level course was intended for mature adult learners and implemented at the Open University. The course spans 15 weeks and comprises three kinds of student participation: face to face meetings, e-mail sessions and written assignments. The teaching materials are pre-prepared and include a collection of reading passages; workbooks dealing with nine texts that include approximately 20 questions and relevant teaching points. The course consists of three 3-hour f2f meetings and nine asynchronous e-mail sessions. Students have a week to complete each e-mail assignment and they receive the tutor’s feedback within 3-4 days. Student feedback on the course is obtained through a questionnaire.

Distance education (DE) is not a new concept. Applying modern technology to distance learning enhances the advantages that DE is known to have over traditional programs (Holmberg 1995). DE is flexible in terms of its adaptability to students’ conditions in time and space and thus provides a platform for independent learning since the student is the deciding factor in when, where and how the learning takes place (Knowles 1975, Mezirow 1981). There are, however, some serious criticisms of DE: the fact that students work completely on their own, that they have impersonal contact with tutors, that the turnaround time for feedback is lengthy, that they do not interact with fellow students, and that, generally, they experience a disheartening feeling of isolation. These disadvantages may explain why drop out rates in distance courses are far higher than in regular programs (Delling 1987). This paper will describe a new endeavour in the area of distance education: the design and teaching of an e-mail supported academic second language reading comprehension course.

Computer-mediated communication (CMC), in its various forms, attempts to compensate for some of the disadvantages of distance learning. Since most CMC distance courses developed to date are, by nature, content rather than process courses, their major advantages are the opportunities they provide for collaborative learning and easy access to information resources (McConnell 1994). In this, CMC reading courses differ from other courses. CMC allows for the adoption of a learner-centred approach so suited to the nature of reading. If we consider reading as a mode of language use, and DE as a mode of language instruction, we encounter striking parallels: the reader (when reading in real-life) and the learner (when learning to read) both function in isolation when interacting with a text. In both cases, discourse is enacted at a distance, a disassociated first person (the author or the instructor) is actively present, and no reciprocity is manifest, within the interactive context. One could, therefore, argue that reading instruction and distance education are particularly well-suited.

Because CMC has the capacity to empower students to direct their own learning to a greater extent than traditional DE courses (White & Weight 2000), it seemed appropriate to utilise it to create a reading course that would offer a more motivating and rewarding medium of instruction to existing face to
face (f2f) text based reading programs available at all colleges and universities in Israel. Traditionally, Reading Comprehension programmes rely entirely on pre-defined and pre-produced teaching/learning materials which are predominantly syllabus-writer led in the selection and organisation of the reading texts and the tasks. It is the instructor who controls and promotes the learning. With CMC, on the other hand, it is the learner who mediates and manages his/her own learning through a set of bearings which need to be clearly outlined in the syllabus. Tasks are pre-designed and explicitly shared out in advance, so that all participants know exactly their share of responsibilities, what is expected of them, and when.

The following description is of an e-mail mediated reading course implemented at the Open University. The objective of the course is for students to reach the same level of proficiency as students taking a parallel, traditionally taught course. This is determined by having the students sit for the same mid-term and final examinations taken by all students registered for the course nation-wide.

Participants: In order to make the course manageable for the tutor, the number of participants in a group is limited to 20.

Structure: The course spans 15 weeks and comprises three kinds of student participation: face to face meetings, e-mail sessions and written assignments.

Materials: The teaching materials, which are pre-prepared and handed out to the students, comprise: A collection of reading passages consisting of articles selected on the basis of topic interest and level of difficulty; Workbooks dealing with nine texts, arranged in modules according to test organisation patterns (comparison/contrast, description, cause and result, argument, research). Each text has approximately 20 questions to guide the reading process and relevant teaching points (reading strategies and linguistic features). In addition, the students receive a booklet of cloze exercises to provide additional vocabulary practice for each of the texts and a "Resource Centre" which brings together all the major teaching points dealt with in all modules as a handy reference.

Process: The f2f meetings are three hours long. The initial f2f meeting provides the students with the opportunity to get to know each other, to familiarise themselves with the structure of the course and to understand what their responsibilities are. This meeting serves as a kick-off point for the course and its main focus is to deal with students' queries and technical problems, as well as an introduction to pre-reading activities. The second meeting, a week before the midterm examination, serves to prepare the students for the exam by explaining the format of the exam, and doing a practice examination together in class. The third f2f meeting, at the end of the course, combines a farewell session with tips for the final examination, and a practice exam.

The rest of the course consists of nine asynchronous e-mail sessions. Prior to each e-mail session, students are sent a list of the questions they are assigned by the tutor. The questions deal with pre-reading, close reading and post-reading. Each student is assigned 8-9 questions for each text. The pre- and close-reading questions are rotated among the students so that for each text, the student is assigned questions of a different kind. All the students are assigned identical post-reading questions. The date of submission is mandated in advance as a specific day of each week, and the students have a week to complete each assignment.

The weekly tasks demand active learner engagement rather than passive participation in classroom sessions. The tutor's feedback at the end of each session, which provides correct answers, as well as specific comments regarding language features, useful reading strategies and general and individual feedback relating to students' cognitive and metacognitive awareness, is sent out to all students within 3-4 days and serves as additional English-language reading material. The students were told in advance that they only had to hand in seven of the nine e-mail assignments.

The course described above was designed to suit the needs of mature adult learners who are best motivated when they can choose to study at a time that is most convenient to them; they are actively involved in meaningful tasks; they are given the chance to self-direct their own learning procedures; they can work in ways that suit them best.

On the mid-term and final examinations, the students achieved grades as good as or better than the entire population. Student feedback on the course is obtained through a questionnaire administered at
the end of the semester, and includes open and closed questions. In all four groups which have taken the course to date in this format, students' enthusiasm is apparent. They are especially enthusiastic about the close contact they have with the tutors. The tutors seem to enjoy the course as much as the students do.

Abstract: The reform in teacher technology integration at our university is based on a school reform project. Thirteen area classrooms were equipped with the latest technology. We were selected to train the teachers to use technology and inquiry-based, student-centered learning. Monthly meetings, training sessions and classroom visits were instituted. Our teachers were eager to learn and returned to their classrooms ready to try the new technology-rich, inquiry-based projects with their students. The result: student scores improved, students' projects became more professional, and the students became empowered by their success. We based our strategies on the success we had with our involvement in the aforementioned school reform and we relied heavily on the thirteen classrooms as observation sites for our preservice teachers. Our success during our first year far exceeded expectations. We are on our way to preparing our students to be the facilitators of technology-enriched, activity-based classrooms of the future.

Background: K12 Technology Integration Initiative

Four years ago the Multimedia Interactive Networked Technologies Project (MINTs) began in 13 classrooms in the St. Louis area. Due to a settlement from Southwestern Bell, money became available to equip these classrooms with the latest in educational technology: one IBM computer for every two students, a teacher's station, scanners, interactive white boards, LCD projectors, color and laser printers and video conferencing capabilities. Each teacher selected for the project also received a laptop computer for home use. The teachers that were selected to teach in these classrooms were not technologically literate. They were, however, willing to try something new.

The timeliness for this type of project has been documented by the report: Technology and the New Professional Teacher: Preparing for the 21st Century Classroom (NCATE, 1998). That report predicted that technology will revolutionize the classroom of the future. When used correctly, technology has a strong potential to facilitate cooperative, inquiry-based learning, support different student learning styles, reinforce positive behavioral and social skills, and model real-world applications. Researchers involved in reform (e.g., Newman, Griffin & Cole, 1989; Pea, 1993; Polman, 1997) have argued that inquiry-oriented instruction is most appropriate because it provides for active engagement by learners, involving rich social interactions in real-world experiences.

The Missouri Research and Education Network (MORENET), a state agency in charge of providing bandwidth to Missouri's schools and public institutions, became the lead agency for the MINTs...
project. MOREnet offered technical training to the 13 MINTs participants during a weekend meeting at the Lake of the Ozarks. This training covered the basics of using their laptop computer, dial-up features, and email. The University of Missouri-St. Louis was sub-contracted to provide ongoing technical and curriculum support and additional training for the MINTs teachers. Our online discussion list was very active as the teachers shared the web sites they found and were using with their students. They also shared their accomplishments, students' "wow" moments and the ideas that were working in their classrooms. The online discussions and our monthly meetings provided a way to build camaraderie in our group of 13 and bind them together by their shared experiences.

Our plan consisted of monthly meetings of all the MINTs teachers and weekly visits to their classrooms. We also provided two-week training sessions during the summer and held sessions after school and/or on Saturdays. All the teachers attended the MOREnet Technology Conference, held yearly at the Lake of the Ozarks, compliments of MOREnet. The first year they attended, the MINTs teachers found the technology enlightening and interesting and they left excited to use what they had learned. By the second year they found the presentations to be routine and by the third year four of the MINTs teachers presented at the conference.

The success of the MINTs project was not coincidental. Unlike other projects that had failed in the past due to lack of teacher support (Cuban, 1986), we provided ongoing support and training, first in the technological skills needed, then in creating projects that required the use of cooperative, activity-based learning and higher order thinking skills. We held monthly meetings where all the teachers could share their successes and frustrations and receive feedback from their colleagues. We also had a MINTs listserv used for sharing ideas, web sites, classroom success stories and questioning other MINTs teachers regarding a particular problem. The list proved to be very beneficial. A teacher embarking on the creation of a new project could send out a message in the morning to the list asking for advice or web sites and have four or five responses by the afternoon. New sites that proved useful in one classroom and held potential value for other classrooms were quickly shared via the list. The list served to help develop a cohesive group among the MINTs teachers.

Our classroom teachers were not left to their own devices in the classroom after a brief period of instruction. They had continuous training and support, and they knew they had someone to call on at anytime for assistance. Jan Mastin, the MINTs Area Technology and Curriculum coordinator, received many requests to visit classrooms. When the MINTs teachers were introducing a new program or technique, they wanted an extra pair of hands in the room to work one on one with the students. We also had some teachers who were comfortable using certain software, but did not feel expert enough to teach it to their students. Ms. Mastin would visit their classrooms at the teacher's request and demonstrate the needed software.

During the MINTs project we learned that students are quite industrious when learning new technologies; as soon as they learn the basics they are ready to explore more. When they discovered something new, they were eager to use the interactive whiteboard to share what they had just learned with the rest of the class. They were always open to helping their fellow students as well. One of our MINTs teachers had her students hold their hands behind their back when helping another student. That way they had to talk the other student through the problem, improving their communication skills while the other student learned how to carry out the particular task himself.

Overall, the MINTs project did succeed. However, not all of our teachers reached the level of technology enriched, project-based learning for which we had hoped. One teacher in particular never quite believed that project-based learning would result in increased scores on the standardized tests that were required during the fifth grade. This teacher's students used their computers but they could have completed the same tasks using paper, pencil, and textbooks. The students would be working on a project while the teacher sat behind the desk. We suggested that the teacher needed to be monitoring the students as they worked, asking questions and making sure they were on task. He preferred to sit at his desk and grade papers.

Not everyone is cut out to teach in this type of classroom. We found that a teacher must be very flexible, open to new ideas, and acceptable of controlled chaos to succeed in this type of classroom.

As the MINTs Area Technology and Curriculum Coordinator, Ms. Mastin has been working with the MINTs teachers for about two and one half years. This experience became a major influence when it came time to plan our PT3 grant proposal.
A College of Education poised for Technology Integration

The College of Education at the University of Missouri-St. Louis was undergoing a curriculum redesign at the time, grouping courses by three levels and requiring 40 hours of observations in the "Exploration Level" and "Analysis Level" classes. Students would now have the opportunity to observe what a teacher really does in a K-12 classroom before their junior or senior year. Through reflection and class discussions, the preservice teachers would gain a deeper understanding of what it meant to be a classroom teacher. One part of this redesign targeted observations in technology-enriched classrooms.

At that time all of our faculty members had computers in their offices. However, they were mainly used for word processing, email and preparing syllabi and class handouts. Approximately 2% of our faculty members were using email and online discussion groups with their students. About that same percent referred their students to web resources and taught using technology. This lack of technology integration by the rest of the faculty was what we wanted to target in our PT3 proposal. Ms. Mastin had seen firsthand that project-based, technology-enhanced learning could raise students' enthusiasm, increase test scores, improve self-worth and generally improve a student's attitude about school. We wanted our faculty and preservice teachers to be made aware of those outcomes and to become adept at integrating technology in their classrooms.

Dr. Charles Schmitz, who became the Dean of the College of Education in 1996, was a firm believer in the power of technology. Paper copies of "The Dean's Weekly Update" were banished upon his arrival. If there were faculty members who did not use email before his appointment, they began using it soon after. He also envisioned a Technology and Learning Center (TLC) for our College and an Endowed Professorship of Technology Education. With the TLC and the Endowed Professorship funding secured in the spring of 1999, we were poised to begin a comprehensive program of technology training and integration for our faculty. At that time, we applied for a Preparing Tomorrow's Teachers to Use Technology (PT3) grant.

Faculty Teaching Reform through the Support of a PT3 Grant

We planned our grant with great zeal, based primarily on the success and knowledge gained from the school-based reform of the MINTs project. We were convinced that the procedures that worked for the MINTs project would, with some adjustment, work with our faculty, as they began learning about the rewards of technology integration. Our PT3 grant application was approved in September 1999 and our new TLC had its grand opening in March 2000.

Cadres of five full-time and five part-time faculty members were chosen first from the Level I "Exploration" courses. The idea was to begin modeling and teaching technology integration when our students began their education courses. Our professors would teach with technology, but first we had to teach them.

We chose our first cadre members carefully. We wanted people who were not afraid of trying something new and we wanted those faculty members who agreed with the basic principle that the use of technology would improve their students' learning experiences and better prepare them for the classrooms of the 21st century.

At one of the first meetings, participating Cadre I members and the PT3 staff created a list of technology integration options that people could select from to begin using technology in their classes. This approach, of asking our faculty members for their input and ideas, provided them with a sense of control and paved the way for a commitment to carry out their choices. Only later did we realize that there was a lack of accountability in this model.

During the following semester we presented the list of technology integration options to Cadre II members and also had them sign a commitment paper, agreeing to initiate the five items they selected. Posting their syllabus on the web, using email with their students, and holding online, asynchronous discussions were a top priority for everyone. These served the dual purpose of acquainting the instructor with technologies that they may not have used before and requiring their students to do the same. We also encouraged the use of PowerPoint presentations, both for the instructor and the students, posting assignments to the web, and student web page creation for class.
Unlike previous technology integration projects that had failed in the past due to lack of teacher support (Cuban, 1986), our instructors had a lot of support. Small, informal workshops were held in the TLC on numerous technologies; file management, FTP, PowerPoint, HyperStudio, Netscape Composer, and web search techniques. Four of the five faculty members in the first Cadre attended these sessions. The PT3 PI and Project Director were available for one on one meetings with each Cadre member to discuss technical issues or the details of how to incorporate technology into their curriculum that would enhance course content and most benefit students.

During our monthly meetings we invited some of the most successful MINTs teachers to talk about their experiences with technology integration and highlight assignments, student projects and outcomes. At our first meeting we discussed what experiences a preservice teacher needs to fully understand the meaning of technology integration and how this type of learning works in a K-12 classroom. Most of our instructors had no idea that 4th-6th grade students were capable of such sophisticated projects using technology. They left the meeting impressed with what they saw -- the enthusiasm of the MINTs teachers, the student projects and the positive results this type of learning has on test scores and student outcomes.

The MINTs classrooms were used as technology-rich observation sites for our preservice teachers and a guide sheet for observations was provided. We found that the observation sheet was not enough. Some of the MINTs teachers reported that the preservice teachers would visit and just sit in the back of the room. The preservice teachers did not understand why the classroom teacher was not "presenting information" and some of them left thinking that what they had just witnessed was a chaotic, unmanaged classroom where the teacher was not in control. What we apparently had not clearly conveyed is that the classroom structure and management in a technology-enriched classroom is quite different from what our preservice teachers might expect. Most of our students are products of teacher centered classrooms. When faced with the project-based model they did not quite know what to make of it. We needed to make sure our faculty members had a clearer picture of the realities of project-based learning so they could impart that to their students prior to sending them out for their observations. We also needed to convey that the preservice teachers needed to interact with the students in high-tech classrooms. Sitting in the back of the class, watching students work in collaborative groups proved to be a less than enriching experience.

Some Lessons Learned

Coordinating the schedules of classroom teachers with the availability of 300 preservice teachers proved to be a real challenge. The classroom teachers want to be notified by email at least two days before a visit. We are in the process of devising a better system than the one we currently use to accomplish this. One major roadblock is the mindset of our faculty. Some of them do not believe that they can send their students to a high-tech classroom to observe "things you would see in a normal classroom." In one way that may be true. Classroom management in a high-tech environment is not the same as the teacher-driven model that most of our students are used to from their own experience in high school.

One of the professors who teach Level I classes did not really see any reason to change the way he was teaching. He had no desire to use web sites as resources for his class, even if they were presented to him for his use. Correspondence by email or listserv was not an option for him either. He was aghast at the thought of tracking the correspondence of his 40+ students. He did, however, see the possibilities as he listened to the other Cadre members as they talked about and shared their excitement of using listserves and web resources. By the second semester this professor was using web resources in his class.

Our PT3 listserv is not the solidifying resource that it was for the MINTs teachers. Lack of time on the part of the Project Director has prevented the posting of questions to the list and the encouragement of PT3 faculty to share their experiences there.

We had also envisioned a close relationship between our MINTs teachers and our PT3 faculty. All but one of our faculty members has yet to go to a MINTs classroom to observe. The Project Director tried to initiate these visits for Cadre I, but scheduling problems proved to be insurmountable. We see a close relationship between our faculty members and the MINTs teachers as beneficial for both, but we are still trying to devise a way to accomplish that goal.
Time is on our side though. Our successes and near successes have been enlightening. As our Cadre members share their experiences with us, we are envisioning new ways to work with the faculty to bring about a shift to a technology-integrated curriculum.

One top priority is to ensure that our faculty members visit a technology-enriched classroom. Cadre 3 members will take at least one field trip to a high-tech classroom during one of our scheduled meetings. A new assistant will take some of the workload off of Ms. Mastin, and allow more time for her to schedule monthly visits with each faculty member, sit in on some of their classes and spend more time monitoring the listserve so that it becomes an important resource for the PT3 faculty members.

This coming semester we will schedule our panel discussion by technology using teachers early in the semester. We received a lot of positive feedback from the discussion, but we also learned that it would have been even more helpful earlier in the semester.

References

We wish to thank our colleagues at the College of Education, especially the staff of the Technology and Learning Center, faculty participating in PT3, Charles Schmitz, and Dee John. A Preparing Tomorrow's Teachers to Use Technology grant from the U.S. Department of Education and a gift from E. Desmond Lee made this work possible.
Putting the Instructor in Charge: Component Architecture and the Design of a Course Web Site.

Punyashloke Mishra (punya@msu.edu)
Matthew J. Koehler (mkoehler@msu.edu)
College of Education
Michigan State University

Abstract: This paper describes the “component architecture” of the web and how teachers can use various existing components of the web – plugins, websites, applets, web services etc., to develop complex applications with limited investment of resources. Furthermore, the pieces of independent software units can be coordinated towards a final product that effectively hides the “duct tape” that holds the pieces together. This “mix and match” approach towards developing educational software saves money and time and allows information sharing across activities in an integrated fashion which in turn.

Introduction

One of the most important tasks faced by a teacher is designing the classroom learning environment. Either consciously or instinctively (or a combination thereof), teachers chose the topics that will be covered, they structure the classroom conversations, they assign tasks for students to work on, and they provide tools and resources to students. It can be argued that some of the resistance teachers felt towards technology (specifically computer-based technologies) could have been caused by a feeling of losing control of their classrooms. Until recently, teachers did not have access to technology, could not participate in its design and its integration into their teaching practices.

Introducing Component Architecture and the Web

We believe that we are at a new position now. New technologies (such as the Web) allow teachers to take on a far more proactive role in the design and implementation of new technologies. One concept that we believe is key to teachers becoming designers has been called “the component architecture of the web.” That is, using various existing components of the web (plugins, websites, applets, web services etc.) instructors can develop very complex applications with limited investment of resources. Furthermore, the pieces of independent software units can be coordinated towards a final product that effectively hides the “duct tape” that holds the pieces together (Zhao, Mishra, Ferdig, in press). This “mix and match” approach towards developing educational software has two main advantages: (a) it saves money and time; and (b) it presents different functions in an integrated fashion which in turn; (c) allows information sharing across activities.

Teachers as designers

It is our contention that the component architecture of the web allows us to easily, and inexpensively, develop complex, diverse, dynamic, and pedagogically sound web sites. It is for these reasons that we argue for teachers to become designers of their own technological solutions. To support this claim, we describe a web site that was used to support a teacher professional development course taught by the first author. We describe the goals of this undertaking, how existing components of the web were used to meet these goals, and the lessons we learned from this undertaking. We conclude by contrasting our approach with a course web site developed using an existing prepackaged approach offered by Blackboard.com.

Putting the pieces together for a course web site

The web site was designed for use in a graduate educational technology course consisting primarily of in-service teachers (with a few master’s students in educational technology). Students in this course worked in design teams to develop computer-based products that would be useful for teaching and learning. To meet the needs of the course, we needed to develop a technology environment that would help us with effectively communicating within project teams, across project teams, and among all class participants, managing projects, providing access to readings, and archiving artifacts developed in the course. Instead of developing or purchasing a large software package, we assembled an efficient environment from mostly free software and existing services on the web. All of these components were integrated into the course web site seamlessly.
The web site included standard course information—the syllabus, readings, pictures of artifacts developed, and powerpoint presentations based on lecture. Beyond these basic resources, the web site employed several other technologies to meet other course needs. The technologies, or components used for the design of the web site were as follows:

Blogger.com: A free web service that allowed the faculty to update and ftp web pages to one part of the web site without having to use any web- or HTML-editing facility.

Egroups.com: A web service for managing mailing lists and threaded discussion groups. Egroups also offered, (a) an archive of all communications; (b) a classlist (with pictures) and contact information; (c) web polls; (d) a group calendar, and (e) 20 MB of web space for archiving files and readings.

Idrive.com: Each student in the class was required to register for an Idrive account. Idrive offers its users 50MB of free web space to upload, save and share files. In addition, Idrive also offers unlimited web space for files that are saved directly off the Internet. This feature is useful to practicing teachers who wish to "file" useful lesson plans and other web sites for future reference.

Apart from the organizational and pragmatic uses of these free services, the course web site also attempted to offer a new way of thinking about learning in today's networked environment. These options were seamlessly integrated into the class site by maintaining all of the course options in one frame while presenting the "outputs" site in the other frame.

The History Channel: The course page linked to the History Channel web site that provided information about "this day in history" and "this day in the history of technology."

Searches via Google, Encyclopedia Britannica and Merriam Webster: To emphasize how information on the web could be easily accessible the course web site has fields that allow students to search Google, Encyclopedia Britannica and Merriam Websters Dictionary.

Lessons learned

We see the development and maintenance of such a system as an ongoing experiment to study and reflect on what is possible using freely available services on the Internet. Some things we have learned are: (a) Users of the system see an integrated web-site and were unaware of how the entire system is cobbled together from what is essentially freeware on the web; (b) One can reinterpret the functionality of software i.e. they can be used in ways and within contexts that were not envisaged by the designer of the original computer program. For instance, Blogger was used to maintain an announcements page. This was not something that Blogger was designed to do but which worked out quite well; (c) Trouble shooting the system is quite easy. If the mailing list does not work for some reason it is because egroups is down, not because there is something wrong with the whole class site. In fact, the loss of one component does not bring down the entire course site; (d) This system gave the instructor much more freedom and flexibility than the system run by the university; (e) Such a system should be within the reach of common teachers financially and technically.

Course web sites using Blackboard.com

We offer a contrast of our component approach with a pre-packaged system such as Blackboard.com. This company offers an integrated web course site development and presentation environment, developed for and by educators. However, Blackboard.com constrains the options the instructor would like to have. For instance having a listserv (which could be accessed just through email), with built-in web archives (as in Egroups) was important to the instructor. However Blackboard.com allows just web based discussion forums which would be hard to access on a slow phone line. Also, the instructor may want to disable certain options available (say, on-line chat). Though Blackboard.com allows instructors to disable online chat it provides no way of removing the chat button from the options. Moreover integrating functionalities such as the web search from within the course site, is not easily done with Blackboard.com. And finally, using Blackboard.com as a solution does not allow students to learn about the messy process of design of through an actual case study—the course site itself.

By constructing this class web site, we not only provided students with tools that made their participation in the class easier, we also gave students an example of how to design and integrate technology into classrooms. Since the main goal of the class was to help teachers integrate technology, the web site was one way to help "lead by example."

Abstract: This information was written to help teachers understand steps that they can take for to keep their equipment running longer and better. It will walk them through steps to see if they can troubleshoot their problem or if they do need to send for help.

Preventative Maintenance

1. In a low traffic area-Place computers away from chalk dust or other contaminants, on a sturdy table or countertop. Store power and printer cords away (no entanglements for feet, no accidental unplugging of power or other cords.

2. Preventative actions for computer hardware and disks-Avoid exposure to magnetic fields, avoid exposure to static electricity (touch something metal to ground yourself first), avoid exposure to extreme temperatures (don’t leave hardware or disks in an environment where the temperature can fluctuate several degrees either), avoid exposure to liquids or to conditions that could result in condensation on the equipment. Run Scandisk on hard drive and floppies to keep disks in working order. Run Disk Defragmenter on hard drive to ensure fastest storage and data retrieval rates.

3. Preventative actions during computer use-Close applications that are running but don’t need. This will free up memory. Look at the taskbar and see the number of buttons you have representing programs running or windows opened. If you have more than four buttons present, consider closing some windows, especially if you have less than 32 Megabytes of RAM. Save your work regularly!!! This doesn’t prevent “crashes”, but it reduces the level of stress within the computer user in case of a crash. If your Windows computer “crashes”, press ctrl-alt-delete, then ctrl-escape. It will bring up the start menu allowing you to safely shut down your system. If you have to turn it off without going through the shut down procedure, don’t turn it off and on again rapidly. Wait 10-15 second before turning it back on. If your Windows computer shows a window that says it needs to run Scandisk to check for errors on the drive—let it run and correct the errors—do NOT exit Scandisk before it has completed its procedure.

Keep your system running more smoothly by following just a few steps:

SCANDISK-A Microsoft utility, which acts as a disk analysis and repair tool that checks a drive for errors and corrects any problems that it finds. A Standard SCANDISK should be done once a week. A Thorough SCANDISK should be done about once a month.

⇒ Double click on My Computer.
⇒ Right click on the C drive—choose Properties.
⇒ Click on the Tools tab
⇒ Under the Error Checking Status click the Check Now box
⇒ Click on Thorough, and then make sure there is a check in the box Automatically fix errors, and then choose Start.
⇒ When SCANDISK has completed, results will appear and let you know if it found errors.

DEFRAG-It’s a disk defragmenter, which reorganizes the files on a disk to optimize the disk performance. Running Defrag periodically will help your PC run more efficiently and speed up performance.

Correct Shut Down- Close all programs. Click the Start button; choose Shut Down Select one of the options from the Shut Down Windows dialog box. Click Yes.
General Troubleshooting Techniques

1. Check connections - Whenever some component (CPU, mouse, keyboard, monitor, printer, etc.) doesn’t work, you should check the connections of that device (e.g., power cord, printer cable, mouse connector wire, keyboard connector wire) and make sure the cords and connectors are securely attached.

2. Try swapping devices to pinpoint the problem. (CAUTION: If you haven’t done this before, do not attempt it without help from the building technology person or another knowledgeable source) - For a device like a mouse, keyboard, or monitor that doesn’t appear to be working, try attaching the device in question to a different computer. For example, a monitor doesn’t show a picture. If you attach that monitor to another computer and DO get a picture, you know the problem is not with the monitor, something to do with the computer (such as a bad video card or cord). For school-owned computers, limit your efforts to devices that connect to the outside of the CPU case (don’t open the case).

3. Use diagnostic and/or repair software to help pinpoint and possibly correct problems.
   a. Scandisk - this program comes with Windows. It can detect and fix some errors in the way files are written to disks. It can also help free up unusable disk space.
   b. Disk Defragmenter - moves data around on a disk so that files are not “fragmented” (parts of individual files saved in different locations). The process of defragmenting can result in faster file access from disks because the disk drive doesn’t have to look at a wide variety of locations on a disk to find and retrieve a file.
   c. Software such as Norton Diagnostics, Norton Disk Doctor, and Conflict Catcher (Conflict Catcher is for Macintosh computers). Use this on your home computer, but not on your school computer without permission and assistance from the Technology Department.

Consult with your school technology person and/or any other qualified personnel (Example: Customer Service Desk)

Correcting Common Problems

When Your Computer “Crashes”

1. DON’T PANIC - it happens to the best of us!
2. On a Windows machine, use the keyboard command Ctrl+Alt+Delete to see if you can bring up the “Close Program” dialog box.
3. If you CAN bring up the “Close Program” box, look for applications listed as “not responding”. If there are any, click on their name and click the “End Task” button.
   If you CANNOT bring up the “Close Program” box, try using Ctrl+Alt+Delete again to see if you can restart the computer. If that doesn’t work, turn the computer off and back on again after 15 seconds, or press the “Reset” button. Realize that, upon restart, Windows will want to run Scandisk. Let it do so! Press F1- A great Help utility that can walk you through the troubleshooting process.

Error Messages and What They Mean

Mapl DLL Error-Sometimes found when trying to run Netscape. Go to Edit>Preferences>Mail and News. Uncheck the last box that enables the Mapl. Exit and Log off then log back in and Outlook should work.

Save changes?- This usually appears when you close a program and haven’t saved the work.

The device is not ready-This message usually means you have forgotten to place the CD or floppy in the drive securely. Just place your CD or disk in the drive and click on Retry.

The item this shortcut refers to has been moved or changed-The shortcut to the original file has been altered on the hard drive or totally removed. Point at the shortcut, right click and choose delete. Find the original file and make a new shortcut.

The disk in the destination drive is full-If your disk if full or Windows knows it won’t be able to fit your entire file on the disk; you’ll get this message. To fix this problem, just delete a few things from your floppy disk or use another disk.
The specified path is invalid—This message appears when you try to open a program from the Start menu and Windows can’t find the file. More than likely, someone’s removed the program from the hard drive and forgot to take it off the Start menu. The names and icons on the Start menu are placeholders directing the computer to the original files on the hard drive.

This filename is not valid—You’ve probably typed a filename that contains one of the forbidden characters: "*/<>?" Rename the file and leave out any of these characters.

The file has a resource conflict—This happens when one piece of equipment is trying to use a port of other piece of hardware. Use the Hardware Conflict Troubleshooter. Click on the Start button, and choose Help from the menu. On the Contents tab, double-click on Troubleshooting, then click on the entry labeled “If you have a hardware conflict”. You’ll see a dialog box. Click on the appropriate button to get the process started, then follow the detailed instructions.

Desktop Problems

Missing Task bar—Most of us have lost the Task Bar at one time or another. Move your cursor to where it used to be. Did it appear? It may be on Autohide. If not move your cursor further toward the edge. Hold down the left mouse button and try to drag it back into sight.

A flawed program

✓ The icon on the desktop turns black.
✓ Your system freezes up. You might be able to move the mouse but nothing happens when you tap the keys or click the mouse. The usual cure is to turn the machine off and back on.
✓ The picture on your monitor starts to act up. Windows might refuse to go away, or you’ll see dark holes in the background.
✓ Everything begins to move at a glacial pace. Save what you can and prepare to restart.
✓ You see a bright blue screen with a white error message on it. That generally means something bad. If you’re lucky, you can hit the Enter key and get back to work.

You see a Windows dialog box; telling you your application has caused a general protection fault. Click OK and see if you can get back to work. You’ll probably lose anything you haven’t saved lately.

Mouse and Keyboard problems

Left-handed Users in a right-handed world—From Start go up to the Control Panels. In the Control Panel you will find an icon entitled Mouse. Double click on it and it will give you the choice for right or left-handed.

Troubleshooting a mouse or keyboard freeze

1. Close all applications if possible.
2. Power down the machine.
3. Check the cords.

Disk Space Troubleshooter

This troubleshooter helps you solve problems you may encounter if you run out of disk space.

Empty the Recycle Bin
Use ScanDisk to check for errors that may be using up disk space
Back up unneeded files and remove them from your hard disk
Remove Windows components that you don’t use
Create more disk space by using DriveSpace disk compression.

Recovering from a Hang

Press ctrl-alt-delete, then ctrl-escape will bring up the start menu allowing you to safely shut down your system.

Restart Windows

To restart Windows with a full warm boot, select shut down from the Start menu. Click the Restart Computer option, and hold the shift key down while affirming “Yes”.
**Peripherals**

When Windows starts, it automatically scans your computer for any device without a driver and installs drivers as needed. (Plug and Play)

If you think that keeping those old drivers loaded is a good idea in case you need to re-install Windows, you are mistaken. You will have better performance and stability if you use the native Window drivers.

**Connect SCSI devices without restarting Windows**

Right click on My Computer, and select Properties.

Click the Device Manager tab, and select Computer at the top of the list.

Click on "View Devices By Connection".

Press Refresh. This will take several seconds, but the new device should appear in the list.

If you don't see the new device, choose "View Devices By Connection", find the SCSI card in the list, and expand it out to see all the devices attached to it.

**Printers**

Troubleshooting steps:

- Is the printer connected to your computer (Check the plugs on either end of the connection, just to be sure.)
- Is the printer plugged in and turned on?
- Does Windows know about your printer? (My Computer-Printers) Did you log on to your computer?
- Is the printer out of paper?
- Are there any lights flashing on the printer's front panel? If there are, try turning the printer on and off to clear its memory and reset it, then try again.
- On the Windows Start menu, click Help. Click the Index tab, and then search for "print troubleshooting." Click Display, and then follow the instructions in the Windows Print Troubleshooter.

If your Windows printer setup looks correct, check your Word printer settings.

Make sure that the selected printer matches the printer you're using. On the File menu, click Print, and then click the name of the printer you want to use in the Name box.

Make sure the page range you've selected in the Print dialog box corresponds to the pages you want to print.

**Does your computer say that it has printed your job but the printer doesn't print?**

This may be caused by selecting the wrong port to print from. For instance if you have a network printer and try to print to a local port you will not get any printout. Check by going to the printer folder and highlighting the appropriate printer. Click the right mouse button and check to see if the correct port is selected by clicking on the Details tab.

**Is your printer spitting out sheets with strange characters on them?**

Go to the Printer folder and check to make sure you are using the correct print driver. Highlight the printer and then right click. Choose Properties and then click on the Details tab. Look to see if the print driver being used is correct. Select the appropriate drive, remove the bad print job. Turn the printer off and back on to clear out the garbage.

**Is the printout streaky?**

Clean the print cartridge head with alcohol. Let it dry, and place it securely back in the carriage. If this doesn’t work, it’s probably time for a new cartridge.

**Does the paper keep jamming?**

Check for small bits of paper in the paper path. Humidity sometimes causes paper to stick together. Manually separate the pieces of paper and put them back into your printer.

---

*Working between a Macintosh and Windows computer is possible if you format your disk in DOS and have the same program versions on both computers (example: Word 6 on a Mac can be read by Word 6 on a Windows machine).*

## End-of-Year Maintenance Windows Computers

### Clean up your Hard Drive

- If you haven’t used the file or document in the past year, delete it.

1. Double click on “My Documents”
   - If it is not on your desktop, double click on “My Computer”.

---

![ERIC Logo]
2. Double click on the “C” drive. A list of all your files should appear. Most people default their documents to this folder. If you save to the desktop or to another folder, you will need to go to those locations.

2. To delete an item, right click on the item and select “Delete”.
3. To delete multiple items, hold down the “CTRL” key. Click each item you wish to delete. Right click on any one of them and choose “Delete” from the menu that appears.
4. Right click on the “Recycle Bin” (on the desktop) and choose “Delete All”. The items are still on your computer until you empty the recycle bin.

Backing up Files

Backing up to the server
1. Double click on “My Computer”.
2. Double click on the folder with your username on it. This opens your folder on the server.
3. Locate the documents you wish to back up. Drag the documents to your folder on the server. You are copying the files, not moving them. You will now have them on both the server and the original location.

Backing up to a Floppy Disk
1. Insert a blank disk into the disk drive.
2. Double click on “My Computer”.
3. Drag your documents over the icon for the “Floppy Drive”.

Cleaning up Microsoft Outlook
1. Open “Outlook”.
2. Click on your “Inbox”. Hold down the “CTRL” key and click on all items you would like to delete. Click on the black X on your tool bar OR go to the edit menu and choose “Delete” OR right click on the item and choose “Delete”. This will delete all the highlighted items at once.
3. Click on the “Sent Items” folder. Follow the above instructions.
4. Right click on the “Deleted Items” folder. Choose the “Empty Deleted Items Folder”.

Local Printers (Except for the Epson 740)

Removing cartridges from the Epson 740 destroys them.
1. Open the printer’s cover and remove the print cartridge. Place the cartridges in a ziplock plastic bag. This will help to keep your cartridge from drying out. Don’t touch the metal parts.
2. When you return in the fall, put the cartridges back in the printer. You may have to clean the bottom of the cartridge with alcohol if it gets dried out.

Defragment your Hard Drive
1. Double click on “My Computer”.
2. Right click on the “C” drive. Choose “Properties”.
3. Click on the “Tools” tab.
4. There are three different choices on this window. Click the “Check Now” button for “Error-Checking Status”. It takes awhile so don’t waste your time watching it.
5. In the “Defragmentation Status” click the “Defragment Now” button. This also takes awhile but improves the efficiency of your computer.

Before you leave for the summer
1. Change your password. Passwords are good for 120 days so it is better to change it now than to try to figure out why the internet doesn’t allow you in after vacation. You may want to write the password down.
2. Unplug cords from the wall and television. (Feel free to color code or label cords so you can reattach everything yourself in the fall.)
3. Leave the cords attached to your computer. Wind the cords up and secure them with a rubber band or twist-tie.
4. Cover your computer with a large piece of paper or cloth (not plastic). This helps your computer to stay clean.
5. Although it is best to store the computers in a dry cool environment, that is not always possible. Your principal and Building Technology Specialist can tell you if you need to move your computer to another location.
Dancing with Technology to Teach Technology
Tweed Ross, Kansas State Univ., USA

"Those who cannot hear the music believe the dancer is mad."

Those who believe modern electronic technologies are fundamentally changing the learning of young people are faced with an intractable conundrum. To teach the new technologies to the uninitiated they are relegated to the old practices used in education for some considerable time: lecture, textbook, guided demonstrations, and lab exercises. In short while they believe in discovery learning and constructivist theories they end up using didactic process and behaviorist means. Is there a better way?

Colleges of Education setting about to reform the teaching of the future teachers in the K-12 classrooms of this century would do well to consider how their student learn technologies differently than the professorate. To reinforce the need for new learning strategies spend a Saturday morning at the electronic arcade in the mall and watch juveniles solve complex, action packed, eye-hand exercises for as long as their pocket change lasts.

The College of Education at Kansas State University set about seven years ago to revamp the way it's undergraduate, required, introduction to technology class was taught. Some years earlier the move from bulletin boards, filmstrip, overhead transparencies, and 16mm. projectors had been navigated. The new instructional media course was designed to meet the outline of then current ISTE standards. However, the teaching method was still much the same: regular class meetings, professorial lectures and graduate student supervision of lab assignments followed by paper and pencil tests.

The Dean of the College along with the administrative council recognized this was not good enough and started on a new, ambitious project to "teach technology using technology." The first iteration of this effort was a video based project. This project was produced using a digital video editor. Video tapes were produced for students to watch and work through exercises in their own time frame. There were no established class times and assignments were project based for activities likely to be encountered by beginning teachers.

As new technologies became available to the College of Education and students the course was rewritten into be delivered in a CD-ROM format. As the Internet became an effective part of modern technologies the course was once again revamped to make use of this new resource.

A close reading recognizes that while new asynchronous methods of teaching were employed, the course was still a self-contained course taught essentially by a "technology guru." This guru was responsible for its design, implementation, staffing and supervision. In short, the course was isolated from much of the rest of the pre-service teacher program. Teaching the use of new technologies to undergraduate education majors was the responsibility of the technology person. Technology was something to be learned, not something to be employed. Recently public schools and general experience have provided incoming students with far greater technology. To meet these new abilities of students to "dance with technology," the bar has been raised to higher levels by the NCATE 2000 standards and the new ISTE standards.

These standards, if they are to be incorporated by Colleges of Education, requires that the delivery, implementation and evaluation of a technology component for pre-service teachers no longer remain an isolated course taught by the computer guru. Technology must be integrated into the pre-service program of the college.

The unit's conceptual framework(s) reflects the unit's commitment to preparing candidates who are able to use educational technology to help all students learn; it also provides a conceptual understanding of how knowledge, skills and dispositions related to educational and information technology are integrated throughout the curriculum, instruction, field experiences, clinical practice, assessments and evaluations.

1 ISTE (1997). National Standards for Educational Technology
2 http://Courses.educ.ksu.edu/EDETC318/
3 NCATE. (2000). NCATE 2000 Unit Standards
On the surface these new standards require several things to occur in relatively short order.

1. Members of the academy responsible for pre-service teaching must model and demonstrate effective technology. This requires that available resources, support, reward and development be readily available.

2. Members of the academy must be able to evaluate pre-service student teaching practice for both the appropriate use and quality of use for technologies. This requires a qualitative understanding of when technology should be used and what how to evaluate and advise others in technology application for teaching.

3. Members of the K-12 community must be prepared to support pre-service teachers in their intern experiences, evaluate technology teaching efforts and cooperate in pre-service teachers' growth and appropriate use for technology.

4. Pre-service teachers must be able to demonstrate that they can appropriately integrate technology into their repertoire of skills for teaching. K-12 schools must search for and hire graduates who can demonstrate these abilities.

At this point becomes apparent that "those who cannot hear the music" i.e. those who do not have a vision for integrating technology into the teaching skills of pre-service teachers, must think those who do are mad. Therefore it is important that "technology guru" step out of the role of the technologist who knows how to make the tools perform and enter the role of "instructional support" vs. "technical support."

Faculty members must be encouraged to use email, not just to dialog concerning professional papers, but to react with students in a new sense of time and space. Internet applications for course management most evolve from electronic syllabus to interactive vehicles for class presence. PowerPoint presentations need to grow from electronic transparencies to ways for students to constructively collaborate on demonstrations of content. Internet searches and activities change from what is fun and flashy on the web to what has real meaning for constructing a deeper understanding of content.

Colleges of Education must insist that their technology programs not just teach the playing a musical instrument, but how to effectively appreciate the music and join in the dance. Clearly not an easy task, but one made possible if we think of ways to "use technology to teach technology."
Development of English Department of Computer Information Systems as a Way of Worldwide Educational Integration

Anatoly Sachenko
Director
Institute of Computer Information Technologies
Ternopil Academy of National Economy
Ukraine

Ukraine
iv@tanet.edu.te.ua

Andrij Vivchar
Lecturer of the Department of Information-Control Systems and Management
Institute of Computer Information Technologies
Ternopil Academy of National Economy
Ukraine

Abstract: reforms started in Ukraine caused creation of new speciality "Economic Cybernetics" which combines mathematical modeling and information technologies and is applied in national economy. One of the most important task during Faculty development it is curriculum development. Analysis of Ukrainian post-secondary school curricula showed, that they are oriented on traditional methods and do not consider international experience of training specialists of profile given above. There are a number of potential results, which possible to obtain, the main one consists in the developing new Faculty, "English Department of Computer Information Systems". The results of the proposal faculty development may be used as a basis for curricula development by post-secondary schools of Ukraine and other countries, which are going to integrate in the World community.

Introduction

As young independent state, Ukraine started reforms in economy, policy and education and began integration into worldwide international institutes recently. Economy reforms entailed development of enterprises of small and middle business, political and economic reform assisted to stormy development of new information technologies. In connection with that there appeared a need in highly skilled specialists of economic profile, which would have a command of information technologies and methods of their implementation in business-activity. It caused creation of new speciality "Economic Cybernetics" which combines mathematical modeling and information technologies and is applied in national economy. Besides, taking into account stormy expansion of Ukraine co-operation with most progressive World countries, appear joint enterprises with allotted capital the employees of which ought to be skilled in information technologies, business, and also to have education, in accordance with World standards.
Curricula Development as a Main Task of the Faculty Development

One of the most important tasks during any Faculty development is the development of the curriculum. Analysis of Ukrainian post-secondary school curricula showed that they are oriented on traditional methods and do not consider international experience of training specialists of profile given above. That's why the development of new curricula for specialty "Economic Cybernetics" according Western Universities Standards is an actual and important problem, and Institute of Computer Information Technologies (ICIT) of Ternopil Academy of National Economy carries it out. Analysis showed that the popular two specialties "Business Information Systems" (West Europe) and "Management Information Systems" (USA) are the most closed relative to "Economic Cybernetics". Therefore ICIT has started with some partners from West Europe together to develop new BIS's curriculum. The main result of collaboration, which can be obtained, lies in the developing new Faculty, "English Department of Computer Information Systems" consisting of ICIT where all subjects will be taught in English (similar department has been successfully functioning in TU Sofia, Bulgaria since 1995).

Potential Results

There are a number of potential results, which possible to obtain:

- Assisting to reform system of post-secondary education in Ukraine;
- Widen co-operation of the Department with business-structures (specially with those dealing with international business and computer technologies);
- Increasing the co-operation of workers of post-secondary school with universities of different World regions.

Moreover, as for the Western Countries the obtained results allow to:

- Enrich the Western Partners by experience elements and activity peculiarities of post-secondary school in Ukraine and post Soviet Union countries;
- Increase prestige of countries and post-secondary schools participating;
- Widen the co-operation of western countries as well as Western and Eastern Countries;
- Assist the unification of World market of labor resources that is important in period of world integration.

Conclusions

The results of the proposal Faculty development may be used by post-secondary schools of Ukraine (and other countries, which are going to integrate in the World community) as a basis for curricula development for Business Information Systems as well as for other similar specialties and branches. Thus the principals of post-secondary school system of Ukraine and other post Soviet Union countries are similar, the obtained results can be adapted to national peculiarities.

Abstract: Advanced technology has a relatively short life span before it substantially changes; this is especially true of computers and information technology. Acquiring skills that are well developed and flexible will allow students to adapt to the rapid changes and innovations in technologically advanced environments. As the demands of teaching have changed over time educators have examined a variety of approaches in order to make the process of computer and technology education as efficient as possible. Albert Bandura’s Social Learning Theory offers both concepts and techniques which can aid the professional educator in optimizing classroom instruction in technology and computer skills. Bandura’s descriptions of the learning process and mechanisms by which they operate are especially well suited to the teaching of computer and technology skills. Techniques and theory from this approach are applicable to almost any level of education from grade school to college.

Introduction

The impact of technology on the process of modern life is undeniable. In the past two decades we have experienced the development and dissemination of a new form of mass and interpersonal communication, namely the Internet. The Internet, made possible by affordable advanced computer technology, is quickly becoming a staple of education, businesses, public administration, and private life. The same advances which drive the Internet are also revolutionizing many traditional areas of human endeavor; this impact is certainly felt in all levels of education from preschool to the college/university arena. Changes in elementary, secondary and higher education with respect to technology are rapid and widespread. Computers as teaching tools provide access to staggering amounts of information. Modern audio/visual aids, including cable television, digital recording and imagery, and satellite broadcasting can produce phenomenal lesson plans and bring the individual student into direct contact with
experiences that would have only been abstract concepts even twenty or thirty years ago. Education at all levels is beginning to focus more and more on the student's acquisition of relevant technology skills both in and out of the classroom; these same advances which facilitate the process of education will also be the tools of many trades and vocations awaiting the prospective graduates.

The Dynamic Nature of Technology Skills

Advanced technology, unlike most aspects of education, has a relatively short life span before it substantially changes; this is especially true of computers and information technology. As of this writing the one gigahertz microprocessor is now commonly available from many computer manufacturers; just five years ago the most advanced processor was less than a tenth of this speed and the platform to which it was attached could not handle streaming audio or interactive video without prohibitively expensive modifications. By the time this article reaches publication the one gigahertz microprocessor likely will be found in budget computers and will no longer be state of the art technology. Operating systems, word processing programs, and other software packages are functionally reinvented every three to five years. To use these tools to their maximum advantage requires a degree of multitasking from the learner. They must first learn the basics of the device or the software package and while they are learning this they must also adapt to any real changes in the software or hardware which impacts the capacity for output, how it is put into operation, and exactly what its new, expanded capabilities may be. The dynamic nature of technology places added demands on the instructor; unlike course content in history, philosophy, or mathematics the substance of a college level computer science course or an elementary level internet familiarization program can change dramatically in just a few months. This can present special challenges and complications to educators who strive to offer students the most current topic related information and experiences.

The next logical consideration is one of maximal efficiency; how can we, as educators at different levels, facilitate the development of technology skills in students and also ensure the flexibility of those skills so the student can adapt to these rapid, major changes? One possible solution lies in Albert Bandura’s Social Learning Theory. Bandura’s Social Learning Theory can be seen as an update and an expansion of Skinner’s Radical Behaviorism. Bandura essentially saw Behaviorism as sound but incomplete (Hjelle & Ziegler, 1992); he postulated that there were other learning processes operating in humans that have been ignored or undiscovered in behavior theory. Behavior theorists demonstrated that external reward and/or punishment was necessary for the acquisition, maintenance, and modification of behavior. Bandura noted that while the behaviorist description of learning was accurate, people also learn in the absence of external reinforcement or punishment. Bandura described the processes of vicarious learning which involve observation, reading, oral communication, and social interactions with others. Much of the behavior we display, according to Bandura, actually is the result of learning by example or by observation.

Social Learning Theory

Bandura postulated that people have the ability to preserve experiences acquired via the observational process by generating mental imagery and through verbal representations. Through our ability to predict future consequences we can anticipate when this behavior or skill may be needed in the future. This gives us the ability to problem solve without the need for laborious trial and error learning. The experience is remembered and is translated into new behavior patterns. These patterns serve as a guide for future action.

Exactly how this learning occurs in Social Learning Theory is depicted in a specific, linear process. The individual attends to a new behavior or skill (Attention), the individual codes the experience into long term memory (Retention), the individual uses the new behavior in the future (Motor Reproduction) and when the individual predicts the future need for the behavior they are ready to use it (Motivational Process).

The skills acquisition process of Social Learning Theory is easily adapted to the teaching of technology skills, especially computer and software skills, to students of all ages. As long as the task is approached in a systematic manner, including an assessment of the student’s current skill set, the student’s level of development is functionally irrelevant. The application of the new skills will likely reflect where the student is on the various relatively common developmental scales and this application should broaden as the student develops and matures.
One of the major advantages of Bandura's theory is its inclusiveness. It does not refute the power of reinforcement based procedures or the efficacy of reward systems in learning, especially in the classroom. Social Learning Theory includes the time tested procedures of reinforcement based learning but expands on them with the procedures of Observational Learning. In essence, Observational Learning processes, when used with reinforcement, can dramatically increase the outcome and efficacy of instruction. Observational Learning includes reinforcement but is not dependent on it.

Observational Learning is especially applicable for the teaching of technology skills to children in grade school or young adults in college. It effectively removes one of the shortcomings of reinforcement based instruction, namely the integration of several tasks which are conceptually very different. Teaching a grade school child how to use the internet, for example, involves both simple, concrete motor skills and more abstract conceptual abilities. The simple mechanics of using a dial up adaptor and an internet browser are different from conducting a subject relevant search for a school assignment. Instead of looking at a total task as a series of steps in which each step is reinforced until the whole is acquired (chaining) or rewarding successive approximations to the target behavior (shaping), Social Learning Theory's principle of Observational Learning and Learning via Modeling provides an avenue to effectively teach a total task without having to break the task down into equal steps. Technology skills, especially software skills, may prove to be very difficult to break into steps for a purely behavioral approach to applications education. Reinforcement still plays an important role in the Social Learning Theory approach but it is subsequent to skill acquisition; the process by which skills are acquired may initially have little to do with overt reward. Instead reward is viewed as that which maintains the skills and makes future use of the skills attractive to the individual. Bandura also argued that success itself is rewarding; a student who learns to use a computer is likely to continue to do so because using the computer is “fun”, or because the student’s interaction with the computer is itself the reward.

As individuals learn by observing others and attempting to duplicate observed performance they form opinions about their own ability to successfully execute a skill. Bandura’s concept of Self Efficacy acts as a mediating variable in observational learning. Self Efficacy is essentially the individuals’ subjective belief in their own ability to complete a task or successfully engage in an activity. Persons with high degrees of personal self efficacy display confidence and willingness to try new things. Self Efficacy can be seen as operating in both a specific (general skill, a particular activity) and a general (large undertaking, life itself) context.

The development of positive Self Efficacy is managed by several factors. The most powerful is the performance accomplishment; effectively individuals raise their own self appraisal of their ability to successfully execute the skill with each rewarding application of the desired ability. Verbal encouragement can also be a very powerful motivator, especially for children and adolescents with whom the teacher/instructor has good rapport. Peer models who are very similar to the student can also raise self efficacy when the student sees someone comparable successfully execute a task such as operating a computer or applying software to solve a problem.

The Social Learning Theory model is one of a number of interacting components. The Observational Processes of attention, retention, motor reproduction and motivation for future skills use essentially describes the basics of learning. Reinforcement acts as the cement which crystalizes information acquisition and makes the individual more likely to engage in the skills in the future. Self efficacy also mediates the individual’s likelihood of approaching tasks which require the new skill. Learning in a social context can help develop and maximize efficacy achievement in students through performance accomplishments, verbal persuasion, and vicarious reward.

Applying Social Learning Theory

The application of Social Learning Theory does not require special modifications to the environment as the majority of the processes emerge from the social context itself. Social Learning Theory is very flexible and can be applied in almost any area of traditional education. Focal points for the efficacy of this approach stem from observable behavior demonstrated by a model for the student and a context in which the student can mimic the model’s behavior and receive feedback from others. The behavior, or skill, which is modeled should be practiced in a number of different settings and with a future focus in mind. Competition between individuals is discouraged as the social experience of learning is important to the vicarious process. The attention/retention/motor reproduction/motivation model of learning is coupled with special attention to the student’s Self Efficacy. This model includes reinforcement at various stages and assumes that students will engage in behaviors because they are both rewarding, in that they allow them to solve problems and gain reinforcement, and because they are reinforcing in and of themselves.
Promoting the generality of a skill is less of a social process but it still requires the attention and motivation components of Bandura's model. Generality is important in that a student is more likely to apply a skill if they can see (predict) its utility in a number of different situations. To apply a skill to abstract problems a student has to be able to conceptualize the problem in the future sense and see how the skill helps the student solve the problem. An example would be using a computer to make a sign which lists a car for sale, using a computer to print a newsletter or a bulletin to avoid costly printer's fees, developing one's own greeting cards, keeping a digital record of valuable property on disc, scanning important documents for safekeeping, electronic banking or business, and so on. Teachers are in a unique position to help students learn how to apply technology skills in the broadest sense; they not only have their own experience but also that of each student in the classroom. The social learning model allows for verbal representations of ideas to be shared among students and for vicarious modeling to take place in a 360 degree context.

Modeling

Modeling is an important aspect of Social Learning Theory and is already present in most aspects of traditional education; the teacher/instructor/professor is a model for the student. Modeling can be maximized by recruiting students as models as well and by establishing controls over the social context in which skills are displayed. The following example involves using modeling and social context control in teaching basic computer operations to elementary school students.

The instructor demonstrates the basic operation of a personal computer to a small group of students who will later become models themselves. She turns the computer on, creates a user name and password for herself, checks the computer for errors using a basic utility program, and then demonstrates how to use the basic functions of the PC. She then supervises each student as they complete each step of the operation: turning on the power, creating their own personal identity, and so on. The students then work as a group to complete a basic assignment involving the newly acquired skills. After this small group of students has demonstrated basic competency in computer operation she then familiarizes them with the basics of a word processing software package. This small group of students is now ready to act as models for a larger class.

In class the instructor assigns a number of students to each student model, effectively forming small groups with their own access to a PC. The instructor then takes the class through the prepared lesson in basic computer skills; she models the behavior in front of the class and directs the class' attention to the student models in each group (attention process). The student models then demonstrate each step as the instructor describes it. After a complete cycle of the skill the student models then assist each member of their group in duplicating the instructor's performance while other group members watch (retention process/motor reproduction). The instructor moves from group to group and provides supervision. The student models and the instructor provide encouragement and suggestions to the students learning the skills; the instructor also provides praise to the student models (verbal persuasion, reinforcement).

After the students have acquired basic skills, the instructor and the student models demonstrate problem solving and apply the skills to a certain task, such as installing a simple program or running a virus scan. The instructor then provides each student model with a list of tasks to be completed by the group using the new skills. The student model supervises the group members as they each in turn use the new skills to complete an assigned task (retention/motor reproduction/motivational process) on the group computer. The other group members are encouraged by the model to provide verbal support for the student currently applying skills but not to give them answers outright. The student model can stop the exercise and demonstrate the required behavior as needed to refresh the memory of group members.

After the basic skill set is present in all class members the student models are trained in the next set of cogent operations such as using a word processing program or connecting to the internet and establishing an E-mail address. The process then repeats itself with the new skills being presented to the class to build on the old ones and the student models serving to reinforce the instructor's efforts.

Self Efficacy
Student Self Efficacy is very important in the acquisition of new skills. Students who appear to be "technology resistant" likely have a negative belief about their ability to succeed, despite the assurances of an instructor. Student self efficacy can be bolstered by using the same process as above except more care must be taken in establishing the social context. Pairing the student with a model who appears to be very similar to the student in question is useful. The student can make positive vicarious comparisons between the self and the model. Verbal persuasion from peers is often more encouraging than the same encouragement from an authority figure such as an instructor; this is especially true of students in the elementary through high school range. Peer models can encourage a student to try a simple exercise with the new skill (positive peer pressure/verbal persuasion) and provide praise when they successfully complete the task (performance accomplishment). The peer model then reminds the student of how easily they completed the last task and provides them with the next. The peer model makes sure the student understands that the new task incorporates the previous skills with a few extra steps or some variations. Once the student is able to demonstrate the behavior of interest on demand a further useful approach is to get the student to demonstrate the skills for other students, effectively turning the student into a model.

The effects of performance accomplishment and social reward on the student models is pronounced. The student models likely receive great benefit from teaching others. This is due to the attention/retention process they have to display in the course of learning the skill and the motor reproduction involved in demonstrating it repeatedly for new students. The models also already have the motivational process in play; they know while learning the skills for the first time that they will be using them in the future to teach other students.

Promoting Generality of the Skill

After a certain set of skills has been acquired by the learner it is very useful to challenge the students to develop personalized ways of using the skills. This personalization encourages generality of the skill, or the likelihood that the student will use the skill to solve problems and complete activities which are not directly related to the context in which the skills were learned. For example a student learns to use a popular word processing package, photo editing software, and develops the skills necessary to operate a PC and connect to the internet. The student, a college sophomore in a computer course, now types all of his term papers using the word processor and searches the internet for humorous stories to send his friends via E-mail. The student is challenged by the instructor to apply all of these skills to their favorite hobby.

Within the social context the instructor can challenge the group, including the student model, to develop a group specific project which incorporates all of the desired skills. Each group member has input into the process and is required to demonstrate how they used their skills in the creation of the final project. Another project to encourage the generality of skills is to ask each student to demonstrate a set number of distinct operations using all or some of the skills under development. Exactly what those operations are would be left up to the individual but they would have to meet a set criteria. An example would be using the word processor to keep up with homework, develop an accounting sheet for budgeting purposes, and making a sign or a banner which runs the length of the paper. This approach, along with verbal encouragement and a demonstration from peer models, can help a student find more abstract (and more general) applications for their skills.

Generality is also promoted outside of the classroom. The instructor can give assignments to the students to find uses for the new skills at home or at work and to at least hypothetically demonstrate the use of the new skills (motivational process, motor reproduction).

Emphasize Cooperation

When students are competing they not only tend to work in isolation but they also tend to avoid sharing information and providing encouragement to others; this is true of elementary students and college students alike. The pitfalls of cooperative work among students include no assurance that the individual has actually met the standards of evaluation for the course and that a few individuals in the group may be completing the majority of the work. The benefits of the social cooperative approach include constant feedback from other group members (especially when the group includes a peer model), peer support and encouragement, and a number of different sources of observational learning. The negative aspects can be controlled by encouraging group effort and participation in learning and demonstrating the tasks while evaluating each student's participation on an individual
level. This evaluation would include the peer model. The instructor would establish the skills to be learned by the students and inform the students how each person will be evaluated by the instructor (motivational process). The peer model and the instructor demonstrate the skill so each person has the opportunity to observe and duplicate the model’s performance (motor reproduction). The individual student is then required to participate in a practice evaluation with the other group members providing encouragement but no direct assistance. Each step is reinforced by the group and the peer model (efficacy) as it is successfully completed. Students who display difficulty in acquiring the skill during the practice evaluation may receive more direct instruction from the peer model and the instructor. A second practice evaluation is attempted without peer support; after this evaluation is completed each group member practices the skills while waiting their turn for the actual evaluation.

The social context in which cooperation occurs is not much different from that of competition; the difference lies in the emphasis placed by the instructor (the primary model). Cooperation itself is a skill which is useful outside of the educational arena, especially where technology skills are concerned. This should be emphasized when the instruction is taking place; it provides a basis for the student to imagine a future using these skills in an occupation or recreational setting. For example software developers, journalists, music producers, and engineers are all dependent on technology for their vocations and rarely do they work on projects outside of a team environment. In using a Social Learning approach to the teaching of technology skills the students not only learn the skills in question but also learn how to apply them outside of the strict context of the educational setting and how to act as part of a team, a skill which will be necessary in the pursuit of a career dependent on computer technology.

**Conclusion**

Bandura’s theory has tapped a number of different processes which relate to human learning. These processes include the demonstrated efficacy of reinforcement/punishment based learning espoused by traditional behaviorists and the previously ignored vicarious/observational processes which tend to occur in the absence of reinforcement. Bandura’s theory is a flexible approach which adapts well to many settings and is especially well suited to the teaching of technology skills. Social Learning Theory also includes the subjective component of Self Efficacy. Self Efficacy is not only important but it may explain why some students appear to be resistant to learning technology skills. The social context also helps students prepare for future team-oriented work environments; software designers, engineers, editors, journalists, and many other professionals rely not only on advanced technology but on team contributions to the completion of a project. Computer technology, software design and capabilities, and media technology all progress and change at a rapid pace. The social learning perspective not only helps students focus on the future and prepare for potential changes but also provides them with skills necessary to acquire new information and update old skills with maximal efficiency. The model of attention/retention/motor reproduction/motivation, coupled with opportunities for the individual student to develop and demonstrate Self Efficacy, can be very powerful tools for helping learners acquire and apply technology skills.

Abstract: This paper proposes ways of helping technology resistant (TR) students in terms of Carl Rogers’ theories. In this view, students are motivated by the single, unitary motive of actualizing—maintaining or enhancing their lives to their fullest potential. Resistance to technology is defined in terms of incongruence among the Real Self, the Ideal Self, and the technological task to be learned. Suggestions using Rogerian principles are given to assist educators in working with technology resistant students.

Introduction

The theories of Carl Rogers do not find much application in the various applied disciplines of education because of the preference for more learning oriented approaches. However, it appears Rogerian principles and methods may well be suited for facilitating the acquisition of technology skills in the modern classroom, especially with the so-called technology resistant (TR) students who otherwise demonstrate adequate performance to overcome resistance toward learning technology skills. As the world progresses through the computer and the mass media revolution, technology skills are rapidly becoming a required skill set of the modern student. Students who have no computer or technology skills may find themselves at a disadvantage educationally and occupationally. Many students have difficulty acquiring computer and technology skills, especially when their access to computers outside of the learning environment is limited. Children, whether very young, the adolescent high school student, or the young adult leaving for college, learn most of their attitudes towards the processes of life from their parents. Trying to help a student overcome a counter-productive belief about the self or the self’s abilities, especially about technology, can be a source of frustration. Instructors and educators at all levels have certainly experienced frustration with otherwise good students when confronting the statement "I just can’t do math." This self-statement not a statement of incompetence but rather a self-expression of one’s own beliefs about the self as the person understands it. Such self-statements lead to internal beliefs about the self’s ability to operate in the world. These beliefs, in turn, impact the individual’s future perceptions and behavior. The same statement regarding computers in the place of math is no different. For example, an elementary
student who uses the self-statement "I can't understand computers" is actually making an assessment about his or her own ability to interact in any situation where computers are important. This leads the person to seek situations that are more congruent with his or her perceived strengths. Fortunately, such a self-attitude concerning computers is easier to correct than math. This is because technology skills, for the most part, are hands-on and concrete, at least initially. Math is also highly structured and sequenced but is abstract in the extreme and is almost entirely conceptual. A Rogerian approach can quickly get to the heart of the matter: the conflict between the individual's assessment of his or her abilities and the individual's perceived requirements of the skill.

Students, from grade school to college level, can display TR in a number of ways. These students have the capacity to learn the skills but are just not learning them. Resistance can take the form of quitting easily and becoming quickly frustrated when presented with a technology oriented task. Resistance can be simply avoidance of anything related to a particular theme, such as the internet, media technology, or computers in general. Some students may display apprehension of the device or its applications. Others may insist that the problem has little to do with technology but instead internalize the problem and insist that they do not the necessary requirements to learn the skills. These problems are most likely simple self-concept dilemmas.

Self Concept and Learning

Self-concept is a key element in Rogerian theory. It is basically composed of two parts: the Real Self and the Ideal Self. The Real Self is the person's subjective, phenomenological, interpretation of how he or she is right now. Because reality is subjective and is interpreted differently by all who view it, the student's perception may be very different from that of the educator. The Ideal Self is the personalized, hypothetical "perfect" self of the student. This is the goal to which the student aspires to become, and the metaphysical yardstick by which everything the person does now is measured. Any disagreement between the Real and the Ideal Selves, or between the Real Self and the person's assessment of the task at hand will cause problems. Human nature is growth oriented, or actualizing. The Actualizing Tendency is the tendency to maximize experiences and develop perceived strengths and talents as they relate to the Ideal Self. The Actualizing Tendency can be blocked or frustrated by social pressure, outside influences, and any situation that places conditions of worth upon the student.

Educators can overcome TR in otherwise capable students by applying a fundamental method of communicating and problem solving. Many educators who enjoy good rapport with their students may already apply some of these techniques in a general sense. These techniques begin with a one-on-one dialogue with the student away from other social influences. The components of this dialogue consist of empathy, communicating unconditional positive regard, understanding of both the individual and the problem, and a firm willingness to actively seek a resolution with the student, not for the student. Empathy is best communicated through simple statements and nonverbal communication. Coupled with eye contact and open body posture, such statements can help students feel that the educator understands their feelings. Unconditional positive regard for the student can be communicated by showing respect for the person and his or her ability to learn, and by avoiding criticism of a student (even if deserved). Focus on the student as a person, not just a learner. This does not mean that the educator has to accept everything that the student does, just that the student is a person with his or her own feelings, fears, and dreams of the future. Statements such as "I think you're all right" communicate this regard. Once the educator has a sense of the student as a person they can begin trying to understand the nature of the problem. Understanding the person as well as the problem will lead to the most effective solutions. Ask students general questions about what they think of the task and if it is important to them. Communicate that there is no wrong answer but that these skills are important.

Many otherwise good students can have a difficult experience in acquiring technology and computer skills. These students may appear to be motivated, frustrated, confused, or even hostile. It is possible that the students themselves are not disrupting the process for its own sake but rather have difficulty in conceptualizing their role as learners and consumers of technology and related skills. The theories of Carl Rogers may have a solution for educators who are trying to reach a TR student. Rogerian theory centers upon the person and how that person perceives others, the environment, and the self. Using Rogerian techniques and principles the educator can approach a student, even one who is actively resistant, and find mutual solutions which not only will aid the student in overcoming TR but will also serve to reinforce and maintain positive rapport between the educator and the student.
Remote-Control Computing

Mark Smith
Computer Technology
Purdue University North Central
United States
mismsith@purduecc.edu

Abstract: This interactive session presents remote-control computing from the perspective of the educator. If you have ever taught a class where your students use software at home, or have ever had the need to access your office computer files from home, then remote-control computing is for you. Remote-control computing software allows you to connect to remote computers from your computer, and control those systems as if you were right there in front of them. You can take over the remote system and provide problem solving assistance, upload and download files, and even change system parameters and re-boot. And it works over the Internet! In this interactive session, participants will gain an understanding of what remote-control computing is, who the major players in the industry are, and how educators can use it. Session attendees will also see remote-control computing software in operation, performing tasks in the academic environment.

Introduction

As a computer technology instructor, I teach classes in which students use software that they run at home or in a lab remote from me. Often they will have problems that are difficult to resolve over the phone, via email, or even in a classroom discussion. In fact, some problems are nearly impossible to solve without seeing the actual conditions surrounding them. If only I could be there with the student to help...

Have you ever been working on a project at home, only to discover that you need a file from your office computer or access to a campus information system? Wouldn’t it be nice to be able to handle this without driving out to work?

Remote-control computing

Remote-control computing refers to the ability of one computer system to control another computer system from a remote location. It is implemented over a network using software that resides on both computers. One system acts as the Host (or server) and the other system as the Guest (or remote controller). The guest system takes control of the host system.

There are many software packages that provide some level of remote-control processing capability. Generally, they are categorized into two groups: consumer-oriented remote control and enterprise system remote control (Fratto, 2000). The marketplace is fast and furious, with products refreshed quarterly with new features and functionality (Doherty, 2000). Enterprise remote-control products have the highest level of functionality and are the focus of this paper.

The role of remote-control computing in the academic environment

Student Assistance / Distance Learning

Many problems students have when using a software product can be resolved when they occur, by taking over control of the students' computers using the remote-control capability of the software. This allows
you to connect to their computers (using a number of different connection options) and control the systems as if you were right there. You can run the software, confirm input requirements, check output, etc., and in fact, try anything you would do if you were sitting at their keyboard. This certainly beats troubleshooting through a conversation over the phone, or sending software files back and forth via the Internet.

Administration

Remote-control computing also allows you to link to your office computer and access other systems on the campus intranet. This includes applications on network servers and other operating system platforms. For example, I’ve used it to register students on the internal campus registration system from my home computer.

Telecommuting

It’s very handy for administrators and faculty who need to access work files at home as they telecommute or put in those extra hours sometimes required to get the job done. You can even transfer files - interactively sending and receiving data or programs that may assist with your project or problem resolution activities.

Research

The ability to share computer-controlled research equipment is enhanced by remote-control software. The Oak Ridge National Laboratory uses remote-control software at its High Temperature Materials Laboratory to allow researchers from across the country to use a million-dollar electron microscope (Krause, 2000). Even if we don’t have million dollar pieces of equipment, the ability to remotely monitor and control research processes is valuable to most of us.

Remote-control computing software

As stated earlier, there are many players in the remote-control software marketplace. Many of the consumer-oriented products are available as Freeware or Shareware. These products provide some level of remote-control and/or file transfer capability, but generally do not contain all of the features and functions required by the enterprise system user. For those interested, a table identifying many of these systems and their capabilities can be downloaded from the Internet (Winfiles, 1998).

The following table consists of a number of the more robust enterprise system remote-control software packages.

<table>

Table 1: Enterprise System Remote-Control Software
Features & Functions

The features and functions of these software packages fall into the following categories:

Remote control capabilities: what you can do/control on the host machine. This describes the extent to which the software can recognize and utilize the hardware and software components on the host (Doherty, 2000). This might range from limited capabilities to run programs on the host computer all the way to being able to run programs on any network server attached to the host.

Connectivity: the options for connecting the guest system to the host system. Most remote-control software products offer multiple connectivity options that may include: direct connect (cabled serial or parallel ports), modem to modem, LAN, WAN, Internet, and wireless infrared. Most systems utilize TCP/IP communications.

Supported operating systems: the operating environments supported by the software. Most of the packages support only the Microsoft Windows environments, although VNC and Timbuktu support Apple MacIntosh, and VNC also supports Unix.

File Transfer: the ability to transfer files and programs between the guest and host systems. Features of this capability include the ability to handle long file names, drag and drop transfer functions, the ability to synchronize files so that they are the same on both systems, and the ability to continue interrupted file transfers.

Security: this includes password protection of the guest and host systems, encryption of data transmissions, virus protection, and host system screen blanking and keyboard locking to prevent an onlooker from observing confidential processing (Robinson, 1998).

Printer redirection: the ability to print at both the guest and host locations.

Chat: the ability to conduct a PC chat with a user at the host site during the remote-control session.

Drive mapping: the ability to map the disk drives from the host system to the remote system so that the remote system may use the files and programs located on them as if they were local disk drives.

Product Ranking

In my research, I was able to find three different organizations that have tested and ranked some, though not all, of the remote-control software packages listed in the table above. The test criteria was similar in all three organizations; focusing on performance in terms of screen refresh and file transfer speeds, security features, remote-control functionality, and ease of use.

The comparison done by Network Computing concentrated on solutions that offered operating system and network integration, advanced security options, and enhanced network installation capabilities (Fratto, 2000). The News-Times Computer News focused on security and connectivity, as well as remote-control functionality (Robinson, 1998). Smart Computing looked at file transfer features, security, and chat capability in addition to remote-control ability (DePasquale, 1996). All three organizations were unanimous in selecting Symantec's pcAnywhere product as their remote-control product of choice.

pcAnywhere

Supported hardware & software platforms

Designed for the PC architecture, Symantec's pcAnywhere was one of the first remote-control software products available. While the current product level (pcAnywhere 32) was developed for Windows/9X,
Windows NT, Windows 2000 and Windows ME environments, it is backwards compatible to Windows 3.1 and DOS (DePasquale, 1996).

Connection options

pcAnywhere can be configured to connect via modem, serial port, parallel port, infrared connection, ISDN connection, and several network protocols including TCP/IP, Novell and netBIOS. Access over the Internet is achieved by using the TCP/IP protocol over a dial-up or dedicated connection to an Internet Service Provider.

Security features

Security is a primary consideration when you run a remote-control host on a critical system, especially if it is networked to other systems on campus. You can setup passwords at both the host and guest system to protect the configuration data from being viewed or modified by unauthorized people (Rockett, 1999). Several levels of data encryption can be invoked to protect data transferred between the systems. You can even blank the host screen and lock the keyboard and mouse so that people present at the host site cannot observe confidential information.

File transfer

pcAnywhere provides a File Manager window of files and directories for both the guest and host systems. You can drag and drop, select a group of files or directories to transfer, and synchronize (or clone) files between systems. Files are compressed for transmission and transfers can be restarted from where they left off if the connection temporarily drops.

Miscellaneous functions

Drive mapping, virus checking, and interactive chat between the guest and host systems are also supported by pcAnywhere.

Demonstration

During the interactive session, features and functions of pcAnywhere will be presented to demonstrate how the educator might use this remote-control computing tool.

Software Installation

The minimum system requirements to run pcAnywhere are:

- 486sx 25MHz processor or higher
- 16 MB of RAM (20 recommended)
- 32 MB of hard disk space
- VGA video minimum
- Windows 95/98, Windows NT Workstation and Server 4.0
- CD-ROM drive

Installation is very simple and can be accomplished in just a few minutes. Just load the distribution CD into your drive and select “Install Software”. An installation wizard is loaded that guides you through the process. Documentation and technical manuals are also included on the distribution CD.

Host Setup & Operation

For the demonstration, a host system will be setup to allow remote control over the Internet. To create a host environment, start the pcAnywhere program, and then click on the “Be a Host PC” tool bar icon. Next
double-click on the “Add Be a Host PC Item” icon to start a wizard to guide you through the process. The first thing you must enter is a name for this host session. Next, select the connection option you want to use. Since this is for an Internet connection, you select TCP/IP. That’s all there is to it. The wizard will ask if you want to start the session immediately. It will also add an icon to the “Be a Host PC” folder and you can select it whenever you want to start the session.

In order to link to this session for remote control, the guest computer will need to know the TCP/IP address of the host computer. To get the TCP/IP address, connect to the Internet through your Internet Service Provider (ISP), and then start your pcAnywhere host session. The TCP/IP address will be displayed on the pcAnywhere window.

Remote Setup & Operation

To create a guest environment to control a host session over the Internet, start the pcAnywhere program, and then click on the “Remote Control” toolbar icon. Next, double-click on the “Add Remote Control Item” to start a wizard to guide you through the process. The first thing you must enter is a name for the remote-control session. Next, select the connection option you want to use. Again, since this is for an Internet connection, you select TCP/IP. This window also asks you for the name of the computer running the host session. Leave it blank and end the wizard without starting the session.

Now right-click on the remote-control icon you just created and select “Properties” from the menu list. Click on the settings tab and enter the TCP/IP address of the host computer into the “Network Host PC to control or IP address” field provided. Click on “OK” and you’re ready to start your remote-control session. To start it up, connect to the Internet through your ISP, then start pcAnywhere. The systems should connect in just a few seconds.

Security

Passwords can be entered for the guest and host sessions that will restrict the ability to view or modify the configuration of the sessions and to prevent unauthorized people from starting the sessions. This is done by selecting the “Protect Item” tab from the session properties dialog window. Simply enter the password and select the level of security wanted.

The keyboard and mouse of the host or remote system can be disabled from the settings tab, and data encryption levels are selected from the security options tab. You can also blank the host screen from the security options tab.

The host session also allows you to set up a folder of authorized callers and the passwords required for them to gain access to the host system. This is done from the callers tab. This is where you also configure what resources a given user has access to on the host.

Remote-Control

Once the guest and host systems are communicating, you can begin remote control operations immediately. You can literally do anything a local user could do (provided it isn’t restricted by the security options), including linking to networks and other equipment connected to the computer.

File transfer

While you’re in remote-control mode, you can begin file transfer activities by clicking on the “Load file transfer” icon in the pcAnywhere tool list. This starts the pcAnywhere File Manager window that allows you to navigate through the files on both systems, including network drives. To send a file, select it from one of the navigation windows and press the Send button. You can also select groups of files and folders to transfer. Other feature will be demonstrated as time permits.
Academic Simulation

The interactive session will include the simulation of student assistance and administrative uses for pcAnywhere to demonstrate how it can become a useful component of our information system resources.

Conclusions

Remote-Control computing has a place in the software portfolio of the academic user. It has many uses in the areas of student assistance, administration, research, and telecommuting. As our information systems become more network centric, and we look at using Internet technologies to deliver education, we must develop skills at using tools that can help us provide better support and assistance to our students. Remote-control computing can help us provide this support and be more productive at our administrative tasks.

The Use of Instructional Technology to Enhance Teaching Outcomes on Site and at a Distance

Dr Armand St-Pierre
Department of Business Administration
Royal Military College, Kingston (ON), Canada
Stpierre-a@rmc.ca

Abstract: Constant changes in technology are a major threat to the survival of traditional education systems. Instructional technology (IT) has to become a major component to the educational system to help teachers effectively and efficiently integrate new media in their teaching. Several factors such as a greater demand for technological learner graduates, the teaching of knowledge for distant learners and a more effective delivery of the curriculum influence the use of IT in academic institutions. The author of this article will present a practical framework to help faculty and academic staff to incorporate IT into the teaching process.

Introduction

Ample computer and Web-based resources, technologies, and media installed in several academic institutions (Schools, Colleges, and Universities) are not used either efficiently or effectively to enhance teaching on site or at remote locations. On one hand, teachers use very little computer resources and instructional technology in their teaching. Methods of instruction do not include the use of Web-based and computer resources. In several situations, development programs for faculty fail to incorporate modern technologies as resources for instructional units. On the other hand, educational budget cuts and a greater demand for technological learner graduates force higher educational systems to incorporate instructional technology in the curriculum. Morrison (1999) focuses on the challenge that learners needed to be well prepared to face new highly-technical skilled jobs in a world market where the professional knowledge base is rapidly changing. The author mentions that these students should be able to use information and communication technology tools competently.

The objective of this paper is to describe the factors influencing the incorporation of IT in Schools, Colleges and Universities, to present a framework for integrating IT in the teaching process, and to examine the use of a Web-based instructional model (WBIM) with sound instructional design principles.

An assessment of the factors influencing the use of IT in academic institutions

Due to external factors such as education and government policy, education systems have to do more with less resources (budget cuts in education), and a greater demand for technological learner
graduates require teachers to use modern media to create teaching prototypes and deliver the course contents. Internal factors such as better network and communication infrastructures, wide installation of computers on the campus, pressure by the learner body for incorporating modern media in teaching. However, several barriers as Garland (1995) describes in his paper are major factors to be considered by the instructional technologist for the diffusion and adoption of IT: individuals including cultural traditions, lack of knowledge, cost issues, infrastructure (if cost savings do not justify major changes in the infrastructure), and user acceptance. The author mentions that "the culture developed within an institution can act as a barrier to change, ... the difficulty encountered with transplanting the open classroom approach from Great Britain to United States during the 1960s is a good example of this (p. 254).

Jacobsen (1998) points out in his paper that academic institutions have great difficulty in integrating computer technology for teaching and learning in higher education. He also mentions that many faculties are highly motivated to integrate computer into the teaching process, but schools provide poor financial and technical support for the use of technological media. The literature describes several barriers that are impediments to integrating technology in the curriculum: lack of time to develop instruction that uses technology; lack of computer resources in the classroom and no connectivity to the Internet; old classrooms without new technological media; poor technical support for the incorporation of computer and Internet resources to the curriculum; inadequate financial support for computer and Internet integration in the creation of open learning prototypes and its delivery; too few computers for the number of learners; inadequate training for staff and faculty; inadequate financial and technical support for the development of instructional uses of Internet services and computers; poor planning and lack of coordination of computer and internet resource usage in the curriculum; and poor assessment and control of the computer-mediated resources uses in the classroom and at a distance.

A framework for integrating IT in the teaching process

Over time, the teaching environment evolved from a closed traditional classroom to a open virtual classroom. The field of technology has evolved from an information technology era to a communication-networking technology environment where teachers and learners can exchange ideas and knowledge. Figure 1 presents the technologies that are needed to support teaching and learning in higher education. With the introduction of new media and technology for learning and teaching, academic institutions have begun to enrich their once impersonal lecture classes using E-mail, discussion groups, and personal Web pages (Perrone, Repenning, Spencer, and Ambach, 1997). However, institutions will have to be cognizant of the pros and cons of instructional technology used in the curriculum.

Kurshan (1990) states that telecommunications must become a part of daily classroom activities. A practical framework must exist for incorporating IT into the curriculum. First, the academic institutions...
have to implement an efficient network infrastructure (LANs and WANs) to support the communication infrastructure as shown in Figure 1. If these infrastructures are not working properly in synergy, the faculty will not be able to develop effective open learning systems. Academic institutions have to create computer services centres (Web help desks) and instructional technology centres to support teachers in the development of open teaching prototypes (St-Pierre, 1998). Several academic institutions have a network to store and deliver distance-learning courses. The teachers should use the Web server on the Internet to store and deliver teaching materials and services to the learners.

Figure 1: The technologies in support of teaching and learning

The use of a Web-based instructional model for teaching and learning

Crossman (1997) and Rossner & Stockley (1997) see the Web as an instructional technology tool comprised of a variety of media with the potential to carry substantial information to a great number of people all over the world. In their research, Shaw and Gaines (1996) experimented with the application of the Web to undergraduate collaborative learning and the development of special-purpose tools supporting the learning process via the Web. With the constantly increasing popularity of the Internet, distance learning becomes available to everyone. The Web could become an effective delivery system for the courses on site and at a distance. Academic institutions should establish incentives to encourage the teachers to use the Web technology for creating open learning systems as shown in Figure 2.

Modern Web communication media such as Web bulletin board, chats, e-mail, Web audio and videoconference systems present a good communication platform to exchange ideas, homework, and course materials for the teachers and the learners. There are several Web authoring tools on the Web, such as WebCT, Lotus Learning Space and the Blackboard, that help teachers to design open teaching prototypes. Butler (1997), using a multiple-case study, builds several Web-open teaching prototypes, and
views the Web as an educational tool for bringing outside knowledge into the classroom and opening the classroom to the world.

![Open Learning Systems](image)

**Figure 2: The use of Web technology for creating open learning systems**

**The use of sound instructional design principles for Web-based teaching models**

Ritchie and Hoffman (1997) feel the Web, with its constant change in technology, provides a dynamic platform wherein sound instructional design principles could be incorporated to present teachers and learners with a more intuitive, interactive, and easy-to-use medium. Teachers could create maps to guide the learners through their learning paths. Online delivery using the Web is a means of fully augmenting or replacing other methods of teaching and learning. Mediated forms of delivery using the Web make it easy to update dynamic, constantly changing information. A well-designed Web-based instruction provides an efficient delivery medium for the teacher and an attractive content for the learner on site and at remote.

A list of instructional design principles should be considered while the teacher is developing Web-based teaching prototypes (St-Pierre, Bettin, Dilliger, & Ferraro, 1999). The instructional designer should introduce sound design in the Web-based learning prototype such as a good navigation structure to help the learner to navigate nicely the Web course without being frustrated. He/she should insert images to attract the learner to key components of the learning prototype such as course objectives, course materials, online tests and assignments. The Web course should clearly identify learning objectives early in the course and define precisely what is expected from the course. The open learning prototype should include learning and discussion activities to involve the learner actively in the learning process. Guidance and quick feedback such as a help function and interactive forms could guide the learner to a more appropriate learning path.
Online tests should exist to assess the students' learning and to assure that the learners have integrated the desired knowledge. The open learning prototype should provide communication media to allow the student to exchange ideas with his/her peers and the teacher. Technical and moral support is a necessary ingredient for distance learners so he/she will be encouraged to complete the course.

During the design of a Web-based learning system, instructional strategies need to be diverse and robust. For example, a distance course needed to be supported by online materials with the learners, collaborative technological media, such as videoconferencing, and communication media, such as e-mail, for a better learning environment. The strategy will move away from the traditional rule-based, procedure-oriented mode to a more dynamic, interactive learning mode. In designing a Web-based open teaching course for distance education, a set of criteria have to be defined for its success and effectiveness: enhances student-to-student and faculty-to-student communication, encourages students-share perspectives, enables student-centered teaching approaches, accommodates varied learning styles, provides opportunities for exploration and discovery, promote additional rehearsal time, provides 24/7 accessibility to course materials, provides just-in-time methods to assess and evaluate student progress, and adds pedagogical benefits such as providing self-testing (Porter, 1997; Pahal & St-Pierre, 1999). The author developed web-based instructional models that meet the above criteria (StPierre, 2000).

The author of this article believes that Web media and technology should be used simultaneously in the teaching and learning processes, i.e. there should be equilibrium between the left-hand side (teaching) and the right-hand side (learning) of the equation with respect to the uses of Web resources in the curriculum. If the teachers were using Web media in the delivery of course contents, the learners should be learning how to integrate these tools into their learning process and vice versa. The technological delivery platform for the curriculum is ineffective if the learners are frequent users of Web resources and technology in their learning process; whereas, teachers do not know how to integrate these media into their teaching process. Based on the author's experience in using technology in teaching for several years, the author firmly believes that Web media and technology have to be in equilibrium if the institution wants to effectively deliver the curriculum. For instance, Athabasca University, located in Edmonton, Alberta, offers a Lotus notes environment where teachers and students use the same media and technology to do collaborative work. Surveys showed that Athabasca University rank among the best distance education schools in business that promote learning outcomes and provide rich learning experiences with asynchronous learning media such as bulletin boards and database discussions.

Conclusion

IT plays an important role in educational systems as it brings new media and technologies to the teaching world. Continuous changes in technology create major changes in educational systems, and IT has to evolve to help teachers bring new teaching media and instructional strategies in the classroom to deliver the curriculum (Salisbury, 1996). Teachers have to learn these new media to enhance the teaching process.
Young learners are brought up in a multimedia environment and they expect to find a similar learning environment when they come to institutes of higher education. The field of instructional technology is evolving, especially due to the change in multimedia (CD-ROM), Web, networking, and communication technology. We are living in a communication age and open learning systems will dominate traditional classrooms. The Web teaching tools and services now available such as Bulletin Boards, chat rooms, Web pages, listserv, e-mail, etc., are present in this society and will be more effective than the old methods for many aspects of teaching.

In conclusion, IT will play an important role in the 21st century with the advent of new media and technology, and a younger teaching body that will be motivated to work in an open-learning environment. Distributed knowledge database will be available to any learner at any time as educational systems will promote the development of sound instructional teaching systems. E-commerce will promote the development of electronic education malls where teachers and students can communicate and interact using University-based telelearning approaches (Langenback & Bodendorf, 2000). The teacher will play the role of a facilitator and/or a mentor in several teaching instances.

How On-Line Collaborative Study Improve Human Cognition
A perspective on the evolution of modern education

Abstract: This paper is a research to investigate the growth of Internet which will give rise to new
adventure of teaching and learning strategies in the decade to come. A series of more recent
education approaches that come into play will be examined by addressing their advantages versus
shortcomings to identifying why they have come to contribute the collaborative study method and
how they are taking shape in the new education trend. The principle of “Collaborative Study” and
how it fits appropriately and closely into the modern network media revolution will be demonstrated
and explained. Virtual Learning and developing highly effective human cognition techniques through
investigative problem solving, thinking and creativity are the major components that will assist the
success of Collaborative Study and in fact new ideas in education. This research also brings teaching
and learning to a higher level by exploring collaborative study and modeling it as the future
education template to be deployed countrywide in Taiwan.

Introduction

The idea of Open Study in this context is to tailor the instructional materials and methods to individual who
undertakes the study. The nature of Open Study consists of the following features: Great emphasis on
individualism; Learning by exploring subjects of interest; Learning through getting in touch with real world
problems; A wider domain of teachers and professions; Student-dominated teaching-learning process in contrast
to instructor-dominated.

The arrival of on-line or Web-based Information retrieval in learning the environment also opens the
possibility of fulfilling Open Study. While the idea of Open Study is beginning to take shape in modern education
practice, the Summer Hill School in England has blazed the trails in this new area. Students are the center of the
school and they can also determine the content of what they can study and the way of life in the school (Van Vliet,
1999). Students’ creativity should never be hindered by the heavy, century-long pedagogy and rules (Khan, 1997).
Another example in a Japanese primary school also reveals that real world problems are amongst the best
materials to use for instruction purposes, and organizing instructional and curricula should accommodate
differences between students. Through this combination of features, Open Study sets forward a clear image for
developing a new education strategy: Student-oriented; Problem-Solving; and Creativity-Enhancing.

The Internet provides an ideal setting for Open Study by its nature of being individual-orientated and irrespective
of time and space. Despite the fact that adopting the Internet as a major channel and media is currently favored by
most educational practitioners, there are still some limitations to be overcome by Open Education’s developing
community before the approach can become mainstream in Taiwan. For instance: The Fear from Parents,
Bridging the gap between open education Curriculum and Current School Curriculum, Lack of Measurement of
Study Performance, Parental Guidance and Control and The Need to be more Convincing.

Findings

The idea of collaborative study will let learners be equally and mutually treated and respected and thus this,
in turn, pushes learners to become more willing to carry out study in this specially catered environment. The gain
is mutual and this provides a fearless environment that is rarely sought in conventional schooling (Barron & Ivers, 1998). "Collaborative Study" is achieved by grouping and sharing topics of interests. Collaborative Study has been identified as the most effective approach among individual tutoring, studying by competition and collaborative study that are currently deployed by many primary schools and high schools in Taiwan. In fact, this study method can also promote student awareness and participation in community and social skills. Highly Effective Cognition technique is essential to collaborative study. The job of any teacher/instructor is to clearly identify and rectify what students need most (Forcier, 1999). However, in the virtual learning world, teachers and students are altogether taking up the roles of learners and students in fact need to be able to know what to grab as their highest priority. In the interests of developing individualism of value and practice, the collaborative study aims to bring students to the upper level of the pyramid of human cognition.

Unresolved problems will often stimulate the creation and persistence of human's thinking capability. The term "Problem" which is different from "Question", has the following distinctive characteristics: (1) More than two variants exist in a special manner and relation; (2) the relation between variants can stimulate seeking a solution to the problem or exploring the "how" and the "why" of the concerned topics. There are various levels of study in which learners might receive a problem in different ways (Drake, 1967). Organizing highly effective levels in study complexity and exploration requires clear distinction of the purposes of study and its relationship and coherence in context.

The government in Taiwan is looking at how to best qualify teachers in primary and high school systems to be able to adapt to new thought and technology. Meanwhile, government has been aware of the consequence resulting from the training of most teachers in the fundamental school system. Invention can be difficult because most teachers were not themselves trained in such a way. Providing new channels and media of education for adult learners and teachers becomes the responsibility of national education policy.

Taking a psychological perspective of Internet communities, the problem arising from over-indulgence of online resources and improper relationship between information provider/service provider can harm people enjoying the education through surfing the Net. In implementation of study on the network webbed by the Internet communities, education practitioners have to be very aware of the danger caused by negative aspects of the Internet. Developing high quality of human cognition through developing creativity poses a contrasting revolution to the long tradition in Taiwan where more focus is on memorizing skill and less focus on realizing the significance of how to think. The first step toward the cultivation of thinking capability in school is Knowledge. These changes in form of knowledge in modern society will have significant meaning and raise new questions in education: how to define knowledge, how to best capture the knowledge and how best to make use of it. Psychologically, creativity is based on a fundamental mastering of the subject of interest and then carrying out certain levels of exploration and taking risks of desired proportion. This involves a thinking process in which an in-depth understanding of required "Knowledge" is essential (Drake, 1967). Thinking, by the definition in psychology, is a process of mental activity. There are two types of thinking, one related to the situation where the learners stay and another one related to the cause-effect.

Problem-solving and Collaborative study can enhance the outcome of study by giving more freedom to the student, creating a better opportunity of demonstrating both teachers' and learners' inventions, evoking study by virtually placing students under real-world constraints and environment and emphasizing an active study approach. Therefore, Problem-solving and Collaborative study open a window in introducing new ideas of education.

Conclusion

Teachers in this age should learn to adapt to new technologies and models of teaching and learning, particularly in this age of rapid technical advance. The enormous potential of applying the Internet into education community will extend both teachers' and students' creative skills that are required in changing society. High quality study must be assisted by advanced skills and mental training strategies, such as those discussed in this article. Education policy-makers should also examine many possible ideas and aspects of knowledge to clearly see what society is heading for.

Abstract: The use of technology and computer mediated communication is changing the lives of students in the classroom. Research is beginning to emerge examining the effects that technology is having on the social behavior and adjustment of students. Computers and technology are influencing the interactions between teachers and students, as well as other interactions in a student's life. Research is sparse at this time as to the effects of this new form of communicating, however, it appears that it can have many positive as well as negative impacts on students development and adjustment. The use of technology appears to down play the importance of social contact and may lead many students to not develop the necessary social skills to function in the world. This article examines the impact that technology may have on educators will be cognizant of the potential social and developmental pitfalls that can occur when blindly implementing technology into the educational process.

Introduction

The use of computer mediated communication continues to grow in today's society and the impact of this new technology is just beginning to be investigated. Scholars and technologists believe that advances in technology and computers are altering people's lives in numerous ways (Atewell & Rule, 1984; King & Kraemer, 1995). Although, most researchers would agree that technology is changing the lives of people, the question still remains open to what extent the use of these technologies is influencing student's academic achievement and social development. Research is beginning to emerge examining the effects that technology is having on the social behavior and adjustment of students. The extent and influence of technology on student development will remain an open debate for years to come. This article reviews some of the more pertinent findings and thoughts on the influence of technology on student development.

By 1998, roughly 40% of all U.S. homes owned a personal computer; about one third of these homes had access to the Internet, with these numbers increasing on a daily basis (Anderson, Bikson, Law, & Mitchell, 1995; Attewell & Rule, 1984; King & Kraemer, 1995). It can be assumed that as households increase there exposure to technology, students living in those households will be increasingly exposed to and use technology. With these technologies the availability of alternative modes of interacting and spending leisure time has changed. Individuals
and students may be spending more time interacting with technology than in more traditional activities. Internet, e-mail, and chat rooms have become a major form of communication and social interaction for millions of individuals in general and students in particular. Although the Internet has many uses (communication, commerce, information source, etc.) the dominant use for most people is interpersonal communication (Kraut, Mukhopadhyay, Szczypula, Kiesler, & Scherlis, 1998). With personal computers becoming an integral aspect of our lives, researchers are questioning whether computers, Internet, e-mail and chat rooms are enhancing or hindering individual's personal wellness and social involvement (Kraut, et al., 1998). There is little question that online relating will increasingly become a major way in which teachers and students interact on a daily basis in the classroom. In addition students at home are spending a great deal of time on computers, Internet, E-mail, chat rooms and playing games like “Dungeons and Dragons”. The extensive and continued use of computers in the classroom, at home and in the world may be becoming a problem for students and society in general as students and individuals spend more time interacting with technology and not each other.

Computers and technology have become an important and integral aspect of student's education. Teacher-student interactions, student friendships, family relationships and students socialization is being influenced by technology. Researchers differ as to whether technology is a positive tool with the power to change schools and revolutionize students' learning or a force that can undermine students' education and social development. Lepper & Gurtner (1989) indicated that the potential positive effects of computers on students' growth pertain to using the computers as personal tutors, multipurpose tools, and the motivational and social effects of computers. Research has consistently demonstrated that the effects of computer assisted instruction is generally positive. In fact, the effects are more positive with programs involving tutorials rather than drill and practice, with younger rather than older students, and with lower ability than average or unselected populations (Lepper & Gurtner, 1989). For learning, computers are excellent mediums for students facilitating an open-ended, exploratory and experiential learning environment. Collins (1986) found that computers are helpful in particular for improving adolescents' writing and communication skills.

Impact of Technology on Student Development

Additionally, research has appeared indicating that computer use has a positive influence on student's development. Lepper (1985) believes that computers make learning more internally motivating. Other computer advocates believe that computers make learning more fun, increased computer use in school will add to increased student cooperation, collaboration as well as increased intellectual discussion among students (Becker & Sterling, 1987).

Some of the possible negative effects of computers on student growth in the classroom pertain to regimentation and dehumanization of the classroom and shaping of the curriculum. While some students may prefer to work alone, and learn while progressing at their own pace others students may rely on social interaction and cooperation to learn and may need guidance by the teacher (Malcom, 1988).
In the classroom setting, students interact with students, teachers and administrators on a daily basis. They learn that many real world relationships begin with face-to-face (FTF) contact. In FTF interaction students make quick judgements based on physical attributes and other observable qualities while beginning a relationship. This has been the traditional way of initiating relationships for many years and will continue to be important in the future. With the use of computers in the classroom or at home, electronic relating offers a different format of interaction compared to FTF contact. Use of these new technologies may lead to a decrease in social contact as students spend more and more time on computers in school and home and less time with other individuals. The reliance on technological mediated communication may not allow students to develop and practice the socialization skills that will be necessary for future success. Early research investigating the importance of social contact (Gove & Geerken, 1977) found that when people have more social contact, they are happier and healthier. Currently, some researchers argue that the Internet is already causing students to become socially isolated as they spend hours in front of their computer communicating with other Internet users in the evenings and all day during school hours (Stoll, 1995; Turkle, 1996) and not in physical social contact with others. Time spent at the computer prevents many students from physical activities, social interaction, and outside activities. In addition, for some students staying up all night on line, in chat rooms, or playing games prevents them from getting necessary sleep and some cases not completing homework or interacting with friends or family. Clearly, technological and communicational advances are continually influencing society in general. However, due to the personal nature of some of these technologies and ease of access, the impact on education processes, students’ socialization and development appears to be greatly influenced.

Current Evidence and Theory

The research to date on the impact of computer and Internet use on social relations is sparse. However, some theoretical positions have been posited concerning the use of electronic mediated communication in forming social relationships and the potential effects of this new relating style. It is possible that negative or positive effects of the Internet may be related to the balance of strong or weak ties that people can generate and maintain with others (Kraut, et al., 1998). The Internet potentially reduces the importance of physical contact in developing and maintaining networks of strong ties due to the fact that communication via the Internet does not depend on the distance between parties. This may have severe consequences for students, as part of the education process is not only academic learning, but also learning many of the social skills that will be needed in life. With educators relying more and more on technology and distance education, it may be decreasing the opportunity for students to interact with others (students and teachers) in a personal way which leads to the development of appropriate socialization skills. With electronic relating becoming very appealing to some individuals (Schnarch, 1997) as a way of relating and gaining support without the risk of FTF interaction, students and individuals may be forgoing experiences that would lead to the development of appropriate social skills that will be needed in the future.

As computer technology and the Internet infiltrate every aspect of student’s lives and as a possible negative consequence of technology and computers, marriage and family therapists are encountering clinical cases in which these technologies are having a serious impact. Many clients are involved in Internet usage, and cyber-dating/relating as an everyday part of communicating and developing a social network on the computer, while in some cases ignoring their friends, families and significant others.

Evidence is supporting possibly a new type of clinical disorder that will impact society, namely “Computer/Internet Addiction” (Young, 1996). This addiction refers to students and individuals who spend the majority of their time interacting with computer technology and using the Internet for a variety of purposes, while not spending time in more traditional social and recreational activities. These students and individuals would appear to have a preoccupation with the use of the computer and Internet as a centralized activity in their life. Based on current data, “Computer/Internet Addiction” and online relating will continue to increase and become a major way in which individuals and/or students interact or not interact and function on a daily basis. It may also be construed that this is leading to greater social and civic disengagement, which will have an even greater effect on individuals in society.

Griffiths (1997) in reviewing the available data on “Computer/Internet Addiction” stated that it is an area worthy of further research. Specifically, “Computer/Internet Addiction” research need to focus on its effects on students. In response, investigations of this phenomenon have found a specific personality type that tends to become addicted to the Internet. Shotton (1991) found that predominantly object-oriented males are more likely to become addicted to the computer and Internet. This addictive personality type was investigated.
and described by Hybels (1995). He suggested that the typical addict is a teenager, usually male, with little social life and self-confidence. Internet relating and relationships offer lonely or emotionally isolated people the opportunity to talk easily and conveniently to strangers instead of being open with themselves about their difficulties in relationship development (Shaw, 1997). Clearly, the introduction of technology into the classroom and educational endeavors may be providing students who are in need of help with social relations, an opportunity to fulfill some basic needs for relating. While at the same time ignoring the potential impact that this may have on their long term development.

**Conclusion**

Currently, the impact of computers and Internet usage on individual’s, their relationships and families are difficult to evaluate. Based on the recent influx of clinical cases with a computer/Internet-related concern it has become apparent that this is an emerging area of concern and research. Clearly, the question is still out on whether computer and Internet use in general has a negative or positive impact on individuals, students, their relationships or other aspects of development. It is possible that the influx of technology may have both positive and negative effects and by only examining the issues can we develop and implement technology in a way that will have the most benefit while keeping the potential negative effects to a minimum. It is clear that technology can be implemented in a manner that does eliminate many of the traditional roles of the educational process, which include the learning of social rules and relationship development. It is hoped that educators will be cognizant of the potential social and development pitfalls that can occur when blindly implementing technology into the educational process. By being aware of these pitfalls, educators can better devise technological rich learning environments that meet the needs of the whole student and not just the students academic needs.

The Internet and asynchronous delivery continue to dominate distance education presentations this year. As web-based learning becomes more commonplace, scholars are turning from writing about discovering the medium to investigating the underlying issues related to designing and evaluating distance education. Instructional design and program development papers occupy prominent roles in the Distance Education section, and the descriptions of exemplary programs include extended discussions of the implications for development across the discipline. Several presentations center on broad management, technical, or cost-effectiveness issues of distance delivery, overall. Video and other delivery media than the web have a place in this year's collection, with studio and desktop video the most regularly occurring.

How distance delivery affects instructional design continues to be the central question in distance education, and that centrality is reflected in the number of papers in this section. Nada Dabbagh addresses the issues that arise in The Challenges of Interfacing Between Face-To-Face and Online Instruction," while Michael Kadiubowski probes the impact of design on faculty in "Is A Paradigm Shift Required In Order to Effectively Teach Web Based Instruction?" Kasprzak and Nixon raise—and significantly answer—the troubling issue of "Cheating in Distance Education. Broader considerations comprise the "Kaleidoscope of Designing, Administrating and Teaching Distance Education" in a panel led by Sheila Kieran-Greenbush, Victor Alusine, Pamela Furline, and Elsie Szeczy. "Kaleidoscope" implies many views and many choices, and that variety is explored by Karen Lemoine, who examines the role of "The distance teacher: the ultimate distance learner."

The faculty member's role in distance programming is also the subject of "One size does not fit all: designing distance education Support" by Euncie Merideth and Peggy Steinbron; while Kevin Oliver and John Moore describe faculty development in the process of "Transitioning from online teaching to online learning." "Web-based instruction: what should we know?" explores the full scope of technical and design skills necessary, in a paper by John Ouyang and James Yao. Technical tools form the center of the discussion of the vital subject of providing education to persons with disabilities, in "Access for all: developing an online course about online courses" by Loye Romereim-Holmes and Denise Peterson.

Equity in distance education extends beyond overcoming handicapping conditions, of course, and Luiz Senna introduces the changing equity picture in "Autonomy and knowledge—comments on distance education design," while Osama Shata and Mohamoud Abaza, in "Distance education: an ultimate subject for teachers and students," and Ya-Ting Yang and Timothy Newby ask "Does distance education resolve the current problems of education?"

Three papers investigate the relationship of learning theory to distance education. In "Using constructionist principals in designing and integrating online collaborative interactions," Blocker and Tucker make a case for a necessary relationship between constructivism and distance education. In "Learning styles and potential relations to distance education" Buboltz, Wilkinson, Thomas, and Jenkins present theory and strategies for meeting the needs of different kinds of learners, as do Jenkins, Buboltz, Wilkinson, and Beatty in "Matching distance education with cognitive styles in various levels of higher education."

Theory and design alone do not characterize distance education, of course. There still is a place for explorations of computer programs and delivery platforms. Five papers present a broad spectrum of technical variety within the general framework of asynchronous delivery. In "The road ahead: the evolution of online learning," Alicia Balsera explores the changes that technology will permit, and require, in the near future, while Hossein Jahankhani presents a cross-discipline review in "How information technology can help education, distance learning."
Some familiar specific technology solutions have a new life in three papers. “Simple is good: course content, electronic mail and the benefits of asynchronous online forums” is Kevin Lee’s exploration of text-based tools in student interaction and reaction. The electronic discussion board within otherwise traditional classes is explored by Richard Pountney and Alice Oxholm in “Supporting and evaluating distance learning students’ use of an electronic discussion board”; while Web-CT as a delivery platform forms the way Ingrid Thompson-Sellers moved delivery “From ‘inches to miles’: Web-based instruction using WebCT (V 3.1).”

Though many presentations focus either on post-secondary or general issues, training and staff development continues to grow in its importance within distance education. In “A hybrid online course to enhance technology competencies of school principals,” Sally Beisser and Peggy Steinbronn describe an approach to the important task of providing graduate education to working school principals. Electronic media sometimes replace printed material, of course, and “A comparative project: web-based faculty development versus print-based faculty development” describes Melissa Diers’s analysis of the effectiveness of both forms of delivery. Chris Koble compares distance to face-to-face development in “Action research results: on-line vs. traditional face to face professional development.” As distance education closes distances, problems and their solutions continue to be broadly interesting without losing a local flavor, and Marina Moisseeva and Victor Krivoshokov provide a particularly interesting example. “Academic stuff development course for coordinators of distance education: Russian experience” details a national project addressing needs that are perceived world wide.

No form of professional development is more important to SITE readers, overall, than teacher education. The pioneering role of distance education in preservice teacher education programs has only grown, as have the burgeoning needs for electronic portfolios, field experience, and alternative certification. Gerald Burgess and Barbara Holmes describe how to use “Electronic portfolios to support accountability and preservice teacher preparation” in their poster session, while David Gibson focuses on “Online personal learning in teacher preparation.” Personal growth and exploration is the focus of Helflich and Putney, in “Reflections of reality: online conversation in a teacher education seminar” and of Stinson and Stanbrough’s “Reflections of K-12 teachers on graduate education via distance learning.” Discipline-specific preparation, on the other hand is the focus of Allen and Pilant’s “The distance education degree program for the master of mathematics with a teaching option at Texas A&M University.”

Instructional programs aren’t limited to teacher preparation, of course, and four papers present lessons learned from elaborate and innovative projects. Baumbach, Bird, and Eastman present “Teaching & learning online: lessons learned” describes the experiences of a technology resource center, and Krin Bryson presents a poster session on the “SETTEN distance learning project.” A national support system is described by Salvador, Santos, and Lima in “UGF Virtual Campus: integrating information, communication and cooperation in the web,” while Jean Kueker and Jerrie Jackson ask, simply, “Are we there yet?”

Management and budgeting are never far from consideration by the technology educator, as three papers review issues that concern us all. Dickey and Dickey describe a model for calculating “Cost effectiveness and distance education: a perspective decision,” as does Michalski, in “Cost effective electronic course development and delivery via the Internet.” Judith Smith, more ominously, describes “Managing the dark side of on-line courses — while enlightening your online students.”

The management considerations across borders and among institutions are the focus of “A survey of internet based distance education” in the United Arab Emirates, by Emad Bataineh, and of the Canadian perspective on “Real concerns on distance education when distances are real” by Leo Wells.

Not all distance education is delivered through the Internet, of course, and video applications continue to grow in popularity as they cost less. Even “Interactive television: the good, the bad, the ugly” interest Allen, Gustafson, Holt, Kysilka, and Dickey. The international implication of “Videoconferencing in practicum of educational studies” is the focus of Jukka Maki’s description of a program in Finland, while “The use of two-way audio video at the University of North Texas as a tool for practicum supervision” is a description of a vital link in field experience, presented by Pemberton, Tyler-Wood, Cerio, Rademaker, and Mortensen.

Practice, of course, rides on research. Five papers describe the considerations both practitioners and researchers must make when designing effective models of enquiry for distance education, either for assessing programs or creating knowledge. “Assessing best practices in online learning: A review of the literature” summarizes many of these studies, compiled by Dwyer, Sunal, Giesen, Sunal, and Trundle. Participant opinion in one program is gauged in “Distance learning: Perceived effectiveness and student satisfaction in higher education” by Donna Gabrielle. And
Hartley, Gibney, Heflich, and Strudler describe “Developing standards of quality for educational technology distance education courses.” Assessing multiple roles forms the center of “Teacher and developer: compromise for the creation of CSCL applications” by Osuna, Dimitriadis, Martinez and Anguita, while Burcu Tunca predicts “Distance education and what is coming next.”

Every reader is touched, in some way, by distance education; none of us is immune to its effects, and few can help feel excited by its implications. The authors of these papers share that interest and excitement. From international programs to innovative research strategies, there is some thing in this section to intrigue, inform, and challenge every reader.

Abstract: This paper is a report on the planning, development, and implementation of the online Masters degree program offered by the Mathematics Department at Texas A&M University. The degree, which is completely online, is targeted primarily to secondary high school teachers that desire to sharpen their mathematical skills or advance their overall learning, particularly to qualify for teaching positions in community colleges. The issues, far exceeding those of a new program in the traditional form, range from recruitment of students to negotiating intellectual property contracts.

Introduction

In the spring of 1999, the Provost of Texas A&M issued a Request for Proposals to develop online graduate programs. With funds up to $150K available, the RFP attracted many proposals. Fortunately the authors had already established a record of accomplishment of producing Web assisted and Web-based materials. (Allen 1998, Pilant et al. 2000). The next step towards establishing a Web-based degree program was not a large one. There were details, primarily logistic in nature, regarding timetables and deliverables.

In this paper we consider a number of the most important aspects of putting together such a program, making it as generic as possible, so that it may apply to areas other than mathematics. The process is new to most institutions, and the issues are far-reaching. In this paper, we will discuss:

1. Creating the program
2. Designing online courses (two examples)
3. Intellectual Property
4. Publicizing the program
5. The students.

Creating the Program

Making a case for a graduate program to serve schoolteachers is not difficult. The facts of the current educational state of the country make the case for us. The first few lines of our proposal read as follows:

299
With current State of Texas mandates to offer more AP level courses, the educational needs and demands on the high school teaching faculty of State high schools are greater than ever before. These and state requirements for CEU's (Continuing Education Units) give a ready market of potential students for a distance master's level program in mathematics education that in numbers alone exceeds almost every other potential distance masters program. That this program already exists in traditional format and has graduated many students serves to establish that it already enjoys a credible market.

The need, as we argued, was certain. However, was the desire actually there? That remained to be determined. Programmatically, our department already operates a Masters of Mathematics with a Teaching Option, which has been fully approved by the State of Texas Coordinating Board of Higher Education. Therefore, the implementation of the online program did not require the massive procedural measures of that process.

To complete the program, that is, to obtain a master's degree, the student must complete the same requirements as the on-campus student. Students must take 36 hours of courses, of which at least 24 hours must be mathematics courses. Enrichment courses in statistics and education or educational psychology are required, as well. There is no diminution of the course requirements. At present, students must appear on campus to take a one to three-hour comprehensive oral examination to satisfy the degree requirements.

Designing Online Courses

The issues are becoming well known: Before constructing an online course, a Web assisted course, or a Web-based course, it is important to consider the many choices available to accomplish the project (Pilant et al. 2000). We collect a few of the choices of greatest urgency, focusing on the various styles and features that can be brought to such a project. We will also consider some of the logistic details of Web course creation, deployment, and use. Just to mention a few:

- What are the merits of Java Applets?
- How much does it cost to produce a course?
- Can online course be cost effective?
- What about video-streaming?
- What are the basic tools?
- How can we provide help online? Is there really a way to do it?
- What types of skills does the faculty member need?
- How much time does it take?

Full or partial content or textbook-based courses are current choices. The value-added features can make the difference between a mere sequence of Web pages and a truly online course. What sorts of features you add will make the course a success or failure. Content should be relevant. It should be easy to navigate, and your design should be intuitive. The online course should consist of several features: content, links and resources, quizzes, homework problems, navigational devises, and a table of contents. If your course is full content, you must of course write the equivalent of a textbook, a time consuming task, as one knows. Still, writing such a course is sufficiently different from writing a print text that considerable time must go into its creation. This is not the place to describe these features; so, it is best for the author to find examples of online courses and note their differences from a full print text.

If the course is to be primarily text based, then the value of the course is equal to the portion that is value-added to the textbook. For example, if all that is added is the syllabus portion, with assignments, this is little more than a self-study course. However, it is well known that such courses have limited efficacy for most students and none at all for some. Therefore, it is important to include a variety of materials that will aid the student in comprehending the text. This can include further or fuller explanations of important issues. It can include links to and discussion about resource links; it can also include particular goals of selected readings or text chapters. The student should feel that the online course is an essential part of the course, without which comprehension would be difficult to achieve. In addition, your portion of the course should include content, which the student must learn to be successful on exams. The partial content course
should not conflict with the primary text. If it contains supplementary examples or chapters, this is ideal. It could also present alternative viewpoints for comparison. However, it should avoid dual sources of course materials. In most cases, the student will select one of the sources over the other as the primary authority.

There are more issues. For example - assessment (Hall et al. 1999), streaming media, JavaScript, Java, testing instruments, bulletin boards, chat rooms, development tools, homepage, and course management systems (Allen 2001). Each of these requires an equivalent chapter of discussion. However, in this note we limit the discussion to two particular courses.

Math 629 – History of Mathematics.

This course is full content based. The course page is primarily a collection of goals, readings, and problem sets. In appearance, it looks much like a book online. Most of the readings are PDF Acrobat files that can be printed by the student. It should be noted that one of the major issues still facing the technical sciences is how to adequately display mathematics on the Web. There are many ways to do it poorly, but the ultimate way embodied in MathML (a markup language akin to HTML) has yet to be implemented by the major browsers (Allen, 2000b). A popular alternative to MathML is Adobe’s Portable Document Format, PDF. It makes the document look exactly the way it was typeset. However, inserting interactivity, or almost anything else is either time consuming or difficult.

In addition, there are a large number of links to readings at other Web sites. The reason is two-fold: First, there is a wealth of material about the history of mathematics on the Web, and much of it is first rate. Students should learn to explore the Web and use it to their advantage. The second reason, is that it is almost impossible to write in a single document all that should be available to the students.

Math 696 – Mathematics Communication and Technology.

This course is based on the idea of directed tracks, a set of which will be selected by each student enrolled. With each track, specific milestones of accomplishment will be attached. The course will be complete with a capstone project that will bring the various tracks together in a large project. Below we list some of the envisioned tracks.

1. Mathematical document preparation
2. Computer algebra systems (e.g. Maple, Mathematica)
3. Web page development (incl. math-to-web conversion)
4. Programming (Java, C++, asp)
5. JavaScript
6. Test preparation/Online testing
7. Using graphing calculators
8. Graphics design for Web pages

As is apparent, the skills of the instructor should be broad based for this course format. Indeed, at this time, no faculty member in our department would feel comfortable directing students in all the possible tracks. Yet, people are continually emerging with new skills. We are excited about this course, particularly its nature that seems very much in concordance with the paradigms of the Web. More information about this program can be found at http://distance-ed.math.tamu.edu/index.html

Intellectual Property

With two authors producing content under the terms of the proposal, with the University contributing funds toward the production, and with the assumption that the materials generated have market value, the natural question to ask is: Who owns the material? Concomitant with that question is another one of equal importance: How should the distribution of royalties or income from these materials be made? Both of these complex questions required ongoing discussions with university lawyers and licensing officials for more than a year before an accord was reached. Before outlining what contractual terms we regard as fair, it worthwhile to mention and discuss other questions that may be even more complex.
1. If Professor X writes online content for Math YYY partially using institutional resources, does the institution have the right to revise those materials at some future point? (Naturally, the "shelf" life of one of these early efforts of online courses is brief—perhaps two years. To keep the course viable, it will need to be updated or upgraded. Who controls that process? What remedy is accorded the institution if Professor X declines the task?

2. What if an author permanently leaves the institution? Does the author have the right to load the course on a server at a new institution? Can he subsequently revise it there and offer it in competition with the version running at the original institution?

3. Should students at the home institution pay to use the materials?

The answers to these questions hinge critically upon the definition of the term "substantial resources." For example, if the faculty or staff member is assigned the task of creating an online course and that becomes part of the job requirements, the "work-for-hire" model may apply. In this case, the university owns what is created, and may at its discretion distribute future income to the creator. When the compensation is more than just an office computer and secretarial help but less than the full salary, the question becomes this: Does the contribution of the institution measure up in a tangible way as a substantial contribution to the production of the online course? Some institution will argue in even this case that ownership resides with them because an employee created the product. We regard this view, which makes sense in industry, to be stifling to the creativity of their faculty. Such a narrow and constrictive (even greedy) policy may well result in diminished quality or quantity of production that over the long run may be more costly, when that same institution, in order to operate their Web-based and distance education programs, will have to license products generated elsewhere.

Since the creation of one of these courses requires time far in excess of writing the equivalent amount of material for a textbook, and since only a handful of faculty have anything near the skills to produce such an effort, it would seem prudent for the institution to be as generous as it can and to nurture this talent for maximum creativity. Faculty members treated fairly work tirelessly in such an environment.

At the opposite end of the work-for-hire model is the professor that produces a Web-based course solely on his/her own initiative. In this case, the university does not contribute any meaningful resources toward the effort. In this case, the creator of the materials should have 100% IP ownership and should be accorded 100% of income distributions. Moreover, the university may not revise the materials without consent of the author. Succinctly, the traditional textbook model applies.

Somewhere in the middle is where the real difficulties reside. Most institutions will regard any amount exceeding $20K, or several course releases, as substantial. Admittedly, they have a case. Nonetheless, authors should be granted 100% IP ownership. If the author owns it, the product will undoubtedly be better. However, the distribution of income can be negotiated. With regard to our particular program, the university agreed to just these terms and to giving the authors a majority of future royalty income. As is the custom here at Texas A&M, authors do not benefit financially from students at their own institution using their books or online materials. That means course fees are either not assessed or are returned to the university.

Texas A&M University has recently proposed a meditated technology instruction policy with terms similar to these at its cornerstone. The basic belief is that an open and fair policy will foster participation by qualified and competent faculty to produce the highest quality online materials.

Publicizing the Program

Advertising our program was an aspect that we did not originally anticipate nor fully understand. Normally, it is a process transparent to the faculty members' duties. Colleges are established institutions that attract students in traditional ways. For online programs, the rules change. We have prepared brochures, we have given numerous talks at teacher conferences and conventions, and we have engaged in direct mail advertising and we collect mailing lists. Below is one part of some advertising material.
The Masters of mathematics with a teaching option taken online has four tremendous advantages:

- You can take courses at your convenience.
  *There is no residency requirement.*
- Partial courses, called certificates, are available.
- Special courses, such as Maple, Java, and Web design will be available – with a mathematical emphasis.
- Courses are transferable.

In this brochure, we review the procedures for getting started.

Prospective students don't have a historical perspective of these programs or what they are about. We must educate the students to what the program is like, how courses operate, what is expected, and even how to enroll. They want to know. At the recent CAMTI meeting in Houston, we presented our new program to an overfilled room of more than one hundred teachers. The interest is genuinely profound. Many teachers said how appreciative they are that such programs are becoming available.

Because of these efforts, we receive inquiries about this program on a daily basis. The questions are similar. All want to know what, how, and sometimes how much. Typical questions follow. “Are there scholarships?” “I haven’t been in college for twenty years. How will I do in math courses now?” “What courses are offered now?” “What about the summer?” “I just finished a degree in computer science, but I want to teach math. Will this program enable that?” It is gratifying for professors at a large university such as Texas A&M to see impact of their work so quickly, and with such enthusiasm.

The Students

The demographics of teachers that have enrolled in the program range far beyond what we expected. Excepting a few regularly enrolled graduate students, all teach mathematics at some public institution. We anticipated the bulk of our teacher/students would be high school teachers. However, they span a wide range from elementary school teachers to community college instructors. Their reasons for taking the course are as many as their number. None of them have indicated that their direct goal is to get a master’s degree at Texas A&M University. A couple of them desire better positions in their own schools, and taking these courses as CEU’s will help them. One requires 18 graduate hours in mathematics to qualify to teach in a community college, a SACS requirement. Another is enrolled in a masters program at another institution and is taking online courses from us to transfer. Yet another has been teaching 25 years and just wants to take a mathematics course.

All the students have full and complete lives – job – family – children – community involvement, etc, and many of them are taking several courses simultaneously. Indeed, two are teaching full time and taking three graduate courses! Both have expressed some regret about that. We have tried hard to be flexible about assignment dates, realizing that these students are fully mature individuals and do not merely shirk their scholastic duties. It is important to accept these facts about this new educational landscape, and to remember that the educational service we are providing is crucial to many, many people. Strict construction of assignment dates seems somehow inappropriate.

We suspected that the mathematical strength of our new distance students would not be up to full time regularly enrolled students. What was the case was that they were mathematically weaker than we hoped. This has required some adjustment in the types of assignments given. For example, in the History of Mathematical course, mathematical problems are typically assigned to be solved with period techniques. These problems are not difficult but do require advanced problem-solving skills. Many teachers in the field for several years or those that focus on educating the very young have seen those skills erode over time.

---

1 Conference for the Advancement of Mathematics Teaching. This is the major annual conference for schoolteachers of mathematics in Texas. It normally attracts about 8,000 attendees. Teachers come for many reasons: to gain CEU’s, to learn about new programs, to present results of their classroom activities, and more.
Therefore, to compensate for this, optional assignments of essays were given wherein the teacher could relate the period methods or problems to teaching and pedagogical issues. For example, one essay given to all students was to analyze the use of pictures in (mathematical) proofs. This essay question, which was based on a current paper in the Notices of the American Mathematical Society, allows the student to bring in a wide array of historical resources and then to relate it to their personal teaching philosophy. Other questions of this nature have been created to challenge all students, whether pursuing a Ph.D. here or whether just learning some more mathematics.

Conclusions

Creating an online degree program today has very much the same comprehensive, all encompassing nature of forming a new business. There is little one can simply plug-in to existing infrastructure. The delivery is different; the assessment is different; the student demographics are different; recruitment, retention, and motivation of students are also different. The desire for learning is intense. However, the need for temperance of course administration is essential. As well, an acute understanding of student backgrounds in contrast to regular on-campus students is paramount.

Finally, as must always be mentioned in a forum such as this, we are in a transition period. In just a decade, perhaps less, online education, online degree programs, and the like will be institutionalized. Students will have clear expectations, and faculty will again have established ground rules. Course administration will be established in comfortable grooves. Methods universities use to compete for and recruit students will be once again transparent to faculty, and developers such as these authors will spend all of their time developing online courses, new techniques, and learning new skills for the next generation of interactivity.

alicia@usf.edu

Abstract: This paper will focus on the structural and interfacing mechanics of the software that will facilitate support efforts and minimize the frustrations encountered by new users whether they are students, faculty, or course creators. The course shell creation process, student enrollment, passwords, faculty loading, role definitions, reusability, reliability, scalability, all provide potential challenges—even for the best pedagogical designs. The goal is to define a comfortable environment for technology application to classes so that online instructional tools may be assumed as much a part of the academic environment as classrooms and chalkboards.

Introduction

Institutions with mission-critical needs for their online teaching and learning environments require a comfortable environment and a sophisticated technology base for their large-scale systems. Considerable attention has been paid to estimating the effectiveness and general pedagogical value of classes using web-based courseware as the delivery mechanism. Aside from the learning dynamics themselves, there are features of the courseware that can lead to adoption- and support-related challenges. These features are often inherent and not under the control of course creators. Unfriendly access procedures can create enormous frustrations for novices. The resultant loads on faculty can lead to disenchantment at the least.

The course shell creation process, student enrollment, passwords, faculty loading, role definitions, reusability, reliability, scalability, all provide potential problems—even for the best pedagogical designs. The goal is to define a comfortable environment for technology application to classes so that online instructional tools may be assumed as much a part of the academic environment as classrooms and chalkboards.

This paper will focus on the structural and interfacing mechanics of the software that will facilitate support efforts and minimize the frustrations encountered by new users whether they are students, faculty, or course creators.

Thesis

Online education can be defined as an approach to teaching and learning that utilizes networked technologies to communicate and collaborate in an educational context. This includes technology that supplements traditional classroom training with web-based components and learning environments where the educational process is experienced online.

The application of computing to the teaching/learning process often follows a sequence of this kind:

- Adoption of a small number of tools (either for presentation preparation or specific tools for the disciplines)
- E-mail as an aid to communication
- Electronic threaded forums
- Instructional modules and class materials
These "islands of applications" often lead to a fragmented environment requiring multiple authentications (i.e., logins), with system administrators adopting a cottage-industry approach to class management issues such as class rolls and grading. Integration to the Student Information System seldom exists.

Nearly all of higher education institutions currently engage in some type of online learning. Academic and professional organizations agree that using web-based learning environments can offer sound pedagogical benefits. Researchers from Cornell University estimate that "the web provides significant new functionality in transmitting information to the student and providing forums for exchange. The web is revolutionizing some areas of study through increased opportunities for learning and alternative formats for information" (Dwyer, Barbieri, & Doerr, 1995). The American Distance Education Consortium has derived a set of Guiding Principles for Distance Teaching and Learning based on the assumption that "principles that lend themselves to quality face-to-face learning environments are often similar to those found in web-based learning environments" (ADEC, 1999).

The web’s facility for synchronous and asynchronous interaction provides the medium of choice for online learning offering educational advantages such as:

- 24x7 accessibility to course materials
- Student-centered teaching approaches
- Enhanced student-to-student and faculty-to-student communication
- Just-in-time methods to assess and evaluate student progress
- Reduced administration overhead via course management tools

Again, there are the issues of the islands of applications.

Online Class Concerns

In an effort to streamline the online educational delivery systems and create more of a "one-stop shop" for teaching, learning, and doing business with the university, USF began to investigate methods for improving its on-campus course offerings in 1994. Tasked with finding a software platform that would be valuable for students and instructors, administrators, as well as IT staff, we began by compiling faculty-defined requirements for class delivery. The checklists of critical issues considered are provided below. The first deals with the functions delivered by the courseware, the second with issues critical to the successful deployment and operation of the instructional environment provided by the courseware.

Desired Functions

- Single point of entry, one integrated application for users
- Web interface (no client required)
- Easily used by students, minimal learning curve
- Ability to include text, graphics, video, audio; minimal use of HTML if at all (but available if desired)
- Threaded discussions
- Full text search
- Support character sets for other languages, and for mathematical symbols
- One-to-many, many-to-one, many-to-many communications, public and private, asynchronous and synchronous
- Record students viewing material (attendance record and timing)
- Online testing of various kinds with provision for feedback if desired; test record/grade book
Academic Issues

- Carry-overs for incompletes
- Semester-to-semester course migration
  - Same course number, different instructor, different content
  - Serially in time or at the same time
- Completely distant learners (no access to campus) vs. campus visiting learners
- Student Internet skills

Support Issues

- Security
  - Student privacy
  - Intellectual property
  - Assessment integrity
- Ability to easily and automatically import class lists and associated information from external sources
- Ability to easily and automatically create course sites for many classes (i.e. templates); batch registration tools
- Ability to easily and automatically transport material easily between courses
- A global view, calendar, task scheduler, etc. for students in multiple classes
- An organizational chart (equivalent to a site map) for the class
- E-mail/chat/discussion groups created automatically for the class, with the ability to be reorganized by the instructor
- Web-based vs. application-specific e-mail
- Industry standard database interface vs. proprietary database
- Server requirements, storage estimates
- Scalability
- Extensibility via open API’s

Online Educational Delivery Systems

In August of 1998, three course management systems were selected for evaluation based on the measures defined previously:

- TopClass - WBT Systems
- Web Course in a Box - MadDuck Technologies
- WebCT - WebCT, Inc.

The comparison criteria used in the assessment took into account the roles of the learner (consistent navigational interface, student tools, etc.), the instructor (access to grade book, course/lesson tools, etc.), as well as, the administrator (batch mechanisms, help desk tools, etc.). A significant number of instructors used the delivery systems as an adjunct to classes and provided feedback with respect to the breadth and depth of the features of each courseware for a period of one year.

Although these multimedia courseware-authoring systems facilitate the creation of more flexible and customized educational environments, no single product by itself contained all the desired features. In addition to the applications concerns, areas connected with technical support issues, scalability and reliability were also explored.

In January of 1999, Blackboard’s CourseInfo was added to the evaluation pool, and by August of 1999, two of the applications were identified as desirable vehicles for the delivery of online courses warranting further appraisal.
Enterprise Electronic Aid to Instruction

The University of South Florida wished to deploy a portal with implementation of single sign-on access to a full range of applications and information (represented below in Figure 1). In the first phase USF's efforts were to focus tightly on courseware delivery. The tasks associated with this phase would involve mapping more than 36,000 students and their instructors into 3,000 classes each semester. This courseware development was tempered by our concern to ensure that the authorization process and other related procedures would also facilitate the development of the portal as a vehicle for delivery of other services to the entire USF community.

With the intent of unifying USF's diverse online campus systems into one fully integrated platform that incorporated the university's administrative systems, such as registration and grades, with a course management system to deploy Web-based courses, the task at hand was finding a software platform that would be valuable for students and instructors, administrators, as well as IT staff, and that could satisfy the following requirements:

- The platform must revolve around teaching and learning, with a robust course management system as its backbone
- The platform must offer opportunities to create a community of teachers and learners
- The platform must integrate with pre-existing administrative systems, specifically SCT® Banner™, to create a complete online environment

In September of 2000, Blackboard, Inc. and USF signed an agreement to integrate the Blackboard 5 Level Three advanced course and portal manager platform with the institutional back-office systems. In addition
to Blackboard’s course management technology and new portal capabilities, Level Three includes system integration tools that combine data from the existing Student Information System, Financial Aid Office, and other data-rich environments.

The levels of customization, flexibility, and scalability in Blackboard allow instructors to concentrate on providing high-quality content while administrators concentrate on managing the platform itself. The portal capabilities allow for the development of an online campus, giving distance learners and commuter students the ability to participate in on-campus life without needing to be physically present, minimizing the distinctions between distance learners and on-campus learners.

As a considerable number of faculty members use the courseware live in the classroom, as an adjunct to classes, even a brief loss of service is extremely serious. There is also almost no time available for loss of service for system maintenance, as the concept of the academic year becomes invalid in terms of extended online delivery of instructional materials. Thus, to provide the capabilities instructors need to leverage technology within the traditional classroom, these challenges inherent in bringing a campus online must be addressed. Disparate academic computing resources must be unified and integrated with existing back-office systems, and bombproof support services must be facilitated.

The integration concept involves process design, integrative software, effective training and support, and technological tools:
- Automatic assignment of an e-mail ID and computer account for every student
- Automatic creation of a set of electronic tools available for every course (listserv, chat, etc.) --to be used optionally at the faculty member’s discretion
- Student name and address information captured once, and automatically made available wherever needed
- Cumulative student portfolio
- A single portal for students to access information for all courses, to financial aid information, to book purchases, etc.

This institution-wide portal is to provide single-login user authentication, as well as capabilities that allow each school, department or campus within the university to maintain its own customized environment. Some of the core features and functionality of this system are:
- Personal information management tools
- Powerful course management tools that enable instructors to provide their students with course materials
- Course communication and collaboration tools, such as discussion boards and virtual chat rooms
- Online assessment tools
- Dedicated academic resource center on the Web
- Web-based e-mail, calendar, announcements, and tasks scheduler
- Community management
- Institutional services management
- Institution-wide content sharing and management
- Course e-commerce management
- Customizable portal modules and information services
- Extended customization for institutional branding
- System administration management tools
- Enterprise-level database user management tools
  - API for user information batch extracts
  - API for event-driven (real-time) user updates
- End user authentication (security) API
  - Protection of intellectual property
  - Safeguard online enrollment and fees payment

These criteria enable the development of a mass-customization model for the development of an online teaching and learning environment that is both sustainable by our institution’s infrastructure and flexible.
enough to adapt to the emerging technical environment. This approach comprises the linking of both existing corporate databases and purpose-built data stores linked to web pages that can be operated upon via standard web interfaces. Thus full extensibility and interoperability is provided for.

The intent is to concentrate on a functionality that can be accessed via a standard browser interface without the need for the installation by the user of client software. The Blackboard platform, while including text-based materials, online discussions and interactive quizzes, can also be used to extend the richness of the resource base for teaching and learning by increasing the use of a range of multimedia forms. It provides a simple and consistent user interface for all of the university’s online offerings.

The USF Web Portal is to be implemented in stages. Underlying these is the strategic intent to:
- Establish first an online presence for every course in the university that affords student access via a standard browser to a simple and straightforward set of teaching and learning resources
- Use the experience of this minimalist online presence as a basis so that instructors can author materials via web forms, thus enabling them to focus on content rather than technical detail
- Integrate over time online other forms of student support and online administrative functions with teaching and learning resources
  - Access to a range of Library services
  - Access to online enrollment and fees payment

Ultimately, our goal is to service online all of a student’s engagement with the university.

A Summary Look at
Internet Based Distance Education

Emad Bataineh, Ph.D.
Zayed University
College of Information Systems
Dubai, UAE
Emad.Bataineh@zu.ac.ae

Abstract: The Internet has truly and significantly changed the way we live, learn, work, and communicate. In today’s digital information age, electronic services are constantly growing and becoming an integral part of our daily life. One of these popular electronic services is e-education through distance learning, and in particular Internet-based learning, which uses the Internet technology as a medium to deliver instructions as well as a communication tool to support interaction between faculty and learners. Distance education is originally designed as a self-paced alternative to traditional classroom instructions and becoming a major trend in higher education. Community colleges seem to be leading the way in the application of Internet based distance education technology by providing more educational opportunities to adult learners than those in four-year institutions, should four-year universities pursue this trend? especially small and private liberal arts colleges who are suffering financially as a result of low students enrollment, should they consider investing in electronic instruction delivery methods to expand their classroom-based academic programs.

Introduction

In today’s digital information age, where e-education, e-business, e-commerce, e-government, e-communication, e-banking, e-entertainment, and other forms of electronic services are growing and becoming more and more closer to the mainstream, all of these services share one common technology and that is the Internet; which is used as a platform to deliver the above services. The Internet is a global network that consists of a large collection of interconnected computer networks around the world. The Internet contains a vast amount of information, estimates of several hundreds of thousands of terabytes (one terabyte almost equal to one trillion characters) that can be searched, retrieved, processed, and distributed electronically. The information found on the Internet exists in a multimedia form, and that is a combination of text, graphics, still images, sound, animation, and video. There are several services available on the Internet including electronic mail, world wide web (www), ftp, telnet, gopher, newsgroup and others. A synonym of the Internet is information superhighway, which emerged in early 90’s; it provides a high-speed digital transmission system capable of providing connectivity to homes, schools, universities, businesses, and government offices (Kushwaha, & Whitescarver, 1994). It is capable of delivering and receiving multimedia information instantaneously.

The Internet has significantly changed the way we live, learn, work, and communicate. The Internet has revolutionized teaching and learning in many positive and effective ways. In addition, the Internet has a strong influence on distance education. Education has always been a challenge for many people to obtain, because it demands time, effort money, and high level of concentration and determination. But, sometimes people are faced with limitations that prevent them from pursuing their education; therefore, they start exploring other alternatives that can be the solution. Distance education is one of these alternatives, which offers educational opportunities at a time and place convenient for the learner. It also has increased people’s access to the higher education.

"In the past, universities tended to own a local geography area, but there is no geography to it anymore. In the industrial age, we went to school. In the communication age, the school comes to us”, DiPaolo said.
There is a growing number of faculty using the Internet to complement conventional classroom based courses (Pittinsky, & Chase, 2000). Current research has shown that one-third of all four public institutions and nearly 30 percent of all four-year private colleges and universities offer a complete degree programs through distance education (Wong, 1999). An estimated of 55 percent of four-year colleges and universities now offer online courses (Telg, & Irani, 2000). With increasing population of Internet users (80 millions in the US only), and the availability of personal computers at homes, with almost 50 percent of American households have a PC at home; this made it so convenient for people to acquire education through distance learning.

The common uses of the Internet in education include: research, communication, training, and curriculum as well as distance education. Internet based education is one way to implement the conceptual framework to use Internet technology in teaching and learning. In the past decades, there have been several medias and technologies used to deliver distance education such as regular mail, radio, television, facsimile, satellite broadcast, video tapes, telephone, teleconference, audioconference, videoconference, and recently the Internet. The three popular methods of distance education include one way prerecorded video-using satellite technology, two way interactive video and audio - using compressed technology, and Internet based technology (Pittinsky, & Chase, 2000). Internet based distance education is quickly becoming the predominant technology in distance education. This growth is attributed to the increasing power of personal computers, increasing telecommunication bandwidth capabilities (ISDN, ADSL), and powerful interactive communication and collaboration software and technology.

In this paper, my primary objective of this study is to provide a comprehensive understanding of several aspects, issues, and ideas related to the Internet based distance education and its technology. It will provide a look at the history, uses, technologies, challenges, effectiveness, advantages and disadvantages of the Internet based distance education as well as the characteristics of a typical distance education learner.

**What is Internet Based distance learning**

Internet based distance education is a form of distance learning in which the course content is delivered and the interactions are provided by the communication tools, technologies, and methodologies of the Internet (Jung, 2000). Internet based distance education has three major components: teacher and learners, separation by time and/or space (geographic distance), and communication mediated by Internet technology (Telg, & Irani, 2000). Through Internet based distance education learning occurs at the student’s own pace, at a time and place convenient to the learner, with courses that meet his/her personal, educational, and professional goals (Weller, 2000).

The purpose of distance education (online classroom) is designed to reach a diverse population of learners and to provide open and convenient learning environments 24 hours and 7 days a week (Hara, & Kling, 1999). Distance education is designed as a self-paced alternative to traditional classroom instruction and becoming a major trend in higher education. It is suited best for self-motivated, self-directed, and self-disciplined individuals. Internet based education with the use of Internet based technology creates something called the virtual classroom or campus environment, where online it can provide learners the instructions, library resources, student learning assessment, course evaluation, student support services, and admission and courses registration. Through Internet based distance education, an individual can earn college credits, college non-degree credits, college degree (Bachelor, Master or Doctorate) or professional certificate as well as be able to participate in workshops, seminars, or training sessions.
Distance Education Learner Profile and Characteristics

Distance education is definitely not for everyone. A typical distance education learner usually belongs to one or more of these categories:

- Nontraditional learner
- Full time worker
- Parents
- People living in rural areas
- People with disabilities
- Females with children

In addition, each learner preferably should have the following key characteristics or skills in order to be a successful distance education learner:

- Good computer and Internet skills: basic computer, email, and www knowledge.
- Good time management skill: be able to complete tasks within the allocated time.
- Independent learning style: be able to work, study, and learn independently.
- Effective communication skill: be able and comfortable in writing.

Forms of Internet Based Distance Education

The five common Internet services used in distance education are electronic mail, file transfer protocol (ftp), world wide web (www), newsgroup, and chat lines. www is a hypertext based information service; it provides access to multimedia information in documents and databases. www is the most popular and fastest growing part of the Internet. E-mail is an electronic messaging communication system, which allows users to send and receive electronic data messages. Newsgroup is an electronic bulletin board that allows public discussion groups containing a set of articles about a single topic. File transfer protocol allows the transfer of data files and software between computers. Some or all of these Internet services might be incorporated into the Internet based course, depends on the pedagogical needs and instructional design used in the course (Telg, & Irani, 2000). Internet based education ranges from posting the course syllabus on the www to fully delivered, managed, evaluated, supported through the Internet. The four popular categories of web-based courses are:

- **Web-presence courses:** Only very small portion of the course is presented on the web, such as a course syllabus.

- **Web-enhanced courses:** Almost half of the course material is delivered through the web, including course syllabus, supplementary course material, assignments, projects, and additional resources.

- **Web-centric courses:** The majority of the course material is delivered through the web. It integrates a significant use of web technology and services in the course, plus support for communication between the learners and the instructor.

- **Web-based courses:** The entire course is taught, delivered, assessed, evaluated, managed as well as the communication between students and instructor occurs entirely through the web. Neither face-to-face interaction, required between learners and instructor, nor physical attendance in a specific location is required.
The two popular forms of delivery of web-based courses are synchronous and asynchronous modes. The synchronous form requires real time communication and fixed time class meeting as in conventional classes whereas the asynchronous form does not require the learner or the instructor to be in a fixed time or location and no real time communication. An example of successful models of distance education are British Open University (international model), Western Governors University (consortium model), California Virtual University (Virtual model).

Internet Based Distance Education Technologies

Currently, there are several Internet based technologies such as communication tools, services, and products that can be used by instructors to help them develop and maintain their online courses. An example of synchronous delivery is web based videoconferencing technology, which provides two visual connection and real time interaction and collaboration between instructor and learners. A synchronous learning environment requires a monitor or TV screen, web camera, microphone, and speakers. Some of the software tools available in the market to implement synchronous learning mode are NetMeeting and CU See Me tools and both provide Internet videophone system and real time communications.

Other type of commercial products and services used to implement Internet based courses are Blackboard, WebCT, Real education, and e-college. All of these services help colleges and universities to plan, design, create, manage, and maintain web based courses as well as creating virtual campus. Another option available for higher institution is to purchase programming development tools such as Java, HTML, and FrontPage or authoring software tools such as Macromedia Director, Macromedia Author ware, and Macromedia Dream weaver, and let the faculty develop their own courses. This option entitles higher education institutions to provide faculty with strong technical support and intensive training workshops to prepare faculty with basic and advanced skills and knowledge in technical, instructional design, and web based programming.

Distance Education Effectiveness

Here are some factors that help make distance learning more effective than traditional classroom instructions.

- When methods and technologies used are appropriate to the instructional design and learning activities.
- When there is student to student and instructor to student interaction through interactive communication tools such as e-mail, newsgroup, electronic bulletin board, and chat rooms.
- When there is fast and timely instructor to student feedback (exams, quizzes, assignments, and projects)
- The web-based courses should be interesting and appealing and should address a wide-range of learners with diverse learning styles and different needs and interests (Weller, 2000).

Many studies have indicated that students participating in distance learning courses perform as well as their counterparts in a traditional classroom (Phipps, & Merisotis, 1999). The student performance is measured using test scores and grades in the courses. Similar studies have also concluded that students and faculty have a positive views and attitudes toward distance learning (Phipps, & Merisotis, 1999). In the contrary, there are other studies have shown students' frustrations and dissatisfaction due to the following reasons/ factors (Hara, & Kling, 1999):

- Lack of prompt feedback
- Ambiguous instructions on the web
- Experience technical problems
Advantages and disadvantages of distance education

Most research studies emphasize the positive aspects of distance education. Here are the advantages so far for distance education technology:

- Offers educational opportunities at a time and place convenient for the learner.
- Removes geographical boundaries between learners and the instructor (students in remote areas can take advantage of learning opportunities with traveling long distances).
- Increases access to higher education.
- Offers learners a wide range of choices, topics, courses as well as degree programs to students.
- Cost effective, travel costs are saved, especially in times of high gas prices.
- Reduces the need to build and maintain college buildings and facilities.

But, disadvantages of distance education can also be summarized as follows:

- Start up costs to students and institutions are high, a learner will pick up the cost to purchase a computer with all necessary software to get connected to the Internet, in addition to monthly fees for an Internet service provider company. Institutions also need to provide all the required equipment and proper faculty training to use the technology effectively.
- Labor intensive, web-based courses usually take long hours to plan, design, develop, manage, and deliver.
- Most educational institutions still do not have adequate infrastructure to design and deliver web-based education.
- A lot of legal issues such as copyrights and intellectual property rights need to be clarified and explained.

Conclusions

In conclusion, Community colleges seem to be leading the way in the application of distance education technology in course delivery and assessment by providing more options to adult learners those four-year institutions. Should four-year state universities pursue this trend? Especially small and private liberal arts colleges who are suffering financially as a result of low student enrollment should consider investing in electronic instruction delivery methods to expand their classroom-based academic programs. The fact that the course contents and support services exist 24-7 online on the web, it does not mean by any way that the instructor will also be available and accessible online 24-7, this misunderstanding among learners sometimes lead to frustration and dissatisfaction.

Teaching and Learning Online: Lessons Learned

Donna J. Baumbach, Mary Bird, Janet Eastman, Kathy Katz
Florida Instructional Technology Resource Center at the
University of Central Florida
United States

katz@pegasus.cc.ucf.edu

Abstract. Currently, there is a great deal of interest by school districts, educational
software companies, teachers and others in providing staff development through the
Internet. While research findings in this area are only now beginning to appear, a great
deal can be learned from the “pioneers” in this area, including course developers,
facilitators and participants. After designing and facilitating several online staff
development components as well as from participating in some, the staff of a statewide
technology resource center for educators began to document “lessons learned” from their
experiences. In addition, a thorough literature review was conducted to validate these
lessons and identify additional lessons. Online course developers, facilitators, and
participants were surveyed to validate the lessons and to add additional ones. The result
is a document, available in both hard copy and online, which delineates over 200 lessons
learned in online staff development from three different perspectives.

Introduction

At a time when teachers face growing needs for ongoing professional development, online courses
and components, delivered via the World Wide Web, are becoming increasingly popular. Individuals,
institutions and commercial organizations are developing online staff development courses and lessons in
order to effect more timely and, hopefully, less expensive training. Proponents see online learning as a
potential solution to all training needs; opponents see it as less effective than face to face instruction.
Meanwhile, course developers and staff development offices are looking for guidelines and ideas to make
the most of this potentially exciting opportunity for leveraging existing resources, utilizing technology
effectively and meeting the increasing demands of educators for updating and training.

While research findings are just beginning to make their way into the literature, a great deal is being written
about distance learning, online training and “eLearning” for both K-12 students and their teachers.
Participants are
learning from online components, as are online instructors, those charged with facilitating the learning
experiences and developers, those who design the instruction. We can learn a great deal from these
“pioneers.”

Background for the Project

The Florida Instructional Technology Resource Center (ITRC) at the University of Central Florida
has been supporting educators statewide for 18 years. Recent efforts by the ITRC have focused on web-
based tools and staff development. The ITRC staff has developed online staff development components to
assist teachers in several different areas: learning to integrate the Internet into the classroom, school library
automation, online learning, and web-based tools for teachers. As a result of developing and offering these
components, the ITRC staff has learned a great deal about what leads to successful online teaching and
learning in the context of staff development for professional educators. A review of the literature and a
survey of participants from a variety of online staff development programs resulted in a document that
compiles these “lessons learned” in online staff development for professional educators. The document,
available in hard copy and online in HTML and PDF, examines online learning from three different perspectives:

---From course developers: Those who are responsible for the creation of the course or component. They are responsible for choosing appropriate online activities, sequences, strategies and resources to match content and desired learning outcomes.

---From course facilitators (or instructors): Those who are responsible for the day-to-day monitoring of the course, providing expertise in the course content as well as technical assistance and feedback on participants' progress. The facilitator may also be responsible for revising activities and lessons based on assessment data and participant input. (The course developer may also be the facilitator, but this is not always the case.)

---From course participants: The learners in online courses or components; in this case, participants are educators who have taken a course or component as part of their inservice training or for their own professional development.

The Document

These “lessons” have been gleaned from a thorough review of the literature—examining both print and web-based documents, which are listed in the “sources” section of the document. Additionally, a survey instrument presenting a draft of the “lessons” was emailed to over 200 developers, facilitators/instructors, and participants who reviewed, validated and critiqued the lessons and/or contributed additional lessons from their own expertise and experiences.

The document includes: 92 Lessons Learned from Developers: These are grouped by category: Planning; Contact and Support; Online Community; Content; Format; and Miscellaneous; 53 Lessons Learned from Facilitators: These include lessons learned about Contact and Support; Online Community; and Miscellaneous; and 70 Lessons Learned from Participants: These include lessons about Pre-requisites; Course/Time Management; Communication; Online Community; Attitude; and Taking the Course.

A comprehensive reference/resource section and a listing of survey participants is also provided in the document. Online Staff Development: Lessons Learned can be viewed at http://www.itrc.ucf.edu/LL and free single copies can be ordered from that site as long as supplies last.

Conclusion

As we move toward more “anytime, anyplace” staff development, we would be well advised to take advantage of new technologies, research and lessons learned along the way. While not all “lessons” listed in this document apply to all courses or components, educators involved—or contemplating involvement—in any way in online staff development should consider each lesson.

As all educators know, “learning never ends.” Now, through online staff development, there are more and more opportunities for educators themselves to continue to learn and to grow not only as participants, but as course designers and facilitators.

Acknowledgements

The authors wish to acknowledge the support of the Florida Department of Education, Bureau of Educational Technology and the School Board of Monroe County Florida, the findings of those who are conducting research and publishing in this area, and the contributions of online staff development “pioneers,” including survey participants listed in the document and those who chose to remain anonymous.
A Hybrid Online Course to Enhance Technology Competencies of School Principals

Sally R. Beisser, Ph.D.
Drake University School of Education
Des Moines, Iowa USA
sally.beisser@drake.edu

Peggy E. Steinbronn, Ed.S.
Drake University
Des Moines, Iowa USA
peggy.steinbronn@drake.edu

Abstract: Administrative leaders do not necessarily perceive themselves as leaders in technology in schools. Educational administration graduate students in this study acknowledged that their computer skills were often surpassed by their own faculty, staff, or students. This paper describes an online graduate level course for future administrators, “Principles of Curriculum” (EDUC 276), taught at Drake University. The course was developed with on-campus face-to-face classroom meetings to build future administrator’s skills and confidence followed by completion of the course using online web based instruction. Results suggest that administrators who completed the hybrid online course report lack of technology proficiency, have greater willingness to engage in distance learning, and provide technology leadership and support for teachers.

Administrative Leadership in Technology

Exemplary computer-using teachers differ from other teachers in a variety of ways. They teach in an exemplary instructional environment of collegiality and social networking where there is school support for technology. These teachers have strong academic backgrounds and are employed in schools with adequate financial resources and relatively small class sizes (Becker, 1994). Other factors include relevant staff development, on-site computer coordination, and technical assistance. However, a key participant in making these decisions is the building principal.

Today, prevailing views of leadership suggest that the principal's role should not be to direct others but to create a school culture in which decisions are made collaboratively. "Facilitative" leadership exercises power through others, not over them (Conley & Goldman, 1994). However, this leadership style emphasizes organizational culture, thus creating a dilemma for school leaders who wish to build technology-using teachers in their schools. On the one hand, school administrators have long realized that quality schools use technology effectively (Dwyer, 1994; Sivin-Kachala, Bialo & Langford, 1997; Kosakowski, 1998; Technology Counts, 2000). They know that technology-using teachers need technology training and support (Becker, 1994). On the other hand, building principals may lack technological skills themselves in order to provide facilitative leadership in making decisions to support staff development, computer coordination, and technical assistance.

Factors influencing the success of technology-rich schools include administrative support in the form of funding, restructuring schedules, physical space, and curriculum decisions to reflect a new learning environment (Glenna & Melmed, 1996; Technology Counts, 2000). However, administrators in this study report that they need adequate skill development themselves in order to provide facilitative leadership in funded efforts, space and scheduling, and curriculum design to build or lead a technology-rich school.

Educational institutions have clearly recognized the need to prepare preservice and inservice teachers to make technology an integral part of their teaching and learning environments (Thompson, Schmidt, & Hadjiyianni, 1995; Davis, Kirkman, Tearle, Taylor, Wright, 1996; Pelligrino & Altman, 1997; Davis, 1998; Stuhlman, 1998; Strudler & Wetzel, 1999). Yet many school administrators seem to lag in their competencies and confidence in using computer technology for purposes beyond e-mail communication and word-processing capabilities. The “hybrid online
"course" was especially designed for educational administration graduate students at Drake University. It gave future principals an opportunity to develop their technology skills with a common goal to complete one-third of the course online, as well as to consider ways to support effective use of technology in their roles as school administrators.

Background of Web Course Development at Drake University

Drake University's web program, formerly called "Virtual University," began in 1997 with 12 online courses enrolling 149 students with 359 credit hours. This faculty driven web program operated on a budget with no funding for training and support. Faculty who participated did so because they were professionally interested in creating a web presence for the university in order to engage students in online learning. A "Director of Web Education" was appointed the following year. A faculty program called "Academic Computing Fellow, was also instituted. This program gives two faculty members the opportunity to give support to other web faculty, as well as to learn, create, and experiment with some of the more advanced technology features of web education.

In January 2000, an Internet System's Manager position was created to provide technical, pedagogical, and other training support for faculty. Workshops provided hands-on training to learn web software, principles of web design, and elements of effective online teaching and learning.

Faculty workshops provided instruction for interested participants to use WebCourse in a Box™, a commercial software for developing online courses. Academic Computing Fellows assist in this effort and provide one-on-one mentoring for faculty new to the online teaching environment. As web courses go "live" students enrolled in web courses also receive technical support from the Internet System's Manager when necessary.

Enrollment in the web program continues to increase. Currently Drake University offers 65 web-based course for a population of 5200 undergraduate and graduate students. This year 624 students took advantage of web-based learning opportunities.

*Note: Actual enrollment of 624 students resulted in 817 registrants because some students enrolled in more than one web course.

Elements of Successful Online Education Courses

Research studies indicate that online learning environments constitute additional space in which people can learn, teach, communicate, work, trade, and spend leisure time (Harris, 1998; Somekh & Davis, 1999; Picciano, 2001). Educators are well aware of the potential of web technology, have adopted it for creating new learning environments, and have harnessed its power for relevant educational uses (Mioduser, Nachmias, Lahav & Oren; 2000). For example, key features of web-supported courses include the sophisticated manipulation of information. Students generate, transmit, store, process, and retrieve information from online libraries, databases, journals, virtual museums, and other Internet repositories of information. The web also serves as a communication facilitator for e-mail, group conferencing, and threaded discussions enabling peers, instructors, and experts to collaborate. The web is a creation environment to allow students to generate and publish their own research or websites with minimal technical assistance. Finally, the web serves as an instructional delivery medium to disperse intellectual material, connect to relevant URLs, and assess student understanding through quizzes and feedback analysis.

Key Features in Developing “Principles of Curriculum” Online at Drake University

The hybrid online course, “Principles of Curriculum” used these key features in the development of the course. Specifically, educational administration students manipulated information in order to search ERIC databases, ERIC Digests, OERI Research Syntheses, and selected websites through WebCourse in a Box™ hotlinks in order to write...
required research papers. Students read books on educational issues or topics of interest. Following an analysis of
their book, the assigned research paper provided a critique of the ways in which this author’s work or point of view
impacted their role as an administrator.

Communication was facilitated as students e-mailed one other and the course instructor using "Learning Links"
featured in WebCourse in a Box™. Students also communicated with three others to provide critical feedback on
their research papers. Class members had access to all posted research papers. One graduate student remarked, “I
had three times the feedback on my work. Comments were very insightful.” Another student in the class exclaimed,
“In three years of grad school, I have never had an opportunity to read someone’s research paper, thus being able to
learn from their thinking and writing.” Threaded discussions through the use of a forum were available to all class
members. Access to course research and discussion was restricted to enrollees.

The online course provided a creation environment as educational administration students “uplinked” their research
papers in the WebCourse in a Box™ student portfolio section. Practice time in the computer lab was provided
during the on-campus portion of the course. Students were required to electronically publish their own research
work, as well as access the work of their classmates. Four members built websites to share their research while
others added resumes to their electronic portfolios.

In order to promote the delivery medium function of the online course, there were intellectual interactions with the
assigned text readings on curriculum theory, educational theorists, and curriculum design. Students connected to
relevant curriculum URLs, had a chance to respond to the textbook author’s interactive website, completed quiz
questions on the web, check their grades, and provided online feedback to the instructor. Interestingly, because the
course feedback was requested online, the grad students referred to the technology components of the course. Their
responses were favorable and encouraging. One student said, “I had three times the feedback on my work. Comments were very insightful.” Another student in the class exclaimed, “In three years of grad school, I have never had an opportunity to read someone’s research paper, thus being able to learn from their thinking and writing.” Threaded discussions through the use of a forum were available to all class members. Access to course research and discussion was restricted to enrollees.

Online learning meets the needs of adult learners (Imel, 1998; Collis, Winnips, Moonen; 2000; Johnson, Aragon,
Shaik, Palma-Rivas, 2000). It is an approach for integrating technology into adult learning. It helps students
consider how technology can be used to support and expand learning in their role as a school administrator. Not
only did the adults learn content through technology, they also learned about the technology itself. One student said,
“At first, I was not thrilled to take the last block of instruction through the Internet. But, now I am now sold on it.”

Specific to the hybrid course was the use of web-based courseware as more than an electronic syllabus. The web-
based software was used to communicate announcements of encouragement, reminders of due dates, and trouble-
shooting suggestions from other students who had solved specific problems relating to the technology.

Because most students did not have prior online course experience, class was held in the computer lab during the
on-campus sessions. Working together initially helped build skills in a sequential, developmental process. Skills and
strategies for solving problems were acquired gradually and in stages that were more or less predictable (Hilgard &
Bower, 1974). Effective teaching must involve a sensitive assessment of the individual’s status in the learning
process, as well as a presentation of problems that slightly exceed the level already mastered. Tasks must be neither
too easy nor too difficult to understand. Hunt (1961) describes this as the “problem of the match” based on the
principle that learning occurs only when there is an appropriate match between the circumstances that the learner
encounters and the schemata already assimilated into his repertoire. Technical assistance, provided by the Drake
University Internet System’s Manager, was critical in teaching appropriate skills and troubleshooting.

Technical support issues impact the success of an online experience. The learner’s confidence and comfort level
with the technology was enhanced when direct online instruction occurred prior to the online portion of the
Principles of Curriculum graduate course. Besides direct instruction by the Internet System’s Manager, hard copies
of directions that included screen shots taken directly from the web course software was provided to the students.
Students were given time to practice the various components of online interaction during the instructional time. This
included posting to the forum, replying to someone else’s post, uploading files, and submitting assignments and
adding information to an online portfolio. Students were encouraged to log onto the course to ensure that technical
difficulties could and would be kept to a minimum and/or eliminated prior to the online weekend. They were also
encouraged to contact the Internet System’s Manager to help smooth out any technical difficulties that might arise.
Technical online support web pages linked to the course software, as well as a "Request for Technical Support"
form was demonstrated for the students. Phone calls and/or email requests for technical help were encouraged to help the students successfully meet the course requirements during the final, online weekend of the course.

Features of the Drake Hybrid Online Course for Administrators

Student feedback revealed that the features of the online class that were particularly meaningful included:

- Building electronic portfolios
- Participating in threaded discussions regarding their research papers via the Research Forum.
- Strengthening their research skills.
- Completing one third of the course at a time and pace that was convenient for adult learners.
- Exploring technological resources and representing information in electronic forms.
- Becoming more confident and aware of what their computers can do in teaching and learning.
- Communicating effectively about complex processes (research and trouble-shooting).
- Becoming independent learners through their online experience, yet helping each other spontaneously and willingly in collaboratively ways.
- Increasing research and writing skills from exposure to quality work of others.
- Better problem solving and critical thinking skills utilizing technology

Conclusions:

In reality most educational administrative preparation programs lack sufficient technology instruction or support in using technology for administrators to assume new leadership roles. Many principals lack the necessary proficiencies to provide leadership and support to their faculty and staff members. Encouraging principals to use technology in teaching and learning is possible using effective strategies and shared experiences such as a hybrid online course designed to enhance technological competencies.

As Harrington (1991) suggests, there is a difference between preparing teachers to use technology and using technology to prepare teachers. If we only prepare teachers to use technology we limit the conception of the role of technology in education. Administrators, too, must be empowered to take more responsibility for both acquiring technological competencies and to facilitate technology usage and capabilities of teachers and students through effective leadership.

Abstract: Discussion of the value of Web-Based Learning System (WBLS) takes place at two levels, the theoretical and the practical. The practical value of a WBLS depends on numerous factors including: extent of course enhancement, degree of dependence on web-based technologies, the software platform, technology support, students skills, and institutional issues. At the theoretical level the debate on the value of a WBLS occurs both within the discipline as well as within academia itself. This report examines our experience with a WBLS in the context of a new integrated studies course.

We teach at the University of Wisconsin-Waukesha, a two-year transfer institution within the University of Wisconsin System. It is a commuter campus without residence halls. Most of our students work at least twenty hours a week. Over half of our students are from the lower quartiles. Faculty at our institution typically teach 12-credit hours each semester and in addition they are expected to contribute in a variety of ways outside of the classroom, i.e., student advising, committee service, and professional activity.

The institution provides office computers, network access and a web-based learning system (WBLS) for its faculty. While significant dollars are targeted toward the development of on-line, asynchronous courses, there few institutional resources allocated for web-enhanced courses. This despite the fact that the faculty is expected to develop and support web-based activities for their courses in addition to their other professional and pedagogical responsibilities, i.e., "six days and seven nights in the basement."

Furthermore, instructors on our campus have little technological support. For example, our computer center staff is unable to assist either instructors or students having problems with a WBLS or other instructional technologies. Technology assistance is the responsibility of a limited-term employee, who is a half-time student at another campus. Needless to say, much of time the instructor is left to his or her own ingenuity to figure out the solutions to technical problems. These problems range from helping students login to the system, to discovering why the colors they have chosen for their personal web pages look different when they view them at home. The upshot is that at the beginning of the semester we devote many hours to wrestling with these problems while at the same time trying to prepare for and teach the course itself.

Currently, there is really little merit recognition for including web-based activities into our courses. Rather, it is largely a matter of instructor choice. And that choice may be driven more by institutional priorities than by compelling research demonstrating the soundness and efficacy of web-based pedagogies. Although there is ample evidence that students "like" web-based experiences, important questions about the educational value of such experiences remain unanswered. Does more technology mean better pedagogy? Just because we can now put materials on the web and provide virtual discussion forums for our students, should we? The problem is we simply do not know. It seems that such questions ultimately focus on resource deployment. When much of what we do or do not do is driven by enrollment, it is important to determine how to allocate limited dollars. Do we invest in
technological infrastructure, while encouraging the deployment of web-enhanced, hybrid, and asynchronous courses? Or do we support opportunities for greater student-faculty contact, smaller classes, and first-rate teachers. Obviously these choices are not mutually exclusive, but the tension they engender is very real and it has implications for our future as an institution as well as for our students.

A primary motivation for integrating a WBLS into courses is course enhancement. There are several ways instructional technologies can enhance a course. Clearly they encourage interpersonal communication. Discussion forums, group activities and email permit asynchronous exchanges to occur. Student and faculty home pages help in getting to know something about each other. In the absence of opportunities for face-to-face interaction a WBLS can help to foster communication among students and faculty.

However, our aim in using the web is not communication for communication’s sake. Rather we want our students to present clear, coherent, and consistent arguments. We seek to accomplish this in three ways. First, we try to be role models. We provide examples of the kind of analysis we expect. Whether we are presenting our own views or discussing the views of another philosopher or psychologist we emphasize the importance of justifying our conclusions. We provide hypertext links to sites that exemplify empirically based and logically sound arguments. Second, we ask students to evaluate each other’s arguments. And third, we take the arguments presented on the course web site back into our classes to stimulate discussion. This is especially helpful where we have students who don’t say much in class. We use their web comments to get them involved in the face-to-face discussion. The technologies used in our courses also enable us to demonstrate the richness of resources available on the web. Not only do we provide supplementary course materials but external links as well. As we discuss each main topic we provide students with a set of hypertext links that elaborate on the issues. Often the links are directly to the authors who write the articles or to discussion groups currently analyzing the concepts and arguments. Along with web discussions we also present self-check quizzes. The quizzes receive a fair amount of attention. Students will often have follow-up questions about their answers. Thus web-based instruction not only aids in teaching our courses but enables us to tutor the course as well.

Web-enhanced courses present unique involvement challenges. It is difficult to motivate student to participate in web projects without grade inducements. We have offered courses that have included web components where the web work was not required for the class grade. While there was initial interest, the web activity dwindled as the semester progressed. In fact, according to class surveys, one of the student’s greatest concerns about web work is the time it takes. Since most of our students have jobs and many have family obligations, they must carefully budget their time. When we first integrated web work into an interdisciplinary course, we received a lot of student complaints about what they perceived as excessive work. In response to these concerns we have since cut down on the web requirements.

In large classes it takes a fair amount of time to read, record, and respond to the answers to discussion questions. We estimate that in addition the start-up time, web work adds about one hour each day per class. In order to track students’ responses to their web experiences we conduct continuous student evaluations throughout the semester. We ask students to keep logs as well as having them fill out questionnaires. The tracking information is very useful in spotting problems, making mid-course corrections, and insuring that our web demands are not excessive.

There are a wide-range of philosophy and psychology courses at all academic levels now offered on-line. Additionally, there are electronic journals, articles, papers, opinions, and discussion forums on the web. Our professions have certainly embraced the web as a vehicle for exchanging information. The sheer quantity of information is overwhelming and often this makes it difficult to find a useful signal in what sometimes seems little more than a sea of random noise. Within the disciplines there is debate over the advantages and disadvantages of web v face-to-face instruction. Do on-line courses tend to negate the dynamic interaction needed to teach philosophy and psychology? Would Socrates ever teach an on-line course? Can one “deliver” instruction as if it were a pizza? Are courses that are taught on-line better than no courses at all? Fortunately value-added or web-enhanced courses need not answer these questions, although they beg for answers. Instead, we believe that we have the best of both worlds. We interact in-person with our students. Also we exchange ideas with our students over the web. We can take advantage of the richness of information that the Internet makes available, while preserving and celebrating the face-to-face interaction of the classroom. Most of our students are not well adapted to the demands of independent study. For them and for us as well, value added learning technologies provide another means for reinforcing and enriching in-class instruction.
Using Constructionist Principals In Designing And Integrating Online Collaborative Interactions

Abstract: This paper describes a study that took an action research approach to investigate learners' experience using CMC to engage in a collaborative project in an online learning environment. Communication messages were archived for analysis and a post-questionnaire was administered to provide feedback on the students' experience with the project. Findings from the study were then used by faculty at Northern Arizona University (NAU), a small institution that serves mostly rural students in Arizona, to design and implement one of the foundational web-based courses in their online Master's of Education in Educational Technology degree. The course design for ETC 567: Technology, Society, and Education was based on findings from the described study investigating online collaborative interactions and founded on constructionist principals to enhance learner interaction through collaborative writing projects in the online learning environment. Furthermore this paper provides examples for practitioners desiring to integrate collaborative projects in online learning environments.

Introduction

In the 1960's, Seymour Papert and colleagues initiated a research project on how children think and learn and to develop educational approaches and technological tools to help those children learn. From this beginning has evolved a theoretical foundation, which has become known as constructionism. The term constructionism, first coined by Papert (1991), involves two main tenets. First, it affirms the constructivists view of learning and asserts that knowledge is not simply transmitted from teacher to student, but actively constructed by the mind of the learner (Kafai and Resnick, 1996). To this constructionism adds the idea that people construct new knowledge with particular effectiveness when they are engaged in constructing personally meaningful products (Bruckman & Resnick, 1996). Thus constructionism involves two intertwined types of construction: the construction of knowledge in the context of building personally meaningful products (Kafai and Resnick, 1996). It is through this avenue of "constructing" that technology can be integrated into the instructional process such that it promotes teachers to teach from a constructivist model.

Moore (1989) described interaction within distance education as that interaction between a) the learner and the content, b) the learner and the instructor, and c) the learner with other learners, and suggested that it is most desirable to incorporate all three types into instruction. Interaction between these shareholders permits sharing of ideas, concepts and valuable feedback. Hillman, Willis, & Gunawardena (1994) suggest that learners also interact with the instructional interface – the technology.

In today's distance learning environments Computer Mediated Communication (CMC) becomes the venue or vehicle where the social construction of knowledge (Vygotsky, 1978) occurs for learners to build their understandings through their communication, social interactions and collaborations. CMC supports collaboration among learners, instructors (experts), content, media, and writing/composition (Misanchuk, Morrison, and Peterson, 1997; Sproull and Kiesler, 1991; Seagren and Watwood, 1997; Gunawardena, Lowe, and Anderson, 1998; Jonassen, 1996; Moore and Kearsley, 1996; and Harasim, 1996). The learning and interaction that occur in environments that employ CMC encourage collaboration and teamwork and require
active rather than passive participation.

The Study

An action research study was conducted with fifty-seven graduate students from two different sections of the same course taught by two instructors who team-taught both sections at a large southwestern university. The study included one traditional face-to-face section that met once a week in a computer lab and another section that was televised over an Interactive Instructional Television system (IITV). To enhance these students' learning experience and increase peer to peer interaction, the sections were taught as one class and all students were required to interact with one another via Soft Arc's First Class® computer conferencing system in both asynchronous and synchronous sessions. In addition, the First Class® venue was used as a location to upload assignments and other documents for the collaborative assignment. Furthermore, students were given a collaborative project where they would use CMC and First Class® to organize and communicate on their common task.

Anecdotal data were collected via the First Class® conferencing system in the form of a discussion of the collaborative project. Students were also asked to respond to a questionnaire and then reply to their peers' responses. The questionnaire was designed to elicit basic information about their experience and asked for general comments for making the assignment better.

Findings

The results from this study indicated that these individuals successfully used CMC for this student collaboration project. Overall students reported in greater numbers that the experience was better than they expected. However, as in all classroom collaborations, this activity did have some difficulties that arose to flavor the students' experience. While students generally reported that it was better than expected and overall a positive experience, they also made suggestions that they felt would have made it a better experience. Those suggestions included some very specific changes.

Overall students reported in greater numbers that the experience was better than they expected.

Table 1. Questionnaire Results

Positive comments included:

- "It was actually better than I expected. The hardest part was our first chat. After that it flew. I expected a lot more communication problems and we actually only had one. I also had a very good group. I have had so many projects where group members did not pull their weight."

- "Our group (The Red Team from Group 3) had a good time doing our web pages! We didn't have any serious topics in mind so we had a little fun! The experience was better than I expected. Since this was an on-line collaborative effort, I thought we were going to have trouble communicating, but we didn't!"

- "What I liked most about the project, and about my group, was our helping each other out. Sometimes one of us knew something and other times the other group members figured things out. We worked really well together. We weren't trying to outdo each other's pages."
Though my group experienced a few glitches, I feel working on the group project collaboratively online was very interesting. It turned out better than I expected. I thought it would be very difficult to get things organized. The members of the group were at different levels of watching the class, and on downloading and understanding the workings of Claris Home Page. This is why I thought it would have been difficult. It did not turn out being as hard as I had expected."

Negative comments included:

"My experience with the online collaborative activity didn't go as well as I would have liked it to. I moved house in between all of the collaboration and had a lot of other work to do with my other classes. To top it all off, something went wrong with my computer and I had to get it fixed. By the time I got in contact with my group, everything had been decided for me as far as what page I would do and the subject which I knew nothing about. So I had to scramble for ideas and research the web for images etc... and get it all done by the due date. Needless to say, there was nothing that I liked about this activity. It was hard to connect our ideas (for me) without using the telephone because of the time element involved. It would have been better if we were given a list of phone numbers at the start so that I could have at least gotten to talk with my group members as to what all of our duties would be and a topic that was agreeable with all. Another suggestion would be to have a sign in place where people could choose to be in a certain group and talk/meet/chat at a common time. It's hard to collaborate when there is a missing link."

"It was worse than I expected simply because of the technical problems I encountered on my end. But though it all I learned something I could use."

"It turned out worse than expected, due to delays in getting input from team members, and a team member missing from the organizing chat. Most of our team's difficulties were from outside sources. We didn't have a lot of technical problems because I already have some web page construction knowledge. But we were delayed one day when the teammate who was supposed to be designing the colors, college name, etc. could not get one of the ASU computers to work. So better, quicker help for her would have made it better for the team."

"I found the online collaborative activity to be frustrating. Perhaps because it was my first attempt. It was worse than I expected. We had a hard time getting together and communicating. It was helpful however to know someone else was as frustrated as I was and we did figure out how to solve some of our technical problems. I'm not sure what could have made our experience better. Each one of us was at a different skill level and that made it hard. This wasn't anyone's fault - it just increased the anxiety and frustration level. I think group projects via distance learning can work - I think it takes practice, patience, consideration and commitment. I would not be opposed to doing another group project in this manner."

Interestingly, many indicated that they were surprised that some expected difficulties did not occur and that unexpected difficulties did occur. For example one student commented,

"I think the group project was better than I expected. My fear was that one or several students in the group and team would not be able to meet to chat due to excuses, meaning that the assignments may not be thoroughly completed. However, I am happy to report that my group and team had no problem at all chatting and coordinating our ideas, though there ultimately was a little problem linking one of the pages to the other two. On the other hand, I guess that I may have bee fortunate by being placed in a group with "serious" students since I heard of others who were less fortunate and could not complete the assignment on time nor chat at the scheduled chat times."

Another student commented,
"The group project was neither better nor worse – I’ve learned not to predict in this class. I was surprised at what was easy and what was hard. I thought it would be really hard to link the three pages, and it was easy. The problem was that two of us had problems getting our images uploaded – I thought it would be automatic. Constructing the web page itself was very easy."

Course Design

Based upon the findings from the study, a re-design of ETC 567: Technology, Society, and Education was conducted and is being taught implementing many of the recommendations from this study and based upon constructionist principals where students interact and construct meaningful products. Two different types of very structured online interactive collaborations were set up to foster better groups, greater support, and leadership. Using both synchronous and asynchronous CMC systems provided learners with several venues for interaction. First, a Homework Network was devised and scheduled which groups students into rotating teams of three for specific peer evaluation of reaction papers written in response to weekly reading assignments. Second, semester-long Discussion Groups were formed in teams of three.

The Homework Network

The Homework Network is designed to provide a way of interacting with course topics, readings, and other members of the class in the online environment. The objective of the Homework Network is for each individual student to complete the assigned readings, create a one-page reaction paper on the assigned "Topics of Discussion" based on the readings and personal knowledge, and share this paper with the members of their network.

Students complete 6 Homework Networks through out the course and are given a grouping assignment at the beginning of each. Once Homework Networks are assigned, they are instructed to establish email contact with the others in their network as soon as possible. They then write and email a copy of their reaction paper to the other two members of their Homework Network as well as their instructor. Once they receive their peers' papers, they read and rate the paper using a rubric (see Table 2.) and email the rating to the instructor.

</tbody>
</table>

Table 2. Grading Rubric

The Discussion Group

The Discussion Group is a semester-long team with each member having a very specific role. The roles will rotate after each assignment so that each person completes each role by the end of the semester. The roles have been designed to provide structured leadership and include: a) Presenter, b) Team Leader, and c) Observer/Commenter.

The Presenter

During the semester, the instructor will present three "condition of the world" topics of discussion based on the readings for the course and the group discussions. The Presenter will examine the topic of discussion and from that determine a specific direction that the group will pursue. The Presenter can ask for input from the group if they wish. Based upon the direction of thought, the Presenter begins a Threaded Discussion by posting a question for discussion on the Discussion Board.
Each member of the team will be required to post two substantive responses each week to the question posted by the Presenter. The Presenter then facilitates the discussion. If new threads of discussion are to be begun, the Presenter must begin them. Other members can suggest new threads but it is the responsibility of the Presenter to post them.

**The Team Leader**

The role of the Team Leader is to take the responsibility for leading the cooperative group to produce a 3 to 5 page position paper on the topic of discussion (assigned by the instructor). Through cooperative effort directed by the Team Leader, the Discussion Group uses the Virtual Chat "whiteboard" to facilitate the creation of the position. The paper should be based upon the threaded discussions of the Group Discussion Board and the discussions in Chat. The Team Leader then takes the suggested changes and creates a final document, which he or she emails to the Instructor. The Team Leader also evaluates the performance of EACH member of the group but NOT themselves.

**The Observer/Commentator**

(Note: In groups that might have 4 members these roles can be separated. If there are only 3 in the group then both roles will be completed by one individual).

The role of The Commentator is to facilitate the Virtual Chat. Upon the completion of the Chat conference, the Commentator is to write a summary of the discussion, and email the document to the instructor.

The role of The Observer is to write a reflection and email it to the instructor on the group dynamics that occurred during the creation of the position paper. The reflection is to discuss what went well and areas of difficulty in creating the product. In the reaction, they are also to comment on the participation of each member, and use the evaluation rubric above to evaluate the performance of the Team Leader.

**Summary**

As web-based courses and degree programs continue to be developed at an increasingly rapid pace, the literature suggests that practitioners design develop learning environments that foster learner interaction and collaboration. The faculty at Northern Arizona University's Educational Technology department strive to do so; providing a learning experience that is rich with interaction and that is based upon constructivist learning theory. The foundational course ETC 567: Technology, Society, and Education provides these graduate Educational Technology students with the opportunity to begin their M.Ed program by using constructionist principals in designing and integrating online collaborative interactions.

Abstract: This article reviews the literature on cognitive/learning styles and how these learning styles can impact the design, implementation and instructional strategies used in the distance education environment. Several cognitive/learning styles have been examined over the years within the educational realm, but few of these cognitive/learning styles have been taken into account in the distance education environment. Several cognitive/learning styles are reviewed and the implications of these cognitive/learning styles are examined in the context of distance education. Without acknowledgment of the differences between students and incorporating these differences into the presentation of materials, evaluation and feedback we may be providing less efficient learning environments for students. As technology continues to change it is imperative that we as educators taken into account the many differences that students bring to the educational environment. This appears to be even more important in the distance education environment as the diversity of students appears to be larger then within the traditional educational environment.

Introduction

As technology and computers continue to infiltrate our schools and institutes of higher education, research and theory is suggesting that these technologies can go a long way in creating complex and rich learning environments (Freedman & Liu, 1996). The use of these new technologies has lead to an explosion in distance education through various mediums (compressed video and Internet courses). With this rapid move toward the use of distance education, researchers and theorist's alike have not had the opportunity to examine the effects of these new technologies and how best to implement them for maximal student performance. Only by examining these variables can we effectively design and implement distance education that will lead to maximal learning and performance. Distance education may not be for everyone. Not all faculty members are suited for the varied modes of teaching, nor are all students appropriate for attempting the various forms of distance learning. It would appear that to obtain the highest quality teaching and learning from a distance, consideration of theoretical perspectives, subject content, learning context and learner characteristics need to be considered. In traditional education many aspects of the learner, learning environment and the interaction...
between the two has been examined. This has not been the case for distance education. This article reviews the research on learning styles (cognitive styles) and how they may interact in the distance education environment. Finally, recommendations are made on how to best implement distance education to meet the unique needs of students with different learning or cognitive styles.

Cognitive/Learning Styles

Research over the years has indicated consistently that people exhibit individual differences in the processing of information and problem-solving. The construct of cognitive styles was originally proposed by Allport (1937) and has been refined and further expanded by several others (Messick, 1976; Smith, 1984; & Tennant, 1988). Based on the various definitions that have been proposed, cognitive/learning styles refer to an individual’s characteristic and consistent predisposition of perceiving, organizing, processing, and problem solving. Typically, learning styles involve four basic steps of information processing. These four steps include: 1) data collection or gathering information; 2) relating information to current knowledge; 3) analyzing logical connections between concept possibilities and consequences of actions; and 4) evaluating the outcomes. Over the years different researchers have focused on different aspects of cognitive/learning styles including: a) cognitive complexity vs. cognitive simplicity; b) field dependence vs. field independence; c) impulsive vs. reflectivity; d) organizer vs. non-organizer; e) scanning vs. focusing; f) simultaneous vs. successive; and g) holist vs. serialist. Taken together, all of these styles have implications for the learner and instructor as they will interact in the learning and produce a variety of results depending on factors such as, material presentation, method of instruction, format of evaluations and feedback.

In general, most researchers tend to use cognitive styles and learning styles interchangeably, which will be done in the remainder of this article. Cognitive/learning styles have been viewed in three major respects: structure, process, or both structure and process (Tennant, 1988). Additionally, Ausburn and Ausburn (1978) have proposed that cognitive/learning styles are characterized by three important properties: generality and stability across tasks and over time, independence of cognitive/learning styles from traditional measures of general ability, and finally the relationship between cognitive/learning styles and specific abilities, characteristics, and learning tasks. At this point it appears that a brief review of some of the more pertinent cognitive/learning styles is warranted. These will include field independence-dependence, holist-analytic, Verbal-Imagery, and sensory preferences.

Field Independence vs. Field Dependence

Witkin (1979) defined field independence-dependence as value-neutral and is the ability to distinguish key elements from a distracting environment. Research on field independence-dependence has found that field independent individuals are more autonomous in the development of cognitive restructuring skills, while field dependent individuals tend to be more autonomous in developing interpersonal skills. Additionally, other research has shown that field independent people tend to be more intrinsically motivated, enjoying individual learning, while field dependent people like cooperative learning and appear to be externally motivated. Additionally, research has demonstrated that field independent individuals tend to be analogical problem solvers, as well as perform better in situations that require parallel processing, while field dependent individuals tend to perform better in serial processing conditions and are non-analogical problem solvers. It should also be noted that some gender differences have been found in this dimension of cognitive styles, with males being more field independent and females being more field dependent (Antonietti & Gioletta, 1995). As can be seen the interaction of the field independence-dependence dimension would have some major implications for the presentation of material and how individuals may learn the material.

Holist-Analytic

Within the holist-analytic distinction, holists tend to view a situation as a whole, while analytics view situations as composed of parts and tend to focus on only one or two aspects. This dimension of cognitive/learning styles is not an all or nothing proposition, and many people fall in the middle and can switch
between the two modes and thus, have the benefits of both. In general, holists are able to more easily see the whole picture and draw conclusions between large pieces of information. In contrast, analytics may have difficulties in seeing the whole picture due to their proclivity to focus on parts. However, there are advantages to being a analytics, as they are able to break the whole into parts and see the interconnections between the parts that make the whole. Clearly, each of these styles has implications for the presentation of material in the distance education classroom and how individuals may learn the material.

Verbal-Imagery

Verbal-imagery style refers to how individuals represent information in their internal mental apparatus. Verbal individuals tend to represent information during thinking in a verbal format, while imagers tend to represent information while they are thinking in terms of visual images. Individuals have related both of these forms of representing information in the internal mental apparatus to various forms of material presentation and subsequent learning. Generally, imagers tend to learn best from pictorial presentations, while verbalisers learn best from verbal presentation. Additionally, due to the nature of the processing of information, imagers recall highly descriptive text more efficiently than verbalisers as they are able to produce highly complex and rich images, which aid in memory formation. Based on this, it would appear that individuals would learn best when information is presented in a mode that allows them to take advantage of their preferred mode of mentally representing information. This would tend to make sense as individuals are more efficient with the use of their preferred mode and can make more connections with other material that has been encoded into their mental apparatus via their preferred mode.

Sensory Preference

A sensory modality is a biological system that interacts with the environment through one of the basic senses to take information into the organism for further processing. The major sensory modalities are auditory, visual, tactile, or some combination of these. Dunn and Dunn (1979) found that roughly 30% of American students are auditory, 40% are visual and 30% are tactile and the remainder is some combination of the three. Each of these modes of taking information into the organism has implications for learning and performance. Research has indicated that visual processes may be incompatible with abstract thinking and thus, information that relies totally on visual information and processing may interfere with abstract thinking. Other research has demonstrated some gender differences in sensory preferences, with females being more verbally oriented and males being more visual oriented.

Taken together, cognitive/learning styles have implications for the delivery of instructions to students in both the traditional and new distance education formats. One approach will not work, as each student brings his/her own style to learning, and as educators we need to tailor our instructional strategies and modes of delivery to meet the needs of students. In the traditional classroom, with an instructor present, the instructor can alter how he/she interacts with each student to help meet the learning style of the student and promote maximal performance. In distance education it may be impossible to meet the unique learning style of each student, due to technological drawbacks and other factors related to the use of technology. However, we believe that by being aware of cognitive/learning styles of students, distance educators can more accurately design distance education opportunities to make them the most useful for a variety of students.

Characteristics of Distance Education

Distance education is emerging as viable force in the education of individuals that appears to be gaining in popularity. The growth in distance education appears to be related to the demand for education and training from a wide variety of individuals and groups, which normally would not have access to education through any other means. The primary characteristic that distinguishes distance education from other forms of education is the separation of student from instructor, as well as the separation between students. Due to this separation between individuals, there is not natural interpersonal interaction. Additionally, there is a separation between equipment and facilities, and the context in which learning is to be situated. Keegan (1986) defines distance
Design of Distance Education with Cognitive/Learning Styles in Mind

Before an instructor can take into consideration the cognitive/learning styles of students, the instructor must be aware of them. Thus, the first component of incorporating these styles is to assess the cognitive/learning styles of the target audience. This can be done formally or informally, either before the instructor begins or during the first instructional meeting. Once this analysis has been conducted, the instructor can get a feel for the cognitive/learning styles of the students and tailor the instruction and presentation of materials to meet their individual needs. Instructors should include instructional materials that meet the styles of students, thus creating a learning environment that allows students to maximally use their preferred style. The following focuses on incorporating methods that match the style of students, and what evaluation techniques would be most useful given the styles of students.

To facilitate this process the instructor should be aware of several other factors that can contribute to effective teaching and learning. Specifically, instructors should match instructional materials with learning styles. Within this domain, there are several characteristics that an instructor should be aware of in selecting a teaching method, a few of which will be highlighted. Content should match the verbal-visual style of students. Thus, instructors should always provide verbal as well as pictorial depictions of information to accommodate the styles of students.

Unfortunately, this is not the case in most circumstances and instructors present information in the format that is most comfortable for them, not taking the styles of students into account. Clearly, instructors need to be flexible and accommodate to the needs of students, as this will have a major impact on their learning success. Sensory preference should be taken into account and instructors should provide instructional material in the sensory modality best suited for the student. Thus, the instructor should provide written material to verbal individuals and graphical or imagery data to visual individuals. Ideally, instructors will provide information and material in a variety of sensory modalities that will allow students to not only use their most preferred sensory modality to learn the information, but would also be able to augment their primary modality with information that was processed through other modalities. Instructors need to aware of the holist-analytic style of students and ensure that information is presented and described in a format that allows both sets of individuals to acquire the knowledge. For instance, instructors should not only provide the holistic or total picture of information, but provide a break down of the material and how the separate materials lead to the whole. These are just a few of the many strategies that can be employed to help instructors and instructional materials meet the unique needs of each student. By employing these strategies students of all cognitive styles should have the opportunity to succeed in the distance education environment. In summary, it would appear that the best instructional strategy would be to employ a holistic approach that incorporates many different formats of information presentation.
through a variety of modalities. By encompassing this vast array of modalities, it is likely that each student will find the opportunity to use his or her most preferred modality to succeed in the course or training experience.

Even though we have focused on the presentation of material to meet the uniqueness of each student, several other variables can have impact on their performance. These include evaluation and feedback to students. It is clear that by being aware of the cognitive/learning style of students, instructors can tailor assessment/evaluation and feedback to match the style of the student. By accomplishing this, students will benefit more from the evaluation and feedback presented. To cover the whole area of cognitive/learning styles that may be present and allow students the opportunity for maximal performance, evaluation should be comprehensive and present assignments and questions in multiple formats to meet the unique style of each student. Failing to accomplish this may leave some students out, even though they may have mastered the material due to evaluation problems and not student related problems. Finally, instructors need to present feedback to students in a manner that best matches their cognitive/learning style. When feedback is unique to the style of the student, it will be well received and processed to a deeper level.

Conclusion

Distance education is becoming a force in the educational realm and appears to be increasing at an astonishing rate as a viable form of education. With this quick to adopt philosophy that appears to sweeping the educational community, many important variables in this new form of education are being overlooked. By focusing on these variables, especially learner characteristics (cognitive/learning styles) we can develop and implement distance education in a format and form that appeals and accomplishes its goal, namely the education of students. Without focusing on these variables, students may be disenchanted with this educational format and feel that they are not getting the education that they deserve, and therefore may seek fulfillment through other methods of education or not seek to advance their knowledge at all.

Using Electronic Portfolios to Support Accountability and Preservice Teacher Preparation

Dr. Gerald W. Burgess

Abstract: The demand for accountability establishes the framework for educational reform in the new millennium. The portfolio process represents a more authentic form of assessment in that it allows the teacher to judiciously select those work products and artifacts that portray the full range of the teacher's work. In an interactive discussion, participants will identify standards, course competencies, develop rubrics, and determine quality statements that support the evaluation and assessment of the electronic portfolio. The result constitutes not the "how to" develop an electronic portfolio but an understanding of the importance of integrating this strategy into the preparation of teachers who are more proficient in using technology to improve student learning.

Introduction

Amidst demands for increased accountability in education teachers must assert individual and collective perspective about the real work that teachers do. Georgia Governor Roy Barnes declared, "There will be no more excuse-based education in Georgia." This means that teachers will be held accountable for learning outcomes and called to account for the success or failure of schools (Hixson & Tnzmann, 1990). This demand for accountability establishes the framework for educational reform in the new millennium.

Traditional measures of teacher evaluation represent administratively directed events in which the administrator observes and records what he or she thinks the teacher does and makes judgments accordingly. Under the current process, the teacher has no formal way to integrate self-assembled documentation into the formative evaluation process that tells the teacher's story from the teacher's perspective. The current process invites the teacher to react to the evaluation rather than participate meaningfully into the evaluation process. If true accountability is to occur, both the teacher and the evaluator should assess if meaningful instruction and learning have occurred (Bain, 1996).

The portfolio process represents a more authentic form of assessment in that it allows the teacher to judiciously select those work products and artifacts that portray the full range of the teacher's work. The teacher can establish the context of the learning experience through the Teaching Statement that describes what the teacher sees as the result of instruction and the philosophy that undergirds the teacher's practice (Lang & Bain, 1997). The teacher is then able to select student work products which demonstrate student understanding of the content taught and the ability to translate this content into a student produced artifact. This process more accurately displays what the student knows and is able to do as a direct result of the teacher's instruction. The portfolio process also provides a way for teachers to capture students learning over a longer period of time and not just during the moment of the supervisor's evaluation visit. Through the portfolio, the teacher can show where the learner began and how the learner progressed through the learning experience. It is this growth process for which the teacher is ultimately responsible for and for which the teacher should be held accountable.
"One of the most difficult and contentious issues we face is accountability. What I want to know is how school systems, schools and personnel can be held accountable for student achievement. And, how can parents, communities and students be held accountable as well?"

Governor Roy Barnes

The Portfolio Process

The production of a portfolio is not new. Many professions, artists, models, photographers and architects are but a few occupations that have successfully implemented the portfolio process. Education has seen the value of this process and is now employing this tool in training programs for preservice and inservice teachers as (1) an evaluation tool to support professional growth and competence and (2) a strategy for accountability for the competencies acquired in the program.

As students learn technology skills, the conventional paper portfolio is being revisited as a means of identifying learner success and the accomplishment of what the preservice teacher knows and is able to do upon completion of established objectives. As administrators, teachers, and learners become more technologically savvy, the traditional portfolio is giving way to electronically produced, computer-generated artifacts reflected in multimedia presentations, web pages, and interactive discussions. As a consequence of these developments, university faculty will need support and professional development to acquire knowledge about integrating and assessing technology-based tools into college classrooms.

In preservice teacher preparation programs, students often do not have time to review the standards that guide the work of the profession. But understanding teaching standards is essential to making a determination of how well one is prepared to teach.

The National Board for Professional Teaching Standards offers five core propositions for effective teaching:

1. Teachers are committed to students and their learning.
2. Teachers know the subjects they teach and how to teach those subjects to students.
3. Teachers are responsible for managing and monitoring student learning.
4. Teachers think systematically about their practice and learn from experience.
5. Teachers are members of learning communities.

Throughout the teacher preparation program, electronic portfolios enable students to document (Figure 1):

1. Technology literacy skills.
2. Collegial skills working on group projects.
3. Content mastery in various courses.
4. Reflective assessments of the teacher preparation experience.
5. Experiences in the classroom where instruction is delivered and managed.

</tbody>
</table>

Figure 1

As students prepare to develop the electronic portfolio thoughtful consideration should be given to what it is that preparer wants to document. The following questions should be asked.

1. Why am I developing a portfolio?
2. How will I let the viewer know who I am and what I do?
3. What are the specific responsibilities that I perform?
4. What activities were implemented congruent with these responsibilities?
5. What evidence can I provide that proves that these things were done?
6. How well do I think I did?
7. How will I show this self-assessment?

The emphasis need not be on collecting "best work" when creating the portfolio. Instead, a wide range of work samples representative of the work will allow the viewer to examine progress. Working portfolios demonstrate growth over a specified period of time. At the beginning of the portfolio development process, preservice teachers should answer questions such as:

1. What standards guide my work?
2. What evidence do I have to document my effectiveness?
3. What are my strategies for assembling this evidence into a growth history?

Conclusion

As the growth history develops, preservice teachers may include interim evidence and notes on progress. Finally, when the teaching/learning task is completed, preservice teachers need to summarize what went into assisting all learners achieve high levels of learning. Work samples, plans, outlines, final products and even unfinished products might be included in the portfolio. The value then is work accomplished over time that illustrates growth and learning. Such evidence is more meaningful than a one-time snap shot during a single evaluation period. The role of the teacher is changing to include a broader use and application of technology in the classroom. What better way to authenticate a process is there to allow the teacher to judiciously select work products and artifacts that portray the full range of his or her work?

Distance Education and What is Coming Next?

Kemal Cakici
Department of Management Science
The George Washington University
United States
cakici@gwu.edu

Abstract: In the last decade distance education has gained more importance and attention in its century long history. The more technology and society develops, the greater need for qualified and educated people exist. In order to support this demand for education, schools at all levels started developing and implementing distance education programs. Distance education helps people to work and complete their degrees anywhere while supporting them to become more qualified. As the technology is evolving everyday, the way these programs are delivered change and become more sophisticated. This paper will give a brief history of distance education and try to explain the latest developments in higher education institutions.

Background

Distance education is a rapidly developing approach to instruction throughout the world. This approach has been widely used by businesses, organizations, medical and educational institutions. Especially, academic institutions have been using distance education to reach a more diverse and geographically dispersed audience that is not accessible through traditional classroom instruction.

Traditionally educational systems required in-class instruction by teachers and in-class attendance by students. When distance learning programs started to appear in the early 20th century under the name ‘correspondence learning’, their major purpose was to serve the population who could not afford to have higher education because of geographical or economical restrictions. In this form, the primary communication mode between an instructor and students was the regular mail and the medium of information delivery was customized printed material. Correspondence learning is the first of three generations of distance learning identified by Moore and Kearsley (Moore, 1996). The second generation began in the early 1970s, with the British Open University. The third generation starts with the advancement of satellite and communications networks in the early 1980s. These networks enabled real time interaction with two way video-conferencing or one-way video and two way audio communications. Multimedia CD-ROM products for self-paced learning and bulletin boards are some of the distance learning tools that emerged in this era.

The distinguishing characteristic of distance education is the physical separation of the instructor and students during the learning process.

As time has changed, distance education concept has changed as well. With the use of Internet technology, the era of the old text based and slow data exchange has evolved into fast high-speed fiber optics Internet bandwidth which allows seamless interaction between the instructors and the students from anywhere in the World. It took almost a century for distance education to gain grounds from the first approaches of correspondence study to today's Web-based technologies.

Today

With the initial developments in the Web technology, there was a concern that the old transmission model of one-way instructional delivery was going to be repeated that ignored the importance of students'
interaction and left the students autonomous and isolated. Instructors initially used the objectivist (teacher-centered) approach to learning where they used Web as a mere information-delivery medium to post online syllabi, assignments and lecture notes. However, with the use of Internet technology, more interaction-based applications started to dominate the distance education such as discussion and chat rooms, whiteboards, collaborative tools and video streaming. As a result of these developments, students are having more “closer” interaction and experience than a traditional classroom. The current question is not, whether there is a physical distance between the students and the instructor. It is whether, the real ‘learning space’ among students and the instructor is closer or not.

Internet and the World Wide Web is the main reason for the paradigm shift from the objectivist (teacher-centered) approach of learning to constructivist (learner-centered) approach of learning. In the latter approach, students learn at their own pace and convenience. A student can now be more in charge of what, when, and where he learns. Along the line, higher education institutions will no longer be the center of power and control of dispensing information and knowledge, but service according to the students’ needs for guidance and leadership.

What else can be done?

Bottleneck, bandwidth and protocol limitations on the current Internet backbone is limiting the possibilities to introduce new tools that will enhance the capabilities of distance education. “The amount of Internet content and users has grown exponentially since the early 1990s creation of the World Wide Web. But Internet hardly kept pace”(Fngerman, 1999). In October 1996, Internet2 (12) consortium was formed by thirty-four universities to enhance the present Internet with new software applications and hardware technologies. The motivational factor behind the formation of this new consortium was to have an extremely high-bandwidth test-bed for academic research and teaching. The possibilities on this new Internet, which will not be clogged by commercial users, are beyond imagination. “Think of the entire contents of the Library of Congress transmitted in seconds. Think of three-D brain imaging transported with clear and instantaneous resolution to surgeons around the world on a particularly difficult case. Think of geographically separated engineers working together in real-time on intricate models and structures” (Fngerman, 1999). “More than a faster Web or e-mail, these new technologies will enable completely new applications such as digital libraries, virtual laboratories, distance-independent learning and tele-immersion” (Internet2 Consortium,)

I envision broader developments such as multi-point, one-to-many, many-to-one video-conferencing. Think of an instructor, sitting in his home-office and interacting with multiple students face-to-face around the world at the same time without compromising the content of the material being taught. In another scenario, a student will be able to feel and smell by using virtual reality technology just as one experience the thrill of flying by using a joystick. There will be virtual laboratories for chemistry, biology, physics and medical students where they can experiment on anything without even leaving their dorms while being guided and supervised by experts in their corresponding fields. The next radical technological development in the distance education will be the ‘wearable computers’. Having a computer that you can wear and be able to access the educational material without the physical boundaries of the computer networks will bring real ‘real-time’ learning. For anything beyond these ideas, we will have to wait and see how technology evolves in the 21st century.

As technology develops, the delivery methods will develop as well. Therefore, now the questions are: What is next and how and when?

The Challenges of Interfacing Between Face-To-Face and Online Instruction

Nada Dabbagh, George Mason Univ., USA

Abstract: The use of the Web for instructional purposes at higher education institutions has crossed the spectrum of distance education delivery contexts, ranging from the Web being used to supplement face-to-face instruction to a primary delivery mechanism for instruction. This article discusses the migration from face-to-face classroom instruction to Web-Based Instruction (WBI) through the experience of a faculty member in the creation and teaching of Web-based courses at a higher education institution. Specifically, four areas which represent challenges for faculty will be discussed: issues surrounding course content; technological assumptions; logistical and implementation challenges; and interfacing between face-to-face and online learning environments. Guidelines for effectively integrating components of a WBI system to support the teaching and learning process in each of these areas will be provided.

Introduction

Interest in the development and use of Web-Based Instruction (WBI) in higher education has seen an explosive surge of activity. In a recent survey by the U.S. Department of Education's National Center for Educational Statistics (NCES), it was reported that the number of distance education programs increased by 72 percent from 1994-95 to 1997-98 and that an additional 20 percent of the institutions surveyed plan to establish distance education programs within the next three years (The Institute for Higher Education, April 2000). It was also reported that 1.6 million students were enrolled in distance education courses in 1997-98. A search for “Web-based courses” using Alta Vista in late 1999 resulted in more than 16 million hits, with results ranging from actual courses being offered on-line, courses enhanced with Web-based resources, and sites discussing the issues surrounding WBI. The results also revealed that the Web is being used for learning purposes in a variety of areas, including business, K-12 and higher education.

Increasingly, institutions and faculty members are feeling pressure to offer Web-based courses to meet economic and student demands. Companies like Real Education (now eCollege.com), WebCt and Blackboard have created environments to make the development of WBI easier for higher education. Despite the advertised ease of creating WBI using "Web course in a box" applications, faculty members and instructional designers working to meet this demand are discovering that the creation of WBI comes at a considerable price in terms of time, effort and resources. While there may be several reasons why the cost of creating WBI is so high, one driving factor appears to be a lack of guidance in "best practices" for creating these types of learning environments. The literature base is beginning to develop (see, for example, Khan, 1997); however, to date, there are not many resources that offer assistance in terms of guidelines for creating WBI on a course by course level. Many faculty are engaged in transforming their current traditional classroom-based courses using a "Web Course in a box" application to a Web-based format ending with a little more than another "version" of the same course. This may be very convenient for students who wish to access course materials at any time, any place, however the effort expended by these faculty is not realized due to the absence of guidelines that could help this transformation process become more effective and efficient.

Web-Based Instruction

Distance education delivery contexts range from Web-supported or Web-enhanced instruction, known as the adjunct mode, to the administration of distance learning courses, known as the online mode. In the adjunct mode, WBI can work hand-in-hand with traditional classroom instruction where classes would meet 15 times during a semester and the Web-based component is an add-on to support classroom instruction. This facilitates the organization of course materials by the instructor, provides continuous student access to these materials, facilitates student-student and student-instructor communication, and offers students a richer and more self-directed learning experience. WBI can also replace a significant
portion of face-to-face instruction. This would be known as the mixed mode with the networking fully integrated into the curriculum and up to one half of the course conducted online. The totally online mode is where the network serves as the primary environment for course discussions, assignments, and interactions even though media such as textbooks, telephones, or face-to-face meetings may be incorporated as part of the overall instructional design of the course.

"Web Course in a box" applications like WebCT, Blackboard, Virtual-U, Learning Space, and many others, can be used to create any of the distance education delivery contexts discussed above due to their comprehensive nature of providing instructor tools, learner tools, technical tools and administrative tools (Dabbagh, Bannan-Ritland, & Silc, 2000) needed to ensure appropriate creation and delivery of WBI. Moreover these applications are integrational in nature in that they incorporate hypertext, hypermedia, graphics, animation, digital video and audio, self-contained interactive modules, and asynchronous and synchronous tools (Bannan-Ritland, Dabbagh, Harvey, & Milheim, 2000) which are features and components of WBI (Khan, 1997). The comprehensiveness and integrational nature of these applications however present many challenges for faculty which can be categorized into four major areas:

- issues surrounding course content;
- technological assumptions;
- logistical and implementation challenges; and
- interfacing between face-to-face and online learning environments.

In the sections that follow I will present guidelines for effectively integrating components of a WBI system to support the teaching and learning process in each of the areas listed above. The focus will be on utilizing a Web-based course management tool to support face-to-face instruction and on the ensuing challenges of interfacing between these two teaching and learning environments.

Using a Web-based course management tool to support face-to-face instruction

A Web-based course management tool is an enabling tool that supports WBI in any of its delivery modes (adjunct, mixed and online). For the sake of this discussion, WebCT has been selected as an example of such a tool. Although some Web-based course management tools may offer different features than others, the majority of these tools have similar standard features making it possible for the reader to apply what is articulated in this discussion to any Web-based course management tool.

WebCT facilitates the organization of course material on the Web and provides a variety of tools and features that can be added to a course. Examples include a conferencing system, on-line chat, student progress tracking, group project organization, student self-evaluation, grade maintenance and distribution, access control, navigation tools, auto-marked quizzes, electronic mail, automatic index generation, course calendar, student homepages, student work areas for posting content, course content searches and more. Hence the comprehensiveness of the tool. Use of these features can promote collaborative learning, enhance critical thinking skills through content generation, representation and synthesis and give every student an equal opportunity to express their views and test their ideas through online discourse and other Web-based instructional activities (Dabbagh, Bannan-Ritland, & Silc, in press 2000).

Issues surrounding course content

Of particular interest in this discussion is the effective use of Web-based features enabling the organization of course content. According to Hedberg and Harper (1998) the visual metaphors employed by Web-authoring tools restrict the learning environment by placing constraints on the organization of content and the learning strategies. WebCT is no different. Faculty using WebCT for the first time tend to follow the structure imposed by the interface which models a linear path of organizing course content. The interface mimicks the organization of a syllabus by providing a template for course information, course content, course resources and a calendar for a timeline. Course content can be organized linearly using a course path tool. Utilizing this tool results in a page-turner format where students can begin in one place and move forward or backward along the path from one document to another. In this case, the content is usually instructor generated and generally stable leaving learners little or no input in the organization or generation of the course content (see figure 1.1).

Insert figure 1.1 here

This method of organizing content works well if the instructor's pedagogy is didactic (instructivist), requiring students to read resources in a certain order and preventing students from getting lost in the process. In an instructivist pedagogy, resources are generated by the instructor and organized in a linear order from the instructor's point of view and every student receives the same instruction at the same
pace using the same context (Dabbagh, 96). Once a faculty member becomes more familiar with the tool's features, other approaches to organizing content and resources become evident. For example the feature of 'adding a single html page' in WebCt provides the instructor with the ability to annotate resources and contextualize content based on related class activities. In utilizing this feature, the instructor has the option of using a Web-based editor to create, organize, and describe course content and resources and then upload this page(s) to the course homepage or to any other page of the existing WebCt interface. This alternative method of content organization and structure provides students with a greater degree of flexibility in selecting and using resources however the generation and organization of content is still largely an instructor's task (see figure 1.2).

The shift to a more constructivist design of content in WBI occurs when students are given multiple opportunities to generate their own resources and are provided with tools to synthesize, organize, and restructure course content (Bannan & Milheim, 1997). This calls for a more learner-centered environment where the instructor requires students to search for relevant resources and upload them to a student 'posting area'. Students can work individually, in pairs, or in small groups on an assignment or a class activity and the resulting information synthesis can be uploaded to an 'individual work area' or a 'group work area' using the WebCt interface. In this situation, learner-generated resources can be characterized as reusable (e.g. in another course or in the same course for a different activity), more contextual than instructor-generated resources (students know where to find them and why they're there), and as enabling a dynamic rather than static structure to content. Figure 1.3 demonstrates resources generated by students who were working in pairs to complete an assignment about comparing and contrasting objectivist and constructivist learning environments. The resources were posted by the students in their designated work areas and later reorganized by the instructor to serve as samples for a future class.

Figure 1.4 is a result of several class activities in which students worked in small groups to generate characteristics of constructivist learning environments (CLEs) for the several models discussed in this class. The resulting information was uploaded to the student posting area and later synthesized by the instructor to form a resource for future class discussions and to serve as evaluation criteria for students' final projects.

The discussion above demonstrates how different features of a Web-based course management tool can be used to generate and organize course content and resources in conjunction with an instructor's pedagogy. Shifting from a didactic to a facilitator role, an instructor can utilize different features of a tool to vary the attributes of instructional strategies and activities from supplantive to generative, allowing students to contribute their own resources and content and structuring and reorganizing content so that it is contextualized and reusable. Figure 1.5 illustrates how an instructor's pedagogy influences instructional strategies, activities and resource generation.

Technological Assumptions
Another important aspect of using a Web-based course management tool to support face-to-face instruction is the technological expectations presumed by the instructor. For example, using threaded discussions can be a difficult concept for students to understand and often instructors or online discussion facilitators assume that if students are familiar with email then using threaded discussions is a natural extension of this skill. In the absence of proper instructional support and practice, posting to threaded discussions can be a daunting task for many. Here is what one student had to say about this issue:

"The process of threading took some teaching time, how to respond to particular messages without creating new strands in the discussion. Navigating through a threaded discussion is also very difficult. Additionally, we are required to post files in another section, and there is some difficulty in accomplishing that."

WebCt has a main forum area which can be used as a practicing ground for first time users of threaded discussions. Instructors can post a greeting to the class containing a brief social bio and then ask students to do the same. This initiates a discussion in an environment which is non-judgmental and where no grade is associated. The instructor can model a moderator's role and provide an ice-breaker for future discussions in which postings are related to the readings and students are required to provide a studied rationale for their statements and positions.
WebCt can also pose a threat to students when it comes to uploading files and resources to the individual or group ‘posting area’. There are several steps involved and the procedure is not intuitive. Students who are technologically skilled usually have little problem and are able to help other students with uploading procedures however others may struggle endlessly. These technological issues can interfere with the learning process causing frustration both for the students and the instructor. Adequate class time and instructional support should be provided for bringing students up to speed with the uploading procedure for any Web-based course management tool in order to minimize such problems.

Logistical and Implementation Issues

Another challenge facing faculty who have committed to the use of Web-enhanced instruction is administrative support for logistical and implementation issues. Many universities have initiated centers to support faculty in utilizing innovative technologies in teaching and learning and the efficacy of these centers is instrumental to the success of such endeavors. Administrative support centers for innovative technologies must keep abreast of faculty needs and provide instructional support through workshops, online tutorials and help guides. Most integrated course management systems like WebCt have extensive resources (some built into the tool itself) to support first time users however faculty are often reluctant to rely on this type of guidance as it does not take into consideration the existing course format and pedagogy which faculty have been using in a traditional classroom format. Instead, faculty find themselves spending double the time and effort in reorganizing their course materials to fit the new delivery medium losing focus of the big picture. The transformation from face-to-face to online requires what Collis (1997) refers to as pedagogical reengineering. This is where support centers can help. Support centers should be staffed with instructional designers who are skilled in identifying the teaching needs of faculty to help them integrate Web-based technologies as effectively as possible. The Institute for Higher Education Policy in its report on the quality of online learning listed the following elements under what it calls ‘faculty support benchmarks’ (April 2000, p.3):

- technical assistance in course development should be available to faculty;
- faculty members should be assisted in the transition from classroom teaching to online instruction and are assessed during the process;
- instructor training and assistance, including peer mentoring, should continue through the progression of the online course;
- faculty members should be provided with written resources to deal with issues arising from student use of electronically-accessed data.

Following the above guidelines will certainly diminish the logistical and implementation challenges associated with using a Web-based course management tool to support face-to-face instruction.

Interfacing between face-to-face and online learning environments

By far the most challenging issue facing faculty who are using a WBI component to support f2f instruction is the ability to effectively interface between the two delivery formats. According to Palloff & Pratt (1999), preparation time for f2f instruction requires between 6.5-7.5 hrs/wk while preparation for online instruction requires 18-19 hrs/wk. Just looking at this statistic one can imagine the time and effort required to prepare for both delivery formats which in essence is what a faculty member is doing when supporting f2f with a WBI component. In many instances faculty have handed print-based syllabi and assignments in class and then also uploaded these documents to the Web for students’ convenience and ease of accessibility. If one is not careful, the experience can be almost like conducting a whole other course! The trick is to learn how to create activities that integrate both formats rather than creating activities for each which could result in ineffective redundancies. For example, one activity can require students to engage in a classroom discussion on course readings and then synthesize the key points of the discussion (individually or in groups) and post the synthesis on the Web in the student posting area for others to download and for the instructor to evaluate. Alternatively, an online discussion can be facilitated using the asynchronous discussion tool in WebCt and the synthesis can be presented in class. Another example of an instructional activity that integrates both delivery formats is requiring students to post drafts of a class paper online and then engage in a peer feedback exercise in class. The instructor can randomly arrange students’ papers in pairs on the Web (an easy task in WebCt) and provide an evaluation rubric that students can download and use to prepare their feedback. Students can then communicate their evaluation to their partner in class making the process more effective and efficient by taking advantage of both mediums. A third example of creating activities that integrate both mediums is to provide Web-based group discussion forums when group work and group presentations are an integral part of the course. This saves student time.
in arranging meetings outside of class and gives the instructor more f2f class time to give lectures if needed. Groups can discuss their work in these forums independently, share documents and resources, and prepare for their class presentation. At the same time, groups can get feedback from the instructor through these forums and more importantly, the instructor can monitor the group process and group dynamics.

Another challenge facing faculty and students who are interfacing between f2f and WBI is time management skills. As one student put it:

"Compared to a traditional f2f classroom environment where one attends a 3 hour class, goes home and has a week to prepare for the next class, WebCt forces you to logon daily to check on things and participate in ongoing online discussions. You end up putting much more time in-between classes."

Though not necessarily a negative comment, adequate time should be provided for students to get accustomed to the added WBI component. Faculty often do not take this issue into consideration and students may become frustrated in having to deal with attending class and contributing to online activities if they don't employ effective time management skills. Another student's perspective indicates that interfacing may save time in the long run:

"Using WebCt does save time in the long run in the classroom in that everyone has a chance to put forth his/her point of view. In the traditional classroom we always seem to run out of time for discussing topics. I also think it saves time in that it gives students more time to process, question, and get feedback as opposed to just being in a classroom setting."

Conclusion

It is a delicate balance to create activities that integrate both mediums, employ effective time management skills and guard against doubling the work both for students and faculty when using a Web-based course management tool to supplement face-to-face instruction. If appropriate guidelines are applied however, the advantages of interfacing between f2f and online instruction, known as the adjunct mode include the following:

- Providing the ability for the instructor to capture class activities and archive process and product enabling access to content beyond the timeframe of the course;
- Providing the opportunity for ALL students to contribute (wider opportunity to communicate and participate);
- Allowing students to articulate reflections on content and course issues at any time through the main discussion forum area (readily accessible, time independent);
- Engaging students more dynamically in thinking about the course content by logging on to explore resources and follow discussions (just-in-time resources);
- Facilitating modeling and scaffolding more efficiently using previous student samples and expert intervention;
- Facilitating peer feedback and collaboration on group projects;
- Promoting distributed learning (multiple perspectives, multiple expertise).

Guidelines for utilizing a Web-based course management tool to support f2f instruction

The above discussion suggests the following general guidelines to be taken into consideration when utilizing a Web-based course management tool to support f2f instruction. Some of these guidelines apply for both the instructor and the students:

- Integrating not duplicating: when planning instructional/learning activities, careful consideration must be given to insure that these activities are integrating both formats and not duplicated in each.
- Don’t underestimate the learning curve: using a Web-based course management tool is a new learning experience for both faculty and students. Plan for and provide adequate instruction on how to use the Web-based tool (for yourself and the students).
- Finding the right balance: interfacing between f2f and online instruction requires knowledge of time management skills. Make sure that you and your students are aware of this aspect and provide some guidelines on how to make this process effective and efficient. An example of such guidelines would
be to give students an estimate of how much online time is required on a daily basis to participate in associated activities.

- Avoid conducting a whole other course: supporting l2f instruction with a Web-based component can easily double the work for an instructor if one is not careful. It can also increase the time spent outside the classroom for students. It is important to keep in mind that the Web-based component is intended to 'support' the course and facilitate the delivery of content and the implementation of existing activities.

ABSTRACT The steady evolution of communications technology (radio, television, interactive video, audio-graphics, electronic mail, Internet, intranet) has considerably influenced the development of distance learning. This third generation of distance education, which includes interactive video, email, Internet, intranet, and audio graphics technologies, learning activities via these distance education systems has been redefined to include and focus on teacher-student interaction. This paper examines technology, student lifestyles, faculty characteristics and continuity, quality and quantity of courses, quality and quantity of students, and interactivity as the primary ingredients of a successful and effective on-line education program. In particular, the program at the Information Technologies Institute in the School of Continuing and Professional Studies at New York University, an asynchronous education programs, is demonstrated and evaluated. Instructional design principles and novel authoring concepts are introduced to the online course environment.

Introduction

The term, distance education, is not a new term, however, in recent years it has taken on new meaning. In the past, distance education was known as correspondence courses that were used to meet the needs of rural areas. The first and second generation of distance education delivery systems was designed primarily to produce and distribute learning materials as efficiently as the technology of the day permitted without any attention to interactive communication between students and teacher. Today’s third generation of distance education, immediately conjures up the notion of teaching that takes place over the Internet and that is facilitated through the use of Web-Based Instruction (WBI).

In the current business climate emphasizing total quality management, it is crucial to analyze the critical factors that will help meet and exceed customer expectations. In an effort to build the foundation for a new paradigm in delivering cutting-edge distance education, the paper discusses what has been learned regarding teaching and studying through this technological medium and also identifies some of the problems encountered. It seeks to address those difficulties and incorporates design features that the research finds to be most useful for both teachers and students. Much of the information is derived from the largely successful on-line education program at the Information Technologies Institute in the School of Continuing & Professional Studies at New York University.
Evolution of the Program

SCPS's Information Technologies Institute began in 1968 under the name of the "Data Processing and Systems Analysis Institute" and offered mainly a mainframe computing and data processing curriculum for the first fifteen years. The department name was changed in 1984 to accurately reflect the interrelationships between computer and communications technologies. In Fall, 1990 the Institute offered 17 certificate programs, a 16-credit undergraduate diploma program in Computer Technology, and introduced a brand new on-site 16-credit graduate Advance Professional Certificate in Information Systems Auditing; the Institute enrolled 5,101 students during the 1990/91 academic year. Almost all of these students worked in Manhattan and lived within a 40-mile radius of the campus.

Fall, 2000 finds the Institute offering 25 certificate programs, a 16-credit graduate Advanced Professional Certificate in Information Technologies, an M.S. in Management and Systems, and the concentration curriculum support for McGhee's Bachelors in Communications Technology. The 1999/2000 academic year has not been actualized, but final calculations indicate that total enrollments will clear 6,000 students. The growth in enrollments can be largely attributed to online enrollments [non-credit and graduate]; for example, this past summer, 2000 term, there were 2025 enrollments of which 501 (24%) were students enrolled online.

Online Programs Facts & Figures

The Information Technologies Institute non-credit online initiative began in Fall 1999, and has consistently expanded over its three semesters.

The Graduate Programs, which consist of an MS and an Advanced Professional Certificate, have grown at an equally dramatic rate and the number of new enrollments constantly exceeds forecasts. In fact, since the 336 points enrollment of the 1994/1995 academic year the program has experienced a 400% increase. The online retention rate is an outstanding 98%, which is well above the national average of 60%. The program boasts a geographically dispersed student body with representatives from Washington DC and 25 different states ranging across America, in addition to internationally based students from Puerto Rico, Canada, Argentina, England, Korea, Thailand, Japan, Spain and Italy. The 30-39 year old range is the predominant age group and there are more males than females, especially in the Master's Program.

Critical Success Factors

The success of the respective programs lies in the commitment to dedicated faculty, finely tuned admissions criteria, industry-driven courses, peer to peer learning, teamwork, faculty development and a meticulous auditing process that monitors both course content and student interaction.

Faculty

Faculty is carefully selected with particular attention paid to the instructor's professional background in addition to teaching ability. It is expected that each faculty member is able to draw on a wealth of industry-related experiences that can enhance the course material and embellish the students' learning process. Since a vast majority of the students are working professionals enjoying advanced positions in their
respective organizations, it is crucial that the instructor is able to command respect and capture the students' attention early in the course in order to provide an effective learning experience. This is far more easily accomplished by recruiting faculty members who are proven performers in industry.

It is often the case that professional success and effective communication skills are not sufficient to ensure academic quality. In order to promote the academic excellence of the programs faculty attend workshops led by a Clinical Professor with over 15 years experience in graduate programs at major universities. The workshops are designed to help the instructors refine course content, improve delivery methods and infuse the material with a rigorous academic component. Since many of the faculty members will be involved in student advisement and/or supervision of the required thesis for the MS degree, the workshops also serve as an opportunity to introduce and develop the required skills and academic standards that must accompany the production of an advanced research paper. In addition, the Clinical Professor will work with faculty members on a one-to-one basis in the area of course development.

Students

The admissions criteria are GMAT (or equivalent) scores, undergraduate degree, professional experience and a personal statement. It has been found that no single criterion can determine whether a student will be successful or not but the most significant predictor is the personal statement. While each student must have performed well on the undergraduate level, at their job and in the graduate test, it is the personal statement that will most likely indicate their propensity for success in the program. It is the Institute's policy to seek well-educated, highly motivated self-starters who are eager to learn and can demonstrate the ability to handle the workload of an intense learning experience. The admissions committee has done an excellent job of filtering a staggering increase in applications so that the increased number of admissions has not compromised the 98% retention rate that the Institute boasts.

Course Content and Delivery

In addition to offering a wide array of new and exciting courses that are industry-driven, student learning and interest is piqued by a number of factors. The courses are delivered in an asynchronous manner over the Internet with a heavy emphasis placed on peer to peer learning and teamwork. The Learning Space is comprised of four major areas: schedule, media center, course room and profiles. The bulk of the course takes place in the course room where there are vibrant, threaded discussions groups taking place on a constant basis. Students check in on at least a daily basis and often several times a day to read and comment on the instructor and student contributions. In order to enhance the experience the media center is used for the instructors and students to post files that may contain links to pertinent web sites, or documents containing current articles, audio, video, graphics and multimedia. The relative anonymity of the course room motivates many students to voice their opinion. This is a substantial advantage over a traditional classroom in which students may be too shy and potentially enthralling class discussions simply break down.

Despite this anonymity students still develop a strong sense of collegiality. In the Profiles section, students are able to enter as much (or as little) information about themselves and their personal and professional lives as they wish. Many students even avail themselves of the opportunity to post a photograph. In the discussions, students are encouraged to relate their work experiences as they pertain to the issue at hand. As a result, students form a sense of camaraderie as they share similar occurrences. Coupled with the strong bond necessitated through extensive and complex team projects the students have ultimately formed many relationships outside the confines of the course. This is especially nurturing to the education process as the students progress through various classes together wherein they will often request to be on the same team. As mentioned previously, team learning is especially valuable and the Institute maintains a database that enables the auditors to help faculty build teams should the students not form ones on their own.
Auditing

The key to successful student participation, learning and the high retention rate has been the vigilant auditing policy in which the Institute engages. Students and faculty are expected to be online every day. Experienced academics monitor the faculty contributions to make sure that the faculty lectures and summaries are posted on a timely basis, that the content is consistent with the course description and objectives and that the instructor provides regular feedback to the students. There is also a group of internal course auditors who will contact students if they have been offline for more than 48 hours. Sometimes this could be due to a technical problem, in which case the technical staff is notified and troubleshooting takes place. Other times this could be due to personal problems or difficulty with the workload. In each case the problem is documented and the faculty member will contact the student via phone or email to try and resolve the issue. The Institute believes in a very strong and personal mentoring process to aid students through a rigorous program.

Troubleshooting

As with all technology there are times when the courses might experience technical difficulties. In an effort to provide rapid identification and response, the Institute employs technical aides who monitor the course for potential trouble spots. Sometimes, problems might be reported to the help desk by a student, in many cases the student posts an advisory in the course room. In addition to its own Technical Director who is responsible for maintaining rapid identification and resolution of technical problems, the Institute outsources to a dedicated help desk that works with vendors, faculty, technical aides and department on solving technical difficulties. The organization also provides one-on one training sessions for new instructors and will assist faculty with configuring their laptops.

Conclusion and Summary

This paper has introduced some of the key issues that are necessary for the development and maintenance of a successful online educational program. The Information Technologies Institute in the School of Continuing and Professional Studies at New York University has evolved into a premier deliverer of superlative, stimulating and academically challenging online education at the Masters, Certificate and Non-credit levels. In addition to having industry-driven courses and faculty the Institute has identified its ability to develop a finely tuned admissions strategy as one of the main reasons for its astounding 98% retention rate. Other critical success factors are:

- Emphasis on team-based work -- the peer-to-peer learning that is fostered and cultivated online
- The equalizing force of the medium that promotes student to student learning
- Internal course auditors that contact students when they have been offline for more than 48 hours
- A database that enables auditors to help faculty build teams
- Extensive faculty training and development technically and academically
- Supervision of course content and academic integrity

Screen Shots

Included in the next two pages are some screen shots illustrating a typical interface that someone in the online course might encounter in the course room. On any given day there may be as many as 150 postings from a 20 student class in a course. The postings will range from comments on other contributions, to teamwork observations to new discussions to questions for the Professor or colleagues in the field.

Cost Effectiveness and Distance Education: 
A Perspective

Steve Dickey and JoAnna Dickey  
Eastern Kentucky University  
United States  
ecodicke@acs.eku.edu

Abstract: The authors develop a taxonomy of motives for distance education, solutions for delivery and likely application situations. These concrete considerations are contrasted with the abstract character of the intentions commonly professed by institutions offering distance education. The authors discuss the problem of on-campus enrollment loss and provide evidence of its severity on their own campus. The paper concludes with a contrast between cost effectiveness and program image appeal. A major point made in the paper is that the most effective form of distance education would involve multiple delivery media.

The purpose of this paper is to place into perspective the idea of distance learning or distance education. The first part of the paper will be devoted to a general overview. The remainder of the paper will be directed to the topic of remote site video classrooms.

Distance education is an alternative to scheduled in-classroom meetings between a teacher and students. Such alternatives are motivated by the desire to execute educational processes so as to allow students to learn at their own pace, at convenient/flexible times, in their home environment. It would also allow students to avoid travel to campus and allow off-campus instructed courses without instructor travel. These features would potentially provide educational resources to the handicapped. There is also the potential for increased enrollment per instructor. Several of these motivations may be present in a particular instance. Naturally, the best solution depends on the motivations in the case at hand. Different motivations can result in different solutions. Most of the solutions available (except for audio tape) are listed below.

Scheduled Live Instruction:  
1. traditional television broadcasts  
2. one-way video/audio course - satellite  
3. one-way video/two-way audio course - satellite/phone  
4. two-way video/audio course - satellite  

Unscheduled Instruction:  
5. paper correspondence courses  
6. video taped presentations  
7. interactive CDs  
8. internet courses

Please note that courses based on interactive CD's offer instruction equal to internet courses and are relatively prevalent in business training. Textbooks/manuals are typically used with each form of unscheduled instruction. The point being that not that much instruction in 7 and 8 comes from the computer screen unless the student is reading text screens. Such a use of text screens is considered a severe misapplication of media. Moreover, 5 through 8 can readily be combined. One can easily imagine a course with a text for reading and reference, video tapes for instruction, CDs for demonstration and interaction exercises, and paper or the internet for communication, discussion, and assessment. In other words, each media has its best use and some advantage in that use. Therefore, optimal use of media implies use in combinations. The traditional paper correspondence course should be viewed as the low cost and minimal media solution of years past.

There are only three situations: (1) students working at home at their own pace, (2) students working
at home paced with TV broadcasts, and (3) groups of students meeting at a local facility. The needs of the first situation have traditionally been met by correspondence courses sometimes with special provisions for handicaps. Multimedia approaches could readily be applied to situation (1) and the internet could be used in various ways. The second situation is the older TV broadcast course concept and will be discussed in terms of its history later. Today, we often think of situation three as what we mean when we say "distance education," the remote site video classroom.

The primary professed motive behind current efforts at remote site video classrooms, RSV classrooms, is educational outreach to the service community. This motive is abstract rather than concrete and so was not listed above. It is an important point that the target audience is stated vaguely as those students who would otherwise not receive instruction. The goal of corresponding instruction is also stated vaguely as an attempt to increase educational attainment. These statements seem to seek a continuing education context as the justification for distance education. It is a certainty that if continuing education was the only possible use for the course, the program would not have the scale to be cost effective. Therefore, the program must sell to those seeking a degree in order to be practical. If nothing else, these points clearly indicate that RSV classrooms were, are, and will remain an experiment in education spurred by technological advance.

One problem with enrollments in RSV courses must be acknowledged; they undermine on-campus enrollments. Students enjoy the convenience of remote site instruction instead of coming to campus. Note that these students are not the target group noted above. Since RSV courses are often located at facilities where off-campus courses are taught, substituting one or the other for on-campus courses is the same situation. Only because offerings at such locations are limited, can we get figures that indicate the extent of the problem. Such a figure is the percent of off-campus enrolled students that are also enrolled in on-campus courses. Zero indicates that there is no problem, while 100% indicates the most extreme problem severity. Because this figure understates the problem, the interpretation of numbers near .25 would be an indication of a substantial drain on the home campus enrollment. For Eastern Kentucky University the figures are:

<table>
<thead>
<tr>
<th>Year</th>
<th>Enrollment</th>
</tr>
</thead>
<tbody>
<tr>
<td>1994</td>
<td>.25</td>
</tr>
<tr>
<td>1995</td>
<td>.26</td>
</tr>
<tr>
<td>1996</td>
<td>.30</td>
</tr>
<tr>
<td>1997</td>
<td>.29</td>
</tr>
<tr>
<td>1998</td>
<td>.31</td>
</tr>
<tr>
<td>1999</td>
<td>.29</td>
</tr>
</tbody>
</table>

At least 29% of this off-campus enrollment, and possibly a good deal more, is pure convenience, is a direct loss to on-campus enrollments, and is not in any sense educational outreach. On the other hand, one could argue that such programs pick up most of the students seeking convenience in their early small-scale stage. Then, as the programs move upscale, most of the additional students will be those targeted for outreach services. One could also argue that convenience motivated students provide the scale needed for the practical operation of the program.

For any distance education program, it is desirable for the program to be cost-effective. One-way delivery of RSV courses is dramatically less expensive than two-way delivery. Broadcast is expensive and reception is not. One broadcast site can reach large numbers of reception sites. One-way video with two-way audio comes in as a close second place in low cost and is thought to be nearly as interactive as true two-way delivery.

A one-way RSV delivery system and education television broadcasts are potentially identical. These delivery systems also parallel the auditorium mass lecture course. So it would be valid to ascribe the same shortcomings to all three. How important is interaction? One must acknowledge that it depends on the course. One must also acknowledge the use of mass lecture courses on most major campuses for the very courses that are most often offered in RSV classrooms. Since these mass lecture courses are by their very nature filled with students, it is difficult to argue that such a format compromises enrollments, but the students in such courses have no choice. On the other hand, education television courses have failed for lack of the enrollment sizes necessary to make them cost effective. It would seem that for outreach education, sufficient enrollment is as much a crucial issue as is instructional effectiveness.

While one-way delivery might be the most cost-effective method of achieving education outreach, there is very little interest in one-way delivery. It doesn't provide an image for the institution that appeals as well to grantors, legislators, and alumni as is the case with a one-way video with two-way audio RSV class or a true two-way RSV class. Moreover, we have been referencing potential benefits. Actual benefits will depend on enrollments, and that will depend on the program offering a circumstance that students want. And as noted earlier, that will depend on how the courses lend themselves to a degree program.
A Comparative Project: Web-Based Faculty Development Versus Print-Based Faculty Development

Melissa Diers, M.A.
Learning Environment and Internet Services
University of Nebraska Medical Center
United States
mdiers@unmc.edu

Abstract: This paper is a report on the findings of a study conducted on a graduate level for a thesis project in partial fulfillment of requirements for a Master of Arts in Education with a focus of Instructional Technology. Two random groups of full-time faculty were selected from the total population for a total sample of 200 study participants. One group was requested to complete a questionnaire upon the completion of a web-based faculty development tutorial. The second group was requested to complete a questionnaire upon completing a print-based faculty development tutorial. Findings indicated the full-time faculty who received the web-based faculty development did not perceive themselves as more aware of the content covered in the faculty development than the faculty who completed the print-based faculty development. Faculty Development programs need to continue the traditional approach when introducing and promoting a web-based approach to faculty development.

Introduction

Universities have experienced significant changes over the decades; the impression of instructional technology has been one of the largest impacts on education. The Internet has changed the way we work and communicate, as well as the way we learn. It is serving as a vehicle for the exchange of information regardless of social, economic or geographical differences (Charp, 2000). Tools and media, which are offered via the World Wide Web have expanded the arena and have empowered educators to transform the teaching and learning process.

Many factors contribute to this change; one is "universities today face a number of internal and external pressures to become actively involved in educational applications of new technologies. Some of these pressures include increasing public access to information technology, government funding priorities for initiatives that support the development of distributed learning networks, increasing competition for students, and the need to provide cost-effective high-quality education to a greater number of students" (Rossner, Stockley, 1997).

Another factor is the indisputable fact that the citizens of the world cannot afford to avoid participation in cyberspace. The nature of the workforce requires higher technological skill level (Hudson Institute, 1987). "Thus, an "elitist" view of education will no longer serve our fast technological, globally-connected society. Faculty must be encouraged to expand their views of education and to grow professionally. Students, like faculty, must be prepared to flourish in the increasingly technological society (Millis, 1994). This change in societal expectation requires the faculty and students to expand their educational and technological skill set. The enhanced faculty technological skill set will contribute to the process of mentoring students to become active citizens within our community and prepare the students for future careers.

To enhance the technological and educational skill set of the faculty an innovative approach to faculty development needs to be implemented. In the past faculty development has appeared in various contexts, typically focused on enhancing the talents, expanding the interests, improving the competence, and facilitating the professional and personal growth of faculty, primarily in their role as instructors (Gaff, 1975).

In recent years, faculty development strategies have taken a different approach by addressing
instructional improvements through skill development, enhancing support services, and ensuring that institutional reward structures reflect the challenges of the effective instructor integrating educational technologies (Willis, 1994).

The use of the World Wide Web as an instructional method represents a new way of looking at instruction and emphasizes the importance of the recent changes in faculty development. “Web-based instruction provides exciting opportunities for universities to introduce sophisticated, interactive technologies into more traditional and familiar instructional settings. These technologies will allow for greater dissemination of information and greater access to knowledge for participants within and beyond the university community” (Rossner & Stockley, 1997).

The expense of integrating the instructional technology has required many universities to restructure budget allocations. Unfortunately, many times the budget provides for hardware and software, but is not sufficient for instructional technology faculty development programs. This oversight has made it more difficult for the faculty to juggle traditional demands with the necessity to enhance technological skill sets, change of instructional methodology, and seamlessly integrate web-based technology into instruction.

Recently, the University of Nebraska Medical Center has attempted to raise the faculty level of awareness of new methods of instruction. The communication model, which has proven to be very effective, has been one-to-one sessions between a faculty member and a consultant. Though this model has been successful it has not been widespread due to the lack of personnel. This study, focused on web-based instruction, represented a cost-effective faculty communication model that has the potential to reach more faculty members by offering a self-managed introduction to the university supported web-based applications and available consultant services when integrating technology into curriculum.

This study focused on the impact of self-perceived faculty awareness of available University of Nebraska Medical Center web-based applications and consultant services after the completion of a researcher-designed web-based faculty development tutorial.

The Study

Recently, the University of Nebraska Medical Center has attempted to raise the faculty level of awareness of new methods of instruction. The communication model, which has proven to be very effective, has been one-to-one sessions between a faculty member and a consultant. Though this model has been successful it has not been widespread due to the lack of personnel. This study, focused on web-based instruction, represented a cost-effective faculty communication model that has the potential to reach more faculty members by offering a self-managed introduction to the University of Nebraska Medical Center supported web-based applications and available consultant services when integrating technology into curriculum.

At the time of the study there were 557 full-time faculty, two random groups were selected from the total population for a total sample of 200 study participants. One group was requested to complete a questionnaire upon the completion of a faculty development web-based tutorial. The second group was requested to complete a questionnaire upon completing a print-based faculty development tutorial. Both questionnaires contained three sections; section one contained demographic information, section two contained information regarding the awareness of the available web-based applications and section three contained information regarding the awareness of the available consultants when integrating instructional technology.

Immediately after the random group assignments were made, the researcher sent a packet to both Group A and Group B. The packet for Group A included a cover letter which outlined the purpose of the faculty development tutorial and directions of how to complete the duties of a study participant, campus self-addressed return envelope, and a researcher-designed questionnaire to be completed upon the conclusion of the researcher-designed web-based faculty development tutorial. The packet for Group B included a cover letter which outlined the purpose of the tutorial and directions on how to complete the duties of a study participant, self-addressed campus return envelope, and a researcher-designed questionnaire to be completed upon the conclusion of reading the researcher-designed print-based faculty development tutorial.
A blanket reminder letter to Group A and Group B. The individuals in each group who had not completed the questionnaire prior to March 13, 2000, were no longer considered part of the study.

The raw score means of Group A and Group B questionnaires were calculated, by sections:

- Section one: demographic information,
- Section two: information regarding the awareness of the available web-based applications and
- Section three: information regarding the awareness of the available consultants when integrating instructional technology.

A one-tailed t-test with a .05 level of significance was used to determine if there was a significant difference between the means of each group.

The data and findings of the study provided information about the self-perceived awareness levels of UNMC faculty members exposed to the researcher-designed web-based faculty development tutorial compared to those who were exposed to the researcher-designed print-based faculty development tutorial. Such information may provide educators with guidance towards beneficial instructional methodologies for faculty development. Such data may help those responsible for the faculty development make better decisions about suitable approaches.

Findings

The study was limited to measuring University of Nebraska Medical Center faculty self-perceived awareness level related to supported web-based applications and consultants, which are available to faculty during the process of integrating web-based instructional technology. The perceptions of the faculty were inventoried with a researcher-designed questionnaire after completing a researcher-designed web-based faculty development tutorial or a researcher-designed print-based development tutorial.

Entire Questionnaire

The total questionnaire response rate was 26.5%, with a total of 53 responses. Group A participants who were requested to complete the researcher-designed web-based faculty development tutorial and questionnaire had a response rate of 24 out of 100 of the sample population. Group B participants who were requested to complete the researcher-designed print-based faculty development tutorial and questionnaire had a response rate of 29 out of 100 of the sample population.

The researcher utilized the reported results to determine the means, standard deviations, and variances for the raw scores of the entire questionnaires for both groups. A one-tailed t-test with a .05 level of significance standard was used to determine if the difference between Group A and Group B means were significant. The results showed that Group B (print-based group) (M=3.92, SD=.80) perceived themselves to be more aware of UNMC supported web-based applications and consultant services available to assist in the integration of web-based technologies than the Group A (web-based group) (M=3.15, SD=.82) (t (51) = -3.44, p=.0024, one-tailed test).

Questionnaire: Section One

The first section of the questionnaire consisted of 7 items on the print-based questionnaire and 9 items on the web-based questionnaire. The items pertained to demographic information and specific questions concerning the researcher-designed print-based and web-based tutorials.

Gender Distribution

The gender distribution within the total population of the University of Nebraska Medical Center full-time faculty consisted of 373 (66.9% of total population) male faculty and 184 (33.1% of total population) female faculty.

Group A (web-based group) sample population consisted of 69 (69% of Group A sample population) male faculty and 31 (31% of Group A sample population) female faculty. The Group A response rate population was
17 (70.9%) male participants and 7 (29.1%) female participants.

Group B (print-based group) sample population consisted of 64 (64% of Group B sample population) male faculty and 36 (36% of Group B sample population) female faculty. The Group B response population was 20 (69%) male participants and 9 (31%) female participants.

Based on statistical analysis the researcher concluded the sample population and respondent population of both groups were reasonably accurate representations of the entire gender distribution of UNMC full-time faculty population.

**College Affiliation**

The college affiliation population of the total University of Nebraska Medical Center full-time faculty consisted of 393 (71%) from the College of Medicine, 84 (15%) from the College of Nursing, 28 (5%) from the College of Pharmacy, and 52 (9%) from the College of Dentistry.

Group A sample population consisted of 70 (70%) College of Medicine faculty, 15 (15%) College of Nursing faculty, 5 (5%) College of Pharmacy faculty, and 10 (10%) College of Dentistry faculty. Group A response population consisted of 15 (62.6%) College of Medicine, 4 (16.6%) College of Nursing, 3 (12.5%) College of Pharmacy, and 2 (8.3%) College of Dentistry.

Group B sample population consisted of 71 (71%) College of Medicine faculty, 14 (14%) College of Nursing faculty, 5 (5%) College of Pharmacy faculty, and 9 (9%) College of Dentistry faculty. Group B response population consisted of 19 (65.5%) College of Medicine, 5 (17.2%) College of Nursing, 2 (6.8%) College of Pharmacy, and 3 (10.3%) College of Dentistry.

The College of Nursing and College of Pharmacy respondent population of Group A was greater than the sample population. The College of Medicine and Dentistry respondent population of Group A was lower than the sample population.

The College of Nursing, and College of Pharmacy Group B respondent population was greater than the sample population. The College of Medicine and Dentistry respondent population of Group B was lower than the sample population.

Overall the sample population and respondent population was an accurate representation of the college affiliation.

**Age**

The mean age of the respondent population was 41 to 50 years of age. Group A consisted 4 participants 40 or under, 12 participants 41 to 50, 6 participants 51 to 60, and 2 participants greater than 60. Group B consisted 7 participants 40 or under, 10 participants 41 to 50, 11 participants 51 to 60, and 1 participant greater than 60.

**Skill Level**

The Internet is making an impact on many aspects of our lives. It has changed the way we work and communicate, as well as the way we learn (Charp, 2000). All of the study participants have used the Internet, 17% self-rate their skill level at Beginner, 62% self-rate their skill level at Intermediate, 19% self-rate their skill level at Advanced, and 2% self-rate their skill level at Expert with using the Internet (World Wide Web).

The total respondent population reported only seven (13.2%), two Group A (web-based) respondents and five Group B (print-based) respondents, had personally developed an entire World Wide Web-based course. The total respondent population reported 18 (33.9%), seven Group A respondents and eleven Group B respondents, have personally supplemented a course with the World Wide Web-based materials.

**Time Allotted to Completing the Tutorial**

The mean time respondents allotted to complete the tutorials was ten to twenty minutes. Group A reported an average time allotment of 21 to 30 minutes and Group B reported an average time allotment of 10 to 20 minutes.
Questionnaire: Section Two

The second section of both questionnaires consisted of eleven items that addressed the level of self-perceived awareness of the UNMC supported web-based applications. The researcher used the reported results to determine the means, standard deviations, and variances for the raw scores on section two of the questionnaires for both groups. A one-tailed t-test with a .05 level of significance standard was used to determine if the difference between the means were significant.

Questionnaire: Section Three

The third section of both questionnaires consisted of four items that addressed the level of self-perceived awareness of UNMC consultant services available to assist in the integration of web-based technologies. The researcher used the reported results to determine the means, standard deviations, and variances for the raw scores on section three of the questionnaires for both groups. A one-tailed t-test with a .05 level of significance standard was used to determine if the difference between the means were significant.

Conclusions

The results of the second section of the questionnaire showed that Group B (print-based group) (M=3.90, SD=.81) perceived themselves more aware of University of Nebraska Medical Center supported web-based applications than the Group A (web-based group) (M=3.20, SD=.89) (t (51) = -2.97, p=.0088, one-tailed test).

The results of the third section of the questionnaire showed that Group B (print-based group) (M=3.96, SD=.87) perceived themselves more aware of the available consultant services available to assist in the integration of web-based technologies than the Group A (web-based group) (M=3.28, SD=.98) (t (51) = -2.65, p=.0212, one-tailed test).

Both questionnaires proved to be reliability based on the results of the Cronbach’s alpha test. The statistical findings of the entire questionnaire, section one, section two, and section three was discussed. Section one compared the gender, college affiliation, age, skill level, time allotted to completing the tutorial, and printing the web-based tutorial of the two response groups. Section two and three concluded Group B (print-based), the participants that completed the print-based tutorial showed a significantly higher level of self-perceived awareness when compared to Group A (web-based), the participants that completed the web-based tutorial.

The implications of the results validate the current form of faculty development and emphasize the necessity of the continuation of the current programs focusing on the integrating technology into instruction. An expansion of the number of available consultants might be necessary to gain a broader coverage of the full-time faculty. A print-based promotion emphasizing the potential outcomes and focus of technology within the classroom needs to be implemented. One primary potential outcome of the promotion would be to contribute to the cultural transition period from traditional role of the faculty and student to the new faculty and student role.

The researcher recommends future studies to consider 1) the impact of college culture, 2) use of the Internet, and 3) a comparison between UNMC, a medical university to a non-medical university. With further studies, the impact of web-based faculty development can be modified and embraced to serve the needs of the UNMC full-time faculty.

Based on the results, the study showed the UNMC full-time faculty who received the web-based tutorial (Group A) did not perceive themselves as more aware of the UNMC supported web-based applications and consultant services available to assist in the integration of web-based technologies than the print-based group (Group B).

Abstract: This literature review provides an overview of recent research that has been conducted on online learning, as well as indicating the extent and type of research being carried out. Twenty-five representative studies were selected and categorized. Addressing four questions can best summarize the review of research on online learning. They are: 1) What scientific research design criteria and types of theory can be applied to evaluate the quality of research on online learning environments? 2) How do the online learning research examples that have been sampled meet the criteria for scientific research? 3) What can we learn from the results of the review of research on online learning based on the type of research performed? 4) What can we conclude from the results of research on online learning environments to date?

Introduction

Delivering instruction online is a relatively new phenomenon for educators. Concerns over student achievement and attitudes, course design and delivery, course evaluation, instructor abilities, and attitudes are currently being explored by researchers; however, detailed evaluations of these factors utilizing well-developed research plans are relatively scarce at this time. The purpose of this literature review is to provide an overview of research that has been conducted on online learning, as well as to indicate the extent and type of research being carried out. Two research questions to be answered are: What
can we learn from the results of the review of research on online learning based on the type of research performed? What can we conclude from the results of research on online learning environments to date?

Planned professional use of this literature review includes; 1) identifying best online learning practices to serve as a basis for the development of guidelines and evaluation tools for online interactive learning environments, 2) developing research design strategies for exemplary online modules addressing time, place, and physical limitations for traditional and nontraditional students in education and engineering, and 3) utilization of constructivist pedagogy as the foundation of the development of the interactive learning exemplars.

Review of Research Process

The review concentrated on research findings published recently during which online learning became a common part of the use and development of the Internet. The purpose of the review was to show what is being selected, categorized, and published in the field. The professional literature sources searched were selected as representative of the core of literature databases in the area of online learning and classroom teaching and learning. The sources included Educational Resources Information Center (ERIC), Dissertation Abstracts, abstracts from the annual and regional conferences of the American Educational Research Association (AERA) and the National Association for Research on Science Teaching (NARST), Internet online journals specializing in research, and specific science education journals publishing research on learning.

Nominations of citations to consider were related to several selection criteria. The first required citations to be reporting results of studies published between 1997 and 2000. Few pre-1997 studies of online learning warranted inclusion. The technology has been changing so quickly that recent studies use significantly evolved hardware and software rendering possibly different conclusions. The second criterion required that the study relate to courses or modules involving online learning providing distance education via the Internet. The third criterion required the citation to relate to evidence of learning outcomes of students involved. Particular priority was made to find studies that compared online and classroom learning outcomes. An effort was made to eliminate citations that focused on “how to” and “show and tell.” Finally, citations relating only to courses and modules for higher or adult education were sampled.

Multiple searches were performed on each database. Searching on the queries related to “online and classroom learning” and “online courses and classroom teaching” yielded more than 400 citations. Adding the term “research” reduced the yield to 155 citations. Full articles obtained for these 155 citations were read and reviewed. Final selection of the studies to be included in this review of research applied the four criteria cited above. The final list included 25 studies. The studies, by type, are as follows:

Quantitative and Qualitative Studies

Pre-Experimental and Pilot Studies

De Simone, Schmid, and Lou (2000); Saunders, Malin, Malone, Nay, Oliver, and Thompson, Jr. (1997); Gaud (1999); Shih, Ingebritson, Pleasants, Flickenger, and Brown (1998); McLellan (1997); Mende (1998); Schlough and Bhuripanyo (1988); Powers, Davis, and Tarrence (1998); Hegengi (1998); Loomis (2000); Stith (2000); Kroder, Suess, and Sachs (1999); Vrasidas and McIssac (1999).

Large Surveys

McNaught, Kenny, Kennedy, and Lord (1999); Rossman (1999); Jiang and Ting (1999).

The 25 studies were reviewed and evaluated using the following tasks and measures: type of study and comparison basis, number of subjects, data collection instruments, outcome variables measured, courses studied, and results and conclusions based on evidence obtained from students outcomes. A narrative review of the 25 selected studies, grouped by online versus traditional learning, student and
teacher perceptions, and reports of online course design, was completed, as well as a summary table of this information.

Discussion of the Review of Research

Addressing four questions can best summarize the review of research on online learning presented here. They are:

1. What scientific research design criteria and types of theory can be applied to evaluate the quality of research on online learning environments?
2. How do the online learning research examples that have been sampled meet the criteria for scientific research?
3. What can we learn from the results of the review of research on online learning based on the type of research performed?
4. What can we conclude from the results of research on online learning environments to date?

Question 1: What scientific research design criteria and types of theory can be applied to evaluate the quality of research on online learning environments?

In answer to the first question, the literature identifies specific design criteria for quantitative and qualitative research (Brause & Mayher, 1991). Among these criteria are random sampling, appropriate group size, controlled variables, and internal and external validity that are addressed in the research design (Campbell & Stanley, 1963). For qualitative research sample criteria are a clear statement of the research purpose and question, research design, sample population, observer researcher, and the data analysis procedures (Stake, 1995; Denzin & Lincoln, 1994; Wolcott, 1990). Types of theory used to categorize the research studies can be summarized with a hierarchy of categories (Reynolds, 1971; Snow, 1973). The least useful type of theory involves creation of typologies that can best be identified as descriptive research. The next level of theory involves looking for correlation between events. The third level involves cause and effect. This level involves an experimental design with control and experimental groups. It may involve application of inferential statistics. The fourth and fifth levels of theory, sense of understanding and control, were not found in the research reviewed.

Question 2: How do online learning environment research studies that have been sampled meet criteria for scientific research?

In reviewing the research literature selected for online learning, no study was found to meet the scientific research design criteria given above for Question 1. The research designs were flawed, making the conclusions derived from the studies open to debate. Of the 25 studies reviewed, 16 had serious design flaws. Using these studies, it is not possible to determine whether learning online results in more positive attitudes and higher achievement, than does learning in the traditional classroom context. These studies do not meet the third level type of theory. They were, at best, pre-experimental case studies of web design courses. They used the development of typologies or determining correlations among events as the main form of analysis.

The remaining nine studies compared traditional with Web-based courses. Seven of these studies were quantitative studies and two were qualitative. In each case, the study had design flaws. Some of these flaws in the quantitative studies included: lack of use of random sampling, small sample size, lack of control of alternative variables, treatment periods that were too short, and lack of assessment of instruction or instructor quality. The two qualitative studies were designed for hypothesis generation rather than hypothesis testing. Because of a lack of triangulation, small number of subjects, and the few specific situations studied, results cannot be generalized beyond these studies' settings.

In both types of studies there was a failure to describe adequately pedagogical methods used. There was no description of the prior knowledge students brought into the learning situation, such as knowledge of the content taught or their ability and experience with the technology used. Therefore, it is
not possible to determine whether improvement in achievement was the result of online instruction or other uncontrolled factors.

Question 3: What can we learn from the results of the review of research on online learning environments based on the type of research performed?

In the studies selected, it was concluded that online instruction was as good as, or better than, traditional instruction, or that online learning is a viable strategy. These conclusions were not warranted because of the flaws in research design. However, online learning research in the selected studies can inform us in regard to potential variables and best practices that should form the basis of future research. The research base to date should be seen as a basis to begin hypothesis-generating research. It informs us about suspected and potential variables that should be considered in creating research designs and performing the research process to determine cause and effect for higher levels of theory and more useful knowledge.

At the present time, the lack of adequately designed research does not allow us to rate online instruction as better, or even the same, as traditional forms of classroom instruction. However, the results of the studies reviewed provide useful information to be explored using the media with research-supported classroom pedagogical practices. Some of these pedagogical practices include adequate and timely feedback, student-student and student-teacher interaction, and a safe and supportive climate for learning. Thus, the results of the online studies demonstrate that potentially viable online courses need strong consideration of structuring, timing, and the use of specific pedagogical practices. Studies of online courses demonstrate possible approaches to successfully implement these pedagogical practices.

Question 4: What can we conclude from the results of research on online learning environments to date?

The reviewed studies provide some support for the use of particular practices in an online learning format. These best practices are described in Table 1 and are grouped into four categories: 1) student behaviors; 2) faculty-student interactions; 3) technology support; and 4) learning environment. These best practices are associated with higher positive learning attitudes and achievement. Where they can be connected to, or derive from, research-supported pedagogical practice these best practices serve as potentially effective practices in online course design.

### Technology Support

### Learning Environment

| Mandate smaller class sizes for online courses to give the faculty appropriate time to deliver quality instruction | Gaud (1999) |
| Use flexible deadlines in online courses (helps to motivate students, maintain communication, and allow for technical problems) | McLellan, 1997 |
| Use streaming audio for reading online | Kroder et al. (1998) |
| Organize web site to allow the student to interact with the content and other students and instructor | Gillani (1998) |
| Create an online environment that is welcoming, nurturing, and safe | Bonk & Cummings (1998) |
| Present course content in a manner that hierarchically structures the sequence of information | Miller & Miller (1999) |
| Obtain student feedback to insure accuracy of understanding | Miller & Miller (1999) |
| Provide opportunities for students to question the instructor to insure accuracy of understanding | Miller & Miller (1999) |
| Create opportunities for students to communicate with each other in class | Miller & Miller (1999) |
To share their understanding of course content

- Present a problem-solving situation in a realistic context
  - Miller & Miller (1999)
- Provide opportunities for learners to collaboratively construct knowledge based on multiple perspectives, discussion, and reflection
  - Miller & Miller (1999)
- Provide opportunities for students to articulate and revise their thinking in order to insure the accuracy of knowledge construction
  - Miller & Miller (1999)
- Ensure an equitable environment exists for gender differences in learning styles, participation barriers, and communication
  - Blum (1999)
- Include cooperative and collaborative learning in courses to distribute workload through group (supports female students preferred method of connected learning)
  - Blum (1999)
- Promote gender equality by encouraging females to post messages while asking males to subside if a pattern of male domination is noticed
  - Blum (1999)
- Ensure an equitable learning environment exists for all students
  - Blum (1999)
- Allow time for reflection at the end of the course
  - Wegerif (1998)
- Include a "warm-up" period with light-hearted exercises aimed to help students get to know one another
  - Wegerif (1998)
- Start an online course with all students together at the same time
  - Wegerif (1998)
- Provide equal access to the shared conversation in online course
  - Wegerif (1998)
- Provide opportunities for students to control online learning and structure it for themselves
  - Wegerif (1998)
- Provide discussion forums which encourage open and honest dialog
  - Rossman (1999)
- Conduct a teleconference during and at the end of the course to discuss successes and problems
  - Rossman (1999)
- Use computer conferencing to develop overall critical thinking skills

Distance Learning: An Examination of Perceived Effectiveness and Student Satisfaction in Higher Education

Donna M. Gabrielle
The Florida State University
Department of Educational Research, Tallahassee, Florida, USA
gabrielle@mailer.fsu.edu

Abstract: Distance learning is a tremendous issue due to paradigm shifts in pedagogy and business. Data was collected from eight Florida postsecondary institutions, then multiple regression and conditional regression analyses were conducted. Findings indicated that technical quality and student interaction were significant predictors of effectiveness and satisfaction for distance students. When using personal characteristics as predictors, younger students, males, and students with higher levels of education were more likely to report higher levels of both instructional effectiveness and satisfaction. Finally, distance students indicated less satisfaction and effectiveness than traditional students. These differences, as well as student-material interaction, perceived quality, and prior distance experience, were found to be statistically significant using two-tailed t-tests. This research suggests that there are distinct factors that predict satisfaction levels and perceptions by distance students of the effectiveness of instruction they are receiving, stressing the importance of focusing on quality and interaction between students and instructors.

Introduction

Distance learning involves a series of controversial issues due to enormous paradigm shifts in pedagogy, demographic changes, increasing demands for both formal and continuing education, plus spiraling education costs. A growing number of new broadcast and interactive communication technologies further complicate the issues.

Prior research has pointed to the effectiveness of carefully conceived interactive radio, educational television and distance learning programs. Many of these successes, however, are shadowed by low student completion rates. Consequently, there are numerous concerns over what factors help determine students' willingness to initiate and complete distance programs. This study examines a series of educational, technological and personal characteristics that predict students' perceptions of instructional effectiveness and satisfaction with distance learning classes.

Distance Education and Distance Learning

Distance education has its roots in correspondence courses, which became popular in the late 19th century. By some accounts, correspondence education dates back to Biblical times (Bates, 1995; Holmberg, 1986), however, one of the first documented references to organized distance education was in the March 20, 1728 edition of The Boston Gazette. An instructor of the “New Method of Short Hand”, Caleb Phillips, advertised that “Persons in the Country desirous to Learn this Art, may by having the several Lessons sent Weekly to them, be as perfectly instructed as those that live in Boston” (Battenberg 1971, p. 44, cited in Holmberg, p. 6).

More than two centuries later, the demand for education increased immensely as hundreds of thousands of World War II troops were granted benefits under the Government Issue (GI) Bill. Some of this demand was met through correspondence courses, but in 1969, the pass rate for such courses was less than 5 percent (Garrison, 1989). Partly in response to these low pass rates, correspondence education evolved into courses that use new educational paradigms and communication technologies to enhance traditional print media and provide more reciprocated communication. During this evolution the term “distance education” was developed (Holmberg, 1986).

Sukow (1992, p. 47) noted that the meaning of “distance learning” tends to change radically, depending on which company or government organization is approached and the technology employed. Distance learning via interactive technology refers to delivery of video, audio, and data at one site to one or more sites, where the remote sites can interactively and synchronously or asynchronously communicate through audio, text, or both video and audio to the host site. This includes instruction through Instructional
Television Fixed Services (ITFS), satellite, cable, fiberoptics, the Internet, the World Wide Web (WWW), CD-ROM, and forms of video conferencing.

Simultaneous to the progression of interactive technologies, comparable changes have been occurring in pedagogy. This shift has been brought about, in part, by the fact that educational institutions now see the necessity to reach people who might not otherwise be reached. There similarly is a growing number of work force groups that require continuing education. Furthermore, the emphasis in education has now changed, shifting much of the paradigm from teaching to learning.

In addition to the paradigm shift in U.S. education, there also are changing demographics. The average age of the population is increasing while the number of 18-21 year old college students is decreasing (Gessner, 1987). The majority of these older students are already in the work force. Many are extremely busy; most are interested in part-time education, and some are interested in lifelong learning (Burnham and Seamos, 1987). Between 1970 and 1993, part-time enrollments in American higher educational institutions increased 128 percent from 3 million to 6.6 million, while growth in full-time enrollments only increased 38 percent (Brown, cited in Johnson, 1995, p. 22). Educational institutions are expanding their clientele to include people who may have never thought of attaining a higher education.

The Open University (OU) in Great Britain was one of the first educational facilities to use technology for distance learning. When OU began offering courses in Great Britain in 1971, it changed the reputation of distance learning by providing quality education to students through the use of a variety of media (Tait, 1991). This concept of using a variety of media in a distance learning environment was considered a “radical innovation” (Bates, 1984). However, what was at one time revolutionary is now becoming commonplace. From the Teleuniversité in Quebec to the Fernuniversität in West Germany to the University of Paisley in Hong Kong, distance learning is becoming widespread. Many of these distance learning programs use innovative broadcast and interactive communication technologies.

**Distance Learning Effectiveness**

Previous evaluations of distance learning have been primarily concerned with its effectiveness. Research has found that exam pass rates of distance students are comparable to exam pass rates of full-time students (Perraton, 1991; Zigerell, 1991). Researchers from hundreds of studies have drawn similar conclusions. Nearly 90% of the comparisons between media assisted distance learning and traditional education conditions have shown no appreciable differences in student achievement. (Nakieru, 1985).

There are, however, differences between the retention of students in distance learning versus traditional class settings. Some recent programs have reported dropout rates of up to 80% (Perraton, 1991). Even among the best distance learning programs, such as the Open University, only about 50 to 60% of distance students actually graduate. “This is much lower than the 80-90 per cent achieved by full-time students but is probably comparable to that of other part-time students” (Perraton, 1991, p. 2).

With the rapid expansion of competing distance learning options, students now have a growing number of choices of which classes to take and which programs should be continued. These choices raise inevitable questions concerning what factors help determine students' willingness to initiate and complete programs. In particular, this raises fundamental questions over what factors predict distance learning students' perceptions of instructional effectiveness and students' satisfaction with their classes.

**Perceptions of and Satisfaction with Distance Learning Classes**

Previous studies point to a number of educational features, technological innovations and personal characteristics that may predict students' perceptions of and satisfaction with distance learning classes. The following sections introduce these predictor variables. A series of hypotheses are then proposed along with conditions that may affect these relationships.

**Student-Teacher Interaction**

Student isolation is a potential problem in any learning environment. Isolation especially is a threat to the success of distance students. Student-teacher interaction and feedback are frequently mentioned as distinguishing features of successful educational programs (Bates, 1984). Whether the interaction and feedback are immediate during the class or in subsequent discussions, the nature and frequency of student-teacher interaction have been found to be important to effectiveness (Feldman, 1989).
Student-Material Interactions

In addition to isolation, student boredom is a threat to learning. This threat can be magnified when resources are largely centered on materials (Perraton, 1991). The introduction of interactive technologies further complicates and augments the potential for student-material interactions. In the case of distance learning, instructional designers pay particular attention to the quality of the resource materials, the technologies and the degree to which students can interact with these elements.

Access to Technology

Access to technology is both a social equity policy problem, and factor that can limit the effectiveness of distance learning (Bates, 1995; Cybela, 1996). In order to make materials more available and interactive, instructional designers have turned to the Internet, satellite, cable, CD-ROMs, and forms of video conferencing. The availability and convenience of these technologies plays a growing role.

Perceived Quality

Perraton (1991) argues that quality is of utmost importance to distance education, stressing that it must be monitored to ensure effectiveness. Others note that materials for distance learning courses are typically of better quality, more motivating and more interesting than those used in traditional classroom environments (Bates, 1984; Perraton, 1991). Since the proliferation of the Internet, quality is not as much an issue except with streaming video and other technologies that require higher bandwidth.

Prior Experience

Students bring their prior experiences to the learning setting. In traditional education, students’ backgrounds have often been tested as potential biases in students’ evaluations of their educational experiences (Marsh, 1984). While little research has been conducted in this area, it seems logical that students’ prior experiences with distance learning will likewise influence their perceptions of and satisfaction with distance learning classes.

Technological Levels

Students’ comfort with technologies is a final factor that represents a condition that can influence perceptions of and satisfaction with distance learning. Gehlauf, Shatz and Frye (1991) discuss the issues of anxiety and comfort with technology. They further discuss the role that training can play in helping individuals become comfortable with technology. As educational programs increasing involve new electronic innovations, it is important to understand the role that students’ technological levels and comfort with technologies play in creating conditions where distance learning may or may not be successful.

Propositions and Research Questions

Based upon the previous literature and current issues facing distance learning, this study examined four research propositions.

H1 Student perceptions of instructional effectiveness are positive functions of:
- student interaction with instructors
- student interaction with instructional materials
- student access to technologies
- the perceived quality of instructional media utilized.

H1a The relationship among these four predictors and perceived instructional effectiveness will be greater in distance learning environments compared to traditional learning environments.

H1b The relationship among these four predictors and perceived effectiveness will be greater for students who are more technologically advanced than for students who are not as comfortable with technology.

H2 Student satisfaction with distance education is a positive function of:
- student interaction with instructors
- student access to technologies
- the perceived quality of instructional media utilized
- prior experience in distance learning environments.
H2a The relationship among these four predictors and student satisfaction will be greater in distance learning environments compared to traditional learning environments.

H2b The relationship among these four predictors and satisfaction will be greater for students who are more technologically advanced than for those students who are not as comfortable with technology.

In addition to the research propositions, three research questions were tested. The research questions were:
1. Is there a relationship between student age and the criterion variables?
2. Is there a relationship between student sex (gender) and the criterion variables?
3. Is there a relationship between student education levels and the criterion variables?

Each of these questions was examined in the overall and conditional analyses.

Methods

Data were collected in 1996 from eight higher educational institutions in Florida. The institutions employed a variety of technologies. Several of the participating educational institutions had classes that merged both traditional and distance learning students. In other classes, there were only distance students. Students responded to questionnaires via mail, facsimile, or electronic mail. The questionnaires were adapted from Bolduc (1993), with changes made to reflect the nature of this study. A total of 253 students participated in this study --- 174 distance learning students and 79 traditional students.

Cronbach Alpha analyses indicated that the reliability of the items in this study ranged from .70 to .87. Only the student-teacher interaction variable (Alpha = .70) fell below the traditional criterion level of .80. Multiple regression and conditional regression analyses were used to test the research propositions and questions. One-tailed tests were calculated where a direction was predicted. Since the research questions involving personal characteristics did not predict directions, two-tailed significance levels were calculated.

Results

The predictor variables in this study were student-teacher interaction, student-material interaction, access to technology, perceived quality of instructional media, and prior student experience with distance courses. In addition, age, sex, and highest degree completed were used as predictor variables.

Perceived Instructional Effectiveness

Multiple regression analysis was initially used to predict perceived instructional effectiveness and student satisfaction levels. The data indicated that when using the combination of educational and media factors, and personal characteristics, a significant positive relationship ( = .254) was found between student-teacher interaction and perceptions of instructional effectiveness. The same pattern was found when using perceptions of media quality to predict levels of instructional effectiveness ( = .332). There was also a significant positive relationship with students' highest degree completed ( = .177). Student-material interaction, access to new technologies, age and sex were not significant predictors of perceived instructional effectiveness. The overall multiple correlation for the criterion and predictor variables was .532, with an adjusted R2 = .242 (p = .000).

Predicting Instructional Effectiveness - Distance vs. Traditional Students

The sample group was divided into traditional and distance students. Interestingly, when predicting perceived instructional effectiveness among traditional students, none of the predictor variables was found to be statistically significant. Among distance students, there was a significant positive relationship ( = .260) between perceptions of student -teacher interaction and perceptions of instructional effectiveness. A comparable pattern was found when using perceptions of quality to predict instructional effectiveness ( = .375). The remaining factors and characteristics were not statistically significant. In the total model among distance students, there was a R = .487, with an adjusted R2 = .163 (p = .005).

Predicting Perceived Instructional Effectiveness - Technological Level of Students

Respondents additionally answered questions related to their use of various technologies. A median split was calculated to create conditions of more versus less technologically advanced students.
When looking at the data on technologically advanced students, there was a significant positive relationship \((r = .499)\) between student-teacher interaction and perceptions of effectiveness. Again, perceived media quality was also positively correlated \((r = .265)\). There were no statistically significant predictors between the personal characteristics variables and perceived instructional effectiveness. The overall multiple correlation for the predictor variables was \(R = .660\), adjusted \(R^2 = .351\) \((p = .000)\).

Among less technologically advanced students, there was a significant positive relationship \((r = .209)\) between student-teacher interaction and perceptions of effectiveness. Once again, the same pattern was found for media quality \((r = .287)\). The overall \(R\) was .521, with an adjusted \(R^2 = .177\) \((p = .012)\).

**Student Satisfaction**

In addition to effectiveness, student satisfaction levels were measured and multiple regression was used to analyze the data. When a combination of educational factors and personal characteristics was used, a significant positive relationship \((r = .201)\) was found between student-teacher interaction and student satisfaction. Perceptions of media quality were also positively related to student satisfaction \((r = .415)\). None of the other educational factors or personal characteristics was statistically significant. The overall multiple correlation for the predictor variables was .536, adjusted \(R^2 = .247\) \((p = .000)\).

**Predicting Student Satisfaction - Distance vs. Traditional Students**

As with perceived effectiveness, the sample group was divided into traditional and distance students to predict satisfaction. Consistent with the findings of effectiveness, when predicting satisfaction among traditional students, no educational factors or personal characteristics were statistically significant.

Among distance students, there was a significant positive relationship \((r = .246)\) between perceptions of student-teacher interaction and student satisfaction. A similar relationship was found when using perceptions of technical quality to predict student satisfaction \((r = .517)\). The remaining educational factors and personal characteristics were non-significant. In the total model predicting student satisfaction, the educational factors and personal characteristics were correlated \(R = .557\), adjusted \(R^2 = .244\) \((p = .000)\).

**Predicting Student Satisfaction - Technological Level of Students**

A median split was used to categorize technologically advanced and less technologically advanced students. Among technologically advanced students, there was a significant positive relationship \((r = .267)\) between perceived media quality and student satisfaction. A positive relationship also existed for the age of students and their reported satisfaction levels. Older technologically advanced students reported less satisfaction with their classes. The overall multiple correlation for the predictor variables was .650, with an adjusted \(R^2 = .341\) \((p = .000)\).

Among less technologically advanced students, there was a significant positive relationship \((r = .361)\) between perceptions of media quality and student satisfaction. With personal characteristics, the highest degree completed was positively related to levels of student satisfaction \((r = .264)\). The remaining educational factors and personal characteristics were non-significant. Considering the total model predicting satisfaction among less technologically advanced students, the educational factors and personal characteristics were correlated \(R = .518\), adjusted \(R^2 = .172\) \((p = .015)\).

**Conclusions**

Distance learning is a tremendously important issue in today’s world. This study evaluated how host (traditional) and remote (distance learning) students perceive the effectiveness of their instruction and their satisfaction with instruction. The findings of this study revealed that student-teacher interaction and perceived media quality are consistent positive predictors of student perceptions of instructional effectiveness and student satisfaction. These predictor variables were particularly important for distance students. Student-teacher interaction and perceived media quality are consistent positive predictors of student perceptions of instructional effectiveness for both technologically advanced and technologically less advanced students. When predicting student satisfaction, student-teacher interaction and perceived media quality are consistent positive predictors only among technologically advanced students. However, when predicting satisfaction among less technologically advanced students, only perceived media quality is significant. Finally, while not hypothesized, the means and standard deviations revealed that distance...
(remote) students indicated less student satisfaction and perceived instructional effectiveness than
traditional (host) students. These differences were statistically significant using two-tailed t-tests.

The findings of this study are generally consistent among variables of instructional effectiveness
and student satisfaction. This research shows that despite all of the studies that have concluded that there
are "no significant differences" between effectiveness of traditional and distance learning, there are
differences in the variables that predict traditional and distance learning students' perceptions of
instructional quality and their satisfaction with their instruction. There are many variables that need to be
taken into account, but this study does suggest that in, distance learning, there must be a focus on media
quality and interaction between students and the instructor.

There still are many questions that remain unanswered that could lead to beneficial research
topics. For example, among distance learning students, to what extent can we anticipate class completion
and program graduation using student-teacher interaction, perceived quality, perceived instructional
effectiveness, student satisfaction as predictors? To what extend can we enhance these predictors (through
motivation factors, self-efficacy, etc.) to promote learning, graduation, and increased satisfaction among
distance learners? These are fundamental questions that distance learning researchers should help answer.

Online Personal Learning in Teacher Preparation

David Gibson
The National Institute for Community Innovations
United States
dgibson@nici-mc2.org

Abstract: Work by the National Institute for Community Innovations (NICI at http://nici-mc2.org) is leading to new web-based tools for enhancing preservice education and supporting increased use of technology, especially in Professional Development Schools. One of the tools, the NICI Online Personal Learning Plan (PLP) for preservice students, is intended to assist learners through the processes of: 1) Self-assessment of strengths, interests and aspirations; 2) Planning preservice education learning goals and projects; 3) Linking goals and projects to valued outcome standards; 4) Creating original work and sharing the work with others; 5) Receiving high quality feedback for the improvement of their work; 6) Documenting and validating the achievement of learning goals; and 7) Assisting in the selection and preparation of exhibits of learning. This paper discusses the roots and rationale of the project, and presents some of the details of the thinking that is guiding the web-tool development.

Groundwork and Rationale

The lineage of the NICI Online Personal Learning Plan comes from two sources. One source is a bold move by a local secondary school community in Montpelier, Vermont that in 1993 placed "individualized educational plans for every student" in their long term strategic plan (Gibson & Clarke 1999). This led, in 1995, to the creation and implementation of a school-wide program to place personal learning at the center of a continuous conversation involving all students, their parents or guardians, and caring adults in a school. Support for the school-based development came from the University of Vermont. In addition, early in its development, the concept of the Montpelier "PLP" was picked up by the Regional Laboratory at Brown University, and combined with similar movements and interests in Rhode Island, Maine, Massachusetts and other New England states. In Maine, for example, the concept of personal learning took on a primary role in that state's new proposal for the reform of secondary schools. In other work of the Lab, the theme of personalization became a crucial feature of the secondary reform network in the region, and was tied to the principles of "Breaking Ranks," the reform monograph of the National Association of Secondary School Principals. Thus, the concept of personalization of learning as essential to educational reform is well-founded in theory as well as practice.

The other source is the pioneering work of the WEB Project, which makes available web-tools and networked communities for original student work to be shared and critiqued online. The WEB Project successfully brings together working professionals and classroom teachers in support of the improvement of student work by focusing high quality feedback to a learner based on their articulated intentions for their work. The secrets of success of the project are probably many, but it is worth pointing out the learner-centered nature of the online dialogs and the singular focus on creation of original work. Also, the entire sequence of activity in the project only begins if and when a student shares a work-in-progress and asks for specific feedback. These qualities of learner-centeredness, creativity, self-initiative and intellectual focus have been carried forward into the web-based PLP.

The rationale for building a web-based tool focused on the improvement of preservice teacher work has two parts. First, there is a need for feedback to come from a diverse audience, yet preservice and induction programs sometimes have limited resources and structures that produce scant feedback to aspiring teachers. As a result, an aspiring teacher's work evolves in isolation, perpetuating the general conditions of teaching present in most schools today. A web-based professional network can help overcome isolation, but even more important, it can provide the future teacher with high quality information that might not otherwise be available. The advantages of "anytime, anyplace" access to experts is an obvious benefit of a web-tool.

The second rationale is that there is a need for effective documentation of learning beyond paper and pencil formats. Ideally, documentation should be a record of the decisions as well as the validation of the work produced. In small personalized programs, preservice teachers benefit from many interviews and observation/feedback sessions related to their work, but in many programs, that experience is limited to the last few months of preparation. An online personal learning plan can help create a longitudinal multimedia record of growth and change in an aspiring teacher's skills and capabilities.
The sources of inspiration and rationale led us to ask "What does preservice teacher work look like?" "What would happen if we could build a site for the improvement of a future teacher's work?" "Could the principles of personalization and helpful feedback in a professional network assist teacher education programs?" The online Personal Learning Plan is a way to pose answers to these kinds of questions.

Critical Components in the Online Personal Learning Plan

Online learning is here to stay. It brings remote resources to the desktop anytime, anyplace. Yes, it is in its infancy, and lacks many important features needed for rich human communication, but so in their own way do writing, film, video, and talking. Using the new online communication tools for learning is a matter of integration and balance and their effectiveness depends on the attributes of both the learner and teacher. The Online PLP promotes a uniquely learner-centered approach to the challenge of integration and balance of technology in learning. The following basic assumptions guide the thinking behind the NICI - PLP.

Face-to-Face as a Foundation of Learning The online world is an extension of human contact. The Online PLP does not and cannot replace face-to-face contact needed for learning.

Three bases for planning and action for learning The purposes of learning can be categorized by three domains:
1. Institutional priorities – our shared community goals
2. Professional priorities – our scholarly traditions and expectations
3. Personal priorities – our source of deep meaning

The Learning Cycle The Online PLP can be a powerful extension and helpmate in the "action research" process of planning, doing, reflecting and consolidating knowledge.

Focus on the learner's work The learner's productivity and self-efficacy is the ultimate goal of the Online PLP. Work samples are the critical source for evidence of learning, the documentation of progress, and the verification that high standards have been achieved.

Self-Direction and Making Meaning Learners produce better and are more highly motivated the more they have decision-making power over their learning. Learners gain from posing questions to advisors, and from knowing about, developing and using a variety of learning assets - their strengths, interests, aspirations, community and personal resources. All learning is a matter of making personal meaning out of the alternatives presented in experience.

Flexible Thinking Tools Learners gain from scaffolding and assistance in stages and types of thinking, for example, divergent thinking, using multiple frameworks and perspectives, and so forth.

Two Initial Versions of the PLP

The Online PLP is being developed in two versions (Figure 1): one for 9-12 students and one for educators in preservice, inservice and higher education roles. The underlying structure of the PLP is similar for both audiences. At its heart, the purposes of learning fall into three primary categories.

A first set of purposes is determined by the larger societal and community goals for education. A high school student, for example, is expected to be a literate member of the community, who makes a living, votes, and contributes in other ways to community life. An educator is expected to also be a contributing member of a community, especially a school community, who in addition, has attained a license to teach, and is continually upgrading their professional knowledge and skills. This is the domain of social and institutional goals and expectations. In the Online PLP, learners find the basic social and institutional expectations that are appropriate to their setting, and are prompted to use those expectations when they set goals in this domain.

A second set of purposes is determined by the academic and professional standards that need to be mastered in order to advance and to complete the program goals of high school graduation, licensing for teaching, advanced certificates and degrees, and for continuous learning. High school students, for example, increasingly have to demonstrate mastery of a number of standards that have been defined by their states, districts and schools. Preservice educators, especially in Professional Development Schools such as those in the
NICI Virtual Professional Development School Consortium (http://nici-mc2.org/pgs/highed/hevpds.htm) work on portfolios of evidence. Most teachers in the field work on some sort of continuing education plan, and many of those plans make connections to their school’s long range plan. Highly experienced teachers assemble collections of evidence for National Board Certification (http://www.nbpts.org/nbpts/) and then engage with peers in reflecting on and evaluating their work.

The third set of purposes is one that has been overlooked too often by schools and the professional development process: personal goals. Not all students are routinely asked to think about their strengths, interests and aspirations when making educational decisions. Schools do not routinely make adjustments in what they offer based on what students most dearly want to learn. Likewise, the professional development experiences of most teachers - future, present, and past - have not been designed with personal goals in mind. However, it is well known that doing so increases motivation, productivity, affiliation and loyalty (Costa 1999 ; Friedrichs 2000). The Online PLP is built around this basic theory as a starting point for purposeful learning.

Figure 1: Two versions of PLP with similar goal domains.

**Example Questions Prompted by the Online PLP**

The Online PLP begins the process of goal planning by surveying the learner and engaging the learner in activities that help explore the three domains of purpose as well as areas of strength, interest and aspirations for the future. Questions prompt writing and thinking, which is entered into an online form that then becomes available for editing, sharing privately with advisors, and for honing into long and short term goals. As the learner nears the goal-setting stage, the questions begin to focus specifically within the domains, by asking the learner to make their ideas relevant to learning.

For example, in the educator version, the following questions are asked. Pull-down menus present national and state standards, program requirements, and lists constructed from the earlier self-assessment surveys and activities. Goals become clearer as the learner and advisors dialog about questions such as:

**Institutional Priorities** What are my institution’s priorities for improving student results? What are the skills and knowledge I should strengthen in order to best contribute to my institution’s goals for improving student results?

**Professional Standards** On what standards do I want to demonstrate mastery? What are the skills and knowledge I need to strengthen in order to be able to demonstrate mastery of these standards?

**Personal Learning Aspirations** What are the skills and knowledge areas I most want to master for my own personal development?

The answers to these kinds of questions are then used to construct an action plan to move the learner from the idea stage to the achievement of valued outcomes.

**Structure of the Online PLP**

The online Personal Learning Plan will allow all media formats and a multiplicity of linkages among learning goals, projects, and the evidence of attainment of standards of performance. Distinct from electronic portfolios that concentrate on the presentation and storage of completed work, the PLP concentrates on the improvement of work and the documentation of change of work over time.

Three user levels and a server administrator level are provided. Users levels include the Learner, Advisors, and a Program Administrator. The Learner is in charge of their PLP. He or she creates or chooses goals, links them to standards or other external sources, creates work that stands in relationship to the goals,
makes decisions on when both goals and work will be shared with advisors, and decides when work and goals are to be archived into permanent storage.

Advisors are associated with one or more learners. When a learner's goal or work is being shared for critique and feedback, the Advisor can discuss, offer direct edits or validate the goal or work as adequate for its purpose. For example, a goal might be validated as appropriate to completion of a secondary teaching license in science; a piece of work might be validated as evidence of achieving a standard of performance linked to one or more goals. The validation process can be formalized with rubrics or left as narrative, and any rubric can be associated with any piece of work's link as evidence.

The Program Administrator can review all Learners and Advisor records, add and delete Learners and Advisors, set defaults on the number of advisors that need to agree in order for validation to be complete, create rubrics, create and edit standards, and make other selections associated with program management.

The Server Administrator controls the hardware and communication decisions needed for site maintenance and archiving.

Tools for the Learner

In what follows (Figure 2), the basic tool sets available to the learner are described, organized first by the section name, then by the specific tool available, followed by a description of the tool's primary function.

khartley@nevada.edu

Abstract: This paper will report on the development of a “Standards of Quality” document for educational technology distance learning courses. This project resulted from a concern that the courses were viewed as less rigorous by other faculty and our own desire to insure quality in current and future course offerings.

Introduction

This paper will describe a project completed by the Educational Computing and Technology group at the University of Nevada, Las Vegas. The goal of the project was to develop “Standards of Quality” for distance education courses offered in a masters degree program. The impetus to the project was a concern for maintaining a quality graduate program as on-campus courses were beginning to be offered as online courses. Distance education courses are often viewed as suspect by faculty unfamiliar with its opportunities and record of success. By developing this framework, we hoped to demonstrate why these courses should be considered of equal (or greater) quality when compared to the on-campus courses. Through this project, we hoped to develop a document that was a) based on current research b) could provide guidance for new course development and c) provided a framework for evaluating current course offerings.

A literature review was initially conducted to help guide the project. Each of the four participants conducted an independent search of the literature to identify four or five publications that “provided useful insight into the design and delivery of quality distance education courses.” This approach to reviewing the literature insured a diverse group of publications would result. Once the pertinent publications were identified, a copy of each was shared with the group for review. Subsequent meetings would delineate major themes from the readings that would guide the development of the “standards of quality” document. This document would then be used as a tool to review existing courses and guide further course development.

Results

The search resulted in 23 articles, chapters and guidelines that were reviewed by each member of the group. As hoped, the articles represented a very diverse group of publications that ranged from guidelines such as NCATE standards (2000) to guidelines for online courses (e.g., Palloff and Pratt, 1999) and even a chapter from Dick and Carey’s Systematic Design of Instruction (1996). From this review and subsequent discussion, four major themes were identified as crucial to the delivery of a quality course. Themes identified included, interactivity/collaboration, clarity of student expectations, design and evaluation.

Interactivity / Collaboration

It was clear from the literature and our discussions that interactivity and collaboration were crucial to components of any course. To accomplish this in distance learning courses, activities need to be designed with collaboration in mind. Individual activities can certainly play a role but if the entire course is comprised of individual activities, a sense of isolation will detract from the quality of the course (Gilbert & Moore, 1998; Mioduser et al. 1999; Palloff & Pratt, 1999).

Clarity of Student Expectations

It is vital that students understand what is expected of them from the very beginning of the course. Face-to-face courses normally inform students of expectations in terms of assignments and maybe outside time commitments, but distance learning courses require that expectations be delineated in much greater detail. What the student can expect
from the instructor should also be clearly communicated. Students may expect emails to be replied to as quickly as they get responses in the face-to-face classroom. This isn't reasonable in a distance-learning course. However, a quick response is important and the instructor should let students know how quickly they can expect a reply to inquiries and feedback on assignments. We also feel that outcome expectations should be made clear. We have followed the NCATE (2000) framework for describing course outcomes. Each course will delineate the skills, knowledge and dispositions that should result from the class activities.

**Design**

As we become more dependent on computer based tools such as WebCT and our own Websites for the distribution of course materials, communication with students and presentation of content, we must also become more cognizant of design issues. Consistency between and within courses will help our students tremendously (Hall, 1999).

**Evaluation**

In light of these activities we have also become more cognizant of the need to regularly and systematically evaluate our courses. As we put our courses online, we have a much easier mechanism for evaluating and comparing courses than we did previously be simply reviewing syllabi. It was clear from our discussions that a systematic review of objectives, activities and assessments of all of our courses would improve the quality of our offerings (Dick & Carey, 1996; Jones & Paolucci, 1999).

**Discussion**

Although the focus was initially on courses that were primarily distance education courses, it was soon expanded to include all of our course offerings. This was necessitated by the difficulty in delineating between distance education courses, hybrid courses and face-to-face courses. Our discussion on the distinctions led to the realization that all of our courses are to some extent hybrid courses. In other words, each of our courses have at least some expectations for distance learning activities (e.g., bulletin board postings) and face-to-face activities (even distance courses have at least an introductory f2f session).

We found the work on the project to be as valuable as the product. The dialogue between the faculty members was lively and substantive. It became a wonderful way to clarify what our goals were for the program. In many ways, distance education and new technologies have given us reason to rethink our expectations and approach to a graduate program in Educational Computing and Technology. A final conclusion was the need to institutionalize this process. In effect, we knew that much of what we had discussed would change over time. Students’ needs would change. The needs of schools would change. And certainly, the technologies available would change. Therefore, rather than viewing this as a project with a beginning and end, we concluded that the development and revision of our Standards of Quality document would continue indefinitely.

Abstract: The use of seminars in teacher education have often been used to stimulate reflective thought and moral development among the participants. The use of online resources, listservs and electronic mail, expand the scope and range of seminars by allowing students to participate at any time. This study examines the use of an online seminar with a cohort of students involved in a field-based practicum at a Professional Development School (PDS) on the university campus. The methodology of the seminar is explored as are the topics discussed by participants. Particular attention is given to the ways in which student attitudes develop during the conversation.

Introduction

We have all experienced in-depth conversations that stay with us over time. Such conversations turn over in our minds as we relate what was said to our own experience. Conversations that lead us to rethink what was said and provoke us to make meaning from our own perspective can be termed reflective, and often lead to changes in thinking or practice. In extraordinary situations, such reflective conversations can result in changes in our beliefs (Mezirow, 1990; Schon, 1987). Such conversations have the potential to become valuable, memorable experiences because they enable us to grow, both emotionally and intellectually.

In this article we consider different aspects of reflective conversation, it’s occurrence online in the form of electronic mail messages, it’s role in stimulating professional thought, and it’s use as a methodology in teacher education. We portray a research study conducted in 1999 that explored the impact of online technology with preservice teachers who were participating in a practicum seminar. In particular, we explore the way that protected conversational space offered by computer-mediated communication (CMC) allowed for a unique form of conversation to take place between participants. In this case, the participants explored issues in more depth than they might otherwise have done in face-to-face encounters.

CMC has been discussed as a useful tool for teaching and learning. Used as a tool for online communication, CMC has been credited with helping teachers move to more constructivist teaching practices than previously held (Heflich, 1998). An important aspect of this movement is the extent to which CMC can stimulate discourse that leads to reflection by the participants. CMC discussion groups have been used in preservice teacher education to help develop reflective thought (McIntyre & Tlusty, 1995), the moral development of preservice teachers (Harrington, 1992), and general knowledge building discourse that enhances education (Scardamalia & Bereiter, 1996).

Central to all of these efforts is the significance of the protected conversational space that is offered by CMC. Online conversation has previously been characterized as reflective (Heflich, 1997). For our purposes, reflective conversation is an exchange among participants in which the expression and receipt of ideas leads to the construction of new understanding of their own experience. Bamberger (1991) has described such an exchange as “conceptual chaining” in which ideas are articulated, exchanged, recreated and re-exchanged as they move from person to person in a conversation. The reflective aspect of such a chain is the way in which individuals capture the ideas that are being exchanged to construct their own meaning from them as they reflectively integrate the new ideas with previously held knowledge.
Schon (1987) speaks of three forms of reflective thought. Reflection-on-action occurs as one seeks to make meaning of events that have occurred. One may reflect-in-action while confronting a problematic situation, and constructing a solution. Conversation offers us an opportunity to reflect-on-action, as it allows us to discuss and process into our intuitive knowledge base (Iran-Nejad, 1994) things that have previously occurred. It can also involve reflection-in-action as we dynamically engage in conceptual chaining (Bamberger, 1991) in the midst of an ongoing dialogue. The third form, reflection-for-action, indicates that the participation in the reflection process serves as a guide for taking future action. From this view, the potential exists for conversation to serve as a vehicle for stimulating reflective thought and may lead to both personal and professional growth.

Reflective thought has long been considered an important aspect of professional growth. Argyris and Schon (1974) identified the contradiction between one's espoused theory, one's expressed beliefs, and one's theory-in-use, beliefs made evident by one's activity. Growth for Argyris and Schon (1974) occurred when one recognized the dissonance between one's espoused theory and theory-in-use and took steps to align them. It is inquiry among individuals that helps expose the contradictions between beliefs and practices of teachers. Feldman et al. (1996) argue that teachers in a reflective stance examine their own practice exposing and questioning tacit assumptions about their teaching. This allows them to reflectively evaluate past practices and seek alternatives for future practice.

The Project
The research reported here discusses an effort to explore the impact of exposing preservice teachers to teaching with technology. The thought that teachers teach as they were taught has become conventional wisdom since Lortie articulated the idea in 1975. It is one of the many ideas that fuel the current effort to infuse technology into teacher education, symbolized most recently by the Federal Department of Education's Preparing Tomorrows' Teachers to Teach with Technology program (U.S.Government, Department of Education, 1999). Computer use in K-12 education is at an all-time high. A recent study by Becker and colleagues (1999) indicates that more teachers than ever are using the Internet in their practice, and furthermore that there appears to be a correlation between teachers' use of the Internet and the way they teach. Access to technology is one factor affecting teacher use of technology. Another is the extent to which preservice teachers are exposed to technology use within their classes and in field placements. This project was an attempt to infuse computer-based technology into preservice teacher education. In this study we examined the use CMC as a way of encouraging members of a field placement practicum seminar to explore their experiences reflectively and to discuss those experiences with other members of the seminar.

Online Seminars
The idea of using CMC to foster critical, reflective thought among preservice teachers in field-based settings was first described by Harrington (1992). Students involved in their preservice student teaching seminar were asked to pose a reflective question to a listserv discussion group composed of members of the seminar. Harrington (1992) found that the discussion in these virtual seminars was critically reflective, and led to the moral development of preservice teachers. In the case of our study, the purpose of the online discussion was the further exploration of concepts and ideas that the preservice teachers were learning through their other courses, and their experiences in the classroom. Since they had participated in a seminar the semester before that was held in a regular classroom, these preservice teachers were already familiar with the seminar-as- forum for discussion format. The difference was that this time the discussions would take place online rather than in a face-to-face classroom setting.

The Professional Development School and the PDS Cohort
The venue in which the project occurred has its beginnings in the creation of a Professional Development School (PDS) and the resulting teacher education program embedded within it. The PDS is a joint venture between the university and the school district to better prepare preservice teachers to teach in schools with students who may be considered to be at-risk, and to provide teachers in the PDS with the support and resources of the College of Education (COE). Teacher preparation in this PDS model is conceived of as a cohort of undergraduate students, who together would engage in an integrated curriculum taught by a team of COE faculty and the faculty and staff of the PDS. The curriculum is enacted both in the classroom and through the heightened participation of the cohort in the day-to-day life of the PDS.
Cohort Culture
In discussing the culture of the cohort, we are using a localized notion of culture (Collins & Green, 1992; Santa Barbara Classroom Discourse Group, 1992; Putney & Floriani, 1999). From this perspective, classroom participants construct patterned ways of being as they construct knowledge together. From the beginning of their coursework together, the cohort participated in reflective activity as they interacted with each other and with various university faculty involved in teaching the courses. The cohort maintained a portfolio throughout their experience, and many of the activities and assignments resulted in reflection on assigned texts and their interactions with those texts. In addition, the cohort was asked to reflect on their lesson plans and their experiences in the PDS. At times the reflections were informal through small group and whole group discussions in seminar. At other times they participated in writing more formal reflection papers and in reflecting on their practice through their portfolios and curriculum notebook entries.

In particular, reflection was a component of the seminar in which they participated a semester prior to the online seminar. In the prior seminar the interns were asked to keep a daily log in which they recorded issues that arose from their reading assignments. They discussed their issues in class in small groups and selected one key point to share with the class as a whole. In addition, they wrote short reflection papers from these issue logs each week. The purpose of these assignments was to have the students reflecting on the major topics covered in the seminar such as classroom management, creating types of assessments, reporting student progress, and constructing a classroom environment conducive to learning. Therefore, self-reflection was a component of their educational process in terms of their work in the PDS. However, prior to the online seminar, the reflections were more related to the texts being used in the courses and their work with those texts and in the PDS setting.

The Context
Students in the PDS cohort began spending a greater amount of time at the school during their third semester in the program. Prior to this semester, they had observed teachers in the classroom, worked with individual students or with small groups of students at a time, and taught lessons that they constructed through their coursework. As their internship evolved, they began spending more time at the school as a field-based practicum in teacher education was supported by a weekly seminar in which topics germane to their experiences at the school were raised and discussed. The role of the seminar in the overall PDS program was to introduce and reinforce topics identified by COE faculty and PDS teachers as important to preservice teachers such as classroom management, coping with parental concerns, and authentic assessment. The seminar had been established as a forum for linking current research on teaching with the observations and experiences that access to the PDS classrooms afforded these interns. One of the important themes of this seminar in the third semester was the role of computer technology in elementary teaching and learning.

Cohort members had previously completed a required survey of technology in education as part of their undergraduate coursework. In seminar they were introduced to two new ways in which technology could be used in education. The first activity introduced members of the seminar to a method of integrating mathematics, science, and computer technology into field-based learning. Mentor teachers at the PDS had previously been introduced to a similar methodology through a project sponsored by a Dwight D. Eisenhower grant (Heflich, Dixon, & Davis, 1999). The second way in which the cohort was introduced to technology in teaching and learning, the one presently under discussion, involved the use of online discussion as a venue for exploring students' experiences as they engaged in their practicum at the PDS.

The Assignment
Building upon the model first proposed by Harrington (1992), an effort was made to establish an online version of seminar in which the interns would discuss issues raised during their practicum. Each intern in the seminar was assigned a week in which to assume the role of discussion leader by posting a leading question on the listserv. Other interns could either respond to the leading question, or to one another's responses. The instructor corresponded with the discussion leaders each time, first discussing with them their ideas before they posted them to the listserv; and helping them develop the idea into a leading question. For the most part, the instructor remained invisible, monitoring the conversation, but not
contributing to it. The online seminar began during the second week of the semester and continued for eleven weeks.

The Online Seminar as a Venue for Conversation
Student participation in the seminar was overwhelmingly successful, based upon the usage of the listserv. Each week two of the twenty-two interns would questions to the listserv, to which other cohort members responded. Twenty-one separate topics were raised during the online seminar. Those topics generated a significant amount of activity on the listserv. For example, collectively the questions generated 206 responses during the eleven weeks in which it was active, an average of 18.7 messages per week. The most active topic generated 17 responses while the least active, at the very end of the semester, generated but 3 responses. In terms of the individuals involved, the most active cohort members responded 19 times to various questions, while the least active participant responded only 2 times. On average, cohort members responded 12.7 times to questions posted online.

Topics Raised by the Cohort
Student discussion in the virtual seminar revolved around their experiences at the PDS, common classroom experiences, and the other technology-related experiences in which they were engaged in seminar. The topics discussed and the activity each topic generated is contained in Table 1. Far and away the most engaging topics involved behaviors they observed while serving in the PDS classrooms. Classroom-based topics involved managing student behaviors in the classroom, the use of computers in classroom learning, the celebration of religious holidays, the death of a student's family member, managing student's "tattling" on others, working with students who are labeled at-risk or for whom English is a second language, and how to cope with irate parents. Spending time in the school outside of the classroom was the source of other topics such as what constitutes a professional dress code for teachers, or the importance of reading at home with children, or maintaining positive relationships with administrators. Other topics emerged from their ongoing classroom experience as members of the cohort. These include a discussion that developed about a video documenting efforts to mainstream a student with special needs, comments about field-based learning, and reflections on their experience as members as members of the first cohort of students in an experimental preservice teacher education program.

Topical development
The ways in which topics developed during the conversation demonstrated the extent to which cohort members reflected on the issues and how their discussion led to growth as the discussion developed. An example of this is the discussion thread concerning teacher gossip about student behavior. The leading question was relatively innocuous:

*We have been working very closely with the teachers at PPDS for several weeks now. We are with them during prep periods and lunchtime. In these last weeks I have learned a lot about what goes on outside of the classroom, between the teachers and the staff. During lunch I personally have noticed a tremendous amount of gossip between the teachers, about students and other staff members. Has anyone else noticed this? Is it like this in every school? What effects do you think it has on the children at PPDS?*

Some cohort members quickly responded to the question by characterizing this gossip as unprofessional behavior.

*Thank you for bringing this up. I hear teachers’ gossip about students all of the times in the faculty lounge. Sometimes this gossip is downright mean and very negative. If I were a parent of one of these students, I would have real issues with some of these teachers if this is how they talk about them to other teachers, how objective are they toward these students in the class? I just don’t see these students being treated the same as the students that are spoken of highly in the lounge. Don’t get me wrong, I think teachers need to vent and discuss things and get new ideas from each other. I don’t think all of the nastiness is necessary.*

Others looked at lounge discussion as the one opportunity that teachers, otherwise stuck in classrooms with children, had to express their feelings about the experience to other adults.

*This is a great question. There is what I notice clicks in the teachers lounge with the teachers. You see the same teachers sit together everyday and talk about what ever. By having lunch in the lounge you hear the teachers talking about the students in their classrooms. I think that because with the job we are doing there is no one in our classrooms that we can talk to; many teachers can’t wait until lunch to explode and let everything out to others who will understand and relate to what they are going through. I also hear positive remarks in the lounge about how well teachers and students are doing. This must happen in all schools.*
Still other cohort members looked on such behaviors as ways that teachers could network with one another, sharing ideas about how to cope with problems in the classroom.

I agree that there is much gossip around the school. I also agree that many of the teachers are just venting their long hard days to people who can understand the sort of day they are having. I think teachers should talk to one another about some students so that the next teacher can have a handle on students who have behavior problems. On the first day of school, my mentor teacher filled me in on the students who were coming into her class. She knew the ones who had previous problems and already had some ideas on how she wanted to handle them. I always like to know what I’m walking into if I can.

These messages demonstrate student growth in the midst of discussion in the virtual seminar. Beginning with the early characterization of teacher lunchroom conversations as gossipy and mean, cohort members began to posit reasons and rationales for this form of conversation. The realization that teachers working alone in classrooms and might need to discuss their day with colleagues in the lunchroom is an important one for preservice teachers. Understanding that they are likely to find themselves in a similar situation, they look to why it happens and speculate on how they will behave when they are professionals in a school. In addition, they offered coping strategies for each other to use in dealing with gossip so that they could use the information being offered in a positive way rather than just view it as negative and mean.

Discussion

The use of CMC as a venue for discussion among students involved in field placement is evident from the results of this study, particularly when considered along with the results reported by Harrington (1992). There are some key differences between the two studies that distinguish them from one another, but do little to invalidate either. Harrington (1992) reported on students in a traditional, albeit online, student teaching seminar. This study explores the use of an online seminar during a field practicum with a cohort of students who were well acquainted with one another. Although the groups themselves are very different, the methodology demonstrates the validity of using online seminars with students in field placements.

Certainly the knowledge that cohort members had of one another added to the depth of discussion that occurred in this seminar. The participants already knew about the background of their correspondent, the fact that they were a parent, or had children in school, or worked nights at a particular restaurant. This knowledge added a perspective to the conversation that would have been missing if it had occurred among those less well acquainted. Participants’ knowledge of one another though had little impact on the ideas expressed or the thought that was apparent within their responses. It is difficult to say then that the participants’ prior knowledge of one another invalidates the conclusion that the use of CMC in online seminars stimulates critical, reflective thought among participants that may heighten their moral development (Harrington, 1992).

Another area worthy of consideration is the participants’ choice of content for discussion. All of the ideas introduced in the seminar arose out of students’ experiences either in the PDS or in their class work. Prior to posting a question they discussed their ideas online with the Instructor. In these discussions the Instructor questioned the student about their idea, encouraging them to reflect on it before posting it to the group. This helped the student craft a question that generated a response among the group.

A key to the success of online seminars is the concept of a protected conversational space (Heflich, 1997). In depth conversation be it intellectual or intimate, occurs in a protected space limited to the individuals or group for which it is intended. One feels secure in what one has to say and assurance that what is said will be respected. The asynchronous nature of text-based CMC allows one the space to write a question, or respond to a question, without the pressure of real time. One can reflect on the response, perhaps edit it to better express a thought, before posting it to the listserv. Sproull & Keisler (1993) argue that asynchronous exchanges in CMC are empowering because personal elements of gender, ethnicity, and social status are invisible online. Such elements support the use of text-based CMC as a venue for critical, reflective conversation, appropriate for use in seminars of preservice teacher education students involved in field placements.

HOW INFORMATION TECHNOLOGY CAN HELP EDUCATION DISTANCE LEARNING

HOSSEIN JAHANKHANI, PhD, CPhys, MinstP
UNIVERSITY OF EAST LONDON

Abstract: The aim of this paper is to review how information technology i.e. computer based studies can help education particularly in distance learning. Although this review will concentrate on distance learning it will also discuss and compare ideas such as open learning and flexible learning. The economy behind, and advantage, disadvantage of the distance learning will be analysed and compared between conventional, distance, open and flexible learning.

INTRODUCTION

This paper reviews the impact of information technology i.e. how computer based studies can help education particularly in distance learning. Although this evaluation will concentrate on distance learning it will also discuss and compare ideas such as open learning and flexible learning.

At this stage it is difficult to judge the impact of information technology and networking (internet, web sites) revolution. This remains unknown however, experiences offered by the information technology suggest that it may change our life style.

How can we define distance learning, very confusing according to various definitions. Distance learning is a generic term that means education where you are physically separated from the institution conducting the course. Open Learning, is an extension of distance learning and a buzzword for offering courses in a non-traditional way by opening up the course to those who wouldn't normally be able to use it. Open learning, flexible learning, online learning, distance learning, are very vague terms and may not mean anything in particular (Greville Rumble,1990) calls for a need for greater clarity in the use of these concepts if we are to avoid misleading others and ourselves.

Basically, all the terms mentioned refer to distance learning. Distance learning is any learning that takes place with the instructor and student geographically remote from each other. Distance learning may occur by surface mail, video, interactive or cable TV, Internet, video-conferencing, etc. Therefore in distance learning, there is a gap between the provider and the learner for some, most, or even all of the time. For example, various correspondence learning agencies, and some in-company training Foremost the Learner, Tutor (institution), learning centres for support, the media - technology for interaction and support, various forms of technology for interaction. By using a computer based training system in a distance learning environment, students not only acquire the competence needed to meet the requirements of the syllabus in question, they also enhanced their general technical and learning skills. Therefore, by employing existing staff and environmental resources, training can be delivered to student across wide geographical area who would otherwise be unable to access training resources. Of course, there are drawbacks in this process. Some courses just do not fit very well at a distance. These types of courses need a hands on and gain experience practice. For example we don't want our GP (General Practitioner to learn his or her practice through distance learning, but rather via conventional learning, but we have learned that the fact computer changes the dynamics of communication. In return it is not suggested that distance learning should replace all traditional teaching. For many purposes face-to-face learning situations have advantages over learning alone, and peer group interaction is a vital part of many kinds of learning. Also in distance learning the economical advantages are achieved, both for students and trainees, and for the institution which takes care of the learning process. Since there is no need for travelling, trainees and tutors have not to waste their time and money. On the other hand, from the point of view of these institutions, neither equipment nor lecture rooms have to be prepared.

By far the best situation in which to develop flexible learning resource materials is by being involved face-to-face with 'traditional students'. The ultimate aim may be to produce resources which can promote learning without the presence of a tutor, but the hand-over of control is best done one step at a time, with thorough monitoring of each move towards learner autonomy. A longer term aim should be to establish distance-learning pathways, built initially from those flexible learning resources that prove their worth with conventional students.
At this age of technology, the technologies can support almost all of the components of distance education. Information and communication technologies that must help in implementing such systems are already in place. We now have different types of networks system that can use applications to communicate across the whole world. From the technical point of view the major changes and development can be traced out in concepts of WAP (Wireless Application Protocol) and B - ISDN (Broadband Integrated Service).

To implement distance learning programs through development of the three elements crucial to a successful distance education program: (1) Sound instructional design; (2) Appropriate technology applications; and (3) Support for teachers, students, and collaborative partners.

A distance learning program must meet the educational goals of the institution. Therefore, implementing such a program requires time, people, funding, and careful planning.

The progress of time is inevitable and we can only hope to shape its direction, distance education is definitely the wave of the future.

As (Bates, 1996) pointed out quite categorically "the value of technology is its ability to reach learners not only well served by conventional educational institutions, but also to meet better the newly emerging educational needs of an information society, and to improve the quality of learning".

Within last decade it has become possible to work in a rich variety of ways with others at a significant distance through the use of a personal computer with an internal connection. For many people, their Web browser has already become most important program running on their machines.

Distance learning offers an opportunity to outsource teaching to specialised companies without taking employees away from their work. To gain faster acceptability and recognition, some of their companies have entered into co-operative arrangements with accredited colleges and universities.

Patterson in his paper emphasised the importance of a progression from high teachers' support levels to increased student empowerment. Where technology is concerned, a Bermuda triangle i.e., Teaching - Learning - Computers, may develop with money being poured in to little effect. The World Wide Web offers advantages in several directions. Hypertext linkages in the material mean that a student can work at a suitable pace and can revise and review on demand. The great advantage of the Web is that distance learning is no longer platform dependent it does not matter the sources. It is thus possible to provide a very rich learning environment using the Web. Hypertext links provide an advantage that a conventional course, or course notes can not provide. Although, Web based teachers and their students may be scattered all over the world, the computer can help to overcome the disadvantages of physical separation.

The key economic advantage of distance learning over traditional on-site schooling is that it saves students time. The value of the time-spent learning is the principal cost of investment in human capital among adults with even moderate earnings (Duhaney, 2000, Mitchell, 2000, Ohler, 1999)

**COMPUTER BASED STUDIES/TRAINING**

Higher education has offered distance learning courses for several years, their numbers until recently have been relatively small. The grows use of internet are greatly changing the face of distance education. Computers have been used in many ways in education since 1960/1970's, however the types of use have expanded and the number of students using them has grown. The computer based learning allows the learner to work through pre-designed materials. The most significant feature of 'CBL' is that the learner interacts solely with the computer. In computer mediated communication method of distance learning the learner has opportunity to be contact with teachers and other students, through his/her computer. Through online facilities such as e-mail, video conferencing, people can easily contact each other and transfer data files, text and obtain information from computer databases.

Extensive research comparing grades, test scores, and other measures of student achievement has been compiled, and analysed. Generally seems that there is no significant difference between students in virtual classrooms and students in traditional ones.

A similar study in the Journal of Computing in Higher Education shows that, cyber learning can be as effective as traditional classroom learning, (RUSSEL, 2000), and that there was no significant difference in academic outcomes between the two groups of students tested. Indeed, so far almost 3 million students in America and Canada and Europe already enrolled in distance learning. It is expected that in near future about 80% of U.S. universities and colleges will be offering online classes (EBSCO ONLINE, 2000). Computer based training or Web based training (WBT) is used extensively in industry to train learners and accessible using a computer. The courses are designed to simulate the software being learnt and are pre-programmed and stored digitally on a compact disk (CD-ROM). Courses usually include compressed videos, audio graphics, animations and sound. On the other hand the term WBT means that the training is delivered via internets. It is not, need to be just in the Open University that computer conferencing is used for education. However, the medium is most easily justified when students are distributed widely, and at present the Open University in the United Kingdom plays the major role in this area. Things will undoubtedly change as the
various scheme which support open learning are beginning to start up; indeed, any polytechnic or college with access to a sizeable time-sharing system could start a computer conferencing system. An interesting development in this area is the proposal to use national electronic mail facilities to support programming courses for micro users, in partnership with an educational body.

The advantages and disadvantages of distance education

Advantages:

Undoubtedly the main advantage over traditional on site learning is the amount of time it saves. Students don't have to get up, take an hour getting ready and then an hour getting to school or college and another hour travelling home - essentially three hours a day of "wasted time". They can just stay at home and spend the time learning. This is especially important for people with full time jobs or children who can choose the most convenient time for them to study (DL rarely follows a strict timetable like colleges) without affecting their work or leaving their children. Distance Learning is also especially useful for adults who want to do a degree or executives and highly skilled workers who need to update their knowledge and skills but don't have the time to go to college. Distance education is more flexible, accessible and rewarding than the physical classroom environment. It gives the adult learner the opportunity to choose the time, place and pace for his study without being trapped in fixed time slots at the college or time-consuming and uncomfortable travelling from his home to the campus. Distance Learning gives more students the opportunity to take courses from top universities where physically, places are limited e.g. for every ten students who get a place at Oxford, Cambridge or Harvard, there are probably another hundred who deserve a place. It gives the learner the opportunity to reflect creatively on his own writing. A student learns the ability to formulate the ideas and opinions in writing in such a way that their meaning is clear to other people who are not physically present essay (Bates, 1995).

In addition to that distance teaching universities such as the 'British Open University' are demonstrating significant cost advantages compared to the traditional universities because of the reduction in the need of campus based student facilities such as buildings or administrative and academic staff and because of the economies of scale. Distance Learning via the Web is much cheaper, around 50% to 90%, than traditional courses as there are less teachers, buildings, materials and so on to be paid for. This can also save the Government money along with the economies of scale achieved by many individual institutions sharing their resources and knowledge to provide courses e.g. The UK government is currently seeking to establish an "e - university" whereby they will organise a collaboration of UK universities to provide their expertise for online courses. It offers the companies a very interesting possibility to educate their employees. Online-based distance education offers significant cost advantages. It eliminates travel to and from a specific location. With this option, employees simply log on to any Internet connected computer and begin the training session. Schlumberger PLC, a $9-billion international technical service company, began implementing "just in time" distance teaching in spring 2000 to offer his employees training when it will be most useful and when it will stick best (Ebsco Online, 2000).

Most importantly perhaps is that DL could have a great impact globally by allowing people in the "Third World" the opportunity to learn without its nations needing to find the money to build schools, buy books, pay teachers and so on. This could aid their development.

Disadvantages:

➢ A problem of distance teaching is that the learner doesn't get in touch with other students and lecturers compared to the traditional education with seminars and workshops on the campus. There is a lack of in developing his social skills such as working in a group and to interact with each other order to find a solution for a task, which is based on the consensus of the group.

➢ Though it works well with things like business studies, history etc DL can't be used to take certain courses where hands on experience is needed such medicine, dentistry, some engineering courses.

➢ There are individual preferences and differences particularly among adult learners. Online teaching can't suit all students. The developers and planners often seem to forget the fact that people are different and that they differ just as much in their preferences for learning modes as they do in other areas in their life. Some of the learners will benefit greatly from this medium other will rather prefer traditional teaching methods (Mason and Kaye, 1989).
Converting courses from a classroom to the Internet is hard work for lecturers & Professionals this needs a lot more commitment of time from them e.g. A barrage of e-mails back and forth between students around the clock and more time writing up lecture notes.

There is no physical peer contact/social interaction between students which may take some of the fun out of learning. The impersonal nature of online learning also removes the enthusiasm, skill and wit of lecturers.

The commentator, also fears of the dangers of profit making companies entering the DL market that it is "commodifying" education and making courses competitive. This could lead to an emphasis on quantity rather than quality and individual attention. If the academic is replaced by the businessman it could spell danger for the student.

DISTANCE LEARNING (FLEXIBLE LEARNING) IN THE UNIVERSITY OF EAST LONDON

UEL has a strong national reputation for teaching students of all ages for over 30 years. One of the courses running under Flexible Learning program is BA (HONOURS) IN Business studies. The course is part of the portfolio of courses offered by East London Business School in undergraduate, Postgraduate, MBA and Doctorate levels. About 100 students registered under Business studies scheme. A primary vehicle for achieving this level of cooperation will be the electronic communications network. You will be able to "talk" to others in a group by using the electronic conferences and you can exchange information with individuals by using e-mail. Every student has personal tutor. By visiting the courses World Wide Web site they should able to collect assignment or any other information which they require.

CONCLUSION

Distance learning have played a tremendous part in education over the years, previously known as correspondence courses. Distance learning is a product of the removal of the educational barriers. It is the delivery mechanism that allow anyone access to educational institutions irrespective of where they are, time and space via the media of technology. The teaching and learning paradigm is reversed, whereby the tutor is now a facilitator and the learner has the responsibility of learning in their own time, space and place. As well as making their own decision on how to structure their course. Communication is by means of technology, such as, printed text, videotapes, electronic mail, fax, telephone, video-conferencing, audio-tapes, internet and so forth.

Like all things we have advantages and disadvantages with DL but despite the disadvantages, we must surely conclude that CIT (Communication and Information Technology) in its various forms has had a great impact on education and vastly aids the student to produce well presented and well informed coursework.

It's unlikely that DL will totally replace face to face teaching but it will definitely supplement it. At the end of the day, CIT and DL doesn't make a bad student a good student - they still have to do the work, learn the subject, pass the exam. It appears then that CIT is having a positive impact on education and hopefully, as access to the Web continues to grow rapidly, this will become a global movement whereby education can enrich the lives of people across the world.

Abstract: Technological advances in distance education have resulted in a myriad mediums available for educators to deliver course materials. As technology pervades higher education, educators should be mindful of what mediums and materials can lead to successful learning for the various individuals the course will be reaching. In order to maximize learning potential, courses need to be tailored to the learning styles or "cognitive styles" of the students in each course. The greatest diversity of cognitive styles will undoubtedly be seen in general introductory courses that are required of all university students. However, this diversity will generally narrow as students gravitate toward their field of specialization. With the increasing number of non-traditional students (over age 22), educators must also meet the challenge of designing courses that are directed toward the cognitive styles of a population that may not be as technologically savvy as their younger counterparts. Equally important is the question of, "Is distance education appropriate for all students?" During the first years of college, students are learning valuable social and relationship skills. For this population, the convenience and cost efficiency of distance education may come at the expense of interpersonal development.

Introduction

With the rapid infusion of technology into education, there has been a proliferation in the instructional mediums that are employed. Due to the fast pace of technological advances in today's society, researchers and educators alike have not had the opportunity to fully explore the characteristics and effectiveness of these new educational mediums. Research is beginning to emerge that is examining the effectiveness of various mediums, and the characteristics of these mediums that lead to successful learning in distance education environments (Molebash, 2000; Offir & Lev, 2000). In reviewing the literature, one aspect of these new educational mediums which is not receiving a great deal of attention, is the characteristics of the learner. The main question addressed in this article is, "Is distance education appropriate for all students, or do we need to design distance education to meet the needs of individual students?" It is our belief that by taking into account
characteristics of students, distance education can be designed to better meet the needs of students.

In the past, where distance education was limited to such technologies as television courses (McCleary & Eagan, 1989) and telephone instruction (Burge & Howard, 1996), obtaining educational results similar to traditional classroom instruction was quite an accomplishment, considering obstacles such as lack of visual aides, or the impossibility of student interaction. With advances in computer technology, a seemingly endless list of medias are now available to deliver instruction to students (Marsh, Price & McFadden, 2000). Considering these advances, a goal of developing distance education courses that are roughly equivalent to classroom instruction, appears to be nothing more than striving for mediocrity. We now have the potential for designing distance education courses that will allow students to maximize their potential and learning. This is not meant to imply that the classroom teacher will one day be obsolete. In fact, it is arguable that distance education courses are not suitable for certain types of classes and students.

Not all individuals process information in the same manner. The way that an individual usually processes information is commonly referred to as “cognitive style” or “learning style” (Witkin & Goodenough, 1981). Different cognitive styles require different presentation types, as well as materials, to enhance learning. Classroom teachers face the difficulty of trying to meet the individual needs and learning styles of a diverse population. In instances where the teacher must attend to the needs of an individual student, learning can slow or, at times, completely stop for the rest of the students in the classroom (Moore, 2000). With distance education courses, classes could be designed to match individual learning styles, without slowing instruction for students that do not require individual attention. Furthermore, college students are no longer solely between the ages of 18-22. Columbus State University in Georgia report an estimated 45 percent of their enrollment consists of “non-traditional” (over the age of 22) students (Langford, 2000). Students in different age groups are likely to have differences in maturity level, preferred learning style, and experience. This diversity in students makes the cognitive styles in higher education even more varied than before web-based courses were possible. In order to maximize learning potential, distance education courses must meet this diversity by tailoring distance courses to individual cognitive styles.

Cognitive Styles

Alport (1937) defined cognitive style as, “an individual’s habitual or typical way of perceiving, remembering, thinking and problem solving.” Over the years, several theories and constructs have emerged in the area of cognitive styles and how they relate to learning theories. Witkin’s (1954) field dependence-independence theory has served as somewhat of a foundation for research in this area. He observed that people have individual differences in their ability to distinguish objects from a confusing or distracting background. This concept was expanded upon, and proved to have practical applications in the way individuals learn.

Field dependence-independence theory, as related to cognitive style, evolved out of Witkin’s observation that individuals differ in their ability to separate an item from an organized field or overcoming an embedding context. He found that this concept is actually a universal dimension of individual functioning, in that it shows itself in not only perceptual contexts, but also in intellectual, personality, and social aspects of how individuals process information. (Witkin & Goodenough, 1981). Field dependent people show more interpersonal competencies, function at a more autonomous level, and enjoy cooperative learning more than field dependent individuals. Conversely, field independent individuals are superior at cognitive restructuring and independent learning, yet lack the interpersonal competencies of field dependent individuals. Although some subjects did show extreme dominance, most showed a general tendency toward either field dependence or independence with some ability in both areas. Dimensions of field dependence-independence were also found to be stable over time, and that people are likely to favor and show superior performance in educational/vocational settings that match their cognitive style (Witkin & Goodenough, 1981).

The importance of matching cognitive style with distance education is not a new concept. Dunn (1989) found that students learn, remember, and even enjoy learning more, when instruction is matched with learning style preferences. However, what is commonly overlooked (or under focused), are the vast differences within the higher education population, even at a single university. It seems highly unlikely that a universal format for distance course construction would be suitable for both an 18-year-old freshman and a returning adult graduate student. As alluded to earlier in this article, in order to maximize the potential of creating distance education courses that are superior to traditional classroom instruction, distance education courses should be constructed with an effort to match the cognitive styles of the population within each class whenever possible.
In order to insure that the cognitive styles of students are appropriately matched with the materials and mode of delivery of a course, the cognitive styles of the students should be assessed prior to formal instruction. As students progress through the various levels of higher education, the population of each course they take part in will undoubtedly vary. The design of the course must therefore evolve to meet the changing needs of students. When assessing the cognitive styles for a particular course, the level of education, technological competence, and life experiences of the students in that course should all be taken into account to design courses that will maximize the learning of those students.

Undergraduate Freshmen

The transition from high school to college is generally a period of educational and social adjustment for most students. New levels of social relationships are being developed that are important to the development of the student. This is also often a first experience of living away from one's family and friends, and according to Horn (1997), "...those who extend their associations beyond the classroom may well find their transformation into college students to be easier and more complete." Social interaction is, of course, limited for students taking web-based courses. Students may engage in social activities with other students and teachers via the internet. However, the levels of social interaction and intimacy of these activities are inhibited by distance. Not only are students unable to participate in social outings, they will not be able form face-to-face working relationships when collaborating on team projects or delegating project responsibilities. Hence, students are not developing the skills for face-to-face social and professional relationships that are necessary in almost any career. Likewise, distance education does not provide the development of true public speaking skills. When students deliver speeches or give presentations through distance education courses, the speeches are performed in front of a computer camera, rather than an actual audience that the student will undoubtedly have to face at some point in his or her future career. The development of social skills is often vital to the future career of the student. Work by Mintzberg (1997) showed that managers spend between 63-69% of their work time engaged in conversation. For all of these reasons, it is questionable if distance education courses are appropriate for traditional college freshmen in the first place. However, in certain circumstances (i.e., those living in remote areas) students may be left with little other choice.

In any case, lower-division classes such as Introduction to Biology, or World History, will undoubtedly contain students with a wide range of cognitive styles. Most American universities require students to complete a number of general education courses before they can specialize in a field of preference. Distance education courses at this level should be designed with this in mind. Professors in fields such as physical science, which traditionally attract individuals who are adept at individualized learning (field independent) (Witkin, 1962), may be inclined to produce a distance education course from this perspective without regard for learners who require a more interactive approach (field dependent). Conversely, humanities professors, that are traditionally more social in nature, will need to incorporate technical concepts into the class design to facilitate students who are more cognitively field-independent.

Ultimately, professors must look outside of their cognitive style paradigms to accommodate the myriad cognitive styles students possess in their courses. While the extreme field independent learners could be accommodated with what Bates (1986) refers to as the black box approach which simply lets the computer replace the teacher, the extreme field dependent learner may be best suited with options such as interactive study guides and student video chat rooms. Preparing a lower division course in this fashion has the potential to be quite labor-intensive and costly. To accommodate a variety of learning styles, educators may have to utilize the expertise of several educational consultants, as well as incur additional expenses from computer programmers for the hours needed to implement the extensive design of the course. However, even with extensive design expenses, these courses can still be cost effective considering the large numbers of students that will utilize them. Introductory courses generally have the largest class sizes because they are pre-requisites for advanced courses in various majors. Likewise, if these courses are not constructed to match individual learning styles, a greater number of students stand to be adversely affected.

Advanced Students

As students move into their chosen field of study, media type and instruction could be tailored more
closely to the learning styles of students that are attracted to that particular field of study. For students enrolled in upper division sales and marketing classes (which are people oriented by definition), a team oriented and interactive course format may be most conducive to learning. For such a course, student teleconferencing sessions could be held to brainstorm marketing strategies for a new product. Conversely, this format could be counterproductive and even aversive to those who tend to gravitate toward the physical sciences. As Kolb (1984) suggests, these students are often quite adept at technical tasks and less so at social and interpersonal skills. As the student moves further along in his or her chosen field of study and into graduate school, it may be advantageous for both student and teacher to adjust course structure, focusing more stringently on the learning style associated with that particular field. For doctoral research courses in environmental biology, the needs of the student may be best met if the instructor simply issues a course syllabus that outlines research duties and expectations, and offers periodic feedback via e-mail.

So far we have focused on academic areas that are at opposite ends of the spectrum (extreme field independence vs. extreme field dependence). As noted earlier, learning styles are not necessarily mutually exclusive. Most individuals show a dominance in either field dependence or field independence, however, most students also possess some level of competency in both fields. Therefore, educators must use caution when deciding to adapt a distance education course to strictly emphasize a specific cognitive style. Students specializing in an area such as counseling psychology, which emphasizes the “scientist-practitioner” model of training, may have characteristics of both field dependence and field independence. While scientists often prefer individualized learning, training to be a practitioner involves constant interaction with others. In such cases where the field of study emphasizes contradicting learning modalities, an optimum learning environment through distance education would include a variety of medias and instructional materials. Students would be able to utilize aspects of both field dependent and field independent stimuli for an integrated learning experience.

Non-traditional Students

Non-traditional students represent another unique population. According to Watkins (1983), non-traditional students tend to be more intrinsically motivated, and rely more heavily on an approach that is deeper than rote learning, when compared to younger students. In some universities, a substantial portion of the student body consists of individuals that are well outside of the traditional 18-22 year old range. According to the 1999-2000 San Diego State undergraduate catalogue, more than 10% of the student population was over the age of 30 in 1999. Even though learning styles are stable over time, the returning student that has been away from the academic world for quite some time will most likely have not exercised university-type study skills in many years. Most of today’s “traditional” college students have had exposure from an early age to computer technology both inside and outside of the classroom. Some of the mature students, who have not had the advantage of being brought up in the technological era, may have little or no computer experience. Therefore, the technological competence of the student needs to be assessed before instruction begins to insure that each student has the ability to access and utilize all of the course materials. Aside from the obvious needs of the non-traditional student often mentioned in most literature (i.e., flexible scheduling for the employed student), tutorials and “user friendly” study guides geared toward the learning style of the individual non-traditional student, could be greatly beneficial, or perhaps necessary, for readjustment into academia.

Conclusion

As distance education becomes more pervasive throughout the higher education system, and as new technologies develop, course development that is continually conscientious of the learning style of the individual is necessary to maximize learning efficacy. An exigency to encourage all students to take part in distance education courses may be very attractive and practical for both student and professor in the interest of convenience and financial considerations. However, for students attending college directly from high school, distance education courses may not be in the best interest of the student’s interpersonal development. Considerations must also be made for the non-traditional student’s readjustment to academia. It seems apparent, that in order to facilitate student learning, distance education courses should be tailored to match material, presentation, format, and interactional patterns with the learning styles of students.

Is A Paradigm Shift Required To Effectively Teach Web Based Instruction?

Michael G. Kadlubowski
(Ed.D. Candidate – Educational Technology, Research, & Assessment)
Northern Illinois University

Thesis Objective
The hypothesis of this thesis is to present to the reader an argument as to whether existing educational paradigm’s, philosophies, pedagogy, and practices require revision to effectively teach web based instruction. Due to the length restrictions of this paper the reader is advised that not all paradigm’s, philosophies, and practices are included, and those that are evaluated as to their usefulness in web based instruction are very limited in scope, definition, and explanation. In all probability you will find that this paper will ask more questions than it answers, but in doing so will hopefully stimulate each of us to view and analyze the effectiveness of the current practices employed in web-based instruction.

Background
As early as 1973 Daniel Bell, and later in 1980, the futurist Alvin Toffler identified several massive changes that our society has undergone: from the agrarian age to the industrial age, and now entering into what some call the information age. These futurists, among others predicted a complete change in our societal values, and the reforms that would be necessary to accommodate the change from an industrialized to an information based society. In many cases, these futurists were correct in their predictions, and our society today is indeed mired in the process of adjusting itself to accommodate this new age of information and technology.

In looking at our educational systems and the population of students that these systems serve we find quite a vast array of scope and difference among students. Demands upon and within the educational sectors are changing. For higher education, demographics and workforce changes are fundamentally altering the student population. In 1995, 44 percent of all college students were over 25 years old, 54 percent were working, 56 percent were female, and 43 percent were attending college part time. In 1997, more than 76 million American adults – 40 percent of the adult population – participated in one or more adult education activities, up from 32 percent in 1991 (National Center for Education Statistics).

Today a students’ lifestyle and objectives are also very different than those students of yesteryear. It is not at all uncommon to find that today a typical student may be a single parent, who may be working two or more jobs to make ends meet in order to provide for their family. This same person may want to pursue a higher education, but may be unable to do so as a result of time commitments and constraints that are usually and traditionally required in institutions of higher learning. Additionally we find that many students do not have specific available time blocks, which they can reserve or allocate to a particular course or educational unit of instruction on a regular basis.

More students than ever before engage in learning programs that offers courses at nights or weekends. Some educational institutions even offer courses on Sundays – which in some religions could be considered a sacrilege! Additionally schools have realized that in order to sustain themselves and to remain competitive they must adjust their offerings to accommodate this diverse and ever growing population of students.

As a result of newfound technological advancements in the fields of computer technology, education, and instructional technology, we find that web based instruction is becoming somewhat commonplace in what would be considered traditional higher educational settings. Many schools including Northern Illinois University now conduct
a minimum of some type of web-based instruction. Additionally an entire new industry of web-based instruction has risen to compete with the universities in this endeavor.

In those otherwise traditional institutions where the implementation of web-based instruction has been accomplished, the school is assisting the non-traditional student in the meeting of their educational goals and objectives. The school is also meeting its’ social obligation to educate even the most non-traditional of students. Now that the movement toward web-based instruction is underway, the question and thesis of this paper, is whether a paradigm shift is necessary or required to effectively support the non-traditional student in their use of web-based instruction.

**Instructional Paradigms & Theory**

A paradigm as defined in Webster’s Encyclopedic Unabridged Dictionary of the English Language is an example serving as a model and/or a set of forms all of which contain a particular element...based on a single stem or theme. Therefore in extrapolating and interpolating the term instructional paradigm we could state that the definition would be a set of forms or examples of educational theory and practice based upon particular elements. You could in a broader sense regard this as the practice or pedagogy of instruction.

Probably the most noteworthy expert on instructional design paradigms is Robert M. Gagne, who authored the *Principles of Instructional Design*. Gagne bases his paradigms on the belief that instructional design efforts must meet intellectually convincing standards of quality and that such standards need to be based on scientific research and theory in the field of human learning. Gagne takes into consideration learning outcomes, including intellectual skills, cognitive strategies, verbal information, attitudes, and motor skills. He also considers the knowledge, skills, and abilities of learners and how the differences among learners affect instructional planning and design.

Additional instructional paradigms and principles include the behaviorist also known as the cognitive method and the constructivist orientation or theory of instruction.

Behaviorism was a term coined by the American psychologies John Broadus Watson (1878-1958) in his paper, "Psychology as the Behaviorist Sees It." It is a theory of animal and human behavior holding that actions can be explained entirely as responses to stimuli, without accounting for the profound influences of interpretation on introspection. Thus an educator who believed in behaviorism would tend to attribute learning as a reaction to an event or action that would stimulate the student, but would be provided by the educator. To the behaviorist teaching is essentially a matter of arranging contingencies of reinforcement so as to produce and maintain prescribed behaviors.

Constructivism is quite an opposite paradigm of behaviorism as described and defined above. Brunner first proposed the concept of constructivism in the mid-1960’s and builds on earlier ideas of Piaget. Basically, the theory of constructivism holds that the learner rather than the educator develops or constructs knowledge and that opportunities created for such construction are more important than instruction than that which originates from the educator. This is certainly not to state that there is not educator guidance or involvement, but that the student essentially will have a very strong voice in the selection and completion of tasks that will aid her in their learning approach to the given subject matter.

Now that we are acutely mindful of three major paradigms, philosophies and/or theories of instruction lets determine whether a change or shift in these philosophies is required in instruction that is provided to students via the world wide web.

**Web Based Instruction**

If we look at the delivery of information and learning via web based instructional systems we find some similarities to traditional learning, however we find more differences than similarities. We find that many web based instructional systems do indeed make use of stimulants such as movies, sounds, and graphics. We also find that the
best web based instructional sites provide a reference library of sorts, to assist the student in their understanding of
the material elements of the particular course. These reference libraries are usually hyper links to other educational
or related web sites, which the student can use as a resource to further their understanding of the materials. Some
hyperlinks use video and animation to gain and hold the attention of the student, while others are merely “page
turner” type of information sites.

But what of the interaction that takes place in the traditional classroom? What becomes of the theoretical arguments
that an experienced educator would foster, stimulate and encourage among the students and/or the educator? What
becomes of the personality and strength of conviction that normally results as a benefit of these stimuli? Are they
lost in web-based instruction? Can a chat session accomplish and achieve the finer points of theoretical argument
without having the face-to-face stimulants and reactions that are readily apparent in a traditional classroom?

I believe that the response to these questions is that it depends upon the design of the course and the process of
delivery that is used. If a web site course is designed along the lines of the Gagne theory of instructional design, it
could certainly achieve and accomplish its' objective. However while the elements of design are crucial, so is the
interaction of the students with each other, as well as the educator. I believe that regardless of how well web-
based instruction is designed, if it is designed solely as a stand-alone product without any human interface or
interaction it will not meet its ultimate goal to educate. Most students need interaction and human intervention so as
to gain the sociological elements of instruction.

I have had the personal opportunity to teach web-based instruction. I have found that even on the best graphically
designed web site, the student needs and actually will seek out interaction with another student or the educator. This
human intervention and interaction is crucially required of most students, but not all. Some students are perfectly
content viewing and reading information from a computer monitor and learning in this way. But the fundamental
question remains: what is the objective of the particular course, and what is the desired instructional outcome? If
these two questions do not include the learning of interaction among culturally diverse students, have we not failed
to meet our social obligation to educate?

To illustrate further I have discussed web-based instruction with Professor Margaret West, Ph.D. of Northern Illinois
University. In any course in which Dr. West provides web based instruction she insists on face-to-face class
meetings at various points throughout the semester. This allows the students to interact not only with each other but
also to be mindful of the humanness of the educator. It allows the educator also to view the humanness of the
student, who may be shy, or intimidated by either the web based instruction, or the human interaction with fellow
students. In any event this human interaction provides a further development of the educational endeavor, and
allows for the student to learn the intricacies of the social environment of learning. In a written response to my
inquiry as to the necessity of these activities, Dr. West responded as follows:

"In the past, I taught the course entirely online with just a face-to-face
kick off and a face-to-face debrief. Feedback from students in the debriefs
indicated that they were seeking more external support for avoiding
procrastination in the course. They also wanted opportunities to meet with
their partner for the partner consulting activity. With that feedback, I
decided to add a face-to-face meeting approximately once a month. The goal
of the face-to-face meetings is to provide a "check-in" on course
assignments so the student paces the assignments throughout the semester,
and to provide an opportunity to meet with their partner."

In having the opportunity to bring to fruition a mix of the traditional class room environment along with a
constructivist educational attitude, I believe that the student will learn a great deal more than merely be left alone at
the web site to learn. But I am oversimplifying a bit to make a point. The fact of the matter is that much of web
based instruction includes the ability of the student to engage in forum discussions with other students, and at
predetermined times with an educator leading the course of discussion. Additionally in many web site based
instructional settings the student can and does frequently send e-mails to the educator or other students. But
fundamentally these interactions are not human interactions. These interactions are merely a substitute for the actual
human interactions that would readily take place in a traditional classroom setting.
As an example in a traditional classroom it could be stated that the educator leads the instructional process in somewhat of a behaviorist viewpoint if the educator uses the lecture technique as his sole means of instructional delivery. If however this same lecturer engages the students in the lecture, and encourages them to participate or to make other contributions to the lecture, it could be said that the educator utilized a constructivist approach to learning.

Certainly there are numerous other theories of instruction that could possibly demonstrate arguments on either side of this thesis. As an example, lets briefly consider problem centered learning, within the element of web based instruction. One of the most noteworthy educators of our times, Dr. Thomas M. Duffy of Indiana University and Unext.com is a strong proponent of problem centered learning in a web-based environment.

While I certainly do not possess neither the education, the credentials, or even the experience to argue this point with Dr. Duffy, I believe that I can respectfully suggest at a minimum that problem centered learning on the web, may not be suitable to every student. Once again, without human intervention and the social implications and benefits that this type of interaction provides to the student, the student may eventually find themselves lost in their ability to intellectually engage in the most simple of arguments or discussions.

Aside from the normal fears that some students have relative to their ability to function within a PC environment, what other fears may exist if we enroll this student in a web based course to which he may possess little or no knowledge, and then "throw her to the wolves" using a problem based scenario? I fully realize that even in a problem based scenario there are on-line resources available to the student including chat forums, additional reference materials, and even periodic and timely assistance and feedback by the educator. However, without having any academic knowledge of the subject matter, coupled with a possible fear of the PC environment, within a problem based scenario, with little or no in-person intervention available would appear to me to be a situation that would have a high likelihood of failing to meet the learning objectives of that particular course of study. Even if specific learning objectives were met and determined to be successful, have we not failed to provide the student the type of human interaction and socialization that may assist them overall in their vocation? Why would we want to place a student in the position of potentially passing a course of web-based instruction, but not learn the art and beauty of social interaction and behavior?

On the positive side most web-based instruction does provide discussion forums, discussion groups and e-mail capability. I do believe that we can definitely enhance the students’ ability to write philosophically and intellectually as a result of these forums. I also believe that using these forums will indeed enhance the educational benefit of web based instruction, but not necessarily to the same extent that web based instruction coupled with human interaction could.

**Conclusion**

The real solution to the issue of a changing paradigm is in the answer to the following question. In which ways can web based instruction bring both the best instructional process to the student, as well as bringing about the convergence of a stimulating and encouraging environment of learning while meeting learning objectives? Is a shift in paradigm necessary, or are what we are experiencing merely a juxtaposition and congruency of the instructional design principles of Gagne, coupled with the principles and practices of either the behaviorist and constructivism approaches to learning?

Is or will it ever be possible for us as a society to provide the same type of interaction that takes place in classrooms via web based instruction? If so will we loose any of our abilities as educators, or will web based instruction create more clearly defined challenges and obstacles to the educational process? Will web based instruction be able to take advantage of alleviating distances between the masses while still being in a position to provide a quality education, or will web based instruction fall by the way side as merely a technology fad that was temporary at best?

With little research or empirical data and/or analysis available on this topic or of the effectiveness of web-based instruction to accomplish learning objectives, we can all pontificate and engage in this type of hyperbole. My own personal belief is that a combination of the tried, tested, and scientific principles of instructional design and
educational pedagogy must be employed in order for web-based instruction to succeed. I don't believe that under any circumstances should proven instructional principles be sacrificed in order to serve the masses more efficiently. I do believe, however, that in order to succeed with the same or exceedingly difficult goal of increasing the benefit of the educational experience to the student, that a new type of web based design principles and pedagogy will emerge. I also believe that a new type of instructional delivery system will continue to emerge and evolve as a result of technology advances and convergence in the way of cameras, video, and real time conversations. I believe a new type of educator will also emerge. This will be an educator who has had the experience of teaching in a traditional classroom setting but is able to take advantage of the technology to bring forth a better delivery method of instruction within a web based instructional setting. This will be an educator who believes that personal intervention within a web based environment is not only necessary for the student, but also for the educator and indeed will provide a valued sociological benefit to both.

Is web-based instruction a suitable alternative for all subjects, for all students, and/or for all institutions? The unequivocal response to this rhetorical question is of course not. Each of us possesses certain behaviors, skills and attributes, which allows us to learn. We are as different in these processes as the night is from the day. Web based instructional methods are only a single source utilized to expedite instruction. Some students will continue to use the services of a traditional institution, coupled with web based instruction, while other students will be more suited to the rigors of a traditional classroom situation.

Will we require making a committed and concerted effort in a paradigm shift? I am not certain that a complete shift in tried, and tested philosophies and paradigms is as necessary as is the fundamental approach to education which is to recognize the uniqueness and differences in style and learning patterns that distinguishes us as human beings and students. Only with the acceptance of these learning differences can we as instructional designers, and educators utilize the technology resources to reach the masses. Only with this recognition of differences will we be in a position to challenge and to establish new paradigms of instructional philosophy. Only with the recognition of these differences will we establish and possibly redefine the instructional philosophies, which currently exist.

Time, experience, technology and the dedication of educators and students to attempt new methods of delivery and instruction will be one of the bases of foundations for any new or re-configured paradigms that may come into existence in the future. The evaluation of these success and/or failed attempts coupled with only the passage of time will eventually allow us to effectively evaluate the changes necessary to determine if a shift in educational paradigms, philosophies, and dogma are required to suit the information age.

In any event, we as educators are very fortunate indeed to be involved on the “cutting edge” of a distance learning evolution and revolution! What an exciting opportunity for each of us to participate in a new paradigm ideally suited to this new and ever changing technology as well as meeting the needs of the student and society. What an exciting time to be involved in the educational process and in the future development of intellectual stimulation, inquiry, and argument using advanced technology.

Kaleidoscope of Designing, Administering and Teaching Distance Education

Designing Web-based Education Program

Victor Aluise
Communication, Computing & Technology, Teachers College
Scholastic Inc.
568 Broadway, NY, NY USA
valuise@scholastic.com

Abstract: A program of online courses has been designed by Thirteen/WNET to meet teacher needs relating to the effective use and integration of the Internet in the K-12 classroom. Courses in the program are predicated on action, on learning by doing. Courses are built around hands-on activities, that allow participants to experience and reflect on the topic under consideration.

Online courses define a new methodology that uses the unique aspects of the Internet and is consistent with a constructivist model of education.

- Rather than using a traditional lecture based model, courses are designed to encourage students to discover and create knowledge, and apply that knowledge to real-world situations.
- The instructor acts as a facilitator. Rather than being the expert from whom students must learn, and by whom students are led through a predetermined set of facts, the instructor’s role is to encourage and facilitate students’ creation of their own body of knowledge, and to comment on, assess, and provide feedback on what students have discovered and created.
- Students learn from themselves and each other, through experience, collaborative processes, critical thinking, and problem solving.

At the culmination of each course, students will have a new set of resources and strategies that they can use immediately and effectively in planning and teaching their classes.

Program Design And Methodology

Although it makes use of some tried and tested concepts (for example, required class participation and the completion of assignments), the methodology of the courses transposes them into a new learning environment.

- In seeking to utilize a constructivist methodology, courses are designed such that students’ contributions to a course will form a new body of knowledge to which they can refer and from which they can build further knowledge.
- The creation of an online community of learners, committed to the goals of the program is crucial. Participation in discussion forums, evaluating and responding to others’ ideas and comments, and contributing to the creation and discovery of knowledge is axiomatic.
- Although there are broad outlines and deadlines for the course, participants can work through each course at their own pace and schedule participation at times that are convenient for them.
- Each course in the program will offer audio and video elements, featuring clips from the Thirteen/WNET series, The Internet in Action.

Course Components

Before the start of a course the instructor will be invited to devise and submit INSTRUCTOR’S NOTES. These notes will provide participants with guidelines on the instructor’s learning theory, and how she or he intends them to interpret and use the course materials.
TUTORIALS are divided into three sections. Participants are guided through the topic in a sequence of Explanation (tell), Demonstration (show), and Implementation (think/strategize). Each tutorial culminates in an Assignment (do). Participants are then asked to reflect on the tutorial’s content, in offline journals and in the online discussion area.

In Explanation, some of the big picture, general issues involved with the topic are presented. Demonstration takes a Web site or project that exemplifies some of the issues introduced in the first section of the tutorial and examines those issues in context. And in Implementation, participants are encouraged to think about what they are learning. We will frame strategies that can be used by participants in determining how, why, where, and when they will put these theories and skills into practice.

Each tutorial ends with an Assignment, which offers participants the opportunity to test new knowledge and try out new skills. Assignments are focused, specific, real-world tasks. Whenever possible, participants can choose to center the activity around a specific subject and grade level, thus personalizing assignments and making them as relevant and valuable as possible.

The results of each assignment are submitted online to a document called CLASS FINDINGS. At the end of each tutorial, this document functions as a summary of what participants have learned, as well as a collection of participant created resources. The instructor will read and summate participants’ submissions, provide a commentary on them, and select two or three “tips of the week.” All participants will be able to read all submissions, in addition to the instructor’s commentary.

Posting to a DISCUSSION FORUM is required in addition to submitting results of the activities to the Class Findings. Throughout the course, participants are encouraged to reflect on the processes they undertake by keeping a REFLECTIVE JOURNAL and posting excerpts from that journal online. Participants will post to the discussion forum at least twice a week during the course -- once to share a journal excerpt, and once to respond to another participant’s posting. Links to the discussion forum appear on every page of the tutorial, and in the Implementation section, topics for reflection are suggested. The reflective journals themselves can be kept using pen and paper, or a word processing program.

Throughout the course, participants will refer to a variety of ONLINE RESOURCE MATERIALS. These materials will be developed from wNetSchool content, the Internet in Action video series, and other rich and diverse sources. Resources will be primarily text and image based, with the inclusion of audio and video where available and appropriate. Online resources will be supported and supplemented with print and video materials.

Seven Pointers for Administering K-12 Distance Education Programs

Elsie M. Szecsy
Division of Education and Behavioral Sciences
Concordia College, Bronxville, NY, USA
cms@concordia-ny.edu

Abstract: This paper reviews seven aspects to consider when administering K-12 distance educational programs and draws from the author’s experience as an administrator in a distance-learning program in a metropolitan area in the northeastern United States. This paper also suggests indirectly that administrators (1) take advantage of distance education to promote new and more effective pedagogies and (2) draw from sound practices in pedagogy, professional development, and organizational design that will support them in efforts to improve distance educational programs.
Distance education is one of a number of terms that refers to instruction where teacher and learner are separate from each other and where telecommunications technology is the bridge between them. Administering distance education programs requires creative leadership in ensuring that educational goals and needs of students are met by establishing policy, procedures, and programming components ahead of time (Majdalany 1999) that is well grounded and also flexible enough to accommodate changes in technologies, personnel, and curriculum and instructional practices over time. This paper proposes seven pointers for administering distance educational programs.

Arrange as much as possible in advance. Before program implementation, administrators should establish clear organizational arrangements, policies, and procedures, especially with reference to such areas as budgeting and finance, scheduling courses and special events, reporting grades, and recording attendance. Further, administrators should also be instructional leaders, and reframe perceived insurmountable problems into opportunities to introduce instructional innovations in the broader distance educational context where they may be easier to understand. For these and other reasons it is important that organizational and operational arrangements be spelled out in advance among existing partners, and be equitable and inclusive enough in design to ensure that all voices are heard.

Recruit faculty early. Building institutional and organizational capacity begins with the early identification and recruitment of prospective teleteachers. As technology has the ability to magnify both the best and worst of teaching, administrators should also concentrate their efforts on helping newly recruited and continuing teleteachers learn and refine the best of instructional practice. Ongoing and multi-faceted professional development (including, e.g., peer and cognitive coaching, reflective dialogue, workshops, conferences; independent learning, large group demonstration, independent and assisted practice, hands-on labs), also considered optimal for face-to-face teacher development, is an especially good mechanism to ensure progress for teleteaching (Harris 1995; Lieberman & Miller 1999; Sparks & Hirsch 1997, Szecsy 1999).

Network, network, network. As important as the physical network infrastructure is, so also is the inter-institutional and interpersonal network of relationships in distance educational initiatives. For school administrators, this means communicating with one’s colleagues in the other schools or districts throughout the course of the school year to facilitate distance educational programs that they share. For project administrators, this means taking a facilitative posture and resisting the urge to micromanage. Model the use of distance educational technologies by using them to facilitate networking. Providing an interactive website and using email to support networking activities are ways to accomplish this goal (Szecsy 1999).

Technically possible does not mean institutionally or organizationally permissible. Though it may, for example, be technically possible to record classroom interactions, it may be impermissible because of arrangements and existing policies or laws that preclude recording, especially where minors are present. Likewise, it is important to consider copyright law when analyzing licensing requirements for multimedia resources to be used in the distance-learning classroom.

A distance education course that takes place in more than one site constitutes one section of that course. Though apparently self-evident, when the administrator understands the distance education class section to be one class section that takes place in more than one location simultaneously, the administrator may also understand licensing requirements for multimedia instructional resources and special requirements for staffing support personnel differently from another who interprets a multi-site distance educational environment as separate groups tethered together by technology and a teacher. The difference between the two perspectives may appear slight, but their implications for pedagogy and policy are profound.

Use multiple means to evaluate distance educational programs. Because of the complexity of distance education programs, augment traditional quantitative, empirical, evaluative mechanisms with qualitative,
naturalistic inquiry methods, such as focus groups, interviews, observation, and journal writing. Program evaluation methods should address the following: accountability, effectiveness, impact, organizational context, and unanticipated consequences. Administrators are also advised to consider the following categories of information when evaluating distance learning programs: measures of activities (e.g., number of courses, students), measures of efficacy (course persistence, workload, registrants in multiple distance-delivered courses), measures of program aims, measures of policy (market research), and measures of organization (evidence of procedures and other organizational features) (Woodley & Kirkwood 1986).

Conclusion

Though the uninitiated may consider the distance education classroom to be peripheral to the larger school community, the opposite may be a better description of the place of distance education in K-12 educational programs. Astute distance educational administrators who recognize this possibility are well positioned to leverage the power of distance education to support sound, research-based curricular innovations and effect long-lived improvements in teaching and learning across the larger school community to benefit all students. In constantly changing conditions, however, making long-lived arrangements to institutionalize distance education into the educational program in K-12 settings may appear elusive.

Learning American Sign Language at a Distance

Pamela I. Furline
Hempstead Public Schools
Hempstead, NY, USA
pfurline@optonline.net

Abstract: This paper reviews strategies to consider when designing and implementing a foreign language devoid of voice using distance learning and draws from the author’s experience as an American Sign Language (ASL) Teacher in a distance-learning program in a suburban area in the northeastern United States. This paper will also address the planning, development, implementation and adaptation needed to foster a successful program as well as the role and responsibility of hosting a distance learning course.
Distance learning can be defined simply as any live interactive class in any classroom, which enables the transmission and/or receipt of such class utilizing technology and involving students, and teachers who are separated by time and space. American Sign Language (ASL) is the language of the Deaf community created for and by Deaf people (Baker & Padden, 1978). It is visual-gestural. ASL is a complete and complex language, with all the nuances and subtleties of a spoken language. Because of its signed modality, people often assume that ASL is merely a gestural representation of English. It is not. ASL differs from spoken languages in that it is (1) visual rather than auditory and (2) composed of precise hand shapes and movements. Although ASL is not derived from any spoken language, nor is it a written language, it coexists with English in a bilingual environment (Wilbur, 1987). Teaching a foreign language devoid of voice using distance learning requires innovative planning to ensuring that educational goals and needs of students are met by establishing a professional working relationship with the guest school(s) administration and personnel who will be instrumental in the success of the interactive processes.

Planning, developing and implementing. Implementing a distance-learning course requires time, support enthusiasm for, and belief by, administration, faculty, parents and students as well as careful planning. A distance-learning course that takes place in more than one site requires more planning and preparation than a face-to-face course. Distance learning requires clear planning to benefit the needs of the students enrolled. The Host school must develop a working relationship with the participating schools. It is important to establish guidelines and standards at the beginning of the course. Once these procedures have been established and understood by all, the class should be ready to begin on their new and exciting journey. However, they must remain flexible enough to accommodate unforeseen changes or problems with the technology used for the course. It is important that the teacher understands the technology’s strengths and weaknesses and is able to adjust plans in case of technical failures. Course materials should be sent before the start of the course to ensure a smooth beginning. Effective teaching at a distance is the result of preparation as well as, parents', students’ and administration’s understanding of the special requirements necessary to ensure a successful course of this magnitude.

Goals and Benefits. One of the goals of learning American Sign Language (ASL) though distance learning is to help student develop cultural awareness, cross-cultural adjustment skills and respect for the Deaf community while sharing their experiences with a diverse student population outside of their individual communities. Learning ASL at a distance has contributed to the breakdown of prejudices that have divided many communities in this suburban area. Interacting with students from such a diverse background has helped to develop healthy competitions and personal relationships among the students as well as the staff. Each school strives to exceed the others skill level of performance in ASL.

Adaptation. As stated previously, ASL is a language devoid of voice that requires students to use a different sensory modality than the traditional auditory modality. These students are hearing and must now adjust to using their visual as well as kinesic/tactile modality to be successful in this course. Voice is not allowed and therefore, students must use different strategies to facilitate communicate effectively. The recommended mode to communicate is by using facial expressions, body language, mime, gestures, and writing notes to be placed on the television screen. This adaptation encourages creativeness and critical thinking among students.

Role and Responsibility of the Host School. Communication is the key to a successful program. The interpersonal relationships in distance learning initiatives means that communicating with the technical assistance assigned to the course as well as administrators from the other schools throughout the course of the school year to facilitate communication is essential to the success of the program. The Host school is responsible for facilitating effective communication among all schools involved in the course. They are also responsible for submitting progress reports and grades to the guest schools as well as supervising the technical assistant assigned to the course and maintaining classroom discipline. Establishing good working relationships with the technical assistance assigned by the guest schools is of tremendous importance. The relationship developed is of critical importance to the success of the course. Using the teamwork approach helps to ensure that the basic needs of the course as well as the adaptations can be met in a timely fashion. Unfortunately, because of budgetary constraints, it is not always possible to meet the technical assistance assigned and/or have a run through before the course actually begins. Oftentimes, during class it is
necessary to give instructions to the technical assistant so that adjustments can be made that enhances the flow of the course.

Conclusion
Distance learning presents many new options for learning foreign languages. The electronic classroom is the wave of the future that is here to stay. In an effort to assist student learning, support from administration, faculty and staff, and also the communities involved, is essential for the success of the program.

TEACHING WEB-BASED DISTANCE EDUCATION COURSES

Sheila Kieran-Greenbush
Communication, Computing & Technology, Teachers College
Academic Information Systems
Columbia University, NY, USA
sheila@columbia.edu

Abstract: This paper addresses the issues concerning teachers of web-based courses, drawing on the author's experience teaching graduate-level and professional development web-based courses. Teaching online requires well-planned administrative and instructional support from areas such as a library. Teachers need to explicitly state their expectations and responsibilities as well as those of the learners. Teachers must allocate time to prepare and maintain and design course materials and regularly check what is happening during the course. Text-based online courses increase the demand for new communication skills.

“Distance Education is defined as a planned teaching/learning experience that uses a wide spectrum of technologies to reach learners at a distance and is designed to encourage learner interaction and certification of learning” (University of Wisconsin-Extension, 1999). The “planned teaching/learning experience” consists of social interactions (Bellack, 1966) within the created learning environment. The teacher’s role is to develop, guide and ensure the “planned learning experience.”

For over a hundred years, teachers and learners have engaged in distance education using postal mail service to exchange course materials and communication. Today, the World Wide Web (web) is creating new ways to engage people in distance education courses through interactions with the course content and other participants. Teachers must adapt established teaching techniques, share their role as teacher, and
adjust communication techniques because of the design of the web-based course and the online communication methods (e.g. electronic mail, chats and bulletin boards). In addition, teachers need to have well-planned and accessible administrative, technical and instructional resource support.

*Time Allocation.* As with traditional courses, teachers design their courses and activities. For new web-based courses, the course materials and all the activities must be developed and prepared for delivery via the web prior to the beginning of the course. For existing courses, the materials and links to web resources must be reviewed for currency, accuracy. Teachers must allocate time to each offering of a course for course develop, review and maintenance. Once the course starts, the teacher must be available on a regular basis. Being available means accessing the web-based course on a regular schedule, daily, every other day or once week. Teachers must make the commitment to regularly respond to students’ questions and comments, guide online discussion, start new discussions, and provide feedback to student submissions. Teachers of distance education courses anecdotally state that teaching online requires a greater commitment of time than teaching a traditional course.

*Teaching and Communication Techniques.* Web-based courses are, at this time, primarily text-based with graphics. The course materials are textual documents with images and some limited use of audio and video. Instructional resources constitute referrals to other online sites often text-based and non-online resources. The web-based method of presenting course content emulates the lecture mode in the traditional classroom without the presence of a real human being. Communication between teacher and between learner and learner occurs via typed text either asynchronously or synchronously. Communications methods such as email, chats or bulletin boards are the only means for social interaction. With no paralinguistic cues, teachers need to learn to gather the same information from the text-based communications of the course participants as they would in a traditional classroom. They must ask questions that invite discussion, risk-taking and creativity. They need to share the roles of controller and authority with all participants. The feedback they provide to learners either through submitted work or in direct communications, directly influences the learners’ experience and engagement in the learning process.

*Learner and Teacher Expectations and Responsibilities.* Teachers and learners bring their past learning and classroom experiences to web-based distance education courses. Within the traditional view of school, the teachers are the source of knowledge pouring that knowledge into the minds of the learners. Teachers are responsible for the learners’ learning, control everything else that happens in the class and assess the learning (Scherer, 1999). In this view of learning, students expect teachers to know all aspects of the content, control what happens in the class and ensure that the learners learn what is required. With distance education courses, the responsibility for the learning shifts to the learners. They must learn to schedule their own time, learn to ask for information or help and interact with the course materials and other course participants. Teachers are responsible for providing materials and guidance. They also must support the development of the learning environment and the learners’ efforts, and provide feedback that engages the learners in the learning process.

Distance education shifts the emphasis in the learning environment to a student-centered environment. With this shift, teachers must employ new and adapt existing teaching techniques. They must clearly state what they are responsible for and what are the learners’ responsibilities. Anecdotally, teachers report that learners expect immediate feedback. When it suits them, learners still seem to defer to the teacher as the leader and controller. Teachers must learn to ask questions and guide learners to accept their new responsibilities. Teachers must learn to take learners’ expectations into account as well as state clearly what their expectations.

*Administrative and Instructional Resource Support.* There needs to 3 types of support: administrative, technical and instructional resources. Administrative services such as registration and course publicity need to be as fully functioned as they are for traditional courses. Teachers should be able to contact staff who will resolve questions regarding registration, academic advising and other student services. The staff will coordinate the technical support and administrative work, and ensure that rosters are loaded into the online course and that participant notifications occur. They will coordinate the Registrar’s requirements with the online environment. Technical support functions include loading course materials and student information each semester into the online course and resolving technical issues facing students and faculty. Teachers
need to be able to work with staff to understand what is doable within the online course. Teachers also need to have instructional resource support that includes help building course materials and finding instructional resources such as web sites and full-content/text resources that the learners will use.

**Conclusion**

Each learner is unique. Teachers must adapt their strategies and techniques to create individualized activities and plans that engage and motivate each learner. In web-based distance education, the technology adds new dimensions and demands on teachers to develop student-centered learning environments. With only a small body of literature available on effective teaching in this new learning environment, we can learn much from each other.

Exploiting and Evaluating A Web-Based Learning System

Six Days and Seven Nights In The Basement

John Knight
Department of Philosophy
University of Wisconsin-Waukesha
United States
jknight@uwc.edu

Robert Bermant
Department of Psychology
University of Wisconsin-Waukesha
United States
rbermant@uwc.edu

Abstract: Discussion of the value of Web-Based Learning System (WBLS) takes place at two levels, the theoretical and the practical. The practical value of a WBLS depends on numerous factors including: extent of course enhancement, degree of dependence on web-based technologies, the software platform, technology support, students' skills, and institutional issues. At the theoretical level the debate on the value of a WBLS occurs both within the discipline as well as within academia itself. This report examines our experience with a WBLS in the context of a new integrated studies course.

We teach at the University of Wisconsin-Waukesha, a two-year transfer institution within the University of Wisconsin System. It is a commuter campus without residence halls. Most of our students work at least twenty hours a week. Over half of our students are from the lower quartiles. Faculty at our institution typically teach 12-credit hours each semester and in addition they are expected to contribute in a variety of ways outside of the classroom, i.e., student advising, committee service, and professional activity.

The institution provides office computers, network access and a web-based learning system (WBLS) for its faculty. While significant dollars are targeted toward the development of on-line, asynchronous courses, there few institutional resources allocated for web-enhanced courses. This despite the fact that the faculty is expected to develop and support web-based activities for their courses in addition to their other professional and pedagogical responsibilities, i.e., "six days and seven nights in the basement."

Furthermore, instructors on our campus have little technological support. For example, our computer center staff is unable to assist either instructors or students having problems with a WBLS or other instructional technologies. Technology assistance is the responsibility of a limited-term employee, who is a half-time student at another campus. Needless to say, much of the instructor's time is spent working on technical problems. These problems range from helping students login to the system, to discovering why the colors they have chosen for their personal web pages look different when they view them at home. The upshot is that at the beginning of the semester we devote many hours to wrestling with these problems while at the same time trying to prepare for and teach the course itself.

Currently, there is really little merit recognition for including web-based activities into our courses. Rather, it is largely a matter of instructor choice. And that choice may be driven more by institutional priorities than by compelling research demonstrating the soundness and efficacy of web-based pedagogies. Although there is ample evidence that students "like" web-based experiences, important questions about the educational value of such experiences remain unanswered. Does more technology mean better pedagogy? Just because we can now put materials on the web and provide virtual discussion forums for our students, should we? The problem is we simply do not know. It seems that such questions ultimately focus on resource deployment. When much of what we do or do not do is driven by enrollment, it is important to determine how to allocate limited dollars. Do we invest in
technological infrastructure, while encouraging the deployment of web-enhanced, hybrid, and asynchronous courses? Or do we support opportunities for greater student-faculty contact, smaller classes, and first-rate teachers. Obviously these choices are not mutually exclusive, but the tension they engender is very real and it has implications for our future as an institution as well as for our students.

A primary motivation for integrating a WBLS into courses is course enhancement. There are several ways instructional technologies can enhance a course. Clearly they encourage interpersonal communication. Discussion forums, group activities and email permit asynchronous exchanges to occur. Student and faculty home pages help in getting to know something about each other. In the absence of opportunities for face-to-face interaction a WBLS can help to foster communication among students and faculty.

However, our aim in using the web is not communication for communication's sake. Rather we want our students to present clear, coherent, and consistent arguments. We seek to accomplish this in three ways. First, we try to be role models. We provide examples of the kind of analysis we expect. Whether we are presenting our own views or discussing the views of another philosopher or psychologist we emphasize the importance of justifying our conclusions. We provide hypertext links to sites that exemplify empirically based and logically sound arguments. Second, we ask students to evaluate each other's arguments. And third, we take the arguments presented on the course web site back into our classes to stimulate discussion. This is especially helpful where we have students who don't say much in class. We use their web comments to get them involved in the face-to-face discussion. The technologies used in our courses also enable us to demonstrate the richness of resources available on the web. Not only do we provide supplementary course materials but external links as well. As we discuss each main topic we provide students with a set of hypertext links that elaborate on the issues. Often the links are directly to the authors who write the articles or to discussion groups currently analyzing the concepts and arguments. Along with web discussions we also present self-check quizzes. The quizzes receive a fair amount of attention. Students will often have follow-up questions about their answers. Thus web-based instruction not only aids in teaching our courses but enables us to tutor the course as well.

Web-enhanced courses present unique involvement challenges. It is difficult to motivate student to participate in web projects without grade inducements. We have offered courses that have included web components where the web work was not required for the class grade. While there was initial interest, the web activity dwindled as the semester progressed. In fact, according to class surveys, one of the student's greatest concerns about web work is the time it takes. Since most of our students have jobs and many have family obligations, they must carefully budget their time. When we first integrated web work into an interdisciplinary course, we received a lot of student complaints about what they perceived as excessive work. In response to these concerns we have since cut down on the web requirements.

In large classes it takes a fair amount of time to read, record, and respond to the answers to discussion questions. We estimate that in addition the start-up time, web work adds about one hour each day per class. In order to track students' responses to their web experiences we conduct continuous student evaluations throughout the semester. We ask students to keep logs as well as having them fill out questionnaires. The tracking information is very useful in spotting problems, making mid-course corrections, and insuring that our web demands are not excessive.

There are a wide-range of philosophy and psychology courses at all academic levels now offered on-line. Additionally, there are electronic journals, articles, papers, opinions, and discussion forums on the web. Our professions have certainly embraced the web as a vehicle for exchanging information. The sheer quantity of information is overwhelming and often this makes it difficult to find a useful signal in what sometimes seems little more than a sea of random noise. Within the disciplines there is debate over the advantages and disadvantages of web v face-to-face instruction. Do on-line courses tend to negate the dynamic interaction needed to teach philosophy and psychology? Would Socrates ever teach an on-line course? Can one "deliver" instruction as if it were a pizza? Are courses that are taught on-line better than no courses at all? Fortunately value-added or web-enhanced courses need not answer these questions, although they beg for answers. Instead, we believe that we have the best of both worlds. We interact in-person with our students. Also we exchange ideas with our students over the web. We can take advantage of the richness of information that the Internet makes available, while preserving and celebrating the face-to-face interaction of the classroom. Most of our students are not well adapted to the demands of independent study. For them and for us as well, value added learning technologies provide another means for reinforcing and enriching in-class instruction.
Abstract: Three years ago, the journey of utilizing a distance-learning format for offering coursework began with a low-tech instructional arrangement which we termed "two cans and a string". Technology has continued to be integrated in courses through software application such as PowerPoint, Internet sites and course management software such as Blackboard.com. We are now beginning to offer multiple point-to-point courses over ISDN lines using VCon videoequipment. This session will discuss key points to consider when making decisions about equipment, connectivity, infrastructure and money.

The teacher shortage in the United States is causing many teacher preparation programs to become more creative in how people can become certified. The demand for well-qualified teachers is even greater in rural and inner-city school districts. One solution to increasing the number of certified teachers is to make the access easier to certification courses. Distance education courses can accomplish this; however, the quality of the program must be maintained (Hara & Kling, 1999). Many of our courses require two-way interaction. We agree with Simonson (2000) who promotes the equivalency theory of distance education. That is to say that distance education is a formal, institutional based education that takes place using two-way interactive telecommunication systems. As sited in Simonson, Smaldino, Albright, and Zvacek (2000), Simonson states:

It should not be necessary for any group of learners to compensate for different, possibly lesser, instructional experiences. Thus, those developing distance education systems should strive to make equivalent the learning experiences of all students no matter how they are linked to the resources or instruction they require.

In the Spring of 1998, the Special Education program at Our Lady of the Lake University began our first videoconferencing efforts. With a computer loaded with NetMeeting, a microphone, and an $80 camera at each location, we were able to set up a "low-tech" videoconference classroom at a minimal cost. The teaching site, on the OLLU campus, used a computer, camera, digital projector, and a wireless microphone,
while the remote location used a computer, camera, and microphone set up in either their school's conference room or library. The total cost to outfit three existing computers with cameras and microphones was $550.

The university computer was connected by 100 MB Ethernet to a LAN that was ultimately connected to the Internet. The remote computers were also connected to the Internet via LAN; thus no modems were used. Of significant note, however, is that the school districts involved use the same Internet Service Provider (ISP) as the university, thus they are all directly connected to the same router at the ISP, and the conferences did not actually go out onto the Internet.

With the initial success of the point-to-point, low-end videoconference delivered classes we decided to aim expand on our initial success (plus we got a bigger grant) and move to a high-quality (30 fps), medium-bandwidth (384 kbps), multi-point videoconference scenario to deliver several classes to multiple locations.

Technology investment and connectivity control the limits of many types of distance education instruction. Each strategy must be considered in relation to the kinds of bandwidth, development hardware, and receiving equipment it needs. In many cases, instructional strategies born of high-end technical laboratories can be modified to sell sophisticated settings. We do not have a $250,000 classroom that is "the videoconference room" with a lot of equipment, monitors, and other electronic "bells and whistles".

We are a small Catholic university. We have a limited budget with limited staff to support videoconferencing. Yet, we must extend our teacher preparation program to communities surrounding San Antonio, especially the rural school districts.

Our teacher preparation program has non-traditional components, including evening and weekend courses, but this does not reduce travel time from remote communities. Videoconferencing is a viable solution, but we still must look for cost effective solutions. Classroom space must be multi-purpose: face-to-face teaching, as well as videoconferencing. We have spent $14,000 for the university classroom videoconference set up and $8,000 for each remote site. Connectivity will also cost approximately $40,000 for nine ISDN lines running at 128 kbps, plus one PRI.

This presentation will discuss decision making points: a) equipment options including issues of format (PC based or hardware), expandability, portability, b) infrastructure support (H.320, H.323, and ATM), c) connectivity issues (ISDN, T1, and IP); and d) money. A detailed Request for Proposal with videoconference specifications as well as the videoconferencing project design can be found at http://education.ollusa.edu/site_2001.

Administrators and advocates often promote technology, but true adoption and implementation occur because faculty are not given time, equipment and training (Cuban, 1996). We have the equipment; we are providing the training and release time. We are not there yet, but we are further down the road, and the way is clearer.

lee@wvwc.edu

Abstract: The use of structured listserv assignments is an effective means of generating quality on-line discussions regarding selected readings for text-based courses. Observed benefits of the listservs will be described by focusing on three representative cohorts of student communicators who participate in the forums. Building on the instructor's experience of using listservs successfully for several years, this paper explains the how and why of structured listserv discussions and provides suggestions based on course experiences.

Introduction

The use of structured listserv assignments is an effective means of generating quality on-line discussions regarding selected readings for text-based courses. Observed benefits of the listservs focus on three representative cohorts of student communicators who participate in the forums. Building on the instructor's experience of using listservs successfully for several years, this paper will explain the how and why of structured listserv discussions and provide suggestions based on course experiences.

Description

Using listservs set up by campus computing services, the instructor posts a series of questions regarding a reading assignment for the following week's class sessions. The questions should address matters of interpretation or opinion rather than strictly factual information—"why?", "how?", etc. rather than simply "what?" Students complete the reading assignment at their own pace, then log on and respond to the questions. Sometimes they will pose some related questions.

To receive full credit, students are required to 1) make specific reference to material in the readings by using quotations, paraphrases and citing page numbers; and 2) make specific reference to answers from students who have already responded.

Benefits

Observed benefits of the listservs can be described by focusing on three cohorts of student communicators: quiet, overbearing, and typical.

a) Quiet Students – Shy, reticent students often are terrified to speak up in class, even though they may have wonderful thoughts that could contribute to the course. The quiet student will, however, respond to structured listserv questions because these assignments are graded. Shy students also will respond because they don't have to physically face a whole classroom of fellow students and the professor. A number of the quiet students prove to be quality thinkers and their on-line contributions prove to be very valuable to the life of a particular discussion and to the atmosphere and direction of the course itself.
b) Overbearing Students – The compulsive classroom talker, the speak-before-thinking blunter, and the off-task amateur comedian are much less of a problem on-line than in a traditional “live” setting. They have one shot at answering each set of questions, just like everyone else. Also, they cannot interrupt or intimidate others who are contributing. If they come up with something inappropriate on-line, other students seem much more comfortable letting them know that digitally than shouting across a hushed classroom.

c) Typical Students – The average students communicators -- who view classroom communication as something less than thrilling, but hardly terrifying — benefit in several ways from structured listserv discussions. First, they are prompted to actually read the material prior to class so that they can participate in the on-line discussion and not lose points toward their final grade. And unlike in-class quizzes, their answers are for all of their peers to read. So, they may read more closely for comprehension because — even on-line — they do not want to make an embarrassing mistake in front of their classmates. Because of peers, the writing quality also may be improved.

Lastly, all students benefit greatly from the opportunity to read insights/ideas from their fellow students and to engage in amicable debate on the issues raised by the assignments and by their fellow students.

Challenges and Responses

Challenges and responses include the following: the first person can’t reply to others (however, the same person is rarely first more than once); shy students may be shy on-line too (at least they are writing something); occasionally a student can be rude on-line (tell them you are forwarding a copy to the dean); some students generally just repeat what has already been said (at least they are reading the original thinking of others, writing something coherent, and benefiting from the repetition of cogent comments).

Conclusion

Course listservs can be used by any classroom instructors seeking to use on-line discussions to facilitate quality discussions on required readings and expand the reach of the class beyond the time/space restrictions of the traditional learning space.

The two primary intended outcomes for this information include: 1) that instructors will have an introductory understanding of how to create successful structured listserv discussions for selected courses; and 2) that they will be aware of some of the potential benefits and challenges of this teaching strategy.
The Distance Teacher: The Ultimate Distance Learners

Karen A. Lemone
WPI
United States
kal@cs.wpi.edu

Abstract Distance learners have been increasingly under the microscope as teaching technologies have enhanced to include web-based courses and universities. Predictors of student success have been researched, tools created to enhance communication, thousands of courses put online, and assessments developed to show both success and comfort of students with web-based learning. Instructors share some of the same advantages and disadvantages as do students as well as some not shared by students. Little has been developed to predict instructor success or comfort. We analyze features commonly attributed to be assets and liabilities of distance learning for students and describe, from six years experience, their impact on instructors. We describe problems instructors do not have in common with students. We summarize results of a survey from students at the end of a distance learning class who were asked to describe features an instructor of distance learning classes should have.

Introduction

The traditional model of a web-based distance learning environment shows an instructor delivering a course to students who are scattered. However, if a time element were added to this picture, we would find that instructors may also be scattered: at the office, the airport, home, the summer home, a conference, an Internet cafe in Bangkok. The author has been in all of these places and others - grading, recording, monitoring and responding to bulletin board posts.

In this paper, we analyze features commonly described on distance learning web pages to be assets and liabilities of distance learning for students and analyze whether these are true for instructors. We describe features of distance learning that are particular to the instructor. Finally, we summarize results of a survey from students - some successful, some not - from a distance learning class who described necessary characteristics for an instructor of distance learning classes. From these we draw some conclusions.

Features of Web-based Distance Learning Course sites advertise and studies corroborate the following features of web-based distance learning for students. For each of these, our analysis for the instructor version has been added.

No travel to class Presuming the student has the necessary equipment where he/she wants to study, travel is not necessary. The time spent in class can be devoted to more focused learning. Also, students who are not within commuting distance can take a class they wouldn't otherwise have access to. Or if they live nearby, they needn't worry about class time conflicts. And finally, self-motivated students have always been able to learn independently, and this is a real benefit to them.

For the Instructor The same is true about travel - in fact, the ability to be able to travel is a definite motivator. Being able to attend the entire session of a conference without having to rush back in order not to miss too many classes makes this mode of delivery very attractive for instructors.

But it takes more time to prepare and deliver a distance learning class than to do it live, in class. Answering questions when both the questioner and the answerer are physically present takes less time to resolve the ambiguities inherent in the question-answer dialog. Written words take more time.
Flexibility This is the most common "advertisement" on course web pages, but unless the course is self-paced (many are not), due dates are still due dates. Of course the student can access the materials in the middle of the night, but the same can be said for textbooks. Few courses have the staffing to monitor the bulletin board at 2:00 a.m. In most cases, flexibility means no class (see "No Travel to Class" above) and the ability to access the materials when the student wishes to.

For the Instructor As long as the materials are ready when the syllabus tells the student they need them, they can be prepared at any time. But isn't this true for in-class courses? Also, that which is flexibility for the student (asking a question at 2:00 a.m.) is hardly flexible for the instructor or staff member who may be expected to answer it.

World-wide access to experts and colleagues This is a particular asset for discussion type courses where students can converse with someone from another country and/or culture. A discussion of events at Pearl Harbor would be different if some of the students are Japanese and some are American. For motivated students, searching for supplementary material increases their learning. In fact, students who are motivated to search for answers are enabled by the web.

For the Instructor This is a major benefit for the instructor of web-based courses in general and distance learning web-based courses in particular. In one of our courses, our HYpertext module uses the material (with the author's permission) of a leading expert in the field. Instructional "reuse" is an emerging pedagogy.

Class size A recent study [Institute for Higher Education Policy, 2000] found that class size did not affect quality of online distance learning courses. But studies [Lemone, 1997, 1999] show that class size does affect comfort, however. A study of a class of 30+ students compared to the same course taught with ten or fewer students showed much more anguish. The questions: "Did the staff respond in a timely manner" and "Did the instructor appear to care about the students" received lower scores in the larger class. More students in the larger class indicated that they would not like to take an online course again.

For the Instructor Attempts to measure the time/student vary, but for instructor-led (as opposed to instructor-produced) courses, it is clear that class size does affect instructor success (if measured by course evaluations.) In addition there is a great increase in instructor time even when the course includes other staff to help. For the 30+ class, (taught just once because of the time involved) we joked that there is an exponential relation between class size and instructor time and work. Further studies may show it is no joke.

There are many other features for instructors that can be studied, measured, and compared with those for students: collaboration ease, assessments, management of communication tools and course content, to name a few.

Pretest and Posttest Surveys

The information presented here was gathered from one term of a yearly web-based distance-learning course. The information received is consistent with that gathered in previous years, and from larger classes. Not shown are specific statistics taken week by week, and statistics related to course content.

TIME

Distance Learning takes more time for students and instructors. Below is a comparison between the time students expected to spend (Figure 1), and the time they actually did spend (Figure 2).
Statistics gathered during the course showed that half the class spent 16 or more hours for three of the ten weeks the course was in session, with 25% of the class spending more than 20 hours during two of the busiest weeks.

WEB USE

Students who already use the web to find information might be expected to be more comfortable in a web-based distance learning course. The one student who got a C (the rest of the grades were A's and B's) indicated that he found information best from an instructor.
The amount of time spent on the web also indicates their comfort in this medium. Only one person (the student who received the C) spent fewer than 5 hours per week on the web.

EXPERIENCE IN DISTANCE LEARNING

Students who have taken a distance learning course before might be expected to be more comfortable, and to be better able to gauge their success, but as Figure 4 shows, few have taken distance learning at our university so far.

![Figure 4](image)

Figure 4 Have you taken a distance Learning Course before?

WEB-BASED AGAIN?

The students were asked if they would take a web-based learning course again. Figure 5 shows that most, but not all of them would like to do so.

![Figure 5](image)

Figure 5 Would you take a web-based online course again?

CAMARADERIE

It is important for students to feel a sense of connection to both the instructor and to their classmates. For web-based learning courses, this is facilitated both by the instructor and by the use of web-based communication tools. Figure 6 shows that the course could improve in this area.
STUDENT CHARACTERISTICS

Prior to the course, we publish a list of characteristics found to be predictive of success in web-based distance learning. In an attempt to further refine these, the students were asked after the course for their opinions. They listed many of the same characteristics plus a few of their own: interest in material, self-disciplined, motivated, comfortable learning outside the classroom, comfortable on the web, self-directed (able to search for information), able to keep to a schedule, able to work independently and isolated, be a full-time student (referring to the amount of time the course took), not easily distracted, not needing close attention and one-one attention, not needing physical contact with instructor and classmates, no procrastination, no interfering family responsibilities (for those who work at home),

Students were asked what behaviors enhance web-based learning.

HOW TO ENHANCE WEB-BASED LEARNING

The students mentioned: interacting with other students, being self-disciplined - starting new material early, not to expect spoon-feeding, having a good computer environment, and an easy way to print materials (acknowledging this is hard with hypertext).

What Students Want in a Web-based Distance Learning Instructor

Studies have shown that only those instructors motivated to do distance learning should be encouraged to do so [Institute for Higher Education Policy, 2000]. Those interested and involved in distance learning need to present courses that students can learn in and are comfortable with. The students reported the following characteristics and behaviors needed by such instructors: display correct and concise information, understand that no matter how clear the content appears to be, students will always have questions, respond to questions and requests in a timely manner, respond immediately to bulletin board postings, have good course organization, attend to the course's "portal", have patience (needed more than in-class), be responsive.

While many of these also apply to traditional in-class courses, it is likely they are even more important when the course is entirely web-based.

Analysis, Results and Conclusions

Web-based distance learning courses involve two aspects: 1) course content, and 2) course communication. The World Wide Web itself provides a platform for the content. Course management tools provide the communication, both asynchronous (bulletin boards etc.) and synchronous (chat rooms etc.).
Web-based courses are not an easier way for students to learn, just a convenience in some cases. Clearly, it takes more time to learn in such a course. All students spent more time than they predicted. For the instructors it is also not easier, but also sometimes more convenient. Experience has shown that using the model where the course creator is also the instructor takes the instructor more time than traditional courses, and that the time tends to be more fragmented due to the asynchronous communication features of course bulletin boards. In the statistics, one student requested 24-hour instant response to bulletin board postings. While this may seem unreasonable in a traditional course setting, perhaps it is not unreasonable in a web-based course.

The student characteristics and behaviors, as reported by the students themselves, include some traditional ones: motivation, interest in the subject, avoidance of procrastination etc. But they also include some not needed by traditional students: ability to be physically isolated, no need for one-one interaction etc. While the physical isolation is real, we would question some of the others. Students shouldn't feel isolated. Course management techniques and perhaps virtual styles yet to be developed should enable students to feel they are part of the class — a sense of connection. Facilities for one-one interaction need to be further developed: if the written word is too ambiguous in a situation, emerging interactive technologies should be used.

Although the course described here was entirely web-based, we do not necessarily believe this should be the case. Combining technologies via video tapes, video streaming, and other interactive technologies will increase both the learning and comfort of those at a distance. In addition, web-based distance learning need not replicate the classroom. Rather it needs to develop its own pedagogy which enables learning in its own way.

Abstract: This paper presents the use of ISDN-videoconferencing in practicum of teacher training at the University of Oulu in Finland. A special emphasis is given on music education explaining the problems and experiences of teaching music in VC-environment. Music lessons have more complicated difficulties than a normal VC-lesson, because for example a teacher cannot show the pupils from up close the instruments. But the ISDN-technology even helps the teacher in many ways. Experiences of a distance education project at Utsjoki School in Lapland are explained thoroughly and presented with videotaped-material of lessons.

1. The Finnish degree system

The student at a Finnish university studies a Master’s degree which can be completed in five years (160 study weeks). Before this he can obtain a Bachelor’s degree (120 study weeks). Following the Master’s Degree studies there is also an optional pre-doctoral postgraduate degree of licenciate, which can be completed in two years of full-time study. Studies for a doctorate take approximately four years following the Master’s degree. [www.oph.fi; www.minedu.fi].

2. The University of Oulu

Oulu is a city of 112,000 inhabitants located in Northern Finland, close to the Arctic Circle [www.ouka.fi]. It is well-known in the field of business and advanced technology. Founded as recently as 1958, the University of Oulu has grown rapidly, establishing itself as one of the leading universities in Finland. About three quarters of the 13,000 students come from the two most northern provinces of Finland: the Provinces of Lapland and Oulu. Approximately 1700 new students enroll at the university every year. The University staff consists of 1400 lecturers and researchers.

2.1. The Faculty of Education

The University of Oulu has five Faculties: Education, Humanities, Medicine, Science and Technology. In addition, the University embraces a number of independent departments, such as the Thule Institute, the Center for Continuing Education, the Computer Services Center and the Language Center. [www.oulu.fi].

The Faculty of Education specializes in Educational Sciences and Teacher Education [wwwedu.oulu.fi]. There is also an international Master’s degree program. The disciplines represented by the Faculty are educational sciences, psychology, educational psychology, social sciences and music education. There is a special Unit for Educational Technology [edtech.oulu.fi]. The Faculty of Education has a 10-year tradition and experience in distance learning covering now all of the Northern Finland and Lapland.

The Department of Educational Sciences and Teacher Education offers studies of Kindergarten teacher, Elementary school teacher, Music Teacher and Subject Teacher for comprehensive and secondary schools.

2.2. The Practice of Teacher Training

The Oulu Teacher Training School belongs to the Faculty of Education in the University of Oulu. The school consists of 2-level comprehensive school (primary school and lower secondary level) and upper secondary
school with its own school district. The teacher trainees complete their practicum in these Training Schools but also in other schools of the municipality of Oulu and in village schools which often are located far away. Many students choose a part of practical training using videoconferencing in order to have an extended knowledge of telematics-teaching. [norssi.oulu.fi].

The curriculum of teacher training determines the amount of training hours for teachers in the Training School and in the remote schools. The practicum is divided into five modules during the years of studies. Most of the practicum is done at the Teacher Training School, whose aims are also to experiment new methodologies and innovations in education. Because many remote schools have equipment for videoconferencing and also experience of using that, most students have a possibility to practice teaching at distance.

2.3. The Department of Music Education

The University of Oulu is one of the three universities in Finland providing subject teacher education in music teachers for comprehensive and secondary schools. The goal of the music education program is to provide the student with skills, information and attitudes required in widely and autonomously taking care of tasks in music education as well as developing the work and scientific aspects. The student is familiarized with the goals, contents and protocols of music education as well as with the application and observation of pedagogic music research. [musicedu.oulu.fi].

Essential points of emphasis in studies are amongst others music and communication technology. All students take part in learning of distance education –methods, lesson planning, using videoconferencing and creating www-material for music lessons.

The Music Department has taken a leading role in developing and integrating the music education in Northern Finland. Cooperation has been done between schools, institutes of music and the Department. Some projects have been done by the members of the staff but mostly in cooperation with the students. Thus all the partners - professors, students, distance teachers and students in institutes and schools - have had important and unique experiences in music education by distance.

3. Models for teaching in ISDN-videoconference environment

A teacher with a remote class. In the first model a local teacher is alone conducting the lesson with the remote class. There might also be a teacher, but in many cases in scattered villages there are no special teachers for all the subjects of the school curriculum. Even the pupils take care of the of the facilities and the classroom discipline. More often there is however a teacher as a technical tutor, but he may not have any knowledge of the teaching subject. The local teacher has the main responsibility of teaching.

Two classrooms simultaneously. In the second model a teacher is conducting the lesson with the local class and the remote class together. There may also be a remote teacher or a tutor. If the remote teacher is familiar with the teaching subject, the responsibility of teaching can be divided between the two teachers. The interaction and communication goes on between all the partners. [musicedu.oulu.fi/kotif/maki.htm].
4. Utsjoki-project

Utsjoki is a good example of activities that have been done using videoconference in teaching and as part of the practicum of teacher trainees.

Utsjoki is a village with 1500 inhabitants and it is situated in the very North of Finland on the Norwegian border [www.utsjoki.fi]. The municipality has three villages which are located tens of kilometers from each other. Each of them has a school of own but only with few pupils. Without VC-technology the pupils could not receive all the lessons of the comprehensive school program. The main school in Utsjoki has also upper secondary school. Many students of Lower and Upper Secondary School of Utsjoki are brought with taxi from a distance of 50 kilometers or more and some pupils remain every school week in Utsjoki returning home only for the weekends.

4.1. Background to the Project

In the early 90's there were first experiments of distance learning using Tele-X-satellite and later ISDN-lines. There also existed need for distance medical services and so there was interest in different level of municipality. Other villages in Lapland, technological institutions, universities, state and province became partners in the project, too. Because of the long distances from cultural centers and scarce teacher resources, videoconferencing has given new aspects for education.

The Utsjoki-project started in 1995 as preliminary preparation. Experimenting, research and establishing period was implemented in 1996-1999. It had financial support from the Finnish state, European Social Fund and European regional development Fund-project. Because of the excellent results, the Project-application with videoconference was continued until July 2000. [www.utsjoki.fi/~utspoli].

Most of the activities have taken place in the lower and upper secondary school. The main goal of the Utsjoki-project is to create and develop learning methods and networks that increase educational equality and utilize the decreasing resources of the schools. The networking of schools both inside the Utsjoki municipality and with other municipalities in the Lapland region makes it possible to combine the scarce resources of education providing the schools with further possibilities to exist.

4.2. Practicum of distance teaching for teacher trainees

The Teacher Training School of Oulu University [norssi.oulu.fi] started distance education in 1994 first with few villages and later with many schools in Northern Finland. Utsjoki participated as remote school the following year. Lessons were offered in languages (English, German, French, and Swedish), in mathematics and sciences (theoretical physics, chemistry and chemistry laboratories from a distance) and even in astronomy. For instance there were four pupils for the German group in Utsjoki and two in Karigasniemi (100 km). The groups were united and so there was a possibility to start lessons given by teachers and students from Oulu (800 km far away).

In many cases it is far more economical to organize distance lessons rather than to bring pupils with a taxi to the school. And it is far more economical.

Teacher trainees, who participate in teaching from distance, usually also visit the remote schools for the some period. The experiences have been positive, because they can meet the pupils face-to-face. After this the interaction is closer, because the TV-star comes to them live as one pupil expressed. On the other hand, many pupils say that "the teaching is the same whether the teacher is present or not". Often the learning and the results, according to research, are even better in distance learning, because pupils must concentrate more on the instruction and teachers are better prepared for the lessons.

When having a period of face-to-face teaching the teacher trainees became acquainted with the facilities more of the remote school. That's why, according to the experiences, if planning to implement distance teaching it is advised to start with visiting the remote school and meeting the pupils and other teachers.

Some problems have occurred when shy pupils don't want to talk to the camera and so the distant teacher has difficulties to contact them. But there are different reactions, namely many shy pupils have been encouraged
more in communication when they can see themselves in the screen. Pupils, who have short attention spans, have naturally problems also in distance lesson.

Research done on distance mathematics studies has shown that it is possible to reach equal results in both distance and actual education. In Utsjoki even distance studying in chemistry class in a laboratory course has been experimented. First the pupils in a chemistry group of the upper secondary schools were taught the basics in laboratory working by their own actual teacher. During the six last lessons of the 38 hours unit pupils had an opportunity to follow instructions in Oulu University's chemistry group, where four students were taking their first year examination in chemistry.

4.3. Teaching music from distance

The Utsjoki School had a music teacher last time 15 years ago and so the pupils had no possibility to have music lessons. The use of ISDN brought a music teacher in the classroom and the pupils were enthusiastic with the instruction. The lessons were instructed from the University of Oulu, the University of Helsinki [www.helsinki.fi], Music University Sibelius Academy in Helsinki [www.siba.fi] and the Institute of Orivesi [www.kvs.fi]. The learning environment was developed to create a similar as a normal classroom face-to-face teaching.

The lessons consisted of teaching history and theory of music, singing and solfege, rhythm instruments, rock band instruments, ensemble playing and pupil presentations.

Teaching with two-way videoconferencing has major problems with the limited possibilities of sound and picture which are more emphatically in teaching music. The main role is the quality of sound and picture. Using one ISDN-line (128 kbps) a delay of 0.5 seconds occurs. It doesn't sound very much and in normal communication (speaking) it doesn't bother us at all. But that delay is very big when making music with remote class – it's even impossible to sing and play simultaneously. When there are in use two ISDN-lines (256 kbps) or three (384 kbps) and the lip synchronization is adjusted, the delay is so minimized that the human mind doesn't even notice it.

There are no differences when teaching theory or history of music from a distance or face-to-face. The teacher is able to use all the written and acoustic material plus the internet and application sharing. Also pupils are able to work in groups, present their exercises and teamwork with the same way as in normal classroom situations. Distance lessons give more possibilities for collaborative and self-directed learning and pupils come more responsible for their own learning, because they must be active participants in the learning process.

Learning to play instruments and ensemble playing meet some problems in teaching. When a pupil is learning guitar, the teacher cannot go next to him and show where to put his fingers. He must explain verbally but he can zoom his camera close to his own hands. This is even better than a classroom situation where a pupil tries to see from the distance of several meters the finger placement. So there comes a question: is distance teaching actually “close-teaching”?

The teacher can always show the rhythms with his own guitar. The same happens with teaching the drums: he shows how to play and pupil imitates. In face-to-face situation the teacher is able to take the hands of a pupil and play together with him. This cannot happen in distance lesson. But again one advantage: quite seldom there are two drum-sets in one classroom – during distance lesson the teacher can play together with pupil and the teaching is more practical.

Because music lesson has always quite high amount of decibels, the teacher and the learning group must agree some practical rules: when and how to start and finish, in which way the teacher interrupts the playing etc. Because the sound is delivered with microphone, the distant teacher might not hear all the details. That's why it's good to use more than one microphone and place and direct them in a proper way.

The modern videoconferencing technology also gives the teacher also the possibility to zoom the remote camera. So he is able to follow closely the performance. Furthermore he is able to play MIDI-instruments together with the remote group. If the teacher also has a classroom with him, they become really versatile jam-sessions between the local and remote pupils. The distance has no borders: one group in Finland and the other group in Australia – making music together!
The critical point in teaching music with ISDN-videoconference is the excellence of planning of the lesson. The teacher must prepare everything very well: the lesson plan, all the music to be listened, written examples of partitures, transparencies, instruments, VC-equipment – everything must be physically close to him. And he must always be flexible to change his good lesson plan in case of technical problems. A remote music teacher must be a “super-teacher”. A good music teacher also uses other means like the internet and email which supplements real-time teaching. Often fax, post and even telephones are useful and necessary ways of communication.

The evaluation of the learning sometimes quite complicated in music lessons. The teacher doesn’t always see or hear all the pupils and that’s why the participation during lessons is not always well recognized e.g. when they’re singing together there might be problems to separate the voices. If there is a tutor or remote teacher, the evaluation is possible to do together. Often the atmosphere during the lessons is not conveyed via ISDN. After every lesson it’s good to have a feedback discussion between teachers – and also pupils can tell their thoughts. In the case of the Utsjoki-project it was even more essential, because part of the lessons were instructed by the remote tutor (teacher of physics). Those lessons were however planned by the music teacher and the pupils in turn reported about the lessons to him.

5. The future

The most northern village of Finland, Utsjoki, is creating for its pupils more activities and various learning situations than a normal city-school with the help of videoconferencing. The Utsjoki-project finished, but continues its co-operation with the Povilus project, which is a joint project of 12 Finnish municipalities and the University of Oulu. In September 1999 teachers of those municipalities were given updating training in Oulu and this included 7 teachers from Utsjoki. The future will show what kind of co-operation the network project will create.

In addition to remaining as a remote school for teacher trainees, the Utsjoki school has videoconferencing with other schools, institutes and universities in Finland. One cooperative school is The Ziridis School in Athens, Greece [www.ziridis.gr]. Pupils of both schools have had numerous authentic learning experiences together and they have learnt a lot of culture, history, tradition, way of life etc. of the two countries. And most importantly: the pupils are able to communicate in real-time and learn from each other – although in Utsjoki there might be -40 degrees Celsius and at the same time +40 degrees Celsius in Athens. Both remote ends of Europe.

Abstract: Technologies for teaching at a distance are expanding rapidly. Though web-based delivery, using the computer and Internet, has attracted substantial interest recently, other technologies, like full motion video compression, continue to provide alternatives to the Internet. Factors such as quality of delivery, cost effectiveness and convenience of operation have shifted the emphasis away from high cost video compression systems. Nonetheless, web-based classes taught at a distance provide significant coverage but lack components such as full frame video that allow students to see the teacher during synchronous delivery. The essence of "real-time" instruction is simulated with DVC, though at a fraction of the cost of video compression systems. Desktop video conferencing synthesizes the best features of all distance learning delivery systems, resulting in a technology that provides a variety of applications for the participating institutions. This paper explores desktop video conferencing as the "next generation" distance learning technology, comparing faculty and student preparation time, initial and maintenance cost, and effectiveness of instruction.

Introduction

The technologies for teaching at a distance continue to proliferate. Though web-based delivery, using the computer and Internet, has attracted substantial interest recently, other technologies, like full motion video compression, continue to provide alternatives to the Internet. Desktop Video Compression provides a middle ground between traditional video compression and text-based Internet. Factors such as quality of delivery, cost effectiveness and convenience of operation have shifted the emphasis away from high cost video compression systems. Nonetheless, web-based classes taught at a distance provide significant coverage but lack components such as full frame video that allow students to see the teacher during synchronous delivery. The essence of "real-time" instruction is simulated with DVC, though at a fraction of the cost of video compression systems. Desktop video conferencing synthesizes the best features of all distance learning delivery systems, resulting in a technology that provides a variety of applications for the participating institutions. Since this technology is not dedicated for distance learning the way video compression is, facilities serve as a computer lab when the site is not hosting DVC courses. During class time, the technology, by its nature, provides devices that assist the distance-learning teacher with the best opportunity to simulate a face-to-face environment. An essential ancillary benefit of DVC technology is the system accommodates other applications like staff development and certification training for teachers: it works for short-term training in
situations where a face-to-face simulation is important. As educators make choices about accessing the world of distance learning, DVC technologies are becoming a clear choice as the vehicle to originate or receive courses from another teaching site. Either way, desktop video conferencing expands possibilities for the participating school to teach or receive classes at a distance and use the facility as a computer lab for traditional applications.

Desktop Video Conferencing as the Next Generation Distance Learning Technology

The evolution of distance learning technologies has included a wide array of delivery systems including but not limited to interactive satellite, audio graphics, audio conferencing, web-based/Internet, video compression and more recently Desktop Video Conferencing (DVC). It has been hailed as a dynamic new technology that operates in a synchronous environment and provides a high degree of interaction between students and their instructors (Mize, 1996). Yet DVC is a relatively new and emerging technology that provides cost-effective instruction under the umbrella of distance learning. Specifically, the cost of delivering instruction via distance learning using computer software and teleconferencing strategies—the profile of desktop video conferencing—creates savings in terms of money, time and resources without a substantial loss of effectiveness of instruction (Castellan, 1993). Desktop video conferencing has created more practical, less network specific distance learning opportunities than systems like video compression that cost considerably more (Ward and Lee, 1995). Furthermore, as a distance learning application it is most appropriate for individual and small-group use (Woodruff & Mosby, 1996, Chute, Thompson & Hancock, 1999). Desktop video conferencing is a technology that allows students, teachers and colleagues to interact with each other from their desks or classrooms via the Internet creating the essence of a phone conversation but with video and graphics (Googin, Finkenberg and Morrow, 1997). The design of the technology maximizes the use of its many applications like document sharing, "which allows participants to see and edit a computer document as they see and hear each other" (Furr, p. 46). Instructors use other applications like a synchronized web-browser to access Internet sites. In addition, DVC includes a "white board" which provides the instructor and student, in control of the system, a utility to write, enhance, draw, highlight and grab images to the board.

The first and most recognizable type of desktop video conferencing system is CU-SeeMe, developed at Cornell University (Fudell, Hardy and Terrell, 1997). CU-SeeMe allows students to send and receive video and audio on a computer to other participants (Todd, 1996). Companies like Vtel and PictureTel have developed desktop video conferencing systems using ProShare operating software (Johnson, 1999). Recent entries into operating software include Ilinc Corporation's Learnlinc Version 3.1 which is the system running the desktop video conferencing network at Northwestern State University, the subject of this paper. Unlike video compression technologies which use significant bandwidth, DVC operates on lesser bandwidth using ISDN or T-1 telephone lines that can be fractured for multiple sections.

There are some disadvantages however, to delivering courses at a distance using desktop video conferencing. Video and audio quality will not be as good as broadcast television or video compression. Video and audio use a great deal of space called bandwidth, which is typically not available with desktop video conferencing technologies (Googin, Finkenberg and Morrow, 1997). Comments such as "This would be great if...the video were better...the audio were better...it could multi-point...the screen was bigger" (Johnson, 1999, p.1) are typical comments from users of first generation desktop video conferencing technologies. Additionally, users may have difficulty adjusting to live audio and video while trying to manipulate the technology like microphones and cameras to obtain optimal operating quality (Ward and Lee, 1995). Training of users may become the element that eventually neutralizes any disadvantages of using desktop video conferencing for distance learning applications.

Desktop Video Conferencing at Northwestern State University

Northwestern State University of Louisiana, with assistance from a U.S. Department of Agriculture Rural Utilities Service, created a network with 10 sites primarily located at rural schools to pursue a new direction in distance learning that is flexible, accommodates a variety of learning styles, and is synchronous but can have asynchronous applications.
Northwestern provided a good laboratory in which to test desktop video conferencing instruction, for the University had developed and used several distance learning delivery systems over the previous decade, including audio graphics, interactive satellite, web-based Internet and video compression technologies. The selection of DVC as the "next generation" distance learning delivery system was based upon years of evolution, research and practice.

The desktop video conferencing network at Northwestern State University was the answer to several problems facing the university. First, it introduced a new technology to address several challenges unique to teaching at a distance such as the need to see faces of teachers and students. Second, it provided a network where partnerships were established not out of need but necessity. Third, it afforded the opportunity for courses in a variety of disciplines without restrictions or limitations imposed by other technology. Fourth, it provided a location in each parish where students, teachers and citizens can come together and take classes or participate in training sessions. Fifth, it enabled teachers who have skills unique to a discipline to teach classes to other students in the parish and across the state using their expertise. Sixth, it served as a PC lab at the site that can be used for regular computer activities; unlike dedicated video compression classrooms and satellite studios. And seventh, it provided a low-cost alternative to video compression technology, accessible by public schools.

**Faculty and Student Preparation for Desktop Video Conferencing**

Student and instructors using desktop video conferencing systems typically have little difficulty using the technology. If a teacher is already a computer user, the learning curve for operating a DVC system can be relatively short (Furr, 2000). Nevertheless, as with all distance learning technologies, DVC requires time and effort for training and preparation of course materials (Mize, 1996). Some skills and technical support are needed if students are to interact with instructors using desktop video conferencing (Meresotis and Phipps, 1999).

Introduction and initial training on the system is provided, by faculty members to students during the orientation session or first class. It takes about 10 minutes to prepare students to use DVC a feat unmatched by other prevailing distance learning technologies. Desktop video conferencing systems provide a level of comfort unparalleled in the distance-learning arena. There appear to be two causes for the system's ease of use. First, the technology is a personal computer -- familiar equipment to virtually every student. However, second, the PC, configured for desktop video, is a sophisticated device with applications that enhance teaching and learning at a distance.

Since students tend to feel more comfortable with the technology, they concentrate their efforts on learning in subject areas not struggling with a technology that is difficult to navigate. When the class is not online participants use the lab for class assignments or to perform other tasks. Hence, for the first time user, a desktop video conferencing lab is less intimidating than traditional distance learning technologies and the environment more familiar as well as "user-friendly."

Faculty prepare for DVC classes on their own time. Preparation by faculty as a first time user takes on average about 2 to 3 times longer than that for face-to-face instruction because faculty prepare their lessons using computer applications such as PowerPoint, Word and Excel. In addition, the instructor must prepare a cadre of support resources such as URLs that are presented to students online using the synchronized web browser, a utility available with Northwestern's DVC operating software. Once a course is built, it is easy to modify for subsequent delivery. In fact, most faculty believe that the majority of the effort is in preparation for a first or new class using DVC.

**Initial Cost for Desktop Video Conferencing**

The cost of delivering instruction via distance learning using computer software and teleconferencing strategies--the profile of desktop video conferencing--creates savings in terms of money, time and resources without a substantial loss of effectiveness of instruction (Castellan, 1993). Desktop video conferencing has created more practical, less network specific distance learning opportunities than systems like video compression that cost $250,000 to $300,000 (Ward and Lee, 1995). It is a technology that allows students, teachers and colleagues to interact with each other from their desks or classrooms via the Internet creating the essence of a phone conversation but with video and graphics (Googin, Finkenberg and Morrow, 1997). Of
course, cost may vary, but a typical PC with storage capacity to operate DVC software, the cards, and audio components cost approximately $3500 per unit. Factoring in a network configuration with a server which supports several PCs regardless of their location, add another $12,000. A network with 30 PCs, configured at several sites, has a price tag of under $125,000 without the phone lines. The rates for dedicated telephone lines (ISDN or T-1) vary in cost depending if special rates are available to the institution. Monthly line charges range from $300 to $2,000 for a T-1 line. ISDN with dial-up capabilities are considerably less expensive but may limit the DVC software's performance especially when video is operating on the system.

The initial funding for the desktop video conferencing system at Northwestern State University was supplied from a grant written to the United States Department of Agriculture Rural Utilities Service in August 1997. A second grant was submitted a year later to broaden the scope of the project to include five additional parishes in central Louisiana. The College of Education was awarded a grant in 1998 to parallel the RUS project, which would essentially double the teaching and production capabilities by establishing a second desktop video conferencing laboratory on campus, but in the Teacher Education Center.

The RUS project established a distance learning facility in ten parishes (counties) to address economic and educational challenges for the people of this predominantly rural area. These include: (1) K-12 education-standard, remedial and advanced placement; (2) higher education--undergraduate, graduate, and teacher certification; (3) adult and continuing education--GED, workforce development, and life-long learning; and (4) job searching. College-level courses were planned for the network and made available to those who are time and place bound with specific restrictions that limit their ability to take classes or attend workforce training sessions. Job training and information will also be available for those making transition from welfare to work. Public school administrators will use the system to collaborate on other initiatives by face-to-face conferencing. The match for the project was 60 percent from the partnering institutions and 40 percent from the Department of Agriculture Rural Utilities Service.

The impetus for the grant was to address problems that faced the available user population from demographic data that include a rural population with a high drop-out rate of 50% to the ninth grade, 91% do not have college degrees, a large percentage of the population are classified as disadvantaged, and of those who attend college over 50% need remediation.

A second grant from the Board of Regents Support Fund, State of Louisiana, specifically addressed the need to prepare teachers for the emerging technologies such as desktop video conferencing, centeringk, thereby, the desktop video instructional program in teacher education. The College of Education at Northwestern State University is a leader and advocate of distance learning. The grant provided the tools for training per-service and in-service teachers and administrators to use these new tools. Area superintendents expressed a concern about the infusion of technology without proper training for teachers on how to use and integrate technology into teaching and learning. They were worried the problem may compound an already desperate situation regarding the attitude of teachers and parents about technology in the classroom. What resulted from these grants was the establishment of a network that accommodates a multitude of educational and work related issues while helping to better prepare teachers for using technology in the classroom.

**Effectiveness of Instruction**

In addition to its pervasive coverage, desktop video conferencing conforms to instructional strategies where instructional design theories were considered. Adapting instruction to DVC produced a "best fit" atypical to most distance learning delivery systems. First, the best practice of current instruction must be preserved and renewed. Instructional and evaluative strategies that have been successful in face-to-face settings can be adapted to use with DVC to increase salutary effects with students participating from a distance. Second, the technology's instructional enhancements such as application sharing (Microsoft Word, PowerPoint, Excel, etc.), a whiteboard and synchronized web browser can be incorporated in the instructional design of the class in such a way that virtually makes the technology invisible.

Desktop video conferencing is the newest distance learning technology. As a result the amount of research available regarding effectiveness of instruction is somewhat limited. Most studies have generated qualitative regarding the attitude of students toward using DVC. The findings from a study conducted by Bell Canada and Queen's University in 1996-97 were: (1) participants were "excited" about the new technology; (2) participants needed at least a two-week period of adjustment for using the new technology; (3) participants found it difficult to take notes with demonstrations on the monitor; (4) small groups resulted in better sessions and interaction from the participants; and (5) participants found DVC to be an "informal, no pressure" mode of learning.
Cooke (1999) found that DVC instruction increased students' enthusiasm and motivation. Cooke said, "pockets of creative teachers have risen above the obstacles and found new and innovative ways for collaboration and learning through this medium" (p. 8). He noted strengths for using desktop video conferencing. They include: (1) lower costs for development and operation of classes taught using DVC; (2) students are connected from different locations and backgrounds; (3) it provides access to programs for people who might not otherwise have that access; (4) it overcomes the text-based nature of on-line discussion; (5) it enables extends the classroom such that outstanding lecturers can interact with students in their classroom; and (6) it adds a teacher presence on-line. Furr (2000) noted that technical problems, the knowledge needed to operate the system, insufficient training for faculty and participants, the lack of adequate course preparation and the difficulty of soliciting feedback and interaction were obstacles to using DVC.

Since the DVC system at Northwestern State University is in its second semester of operation there is little data to examine the effectiveness of the delivery system. Information from student surveys suggests that 48% of the students taking a DVC class for the first time would take another. Twenty-one percent said it would depend on which course was being offered which was more a function of the class and not the technology. Most of the students were willing to forgive the technical problems because they believed, "the bugs would be fixed." Finally, 90% of those surveyed were positive about the future of distance education and particularly desktop video conferencing.

Conclusion

As distance-learning applications continue to proliferate, new teaching technologies will appear. Desktop video conferencing is perhaps the first distance learning technology to grow out of the most common technology used in education, the personal computer. Network configurations for DVC are less complicated than other technologies and merge with existing systems. Providers of classes at a distance have noted that the availability of compressed video, web-based classes with applications such as video, synchronized web browsers and shared software capabilities alter instructional choices. Yet desktop video conferencing promises to provide these capabilities that were once the exclusive properties of more expensive technologies. Finally, student access to and skill with the new learning environment must be insured. Since learning with technology is predicated on some degree of learning about technology, efficient instructional systems strive to provide consistent expectations. Consequently, desktop video conferencing has the potential to replicate traditional face-to-face instruction, can access educational resources such as the web, presentation software, video and CD technologies yet has a "price tag" that is affordable.

Abstract: The "One Size Fits All" label is a tantalizing one. It implies that whatever the garment, it is generous enough in intent and design to fit a large individual, yet it is structured so cleverly that it would be useful for the most petite. Like taste and fit in clothing, the need for online support requires different labels that recognize and address shared and unique needs. The purpose of this presentation is to outline a plan for online support that has been implemented at a medium-sized, liberal arts university. When creating a design for this type of support, one begins with all stakeholders' shared needs of communication, servers/computer, and software to make sure that the core of the support system is firmly in place. One then moves outward to address crossover and unique needs of web administration, web faculty, and web students.

The "One Size Fits All" label is a tantalizing one. It implies that whatever the garment, it is generous enough in intent and design to fit a large individual, yet it is structured so cleverly that it would be useful for the most petite. Rarely, however, are the elements of utility and style in apparel really so flexible. Like taste and fit in clothing, the need for online support requires different labels that recognize and address shared and unique needs. The kind and amount of online coaching that a distance learning student needs certainly varies from X-Small to XX-Large. Typically, however, student needs in distance education reflect an individual's technical knowledge of hardware and software, motivation, identification with his or her social context, personal responsibility for learning, and communication skills.

The purpose of online support is to help students start strong and stay engaged in distance learning situations. If it is successful, online support should positively impact the psychological and physical environment of teaching and learning in an electronic arena and influence the retention rate of students. While and Weight (2000) report the following reasons that students drop out or stop out of an online class: students leave because of isolation; students leave because of the accelerated pace; students leave because of competing responsibilities; students leave because of technical issues. (p. 69)

While these reasons are compelling for students, they also deserve serious consideration from a faculty member's point of view. In addition, Chang (1998) maintains that for faculty "technology must be consistent with their existing values, and there needs to be a real educational value beyond the use of technology for its own sake" (p. 1). From an administrative point of view, online support is a necessary part of doing e-commerce, but tension does exist among competing demands on resources, establishing and maintaining communication, and the strength of an institution’s climate for innovation. Support services can also serve the administration of an institution by providing information about student profiles, usage patterns, and evaluation of courses.

The purpose of this presentation is to outline a plan for online support of a web-based, summer program that has been implemented at a medium-sized, liberal arts university where student-involved learning is at the heart of the mission and technology is an important part of the vision of the institution. When creating a design for this type of support, one begins at the center of the Needs for Distance Education Support Diagram (figure1) to make sure that the core of the support system is firmly in place, then moves outward to address all needs. This does not mean that support is only generated as crises occur; support for all shared and unique needs identified should be planned for or in place before the implementation of online instruction. The reality of teaching and learning in any environment, however, is that support is never static. It must continue to evolve to meet new needs.
Shared Needs of All Stakeholders for Distance Education Support

This outward design for online teaching/learning support begins with the shared needs of all stakeholders: communication, computers & servers, and software. Online teaching does not require less communication, but even more communication of specific information that recruits students and then keeps potential students interested. All stakeholders also need server reliability and 24/7 accessibility to be able to function in an anywhere/anytime environment as well as distinct hardware parameters necessary for success. The type of operating system, browser levels, and plug-ins needed to successfully navigate the site and comply with web software should be identified. Web education software defines the look and feel of the courses, so maintaining a balance between power of consistency and flexibility is important.

Serving a variety of stakeholders who have shared needs requires creative strategies to address different levels of need with different measures of support at the same time. Levels of support for shared needs in distance education, like a well-fitting garment, can be categorized by small, medium, and large, depending on how much support is given and the effort incurred in producing and maintaining that support. The following levels of support strategies have been designed to address online stakeholders' shared needs of communication, computer & server information, and software concerns.

Small = Place a promotional communication that is interesting but doesn't overstate the realities of web-based education, a clear description of system, browser, and word processing program requirements on the WWW.

Medium = Create web-based directions with visual aids (screen shots) for setting browser preferences and configurations with directions about how to correct any technical deficiencies. Periodic e-mails to students who have indicated interest also encourage and inform prospective students.

Large = Monitor 24/7 server accessibility and encourage the upgrading and investing in web infrastructure as well as strong hardware/software support for faculty. Electronic mailing of web course offerings and descriptions to other universities and listservs promotes registration on a more global scale.
Shared Needs of Web Administration and Web Faculty for Distance Education Support

Different levels of support are now needed in each crossover areas of need. Web administration and web faculty support needs concern the creation of the course: innovative climate and training. A climate of enthusiasm provides the spirit for innovation, but does not sustain it. "Support must be present in terms of funding, time allocation, technical resources, and investing in a well-trained staff" (Hsu et al., 1999, p. 98). Moreover, consistency is improved when the personnel who are training the faculty to use web software are the same personnel who will support it. Differentiated strategies of support in this area include the following:

Small = Create interest and curiosity by sharing innovative online teaching and learning strategies, incite the possibility of web teaching in faculty members' minds, and motivate faculty with evidence of positive experiences and a reward system. Presentation of successful courses and different "looks" to existing courses offer ideas to faculty who are just beginning to explore distance education.

Medium = Host workshops that offer software instruction, create and maintain a help page for faculty, use work-study student help to aid faculty in research and the technical building of the course. Small but important chores such as taking digital photos and scanning materials can be done by students, freeing the faculty to think, plan, and create.

Large = Create and maintain a one-on-one mentoring of faculty new to the web through teams of faculty members headed by an Academic Computing Fellow or a Web Education staff person.

Shared Needs of Web Faculty and Web Students for Distance Education Support

Web faculty members' and Web students' crossover needs include isolation, the pace of the class, and the ease of use--academic and personal factors in maintaining the course. These needs are both physiology and psychological, so their impact on teaching and learning is substantial. Hatcher and Craig (1998) acknowledge these needs and warn, "this isolation can lead to a de-humanizing of the learning experience" (p. 4). Obviously, then, special care must be taken to design and support the ease of use of course materials and interactivity between students and faculty in a distance-learning course. Chickering and Ehrmann (2000) find that this is not only possible, but interactive communication strategies can actually empower students: "The World Wide Web increases opportunities for students and faculty to converse and exchange work.... Total communication increases and, for many students, the result seems more intimate, protected, and convenient than the more intimidating demands of face-to-face communication with faculty" (p. 1). Different levels of support to further these worthy goals include the following strategies:

Small = Publish an introduction to the course and a short online syllabus at least two months before the beginning of the class. This preview allows students to understand the workload of the class and to obtain textual materials prior to the first day of the class. The online introduction and syllabus also focuses the faculty member's continuing web course design, so that her/his course is not created ad lib.

Medium = Help faculty members design different types of assignments to create interest and use class management tools to increase efficiency. Assisting faculty in the use of management tools so they may enter grades, post to portfolio files, and provide feedback, contributing to a positive virtual classroom climate for both students and faculty.

Large = Build Instructor-Student and Student-Student communication structures to calm frustration and enhance learning for everyone involved. The technology that allows faculty to specify communication-rich assignments (team projects, required discussions, "guest speakers," peer editing or peer presentations with responses) is available. However, this level of Internet use will call for increased support because it also implies difference avenues for completion of these assignments, and a longer learning curve. These interactive types of assignments are more time-consuming than simple read and response assignments; however, they also lead to better exchanges and greater opportunities for learning, even for the instructor.

Shared Needs of Web Students and Administration for Distance Education Support

Web Students and Web Administration crossover needs center around registration, admission and withdrawal from classes, fees and refunds--matters of beginning the course. Like any processes that involve money and credits, these should be as quick and direct as possible. Explicit requirements of online courses may require changes or adjustments in administrative policies that govern traditional courses. On campus and online courses share a concern about the type, sequence, and outcomes of courses needed. Online support in this area
requires clear and clever communication that both advertises and informs. “These students expect a high level of customer service. They want their needs to be anticipated, immediately addressed, and courteously handled” (Klor de Alva 2000, p.37). Different strategies seek to reduce confusion and create a positive climate even before the course begins.

Small = Establish registration procedures that ensure a fast turnaround and confirmation of class placement. Once committed to the idea of learning online, students want to know that they are confirmed as a member of a web course.

Medium = Create a library resource launch page that facilitates easy access to electronic resources. This page should facilitate the student's entry into electronic databases and provide hyperlinks to electronic checkout and acquisition of materials.

Large = Publish and maintain an up-to-date web page which clearly states institutional policy about fees, tuition, withdrawal from a course, copyright issues, and plagiarism. Web clients often assume that because the teaching/learning environment is different, that policies are different as well. While maintaining such a page is no small chore, supplying and finding accurate answers before the fact is vital to good public relations.

Unique Needs of Web Faculty, Students, and Administration for Distance Education Support

Unique needs are no less real or less important than shared or crossover needs. These are, however, more difficult to anticipate, so this becomes the creative part of planning for support. For example, Sherry, Billig, Tavaline, and Gibson (2000), maintain that faculty who will be web teachers need to have time for training as well as “demonstrations of promising practices and ongoing professional development by peers” (p. 45). The unique needs of faculty, therefore, include the planning and design of the course, the faculty member's existing values, and the time available to develop the course. Support strategies that address these needs include the following:

Small: Continue discussion about technology integration that encourages a KISAC (Keep It Simple and Creative!) approach. Mounting a faculty help page with frequently asked questions on the web shares information among instructors and provides faculty support that may be accessed multiple times without intimidation or embarrassment.

Medium: Provide in-depth workshops about web pedagogy and the software that supports it, in a number of time slots, to meet a variety of faculty teaching schedules. Faculty members must make connections between web course content and web course goals/expectations with specific directions and published criteria for assessment. In addition, faculty members must know the strengths and limitations of the software they are using so that they can plan interactive activities and assessments that will work.

Large: Offer "hands-on" workshops about page design and image manipulation. With course plans in place, faculty members require support in making their web courses interesting and their classes learning communities. Uploading visual materials that conform to web standards, internal linking to other sites, and creating quizzes/tests online are more sophisticated tasks and need lab time and direction.

White & Weight (2000) assert that "effective online teaching is twofold: the ability to transmit messages clearly and accurately and the ability to maintain positive interpersonal relationships" (p. 10). If faculty members are to be effective teachers, then, they must have the support to develop the knowledge and confidence to show enthusiasm both for their content and distance education.

The fact that the World Wide Web makes it easier to deliver up-to-date teaching material on a global basis is irrelevant if students find the medium difficult to use, or if they are not appropriately supported in their attempts to learn with it (Mason and Kaye, 1990). Students also need information about time and work management of online learning: Does the potential student like to read and write? More than one student has found that electronic communication means a level of typing that he/she had not envisioned.

Students also need assistance to help them use electronically accessed data and process concerns and complaints. Students want convenience, and they want "a curriculum that integrates theory with practice while emphasizing workplace competencies along with teamwork and communication skills" (Klor de Alva, 2000, p37). To accomplish these goals the following strategies need to be in place:

Small: Provide clear information about the dates the class will be held, how to obtain course materials and textbooks, and a hyperlink to an online student guide for the software.
Medium: Post technical support for students on the web through an e-mail contact. Other types of assistance would include specific help pages about submitting assignments, accessing grades, and participating in multi-level discussions.

Large: Provide immediate technical help with an 800 number or periodic help through office hours in a real-time chat room. Whatever the media, questions directed to support personnel must be answered accurately and quickly. Establishing an electronic peer mentor network in a web-based environment also allows students to interact online with peers who have taken web courses previously so they might seek academic and technical advice.

As higher-education institutions establish web-based courses and programs, the typical college or university experiences "problematic goals, unclear technology, fluid participation in decision making" (Ehrmann, 2000). Resources of money, time, faculty and staff may need to be reallocated to achieve a web program with high standards and goals. To achieve these goals, the following support strategies must be addressed:

Small: Provide information about student profiles and usage patterns so that administration can make consistent purchases of hardware and software to support a web-based academic program.

Medium: Inform the administration about updates and upgrades of web software as well as minimum standards in hardware/software for successful online teaching/learning. This data is absolutely essential for instituting a consistent plan for keeping both hardware and software current.

Large: Create and distribute an online evaluation of web course experiences to students. Support staff then needs to collect and analyze the data as will as publish results so that decisions about web courses and programs might be data-driven.

Assessment of the Support Design

Any design process needs assessment to test its strength in implementation and provide information for refinement or restructuring. This design is informed by data from student evaluations of web-based courses for the summer of 2000. When asked about their experience with web-based courses, 76% (N=268) of the respondents reported that they had not taken a web course previously. This large number of novice users obviously impacted the amount of support needed.

Of those that responded to specific questions about technical support, 68.4% (N=79) found the technical support pages helpful. When the technical support staff was contacted, over 77% (N=66) found the staff helpful. This contact was most often made through e-mail by 53.5% of the respondents (N=71). Initial contact about Web courses by phone or through the summer 2000 website was favorable in most cases (89.5%) (N=57). Of those that responded, over 91% (N=59) found the information they received from these initial contacts helpful and thought it met their needs. Overall, 61.1% (N=90) respondents registered a satisfied or very satisfied level for the technical support they received.

Future Directions

Teaching and learning through distance education on the Internet currently involves radical changes in our traditional paradigms of academic thinking and acting. Yet online teaching and learning will continue to change as software and hardware evolve to allow easy voice and visual streaming for video conferencing. The following areas will undoubtedly affect online teaching and learning and lead distance education support in new directions:

- Bandwidth and speed of data transfer - The segment of the Internet that brings course material into a student's home or the faculty member's office will continue to increase in capacity and speed.
- Availability of hardware and user-friendly software - The dot-com culture of virtual e-commerce and education is influencing the price of web-based hardware and software, bringing it to a level that is affordable by the average user.
- Synchronous learning systems - The ability to log on and to interact in real time with an instructor and/or other students will moderate the amount of text currently required.
- Consumer demand - students are turning to distance education for convenient anytime, anyplace educational experiences.
- Economic factors - Students may be able to avoid travel, and/or on-campus residency, thus reducing educational expenditures. In addition, students can continue to work as they learn because they are not governed by a university class schedule.

443
• Sophistication of web faculty - As higher education personnel become familiar with new software, and digital peripheral equipment, they will need more server space, speed, and support maintaining advanced techniques.

A successful design for distance education support does indeed involve different levels, numerous strategies, and its own measure of resources. Without a strong support system for all stakeholders in the online learning process, however, virtual classrooms could be individually spinning in cyberspace, lacking the anchor that solid technology policies and training can provide.

Abstract: Rapid development of the Internet-based distance courses at Russian universities brought out the problem of special in-service training of faculty members. The training should provide future coordinators of distance courses with information about the online educational environment, active methods of teaching (project-based methods, collaborative learning, cooperative learning, etc.), as well as develop their communication skills that could be considered to be the main skills for the teacher working with students on the net in conditions of the distributed teamwork. Within the course learners identify their personal skills and abilities that can influence their work on the net, and develop their own educational trajectories for self-education after graduating from the course. Learners go through various online psychological tests and participate in a series of online exercises and role-plays. The paper gives the overview of the Internet-based training course for coordinators, methodological basis, structure of the course, and first results of its implementation.

Introduction

Today the society states the problem to provide each man with the free open access to education within his life subject to his interests, personal abilities and needs. The other problem is to prepare a man for a life in conditions of rapid change of information flows, for the possible change of profession, for the active independent life, for the communication with people from different societies and cultures, for the quick adaptation in the newly conditions. The urgent necessity of organization of mass in-service training of specialists in today’s Russia influenced the increasing development of such form of education as distance education.

We understand distance education as a specific form of education, which formally is used when a teacher and a student are divided by miles, being in fact connected by the New Information Technologies including the wide variety of modern means of communication.

Distance education is very popular in Russia now. According to the latest data that was published in the recent sociological surveys, more than 26% of freshmen at Russian Universities and colleges are ready to study on the Internet. 50% of them want to take the distance learning courses at the leading Moscow universities, and 24% are going to attend the foreign virtual universities. 30% of families in Moscow and St. Petersburg have personal computers at home, and half of them use the Internet.

Considering all above-mentioned the most of the Russian universities have recently opened the distance education faculties and departments. The “National Program of Distance Education Development” is in action since 1995. In accordance with the Program Execution Plan, universities were equipped by the modern computer classes. Many universities organized Internet Open Access Centers for the students. There were also developed hundreds of various Internet-based training courses. But the results of the program could be better because it came across several problems, such as the following:

- most of the distance courses are in practice just the ordinary repetition of traditional correspondence courses with elements of the self-education (no permanent contacts between students and teachers, obligatory internal “face-to-face” meetings at exam sessions, etc.);
• there are no well-trained specialists among the faculty members to provide distance courses (i.e. coordinators who understand what distance education is, what are the effective methods of teaching via Internet, what are the basic rules of E-courses development and management, etc);

• it is very difficult to integrate the existing Russian system of distance education into the world-wide system because there is a lack of specialists who can professionally do it.

So there is an obvious contradiction between the urgent need in accelerated development of Russian system of distance education and the lack of specialists to develop it. At present no Russian academic institution is being busy with the complex training of specialists for distance education in such important subjects as:

• active methods of teaching (cooperative learning, project-based methods, etc.);

• psychology of communication via Internet;

• organization, management, and evaluation of distance courses.

General Idea of the Course

Answering the demands of the academic staff involved in a process of distance education in 2000 a group of scientists from the Russian Academy of Education (Moscow, Russia) and Southern Urals State University (Chelyabinsk, Russia) developed the pilot project – Internet-based course for coordinators of distance education http://courses.urc.ac.ru.

What is the coordinator of distance education?

The word “coordinator” is used here as the most general word explaining the role of the “key-persons” in a process of the distance learning and teaching – facilitators, moderators, tutors, coaches, etc. The coordinator influences the educational process at a great extend being responsible for:

• Facilitating the course discussions and forums;

• Supporting the group project activities as a coach;

• Supporting individuals as a tutor;

• Evaluating the assignments;

• Planning and monitoring the course activities;

• Moderating the conflicts, and etc.

Being the coordinator of the distance courses means to be:

• competent in the subject area;

• advanced Internet-user,

• skilled communicator;

• efficient in psychological aspects of teaching and learning on the Internet;

• ready to use active methods of teaching related to Internet.

Aims and Objectives of the Course

The main aim of the course was to provide Internet-based training for academic staff and secondary school teachers and prepare them for the work as coordinators of distance courses. The objectives of the course included the following:

• Give the idea of the distance education;

• Train in the field of new methods of active teaching and learning;

• Develop communication skills;

• Identify personal skills and abilities of learners that can influence their work as coordinators within distance learning courses.

Characteristics of the “Pilot Team”

People
Distributed “pilot team” included learners, authors of the course, coordinator, administrator of the course, system administrator, and professional psychologists. Learners were volunteers from the various educational institutions: teachers of secondary schools, faculty members from two universities, instructors from regional departments of teachers’ training institutes, and coordinators of educational telecommunication projects.

**Equipment**

The equipment that learners used was typical for average Russian learner and included IBM-compatible personal computers with Windows 98, or NT, and MS Office 2000 unit (MS Internet Explorer, Outlook Express, Word, FrontPage). The learners had access to the Internet either from home (dial-up access by 28.8 Kbps modems), or from the University Internet Center (direct access, 64 Mbps channels).

Access to the learning tools was possible via Internet, or from home computers (downloaded zipped files with texts, tests, and instructions).

**Content and structure of the Course**

Within three months of training via Internet the students were involved in a process of active E-learning. They studied the Web-textbook, developed for the purposes of the course. This textbook was enriched by a collection of the links to other Internet-based educational resources and online editions.

The content of the course materials depended upon the main objectives of the course. It included such modules as:

- Introduction into the system of distance education;
- Internet-based technologies and educational environment, used at distance learning;
- Communication via Internet: basic rules and problems;
- New methods of teaching and distance education technologies;
- Psychological aspects of working with students in the Internet environment;
- Monitoring and evaluation of the distance education courses.

**Learning Process**

Learning process within the course was organized by the three months curriculum, series of control assignments, clearly outlined aims and objectives for each unit, and by ongoing feedback.

**Learning tools**

Learners had the access to various “learning tools” and “information tools”, among those were the following:

- Educational courseware kit, that included: a textbook “Internet Guide (for Educators)” with information about Internet main services, software that would be used within the course, search engines, and numerous examples of the educational resources on the Net;
- Web-textbook;
- Sets of control assignments with detailed description of the task, references to the sources of information, general guidelines on preparing the reports and examples;
- Supplementary materials for individual research projects (on-line tests, questionnaires, etc);
- Collection of the links to the Internet educational resources;
- References on the traditional tools – books, articles, etc.

**Modular Structure**

The course had a modular structure. Each unit included several activities (steps) that the learners should pass through:
1. Outlining the learning objectives;
2. Readings & "seeings";
3. Experimenting, testing, self-evaluation and inter-evaluation;
4. Doing individual or/and group assignments;
5. Reflecting, discussing, receiving the feedback;
6. Outlining the new learning objectives and problems.

Interactions within the Course

Learners were involved into numerous interactions with the coordinator and other students of the virtual group. The majority of assignments for students were based on active methods of teaching: Internet projects, cooperative learning, science research methods and etc. that motivated learners to work in collaboration with other students of the group as well as the coordinator. They learned how to think globally, to argue and to find compromise within discussion. They developed the critical thinking and abilities to take their own decisions in everyday situations related to distance learning. This process appeared to be rather difficult for many learners that had problems in establishing communication process with other people on the Net. But the series of specially designed online role-plays and individual advises of the coordinator helped them to solve this problem and to develop necessary communication skills.

All interactions among members of the group were organized by:
- e-mail;
- mailing lists (one for learners and coordinator, and the other - for coordinator and supporting team);
- chat-rooms ("Classroom" for formal discussions with protocol recording and "Break" for informal meetings).

Forms of Learning

Different assessments that learners did within the course demanded the use of different forms of learning:
- Individually,
- In pairs,
- In small groups (3-4 learners);
- In larger groups (10-12 learners);
- All the group.

The larger groups were effective within psychological online role-playing and chat sessions. Smaller groups were effective at doing projects, problem solving, and reflection. Work in pairs was the best form for inter-evaluation of the existing characteristics of the learners, as well as for the reflection and discussions of the results of the tests within "peer-to-peer" experiments.

Tests

One of the course objectives was to provide learners with the effective tools for self-evaluation that could be used for the development of the personal self-education trajectories of the future coordinators of the distance courses. We came across the problem of unsuitability of famous "classical" psychological tests that could be used to identify motivation, leadership, communication type, and other features of character of the learners, if to place them on the Net directly. It was impossible to transform them in a form of the interactive tests either because of the huge amount of questions that learners should read and answer online, or the evaluation of this answers couldn't be done automatically, by computer program. We developed the list of criteria to select the psychological tests available for online self-evaluation and analysis: no more than 30 questions, no open questions, quick automatic response (feedback), etc.
The Supporting Group of Psychologists
Characteristics of the Internet learning Environment

Developing the conception of this course we realized that the majority of the existing problems of the adults’ adaptation to the new learning environment of the Internet are caused by the following reasons (in comparison to traditional “face-to-face” learning experience):

- Domination of the new sensor channel (visual);
- Adult learners working together at a distance course have different learning styles, experiences, characters;
- Some of the learners suffer from information stress and frustration within their first weeks of learning on the Net;
- Internet demands new rules for communication – “democratic Netiquette”;
- Not all the adults like to have many new contacts and collaborate with strangers;
- Not all the learners are highly motivated;
- Not all learners are well-organized and could do the self-assessment tasks.

All these questions are the top-interest questions for the researchers working not only in the field of education, but psychology as well. Professional psychologists could contribute the development of some distance courses helping educators to avoid the “reinvention of the wheel”. Psychologists could share their methods of evaluation of individual characteristics of the learners, methods of evaluation of the group dynamic processes which are very important for proper evaluation of the effectiveness of the distance learning, and appropriate choose of forms and methods of learning. Practical psychology in Russia and in other countries served for many years in the field of business education, developing the strategies and methods of various in-service trainings in communication, collaboration, team-work, etc. We decided to unite together the efforts of professional psychologists and methodologists, developing and monitoring the effectiveness of the distance course together.

The learners were supported by a group of psychologists who consulted students at their request, and monitored the psychological climate within a group of students. Working together with coordinator of the course, psychologists help students to build their self-development program (“educational trajectory”) that would guide them after completing the course.

Objectives of the Online Psychological Service

So, the main aims and objectives of the “psychological service” within the course were outlined as the following:

Aims:
- Creation of the friendly psychological environment;
- Learners support in development of the individual educational trajectory.

Objectives:
- Evaluation of the Course educational environment;
- Study of the personal features of the learners;
- Help in adaptation to the new online environment;
- Popularization of the relevant to the course content psychological issues and theories.

The supporting team of psychologists worked within all stages of the course providing:

- Analytical work and group dynamic’s monitoring;
- Instructive support (advices on the We-site design, structuring of the course context, developing of the ongoing system of the feedback, etc.);
- Consultations (individual and group consultations for students, for coordinator, and developers of the course learning materials);
- Methodological support (participated in development of the online tests for self-evaluation and inter-evaluation, etc).

Development of the Learners Online Community
Though the learners were from different educational institutions their group had all “core” attributes of the network community (Whittaker, Issacs, & O’Day, 1997):
- shared goals, interests, needs, and activities;
- engage in repeated, active participation in the course assignments, chats, etc.;
- access to shared course resources;
- shared social experience, language, netiquette;
- shared support, help, and mutual services.

At the same time (and it's a paradox of the teachers' profession) educators usually suffer from loneliness, they frequently lose the fluency in establishing communication with other adults, are not active, and pretend to be lurkers instead of leaders in a team of the adults (J. Preece, 2000).

Taking into consideration these specific characteristics of the learners and objectives of the course much attention was paid to the development of the system of learners' adaptation to the new communication environment that included:
- Theoretical material to explain the learners the basic rules of Internet environment;
- Online exercises on establishing trust-building and collaboration among peers of the group;
- Psychological role-plays and online tests for self-assessment and self-awareness;
- Project-based assignments.

Much attention was paid to creation of a friendly psychological environment. The objectives for doing this were the following:
- To develop the learners community;
- To help teachers to get acquainted with each other;
- To develop collaboration skills;
- To provide trust-building process;
- To support the on-going interactions among all the members of the group.

The initial educational background and experience of the learners at the course was different. That is why we developed two levels of the specially designed online exercises:
First — for identification of the current status (level) of a learner. At this level exercises are combined with various tests for self-assessment and inter-evaluation as well as group and individual experiments followed by reflection and group discussions of the results.
The second level of the exercises includes exercises which main objective is to put the learner into the new learning conditions and let him use his knowledge in real collaboration with real people on the Net.

Conclusion

The Russian language version of the course was launched in March 2000, and two groups of learners (16 learners in each) from Moscow, Ufa, Novgorod, Chelyabinsk, Irkutsk, and other cities of Russia participated in it. Main achievements of the pilot training:
- Adaptation of new pedagogical technologies and active methods of teaching at online distance courses;
- Effective combination of individual and group activities;
- Permanent contacts and feedback among learners via Internet;
- Development of the system of online exercises and tests for pedagogical and psychological self-assessment and development of necessary skills for communication and collaboration within Internet environment;
- Development of the “Conception of the Psychological Service at Distance Learning”

Acknowledgements: This course was initiated and supported by the Project Harmony, Inc. within the Bureau of Educational and Cultural Affairs’ IATP Program activities in Russia (http://iatp.projectharmony.ru), and then developed and enriched with new content and system of online exercises at Stanford Learning Lab (Stanford University, USA) under the Fulbright Scholar Program (http://learninglab.stanford.edu).

Abstract: This study was created to fill a void in the knowledge of instructor behaviors, effective instructional strategies, assessment measures and the overall effectiveness of learning in the distance education classroom from the student's perspective. Specifically, this study had graduate students evaluate three professors in three different courses during a fifteen-week semester while teaching in synchronous learning environments. Two of the instructors conducted classes at two sites simultaneously and the third conducted a three site class. At the end of the fifteen weeks, students in all classes were surveyed. All classes were comprised of graduate students who were practitioners in various fields of education. The most used strategies were lecture, group discussion, and cooperative learning. The most effective strategy was noted by students as cooperative learning, followed by group investigation, and presentation. On the open-ended questions, students concurred that a plethora of teaching strategies was employed to engage learners.

Introduction

With an extensive review of the literature and a clear understanding of purported limitations in past research, this study was created to fill a void in the knowledge of instructor behaviors, effective instructional strategies, assessment measures, and the overall effectiveness of learning in the distance education classroom from the student's perspective. Specifically, this study had graduate students evaluate three professors in three different courses during a fifteen-week semester while teaching in synchronous learning environments. Two of the instructors conducted classes at two sites simultaneously and the third conducted a three site class. At the end of the fifteen weeks, students in each class were surveyed. All classes were comprised of graduate students who were practitioners in various fields of education. It was hoped that because of their expertise in education, this pool of students would give insight into appropriate and inappropriate uses of various teaching strategies and techniques.

Theoretical Framework

Distance learning has become a reality in an era when universities are searching for ways to increase student populations and to better serve the needs of their existing students (Charp, 1999). This
learning environment encompasses a combination of technologies, including television, videotapes, audiotapes, video-conferencing, email, telephone, fax, Internet, software and print (Merisotis, 1999). It has been speculated that this new form of learning will become a commonplace phenomenon in the next century and has the potential to create a new vision in education (Ben-Jacob, Levin, & Ben-Jacob, 2000). Some have even predicted a new role for teachers; one in which they will act more as social workers or guidance counselors to provide personal one-on-one tutoring and to teach collaboration and interpersonal relationship skills (Schank, 2000).

Should we, as educators, question these technologies and their use in education? Universities continue to add new technologies as they become available. Are we allowing technology to determine the learning experience? And, on a more individual level, what is the significance of teaching strategies in this environment? The future may hold a different role for the teacher, but for now, effective instructional strategies are a large part of effective instruction. Do these change in the distance education classroom?

The literature on distance learning includes numerous studies such as: student perceptions comparing online to traditional lecture class quality (Ryan, 2000), the achievement of students in distance learning and traditional classrooms (Schulman & Sims, 1999; Dominguez & Ridley, 1999), demographics of students taking online courses (Guernsey, 1998), staff training needs (Connell, 1998), support for faculty teaching (Bremner, 1998), and community and team formation in distance education classrooms (Berg, 1999). There is a more limited body of research on the effectiveness of specific strategies using the distance learning platform. Some of these studies discuss the shifts in social relationships (Newson, 1999) and accommodating diverse learning styles (Ross & Schulz, 1999; Diaz & Cartnal, 1999). A few studies suggest the use of specific instructional strategies such as online student portfolios, self-guided online labs, class cybersociety, effective graphics, organized readiness, and the need to adapt instructional materials (Goodman, 1999; Powers, 1999; Grubb & Hines, 1999).

Methods/Results

In this study, two classes consisting primarily of elementary and middle grades' majors were enrolled in core graduate education courses. The first, Connecting Learners and Subject Matter, is a course that connects the examination of curriculum foundations and models of the school learner and educational goals with an intense study of research-based, exemplary instructional strategies focused on learning and achievement, and the second course, Teacher Leadership and School Improvement, was designed to help teachers develop an understanding of and skill in assuming leadership roles and responsibilities in their schools. In the Connecting Learners course, three separate sites were joined with the North Carolina Information Highway. One group of students met in the technology equipped classroom at the university and two groups were approximately 75 miles away at secondary school media centers. Each site had one technician to facilitate the use of cameras and media during instruction. A web site was designed to assist the students with daily assignments and resources. In the event there were delays due to faulty connections, students at the remote sites worked independently using the daily assignments on the web-site to guide them in engaging in class activities. The instructor for this course had no previous experience with distance learning. The second course, Teacher Leadership, was taught in a similar manner to the first course except there were only two sites and a web site was not used. The instructor for this course had no previous distance learning experience. The third class was Telecommunications Technology in Education, usually the second in a series of educational technology courses that students take for a graduate degree for K-12 licensure in North Carolina. While the major emphasis is the development and use of telecommunications tools in instruction, basic considerations in setting up telecommunications connections, and issues in maintaining telecommunications facilities are discussed. This course was taught to two remote sites from the main campus. Each site had computers for each student and two adjuncts to rotate between the two sites to assist with instruction. A web-based supplement was also developed for the course that included course orientation, daily outline and assignments, resources, and a threaded discussion forum. The instructor for this course had previously taught via distance.

Item Response Survey
Fifty-six students in the three courses completed a survey about student demographics, a general evaluation of the instructor, an evaluation of twenty-one instructional strategies, and five open-ended questions about the effectiveness of the course. Fifty-two students were teaching in the public schools ranging in grades from kindergarten through high school. One student worked in the central office of a school system, one was in ROTC, and three were full time students. The students' number of years teaching in public schools ranged from 0 to 27 years, with an average of 9 years. Thirty-one of the students had previously taken courses via distance learning.

Table 1: Evaluation of Instructors

The above table gives an overview of the responses when students were asked to respond to a list of nine instructor behaviors. Students, in each class, either agreed or strongly agreed that all three instructors encouraged participation, actively involved students, etc. Only two students disagreed that active, interesting audio visual aids were used. The results from this portion of the survey suggest that all three instructors were effective in the classrooms engaging students in meaningful collaborative activities.

Table 2: Report of Use and Effectiveness of Instructional Strategies

Twenty-one instructional strategies were listed next to a check sheet and a Likert scale in which students were asked to determine whether or not a strategy was used in class and to rate its effectiveness. The eight most effective instructional strategies are listed on Table 2. The most effective strategy was noted by students as cooperative learning, followed by group investigation, and presentation. The most used strategies were lecture, group discussion, and cooperative learning.

Open-ended Survey
On the open-ended portion of the survey, students were asked to briefly describe and comment on the effectiveness of: 1) Teaching strategies in this course, 2) Assessment in this course, 3) The use of technology in this course, 4) Did the professor's on-site visit(s) impact your class? If yes, how?, and 5) Additional comments. They concurred that a plethora of teaching strategies was employed to engage the learners. Though lecture was used, it was not cited as a dominant approach. Cooperative group activities were used predominantly in each class. Discussions occurred frequently at intra and inter site level following presentations made by the cooperative group activities and individual presentations. Students cited the use of videos, power point presentations, and projects as effective. One student commented that when the class size and number of sites increased, the amount of time required to share research also increased. The suggestion was made to have individual sites hear presentations from their colleagues and "turn off the camera". However, it was noted that the downside of this approach is that sites would not benefit from their peers' research. This comment came from a participant in the section where three sites were linked for instruction.

The use of assessments and reactions varied with these participants. In one section, no traditional tests were used. However, students created culminating projects to demonstrate mastery of course objectives. Though traditional quizzes or tests were used, the emphasis on critical thinking, project-based assignments, and group work made it necessary to incorporate a wider variety of assessments. Attendance and class participation were cited as a component of the final grade in each course syllabus. In one section rubrics were used to evaluate student presentations and written projects. One responder noted that rubrics "were very fair" and provided a medium for giving "informative feedback instead of just putting a grade on our work." Such comments as "fair and reasonable," "prompt and beneficial," "appropriate," and "effective" were included. One student noted that the assessments used were "typical of other graduate classes."

The use of technicians on site was cited as an effective means of ensuring quality delivery of the course. "On several occasions, technology presented a problem because of delays in connections," audio problems and CyberClassroom receptions. Students also commented on their use of technology in individual and cooperative group presentations citing numerous presentation, communication, and website development software. E-mail and websites were used to communicate intermittently throughout the semester. Technology was cited as "a must. Without technology there would be no DE." Students' comments clarified that the technology was critical to the effective delivery of the course and also concluded that video and audio problems "were not the instructor's fault."

For each of the three groups who participated in this study, the professor delivered the instruction from the university setting. In two of the sections, students were also enrolled at the university site. Although professors agreed to deliver the course from the university setting, one to four on-site visits were scheduled throughout the semester. When polled to this regard, students were extremely positive about the opportunity for face-to face interactions. Comments were made such as: "It gave me a sense of connectedness I would never have had," "Having the professor there made it more personable," "I enjoyed her visits," "A warm body makes a big difference in attention span," "It provides a personal touch," "I felt more comfortable voicing concerns or issues that I needed to have taken care of," "The professor's visits provided the needed eye-to-eye contact," and "It made us feel more comfortable, but I'm not sure it impacted the learning." Students at the university site unanimously expressed an advantage over the distanced students because of the interpersonal relationships that developed before and after class with the instructor.

Students entered a variety of responses in the category of additional comments ranging from personal comments about the process of distance learning to specific assignments to the value of this university program. One student doubted the value of distance learning initially and concluded that the unique variety of teaching strategies changed his mind about its utility. Another decided not to enroll in another DE course stating "technology is not always the answer." Several of the students concluded that without the distance learning option, they "would have never gotten a Masters Degree." One student commented, "This class would have been worth the tuition even if I weren't pursuing a degree. I learned a lot and I changed my mind about a lot of things I was doing (in a secondary math classroom). Thanks for doing what a teacher is supposed to do."

Educational Importance
Distance learning offers opportunities for students to obtain new skills and achieve graduate degrees from our universities. As professors, we are charged with the task of delivering course content without compromising its rigor. Thus, the strategies employed in these satellite programs must be examined from the perspective of the learner and the instructor. Teaching and guiding learning is no easy task in the most favorable of conditions, notwithstanding one that may not be optimal as an educational environment. Instructors must be given specific guidance based in research. The stakes are too high for teachers to read manuals on distance learning based on practices lacking a theoretical framework. Thus, additional research is needed to investigate the effectiveness of specific instructional strategies.

Abstract: In this paper we present a methodology that reduces the level of complexity when analyzing, designing and evaluating technology-based collaborative learning applications. Its main characteristics are the agreement or compromise reached by teachers and developers in the creation of those applications and the interaction between both roles. The above-mentioned methodology is based on iterative and participative analysis, progressive design and collaborative evaluation. The analysis is performed by means of the presentation of a series of five templates that comprise and model the domain of a collaborative learning situation and Design is supported by a class model. The validation process is attained through usability-based techniques. The methodology is part of the DELFOS project (A Description of tele-Educational Layer Framework Oriented to Learning Situations).

Introduction

The development process of CSCL (Computer Supported Collaborative Learning) (Koschmann, 1996) applications is a complex task, because several factors play an active part, namely: educational process and classroom aspects and those related to the appropriate use of computer network technology. Hence, the aforementioned applications have to be jointly developed by both the teacher and the developer. The teacher-developer relationship triggers a series of mutual understanding problems derived from their communication difficulty; this difficulty is due to the mismatching between the pedagogical and technological vocabulary used by each of them. Besides, the teacher is not familiar with technology; nor is the developer aware of the needs of the classroom.

The search for a possible solution has gone through different Software Engineering strategies in which the teacher is interviewed by the developer on several occasion. Unfortunately, this sort of activity has not allowed the developer to grasp the adequate and precise requirements derived from the classroom needs. A different strategy has been the creation of authoring tools which should be used by the teacher to build his/her own technological developments. The resulting applications present poor robustness. By means of the third strategy teachers have been provided with genetic telematic frameworks so that they are able to develop the collaborative application. The applications produced focus on solving communication problems, but do not establish tight links with the collaborative learning process. Therefore, these strategies have produced weak applications regarding the classroom problems and they have, once more, triggered the teacher’s uncertainty about the effective use of technology in the classroom. Our strategy is based on the use of a conceptual and technological framework called DELFOS (Osuna, 2000). It proposes an iterative and progressive technique for the analysis and design of systems based on Usability (Mayhew, 1999) and on the use of transdisciplinary techniques (Vilar, 1997); the aim is to stimulate commitment of teacher and developer. The document continues with the methodology description and some conclusions.

DELFOS methodology

DELFOS proposes a four-phase methodology (see Fig. 1). First of all, we can see the collaborative analysis phase, in which the teacher describes the scenario and discusses it with the developer. It is here that DELFOS provides a series of templates describing the attributes that constitute a learning situation. Those templates use pedagogical vocabulary and they cover five aspects: Learning Situation, Learning Activity, Roles, Objects and Interactions. The second phase, collaborative design, starts in the analysis phase resulting scenario...
to which a series of class diagrams (also provided by DELFOS) are applied in order to obtain an object-oriented design. Once again, there is an iterative and progressive process that will suppress any design bug. In this phase, both roles dialogue in order to get a joint vision of the design. In the next phase, the design is implemented and DELFOS proposes a three-layer structure. Each of the layers takes a different problem into account: the situational layer is related to the interface; the constructivist layer deals with problems such as scaffolding and social interactions which are related to the knowledge construction process; the cooperative layer is in charge of defining the technological requirements needed for interaction and collaboration.

Fig. 1 The DELFOS development methodology

Finally, the validation phase is presented by means of a collaborative evaluation of the resulting application. The roles that participate here are the Teacher, the Developer, the Student and External Evaluators. For this purpose DELFOS has in-built evaluation instruments based on usability principles and on ISO 9241-11. This methodology has been used in the development of three collaborative learning applications; one of them focuses on learning reading-writing skills, the other one on social abilities and the third one on language teaching abilities.

Conclusions

A framework like DELFOS diminishes the CSCL applications development complexity, because it serves as a communication means that reduces the vocabulary differences between the teacher and the technology developer. This allows that two roles work together in all the phases of the development process.

On the other hand, the templates proposed in DELFOS have made the application analysis task easier, since they provide the teacher with a reference framework for the observation of the general properties of collaborative applications. Similarly, having a series of predefined classes accelerates the application design process. The implementation has been possible through the use of Java language, though the use of other type of technology is not discarded. The validation process proposed in DELFOS has enabled us to evaluate not only the applications derived from the framework, but also the framework itself and the performance of each of the roles that take part in the development. DELFOS currently aims at getting a methodology that enables the analysis of the interactions carried out by means of the applications and establishes predetermined relations among the interactions.

Abstract: Web-based instruction is the latest development of distance education, which has become an extremely important part of instructional technology. Web-based instruction has commonly adopted by universities and schools to deliver courses online. Challenged by this advanced instructional technology, teachers will ask what we should know about it. The answer is that he or she should be knowledgeable of this advanced delivery method. He or she must be a life-long learner and be willing to face the challenge of being accountable for student's learning achievement. To obtain an effective web-based instruction, specific and clear instructional objectives are critical keys, strategic instructional time management and flexible collaborative learning environment lay down the foundation, and multiple means of evaluation guarantee the high quality of instruction and successful learning.

Web-based instruction is the latest development of distance education, which has become an extremely important part of instructional technology. The university system of Georgia has adopted WebCT as one of the instructional tools to deliver high education online. Challenged by this advanced instructional technology, teachers are facing the question that what we should know about it. A critical issue is whether this web-based instructional approach can provide acceptable quality of instruction and whether students can receive expected opportunity of learning.

The development of web-based instruction

It does make sense that as society moves to a knowledge-based economy, increasing numbers of people will use communications technologies as a major tool for learning, no matter whether educators choose to encourage this process or not. It is believed that a deliberate transformation that maximizes the strengths and minimizes the weaknesses of the communication tools could greatly improve current educational practice (Elementik, 2000; Didsbury, 1982). The knowledge of the development of web-based instruction will help a teacher understand this advanced tool better and use it more effectively.

Web-based instruction is developed from traditional distance education that can be traced back to a century before (Tiene and Ingram, 2001). In the early 1800, because of reliable national mail service in the United States and Europe, instruction began to be delivered by mail. By the end of the century, a number of distance-learning schools were well established. The Chautauqua Institute in New York was providing adult correspondence education across the nation. The International Correspondence Schools of Pennsylvania combined mail delivery and face-to-face instruction by railroad cars to offer training in a variety of job skills. University of Chicago established the first university "extension division" that offered courses by mail.

In the early of the twentieth century, radio broadcasting was adopted in distance education. Along with providing written study materials for students, the University of Wisconsin became a leader who experimented with educational radio broadcasting. During the years of 1920s and 1930s, a number of universities in the United States practiced with radio broadcasting for their distant students. However, the
use of radio broadcasting was declined after the World War II in the United States, partly because of the arrival of television.

Television became widely available in the 1950s. It was considered as a revolutionary development in the field of education, particularly in distance education. The Ford Foundation spent millions of dollars on its "master teacher" project. Lessons were taught by "master teachers" and delivered through television sets in multiple schools. Other teachers remained in their classroom to follow up the television lectures and work directly with their students. It was notable with the project conducted in Hagerstown, Maryland where schools television seemedly promoted the education level of that rural school district. However, the conflict interests between master teachers and regular teachers made it nearly impossible for the implementation.

In the 1970s, the British Open University was established and it soon became a model of distance education around the world. The Open University used multiple media to deliver its courses, including mail, radio broadcasting, television programs, audio tapes, video tapes, and so on. Its well-developed curriculum, course materials, and multiple methods of course delivery made the university become successful. In the nineties, with advanced computer technology, the Open University began distributing lessons on computer discs, and has developed its own Web-based online courses.

The advance of computer technology opened an excellent manner of course delivery in distance education. Web-based instruction makes it an excellent education format for those distant students. Curriculum, course materials and class handouts can be posted on the Web. Instructors and students at a distance can chat in the chat rooms, discuss with a bulletin board, and complete projects online. The increasing popularity of electronic mail and the World Wide Web make Web-based instruction even more possible. At present, many courses already exist on the Web. In fact, Walden University, Nova Southeastern University, The Union Institute and the University of Phoenix have entire degrees offered online.

A tool of Web-based instruction

Like Blackboard and Top class, WebCT (Web Course Tool) is one of the common tools for developing Web-based instruction. WebCT 3.0 provides more sophisticated features for teachers to develop online courses. It includes three major blocks: Course utilities, course components and course tools. Course utilities in WebCT are automatically encased in every WebCT course, allow teachers to transfer course files to the WebCT server, manage students' information, and control course layout. Course components are optional features that help teachers organize and structure courses, such as syllabus, course content modules, and course home page. Course tools are also optional features in WebCT. They allow teachers to present information, communicate with students, monitor and evaluate students' completion of the course, and assist students to facilitate learning.

With course utilities, teachers can create or modify courses with course setting management utilities, transfer course files with file management utilities, and maintain class roster and student grades with student management utilities. Course setting management includes identifying instructors, selecting language (at version 3.0, English, French, Dutch, Finnish and Spanish are available), creating course home page, designing course menu, setting course appearance. File management allows teachers zip and unzip, upload and download, link and group files for course instructional needs. After the files are uploaded, the files can be edited, copied, moved, renamed, and deleted. The files can also be regrouped and filed in exiting or newly created folders. Student management initiates lets teachers add students, import student data, list a subset of students, add or modify columns, and change settings and course access. It also let teachers tracking students' learning and managing students' presentation.

Course components can include course home page, syllabus, content modules, and resources links. On the course home page, teachers can have a welcome message describing the course and making the course accessible to the public. Within the syllabus, teachers can provide course description, objectives, textbooks, requirements, assignments, instructional outlines, and contact information, etc. Teachers can create or modify syllabus categories according to his or her instructional needs. Course content modules are structures of delivering. Teachers can present instructional materials, handouts, and test items. With content modules, teachers can also post discussion questions, assign learning activities, and organize the delivery of the course contents. External resources can be linked by URL. Teachers can introduce
extensive on-line resources and connect them to the course. The external resources will help students enhance their learning.

WebCT 3.0 is equipped with a sophisticated course tool package. Within this package, there are page management tools, course content module related tools, communication tools and evaluation tools. Page management tools include tools for page organization, page creation, and URL links. Course content related tools are those for course module creation, modification and organization. Communication tools consist of mail, discussion, chat plus whiteboard that allows teachers and students to share a drawing palette during an online discussion. Teachers and students can use whiteboard to insert text and graphics, choose fonts and colors, upload images from local computer and save images for future use. Evaluation tools are used to administer quizzes and surveys. Learning assignments, project presentations and students' grades can be monitored and tracked for evaluation.

Teachers, however, may experience some frustrations as they use WebCT. WebCT is not likely to deal with large group of files, like a set of PowerPoint presentations. Thoughtfully designed as it is, WebCT cannot handle the transfer of a group of files on the server at the same time. It is suggested that teachers have to zip those files first and then uploaded or downloaded zipped files. While linking sites or organizing the course topics, teachers can only deal with one site or one file at a time. When an attached file is transferred, the file can only be in html format, otherwise it won't be retrieved by the browser and opened with a mouse click. The attachment has to be downloaded for reading.

A practice of Web-based instruction

Web-based instruction helps distant students access to the courses they need, provides teachers with the new vehicle of instructional delivering to meet the individual learner's needs, and brings teachers and students, students and students together without time and space limitations. Students can access course materials at their local computers, practice skills according to the guidelines online and complete course assignments and projects collaboratively. The courses "Teaching mathematics in P-5" and "Integrating technology in education" have been taught through WebCT for three semesters. Teaching mathematics in P-5 is taught with Web-based instruction as a supplementary practice. Integrating technology is delivered mainly through Web-based instruction. The former has the course materials hosted in presenter's personal Web site, and the latter hosts the course materials on the WebCT server.

The course "Teaching mathematics in P-5" is designed with 4 major components. They are course materials, course discussion, course resources, and course outcomes. The course materials are grouped into ten topics that are delivered together with traditional classroom-based instruction. Course discussions are conducted at WebCT's discussion board, through e-mail and in chat rooms. Course resources are collected and linked on-line to support the course. Course outcomes include daily learning journals, curriculum-technology alignment projects that are eventually posted on-line and shared publicly.

The course "Integrating technology in education" started from web-based discussion and to web-based instruction. It is at present completely delivered on Web. Its delivering modules currently consist of course instruction, practice, discussion, and project-approach online evaluation. With in course instruction, course materials and instructional objectives are delivered. Practice module includes practice guidelines and project examples. Students can follow the guidelines and refer to the examples while completing assigned individual projects. "Classroom" discussions are conducted through electronic mails, at discussion board and in instant message chat rooms. Students Learning outcomes are evaluated through projects completed with specific technological skills. All completed projects are submitted through e-mail and filed in learning portfolios for evaluation. Based on the experience of teaching online courses, the presenters believe that obtaining an effective web-based instruction, a teacher should have his or her instruction be involved in at least four phases: preparing, performing, following-up and evaluating (Hackbarth, 1998).

At preparing phase, teachers not only need to review course components, examine the facilities and personnel, and practice presentation through web, he or she should also have specific and measurable instructional objectives. The courses delivered on line should have general course objectives, more important is that each course unit or class should have clear and specific instructional objectives which can be assessed with the completion of each lesson. Developing a web-based lesson, the teacher should be fully aware of the difference between web delivery and classroom delivery. Web-based delivery has no
face-to-face environment, no on-the-spot explanation, and no students' prompt feedback. Therefore, the instructional objectives for each lesson must be clearly stated before the posting and the delivery of the lesson. An Instructional objective is suggested to include learning goal, learning condition, learning performance and performance criteria. With a specific instructional objective, the learner at the distance can have clear idea what the learning is expected and how learning will be evaluated.

During the performing phase, a teacher need provide orientation of web delivery, elicit students' responses, and facilitate the learning with online delivering strategies. With WebCT, a teacher should realize that it has the features of lesson modules creation, chat room discussion, online test, etc. He or she, however, has to be aware of students' technological knowledge and skills of using computers and the web, their computer and Internet accessibility, and the effectiveness of the course delivery. Orientation will help students get familiar with the delivery tool, assist instructor to know students well, and have both instructor and students get together to make commitment for effective teaching and learning. Communication tools, such as e-mail, discussion board and chat rooms are the strengths of WebCT; however, delivering an effective lesson on the Web, a teacher should be prepared to manage the online instructional "time" and response to students' requests, questions, and/or submissions in a timely manner. A required online chatting and time of posting questions/projects are necessary and a strict deadline for assignment is important. Collaborative learning, sharing and project-oriented problem solving should be strongly encouraged and be highly credited.

Following-up phase plays an important role in Web-based instruction. Lesson modules, assignments, and online time requirement should be an on-going process of refining. For improving students' learning achievement, a teacher should face with the challenge of the rapid development of computer technology, students' increasing needs and bombard online resources. To schedule one or two classroom meetings with students during the period of Web course delivery will be helpful and is necessary. It will help teachers modify the instructional modules, update instructional materials and resources, and facilitate students' learning process.

At evaluating phase, a teacher should understand the purposes of and the means for evaluation in web-based instruction environment. The effectiveness of course delivery and the achievement of students' learning can be the criteria for course evaluation. Teachers have to be aware of the necessity of being prepared for multiple ways of evaluation since students are learning at distant places. The evaluations can be online tests, student activity roll calls, journal posting and sharing, completion of projects, as well as learning portfolios. One of the issues frequently raised about web-based instruction is that how can a teacher know the responses posted or projects submitted through online come from the actual student, not someone else. To pursue a meaningful evaluation on web-based instruction, teachers should realize that online tests are different with tests in the classroom: no on-site supervising. Online quizzes or tests can be used to measure students' learning achievement, however, multiple means of evaluation should be more stressed in web-based instruction.

In conclusion, the answer to the question raised at the beginning of this article-- "what we should know about the web-based instruction" is that he or she should be knowledgeable of this advanced delivery method. He or she must be a life-long learner and be willing to face the challenge of being accountable for student's learning achievement. To obtain an effective web-based instruction, specific and clear instructional objectives are critical keys, strategic instructional time management and flexible collaborative learning environment lay down the foundation, and multiple means of evaluation guarantee the high quality of instruction and successful learning.

Abstract: This paper deals with the introduction of an electronic discussion board into a paper-based distance learning phase of a post-graduate diploma in Teaching English to Speakers of Other languages (TESOL). It outlines the thinking behind the implementation of learner support through on-line discussion. The students' messages were analysed and a questionnaire used to examine and reflect on their contributions. Findings indicate that positive attitudes do not automatically result in high level of use and that the factors influencing this are varied. It goes on to describe a second, ongoing phase of implementation that is based on the lessons learned.

Introduction

The TESOL Centre has been running distance learning programmes for over 14 years and is experienced in dealing with the support issues that arise from distance learning, paper-based models. These include a sense of isolation from tutors and the institution (Edwards & Hammond, 1998), and problems with self-managed time (Mason, 1998). Other issues are the delays in sending and receiving work and a lack of contact, generally, with peers (McGee & Boyd, 1995). The introduction of online learning environments has had an effect on the distance learning tutor's role. Electronic conferencing provides a new context for learning and interacting, where both tutors and students are creating and shaping the learning environment (Salmon 2000). Computer moderated conferences and web based discussion boards fall into the category of text-based systems (Mason, 1998) that includes electronic mail, computer conferencing, real-time chat, Multi-User Dimensions, fax and many uses of the World Wide Web. Discus is a web discussion board software package that can be installed on a Unix, Windows 95/98, or Windows NT web server.

The Study

The Diploma currently has a 40-week paper-based distance learning phase followed by 4 weeks full time direct contact phase at Sheffield Hallam University. The TESOL Diploma students are, typically, experienced native speaker teachers of English, working overseas. Students are asked to submit worksheets by post on a regular basis (as many as 40 items). The subject tutors read these, assess them and give written feedback. This system would appear to be "ripe" for enrichment via ICT.

It was envisaged that the Discus discussion board would enable and encourage students to post-up questions/comments on specific modules and talk about specific tasks with other members of the group. A questionnaire was used to identify the students' computer background and canvass them on the tools. This showed all the students to have access to a computer, either at home or at work. While previous experience of ICT, email and the web was high the majority of the group had little experience with other forms of electronic communication. Face-to-face was seen as the most effective form of communication, followed
closely by email. Interestingly, in a course that relies heavily on material sent through the post, surface mail was viewed as a relatively less effective method of communication. Electronic conferences and discussion boards were rated least effective.

It was anticipated that the main role of the tutor would be to set the tasks and moderate the responses. The students were given access to the discussion board and asked to use it to read and post up messages concerning the distance learning programme. Tasks were allocated to the students each week and these can be divided into three types: Social, Academic and Technical (Salmon, 2000). These were flexible, allowing tutors to follow students' threads of discussion for proceeding tasks if appropriate but in the main this did not occur.

**Findings**

Over the 6-week trial period student participation dwindled and there were very few new participants. The majority responded to tasks set in the early weeks where they were asked to comment individually on their work and give an example of their teaching. Responses and comments to each other were minimal, the main contribution being isolated responses to tutor-set tasks. It was found that a good amount of tutor time was spent responding to individual student questions and encouraging interaction.

Efforts by the tutor to raise key points for discussion based on the collated student responses from a previous task met with little or no response. One of the findings of this trial is that if the online tasks are offered as a non-compulsory extra then students tend not to use the online facilities. More active participation may well be evoked through the incentive of assessment.

A second phase of this research has been set up to examine these questions in more detail. A café area is now available for online socialisation to allow students to become familiar with the environment prior to being asked to exchange academic information. The academic tasks are now integral to a specific distance learning module, chosen for the level of student-perceived difficulty. The tasks will run for a specific time in order to focus students' attention and to develop their facility with the course material and the paper-based assessment tasks.

**Conclusions**

The success of moderation (McGee & Boyd, 1995) is dependent upon a number of factors. In light of this tutor intervention and its effect on the student response needs to be further examined. It is important to clarify what tutors and students are expected to do, and by when, and to be realistic about the amount of time a tutor can give. Students need access to adequate resources and technical competence and the software tools should be robust. The type of task set has a bearing on the perceived relevance and level of difficulty for the student and this can affect the degree of participation and satisfaction.

Tutors need to develop a clear sense of their audience and the composite needs of the group. There are implications arising from this for the training of online tutors. In particular student reticence in contributing, despite expressing enthusiasm for the tools, must be overcome for effective and integral use to be made within a course. Our research will continue to investigate this area.

Abstract: This paper is a report on the results of an online course that focused on online material development that can be used by a diversity of learners. The main focus of the course was on instructional design of web-based materials. An important element of the course was the use of Universal Design for Learning principles to assist designers in creating a course that can be accessed by learners with special needs. The outcomes of the class included feedback on the usefulness of the course, student projects, and discussion on the use of online discussion forums. Individuals planning on creating web-based materials need to be aware of the Universal Design for Learning research.

Introduction

The Internet is growing in use for educational resources. For many educators, the Internet is a tool to find, research, and discover materials and curriculum that can aid students in learning (Richtie & Hoffman, 2000). However, the Internet can also allow teachers to create materials for their students that are useful for learning. The challenge of using technology in these classrooms often is not access, but rather the teachers’ development skills in designing instructionally sound curriculum incorporating technology.

Many teachers in this state’s educational system are learning technology tools such as creation of webpages. However, just because teachers know how to create webpages it doesn’t mean they understand how to create a page that is instructionally sound and universally accessible. Can all students access our materials? We need to design our courses with the awareness that access and usability are key factors in designing successful online courses. This paper discusses the development and delivery of a course that focuses on online instructional design that provides accessibility. The summer course, Web-based Instructional Design, provided learners with the opportunity to design an online unit and materials based on instructional design and Universal Design for Learning principles.

Project Background

The growth in educational use of the Internet for providing materials to learners has been tremendous (Beer, 2000). For the past year, the authors have discussed the idea of weaving the Universal Design for Learning principles used to provide access to individuals with special needs with the concept of instructional design. It was noted that both concepts were closely related and worked well within the framework of putting materials on the Internet. The thought was that if we could teach educators to understand both of these concepts, more web-based curriculum materials could be created to work with diverse learners.

Universal Design for Learning principles were created as a response to those individuals who have a disability that keeps them from accessing information and materials. Universal Design for Learning means the design of instructional materials and activities that allows the learning goals to be achievable by individuals with wide differences in their abilities to see, hear, speak, move, read, write understand English attend, organize, engage and
remember (Orkwis & McLane, 1998). The principles for Universal Design for Learning were initially developed by the Center of Applied Special Technologies (CAST) and continue to be revised by CAST and other professionals in the special education communities.

Instructional design is the process of developing plans for instruction through practical application of theoretical principles (Dick & Carey, 1996). Most traditional models of instructional design can be categorized by five processes: needs analysis, designing the instruction, development of instruction, implementing the instruction, and evaluation of the instruction. Instruction is used to close the gap between what the learner should know or be able to do and what the learner currently knows. If there is a gap between the ideal and reality, we use instructional design to bridge that gap.

The decision to use web-based instruction should never be the first decision to make in putting together materials or a course; however, in education, we often decide to offer an internet course without considering whether the internet is the most effective way to provide the materials or the course. Web-based instruction is a media decision that should be made in the design stage of developing a course or materials for learners. The rationale for providing instruction via the web should be made based on instructionally sound reasons. According to Carlson, Down, Repman, and Clark (1998), some of these reasons include providing more convenient access to education, serving a previously underserved population, developing personal skills and expertise, and maximizing the potential for interactivity and linking.

The concepts of Universal Design for Learning and instructional design provided the framework for the course to offered. The main purpose of the course was exposure to these concepts so that educators would create materials that held relevance and be accessible to all learners while using the Internet resources. Designing materials with a purpose from the beginning may aid in increasing the quality of materials in the Internet.

**Implementation of the course**

Summer was an ideal time to try experimental courses. The authors put together a course called Web-based Instructional Design. The purpose of the course was to focus on using basic principles of instructional design, so that teachers could create web-based lessons that challenge and expand the horizons of the diverse learners in their classrooms. Web-based lessons could include complete lessons or supplemental materials. This course focused on the creation of curriculum materials that were accessible to all learners and provided adaptations to accommodate students with special needs. Students were introduced to topics such as needs assessment, Universal Design for Learning, and curriculum revision for web environments, diverse learning, assistive technology tools, and alternative assessments. This was a two credit hour graduate course meeting through two face-to-face meetings and online resources.

The goal of the course was to introduce web-based materials as a viable way for educators to assure student access to materials. The instructors put together the learning objectives of the course to organize the content. These learning objectives were based on the idea that the course would be a hands-on learning experience. This was important as each unit of study resulted in a project that required students to personalize their newfound knowledge.

The objectives of the course included fell into two categories: applying the principles of Universal Design for Learning and implementing the components of Web-based instructional design. The Universal Design for Learning principles were discussed in unit two where students examined the principles and discussed how these principles could assist the students in designing curriculum materials. The principles of Universal Design for Learning include: creating materials in digital text format; providing relevant captions for audio, images and graphical layouts and video; and providing cognitive supports and activities through the use of several instructional strategies as appropriate to the projects and needs (Orkwis & McLane, Fall 1998).

The components of web-based instructional design composed the rest of the course content. Students were walked through how to complete a needs assessment. Following the needs assessment, students were introduced to writing goals and objectives for their curriculum materials and how to design their instruction including making media decisions. The class also focused on practices that facilitated online learning. Finally students developed various
digital curriculum materials and then assessed the materials. The class also discussed the importance in these steps to the development of an online course that meets the needs of the learners regardless of their diversity.

Both instructors worked together to design the content of the course with the idea that the technology would be introduced at beginning with a face-to-face meeting. One faculty member concentrated on the units dealing with Universal Design for Learning and assessment. The other units were created by the second faculty member including web-based instructional design, needs assessment, instruction design, and material development. Both instructors were available for student consultations as well as responding to online discussions.

The course had four students who participated through the online format. The course was designed to meet initially face-to-face and then continue throughout the summer as an online entity. It was decided that the class would meet for its final presentation face-to-face. The majority of learning would occur through online course materials and through threaded discussions.

The first meeting was on a Saturday from 9:00 a.m. until 3:30 p.m. and offered students the opportunity to learn the online technology that would be used throughout the course. Students were provided a hard copy of the syllabus, which provided the timeline for the projects within the online structure. Students were also given the opportunity to introduce themselves through an activity. A digital camera was used to document some of the proceedings as well as allowing students to post their picture to the course environment. Students logged into the class for the first time and discovered the many features of the online environment by posting a beginning biography. Following, the online activity, students were presented information about Universal Design for Learning as this was definitely a new topic for them and it allowed the class to immediately make use of the online chat feature.

The remainder of the eight week course was conducted through the online course environment. Students were asked to check the site at least once a week, as the units were a week apart. Discussion was relied upon heavily to clear up any confusion or to extend the topic. The final meeting was again a face-to-face meeting where students presented their projects to the class.

The course was set up so that students would look at various resources on web-based curriculum including information on the Center for Applied Special Technology (C.A.S.T.) website about Universal Design for Learning. Once students reviewed the materials, they were asked to read the summary written by the instructors and then comment on the issues and ideas brought up in the instructors' notes. Discussion was used heavily to clarify concepts and to further the ideas as we explored the area of web-based curriculum together. For each "unit" of content, the students were asked to complete an assignment that was part of the discussion on web-based curriculum. The units of study included: an understanding of web-based instructional design, analyzing learner needs, Universal Design for Learning principles, design and development, implementation options for diverse learners, and evaluation. Students were given learning tasks for each unit as well that focused on completing the project through the processes being taught. These hands-on experiences provided an opportunity to question their current practices. For example, during the unit on needs assessments, students were asked to put together a survey that would indicate the needs of the audience they were designing the web-based materials for. Once they would submit their assignments, both instructors would make comments and provide feedback to the students about their use of the instructional design principles and Universal Design for Learning principles.

Assignments ranged from reading assignments to a final project. Students created web-based materials that met universal and instructional design principles during the course. After most units, students were to respond to a discussion question that expanded their thinking about how the unit materials impacted their design processes. Often this called for reflection while practicing these new skills. Also, students were to complete an assignment for each unit that took them through the instructional design process step by step. Students were required to participate in the course discussions online. They also created a unit of study that was built upon the principles of instructional design and incorporated universal design for learning strategies. Finally students orally presented their project to the entire class showcasing the materials they created as well as sharing the process as it applied to them

Results of the class

The instructors learned many things from producing this course. The results offered several items to be considered the next time the course is offered. Many of the outcomes of the class provided both instructors with tools and
processes they could use in future courses and training opportunities. Results were measured by the discussion forum, oral presentation and feedback garnered from the learners.

The final meeting gave all the students an opportunity to share their online curriculum projects. The projects were inspiring. One student was a faculty member who was going to begin an online course in the fall. The class gave her an opportunity to prepare the course using some guidelines and ideas that she would not have encountered otherwise. She ended up focusing her efforts on case studies and discussions. Another student developed a cultural course for English as Second Language (ESL) students and really focused on providing her students an opportunity to interact with students from the American culture. Another student developed mini-workshops for his students' parents on how to use things like digital cameras and developing PowerPoint presentations. A fourth student developed a series of sessions focusing on grief therapy complete with a vast array of Internet resources.

Bibliography

Discussions were the lifeline of the course. The course started out with the instructors posting a deep thought question at the end of each module to provide opportunity for student reflection. The students would then take over the discussion forum. The students asked and answered many of the questions that helped to clarify and strengthen the content of the course. They also began to build a community amongst themselves. When one student had a problem or concern, other students would submit suggestions or resources that could be used in relation to the problem. All of the students actively participated in the discussion forum.

As the course took shape, we decided to include student-to-student discussions to increase the richness of the online experience. At the first face-to-face meeting, the class was given some guidelines and expectations of what the discussion should encompass. The guidelines were based on some of the suggestions made by Pratt and Paloff (2000), but other guidelines came about because one of the instructors was experienced in group communication and made suggestions based on that experience. Based on that classroom experience, a discussion grading rubric was developed for use in other courses. Currently, the instructor is conducting more research on the use of the rubric and its implications for online environments.

Students also indicated through an oral interview process that they gained much from the course. Several indicated that they had never before considered the Universal Design for Learning principles and through the class had become more aware of accessibility issues. Students encouraged consideration of offering the course again or even providing aspects of the course in faculty training.

Discussion and Summary

Based on student feedback, the course should be offered again. Students felt it helped them understand that online environments are different from the traditional design of materials for educational purposes and need to be planned carefully. The instructors also would like to offer the course again to improve it based on feedback and additional experiences. For example, more in-depth information about assignments was necessary to provide a guide for our students to develop their projects.

There is a growing need on our campus to help faculty understand the nature of putting their course online. The more one understands the guidelines of instructionally sound design, which includes creating materials for all students, the more effective the creation process of an online course seems to be. Through a campus grant, faculty will be offered the chance to take an in-depth training (online) on how to create a course that provides a sound instructional structure. Again the issues of diversity and access for all learners will be addressed as we further the concept of Universal Design for Learning.

The online course we developed was an interesting mix of web-based design exploring the issues of accessibility. The results indicated that we should plan on offering the course in the future and it may wind up on a degree program as an elective. Because of the course, the authors were granted an opportunity to examine first-hand the process of putting a course online which emphasizes good design and accessibility information. The experience was a positive one.

Abstract: In this paper, we use the term “distance education” to refer to the situation where computer-mediated technology is used as the main delivering media of courses of study, and where the teacher and the student are physically in two different locations. Many research papers discuss the reform of high school education and deal with issues such as the new technology and computer mediated curriculums without discussing the role that distance education may play in this reform. Other papers discuss how to improve teachers’ knowledge of certain subject areas and only address distance education as a way to make teachers’ professional development more flexible in terms of time and space. This paper takes a different approach in claiming and justifying that taking a course at distance should be part of the high school curriculum, and that students need to experience a form of distance education even if they plan to continue their study at traditional institutions. Moreover, this paper also claims and justifies that distance education is a key factor in teachers’ good teaching at traditional schools.

Introduction

Distance learning has been mainly characterized as a popular method for adults who need to “upgrade.” Typical advantages listed include the flexibility that learners enjoy in terms of time, place and pace of learning. However, the continuous change in computer-related technology have given distance education more credibility by improving accessibility to courses materials on the Web and by improving the availability of electronic equipment that enables students to participate successfully in completing courses at distance. Also, the vast and continually growing Web and the overwhelming increase in the use of the Internet and technology will have an impact on the traditional methods of teaching and learning. We claim that students, after completing their high school education, will most probably have to experience distance education in their ongoing life, either on their way to get a university degree, or to broaden their experience and to qualify for better jobs. Studies show that personal prior experience and acquired knowledge about a certain discipline makes new advances in that discipline easier to grasp, and helps students overcome potential barriers to coping with such new advances. In this context, it can be demonstrated that students taking distance education courses after having some work experience, especially with technology and computer mediated communication, have a better completion rate than those students who take courses at distance without that experience. Recent research suggests that in the new technology-driven economy, a worker may be expected to change her or his career few times before retiring. A worker may need to learn the skills needed for a new job while s/he is working. Distance education may be the most feasible way for learning the new required skills in
that situation. In high schools, students learn basic skills that help them learn, but mainly in a face-to-face environment. We claim, and justify in this paper, that students will very likely need to take courses at distance in later life. Hence, they should be well prepared for it. This paper is designed to explore the need for introducing distance education in high school. It begins with an explanation of our view. Secondly, there is a brief presentation of the associated problems, followed by a description of a modified model for high school students to complete such a course at distance. This model will serve as a transitional form of learning between the common models of face-to-face and the distance education. Thirdly, a description of the content of a course that we recommend for high school students to take at distance. Fourthly, the role of teachers in this transitive model is addressed, as well as what teachers need to know to play a successful role as facilitators in our suggested model. The paper concludes by justifying the need for teachers to learn how to use technology through distance education rather than in a traditional environment.

Distance Education is an Ultimate Subject for Students In Schools

The author teach in a leading institute for distance education and are aware of the difficulties that encounter students when taking distance education courses. We believe that students, in high schools, must be well prepared for dealing with distance education courses. Students of high schools may be classified into the following four categories:

1. Those who will join a traditional university. Traditional universities do not offer all courses needed by their students all year round. At certain times it is very likely that a student will need a courses or more to graduate and such courses are not offered in the semester that student needs them in his / her home university. Hence, the only valid option in front of that student is to take that course(s) via distance education.

2. Those who will work and study at the same time. In such a case, distance education is the ideal route for that group of students. So, it is very likely that this category will go for distance education because such category does not have time to attend a traditional university (e.g. have work schedule conflicts).

3. Those who will enter the work force after completing their high school studies, and will not go directly for continuing their higher education. The following argument will also apply for (a) and (b) above as it applies for most workers who may enter the work force at any point. Suresh Dinakaran (Suresh 2000) states that: "the idea of having a single career in one business or industry is long gone. Several papers and articles suggest that, on average, a worker in the new economy will have perhaps as many as seven careers and many more 'jobs' before retiring". We believe that distance education may be the most viable option for those who need to upgrade either to maintain their competence or to qualify for a better / new job due to its well-known advantages such as flexibility in terms of time and space.

4. Those who will neither continue their higher education nor will work. In case a member of this category decides to change his / her situation and join one of the above categories then the relevant argument will apply.

The above classification claims that students will need to experience distance education at sometime of their ongoing life. Students usually face considerable challenges in their distance education in general and in their first course in specific. The first impression they get from their first course can affect their decision whether to continue with this mode of learning or not. Next, we will briefly list few of the challenges that face students while learning at distance. Such listing will help explaining our suggested transitive model.

Challenges Associated with Distance Learning

Some distance education programs use a variety of "real time" technologies such as teleconferencing and videoconferencing. This requires that students gather in one / few locations to be able to use the voice and video equipment to communicate with the instructor for the conference, or at least, students must be available for the conference at the same time. This means imposing some constraints on students who selected distance education primarily for its flexibility. Statistics show that most students who opts for distance education do so because their circumstances prevent them from being committed to a fixed studying schedule. This implies
that a distance education program that depends on teleconferencing, videoconferencing, or other real time media may not be suitable for them. Also, in a typical distance education program students are spread among different geographical areas with different time zones. This makes using any time-bound technology unsuitable. The distance education program we will focus our discussion on is the one that delivers the course material on the Web, accompanied by printed textbooks. In this program, the material on the Web consists of a study guide that explains and compliments the printed textbooks, and of a set of on line assignments and/or quizzes. Students contact tutors primarily via e-mail and get feedback via e-mail. Students have access to courses’ conferences where students can read and reply to each other’s posted messages at the time suitable for each student. Next, we will briefly identify the main challenges that a distance education learner usually faces, in a similar program to the one described above, in order to come up with a transitive model.

1. Isolation

Student may get the feeling of being isolated from other students and from the instructor because s/he misses the face-to-face contact with the instructor and with the other students. Some educators suggest to students that a technology such as videoconferencing may help overcoming this feeling. We find that real time technologies are not suitable due to the reasons mentioned earlier. Students already know that the nature of distance education differs from that of the traditional education. We do not have to provide an equivalent substitute for face-to-face communication. However, distance education learners may use computer-mediated technology for contact such as e-mails, chat rooms, computer conferences, and MOOs. It is a matter of practice. When students get used to this technology they will overcome that feeling of isolation. Complaints regarding isolation usually come from students taking their first courses at distance. Such complaints usually disappear after completing a second course at distance. An example from real life that may explain the previous argument is buying over the Internet (e-commerce) versus buying from street malls. Buyers over the Internet cannot touch the product, but they know that they have traded touching the product with the convenience of buying at home. As e-commerce is growing tremendously, distance education is also growing tremendously. Distance education learners have traded the face-to-face contact with the convenience of flexibility in time and place of learning.

2. Planning

Some students lack adequate planning that enables them to complete the course of study in time. When student signs for a course s/he is given few months to complete the course (say six months). The student is asked to submit all course work within the specified period without specifying deadlines within that period (e.g. does not have to submit each assignment on a specific date). This is to accommodate for learners’ circumstances such as traveling or peak periods of work. Each course offered at distance is usually accompanied with a suggested study plan as a guide for students but it is not enforced. Students need to learn to determine deadlines for themselves and to meet those deadlines.

3. Motivation to complete the course

Some recent studies mention that distance education courses must provide a sort of motivations or incentives for students to encourage them to complete the course of study.

4. Managing technology

Students who use computer-mediated communication for the first time usually encounter this difficulty in their first course taken at distance. Once they acquire the basic computer skills and trouble shooting they proceed with more confidence.

5. Students’ collaboration

It is very difficult in distance education courses to

6. Real time feedback from the instructor

Although there is no casual contact between students and teachers in distance education, but students receive feedback promptly from their instructors. Usually in the same day, or in the following day at the most.

7. Students’ support Services

Students taking courses at distance, usually need library services and technical support in downloading the course material from the Web, installing new software, logging in to computer conferences, contributing to chat rooms, … etc. Due to students’ lack of the protocols of using or receiving such services, they think that distance education programs lack adequate students’ support. However, in reality, technical staff available, in distance education program, to assist students is usually available for extended hours (could be 24 hours a day) and may have greater experience in computer mediated technology than that of traditional programs. Also, libraries in distance education programs, provide students with comprehensive online resources and journals.
In many cases those resources exceed those provided through traditional programs libraries.

A Suggested Transitive Model

The model we will introduce next takes in consideration the challenges discussed in the previous section. This model will be used to deliver the suggested course in an asynchronous mode with some synchronous features.

Features of the transitive model:
1. A self-paced course that uses a printed textbook that discusses, presents, and explains the course contents. The course has an online component used for sending questions, submitting assignments and quizzes to the teacher, and for receiving marks and feedback from the teacher. This is mainly done by e-mail. The course also has a computer conference where messages and news related to the course are posted. Students also download from the Web a study guide and a suggested study plan. This is the current predominant model used for distance education.

Part of the frustration of students taking online courses at distance is that they expect a virtual environment that substitutes all features of the face-to-face environment. Students expect the excessive use of multimedia to substitute teacher’s explanation of the material. They expect videoconferencing to substitute the face-to-face interaction, ... etc. Most distance education programs do not use such real-time technology for the reasons explained earlier. However, it makes much difference to students to try a technology themselves and see that it is inadequate rather than just being told that it is not inadequate.

2. The online component here would consist of real-time video / tele conference at scheduled times between the teacher and students to clarify course assignments and other matters related to the course.
3. The online component may consist of animated-based capabilities.
4. The teacher will suggest a study plan with deadlines for completing units of the course and for submitting the assignments. Those deadlines must be enforced in order that student learn how to manage their studying time.
5. Students must be committed to log in to the course’s computer conference at least four times a week and to contribute to the course’s bulletin at least twice a week. Also, students must be committed to login to newsgroups and / or public chat rooms and to online journals once a week.
6. Students must be committed to meet a minimum number of sending e-mails per week to the teacher.

The goal of 4, 5 and 6 above is to help students to get used to using conferences, bulletins and e-mail. Such features are optional in real distance education programs. Students joining distance education programs for the first time are usually hesitant in using those feature due to their lack of . However, by making using those feature compulsory in this transitive course, students will consider them routine activities when they join a real distance education program.

A Recommended Course

In this section we recommend the contents of the course that to be taken by students at schools within the transitive model.

1. Enabling Technologies
Students must learn about the technology tools used for delivering a course at distance such as browsers, videoconferencing, teleconferencing, computer conferencing and the Internet. Some distance education programs do not use tools such as videoconferencing, because they are time-bound as we mentioned earlier, and do not use excessive animation, since it requires long time to download. Students must experience those difficulties in order to understand why some programs do not use them.

2. Collaborative Technologies
Chat groups, bulletin boards, groupware, message boards and other interactive technologies help students to interact successfully with other students and not to feel isolated.

3. Operating Systems
Popular operating systems such as Microsoft Windows and Unix should be covered in that course. Students
who lack the technical skills to manage their computer environment usually spend part of their valuable study
time in solving their problems with technology. This causes those students some frustration in their first course
and this feeling may affect their enthusiasm to complete their courses at distance.

Learning computers' troubleshooting saves students valuable time, and gives them self-confidence. It will help
students to learn how to identify symptoms of problems, possible causes, and what to do, or whom to contact to
solve the problems.

Teachers' Role in the Transitive Model

Teachers in on-line classrooms play the role of facilitators rather than educators. While students have
course materials and studying guides to read from, teachers need to have tools to stimulate learning by starting
and directing dialog in class conference rooms and related chat boards. Experience has proven that teachers
should pose themselves as participants in the classrooms rather than authority. By being mere participants
classrooms, teachers give students a better chance to get the perfect understanding of the taught idea.

The most important educational instrument a teacher should add in on-line education is the careful
design of study guides. Study guides contain general teacher's comments on a chapters, and discussion
questions. Careful design of discussion questions is, in fact, the most crucial in crystallizing the objectives of a
chapter. Discussion questions should cover all key ideas in the text in a very logical and guiding manner. For
example, a discussion question should be designed to lead to another question, and then to a third and so forth,
until the idea is fully absorbed by students. While monitoring student's discussion about those questions, a
teacher might choose to revise questions for future use, in addition to directing students to grasp the ideas
behind.

Teacher's participation in on-line classrooms is an art by itself. We recommend that teachers make
their contribution short, precise and to the point. It is obvious that computer-mediated education relies on
reading and writing versus listening and writing in conventional classrooms. Students would need to read a
lot while studying the textbook. We find that students eventually imitate teachers in the style of contribution
to discussion, which we strive to make it short and meaningful.

Among other factors to train teachers for, is to improve social relationship between students. In the
on-line classroom, students need to interact more than they do in traditional classrooms. Teachers should be
able to maintain the class as a single unit. Cohesiveness in classrooms can be maintained by involving all
students in the discussion. For example, a particular student is requested to respond to a certain posting made
by another student. Thus, each student is made to talk to every other student in the classroom. Moreover,
teachers should encourage individuals' participation, to get the most of this model.

With an active on-line classroom, there is a new set of student problems that a teacher should be
prepared to deal with. Some of these problems do exist in traditional classrooms, but they are more serious in
on-line classrooms. Examples of these problems are: a student expressing his frustration in the classroom, a
student who wants to impose his own learning model, a student who distracts other students by side issues and
quarrels, a disrespectful student, and alike. The most important guideline to deal with student misconduct is to
reprimand in private and praise in public. Students are ideally reprimanded via electronic mail, till the
problem mandates a face-to-face discussion.

Unlike traditional classrooms, on-line classroom is full with distractions for students. A teacher might
find his students busy with unrelated material on the computer, instead of concentrating on the class. Teachers
should be able to discover, as early as possible, their students as they drift away and bring them back in a
reasonable time. Since we are dealing with a transit model of distance education, class monitoring is easy
while the teacher is present in the classroom with students.

While discussing a class subject, students might branch to side issues or develop an incorrect
understanding of a subject concept. Discussion in on-line classroom takes the form of a thread of message
exchanges. A one opinion usually draws several student responses. Naturally, some responses to an idea
contain many branced issues. Subsequent responses might carry discussion away from the idea under focus.
Therefore, teachers should be vigilant and follow closely so as to discover how students understand the taught
subject. (Beaudin, 1999).
Student evaluation is one of the most critical issues in distance education. A teacher should be able to evaluate student's efforts, and produce accurate grades. By being around during discussions, experience has shown that teachers are very well aware of their students' achievements.

**Distance Education: an Ideal Route for Teachers to Learn Technology**

Teacher's are in dire need to upgrade their computer skills, since computers are increasingly becoming an all-purpose tool in schools. Students are finding more than word processing and report producing in computers these days. Hence, teachers need to cope with the new computerized classrooms. Moreover, computers continue to develop at a fast rate, so are software teaching aids and tools. There are so many software packages designed for education, and much more is still to come. With the advent of computer technology, more sophisticated software packages are expected to emerge. (Harris, 1997).

Teachers should also learn paradigms for on-line education. Learning the paradigms enable teachers to know what is available at their disposal and how to make use of it. The major paradigms currently in use are: computer conferencing, on-line material, homework submission and instant grading, interaction with students, and audio and video clips of lectures. Teaching on-line cannot continue to follow the same old model. Therefore, students should be trained to learn the new way, before being seated behind computers. More importantly, teachers themselves should also to be trained to apply these new methods. (Bourne, 1997).

To upgrade teachers skills to the level of computerized schools, training should cover two aspects: teacher's technical and methodical development, and development of teacher's ability to handle students in this new environment. Because of time constraints, most teachers cannot afford to join schools and training programs of their choice. Distance education provides an invaluable opportunity for these teachers to upgrade their knowledge while staying at home and following their own schedules. We recommend that teachers complete upgrading course using distance education for two reasons: a) prepares teachers to teach in the new environment, and b) make teachers appreciate the usefulness of this mode of learning.

There is countless number of other benefits that teachers can gain by seeking opportunities provided by distance education. For example, getting to know new colleagues, subscribing to on-line libraries, being up-to-date with new inventions in own fields, and etc.

**Conclusion**

Computer-mediated distance education is already in wide use today, and we believe that it will play even a greater role in shaping future education. Current learning model used in high schools follows a totally different philosophy than the one used in distance education. To prepare students for the new model, we presented a transitive course that facilitates smooth transition into distance educational learning model. We suggested suitable subjects that have more than one purpose while transforming students into self-learners. Finally, we define a new role for teachers to play in this new environment.

Managing the Dark Side of Online Courses
While Enlightening Your Online Students

Judith M. Smith, Ph.D.
Vice President, Instructional Development
CertiLearn, Inc.
Herndon, VA, USA
Jsmith@certilearn.com

Abstract: For every online distance education program launched, there have been five online distance education programs that have either failed outright, or have been deemed unprofitable, because they were launched without benefit of prior research. This is what we term the "dark side" of online education -- for every success, there are numerous failures that provide important strategic learning lessons as we move towards a more technologically enhanced world of education.

Introduction

Nonprofit associations are considering new ways of using educational technology to provide continuing professional development to their memberships. Most association professionals have reported a desire to increase their use of technology to meet continuing education requirements, as necessary to maintain professional certification, but either cannot find the time or the funds (simultaneously) to make this a reality. The more critical problem is that the majority of associations neither have the staff nor the technological expertise to provide online education themselves. While associations understand that online education offers many opportunities to correct this situation; from a managerial aspect, they are unable to work with the variability and continuous change, and the management of "the unexpected" that is online technology at present. This uncertainty is defined as "the dark side" of online education. Much of the uncertainty originates from the association staff and members': lack of experience with online learning; lack of understanding how to migrate a course from traditional to nontraditional platforms; and, lack of understanding how to facilitate a course in the online environment.

These are critical issues, since they impact the association members' persistence in online education. Without a clear understanding of how to develop, manage, and maintain online courses, many association education programs have either failed outright or have been deemed untenable for long-term investment or development. This study attempts to identify those issues that lead to the "dark side" of online education for associations, and provide guidance for associations implementing online education programs. It is in understanding how to best manage the tool of online learning, and how association professionals can be trained to manage online education that can illuminate the dark side, and provide good learning opportunities for adult learners.

The Study

The research examines how educational programs are developed and staffed, starting with the traditional program, and how that program is selected, developed, and maintained for deployment via nontraditional technology. The research also explores how staffing and administration is impacted across the association, since most of these non-profit groups consist of a small staff team (under 50), who are often responsible for performing multiple professional duties simultaneously. The study also explores how associations evaluate online platforms for deploying their online programs, and most importantly, how the associations prepare both the internal staff and the external adult learner-user for online education. Finally, the research explores the impact of new nontraditional learning on existing traditional learning, the motivations to develop association online education as an option, and how online education fits into the
overall business strategy of the association. This study is in progress and expected to continue over the next several years as online learning technology evolves into a viable learning platform.

Findings

At present, the findings are inconclusive, because the research is ongoing. However, a overview of current data on the associations reveals the main issues at the heart of the "dark side" with association online education is a lack of understanding: how online education fits into the current business model; how online education requires different and various budget requirements than other departments within associations; and, how online education requires a heightened support team (both from the technical and the educational teams).

Conclusions

While any conclusion is considered early at this stage of the research, it is hoped that the specific findings from this project result in the development of guidelines and an assessment tool for associations to use in creating viable online education opportunities and options for their members.

Abstract: This presentation will describe a recently NCA approved online delivery of a graduate teacher education that has been developed to accommodate the needs and interests of K-12 teachers in the field. The surveyed needs and technological capabilities of these teachers will be discussed along with the reflections of their experiences with receiving professional information in a distance learning delivery system. Also, the structure and functioning of these courses will be highlighted along with how they are used to foster ideas among K-12 teachers for using this approach in their own classroom settings.

University teacher education programs must realize that technology-based education is here and is rapidly changing each day. Our intent is to relate how we have met the challenges of recent trends in education suggesting that the demand for information technology-based teaching will grow in the next decade and this technology will change teaching and learning profoundly. It is imperative that our teacher education programs incorporate technological strategies currently being endorsed in public and private schools. Our presentation will not only show how we are utilizing educational technologies in innovative ways for teacher excellence and improving the delivery of our teacher education system to a wider professional audience, but more specifically the reflections of K-12 teachers involved in an online graduate program.

As an introduction to the reflections of K-12 teachers in our online graduate program, it is important to relate how this online program emerged as delivery system for our graduate teacher education program. The following scenario is a case in point. The authors had developed a new on-campus course for the Division of Health, Physical Education and Recreation (HPER) at Emporia State University entitled, Analysis of Teaching/Coaching, which it was felt would be an "attractive and beneficial" offering to teachers in the field. A disappointing enrollment and its cancellation thereof prompted the authors to investigate the potential of various educational technologies in order to see if a different packaging of the course would increase its future enrollment and better serve our mission as a teacher training institution. It was evident that an alternative approach had to be developed for this course and others in our graduate teacher education program to survive.

Surveying and marketing strategies became an important component to the feasibility and type of distance learning approaches applied to an alternative course delivery plan. Initially, a hard copy and online survey assessing the attitudes and opinions of over 200 teachers throughout the state of Kansas was accomplished on the distance learning potential of our graduate and re-certification courses. These results gave us an idea of the types of courses and approaches that teachers would desire. These results have been subsequently reflected in the course evaluations of 40 online courses encompassing the 1996-2000 academic semesters. More recently, the findings of a comprehensive study of online graduate courses in HPER at Emporia State University, Virginia Polytechnic University, and University of Texas – Permian Basin reinforced the above findings. The following reflections are the combined findings of the above surveys.
Reflections

**Flexibility of courses.** For the most part, teachers liked the concept of "anytime, anywhere" course offerings and course work fitting into their work/personal schedules. One problematic issue some teachers expressed, was recognizing virtual vs. real time in getting work done. In other words, since I don't have to be somewhere at a certain time; then, I will just do it later.

**Time/Travel management.** With busy professional schedules, the idea of not having to fit in driving time and away time from families was an attractive option for taking classes.

**Development of new technology skills.** In order to participate in a distance learning class, various technology skills of word processing, class web site navigation, internet searches, emailing, and forum discussions actually had to be learned. Class evaluations not only showed that improvement in technology skills was a by-product of the online class; but these skills were being used by teachers in other professional endeavors.

**Well-structured courses.** Because of the nature and necessity of distance courses being displayed ahead of time and assignments clearly spelled out, teachers liked the fact that courses were well-structured, many resources were readily available and accessible online. The downside for some teachers with this format was that unclear, confusing instructions and "glitches" in the technology could restrict access to certain resources for completion of assignments.

**All allowed to participate.** Two dominate issues arose regarding the use of forum discussions and live chats. As a whole, forum discussions received favorable reactions in that they allowed everyone to express an opinion on a topic, not just dominate class members as in many on-site classes. There were some individuals who did desire to have the face-to-face interactions, which is not available in most distance learning classes.

**Diverse student populations.** The very nature of a distance class allows teachers from literally all over the nation and world to be in class together. This component was an impressive one for teachers. It allowed them to meet not only new professionals, but to become enlightened concerning teaching experiences and educational issues of other professionals.

**Writing skills.** Since much of an internet-based class utilizes email, forum discussions and other written activities, teachers expressed improvement in writing skills since many others would be viewing their opinions and their correspondences. Obviously, some students expressed stress and anxiety that their written communications would show a lack of skill and knowledge.

**Instructor/student relationships.** A critical element cited by many teachers was the availability and camaraderie associated with knowing the instructor. Several suggested having a short video clip of the instructor welcoming the class or a portrait picture on a web site as a way of forming an impression of who am I corresponding with or discussion on the forum. Also, virtual office hours and timely email feedback were items that tended to help "personalize" the course and establish that "a real person" was teaching the course. An increase in the number of students per instructor tended to diminish the personal touch student sensed in taking an online class. Any personal activities which highlight and introduce classmates to each other such as student information web pages and/or icebreakers tend to develop stronger intra-class relationships.

**Selected Quotes of K-12 Teachers in Distance Classes**

The following are actual quotes from teachers enrolled in the online graduate masters degree program at Emporia State University. These quotes reflect much of what has been described in the above summation.
“Living in a small rural area with limited educational opportunities, Emporia State University has given me an opportunity to pursue my masters degree in HPER. The courses I have taken have proven to be practical, challenging, and beneficial to me as a physical educator.”

California teacher

“With teaching, coaching, a husband and two small children, I don’t have time to sacrifice a night each week to go to classes. This way, I can work from home when it’s convenient for me. I feel I am getting a quality education.”

Virginia Teacher

“These kinds of courses are wonderful. I live far away from big cities, so I have travel two hours to get a class. I would not have had the opportunity to increase my knowledge in my profession without the Emporia State University program.”

Argentina, South America teacher

“This program allows me to work towards a masters degree while holding down a full-time job half way across the country from the campus. I was surprised how much I could learn through online courses.”

Alaska teacher

“The main problem with online instruction is that I don’t receive immediate feedback from the student/professors when we talk about an issue. Sometimes meanings can be misconstrued because it’s hard to tell “how” somebody is saying something . . .”

Anonymous

“Less interaction with instructors.”

Anonymous

“I feel the quality of VA tech’s distance learning program makes it a much stronger program than the traditional college program that I took 8 years ago. I feel that I have learned much more appropriate skills to make me a better distance educator.

Anonymous

Conclusions

Innovative teaching techniques must be developed to keep up with the flux of information. Technology is impacting research, classroom teaching, and distance education in all fields of education. Distance learning delivery systems have become a focus of educational programs, not only at the university level but in the K-12 setting as well. We in higher education need continue to explore various distance learning technologies to better serve our mission of teacher training in the “new” millennium.
Abstract: This paper is a report based on the design, pilot study and teaching of on-line courses, using the WebCT program as a method of course instruction and delivery. The courses involved in the study were freshmen/sophomore computer literacy courses, one being concepts-based, the other more hands-on type involving computer applications. Based on the differences with respect to requirements of the students, desired learning outcomes and delivery method, the study showed more success in one type of on-line course versus the other. Success was measured by comparison of final grades in the on-line courses with those of face-to-face classes being conducted at the same time. Both on-line courses required an alteration in teaching methods to suit the more technology-based environment.

Introduction

"The demand for educators to respond to the needs of diverse students is no longer an issue for the future" (Armstrong, 2000, Timm, 2000). Changes such as our student population (age, ethnicity, country of origin), instructional methodologies and pedagogy and physical location to name a few are issues that need to be addressed. As educators, it is our job to ensure that learning continues to be a positive experience, irrespective of the changes that are at hand. The role of the teacher is also changing to more of a facilitator rather than instructor. There has been an influx of new technologies available to us as educators to act as tools for enhancing learning, and therefore add more to the changes that are already taking place. "Technological advances have given teachers a number of classroom management and instructional tools" (Jones, 2000). In addressing the issue of technology, a part of the title of the paper comes to mind "from inches to miles". The whole concept of this statement centers on the fact that in embracing any form of technology in the classroom, there are varying degrees to which one can incorporate it into the learning process. Technology should be viewed as a tool, such as a chalkboard and chalk would be looked at, and definitely not a substitute for a teacher. It introduces new methods of teaching rather than teaching new concepts or ideas. Certainly there is additional knowledge involved with learning a new skill, but the content and context of the material should be the same. Due to the influx of these new technologies, some of us as educators have raised our expectations of students with respect to familiarity with computers. Certainly, most institutions today, are requiring certain competency with respect to technology, of our students, by introducing some form of computer literacy course or test before being able to graduate from our schools. There are a vast number of technology tools available for the educator today. Physical hardware which assists in the classroom could start with a simple computer attached to an overhead projector which would take the place of transparencies and an overhead projector, to a "smart classroom", with sophisticated "smart boards", digital video disk players, overhead projectors etc. Software programs could range form a simple word processor, or e-mail program, to web-based educational tools that let you create distance-learning courses to deliver to your students outside of the traditional classroom. The selection of the integration of technology will depend on various factors unique to each individual as an educator, as well as each institution. There are also certain basic methodologies to follow if you will be integrating the technology for the first time, versus approaching the "miles", where you might have been somewhat familiar with certain programs and physical hardware. It will take time, effort and a lot of implementation of plans B and C, when technology might just fail us. The most important thing is that these new technologies should in no way change our overall content and objectives of our courses. The material being taught should remain the same irrespective of our methods. Certain methodologies will inevitably change with respect to how our objectives are achieved. We also have to find some way of measuring our outcomes and comparing this with the traditional way of doing things. A process has to go through a series of refinement. The fact that this does not work the first, second or third time doesn't mean that it might not work the fourth time.
Also, there is always room for improvement, so we should strive to improve the process from time to time. "Distance education is first and foremost a movement that sought not so much to challenge or change the structure of higher learning, but to extend the traditional university and to overcome its inherent problems of scarcity and exclusivity" (Matthews, 2000). There are currently more options available to the student since the idea of distance learning emerged. "Unless you've been asleep for the past five years or so, you are well aware that more and more colleges and universities are turning to the euphemistically-phrased "distance learning," as a way to increase student enrollment and meet the public's demand for convenient access to higher education" (Goodson, 1997).

Preparation

Before efforts could get underway to start developing a distance-learning course for web delivery, an entire summer was dedicated to training and developing the skills necessary to undertake such a job. Participants had to be dedicated and committed from start to end and were given an incentive of a distance education fellowship grant. There were varying degrees of technology experience of the participants, so all courses were broken into at least two levels, basic and advanced, so that all participants were reached irrespective of their skill level. Topics covered varied from e-mail, file management, web authoring to HTML coding and WebCT. At the end of the summer, participants were expected to follow a time-line for the upcoming semester, to start developing their on-line course(s). A part of the timeline involved actually using the on-line course material as a pilot in the face-to-face traditional classroom environment, so that changes could be made and students could contribute to the future learning process of fellow students.

Pilot Study

The software program used to develop these on-line courses was WebCT. The courses that I chose to develop were both computer literacy courses, one being concepts based, the other more hands-on with respect to the computer. I chose to conduct the pilot study using two face-to-face classes that were the same courses as the ones being developed for on-line delivery as well as a business information course, being taught the very same semester. Both computer literacy courses were weighed one credit hour each, and the business course, three semester credit hours. In all three cases, the students had to be instructed as to how to use the program, before they felt comfortable enough to attempt the exercises that were required of them, using this program. Even though we were using this program in addition to having class meetings, students were required to attend the face-to-face class. Students were rated on the discussions and assignments given in class, and also those conducted in the WebCT program. As far as student's reaction to this technology, certain features were more popular than others, such as being able to constantly view your progress. Some students did not see it necessary to go into the on-line portion of the course after a time, as well as some stayed dedicated to the end. The business class however, continued using the program in the absence of their teacher, who went out on maternity leave for six weeks during the semester. On my return at the end of the six weeks, we continued classes as if I had never been away, since they were able to continue with discussions, assignments and communicated constantly with me via e-mail and the bulletin board feature of the program. At the end of the semester, the expected results based on students' grades were within the same numerical ranges when compared with other past courses, for all three pilot courses. There were also changes that were due to errors in data and also refinement of assignments and methodologies that were implemented, at the end of the pilot study.

On-line Implementation

Students were required to attend a face-to-face orientation where students got a chance to meet faculty, and requirements for these courses were highlighted. The distance education program ensured that all students' hardware and software were compatible with the distance-learning environment by requiring them to do a demo course, before actually starting their courses. Teachers in the distance-learning program could choose a separate text from those being used in the equivalent face-to-face classes. I chose to use the same text in both instances, primarily because of me being very familiar with it having taught the courses on several occasions. Each on-line course was conducted separately, one during the first half semester, the other second half. The concepts course was the first to be implemented, followed by the hands-on course. The first course started off with few incidents such as unavailability of textbooks, students not knowing where to begin or what to expect, not unlike the issues
of a face-to-face class. The communication with the students was initiated by the students, as another requirement for them is to e-mail their instructor in order to commence the course. However, if a student was listed as enrolled in the course, but did not initiate communication by the end of the first week, then they were contacted via telephone. The students’ login information and password was e-mailed back to them so the course could begin.

The kinds of assignments that were conducted in class were timed on-line quizzes and exams, group discussions, textbook assignments and group projects. There were on-line office hours for the students to interact with the instructor, and the hours included late evening and a weekend day to assist students who could not have been able to participate had it been during the week only or during regular business hours. Within the class, there was a wealth of diversity due to age, physical wellness, country and state of residence, which would not be possible had this been a face-to-face course. Students could continue the process of learning uninterrupted, despite certain challenges that they faced. This served as a learning experience not only for me as an instructor, but also for the other students in the class, who had never had such an exposure to the diversity of their fellow classmates. Collaborative work was encouraged and assigned by the instructor, which led to students studying and collaborating outside the realm of the class. The grading scheme on the other hand was weighed differently from that of a face-to-face course. More emphasis was placed on the individual assignments rather than the on-line quizzes and exams, which were weighed, less than in a face-to-face class. Students that excelled in these classes were the ones who handed in assignments in a timely and consistent manner. The outcome measured by the students’ performance when compared with those of the face-to-face classes, did not vary much in terms of numerical grades. I am currently tracking the results of the on-line class outcomes versus the face-to-face classes, and there is not enough data collected for me to report any conclusions in this area based on my experiences.

Conclusion
