The purpose of this research project was to determine if online learning could be adapted to individual learning styles and if this made a difference in the standardized testing scores of Internet students. An overview is provided of current learning theories, including the four stages of learning (exposure, guided learning, independent, mastery) and learning styles. Accepted online curriculum design is described, including: (1) course format; (2) four elements of online learning (instructor/teacher, student, curriculum, and infrastructure/technology); (3) characteristics of technology; (4) strengths and weaknesses of online learning; (5) learning activities that different learners respond well or poorly to; (6) adapting curriculum to learning styles; (7) constructivist learning environment, applying the constructivist model to the online classroom; (8) applying Kolb's experiential learning model to the online classroom; (9) considerations in instructional planning; (10) considerations in the construction of the learning environment; (11) considerations in selection of teaching methods; (12) and considerations in evaluation administration. Components of the ideal online course are summarized. Statistics on standardized test scores of online high school students are appended. (MES)
Adapting Online Education to Different Learning Styles

Key Words: online education, homeschoolers versus traditional, standardized testing

Abstract
The purpose of this research project was to determine if online learning could be adapted to individual learning styles and if that made a difference in the standardized testing scores of Internet students. We then compared those scores to those of traditional students. It has clearly been shown that online learning is adaptive, whereas traditional classrooms are not always adaptable. Our goal was to establish whether online learning and adaptive learning styles made a difference in test scores, and if so, could that knowledge be utilized in the traditional classroom? The answer was yes to both questions.

Current Learning Theories
There is a wealth of information, both on the shelves of libraries on the Internet, which addresses the different learning theories that have been suggested over the past 3 or 4 decades. Those most often quoted are Kolb and Gardner.

While most theorists disagree, or come from a different approach, about learning styles, it is generally accepted that there are basically four stages of learning. They are:

1. **Exposure Stage**—the first time a concept (such as long division) is new to us.
2. **Guided Learning Stage**—when we still can’t do the problems without help. This is where most people get stuck.
3. **Independent Stage**—With review, guidance and hard work we reach stage 3.
4. **Mastery Stage**—Comes with more practice, final goal of education

Regardless of how a student learns, the stages remain the same. It is up to the instructor and the curriculum content developer to assist the student in getting past the guided learning stage to become an independent learner, thus building on newly gained learning concepts or skills.

It has also been shown through repeated studies that students learn in different ways, or through a combination of different ways, thus supporting Smith and Kolb’s learning cycle concept.

Students learn:

- 10% of what they read
- 20% of what they hear
- 30% of what they see
- 50% of what the see & hear
- 70% of what they say
- 90% of what they say and do

Based on what we have learned, we conclude that students need:

- A variety of teaching strategies
- A variety of learning paths
- Activities which they can read, visualize, hear, say and do
- Instructional guidance leading to independence
- Ability to work on their own with appropriate assessment methods
- Appropriate tools and technology for independent and guided study

**Review of Learning Styles**

As we have already discussed there is a wealth of information about different learning styles and theories. While many of these theories are methodologies instead of styles it is difficult to relate one to the other, at times. Therefore, we have presented a chart, which shows the relationships a little more clearly, thus appealing to the visual learner!

Another part of employing learning strategies and theories is to incorporate Bloom's Taxonomy. Following the 1948 Convention of the American Psychological Association, Benjamin Bloom took the lead in formulating a classification of "the goals of the educational process". Three "domains" of educational activities were identified. The first of these, named the Cognitive Domain, involves knowledge and the development of intellectual attitudes and skills. The other domains are the Affective Domain and the Psychomotor Domain, which we are not concerned with.

Bloom and his co-workers eventually established a hierarchy of educational objectives, which is generally referred to as Bloom's Taxonomy. This taxonomy attempts to divide cognitive objectives into subdivisions ranging from the simplest behavior to the most complex. It is important to realize that the divisions outlined are not absolutes and that other systems or hierarchies have been devised. However, Bloom's taxonomy is the easiest to understand and is widely applied.

When writing curriculum for the online classroom, or even teaching in a traditional environment, it is as important as knowing how a teacher teaches, as well as how a student learns. Only by balancing the two of them can educational goals be realized.

There are several good examples of learning style inventories on the Internet that focus on a variety of learning styles. They are:

Accepted Online Curriculum Design

Course Format

Until recently online education has been a hodge-podge of techniques in presenting curriculum content and creating an interactive environment. Most of this has been because instructors are attempted to use traditional methods of teaching in the classroom to teach on the Internet. The web based educational environment does well in presenting material in a visual manner. However, as we know, not all learners are visual learners. In order to apply Kolb’s learning cycle concept, different methodologies need to be integrated into the learning environment.

Current online curriculum design includes:

- Syllabus
- Course Outline
- Readings or Lectures
- Classroom or Threaded Discussion
- Quizzes/Tests/Assessments
- Feedback and Interaction between student and instructor/facilitator through email

While these elements typically represent a traditional classroom and should certainly be included, courses also need to develop learning activities which address different learning styles and to incorporate teaching and learning strategies into each element so that all learning styles are addressed.

Most of the online curriculum today is presented by universities and colleges who are moving into the online environment. Few K-12 schools, although making use of the many resources on the Internet, actually deliver full-content lessons or courses via the Internet to distance learning students.

Because traditional online learning is geared towards the adult learner, it can be assumed that students are aiming for a specific goal (a degree, certificate or grade) and thus adapt their own learning styles to the material delivered. Focus on different learning styles is largely ignored in an attempt to address the largest number of students in order to get a generally acceptable results (a degree, certificate or acceptable grade).

The goal of K-12 education, on the other hand, should be not only to teach basic concepts and material, but also to teach students to maximize their learning style, improve upon other learning styles and develop into a life-long learner who can make the best use of material presented at a later stage in life. In order to do this, K-12 educators have tried for years to incorporate teaching strategies and learning styles in coursework and activities through the use of manipulatives, handouts, visualization aids, videos, films, field trips, etc. When reaching the post-secondary level, many of these teaching concepts go by the wayside in order to accommodate delivering large amount of contents to large amounts of students.

The goal becomes: taking traditional learning style teaching methods employed in the traditional K-12 classroom and applying it to online learning which can then be individualized, not only for the K-12 student, but for adult learners as well.

Four Elements of Online Learning

There are basically four elements of online learning. They are:

1. Instructor/teacher
2. Student
3. Curriculum

4. Infrastructure or Technology

As mentioned before it is important to know not only how the teacher is used to teaching (so that teaching strategies can be employed and methodologies adapted), student learning styles identified so that they may be addressed, and curriculum formatted in an appropriate delivery style to address all learning and teaching styles, but the infrastructure or technology must support the delivery of the content.

Characteristics of Technology

Technology, typically, is able to do the following:

1. control the mode of delivery and presentation rate.
2. control the order of presentation, pace of instruction and selection of learning activities.
3. monitor learning performance, store responses, and conduct assessments.
4. provide simulations that supply learning experiences in a variety of low-cost and risk-free topics.
5. formulate collaborative learning groups by linking the learner to the instructor and to other students for technical and curricular support.
6. allow access to learning resources and assessment materials via the Internet.

There are currently 10 standard functions of technology in distance education. This is not to say that this is the way that technology ‘should’ be used, only that this is the way in which it is ‘traditionally’ employed. Technology is traditionally employed as:

1. the notice board.
2. the public tutorial.
3. the individual project.
4. free flow discussion.
5. the structured seminar.
6. peer counseling.
7. a collective database.
8. group products or projects.
9. community decision-making.
10. inter-community network.

While these functions allow all the elements of the course content to be delivered (syllabus through assessment), the method of delivery and amount of interactivity determines how much of the content and delivery is actually learned and comprehended. Without applying learning styles to the methods in which
these technology functions are carried out, technology is not being used to its fullest extend and learners are not receiving the full benefit of online education.

Strengths and Weaknesses of Online Learning

Due to the way in which traditional content has been applied and delivered via the Internet, certain advantages and disadvantages of online learning have become apparent. Advantages include:

- Learning can take place anywhere
- Learning can take place anytime and at any pace.
- There is a synergy between the learner, instructor and environment.
- High quality dialogue can be maintained because it is not restricted by a traditional classroom or time models.
- The environment can be student centered, in that instructors can focus on an individual's learning styles and issues with greater ease.
- There is great access to a larger variety of quality resources.
- There is a level playing field for all learners, regardless of visual or physical handicap, location or learning schedule.
- Teachers can use creative teaching methods in delivering material.

The disadvantages include:

- Equity and accessibility to technology in that not all students can afford top-of-the-line computers with multi-media accessibility.
- Computer literacy—students have different degrees of familiarity with the computer, Internet and software programs. This can adversely impact their ability to participate to the fullest.
- Limitations of technology—there are some things a computer simply cannot do such as real-life simulations, chemical laboratory experiments, and medical dissections. Visualizations are useful, but not as good as actually 'being there.'
- Lack of essential online qualities—without the necessary direction, teaching strategies and integration of student learning strategies, learning styles cannot be fully utilized and learning is limited.
- Levels of synergy—face-to-face or voice-to-voice contact is still useful to establish synergy, trust and mentor effectiveness.
- Some courses (activity, hands-on subjects) can't be taught online—some topics such as music, physical fitness and art are very difficult to teach online.

Learning Activities Which Different Learners Respond Well and Poorly To:

In order to fully take advantage of online learning, an instructor needs to understand what types of activities learners respond to so that they can apply the same techniques in their course delivery. Some of these which they respond well to and poorly are:

Respond well:

- Activists—respond well to new problems, being thrown in at the deep end, and team work.
- Theorists—interesting concepts, structured situations, and opportunities to question and probe.
- Pragmatists—relevance to real problems, immediate chance to try things out, and experts they can emulate.
- Reflectors—thinking things through, painstaking research, detached observation
Respond poorly to:

- **Activists** respond poorly to passive learning, solitary work, theory, and precise instructions. They would rather take an active part in learning.
- **Theorists**—the lack of apparent context or purpose, ambiguity and uncertainty, doubts about validity creates a lack of basis for learning.
- **Pragmatists**—Abstract theory, lack of practice or clear guidelines, no obvious benefit from learning do not allow pragmatists to apply learning to real-life situations.
- **Reflectors**—Being forced into the limelight, acting without planning, time pressures creates a tense learning environment.

**Adapting Curriculum to Learning Styles**

**Different Approaches to Distance Learning (Online Education)**

Up to recently, there have been two basic approaches to online learning. They are:

1. taking structured, pre-programmed learning materials and creating a “black box” approach where the black box is substitute for the teacher and ‘teaches’ the student.

2. using the computer’s communications functions and creating a “networks” approach which views the computer as a channel of communication between learners and teachers. Teachers teach students and the computers facilitate communications between teachers and students.

While both of these methods may be useful in different circumstances, unless they integrate different approaches to address different learning styles and create a learning cycle, they are still basically ineffective.

**Constructivist Learning Environment**

Lately, the most widely talked about theory has been the Constructivist theory that advocates that the learning process should:

1. provide experience with the knowledge construction process (provide students with the knowledge construction process).

2. provide experience in and appreciation for multiple perspectives (multiple ways to think about and solve problems).

3. embed learning in realistic and relevant context (maintain the authentic context of the learning task).

4. encourage ownership and voice in the learning process (student center learning).

5. embed learning in social experience.

6. encourage the use of multiple modes of representation (Use multiple of presentation).

7. encourage self-awareness of the knowledge construction process. (Encourage metacognitive and activities)
Applying the Constructivist Model to the Online Classroom

While the constructivist theory might be an excellent way of looking at the needs of the learning process, it does not imply a way to translate those goals into the classroom, and especially into the virtual classroom. That is what we will attempt to do, as well as integrate Kolb's Experiential Learning Model to the online classroom.

The Constructivist Model has four basic principles:

1. Learning is an active and engaged process. Learners should be actively involved in activities that are authentic to the environment in which they would be used.

2. Learning is a process of constructing knowledge.

3. Learners function at a metacognitive level, focusing on thinking skills rather than working on the "right answer." Students should generate their own strategies for defining problems and working out solutions. Students gain wisdom through reflection.

4. Learning involves "social negotiation." Students should be able to challenge their thoughts, beliefs, perceptions and existing knowledge by collaboration with others and assisting their cognitive development process.

There are also some basic assumptions of design in the constructivist model, although theorists have not told us how to apply these to the classroom. They are:

1. All knowledge is constructed and all learning is a process of construction.

2. Many worldviews can be constructed; hence there will be multiple perceptions.

3. Knowledge is context dependent, so learning should occur in contexts to which it is relevant.

4. Learning is mediated (and delivered) by tools and signs.

5. Learning is an inherently social-dialogical activity.

6. Learners are distributed, multi-dimensional participants in a socio-cultural process.

7. Knowing 'how' we know is the ultimate human accomplishment.

The first step to applying the constructivist model to the online classroom is to construct the environment. You can do this by:

1. Take basic information derived from a learning needs assessment and convert it into:
   - learning outcomes.
   - information included in the materials.
   - how material is structured.
   - what the target audience understands about the material.
   - how the material might be structured for the target audience.

2. Review the basic description and link the elements to an appropriate instruction or presentation strategy. I:
   - Identify metaphors.
• The outcome would be a formal description such as a design brief to enable the reader to understand the underlying knowledge structures and the way it is proposed to link them conceptually and intuitively.

3. Review material again with the goal of linking the design ideas into a potential interaction structure.

• Create an interactive mock-up of interactive materials using an authoring tool.

Applying Kolb’s Experiential Learning Model to the online classroom:
1. Four processes must be present for learning to occur:
   • Concrete experience—laboratories, field work, observations, trigger films.
   • Reflective observation—logs, journals, brainstorming.
   • Abstract conceptualization—lecture, papers analogies.
   • Active experimentation—simulations, case study, homework.

2. Learning is more than just environment:
   • It includes active participation in the learning process and “perception of the learning event through concrete experience (sensing and feeling) or abstract conceptualization (thinking and analyzing).

There are also some things that you need to consider in instructional planning:
1. The Learner as a User
   • Consider Learning Styles
   • The range and extent of user interaction

2. Design Constraints
   • Information and Visual Design
   • Access—Navigation
   • Interactivity and Control
   • Motivation

3. Audience analysis—Use appropriate cognitive style instruments to measure and identify the student’s cognitive styles
   • Kolb’s inventory—too laden with jargon and hard to answer
   • Myers-Briggs focus on personality rather learning style diminished effectiveness
   • Solomon’s 28 questions were easy to answer

4. Terminal objectives
   • Should focus on students’ preferred cognitive styles as well as the nonpreferred cognitive styles.

5. Instructional preparation
   • Instructor should match cognitive styles and instructional contents, methods and styles.
Things to consider in the construction of the learning environment:

6. Online contact
   - Construct a supportive environment and provide timely online contact and assistance to all students
   - Online peer contact
   - Online contact between teacher and students

7. Diversified Learning Styles
   - Theory based learning to 'assimilators'
   - Application-based learning to 'accommodators'
   - Individualized learning to 'field independent' students
   - Cooperative learning to 'field dependent' students.

Things to consider in selection of teaching methods:

8. Match the instructional material with cognitive styles
   - Match the type of content with verbal-visual styles
     - Verbal versions of pictorial and diagrammatic material to verbalizers
     - Verbal material to convert to pictorial form and supplied with concrete analogies of abstract ideas to the visualizers

9. Matching the teaching styles with cognitive styles
   - Match the instructional strategy with field dependence-independence style—both cooperative and individualized learning
   - Match the layout of materials with holist-analytic styles—provide holist view and diagrammatic materials such as tables and tree diagrams
   - Match the conceptual structure with holist-analytic style—identify the parts and structure of the material provide a picture of the whole thing
   - Match the choice of presentation mode with sensory preference—written material to verbalizers, pictorial presentation to visualizers and include multiple modes of presentation such as visual, verbal and auditory imagery.
   - Match social preferences with verbal-imagery style—provide lively, outgoing and stimulating presentations to verbalizers and less bothered tasks about a dynamic presentation to imagers.
   - Match teaching aids with hemispheric preference—a combination of various instructional design, teaching techniques, and modes of presentation, such as computer based multimedia presentation, drawings, transparencies, videotapes, lectures and discussions.

When Considering Evaluation Administration:

1. Assessment—should cover the entire course or lesson
   - Contents of the Assessment
     - Knowledge
     - Comprehension
     - Application
     - Analysis
     - Synthesis
     - Evaluation
• Different Assessment Tools
  • Regular assignments
  • Individual or group projects
  • Online or in-class quizzes
  • Take-home exams
• Content of the Assessment Tools
  • Fill in the blank
  • Multiple-choice questions
  • Identification of terms
  • Variety of short answer and essay questions
  • Writing assignments
• In Addition
  • Teachers should provide appropriate hints or
  • Diagrams, tables, and verbal description for different assessment instruments

2. Feedback

  • Timely feedback
  • Primarily positive and encouraging

The "Ideal" Online Course

In conclusion, if an institution or instructor has incorporated adaptive teaching methodologies and made the best use of the curriculum and technology, an "ideal" online course would include the following:

1. **Full Content Courses**—It should cover the same content that a traditional course would include and should either be text-based, or cover the same content as nationally accepted textbooks such as Prentice Hall, Holt Rinehart and Winston.

2. **Student Learning Objectives which use Bloom's Taxonomy**—Each lesson plan should include student learning objectives which cover the goals and objectives of that particular lesson. They should include Bloom's Taxonomy words at all 6 levels in order to encourage and build upon the learning cycle. They should also include objectives which focus on all the different learning styles; visual, auditory and kinesthetic/tactile.

3. **Teacher Strategies which address all learning styles**—Teacher strategies should be included with each lesson so that teachers have the opportunity and ability to adapt their teaching styles to individual learners without having to resort to continuous re-education.

4. **Activities that adapt to different learning styles**—Web based interactive activities should be included which address a variety of learning styles. These activities should enhance the lesson content and offer opportunity to further exploration in the content area.

5. **Assessments that cover full content**—Assessments that can be computer graded if possible (short answer and essay are rarely graded unless parsing is included in the technology infrastructure) should be included to cover the entire scope of the lesson. They should also be in a variety of forms (identify and define, true/false, multiple choice, multiple answer, short answer, essay) so that individual learning styles are challenged and so that students are encouraged to build a 'learning cycle.' They should also employ all 6 levels of Bloom's taxonomy so that student's are challenged to think on different levels.
7. **Accreditation by a local or state agency**—Online courses should be offered by an accredited institution that has undergone a peer review process.

8. **Curriculum that can adapt to other state curriculum guidelines**—Course curriculum should be adaptable so that it can include additional learning objectives or activities in order to adapt to differing state curriculum guidelines, if necessary.

9. **Use of technology to its fullest**—Courses should use technology to its fullest for both asynchronous and synchronous learning, email, and multi-media presentations.

10. **Be available online 24/7**—Course content should be available at all times online for student review and access. Students and instructors should also have access to curriculum and technical support, within reason.
Addendum Research Statistics

(All statistics are the result of a 3-year study done by E-School International of Iowa City, Iowa involving a total of 158 students in a 9-12th grade, accredited online curriculum. This was done in conjunction with the Belin & Blank Center for Gifted Education, at the University of Iowa and Intelligent Education, Inc. of Atlanta, Georgia. Standardized test results are taken from the Center for Education Statistics, online database.)
