This document contains 143 papers and innovative sessions, three poster sessions presented at a conference on human resource development (HRD). A program overview, author index, and a keyword index are also included. The papers are grouped by the conference's 42 symposia, which were devoted to the following topics: women's HRD-related issues; workforce diversity; organizational learning and development; workplace learning; job satisfaction; HRD competencies; gender issues in the workplace; global team development; technological change and HRD; self-directed learning; leadership development; management education; knowledge management; workers' basic competencies; transfer of learning; HRD training techniques and strategies; ethics and integrity in HRD; HRD in Asia; career development issues; HRD theory; human capital; organizational change; human resource management issues; HRD graduate education; HRD research issues; adult learning; measurement and research tools; assessment and evaluation modeling; issues in training; workplace issues in human resources; executive development; work ethic and values; recruitment issues in HRD; conflict management; HRD in Africa; HRD in Europe; HRD and ethnic minorities; certification issues; multiple intelligences; productivity issues in HRD; and historical perspectives on HRD. Most of the papers include substantial bibliographies. (AJ)

</tr>
</tbody>
</table>
Symposium 15: Different Ways of Learning
How Engineers Learn In The Face Of Organizational Change
Robert Reardon
How Lesbians Have Learned to Negotiate the Heterosexism of Corporate America
Julie A. Gedro, Ronald M. Cervero and Juanita Johnson-Bailey
Internationalization: Learning Processes in a Greek Manufacturing Group
Pat Sherrr

Symposium 16: Approaches to Research in HRD
HRD, Feminism, and Adult Education: A Foundation for Collaborative Approaches to Research and Practice
Yvonne M. Johnson
Research Paradigms in Human Resource Development Competing Modes of Inquiry
Sujin Kim
Mixed methods use In HRD and AE
Tonette S. Rocco, Linda Bliss, Sue Gallagher and Aixa Perez-Prado

Symposium 17: HRD Effectiveness and Transfer of Training
Factors Affecting Transfer of Training in Thailand
Siriporn Yamnill and Gary N. McLean
Characteristics Explaining HRD Effectiveness
Expanding the Transfer of Training Domain of Structured On-the-Job Training
Chan Lee, Jin Hyuk Kim and Ronald L. Jacobs

Symposium 18: Strategic Human Resource Development
Strategic HR Orientation and Firm Performance In India
Kuldeep Singh
Human Resource Development Issues Emerging from an E-Business Corporate Entrepreneurship Team
Jeffrey S. Lewis and Gary D. Geroy
Transforming Human Resources into a Strategic Player on Campus-From Theory to Practice: A Case Study.
Val M. Berry

Symposium 19: Technology Enabled Learning
Current State of Technology-enabled Learning Programs in Select Federal Government Organizations: A Cast Study of Ten
Letitia A. Combs
Technology-Based Training: A Review of Theory and Literature
Chemin Chu
Recurrent Themes in E-Learning: A Meta-Analysis of Major E-Learning Reports
Consuelo L. Waight, Pedro A. Willging and Tim L. Wentling

Innovative Session 4
Integrating Feminist Research and Practice In The Field of HRD
Laura L. Bierema, Elizabeth Tisdell, Juanita Johnson-Bailey and Julie Gedro

Author Index

Key Word Index
Conference Papers

Symposium 20: HRD In Difficult Times
In Difficult Times: Influences of Attitudes and Expectations Towards Training and Redeployment Opportunities in a Hospital Retraction Programme
Sandra Watson and Jeff Hyman

A Qualitative Study of Nonexempt Employees: Careers or Jobs?
Kimberly S. McDonald, Linda M. Hite, and Brad Gilbreath

Is Worksharing a Better Option for Organization Development?
Steve L. Whatley, Chan Lee and Lisa Moten

Symposium 21: Organization Development
Identification of Key Predictors of Rapid Change Adaptation in a Service Organization
Constantine Kontoghiorghes and Carol Hansen

Research and Theory - Internationalization of Organization Development: Applying Action Research to Transnational Health Organizations
Carol Pavlish

The Design and Development of an Instrument to Measure Organizational Efficacy
James G. Bohn

The Relationship of Individualism and Collectivism to Perceptions of Interpersonal Trust in a Global Consulting Firm
Ghazala Ovaice

Symposium 22: Transfer of Learning
The Effect of Organizational Support, Management Support, and Peer Support on Transfer of Training
Susan E. Cromwell and Judith A. Kolb

The Impact of Workplace Design on Training Transfer
Virginia W. Kupritz and Tharulatha Y. Reddy

Transfer of Learning: How Managers Develop Proficiency
Michael D. Enos and Marijke Kehrhahn

Symposium 23: Life Affirming Work and Social Justice
Doing Good or Doing Well? A Counter-story of Continuing Professional Education (CPE)
Laurel Jeris

The Ambushed Spirit: Peace, Violence, Downsizing, and Implications for HRD
Daniela Truty

Family, Culture and Community Work: A View From the Margins
Phyllis Cunningham, Regina Curry and Mathias Hawkins

Symposium 24: Tools in HRD
Game Theory Methodology in HRD
Thomas J. Chermack and Richard A. Swanson

Scenario Planning: An Examination of Definitions, Dependent Variables, and Support for Development as an HRD Tool
Thomas J. Chermack and Susan A. Lynham

Appreciative Inquiry: Assumptions, Approaches, and Implications for HRD
T. Marshall Egan and Cynthia McLean Lancaster
Symposium 25: Team Based Work
Toward Transformational Learning in Organizations: Effects of Model-II Governing Variables on Perceived Learning in Teams
Blair K. Carruth
Training for Team-Based Work: A Study on the Relation between the Organization of Teamwork and Team Training
Rob F. Poell, Ferd J. van Der Krogt and Ad A. Vermulst
Collaboration in a Virtual Team Environment: A Case Study in Planning the ASTD/AHRD 2001 Future Search Conference
Gary L. May, Teresa J. Carter and Jennifer D. Dewey

Symposium 26: Learning at the Top
Learning at the Top: An Investigation of Nonprofit CEO’s Learning Experiences
John J. Sherlock
The Awareness and Utilization of Emotional Intelligence in Leadership Development as Perceived by HRD Practitioners in the Kansas City ASTD Chapter
Joseph Nantawat Leeamornsiri and Robert C. Schwindt
Moving HRD Beyond “Paint by Numbers”: Aesthetic Epistemology and Arts-Based Learning in Management Education
Nick Nissley

Symposium 27: Work Ethic and Values in HRD
Value Priorities of HRD Scholars and Practitioners
Reid Bates, Hsin Chih Chen and Tim Hatcher
The Development of a Research Instrument to Compare Working Values Across Different Cultures: Based on Hofstede’s VSM Questionnaire
Salwa Yousef Al-Shargawi and Sally Anne Sambrook
An Examination of the Viability of the Work Ethic Construct
Sharon S. Naquin and Elwood F. Holton III
Cost Analysis of E-Learning: A Case Study of a University Program
Tim Wentling and Ji-Hye Park

Symposium 28: Issues of HRD
The Complex Roots of Human Resource Development
Monica Lee
HRD Literature: Where Is It Published?
Larry M. Dooley
Post-Millenial Discourses of Organizational Spirituality: The Critical Role of HRD
Sharon Turnbull

Symposium 29: Learning On The Job
On-the-Job Training in Practice
Marcel R. van der Klink
Professional Crisis Workers: Impact of Repeated Exposure to Human Pain and Destructiveness
Lynn Atkinson-Tovar
The Transfer of Technology of Highly Skilled Foreign Workers for Thai Workers in Thailand
Boon-Anan Phinaitrup

Symposium 30: HRD: Past, Present and Future
Revisiting the New Deal: A Longitudinal Case Study
Judy Pate, Graeme Martin and Jim McGoldrick
R. Wayne Pace, First President of the Academy of Human Resource Development: An Historical Perspective
Heather Hanson and Gary McLean
HRD: A Perspective on the Search for New Paradigms in a Time of Crisis
Ross E. Azevedo and Gary N. McLean
Symposium 31: Cost Analysis, Evaluation and Feedback
Training Evaluation with 360-Degree Feedback
Froukje A. Jellema
Theory-driven Evaluation: An Alternative
Katie Robertson
Creation and Utilization of Evaluative Information for Organizational Learning
Youngsook Song
The Effects of Performance Feedback upon Small Businesses: A Literature Review
Sonji Lee, Karen K. Yarrish and Patricia Bederman Miller

Symposium 32: Recruitment and Training
College Choice: The State of Marketing and Effective Student Recruitment Strategies
Fredrick Nafukho and Michael F. Burnett
The Perceived Influence of IT Industry-Sponsored Credentials on Recruitment and Training: An Employer and Employee Perspective
Kenneth R. Bartlett, T. Marshall Egan, Minu Ipe, Sujin Kim and Yuwen Liu
The Role of Training and Development in Newspaper Recruitment Advertisements
Kenneth R. Bartlett and Harriett R. Porter

Innovative Session 5
Recruiting and Developing HRDQ Reviewers: Why You Should Do It and What You Should Look For
Christine Squillac, Darlene F. Russ-Eft, Timothy G. Hatcher, Tonette S. Rocco and Baiyin Yang

Innovative Session 6
Design, Demand, Development, and Desire: A Symposium on the Discourses of Workplace Learning
John M. Dirkx, Richard A. Swanson, Karen E. Watkins and Maria Cseh

Symposium 33: Conflict Management and Decision Making
Two Approaches to Conflict Management in Teams: A Case Studies
Mychal Coleman and Gary N. McLean
A Force-Field Analysis of Factors Affecting Men and Women Choosing to Become Professional Pilots
Steven L. Anderson and David J. Pucel
Decision-Making Processes in Novice and Expert Airplane Pilots
Edward L. Deitch and Albert K. Wiswell

Symposium 34: Learning Organization
Leading the Learning Organization
James R. Johnson
Bella Ya-Hui Lien, Baiyin Yang and Mingfei Li
Our Two-Tiered Learning Organizations: Investigating the Knowledge Divide in Work-Related Learning
Thomas S. Westbrook and James R. Veale

Symposium 35: Adult Learning and HRD
Adult Learning Principles and Concepts in the Workplace: Implications for Training in HRD
Margot B. Weinstein
The Legacy of Malcolm Knowles: Studying Andragogy Andragogically
Mary Boudreaux, Thomas J. Chermack, Janis Lowe, Lynda Wilson and Elwood F. Holton
Facilitating Learning with Graduate Students in Human Resource Development
Barbara J. Daley
Symposium 36: Cross-Cultural HRD
Determinants of Supply of Technical Training Opportunities or Capital Development in Kenya
Moses Waithanji Ngware and Fredrick Mayia Nafukho
Dancing with the Cherokee: Reflections on Learning from the 2001 Globalization
Pre-Conference
Theresa J. Kraemer, and Darren C. Short
Training Expenditures and Practices: Findings from the Netherlands

Symposium 37: Issues in HRM
Employability by Sector of Industry: Taking Account of Supply and Demand Characteristics
Andries de Grip, Jasper B. van Loo and Jos M. A. F. Sanders
Performance Improvement for Teacher Selection: A Holistic Approach to HRD Interventions
Kiyoe Harada and Jeffry S. Bowman
Employment Retention and Advancement Among Post-Welfare Participants in Wisconsin: Insights from W-2 Agency Representatives and Employers
Mary V. Alfred and Larry G. Martin
Multi-Source Feedback Appraisal in Two Types of Organizational Structures: How Self, Supervisor and Other Ratings Differ
Karen K. Yarrish and Judith A. Kolb

Symposium 38: Key Skills and Competencies
Career Related Competencies
Marinka A.C.T. Kuypers
Project Management Competencies of HRD Professionals: A Literature Review
Charlotte M. Nitardy and Gary N. McLean
The Determination of Key Skills from an Economic Perspective
Jasper B. van Loo and Bert Toolsema

Innovative Session 7
Critical Thinking in HRD: A Panel Led Discussion
Carole Elliott and Sharon Turnbull

Symposium 39: Standards and Certification
Implementing Management Standards in the UK
Jonathan Winterton and Ruth Winterton
The Applicability of AHRD Ethics Standards Internationally
Lisa A. Garrett and Gary N. McLean
Nature and Impact of ISO Certification on Training and Development Activities on Singapore Organizations
Hesan A. Quazi and Ronald L. Jacobs

Symposium 40: Emotional Intelligence, Identity Salience, and Metaphors
Applying Client and Consultant Generated Metaphors in HRD: Lessons from Psychotherapy
Darren Short
Emotional Intelligence: Review and Recommendations for Human Resource Development Research and Theory
Lisa A. Weinberger
Toward A More Harmonized View of Emotion Management: The Influence of Identity Salience
C. Leanne Wells and Jamie L. Callahan
Symposium 41: Online Learning
An Instructional Strategy Framework for Online Learning Environments
Scott D. Johnson and Steven R. Aragon
Using Online Learning to Meet Workforce Demand: A Case Study of Stakeholder Influence
Angela D. Benson
Models for Human Resource Development Online Programs
Phoebe E. Lenear and Scott D. Johnson

Innovative Session 8
Applying Metaphor in HRD Research and Practice
Darren C. Short, Alexander Ardichvili, Barbara J. Daley, Erica Kalata, Theresa J. Kraemer, K. Peter Kuchinke and Verna J. Willis

Innovative Session 9
Managing Culture in the E-Workplace: The Practitioners' Perspectives
Catherine Marie Sleezer, Cathy Bolton McCullough and Roger L. Cude

Symposium 42: Performance, Productivity and Continuous Improvement
Investigating the Association Between Productivity and Quality Performance in Two Manufacturing Settings
Constantine Kontoghiorghes and Robert Gudgel
Tri-Dimensional Social Support from Supervisor and Multilevel Performance in Governmental Units in Thailand
Duchduen Bhanthumnavin
Continuous Improvement through TQM: A Case Study in Rhetoric
John Stuart Walton and Prabhjot K. Basra
An Analysis of Factors Associated with Research Productivity of Human Resource Development Faculty
Heather Williams, James E. Bartlett II, Joe W. Kotrlik and Chadwick Higgins

Posters
Intrinsic and Extrinsic Work Values: Implications For The Incoming Air Force Officer Workforce
Stephanie K. Johnson, Jason J. Davis and Christopher Rate
MBTI: A Tool to Enhance Team Learning
Brenda S. Gardner and Sharon J. Korth
Using Technology to Help Foster Critical Thinking and Reflection in Distance and Classroom Instruction: A Poster Presentation of the “R9” Process
David Ripley

What's in a Name? Human Resource Development and its Core

Wendy E.A. Ruona
University of Georgia

Changing the name of HRD is not the wisest course of action given HRD's current state. Our efforts would be better invested in deeply investigating and drawing out the core commonalities spanning multiple HRD professionals, contexts, and emerging paradigms. A name that would better reflect the theory and practice of the profession requires considerable, multi-pronged, and on-going study of the field's history, philosophical paradigms, current roles, and future trends.

Keywords: Defining HRD, Philosophy; Professionalization

It is not uncommon to hear stakeholders, clients, colleagues, and students questioning the efficacy of the term “Human Resource Development”, especially as they begin to understand more about the value that HRD can add. This issue flared during the Future Search Conference (Weisbord & Janoff, 1999) sponsored by ASTD and AHRD (Academy of Human Resource Development) during Summer, 2001 and was identified as a major barrier in thinking about and planning for the future. What was it, really, that we were searching for the future of? Was it HRD? Was it workplace learning and performance? Was it not limited to the workplace or worker? Was it more than learning? Was it really about performance? What about organizational development and the role of OD in HRD? The name was thought to be quite limiting and ambiguous for this expansive yet coherent profession that is capable of doing so much more than what seems implied by the name.

I can hardly disagree. I am a faculty member in a program that is titled “Human Resources & Organizational Development” because we felt the need to better describe our commitment to preparing professionals for a role that is much broader and deeper than that of a traditional trainer. The efficacy of the term HRD does indeed need to be reflected upon. That said, as a researcher in HRD, it is clear to me that changing the name of the profession at this time will do little to answer the questions that distress us. We have no clear alternative name to consider, the current name is historically and socially anchored (and there are immense challenges in doing the same for a new name), and, most importantly, changing the name will likely only propel us into debates that are exactly like those we are having today—wondering and deliberating about what is and is not core to the field and whether this new name reflects it. These themes are all discussed below. This paper then argues that the efforts of HRD professionals would be better invested in taking a firm stand towards professionalization and in increasingly understanding and bounding HRD as a profession. Rather than arguing for the efficacy of the term, this is an argument against renaming the field without a compelling and well-legitimized alternative name that inspires coordinated action.

A Rose By Any Other Name....

Juliet asked Romeo, “What’s in a name?” and went on to express her now infamous reasoning, “that which we call a rose by any word would still smell as sweet” (Shakespeare, 1595). This quote adequately represents the crux of the argument presented below. In this case, a renamed HRD would still be the current HRD we live in today. It would still be an ambiguous, ill-defined field struggling to establish its identity and stalled in issues about what is central to the profession, how the profession adds value to the world, and what HRD professionals do now and need to do in the future.

What to Change It To?

The immediate question that comes to mind when contemplating a name change is quite simply, “to what?” There is widespread agreement in the HRD literature that there is little consensus on the purpose, location, alternative philosophies, and theoretical foundations of the field (Lee, 2001; Garavan, Gunnigle & Morley, 2000; Hatcher, 2000; McGoldrick, Stewart & Watson, 2001; McLean & McLean, 2001; Ruona, 2000b; Weinberger, 1998). Indeed this lack of consensus inspired one of AHRD’s journals, Human Resource Development International, to devote a whole issue (4:3) to the debate around defining and definitions in HRD.

There have been over 20 definitions of HRD forwarded since 1970 when Nadler conceptualized of a field called Human Resource Development. Nadler himself went on to revise his definition of HRD throughout his 30+ years of
advocating for the emerging profession. These definitions vary in their focus, prescriptions, philosophies of development, and beneficiaries (Ruona & Swanson, 1998). Recently, a vocal perspective has emerged that emphasizes the breadth, diversity (McLean & McLean, 2001), multidisciplinary (McGoldrick et al, 2001), and indefinability (Lee, 2001; Mankin, 2001) of the field. These authors point to the dynamic, continuously emerging nature of work required of those we call HRD professionals and advocate a fluid, unfolding meaning of the current name.

What has clearly not emerged is an active and vocal community that is focusing on what these 20+ definitions or the rapidly changing work of HRD professionals have in common over time and context. Ruona & Swanson’s (1998) analysis of definitions identified four major areas of convergence within these many definitions as (1) emphasizing development, (2) advocating multiple interventions (i.e. not just training), (3) focus on individual, and (4) link to work and work-related development. Weinberger (1998) identified 5 dominant theoretical domains that these definitions share: learning, performance improvement, systems theory, economics, and psychology. Grieves & Redman (1999) suggest that four central characteristics of HRD are: (1) the use of HRD as a strategic intervention, (2) emphasizing the active role of line managers, (3) active, proactive, and continual people development/learning, and (4) work-based learning. And, more recently, a study of OD practice found that the most frequently listed activities of 250 OD consultants were eight project focus areas that are often described in the literature (Frey, Schroder, Wheeler & Johnson, 1999).

Even with this handful of pieces and many years of competency and activity surveys such as those produced by ASTD, the HRD scholarly literature has largely focused on the differences and variances in this emerging field. This focus on fostering the pluralism downplays deep investigation of the stable value that HRD professionals contribute and the commonalities that cut across context, organization, and country. As a result, there is no groundswell converging on a shared meaning of HRD, even at its most rudimentary level. And there is certainly no vocal majority that is able to point to the current name and legitimately critique it on empirical, theoretical, or philosophical grounds. Perhaps this is why we cannot find one piece of literature in our journals that explicitly critiques the current title of HRD. In the same vein, there have been no assertions that this term unduly limits the theory and practice of what we understand HRD to be.

**Naming and Classifying: A Social “Taxonomical” View**

We can also take a relevant cue on this issue from the science of classification called Taxonomy. Taxonomy utilizes tools and methods for describing and classifying the diversity of organisms that exist, the most-well known scheme originating from Carl Linnaeus’ classification of plants and animals in the late 1700’s (Cummins, 2002). In the Linnaean system of classification, when a new organism is discovered the first thing to be done is to choose a name. The name must be published and include a description of the new species. It must then be offered up to the scientific community to be further studied and described. This is precisely what has happened in HRD during the past 30+ years. Nadler coined the term “HRD” and he and others published it widely as they attempted to describe it. Descriptions of it were refined over time, and now we find ourselves entertaining the notion that the given name does not adequately reflect what HRD really is.

Here the Law of Priority from the science of classification (Cummins, 2002) has much relevance. It states that the name proposed first has precedence over all subsequently proposed names. The name of a species would only change if those wanting to change it offered a convincing argument for why the name no longer accurately described or categorized the species.

In biology this argument would be built on characteristics that organisms do or do not share and on evolutionary history. In the social world that we are discussing, our charge would be much the same. In the social world one of the truths of practical life is that people naturally classify and organize things to come to grips with and simplify the external world. While the reality of human thought is more complex, it is verifiable that when people are faced with new data they will automatically attempt to compare it to what else they know and cluster that information into similar categories. So, how has HRD come to be known in this socially constructed world during the past 30 years?

The evolutionary history of HRD is complex. In the United States, HRD is often viewed in relation to (and as a sub-set or “child”) of Adult Education and of Vocational Education, two distinctive professions themselves. More over, as the field of HRD has evolved it has been inextricably linked to the diverse (and equally as abstract) field of HR (see Walton, 1999 for an excellent overview on this topic). McGlagon’s (1989) study defined the field in relation to the larger arena of which it was a part and, in so doing, produced the HR Wheel, which identified nine HR practice areas. McGoldrick et al (2001) state “HRD is still in the intellectual shadows of HRM, particularly with respect to HRD research in the UK” (pg. 350). Most importantly, quite often the role of HRD is operationalized in
organizations as a sub-set of a large function called HR and the practical work of HRD professionals greatly overlaps with much of current day HR/HRM practices.

Here in this socially constructed world, it must be accepted that HRD has been understood and institutionalized very much in relation to other disciplines, particularly HR/HRM. Changing the name of the profession will require a lengthy process of reconstructing peoples' understanding of what the field is and how it fits in the world. That demands a strong argument on our part to be able to legitimize the switch. This argument must be based on demonstration of how we are the same and different from each of our relatives. And, most importantly, this argument must be clear and compelling enough to foster a social movement that spreads this new reasoning outward.

*Making Meaning: Pull or Push? It's Still Uphill*

When this issue originally arose at the 2001 Future Search Conference sponsored by ASTD, the proposition was that the name was a constraint and that changing it would serve as a much needed future "pull"—that is, help to pull this ill-defined field towards a new and more shared idea of the future. Immediately I wondered whether changing the name of HRD would really help to address the true challenges facing the profession right now. The answer to that question was unclear and, in fact, the proposition seemed quite dangerous. Changing the name will elicit similar attention that Walton (1999) describes when Personnel changed its name to Human Resources in the 1970's-1980's. It involved, he states, "whether HRM is just a new term or whether it embodies something substantially different" (Walton, 1999, pg. 123). Writers of that time critiqued the name change and wondered whether it was just the same old wine in a new bottle. Which would HRD's name change represent? Old wine repackaged to look new? Or new wine? And, if so, will it be better? It is clear that we have yet to gain any common and widespread understanding of the old HRD wine. To be sure there is even less understanding about any new wine. The field of HRD suffers from a lack of identity and consensus on its key tenants, and changing its name will not remedy this state.

If the name of HRD was to be changed today, without the compelling and well-legitimated alternative as described above, it would actually result in little progress for the profession. Random and reactive assignment of a new term will only confuse the present condition and reflect poorly on a field of theory and practice that has worked for the better part of the last century to gain a foothold. And for what? A new name would likely only propel us into debates that are exactly like those we're having today—wondering and debating about what is and is not core to the field and whether this new name reflects it.

Most importantly, the losses HRD professionals would feel as a result of that decision could be devastating. HRD's founders and professionals have worked tirelessly for credibility, resources, and identity and have been increasingly successful in gaining a foothold in organizations, universities, among other professions, etc... There are now millions of people around the world who earn their livelihood through practicing HRD and millions more who accept the validity of services provided under the auspices of the concept called HRD. The Academy of Human Resource Development was established in 1993 and is thriving, the profession now has four scholarly journals (all with the terms human resource development entwined in their titles), and within the last three years there have been at least four foundational books published that seek to situate HRD and capture specialized knowledge in the field (Gilley & Maycuhich, 1999; McGoldrick, Stewart & Watson, 2002; Swanson & Holton, 2001; Walton, 1999). Changing the name now would ask people of the world to re-situate all of this in their own schemas. We would also surely be questioned as "just another fad" and mistrust would undoubtedly ensue.

Changing the name right now would ask the profession to overcome two extremely risky challenges at the same time. The first we are facing right now—that is, struggling with issues of identity and centrality. Drawing boundaries that both include and exclude people, ideas, and philosophies in an ever-changing world is extremely difficult and, to some extent, goes against the carefree openness of the profession's youth. Too much of this bounding/definitional argument could put the profession at risk of exploding just as its beginning to look and act like a "whole". A change of name, though, is even more risky. This second risk will play out in the eyes and ears of the public-at-large rather than in the halls of our own community. The wiser strategy is for HRD to determine at the most basic level what is core to the field—what's within and outside of our core beliefs, roles, competencies and specialized knowledge. Then, finding a new term that better reflects this will be the easy part!

**The Real Work Ahead**

A title that would better reflect the theory and practice of the field must be grounded in a considerable and multi-pronged study of the field's history, philosophical foundations, current roles, and future trends. Furthermore, the
community of HRD will have to be able to fluently justify why the new term better reflects the domain. Rather than spotlighting this proposition to rename HRD, the community of HRD scholars and practitioners should be focusing on coordinated action that will further and strengthen the profession and its professionals.

Stand for Professionalism

The first and one of the most powerful things that we can each do is take a stand for professionalism. Some in HRD have asserted that the process of professionalization is no more than “a battle for occupational closure and jurisdiction between different professional bodies” (Woodall, 2001, pg. 289) waged by professional associations motivated by “political reasons—in order to patrol their boundaries, maintain their standards, and bolster their power base” (Lee, 2001, pg. 335). This kind of critique focuses heavily on the undeniable shadow side of professionalism without exploring the essence and need for professions in the 21st century.

Current theories of professionalism focus on the “institutional characteristics in which members of an occupation rather than consumers or managers control the work” (Freidson, 2001, pg. 12). Professions evolve out of the belief that the tasks its workers engage in require specialized knowledge and skill—a unique capability that requires a foundation in abstract concepts and formal learning as well as an ample dose of discretion by its professionals. Professionalization is less about defending those tasks from encroachment of competing occupations and more about claiming that the work of these professionals requires something more than everyday knowledge.

It is also fundamentally about professionals being able to optimally apply their specialized knowledge combined with their values and ideologies to do what they know to be best in any given situation, rather than letting others control how that knowledge is applied. Freidson (2001) states that professionalism guards against mere technicians who:

...serve their patrons as freelancers or hired guns. Their loyalties lie only with those who pay them. In light of their shallow specialized knowledge, they may advise their patrons to qualify or modify their choices, but they do not claim the right to make choices for their patrons, to be independent of them, or even to violate their wishes.... The professional ideology of service goes beyond serving others’ choices. Rather it claims a devotion to a transcendent value which infuses its specialization with a larger and putatively higher goal which reaches beyond those that they are supposed to serve. It is because of this claim to strive towards such values that professionals can claim independence and freedom of action rather than mere faithful service. (pg. 122).

If those of us who practice and study HRD believe that we and our colleagues fulfill a unique and valuable need in this world, and that the work we do requires specialized and discretionary knowledge, and, furthermore, that this work is built on an ideology of values that it more than just a simple commodity, then we are obligated to contribute to building the profession in any way that we can.

This necessarily involves identifying, elaborating, refining and growing the body of knowledge and skill underlying our work. It also demands that this specialized work be differentiated from the tasks of other occupations since activity is specialized only in relation to something else. We cannot talk of a single specialization—for one specialization to exist there must be two. They must have some relationship to each other and be defined by comparison (Freidson, 2001). This necessarily entails drawing boundaries and investing our energies in that which is our specialized domain.

The pressure for professionalization must also be considered in light of the “neoentrepreneurialism” world (Leicht & Fennell, 2001) that is emerging and in which our practitioners must execute their work. This world is characterized by (a) flatter organizational hierarchies, (b) growing use of temporary workers hired for specific tasks, (c) extensive use of subcontracting and outsourcing, (d) massive downsizing and replacement of skilled workers, (e) post-unionized bargaining environment, and (f) virtual organizations that exist as technological webs of interaction (Leicht & Fennell, 2001). In this world professionals will be caught up in a complex web of exchanges where stakeholders apply the pressure and whose major interests remain increasing profits (raising revenue and minimizing costs) and increasing accountability. In this world, professionalization is predicted to be the dominant way of organizing work (Leicht & Fennell, 2001), and it is this world in which HRD professionals must contextualize their work and ensure that it is done with the highest of standards and the best practices that we can know or theorize about.

Bound and Understand HRD

It is clear that another key area of work facing HRD is further tackling issues of bounding and defining the field. Many scholarly positions on the topic have been asserted in the literature throughout the past seven years. The
more recent positions vary from a strong call for definition (Grieves & Redman, 1999; Sambrook, 2000) to a refusal to define HRD (Lee, 2001; McGoldrick et al, 2001). What has become increasingly problematic in this on-going discussion is that various people are calling for different levels and types of definitions and all calling their aim "definition", assuming that they are attempting to define the same thing. The scope and bounds of what is being defined in HRD vary greatly and, as a result, comparing definitions is literally comparing apples to oranges.

What is needed in HRD is a rubric for thinking about definition of the field. As a long-time advocate of "definition" myself, I have often been misinterpreted as wanting one way for HRD to be. This is far from where I stand! I do believe however that it would greatly serve the profession to define its primary foci of interest at the most fundamental level and then for various philosophical paradigms within this "system-in-focus", if you will, to surface and articulate their sets of core assumptions, beliefs, methods, tools, and outcomes (or purpose).

A systems perspective (see Ruona, 2001 for an overview) on this will help to explain. A system, according to Joslyn & Turchin (1993) is generally thought to require at least the following: (a) a variety of distinct entities called elements, (b) that these elements are involved in some kind of relation, and (c) that this relation is sufficient to generate a new, distinct entity, at a new, systemic level of analysis. They go on to state:

...thus in the concept of the system we see the unification of many sets of distinctions: the multiplicity of the elements and the singularity of the whole system; the dependence of the stability of the whole on the activity of the relation amongst the entities; the distinction between what is in the system and what is not; and finally the distinction between the whole system and everything else. In the activity of the relation which creates a stable whole, we recognize a closure. (website)

By this definition, HRD can most certainly be viewed as a system. It is a multi-minded entity that is somehow singular in its whole. What is needed is to agree at a high level of conceptualization about what HRD professionals are focusing on and how its various elements in HRD inter-relate to produce that more stable whole. That certainly begins by asking what is it that HRD professionals focus on that Finance, Marketing and other professions do not? HRD is a complex web of activities that is clearly distinguishable from other professions, even the closely related ones (such as HRM and Adult Education) where the boundaries are fuzzier. This emphasizes focusing on the commonalities that dwell in HRD, rather than its diversity. For instance, one would be hard pressed to find any definition or conceptual framework of HRD that does not fundamentally include the notion of learning and people development. Learning and development are both concepts and core values that seem to cut across a multitude of individuals, groups, and emerging schools of thought in HRD.

Within HRD it is also necessary to acknowledge that there are multiple sub-systems that are likely being embodied in paradigms. Since the early-1990’s, for instance, two paradigms that emerged on the HRD scene and have since occupied much attention have centered on whether HRD is for the purpose of improving performance or for learning (Swanson, 1995; Watkins & Marsick, 1995). Where this definitional argument got confusing was that for a while it seemed we had to choose between the two. Nothing could be further from the truth depending on how you bound/define HRD at the larger system level. A good definition of HRD as a profession should be broad enough to encompass and foster multiple paradigms, contexts, and mutations as well as be specific enough to identify the commonalities that bind these paradigms and types together and that differentiate the focus of our work (i.e. specialized knowledge) from other professions. This level of definition reinforces the idea that "while we might all construct slightly different definitions and realities of HRD, there does seem to be a degree of coherence" (Sambrook, 2001, pg. 175) and some level of agreement (Stewart & McGoldrick, 1996) about what HRD is. It reinforces the idea that the system of HRD is indeed greater than the sum of its parts.

Each of these sub-systems in HRD must then be expected to surface and articulate their own coherent ideas about the aims of their work and the assumptions that lead them to their desired outcome(s). These systems of thought and action (Ruona & Lynham, 1999) must each be conceptually sound and held up to rigorous standards of consistency. This certainly fits with recent urging for HRD to improve its capacity to theorize on the basis of solid research and surface philosophical and theoretical perspectives (Lynham, 2000; McGoldrick’s et al, 2001). Other authors, too, have consistently called for alternative philosophies driving action to be explicated (Kuchinke, 2000; Ruona, 2000a) to deepen theory and provide the foundations for research and practice. Holton’s (2000) effort to clarify and define the performance paradigm of HRD is an excellent example of just this kind of process. Sambrook’s (2000) identification of three ways of thinking about HRD in today’s organizations also is representative of this kind of thinking. And Ruona’s (2001) reporting demonstrates that perhaps the learning vs. performance debate is not actually the most important difference between two emerging schools of thought in HRD.

Of course, no matter how well depicted, the reality will always be messier than the portrayal, and the boundaries between these various paradigms will play out differently. Each of these various paradigms, for instance, may be carried out in parallel to each other in one organization (Swanson, 1999), and the complexity increases as the
frame widens. Furthermore, HRD professionals are still themselves grappling with what they believe to be true about HRD and are faced with quite compelling alternatives that could be combined in unique ways of their own.

Further complicating this issue is that in this dynamic and socially-constructed world often times one paradigm will take front and center stage and tend to dominate—so much so that it begins to define the whole of HRD to the public-at-large and perhaps even within the profession. It is impossible to tell right now, but many assert that the “performance paradigm” (Holton, 2000) or “strategic HRD” (Walton, 1999; Sambrook, 2000) have become the essence and focus of modern-HRD (Bassi & Van Buren, 1999). We may be able to only know that in hindsight just as Mintzberg (1994) asserts organizations can only know their strategy as a pattern that emerged out of coordinated action.

What is clear from this discussion, though, is that it is vitally important to view this issue of definition as a dynamic process of multiple paradigms emerging, persuading, dominating, and fading while in the process the whole remaining largely stable and more than the sum of its parts. It is also clear that we must suspend asking only the question, “What is HRD?” and begin asking at least a few different questions. For instance, we should be asking:

- What paradigms can be identified in HRD right now?
- What is it that those philosophical schools of thought share in common?
- Which paradigm(s) are currently dominating and which one(s) are emerging or quietly contributing to the larger whole? How is that continuing to shape the whole?

This view of definition focuses more on our commonalities than on our differences, and more on inclusion rather than exclusion. Boundaries of this type will better equip HRD to focus on building a common body of knowledge and will foster discipline in our theorizing by demanding that we articulate the assumptions driving scholarly and practical work within them. This view also reminds us to be ever conscious and respectful of the dynamic and creative tension that emerges from these multiple lenses through which we can view HRD.

Conclusion

Renaming the profession of HRD is not an issue to be taken lightly. Although the notion is not entirely without merit, this paper has aimed to at least raise reasonable doubt that this is not the wisest course of action given HRD’s current state. Rather it has argued that the efforts of HRD scholars and practitioners would be better invested in more deeply investigating the whole and parts of HRD and by drawing out the commonalities that are core to HRD professionals, contexts, and emerging paradigms. Only then will we be better positioned to judge the efficacy of the current name.

If it is to happen, it is clear that the onus will be on those seeking to change the name. They will need to build a case that clearly demonstrates that the current term does not sufficiently capture the essence of the profession or that the term unduly limits the theory and practice of what we understand HRD to be. They will also need to generate a compelling alternative name and be able legitimize it, which, of course, will itself be an act of definition. This brings us to one of the great paradoxes of this debate. Whether the name is changed now or changed later after the due consideration solicited in this paper, definitional issues will still remain. The pay-off in changing it later is keeping this dialogue within our own community rather than risking external credibility. The benefit is also in knowing that, if and when we do change the name, it will be for sound reasons that a majority of HRD professionals believe in and are willing to live everyday—that it will be a name that fosters coordinated action and strengthens the capacity of HRD professionals to carry out excellent practice.

Enhancing the Career Success of Women Faculty: Mentoring as a HRD Initiative in Higher Education

Sharon K. Gibson
University of St. Thomas

Mentoring has been suggested as a strategy to promote gender equity for women faculty and to enhance their career development. This paper explores mentoring of women faculty, focusing on the key dimensions of roles and functions, outcomes, gender, and formal and informal mentorships. The review suggests the need for the HRD profession to assume an integral role in advancing research on mentoring and other career development initiatives for women in higher education.

Keywords: Mentoring, Women Faculty, Career Development

Although women have made significant gains in entering faculty positions over the past two decades, status inequities and disparities in major indicators of professional status—rank, salary, tenure, job satisfaction, and working conditions—continue to exist for academic women across a variety of institutional categories and types. The proportion of women has grown much faster at lower ranks than among senior faculty and, overall, women remain underrepresented in the academic ranks in proportion to their fraction in society (Bentley & Blackburn, 1992; Glazer-Raymo, 1999). In addition, a number of reports suggest that gender discrimination continues to be prevalent in many of our academic institutions. A recent Women in Higher Education publication identified four separate reports of bias against female faculty at Stanford University, noting that in February 1999 the U.S. Department of Labor began investigating complaints by 32 women and minorities, including 15 former and current faculty, who stated that they were denied tenure or promotion or fired because of their gender ("Is Stanford University Hostile," 2000). As noted by Hopkins (1999), a professor of biology at Massachusetts Institute of Technology (MIT), "Together, the messages suggest that gender bias is widespread in academe....At the White House, where I listened to women who work in diverse occupations, I learned that the problem may be universal in the workplace" (p. B5).

In exploring issues facing women in higher education with an objective of shaping a national agenda, the University of Minnesota 'Women's Voices, Women's Lives, Women's Solutions' National Teleconference Program Committee (1999) noted that equity remains an elusive goal, suggesting the need for continued and revitalized activism in the twenty-first century. Although there is recognition of the need to provide support to women in higher education, the culture of academia and the proportionately fewer women in positions of power makes this a more difficult agenda to fulfill. As stated by Johnetta Cole, the first African-American female president of Spelman College, now presidential distinguished Professor of Anthropology, Women's Studies and African American Studies at Emory University:

Mentoring could help, but it’s less available to those who aren’t mainstream white males. The demands on women or minority faculty to mentor are intense. Most do this essential work generously, then find it ignored by those who evaluate them for promotion or tenure. (“Social Change Requires,” 2000, p. 2)

In looking at the institutional practices that influence career opportunities for women in higher education, Watkins, Gillaspie, & Bullard (1996) state that, although more women have been granted entrance to higher education, there are few institutional incentives in place to encourage their long-term success in positions of prestige and authority. In addition, according to the American Faculty Poll, a nationwide survey of 1,512 full-time faculty at two and four year institutions, women reported being less content with their jobs than did men faculty (Sanderson, Phua, & Herda, 2000). Simply put, a recent Women in Higher Education newsletter had the following headline: “Their Jobs Could be Better, Female Profs Report” (2000, p. 20).

Statement of the Problem

The various perspectives in the literature indicate that the experience of women faculty in adjusting to their professional roles is particularly challenging in a system where men occupy the majority of tenured positions and where women have less access to informal information networks. Issues for women in academia span the academic lifecycle, affecting both those new to academia (junior faculty) as well as women in tenured positions. Faculty members often experience a rude awakening upon entrance into the academic environment and the experience of
Mentoring in Higher Education

Theoretical Framework

Although social learning theory represents the theoretical framework for some articles on mentoring in education (Thompson, 1990; St. Clair, 1994), there is more emphasis in the education literature on the conceptual framework provided by adult development theory and on aspects specific to women’s adult and psychological development. Levinson was one of the first adult development theorists to conceptualize the mentoring relationship

Mentoring in Higher Education

Theoretical Framework

Although social learning theory represents the theoretical framework for some articles on mentoring in education (Thompson, 1990; St. Clair, 1994), there is more emphasis in the education literature on the conceptual framework provided by adult development theory and on aspects specific to women’s adult and psychological development. Levinson was one of the first adult development theorists to conceptualize the mentoring relationship
in a classical sense and as crucial to the overall development of the young adult (Levinson, Darrow, Klein, Levinson, & McBee, 1978). Vaillant (1977) supported the importance of mentoring in adult development in his longitudinal study of 95 male Harvard graduates. He found that the most successful men had been both protégés in a mentoring relationship and mentors to others. In Erikson's stages of psychosocial development, mentoring was identified as part of the developmental stage of 'generativity'. In this stage, individuals in mid-adulthood begin to feel a need to provide support and guidance to the next generation (as cited in Bee & Bjorklund, 2000). Other adult development writers such as Sheehy (1976) explored women's life patterns. Sheehy noted that women who had received recognition in their careers had engaged in a mentoring relationship.

In looking at women's adult development, Gilligan (1982) proposed that women's identity development, rather than being independent, should be considered as interdependent. According to Gilligan, relationships and caring are central concepts for women's adult development and that, when women engage in the adult milieu, "the world of relationship emerges and becomes the focus of attention and concern" (p. 167). In discussing women's ways of knowing, Belenky, Clinchy, Goldberger, and Tarule (1986) identified the importance of allowing women's voices to develop and be heard. Kegan (1982) drew from constructive-developmental psychology in describing development as a series of emergences from and relationships with "cultures of embeddedness" (p. 118). These can include parents, families, schools, institutions, and mentors. The culture, then, supports women rooting their identities in their relationships (Kegan, 1982). Specific to women in higher education, Johnsrud (1991) proposed that the orientation of women toward connectedness and interdependence is fundamental to understanding the growth and development of participants in a mentoring relationship.

These perspectives on women's adult and psychological development would suggest that the different orientation of women influences the nature of the mentoring relationship. As noted, the emphasis in this literature was on individual development, with very little focus on issues of organizational effectiveness. However, Johnsrud (1991) proposed that the establishment of mentoring relationships in keeping with these principles could enhance collaboration across the academic environment, and thus has the potential to contribute to both individual and organizational success.

Mentoring Roles and Functions

Mentoring roles and functions in the higher education literature were conceptualized in various ways. In their discussion of administrative mentoring, Anderson and Ramey (1990) described the role functions of educator, sponsor, coach, counselor, and confronter. An educator shares knowledge about the organization; a sponsor widens the protégé's exposure in the organization; a coach is responsible for the protégé's affective, cognitive, and psychomotor skill development; a counselor listens, advises, supports and encourages problem solving; and a confronter helps the protégé with identifying alternatives and consequences. In one of the larger studies of 347 faculty members stratified by rank and gender, Sands, Parson, and Duane (1991) performed a factor analysis on mentoring functions and identified four kinds of mentor roles: the friend (included providing advice and emotional support, participation in social activities, and defense from criticism); the career guide (included collaboration in research and professional networking/visibility); the information source (included providing information about the organization, both formal and informal); and the intellectual guide (included intellectual guidance and feedback). The complexity and multidimensional aspects of mentoring in higher education were apparent based on this research.

A number of authors have addressed the multiple roles of the mentor in the educational setting in supporting women's adult development. Bloom (1995) described the different ways that mentors stand in relationship to protégés (behind, ahead, face-to-face, and beside), positing that learning and human development for women is based in relationships. Similar to Gilligan's (1982) perspective on women's adult development, Bloom described mentoring as an expression of 'care' in helping protégés develop. Based on the work of Kegan (1982), Johnsrud (1991) proposed a conceptual framework for mentoring that incorporates values of affiliation, caring and interdependence. She described three stages of the mentoring process in academia as follows: the dependent stage (where the protégé needs guidance within the academic culture and where it is difficult to distinguish oneself outside of the relationship); the independent stage (characterized by the protégé reclaiming the sense of self as authority and differentiating oneself from the relationship) and finally, the interdependent stage (where there is the potential for both parties to maintain connectedness and separate identities). The roles and stages proposed by these authors were more grounded in the process aspects of the relationship than the functions that the relationship could provide, again supporting the predominant focus on individual development issues.
Outcomes of Mentoring

Studies of mentoring in higher education indicated that support and sponsorship contributed to faculty vitality and career success (Baldwin, 1990; Cameron & Blackburn, 1981; Corcoran & Clark, 1984; Henderson & Welch, 1993) and that the lack of pre-established mentorships and social networks contributed to a maladaptive start in one's academic career (Boice, 1993). However, it was unclear from these studies as to how sponsorship might be conceived as being either different or similar to mentoring. Williams and Blackburn (1988) studied faculty mentoring in eight nursing colleges and found that, of the potential mentoring types of role-specific modeling/teaching, encouraging, organizational socialization, and advocate, only role-specific modeling/teaching was related to the protégé's research productivity. In conceptualizing mentoring of faculty in academia, O'Leary and Mitchell (1990) emphasized the importance of reciprocity of benefits in a mentoring relationship, which would indicate that the relationship needs to be structured so that both mentors and protégés accrue certain benefits. A recent study by Mullen, Van Ast, and Grant (1999) of 165 faculty mentors and 166 faculty protégés supported this concept, in that those mentors who provided vocational and psychosocial functions for protégés also reported receiving greater benefits as mentors. Stalker (1994) also emphasized this notion of reciprocity in academia and discussed the outcomes of career advancement, personal development and professional identification as characteristic of an ideal mentoring relationship in academia from both the perspective of the mentor and protégé.

In their study of 220 agricultural education faculty, Eastman and Williams (1993) found that mentoring was not related to the majority of career development indicators included in the study. However, participants who experienced higher levels of mentoring felt more satisfied with their jobs and career progress. Hill, Bahniuk, & Dobos (1989) studied 224 faculty and also found that mentored faculty experienced increased job satisfaction and communicative support. With respect to performance scores on an academic career success index comprised of income, number of journal articles and book chapters, and faculty rank, these researchers found that both mentored and non-mentored male faculty received higher scores than mentored female faculty and that non-mentored female faculty had the lowest scores. Based on these results, the researchers concluded that while mentoring is helpful to both genders in academia, being male is more helpful in terms of overall career success indicators.

Gender and Mentoring Functions

Although based on the literature on women's adult development one might expect to see differences in mentoring functions in higher education based on gender, the findings of the studies reviewed do not support any strong conclusions. Mullen et al. (1999) found that female faculty mentors reported greater mentoring benefits, but the gender mix of the relationships did not seem to matter. Sands et al. (1991) found no significant differences in the quantity of mentoring experiences of the men and women in their study. However, a study by Noe (1988) of mentors and protégés in a formal mentoring program for educators did show some gender effects with mentors in cross-gender relationships reporting that protégés utilized the relationship more effectively than those in same-gender relationships and that females in general utilized the relationship more effectively than males.

However, factors other than gender may have a greater influence on the efficacy of mentoring relationships in the academic environment. Struthers (1995) studied 165 female professors who had been mentored and found that a key factor related to the utilization of power to support protégés' academic careers was the rank of the professor, regardless of gender. Johsrud (1991) also discussed various problems with traditional mentoring conceptualizations in academia that had more to do with imbalance of power than with gender. These studies indicated that, possibly due to the hierarchy and power structures of academia, the mentor's rank may be an important consideration in mentoring relationships.

A number of articles also addressed the specific needs that people of color, especially African-American women, have in attaining leadership roles in education and in achieving success in academia. Mentoring and the development of personal and professional networks were identified as important in providing personal and emotional support to African-American women faculty and in assisting these faculty with negotiating institutional politics (Bowie, 1995; Peterson, 1990; Reid, 1990).

Informal and Formal Mentorships

Mentoring in past years appeared to have been more informal in higher education, with these relationships predominantly being established based on mutual negotiation between the parties (Sands et al., 1991). A study by Noe (1988) pointed to the difficulty of assessing these programs, due to the varying types of relationships that could be either negotiated or facilitated by the educational institution. In studying the determinants of successful assigned
mentoring relationships, Noe (1988) studied 43 mentors and 139 protégés engaged in a formal mentoring program designed to promote the personal and career development of educators aspiring to attain administrative positions. He found that protégés reported receiving beneficial psychosocial outcomes but limited career functions as a result of participation in the program. He suggested that mentoring relationships that provide both career and psychosocial functions were more reflective of the classical or primary definition of mentoring. These primary relationships were characterized by high levels of commitment on the part of both mentor and protégé and were perceived to have a higher impact on the individual’s personal development. Therefore, according to Noe (1988), assigned mentoring relationships should not be expected to have the same benefits as that of a primary or classical relationship. In addition, those relationships that provided career functions were likely to be beneficial for instrumental reasons but were characterized as less intimate. Noe also noted that there might be individual-level variables not included in the study that could have a potent influence on the success of mentoring relationships, such as the individual’s level of self-efficacy.

Notwithstanding the lack of clarity of research in education on mentoring outcomes of formal and informal relationships, there was a significant amount of literature recommending the establishment of formal mentoring programs in educational settings. A number of articles addressed the establishment of faculty mentoring programs as a component of faculty development (DiLorenzo & Heppner, 1994; Sorcinelli, 1994; St. Clair, 1994). Other articles suggested programs and strategies for mentoring junior faculty (Borisoff, 1997; Henry, Stockdale, Hall, & Denison, 1994), outlined specific mentoring models or standards (Dagenais, 1997; Pistole, 1994), and discussed options for beginning teachers (Abell, Dillon, Hopkins, McInerney, & O’Brien, 1995; Ballantyne, Hansford, & Packer, 1995; Williams, 2001). This literature predominantly focused on illuminating mentor roles and functions and discussed benefits and limitations of these programs. Although potential negatives to mentoring including protégé dependency and inattentiveness, erratic behavior, inconsistencies on the part of the mentor, and lack of mentor competence were discussed by a number of authors (Anderson & Ramsey, 1990; Braun, 1990; Ballantyne et al., 1995), these programs were commonly viewed as having positive outcomes for both the mentor and protégé. However, specifics on program implementation and benefits of these programs tended to be based more on anecdotal information than on formal evaluation data. As St. Clair (1994) notes: “Community college administrators and faculty must realize the importance of documenting and evaluating existing mentoring programs” (p. 32).

Conclusions: Mentoring in Higher Education

The framework for a number of the studies and reviews in higher education was adult development theory, with an emphasis on processes and programs specific to women and minorities. The roles of mentoring in higher education were conceptualized quite broadly and tended to be process-oriented. Much of the literature focused on issues of individual development, with little attention paid to organizational implications such as gender equity or the achievement of organizational performance objectives.

Although there was general agreement that support and sponsorship contributed to faculty success, only a tentative conclusion could be made with respect to mentoring being related to outcomes such as job satisfaction and the various indexes of academic career progress. There was some indication that women utilized the mentoring relationship more effectively than men and may have gained greater benefits; however, a potential key factor to be considered in these relationships was the academic rank of the mentor, irrespective of gender. It was suggested that assigned mentoring relationships may be less reflective of the classical or primary mentorship role and, therefore, may not produce the same breadth of outcomes as those that are informally established. There was a high level of interest in implementing formal mentoring programs as a HRD initiative in higher education settings; however, not much was known about their effectiveness. Although mentoring programs were generally perceived positively, the need for better program evaluation to guide the development of these programs was identified.

Implications and Recommendations for Human Resource Development

Given the identified need to address issues of status and equity for women faculty, the expectations for positive outcomes of mentoring as a HRD initiative in higher education were high. Mentoring was suggested as a development strategy that had the potential to contribute to the ultimate career success of faculty and to assist in their socialization and orientation. In the literature, programs and practices specific to women in the academic environment were emphasized. For women, mentoring was suggested as a strategy to promote gender equity and as a means to enhance career development in the academic institution. Furthermore, mentoring has been noted as a key HRD initiative for women in terms of its role in leveling the playing field (McDonald & Hite, 1998).
However, this review pointed to the lack of clarity in the literature as to how mentoring can be utilized as a human resource development strategy to help women to achieve career success in their academic institutions. In general, the literature base for mentoring in higher education tended to be more conceptual than research-based. There was insufficient, and at times inconclusive, information with respect to certain key dimensions of mentoring in higher education, including outcomes, gender, and the relative efficacy of formal or informal mentorships, to know what exactly to recommend or what types of mentoring are likely to have an impact on issues of status and career progression.

It is important, however, that we not ignore the substantial support that mentoring has from practitioners in the education field. This support from those who wish to utilize this approach as a HRD initiative to promote gender equity/access and to enhance career development of women faculty would suggest the need to focus additional HRD research on this area. Based on the emphasis in the higher education literature on individual development, it seems apparent that there is a great opportunity for the HRD profession to become more engaged in advancing research on mentoring and other career development initiatives in the higher education context. It is likely that the educational institutions for whom these faculty work would also have an interest in the connection of these HRD initiatives to organizational outcomes. In addition, a number of authors describe complicating factors associated with mentoring of women that focus on issues of workplace culture and power relationships (Hansman, 1998; Schramm, 2000), which fall readily within the realm and interests of HRD.

As noted by Mullen, Steffy, and Van Ast (2001) in their study of mentors in the education context, the literature on mentoring is still in its infancy. Given the need to find ways to improve the experience and adjustment of women faculty so as to enhance their likelihood of career success and ultimately, their contribution to organizational success, enhanced integration of HRD research would likely provide beneficial outcomes and support the development of a more inclusive mentoring model for academic women.

Emotions in Women's Career Development: A Merging of Literatures

Rose Opengart
Laura Bierema
University of Georgia

Abstract: A critical review of the literatures of emotional intelligence, emotion work, and women's career development was conducted in order to examine relationships, similarities, and differences between emotions and women's learning and career development. Common themes are identified, future research questions are posed, and implications for women and organizations are drawn.

Keywords: Emotions, Women's Learning, Women's Career Development

Women's career development is affected by the cultural context of the workplace. The workplace has always been, and remains, a male-dominated and male-defined context. Masculine traits help women advance in the workplace. For women to be successful in their careers, they have been required to conform to this male model and emulate the male cultural standards (Bierema, 2000).

Career development theories, developed by and for men, do not effectively depict the nature of women's careers (Schreiber, 1998). The complex, non-linear pattern of women's careers places them in a situation where they have to try to conform in order to be successful within the work context. Developing themselves and their careers in a male-dominated environment requires working within power structures that reproduce the patriarchal status quo and force women to emulate male attributes and traits in order to advance in their careers.

One trait associated with men is that of being non-emotional. Gender differences exist in the expectations and acceptance of emotional expression. It is assumed in our society that women are more emotional than men and women managers have been accused of being "too emotional" (Crampton, 1999, p. 92). Because emotional intelligence and the ability to do emotion work have been cited as critical to success in the workplace (Callahan, 2000; Goleman, 1995; Cherniss, 2000), it is important to examine any relationship between emotions, gender, and career learning and development. There are no research studies that look at this combination of literatures to examine this issue.

Using a theoretical framework of emotional intelligence, emotion work, women's learning and career development literatures presents an opportunity to merge these areas and to understand the impact of emotional intelligence and skillful emotion work on women's career development. Additionally, approaching this research from a feminist perspective is appropriate because this research examines women within the workplace, a traditionally male-oriented context. In order to examine and understand women's behavior within this environment, one must examine prescriptions for feminine and masculine behaviors and consider their development within the context of our patriarchal, masculine society. The feminist perspective therefore allows the researcher to consider the dissonance between prescribed behaviors according to gender and those expected in the organizational context. The purpose of this paper is to review the literatures of emotional intelligence, emotion work, women's learning, and women's career development and examine any relationship between emotions and women's learning and career development.

Research Methodology

The authors conducted a literature review of empirical and research based articles to understand the theoretical and conceptual aspects of emotional intelligence, emotion work, women's learning, and women's career development. Definitions and current knowledge in each field were synthesized, compared and contrasted against each other. This inductive analysis allowed for any conceptual patterns, relationships, and themes between the literatures to be identified and then described. Limitations of this research include the lack of empirical data. This study is limited to literature review and would benefit from a future empirical study. Lastly, both authors are white women who have worked in the corporate context and therefore bring that particular perspective to this paper.

Emotion Literature

The two emotion literatures addressed in this paper include emotional intelligence and emotion work. Definitions of emotional intelligence vary somewhat between authors (see Table 1). Salovey and Mayer's (1990) model views
emotional intelligence as a series of mental abilities including emotional perception, emotional integration or facilitation, emotional understanding, and emotional management. This model includes the capacity for identifying, inputting, and processing information. First comes the capacity to perceive and express feelings. Next, emotions alter cognition and facilitate thought. Emotions are then reasoned with and understood. Lastly, emotions are managed. The authors distinguish between their definition of emotional intelligence as an ability and others' definitions as including personality traits.

Goleman and Cherniss (1998) describe traits of emotional intelligence as having four dimensions: self-awareness, self-management, social awareness and social skills. Self-awareness involves knowing one's internal states, preferences, resources, and intuitions. Self-management involves managing one's internal states, impulses, and resources to facilitate reaching goals. Social awareness is defined as awareness of others' feelings, needs, and concerns. Social skills are defined as adeptness at inducing desirable responses in others (Cherniss, 2000). Bar-On (1997) characterizes emotional intelligence as "an array of noncognitive abilities, competencies, and skills that influence one's ability to succeed in coping with environmental demands and pressures" (p. 14).

Research has also focused on the relationship between emotional intelligence and leadership abilities. Evidence suggests that emotionally intelligent leadership results in improved business performance (Goleman, 2001). McClelland (1998) studied division heads of a global food and beverage company and found that the divisions of the leaders with strengths in emotional intelligence competencies outperformed yearly revenue targets by a margin of 15 to 20 percent. In a 1994 Catholic Health Association study of outstanding leaders in health care, it was found that more effective leaders were more adept at integrating key competencies (Goleman, 2001). Another study indicated that managers with self-awareness, an important aspect of emotional intelligence, are rated as more effective by both superiors and subordinates than those managers without self-awareness (Megerian & Sosik, 1999).

Definitions of emotion work also vary somewhat (see Table 2). Emotion work was defined in Hochschild's seminal work (1983) as the active attempt to change an emotion held by an individual and as the active effort to change or control emotions in oneself or in others in order to meet social guidelines. Morris and Feldman (1996) used the term emotional labor to describe the effort and control necessary for the expression of organizationally desired emotion. However, Hochschild described emotional labor as a term used only when emotion work is being performed as a required part of the job, in exchange for a wage.

Most of the early research on emotion work in the context of organizations is discussed only in terms of organizational control of employee emotion, either by the elimination of, the controlled display of (Domagalski, 1999; Fineman, 1993; Putnam & Mumby, 1993), or the self-management of emotions (Callahan, 2000). The emotion work research has examined how organizations have applied expectations and boundaries for employees' acceptable emotional expression. Methods used to accomplish this include screening and selection, training, off-the-job socialization opportunities, and reward and punishment (Domagalski, 1999). The expression of emotion, once a personal decision, has become a marketplace commodity, with standards and rules dictating how and when emotion should be expressed (Morris & Feldman, 1996). However, emotion work has also been studied as an employee-initiated move serving individuals' purposes and benefiting the employee to assist them in work endeavors and gain increased power and legitimacy (Fabian, 1999; Kipnis & Schmidt, 1983; Lerum, 2000; Rafaeli & Sutton, 1991).

</tr>
</tbody>
</table>

Another aspect of the literature is the gendered nature of emotion work. Women are prepared for and placed in emotionally expressive positions (Parkin, 1996), such as human resources. Wharton (2000) concluded that women's jobs demand more emotion work than do men's while Callahan (2000) described how culture and gender biases cause the need for emotion work. The author found that women continually suppress emotions and evoke unfelt...
emotions regarding their devalued gender role in order to fit in to the culture. Some researchers suggest that emotion requirements function to reproduce structural oppression (Brody, 2000; Parkin, 1996). Socializing men and women to express different emotions serves to maintain polarized gender roles and power and status differences (Brody, 2000). Emotions are controlled by those in power who define what is appropriate, imposing a pathology on emotional expressions that do not fit criteria (Parkin, 1996).

Many researchers have discussed the significance of emotional intelligence and emotion work in the workplace. Cherniss (2000) argued that emotional intelligence contributes to the bottom line in any organization. Goleman (1998) discussed the importance of emotional intelligence over that of traditional cognitive measures of intelligence. Salovey and Mayer (1990) demonstrated quick recovery from emotional situations. Similarly, Salovey, Mayer, Goldman, Turvey, and Palfai (1995) found emotional intelligence to be an indicator of those who can respond flexibly to change. Emotion work has been described as necessary for one's successful job performance (Callahan, 2000; Hochschild, 1979, 1983) as well as an effective tool of social influence (Kipnis et al., 1980; Rafaeli & Sutton, 1991).

The previous sections have defined emotional intelligence and emotion work, and detailed empirical studies of these phenomena. We will now turn to a discussion of women's career development.

Women's Career Development

Women's career development has been dominated by male-oriented theories that inadequately illuminate women's careers. For instance, trait-and-factor theories explain career choice as matching individual ability and interest with a work experience (Holland, 1966, 1985; Parsons, 1909). Trait-factor theories of career development are inappropriate for women because they perpetuate social role and sex stereotyping and assume that women have equal opportunity to explore matches between their personalities and work environments. Super's (1953) influential Life Span, Life Space Theory explains vocational development as a process of making several decisions culminating in career choices representing an implementation of the self-concept. Choices in this model are regarded as successively good matches between the vocational self and the world of work (Swanson and Fouad, 1999). Super recognized five career stages as growth, exploration, establishment, maintenance and disengagement. This model has been highly influential but falters when applied to women because it assumes linear, uninterrupted career trajectories, and ignores the fact that women's careers tend to be non-linear, characterized by interruption as women move in and out of the workforce.

Women began criticizing classical career development models during the 1960's. Today there are calls for career development theory accounting for the experiences of persons from poor families, persons of color and women (Farmer and Associates, 1997). Women's career patterns are complex because of social expectations for them to assume primary care giving and homemaking responsibility. Several forces are shaping women's distinctive career development including juggling multiple roles, the increasing availability of alternative work arrangements, and the eroding (however slight) of structural inequalities (Bierema, 1998; Schreiber, 1998). Women tend to develop occupational qualifications that are easily transferable between jobs to support their discontinuous careers (Edwards, Robinson, Welchman and Woodall, 1999). Although theorists agree that women's careers cannot be adequately explained by traditional theories of career development, there is disagreement about whether existing theories need modification or new ones need to be created (Swanson and Fouad, 1999).

A key learning issue for women at work is forging an identity in a male dominated world. The multiple roles women are expected to play can contradict and confuse identity. Masculine social roles in paid work are valued in the workplace while women's informal roles in relationships and caring for others are devalued (MacRae, 1995). Yet, relationships and caring are important aspects of women's self-identity. The meaning that women attach to their paid labor and the extent to which it is a salient and meaningful component of women's identity has been largely ignored (MacRae, 1995). The devaluation of women's roles in the paid workforce in effect suppresses women's identification with relationship and caring and may cause them to be untrue to themselves in exchange for a paycheck.

Workplaces are social institutions, and thus, mirror the power structures and oppressive forces in society. Organizations are primarily male-dominated and success normally involves emulating the successful (Diekman and
Eagly, 2000; Fagenson, 1990; Maniero, 1994). Hayes and Flannery (2000) suggest that like education, the workplace has hidden curricula that reproduce power structures. Evidence of this assertion is found in many studies suggesting that masculine traits help women advance at work. For instance, women at senior hierarchical levels in organizations scored significantly higher on measures of masculinity scales (Fagenson, 1990). Cejeka and Eagly (2000) explored the role of gender stereotyping in justifying social systems and gendered divisions of labor. They found that feminine personality or physical attributes were thought more essential for success in female-dominated occupations, while masculine personality or physical attributes were thought more essential in male dominated occupations. The masculine roles and personality attributes were also given higher prestige by study participants.

Diekmann and Eagly (2000) conducted several studies to test the dynamism of stereotypes about men and women. They suggest that although women's presence in the workforce has created resistance to the corresponding change in women's roles and characteristics, there is a belief that women's personality, cognitive, and physical attributes will become more like those of men. In turn, these changes will provide greater access to top male-dominated roles and to socialization and training opportunities. In another study, Kolb (1999) found that the sex and personality trait of femininity had no significant effect on leader emergence, but self-confidence, attitude toward leadership, prior leadership experience, and the personality trait of masculinity did. Mainiero (1994) interviewed high-profile executive women and concluded that fast tracking was dependent upon assignment to a high visibility project, demonstration of high performance, attraction of top-level support, display of entrepreneurial initiative, and accurate identification with company values.

Career success is dictated by assuming masculine attributes, stereotyping gender roles, and following a set of “rules” for success. The result of these dynamics is the acculturation of women into male work culture, devaluation of women's gender roles, and deprivation of women's identity. Women's need or desire to buy into the “old boy” network may be explained by either suppression or unawareness of themselves as gendered beings (Bierema, 2000; Caffarella, Clark and Ingram, 1997). Women's uncritical career development not only causes them to adapt to a masculine model, but also prevents them from addressing power differentials or claiming a career on their own terms as women.

However, women in the workplace are in fact influenced by their gendered perspectives and experiences. For example, Egan (1996) considered the effect of epistemology on women’s perceptions of the workplace, themselves and their work with relation to career mentoring. She applied the three epistemological categories of constructivists, proceduralists, and subjectivists as identified by Belenky, Clinchy, Goldberger and Tarule (1986). The author studied 41 women members of American Women in Radio and Television and concluded that mentoring needs depend on the type of knower the woman is.

‘Constructivist knowers’ provide the ideal model for mentoring success through meshing experience with objective reality, functioning with high levels of self-efficacy (viewing oneself as effective), and absorbing learning in all forms. Constructivists are likely to seek mentors in all guises, role models and consultants regardless of age, race, gender or appearance. On the other hand, ‘procedural knowers’ are less likely to seek mentors and to gain from being protégés. They recognize that men are favored in the workplace and view the women ahead of them as antagonists. Egan claims that the ‘subjective knower’ is unlikely to sacrifice relationship for career nor will she envision long term career goals if she has family obligations. She is unlikely to identify high career achieving women as role models and is lowest among the three knowers in self-efficacy. She will usually resist seeking career advice, but will listen to a sponsor or a challenge in recognition of her skills. Subjectivists, concludes Egan, are most likely to gain from formal mentoring programs. Egan’s work, therefore, is a strong reminder that forging an identity in the workplace is not a “one size fits all” concern and that the woman’s developmental level has an impact on her learning at work.

Common Themes

Several themes emerged during our comparative analysis of the literatures. These themes have significant implications for women's career development. The themes include learning and development patterns, career competencies, function of context, role expectations, the role of relationships, power issues, identity development, and issues of voice. Each will be discussed and implications for women, organizations, educators, and researchers will be delineated.

Learning and Development Patterns

The emotion literature tends to be highly linear and women's development literature tends to be non-linear. Emotional intelligence is described as having increasing levels of complexity that appear to follow a certain hierarchical trajectory. The first level in the developmental process is awareness of one's own emotions. This is thought to be a primary component of emotional intelligence, serving as a foundation for the other components
Lane and Schwartz (1987) proposed that emotional awareness, an individual's ability to recognize and describe emotion in oneself and others, is a cognitive skill that develops in a process much like that described by Piaget's stages of cognitive development. In order to progress to the next stage in development, one needs to first be accurately attuned to the self in order to differentiate one's own emotions from those of others (Lane, 2000). Much of the writing on emotional intelligence parallels cognitive development literature.

This linear development process is similar to some of the traditional adult development theories proposed by Perry, Erickson and Lovenger. However, such adult development theories have been criticized for basing their conclusions on empirical studies using only white men. More recent studies of women's development point to a less linear developmental process.

Traditional career development theories also suggest that people have linear, uninterrupted career paths. The theories assume a career progression that continuously builds upon previous experiences. A major shortcoming of these theories, however, is that they were developed by and for men, and they fail to address the complexity and variation that women experience in their career experience. Newer, non-linear women's career theories are emerging (Bierema; Schrieber, 1998) that account for social expectations of women as the primary caregivers and nurturers. These new theories also consider important variables such as age, race, social class, and sexual orientation (Bierema, 1998; Farmer & Associates, 1997; Mott, 1998; Johnson-Bailey & Tisdell, 1998), entrepreneurship (Inman, 1998), and training and development opportunities (Knöke & Isho, 1999; McDonald & Hite, 1998).

The implications for women include seeking career guidance that avoids automatically placing them into career paths or rewarding them for stereotypical female behaviors. Organizations can help by providing this type of career guidance and assistance. Educators need to teach alternative developmental models that apply to women as well as men. Researchers can explore alternative models and study intersection between emotional learning and career development.

Role Expectations

Social and contextual expectations are powerful teachers of appropriate roles and emotions. An issue concerning women in the emotions literature is the extent to which the emotional responses they learn and express in the workplace serve to reinforce patriarchal systems that ultimately oppress women. Success in many organizations requires women to emulate men, fulfill male role expectations, and suppress femininity and caring roles. Conversely, there has been a trend toward valuing the unique roles that women bring into the workplace by virtue of their gender.

Calas and Smircich (1993) explore this phenomena and ask "What is the historical significance of recent discussions about 'women's ways of leading' and the 'female advantage'?" (p. 1). They have termed such constructs as "feminine-in-management"—the process of women bringing "female" emotions and style to the workplace to foster performance and change—and argue that they do little beyond reinforcing existing gendered power relations in organizations. They suggest that valuing essential women's qualities creates an illusion of opportunity and equality in the managerial world while blocking critical reflection on the underlying assumptions of the structure of patriarchy. Recently the New York Times (2001) published an article on "Bully Broads." Bully Broads is a training program for women who have become too "masculine" and hard driving in their roles (according to their male managers). They attend training to soften their rough edges and become more feminine in their management style.

Similarly, in the emotions literature, evidence exists for an interaction between a leader's gender, expressed emotion, and perception of effectiveness (Lewis, 2000). Leader effectiveness ratings decreased dramatically when women expressed anger, but remained unchanged when male leaders expressed anger. On the contrary, sadness expressed by women resulted in increased perceptions of leader effectiveness, yet expression of sadness by male leaders led to decreased ratings (Lewis, 2000).

Implications exist to increase the consciousness of role expectations. Women need to be critical toward expected roles and learning and training opportunities. Organizations need to be aware of creating and reinforcing role expectations and of sending conflicting gender role messages to their employees. Educators can help increase consciousness of gendered power relations and researchers can study role development and women's efforts to find voice in the workplace.

The Role of Context

One of the similarities between the literatures of emotion and women's development is the importance of context. Context has a significant impact on the development of women's careers, as well as in the development and effective use of emotions. Emotions can only be understood within a particular social context. They are socially learned and interpreted and culturally specific. Many explain emotions not merely as biological forces, but as
learned behaviors from both early and work-related organizational socialization (Domalgalski, 1999). Comparatively, learning is situational and dependent on the environment that provides tools and cues to guide learning.

Career development depends on the work context to yield behavioral clues. A challenge of working in a male dominated organization, however, is that the context functions to reinforce women's conformity to the patriarchal standards characterizing organizational culture. In both instances therefore, development of emotional intelligence and emotion work abilities as well as career development, women's learning and development are framed by the situation and context that can have either positive or negative consequences for women employees.

The importance of context creates many implications. Women need to understand how their context affects them. Organizations, educators, and researchers need to examine and understand how organizations and the patriarchal structure reinforce gender stereotypical behavior, including specific emotional responses.

**Relationships and Connection**

The importance of connection in women's learning and career development is repeated throughout the literature (Belenky et al, 1987; Caffarella & Olson, 1993; Gilligan, 1979). Belenky et al. (1987) concluded that connected learning is most effective when members of a group meet over long periods of time and know each other well. They define it as learning that is grounded in relationship, reciprocity and conversation. It is also a means of identifying common ground among learners. Further, it has been found that developing a sense of connection is an important feature in the development of gender consciousness among women (Bierema, 2000).

MacRae (1995) found, in a study of elderly women, that the women tend to describe themselves in terms of their interpersonal relationships. Gilligan (1979) also argues that relationships and connectedness with others are of central importance to women's development and writes, “the female comes to know herself as she is known through her relationships with others” (p.437). Giesbrecht (1998) found through factor analysis that in the construction and negotiation of identity, “male perspectives emphasized instrumentality and female perspectives emphasized social connection” (p.7). Ruddick (1996) notes that the idea of a relational self or that humans are composed by the relationships in which they participate, helps explain how women become connected knowers. Finally, Caffarella & Olson (1993) note in their critical review of the literature on the psychosocial development of women that: “What surfaced as central to the developmental growth of women was the web of relationships and connectedness to others” (p.135).

Relationship and connection are clearly pivotal to women's development, yet often women and men are expected to suppress emotions in the workplace and display emotions that are the opposite of how they feel. The emotion literature also discusses awareness of others’ feelings and the ability to be inspirational and motivational as aspects of emotional intelligence. These abilities imply a connection towards other people. The contradiction it seems is not with developmental processes or emotions, but the contexts in which both are actualized.

Women need to use their own initiative to seek out mentors and networks and organizations can assist and support these relationships. Educators need to teach of the importance of developing mentoring relationships as well as particular skills involved in accomplishing this. Researchers can examine different forms of developmental relationships in the workplace to help determine which are the most effective.

**Identity Development**

Many fields have broadly conceptualized the self in terms of multiple identities, with individuals holding perceptions of themselves in terms of traits and values, attributes, experiences, thoughts and action, physical appearance, demographic attributes, and dispositions of various sorts (Leonard, Beavers, & Scholl, 1999). Gender is socially constructed and a part of human identity development that is based on life experience. Self-identity has been found to be created through participating in work, private life, community and other social entities. Gender socialization may result in both identity development and identity conflict. For instance, women and men may be socialized to fulfill sex role expectations that conflict with their self-image, goals, or occupation. MacRae (1995) suggests that women's identity has been conceptualized in terms of formal roles in the paid work arena dominated by male experience while their informal roles, such as relationships and care giving, have been ignored and made invisible. When women try to challenge formal or informal roles, resistance is high and leveled from friends, families and co-workers. This results in high levels of emotion work to fit into the work culture.

Implications exist for assisting women to develop an identity with which they feel comfortable. Organizations need to avoid framing women into particular roles, allowing women to effectively and authentically develop themselves. Educators can teach the importance of developing identity and the fact that gender is socially constructed. Researchers can assist the effort by studying identity development and its interaction with gender construction.

**Devaluing of Women**
Theories of women's development and career development underscore the fact that women have been devalued in theory and in social context. Their experiences have been ignored, minimalized, or lumped in with those of men. Emotion work functions to devalue women by the organizational expectation that women will emote in ways that serve the business. Career success rests on getting their emotions "right." Often this involves suppressing or denying identity as women altogether. Such suppression helps women succeed individually, but it only reinforces oppressive patriarchal culture that prevents women from accruing power and influence.

Organizations, educators, and researchers alike need to make women and women's identity visible. At the same time they must accept gender differences; it is also crucial to avoid framing and reproducing gender role stereotypes. Women need to first become aware of this gender devaluing and increase their gender consciousness in order to challenge oppression.

Future Research

The purpose of this literature review was to examine the literatures of emotional intelligence, emotion work, women's learning and women's career development in order to examine similarities and differences between the literatures, as well as derive some implications for human resource development and women's career development. We have several recommendations and questions for pursuing future research:

- How does emotional intelligence develop for women in the workplace?
- What types of emotional learning experiences benefit women's development and career development?
- Do patterns of women's emotional development differ from men's?
- Do patterns of women's emotional development differ based on race, social class, sexual orientation, etc?
- To what extent does emotion work reinforce patriarchy?

The Meaning of Korean Women’s Experience of Reentering the Workforce

Yu-Jin Lee
Gary N. McLean
University of Minnesota

A qualitative study of the experiences of reentry women in Korea was conducted using phenomenology. The research question was, What is the meaning of the experience of women reentering the workplace after a career interruption caused by marriage or childbearing? Individual telephone interviews were conducted with each of six women who had reentered the workplace after a career interruption caused by a change in the women’s family roles. The interviews yielded much rich, detailed, and revealing data.

Key words: Women’s Reentry, Career Interruption, Korea

A global trend appears to be an increasing number of working women, at least in industrialized countries. The USA, Europe, and Asia have witnessed more women working outside the home over the past decades (Santrock, 1994; Hakim, 1996; Kim, 1999). As women enter the workforce, societies, at levels from families to nations, have kept altering and adapting their explicit and implicit rules and policies to accommodate working women’s needs.

In the last 30 years, Korean women’s economic participation rate has been increasing gradually, and women are becoming essential in Korea’s labor force. In addition, the number of women completing higher education has increased (Moon, 1998), adding more professional work and a greater variety of types of work into women’s labor options. In the past, these options had consisted of unskilled and low paying jobs. Despite this change, Korea’s female workforce development has a long way to go, even compared to other Asian countries such as Japan, Hong Kong, or Singapore. Korean women, especially, even those with higher education, have a high tendency of career interruptions due to marriage or childbearing and childrearing (Kim, 1999). This pattern inhibits continuous workforce development, impeding women’s potential.

After the economic crisis that hit Korea in 1997, many became unemployed from their previously trustworthy lifetime workplace. Now, the concept of a lifetime workplace is gradually disappearing. With this unstable economic trend, a two-income family has become desirable. More women want to continue working without career interruptions, and an increasing number of women want to reenter the workforce after a career interruption.

Unlike the situation in some other countries, it is not easy to return to school in Korea because of the rigid higher education system. When reentry women want to change their career field, it is not easy for them to obtain a good education or training in higher education. Thus, most of them turn to short-term vocational schools or social and cultural education centers where skills and knowledge are usually geared toward low-paying, low-level jobs. As a result, many reentry women settle for low paying jobs that do not require a high level of knowledge or skills.

As a researcher and a Korean single woman, Lee’s interest in reentry women came from friends who had quit their jobs after marriage or child bearing. Most said that they hoped to go back to work, but their plans were vague. Some of them tried to reenter the workplace several times, but they have not yet succeeded. They grew up believing that a normal and ideal family has a father as the sole breadwinner and a mother who is the full-time homemaker. However, with the recent unstable Korean economy in the last couple of years, the concept of dual-career women has become idealized and desirable. Starting from these personal interests, Lee wanted to understand those women who have already experienced or who are currently experiencing reentry in Korea. The purpose of this study was to uncover the meaning of the reentry experience of women in Korea.

Literature Review

Reentry women have generally described women reentering educational institutions or the labor force after an absence for an extended period of time, ranging from a few years to over 30 years (Padula, 1994). In this study, it refers to women who have reentered the workforce after a career interruption due to their family responsibilities, such as childbearing or childrearing. Most of the studies done with reentry women have focused on adult women students (Petersen, 1991). Thus, there is a lack of research concerning women’s reentering the workplace in Korea.

There is no comprehensive theory of women’s career development (Betz, 1987). However, it is well documented that career developmental models based on male experiences cannot be applied to women’s career
development (Eastmond, 1991). This discrepancy based on gender can be partly explained by the fact that women tend to have more interruptions in their career paths than men, whose career paths tend to be more linear.

Research regarding reentry women was conducted mostly in the 1980's and early 1990's in the USA, but these studies have focused mostly on reentry women in educational settings (Padula, 1994). It is not known whether this group of reentry women differs from those reentering the workplace with respect to their roles, values, concerns about family, personalities, general characteristics, motivation, and the like.

According to Even (1987), career interruption partially explains the wage gap between male and female workers. If female workers do not return to work after the typical maternity leave, the likelihood of an early return to work quickly becomes remote.

Watkins (1988) illustrated what reentry women would face when they contemplate returning to work:

Women who return to work after several years find that the men and women they used to work with have received regular pay increases, promotions, and on-the-job training that have made them more valuable to their organizations, at the same time that the reentry woman's skills have grown rusty and outmoded (p. 52). They must compete with younger men and women for jobs they would long since have outgrown had they stayed at work. Their social status while at home has often been a function of volunteer work and of their husband's status (generally higher than that associated with the jobs for which women must now apply), and they may feel threatened by having to consider jobs their children would find demeaning. (p. 54)

Research Question and Methodology

The research question was, What is it like for Korean women to reenter the workplace after a career interruption caused by marriage or childbearing? Because individual reentry women have different backgrounds and contexts, we believe that it is important to understand the core essence of the experience of reentry into the work force after a career interruption.

A qualitative investigation using phenomenology was undertaken. Qualitative research is used when the underlying theories are not formulated, the existing theories are questioned, or when the phenomenon has received minimal empirical examination and requires an exploratory descriptive approach (Denzin & Lincoln, 1994). Among several qualitative approaches, phenomenological research emphasizes the meaning of lived experience; it examines how human beings construct and give meaning to concrete social situations (Creswell, 1998). The focal point of phenomenological research is to "borrow" other people's experiences and their reflections on their experience for better understanding of the deeper meaning or context of the whole human experience (van Manen, 1990).

Methods

Participants and Researchers as Persons

Six Korean reentry women participated in this study. The reasonable number of participants (or subjects) in a phenomenological study varies from 3 to 10 (Creswell, 1997; Dukes, 1984; Polkinghorne, 1989). The researchers considered six participants to be enough to describe the meaning of the phenomena in this study. The snowball sampling method (Patton, 1990) was used to locate participants with the help of friends. Two Korean women development centers helped locate two participants. Two criteria were used in choosing the interview participants: the participant must have had the experience of reentry into the workplace after at least one year of career interruption caused by the demands of the women's domestic roles, and the participant must be willing to participate in the research and share their reentry experiences. Table 1 shows a brief description of each participant. Participants signed consent forms that stated the purpose of the research, the process of the interview, the possible advantages and disadvantages of participating in the study, and their freedom to quit at any time during the interviews.

Lee was 29 years old at the time of the research, a single female Korean Ph. D. student studying Human Resource Development at the University of Minnesota. She graduated from a women's college in Seoul, Korea, and has been in the USA for 6 years to study. McLean has a longstanding interest in the issue of gender equity (see, for example, McLean & Crawford, 1979). Further, McLean has a longstanding interest in Korea, having four adopted Korean children, having several former and current Korean advisees, conducting research and consultancies in Korea for more than a decade, and editing Korean Philately, the official journal of the Korea Stamp Society.

Data Collection

The interview questions were semi-structured in order to stimulate the participants' responses about their reentry experiences:

- Describe your experience of reentry into the workplace after a career interruption caused by marriage or childrearing?
- Describe your first week after reentry into the workplace?
- Do you think about work differently after reentry?
- What did the experience of reentry mean to you?

These questions were used as guiding questions, and the interviews were led openly and freely as the participants revealed their experiences; other questions were asked for a fuller description of their experiences.

Since the senior author is studying in the U.S. and the participants were in Korea, the interviews were conducted via telephone. Participants were asked to find a place where there would be few interruptions and where they could express themselves freely. The interviews lasted about 60-90 minutes and were tape-recorded and transcribed verbatim in Korean.

Data Analysis

Giorgi (1975) developed procedures for data analysis in phenomenological research. The procedures help researchers bracket their preconceptions and rigorously focus on the phenomenon for the other. By dwelling on and reflecting upon the exact words of each person, the researcher can uncover the salient features of the phenomenon (Polkinghorne, 1989).

The procedural steps used, as outlined by Giorgi (1985), were:
1. Gaining a sense of the whole.
2. Identifying meaning units.
3. Labeling and defining themes.
4. Transforming the participants' language into a more abstract language.
5. Synthesizing the transformed meaning units from all participants' protocols into a final general description of the phenomenon being studied.

Since the raw data were in Korean, the text was not translated until the fifth step of the data analysis. Then, the results of the data analysis were translated into English.

Sense of the Whole. The first step of the analysis involved gaining an overall sense of the major ideas that were provided by the participants by reading the whole interview text over and over again. The following is a part of one interview text provided in order to give the readers a holistic sense.

The reason I made up my mind to go back to work was a thought that came to me very slowly, but firmly, that a woman also needs economic power. It was strong. That point came...right after I quit my former job....You know that you spend much more money when you get married. I had to save. I also had a plan to buy a house. Those issues struck me so strongly after I quit my job. Strange, huh? But time passed so quickly while raising my daughter. When I thought about returning to the workplace, people around me said it's very hard for a married woman to get a job, but a single woman could change her job very easily. Those rumors made me nervous. My insides were stirring and I felt sick. The moment when I was informed that I got a job again...I felt like I had conquered the whole world.

Identifying Meaning Units. After gaining a sense of the whole by reading and dwelling on the interviews, the
senior author identified blocks of meaning units in each participant's interview. Meaning units are "constituents of the experience, not elements, in that they retain their identity as contextual parts of the subject's specific experience" (Polkinghorne, 1989, p. 54). Each meaning unit was written in the participants' own language.

Labeling and Defining Themes. The senior author labeled each meaning unit with a simple and concise statement of the dominant natural meaning of the unit and wrote a sentence in the senior author's words that defined the theme. Each participant's interview text was printed on papers of different colors and then was cut into meaning units. A theme was then marked on each meaning unit. After eliminating meaning units unrelated to the research question, meaning units were clustered into similar themes.

Transforming the Meaning Units into More Abstract Language. The research question was applied to each meaning unit and its accompanying theme to draw out aspects related to the research question. These were re-described in language from the perspective of women's career development. Reflection and imaginative variation were used in this process.

Synthesizing: Universal Wisdom. The last step of phenomenology requires moving from the parts (individual interviews) to the whole (all interviews). Synthesis involves tying together and integrating the list of transformed meaning units into a consistent and systematic general description of the essential structure of the experience under investigation (Polkinghorne, 1989). In this procedure, the re-described meaning units were read through and then a general description of the structure underlying the variations in the meanings were described.

Results

Seven themes emerged from the data analysis: 1) giving up the fantasy of becoming a happy homemaker; 2) feeling not welcomed; 3) first come, first served; 4) feeling empowered; 5) feeling guilty; 6) being vulnerable to the patriarchal workplace culture; and 7) redefining one's meaning of work. Two universal wisdoms were perceived from the participants' experiences: experiential life learning and the desire to be self-sufficient. Each theme follows; participant initials are used for attribution. The following meaning units in each theme are inclusive but not exclusive. Only three to four meaning units in each theme are presented here due to the limited space.

Giving up the Fantasy of Being a Happy Homemaker.

Five of the participants were surprised to find that they did not enjoy being a full-time homemaker:
I was bored to death after staying at home for two months, and I was very tired of just cooking and cleaning all day. One day I really had a deep thought about why people should have three meals a day (J).
I quit my job after the wedding. I believed that becoming a homemaker would be the key to my happiness. You know... baking cookies... From my childhood, I've always held a grudge against my working mom, and I wanted so much to stay home after marriage. I didn't want to give that emptiness to my child. But, to my surprise, I felt emptiness at home. I felt like my feet were not grounded on the earth. Even when I was with my son, I felt confined, lonely, and alone. I found myself envying my working mom. I realized that being a stay-at-home mom was a harder job for me (C).
I was hungry for conversation all day. I was a graphic design instructor before. You can imagine how hungry for adult interaction I was. I was practically deaf for three years. Negative thinking haunted me, and it led me to "housewife's depression." If I had felt happy staying home, I wouldn't have gotten a job again (P).
I just don't do housekeeping well. I enjoy a clean and organized home only when other people do that for me. So, I thought I could do this level of housekeeping even if I worked outside. I thought I was better at working (Y).

Feeling Unwelcomed.

Participants found to their dismay that, when they returned to work, the workplace did not welcome them:
I was 29 then, and I didn't think that I was that old to get a job. Because I didn't have a child and didn't live with my parents-in-law, I thought that nothing could block my getting a job. But every interviewer asked me if I was married and rejected me (B).
First, I contacted a graphic design institute for a job as an instructor, but they told me they didn't hire married women. They seemed to worry that my married life would interfere with my teaching (P).
I began searching for a job that would fit me. I preferred a job with a regular income and fixed office hours, such as an office job. But I couldn’t find such a job for a married woman. So I chose a sales job (L).

First Come, First Served.

The participants found that they accepted the first job that was offered, rather than taking more time to find something that might be more appropriate.

I accepted a job offer as a temporary secretary, filling in for other women on maternity leave. I knew that it was not a good option, but I couldn’t help it. I didn’t have any power in this situation. I had to swallow my pride to get a job. If I had insisted on a full-time permanent position, there wouldn’t have been any job for me. And that means that I would be getting further away from the job market as time passed (J).

While I was doing a part-time job, one of my friends introduced me to an insurance agency. At first, I thought I’d just give it a try to become an insurance salesperson, just for three months to see if I liked it. I didn’t think about it seriously (L).

I searched for a job for a while and couldn’t find any good one. One day my sister hooked me up to a telemarketing job, and I took the job without hesitation. One year later, I quit that telemarketing job because it wasn’t my type of work (Y).

Feeling Empowered.

The outcome of the work experience was to give the participants a sense of empowerment, both at work and at home.

People recognize that I became brighter and more cheerful. In the past, some told me that, even when I smiled, they could see the sadness in my eyes. Now any word coming out of my mouth is positive. I became positive. My body was full of irritability before, but these days, I take care of my children differently—better and more patiently. Even though I feel tired after work, I help my children with their homework at least 30 minutes a day, which I didn’t do before. I became much more confident in myself. To be honest, I still have some fear, but I think I will be able to be a leader for my family and raise my children in case my husband gets laid off (L).

When I stayed at home, I didn’t put on makeup. I didn’t take care of myself. Now I take good care of myself—my appearance, my attitude, and my behavior. I feel good about myself. And my husband likes it, too (Y)!

When I didn’t make money, I hesitated to spend money on myself. I didn’t feel right about buying myself clothes, buying my friend lunch, or paying for my lessons, such as English tutoring. People would laugh if I got English tutoring. English tutoring...what for? Now I can do those things without feeling sorry for my husband. Even when I have to help my parents with money, I feel so free that I don’t have to get permission from my husband. It feels good (J).

I feel as though I were an iron woman. I work, take care of the children, support my husband, and do my best as a good daughter-in-law for my parents-in-law (L).

Feeling Guilty.

In spite of the sense of empowerment that most participants felt, there was also a sense of guilt about what their decision means to those around them.

My mother is babysitting my daughter while I am at work. I feel so sorry and thankful that she does this for me. She comes to my home every day from afar. My mother spent her whole life raising her children, and now again for her granddaughter. When my daughter was in daycare, she looked sad and weak. She needed special care and attention as there were more than 17 kids per teacher. She got so sick one day that I had to quit my job temporarily to take care of her. I felt very guilty about her sickness. I didn’t tell my husband’s family that I went back to work. They would disapprove of my working (P).

My husband lost 10 pounds after I began working because I could not cook as often as I did before. When my parents-in-law noticed his weight loss, I felt ashamed and guilty (B).

The first day I said goodbye to my son at the door to go to work, I cried so hard. I felt so sorry for him even though he is too young to know that I am off to work. For a couple of months, I didn’t even put any picture of my son in the office. It hurt very much (C).

It troubles me every day more than 12 times a day, especially when I have to go out to work early in the morning before my children get up, and I can see them only two hours at night, I feel bad (Y).
Being Vulnerable to the Patriarchal Workplace Culture.

The participants recognized that the rigid workplace culture does not accommodate their personal needs. My department consists of mostly women. They are all single, except for me. They go home after 9 pm because there is always overtime work. I try to get out one or two hours earlier, but I feel odd. I sometimes feel isolated because I am the only married woman there. It seems that I am the only one complaining. In the beginning, the employer told me that closing time would be 5:30 pm. If I had known then what I do now, I wouldn't have chosen this job (Y).

I love my workplace. It's my second home. It has a daycare so that I can bring my kid whenever she wants to go with me. Nobody frowns on bringing your child to work. They treat the kids like their own nieces and nephews. I guess it's because my workplace is a women's development center. I have been in an ordinary workplace before where I had to please my employer and couldn't request any special favors for my personal needs. They didn't want to accommodate employees' creative thinking and demanded that I adjust to their way of socializing—drinking. I'll never go back to that ordinary workplace again (P).

I don't think my workplace can afford my maternity leave. It's a tacit agreement. Actually, I took over my job when the former employee left to have a baby. Nobody told me to leave, but I just know how it works here. I wish I could find a more stable workplace next time (B).

Redefining the Meaning of Work

The participants recognize that what they work for is not the same as it was before they left their original workplace. If I could continue working without a break, I would consider working to be so boring and would take it for granted, wondering what I was working for. I would be dreaming about something other than working. Making money is definitely important, but socializing with people at work is also a joy. Meeting people and doing things together... I didn't know that it would mean so much to me. You don't appreciate what you already have. Then once you lose it, you realize how valuable it was (C).

In the past, it was an obligation that led me to work. I had to support my family with my salary. Even when I didn't feel like working, I had to do it because my family's financial situation was not good. But now I am really enjoying my job, free from the stress of having to make money. I would do my job, even without getting paid (P).

In the past I worked just because I wanted to set a role model as a professional secretary. I wanted to show people that the job of secretary could also be performed professionally. However, that doesn't matter to me anymore; now I work to save more money while I am still young. Nowadays, it's very hard to save money and set a financial foundation if the husband alone works (J).

Discussion

The seven themes are presented in the order of the women's experiences. The first theme, giving up the fantasy of being a full-time homemaker, emerged when the reentry women in this study were at home during their career breaks. All of the participants in this study considered marriage and childbearing to be significant changes in their lives to the extent that they had to change their lifestyles dramatically—quitting work and staying home. They fantasized about being a wife and full-time mother and idealized staying at home. Furthermore, they did not doubt that they would regret that decision to stay home later. They soon realized that being a full time homemaker was not as satisfactory, rewarding, and interesting for them as they imagined.

The second theme, feeling unwelcomed, is derived from the experience of finding that getting hired was much narrower and harder for married, reentry women than for younger, single women. The participants became frustrated and discouraged when they saw "female singles only" job advertisements or when they were rejected at job interviews due to their marital status. The participants suddenly felt that they had become "old and second hand" in the labor market. On the other hand, interestingly enough, they understand the perception of reentry women as rusty and outdated in the labor market in Korea.

The next theme, first come, first served, concerns the moment they chose their jobs upon reentry. After facing the narrow and harsh labor market reality for reentry women, they chose whatever came first. Some women regretted their decision later if they had not obtained enough information about the job, including its downsides and its dead-end reality. Some women are satisfied with their decision if it leads to career progress.

The fourth theme involves feeling empowered. All of the participants felt empowered after they reentered the
workplace—financially, physically, emotionally, and mentally. This feeling is a positive reinforcement for reentering the workplace. The participants compared this feeling with how powerless they had felt when they stayed at home. One participant said, “It feels like I conquered the world.” Two participants in this study stated that they learned how to love and take care of themselves. Some mentioned that they did not want to be superwomen, but they just felt more energized to do the housework more joyfully and effectively than before.

The fifth theme deals with feeling guilty. This feeling is a downside of the reentry experience. These women felt guilty for anybody who was negatively affected by their reentry into the workplace. All participants who have a child or children expressed guilty feelings about not being able to stay at home with their children all day. Three women felt sorry for the sacrifices of their mothers who were taking care of their children. This guilt appears to come from the socially shared belief that mothers should be the sole caregivers who provide family members with comfort and full attention. They had inner conflict over their decision to go back to work when they feared that their children would be negatively affected.

Being vulnerable to the rigid workplace culture emerged as the sixth theme. Most of the workplaces in Korea are patriarchal. Goldberg (as cited in Hakim, 1996) defined patriarchy as “the overwhelming number of upper positions in hierarchies are occupied by males (p. 7).” Despite the increasing number of working women in Korea, the customs, policies, and tacit rules are intertwined for the benefit of the patriarchal organizations. When the participants confront this patriarchal culture, they feel vulnerable and powerless. As a reaction, some try to accept and adjust themselves to the rigid workplace, while other women with choices try to avoid the rigid patriarchal system and choose more liberal workplaces, such as multinational companies in Korea. All participants expressed some longing for a more flexible and egalitarian workplace, where their personal needs could be met in harmony with the organization’s needs.

The last theme concerns redefining the meaning of work. Going through career interruptions and reentry experiences, all women in this study redefined their meaning of work. Some imposed the meaning of self-actualization and self-development, and some came to focus on the monetary rewards. The meaning of experience changes progressively as adults develop cognitively (Blocher, 1980). The reentry experience is recalled by the participants as adding additional meaning to work.

Limitations

It would have been instructive to hear the voices of more women. However, within the time restraints allowed for this study, only six participants who met the criteria and who were willing to participate were identified. The participants lived in Seoul, the capital of Korea. A sample of other areas might yield its own rich set of descriptions on the reentry experiences of these women as these areas are considered to be more conservative and more patriarchal.

Credibility is a concern in qualitative research. It relates to internal validity and asks how confidence in the truth of the findings of a particular inquiry can be established (Lincoln & Guba, 1985). The senior author grew up in Korea, so she is well-equipped to understand the Korean cultural context. In addition, as she has also lived in the U.S. for six years, she is able to view the Korean cultural context with a third-eye perspective. Moreover, the one-time telephone interview might not have produced quite as full a description of the reentry women’s experience in Korea, compared to live, in-person interviews.

Contributions of Research to HRD

The results of the current study will contribute to the understanding of the reentry experience of Korean women after career interruptions. This study provides a rich and in-depth description about reentry women’s actual values, beliefs, or attitudes, from their own voices. This research provides several implications for professionals working with reentry women, such as career counselors, adult educators, and corporate human resource developers and managers.

First, career counselors working with reentry women will benefit from the results of the current study by helping them to locate appropriate jobs and meeting reentry women’s unique career counseling needs. In Korea, there are few career counseling services intended for adult women. In most cases, reentry women in Korea make significant career decisions without professional career counseling or career information. When women stay at home, they are unlikely to access appropriate career counseling. Thus, career counseling service organizations should devote more energy to outreach into the community for potential reentry women in their homes.

Second, this study provides adult educators with in-depth understanding about their potential clients—reentry women intending to return to schools. Women who wish to reenter the workplace may need help in recognizing
which skills and knowledge are outdated. They may then be willing to update themselves to regain employability via vocational training or learning. Adult vocational educators can target this reentry women population and attract them by addressing their unique needs.

This study can also help corporate human resource developers and managers who want to make use of reentry women’s skills and talent. By recognizing conditions that keep women from reentering the workplace, corporate HR developers and managers should try to create more flexible and egalitarian work environments in order to increase employee job satisfaction.

Finally, many potential reentry women in Korea can benefit from this study. Because of a lack of role models for reentry women in Korea, and because of differences in individual situations, this research may provide a foundation for understanding the common thread that links reentry women’s workplace experiences. By understanding reentry women’s experiences, women who dream of reentering the workplace can reevaluate and successfully carry out their career plans.

Factors that Assist and Barriers that Hinder the Success of Diversity Initiatives in Multinational Corporations

Rose Mary Wentling  
University of Illinois

The purpose of this study was to identify and provide information on the factors that assist and barriers that hinder the success of diversity initiatives in multinational corporations. Eight multinational corporations headquartered in the United States were selected for this study. Two methods of data collection were used: semi-structured face-to-face interviews, and document analysis.

Keywords: Diversity Initiatives, Multinational Corporations, Organizational Barriers

The populations of the United States and other countries around the world are becoming more diverse, causing organizations to become more diverse as well (Fernandez, 1993; Gilbert & Ivancevich, 2000; Norton & Fox, 1997). Demographers have reported that the workforce population will include an increased number of women, more minorities, varieties of ethnic backgrounds, more aging workers, and people with different life styles (Schraeder, 1999). People from many diverse groups will be working together to keep businesses running competitively throughout the world (Dutton, 1998). It is expected that the extent to which these demographic workforce shifts are effectively and efficiently managed will have an important impact on the competitive and economic outcome of organizations (Dass & Parker, 1996; Gasorek, 1998). Only companies that have cultures which support diversity will be able to retain the best talent necessary to remain competitive (Morosini, 1998).

Increases in competition and demographic changes have convinced many business leaders that diversity should be an essential part of their business strategy (Cox, 1993; Pollar, 1998). Demographic changes, the shift from a manufacturing based economy to a service economy, and global competition are some factors that have forced US corporations to reexamine their policies, programs, and practices to remain competitive. One of the most cited reports on the dramatic demographic changes in US society is Workforce 2000: Work and Workers for the Twenty-First Century (Johnston & Parker, 1987). This report and others (Judy & D’Amico, 1997; US Bureau of the Census, 1994; US Bureau of Labor Statistics, 1998) indicate that workforce demographics are expected to change dramatically. Managers who want their organizations to remain competitive are concerned about how to implement different initiatives and programs in order incorporate and retain diverse body of employees (Gasorek, 1998; Rosner, 1999).

There are numerous ways in which different individuals have defined diversity. Definitions of the term range from narrow to very broad. Narrow definitions tend to define diversity in terms of race, gender, and ethnicity (Kossek & Lobel, 1996). Broad definitions may also include age, national origin, religion, disability, sexual orientation, values, ethnic culture, education, language, life style, beliefs, physical appearance, and economic status (Norton & Fox, 1997). Each of these characteristics can affect an employee’s attitudes and behaviors in the workplace, as well as influence their ability to work well with other employees. For the purpose of this study, diversity is defined as all the ways in which people differ, and it encompasses all the different characteristics that make one individual or group different from another. It is all-inclusive and recognizes everyone and every group as part of the diversity that should be valued (Hayles & Russell, 1997; Kossek & Lobel, 1996).

An important force influencing workforce diversity is the globalization of the marketplace. As global competition is increasingly becoming more important, it has become apparent that American competitiveness in the global marketplace will depend on effective human resource development and management (Fernandez, 1993; Poole, 1997). Wentling and Palma-Rivas (1998) interviewed diversity experts throughout the United States and found that the globalization of many American corporations has raised the need for a multicultural perspective to compete successfully abroad. These companies need to deal with diverse employees, customers, and suppliers around the world. Therefore, many companies are providing skills and cultural awareness training to help their employees be more knowledgeable, understanding, and sensitive to the differences which may exist between themselves and people from other countries. According to Fernandez (1993), US companies will continue to expand through acquisitions, mergers, the transfer of facilities overseas, and will be faced with increasing diversity in the workforce.

During the last decade, many organizations have responded to the increase in diversity with initiatives and

programs designed to manage diversity in the workplace (Arredondo, 1996). For example, Cox (1993) identified work arrangements, education and training, career management, and mentoring relationships as specific diversity initiatives in American corporations. Morrison (1992) found diversity initiatives related to accountability, career development, and recruitment. Although there is a wide range of initiatives and strategies for managing diversity and organizations are scrambling to develop diversity programs, very little is known about factors that assist and barriers that hinder the success of diversity initiatives in multinational corporations (Fernandez, 1993; Florkowski, 1996; Hayles & Russell, 1997).

Purpose of Study

The purpose of this study was to investigate the factors that assist and barriers that hinder the success of diversity initiatives in multinational corporations. Diversity initiatives for the purpose of this study are defined as specific activities, programs, policies and any other formal processes or efforts designed for promoting organizational culture change related to diversity (Arredondo, 1996). This study examined the following major research questions:

1. What factors have assisted in the success of diversity initiatives in corporations?
2. What barriers have hindered the implementation of diversity initiatives in corporations?
3. What can be done to prevent failure of diversity initiatives in corporations?

Methodology

This was a descriptive and exploratory study. Two major methods of data collection were used: semi-structured face-to-face interviews and document analysis. Interviews were conducted with workforce diversity manager/directors who are responsible for diversity initiatives in multinational corporations headquartered in the United States. The data obtained through the interviews consisted of words in the form of rich verbal descriptions (qualitative data), as well as quantitative data. Essentially, this study used a qualitative approach to answer the research questions. A quantitative method in the form of frequencies and percentages were also used to support the qualitative data. The second major method of data collection used was document analysis. Documents related to the organizational diversity initiatives in the multinational corporations were collected from primary and secondary sources. Documents were solicited from the corporations and from standard literature sources, such as, annual reports, community relations reports, journals, magazines, world-wide-web, newspaper articles, research reports, and diversity-related books. The data obtained from these documents provided insightful and enriched information that was used to confirm and verify the information provided by the study participants during the face-to-face interviews.

The population for this study was composed of the 30 multinational corporations in a mid-west state in the US listed in the book entitled, Directory of Diversity in Corporate America (1994). From those 30 corporations, a sample of eight was randomly selected to participate in the study. The population and sample that was selected for this study was ideal because in order for a corporation to be included in the Directory of Diversity in Corporate America (1994), it must meet the following criteria: (a) have extensive experience with workforce diversity, (b) be multinational corporations, (c) be allocating resources to diversity initiatives, and (d) have launched successful corporate diversity initiatives.

The data were collected through interviews and document analysis. The researcher conducted face-to-face interviews with eight workforce diversity manager/directors in charge of diversity initiatives in eight multinational corporations in a mid-west state in the United States. The researcher developed a semi-structured interview guide to assist in collecting the data from the interviews. The interviews were conducted on-site at each participant's corporate office. All interviews were tape recorded and extensive notes were also taken during each interview. The interviews lasted from one and a half to three hours, with an overall average of two hours.

In addition, the researcher conducted a document analysis of written and printed materials related to the organizational diversity initiatives in the multinational corporations. These documents were solicited, collected, and included the most current corporate annual reports, newsletter articles, newspaper articles, and profiles from general business directories, research reports, journal articles, magazine articles, and chapters from diversity books.

The data from the interviews were content-analyzed. Content analysis is a research technique for systematically examining the content of communications—in this instance, the interview data. The researcher and a research associate independently analyzed the participants' responses and the related issues that arose during the interview process. No major discrepancies were found when the analyses from both researchers were compared. The researchers read the responses, put them together as complete quotations, and filed them according to the topic or
issue addressed. Responses were analyzed thematically. Emergent themes were ranked by their frequency of mention and finally categorized. Data obtained through the interviews were analyzed qualitatively and quantitatively. Quantitative data were used to provide the basic research evidence, while qualitative data were used to round out the picture and provide examples.

Documents were collected and analyzed prior to, during, and after the interviews. All together there was a total of 47 related documents analyzed. Related documents obtained from the world-wide-web, corporate sources, books, journals, newspapers, newsletters, reports, and so forth were all included in individual files for each of the corporations in the study. The researcher coded the related documents by relevant topic as they related to the major research questions. To further assist in ensuring the reliability of the data analysis, the researcher invited a diversity manager from a multinational corporation in the west coast to review four of the interviews. The ratings (frequencies of emergent themes) of the diversity manager matched the researcher’s ratings in all of the four interviews reviewed. The same procedure was followed for the related documents analysis, which produced similar results.

Results

The results of this study are summarized in three major sections that parallel the research questions: (a) Factors that assist in the success of diversity initiatives in multinational corporations, (b) Barriers that hinder the success of diversity initiatives in multinational corporations; and (c) Preventing failure of diversity initiatives in multinational corporations.

Factors Assisting in the Success of Diversity Initiatives

The first major research question in the study attempted to identify the factors assisting in the success of diversity initiatives. To analyze the data on the factors assisting in the success of diversity initiatives, the researcher developed three categories based on what the study participants stated. Factors identified were classified under the following three categories: (a) diversity department, (b) human, and (c) work environment. Factors identified in each of the categories were ranked-ordered according to the frequency of mention by the study participants. The categories are described as follows:

Diversity Department Factors Assisting in the Success of Diversity Initiatives. The study participants cited a variety of factors assisting in the success of diversity initiatives, which the researcher assembled under the category of diversity department. This category had the largest number of factors and also some of the most frequently mentioned. These specific factors fell under the diversity department's responsibility for success. The three most frequently mentioned factors under this category were: (a) have a strategic plan for diversity initiatives, 8 (100%); (b) integrate diversity initiatives into the corporate goals and priorities 8 (100%); (c) implement several initiatives simultaneously, 7 (88%).

The importance of having a strategic plan for the success of diversity initiatives was recognized by all the study participants. They all agreed that strategic planning is an important factor that leads to the success of diversity initiatives because it provides guidance, makes them reactive, and avoids shortsightedness. Since strategic planning emphasizes long-term initiatives, it avoids the danger of having "one-shot" diversity initiatives that are likely to disappear with time. In other words, strategic planning does not allow diversity initiatives to become a fad. Having a diversity strategic plan was also recognized as a primary responsibility of the diversity department or function.

Another factor considered highly influential in the success of diversity initiatives is the integration of diversity initiatives into the corporation's goals and priorities, or the linkage of the diversity initiatives to the corporate strategic plan. All the study participants agreed that diversity initiatives should be integrated in the strategic goals and priorities of corporations. This is also a responsibility of the diversity department or diversity function. If managers and employees in an organization clearly see the relationship between the diversity initiatives and the corporation goals, this can demonstrate that diversity is important and unlikely to fade away. This can also lead people to become supportive, and management to become committed to the initiatives.

Eighty-eight percent of the study participants agreed that in order for diversity initiatives to be successful, diversity departments have to coordinate several initiatives simultaneously. To implement a single initiative is perceived as negative and not likely to be successful. Study participants stated that “diversity initiatives should not stand alone and should be connected to the diversity business case.” Some diversity initiatives are perceived as very important but "not a solution in itself." One of the research participants stated, “I think that diversity initiatives
really do work, but they do not stand alone. If you implement just one initiative, you are not going to get the rest of what needs to happen; meaning, you don't have the good foundation in place."

**Human Factors Assisting in the Success of Diversity Initiatives.** Many factors assisting in the success of diversity initiatives were identified for the category of human factors. The three most frequently mentioned factors under this category were: (a) recognition that diversity is a business imperative \(8 (100\%); \) (b) acknowledgment of the benefits of diversity, \(7 (88\%); \) (c) people personally committed, \(5 (63\%).\)

In order for diversity initiatives to be successful, there must be recognition that diversity is a business imperative. This factor was recognized as a driver of success by all the study participants. Managers and employees alike need to recognize that diversity is a business imperative. One study participant stated, "Diversity initiatives have been successful for us because we have been able to make diversity a business case, a business imperative." Another study participant said, "Recognition by many people in the organization that diversity is a compelling business issue has led us to have successful diversity initiatives." Acknowledging the benefits that diversity brings to corporations, managers, and employees was another factor identified as a driver of success for diversity initiatives, by eighty-eight percent of the study participants.

Another human factor associated with the success of diversity initiatives is to have people personally committed to diversity. This factor was recognized as a promoter of success by sixty-three percent of the study participants. The following was stated by one of the participants regarding this aspect, "I think what has been very successful is the energy and the commitment you get from people in the organization. We have people that at different levels wanted to be involved because they are really committed and recognize the importance of respect and inclusion. Because they are committed, they can also connect diversity with its impact on teams, and also can understand how important it is for an organization to utilize everybody. We have people functioning as champions in the workplace and they are really trying to raise issues around diversity whenever they can, and that I think it has been really successful."

**Work Environment Factors Assisting in the Success of Diversity Initiatives.** Many factors were cited by the study participants under the category of organizational factors. The three most frequently mentioned factors under this category were: (a) have a culture that values diversity, \(8 (100\%); \) (b) top management support, endorsement, and commitment, \(8 (100\%); \) (c) recognizing that diversity is more than an HR issue, \(6 (75\%).\)

All the study participants identified having a culture that values and supports diversity as the most important factor leading to the success of diversity initiatives. One study participant stated, "Our diversity initiatives have been successful because we have a culture that fully supports diversity. Diversity is part of the culture from the highest to the very bottom levels. The value of diversity is something that is communicated throughout the entire organization just as any other business strategy, such as quality management."

All of the research participants also identified top management support as one of the most important factors driving the success of diversity initiatives. According to the study participants the most influential factor that has assisted in the success of diversity initiatives is the commitment and support of top management. One study participant indicated, "They (senior management) firmly support the diversity initiatives. We started off with top leadership and pushed it down. Much effort is going on at the senior level of this company. Success is because we have commitment from the executive group in the organization."

Seventy-five percent the study participants also agreed that in order for diversity initiatives to be successful, the top executives and everyone in a corporation should recognize that diversity is a business imperative or a business advantage and much more than an HR issue. Recognizing the advantages that diversity management brings to organizations and individuals can be a strong factor leading to the success of diversity initiatives. One reason is that people's understanding can make the implementation and development processes easy. Another reason is that if people in corporations understand the value of diversity, they can become more receptive and willing to participate.

For some study participants it was difficult to identify major factors assisting in the success of diversity initiatives. For them, various factors complemented each other in supporting successful diversity initiatives. The ideal, for them, would be to have all the factors described above working together to ensure the success of diversity initiatives. The rationale for not mentioning specific factors was that they depended on each other to make diversity initiatives effective. For the study participants who perceived the combination of factors as leading to success, all factors were very important, but success depended on a combined approach. For example, just one factor, such as management commitment, in itself will not lead to success, it has to be complemented by other factors as well.
The second major research question in the study addressed the barriers that have hindered the diversity initiatives in the corporations. The study participants were asked to identify the barriers that have hindered the diversity initiatives in their corporations. To analyze the data, the researcher developed three categories based on the barriers cited by the study participants. Barriers identified were classified under the following categories: (a) Barriers of the work environment; (b) Barriers of people in corporations; and (c) Barriers of diversity initiatives. Barriers identified in each of the categories were ranked-ordered according to the frequency of mention in the interviews. The categories are described below.

**Barriers of the Work Environment.** The study participants cited many major barriers that the researcher categorized under the category of barriers coming from within the corporations’ work environments. The three most frequently mentioned barriers under this category were: (a) competing agendas, 6 (75%); (b) size and complexity of the corporation, 6 (75%); and (c) economic changes, 4 (50%).

Having competing agendas is a corporate barrier that was identified by seventy-five percent of the study participants. These corporations are engaged in many additional projects other than diversity, and all of them are perceived as important by the leaders of their corporations. Most of them are engaged in total quality management, process improvement, strategic planning, team development, and many other types of organizational development interventions. They all require time and resources. Therefore, financial support, human resources, and time have become very scarce for managers and employees. One of the study participants stated that, "There is a constant struggling to get the most urgent done. People set their priorities and diversity issues are left behind because they are easier to put off."

Seventy-five percent of the study participants identified the size and complexity of the corporations as a big barrier hindering the development of diversity initiatives. All the corporations studied are very large with a number of divisions and branches inside and outside the United States. The complexity of their operations and their sizes make it difficult to effectively coordinate the overall process of diversity initiatives. Corporations’ large number of units, branches, sub-cultures, and locations are barriers that do not allow diversity initiatives to be implemented easily. The importance each corporate unit gives to diversity also varies. This also leads some units or branches to adapt changes at differing speeds. Size of the organizations was also seen as a barrier because it interferes with conveying the diversity message to many people in a limited amount of time. In addition, corporate size makes it difficult to come to decisions and agreements in a reasonable time frame.

Half of the study participants identified changes in the economy of the corporations as an important barrier hindering the progress of diversity initiatives. These economic changes have forced corporations to decrease financial resources and to reduce the number of people working in corporations, causing excessive overload work schedules. Due to economic changes, corporations have less resources in general. Economic changes have led corporations to reduce, downsize, and flatten. This means that corporations have to function with fewer people, which, in turn, brings more pressure and overload work schedules for everyone in the organizations. Unfortunately, this leads to lack of time and financial resources to devote to diversity initiatives.

**Barriers of People in Corporations.** The study participants cited a variety of barriers that the researcher categorized under the category of barriers of people in corporations. The three most frequently mentioned barriers under this category were: (a) people not understanding the value of diversity, 7 (88%), (b) people not fully supporting diversity, 6 (75%); and (c) slow involvement, 4 (50%).

The most frequently mentioned barrier was people not understanding the value of diversity. Eighty-eight percent of the study participants cited this as a major barrier. The following phrases are evidence of this barrier: people not understanding why diversity is important; people not seeing its value; lack of awareness of the value of diversity; people not knowing what to expect; people not understanding what impact diversity has on them personally; people with myopic thinking; lack of visionary people; and people not seeing the true value of diversity.

Not having full support for diversity initiatives was mentioned as another barrier by seventy-five percent of the study participants. Not understanding the value of diversity and what it means for corporations and individuals can lead to this lack of support. However, some people may understand what diversity is and its value and still not
support it. The most serious barrier in this context is when leaders in companies do not fully support diversity. One of the study participants put it this way: "I don't have, nor do I expect complete buy in. We actually do not have total support from everybody in the corporation. However, the person who was the most important for the diversity strategy to work was the CEO."

Half of the study participants identified slow involvement as a barrier. One of the participants described this barrier in the following way: "Some groups of people are much slower in reacting to change than others. That is a barrier that we encounter within the organization. If you have six business units, and two of them are slower than the others in implementing the diversity initiatives, people do observe and that is a double edged sword. It is especially negative when the slower ones represent business units with significant size." Leaders being slow in implementing their diversity initiatives can create other obstacles, such as people within the business units complaining, missing work, becoming dissatisfied, and quitting and leaving the company.

**Barriers of Diversity Initiatives.** The study participants identified several barriers that the researcher categorized under barriers of diversity initiatives. The three barriers most frequently mentioned under this category were: (a) difficult to evaluate, 6 (75%); (b) difficult to show return-on-investment, 4 (50%); and (c) organizational policies interfering with diversity initiatives, 4 (50%).

Seventy-five of the study participants identified the difficulty to evaluate diversity initiatives as a barrier. According to the study participants, diversity initiatives are difficult to evaluate because many of them are long-term and cannot demonstrate their impact and effectiveness as easily as other types of business initiatives. Half of the study participants identified the difficulty of diversity initiatives to show return-on-investments as a barrier. According to the study participants diversity initiatives may take a long time to show their impact; therefore, it is difficult to measure the financial gain that may have resulted from the money invested on them. They also indicated that it was very difficult to develop methods for measuring the profitability gain that resulted from the money invested in diversity initiatives. Half of the study participants identified organizational policies interfering with diversity initiatives as a barrier. Participants indicated that out-dated organizational polices often do not accommodate the changes taking place in the diverse workplace and may not allow the proper implementation of the diversity initiatives. Participants stated that companies need to revise organizational policies and procedures that support diversity and help the organizational culture continually adapt in response to the changing workforce.

**Preventing Failure of Diversity Initiatives**

The third major research question in the study addressed what can be done to prevent failure of diversity initiatives. After having identified the barriers that have hindered the progress of diversity initiatives, the study participants were asked to provide information on what they have done to prevent failure of diversity initiatives. The six most frequently mentioned ways that were identified by the study participants were: (a) obtain top management commitment, 7 (88%); (b) treat diversity as a business issue, 6 (75%); (c) conduct diversity initiative planning, 5 (63%); (d) provide diversity training and education, 4 (5%); (e) communicate the value of diversity, 4 (50%); and (f) approach diversity as branches, units or corporations are being created, 3 (38%).

Eighty-eight percent of the study participants indicated that top management commitment was a way to avoid failure of diversity initiatives. Having top management support was seen as a way to prevent many of the corporate and people barriers. For example, a study participant stated, "Having executive leadership support makes a big difference. Having their participation and visual commitment helps avoid failures, such as implementation of policies that can hinder the development of diversity initiatives."

Seventy-five percent of the study participants reported that, to prevent failure, diversity initiatives had to be considered a serious business issue. This meant that diversity initiatives had to be connected to the corporate business strategy. When diversity initiatives were treated as business strategies, then corporate barriers such as competing agendas and economic changes were more likely to be eliminated.

Sixty-three percent of the study participants identified planning as an effective way to prevent failure. According to the study participants it took much time and effort to develop effective diversity plans that were flexible, easy to understand, and linked to corporate strategic plans. Half of the study participants indicated that diversity training and education played an important role in avoiding potential failure of other diversity initiatives. Training and education was considered an effective tool to assist in removing barriers such as people not understanding the value of diversity, slow involvement, resistance to change and unwillingness to participate. Diversity training was a way to communicate the
importance of diversity and its impact on the organization. Communicating the value of diversity was reported by half of the study participants, as a way of preventing failure of diversity initiatives.

Thirty-eight percent of the study participants stated that an effective way to prevent failure and ensure success is by introducing diversity management as units, branches, or corporations are being created, formed, or transformed. One of the study participants put it this way: "The good news is that we are creating a new company. What we are doing at this point is addressing diversity as we are creating this new company, as opposed to going back and trying to change an organizational culture that has already been established. It is the most opportune time to be involved in diversity. Diversity is part of the three new policies and foundations that we are going to operate under. When diversity is integrated into the culture of an organization from the very beginning, people look at it through different eyes, which is really great."

Discussion

This study revealed that a wide range of barriers are likely to hinder the success of diversity initiatives in multinational corporations. The findings of this study indicate that, unfortunately, diversity initiatives are not free from barriers that hinder their progress. Barriers come in different forms and they may appear at any time during the developmental process of diversity initiative--that is planning, implementation, and evaluation. This study specifically found sources of barriers. Barriers to diversity initiatives come from the work environment, people, and even from the diversity initiatives themselves. Diversity leaders, human resource development professionals, managers and anyone else who supports diversity initiatives in corporations should be aware of the specific barriers to diversity initiatives and their sources so that they can be prevented from blocking the successful development and implementation of diversity initiatives. Although the specific barriers to diversity initiatives vary from organization to organization, their effect is the same in the sense that they are detrimental to the progress of diversity initiatives.

Diversity initiative planning was identified as an important way of preventing failure of diversity initiatives in corporations. The importance that planning is essential for having successful diversity initiatives has been reported by many authors (Arredondo, 1996; Poole, 1997). Arredondo (1996) stated that not having a plan may be perceived as giving less value to the diversity initiatives. Corporations that engage in diversity initiative planning show that they take diversity initiatives very seriously because they can then develop well-thought diversity strategic plans.

Furthermore this study revealed the factors that assist in the success of diversity initiatives in multinational corporations. Having a strategic plan for diversity initiatives, senior management commitment and support, diversity linked with strategic business plan, recognizing that diversity is a business imperative, and having an organizational culture that values diversity were all identified as important factors that assist in the success of diversity initiatives in multinational corporations. To be able to implement effective diversity initiatives, HRD professionals and other corporate leaders will need to have a global mindset. According to Florkowski (1996), having a global mindset means that business leaders find creativity in diversity; value diversity that is accomplished though their personal, professional, and organizational objectives; and promote a culture that supports inclusiveness. This global mindset is important when implementing effective diversity initiatives that increase the diversity of employees, products, markets throughout the world, and achieve a competitive advantage.

Diversity training and education was identified as playing an important role in avoiding potential failure of other diversity initiatives. Training and education was considered an effective tool to assist in removing barriers such as people not understanding the value of diversity, slow involvement, resistance to change and unwillingness to participate. Diversity training was a way to communicate the importance of diversity and its impact on the organization. Although organizations are using a broad range of initiatives in their efforts to manage diversity, training is widely used strategies in effectively managing diversity in the workplace (Baytos, 1995; Martino, 1999). Florkowski (1996) found that training and education are considered the most effective international diversity initiative used by multinational corporations. They also found that training as an international diversity initiatives is a growing concern for organizations operating in international settings. Similarly, Littlefield (1995) reported that representatives of over 50 countries identified diversity training as a key intervention to solve diversity problems.

The results of this study seem to indicate that many challenges lay ahead in managing diversity successfully. It seems vitally important for diversity leaders and human resource development professionals to find mechanisms and strategies by which to identify and understand barriers that hinder the success of diversity initiatives on a on-going basis. Diversity leaders and human resource development professionals also need to show their level of commitment to diversity by developing short and long-term strategies to address diversity issues in substantive ways. However,
such change and transformation within organizations is difficult and leadership at all levels must be involved in the process (Johnson, 1996).

Determining the specific barrier that hinder the successful implementation of diversity initiatives in corporations is one of the first step in developing strategies and initiatives that remove barriers and assist and support the success of diversity initiatives. Barriers that hinder the success of diversity initiatives prevents organizations from developing the full potential of their workforce, which they greatly need today, as they face worldwide competition.

Developing Organizational Awareness: Gaining a Distributed View of Organization-Level Change in Workforce Diversity Awareness

Martin B. Kormanik
O.D. Systems, Inc.

Despite the prevalence of diversity programs, few measures have been identified for assessing their effects. This study shows that using the cycle of awareness development (CAD) model to examine individual employees’ awareness development regarding workforce diversity may serve as a measure for assessing organization-level outcome. Implications for theory and practice are discussed, along with suggestions for further research.

Keywords: Organizational Change, Awareness Development, Diversity

The work environment has experienced wrenching change in recent years. One factor that has been a compelling force for organizational change is workforce diversity. Studies of U.S. demographic changes indicate that the American workforce will continue to grow more diverse (Tsui & Gutek 1999). Lifestyle and societal attitude changes that impact the workplace are occurring at such a rapid pace that they are difficult to manage (Ingrassia, 1993). The "increasing awareness of how our melting pot society affects business has increased the demand for diversity" programs to help organizations deal with change (Caudron, 1993, p. 51).

Diversity Programs in Contemporary Organizations

As of 1997, approximately one-third of the 500 largest companies in the United States (U.S.) had developed programs addressing workforce diversity, and another one-third had programs in the planning stages (Blackmon, 1997). The primary objective for diversity programs is enhanced organizational, work group, and individual effectiveness (Lobel, 1999). Diversity programs are expected to impact attitudes, individual and team performance, human resource management, and strategic organizational goals.

Diversity programs frequently use a systems approach, initiated by some sort of organizational culture audit addressing the organization’s informal culture, policies, and management practices (Wilson, 1997). This serves as an organizational needs assessment, establishing a measure of the current status of the organization. From this baseline, management develops a comprehensive diversity strategy, including: the vision/mission for the diversity effort; specific objectives the effort is to achieve; specific initiatives to undertake in support of the diversity vision; and, a plan for implementation. Part of any diversity program strategy is the expectation for continuous improvement, requiring constant assessment of progress on diversity program objectives. The diversity program strategy should include an annual or follow-on cultural audit, demonstrating the extent that change has occurred, or is occurring, around the management of workforce diversity.

Some diversity programs focus primarily on race and gender, while others include the broad spectrum of diversity factors such as age, socio-economic status, and occupational differences (Tsui & Gutek 1999). The majority of diversity awareness training programs focus on appropriate workplace behaviors, emphasizing sensitivity and understanding of difference. Increasingly, diversity programs look beyond legislating employee behaviors to changing attitudes. Fundamentally, any diversity program must create awareness of workforce diversity, its impact on the workplace, and its impact on the organization’s bottom-line (Wilson, 1997).

Problem Statement

Measuring progress in accomplishing the desired outcomes is critical to diversity program effectiveness and longevity (Lobel,1999; Wilson, 1997). Tsui and Gutek (1999) focus on two broad categories of desired diversity program outcomes: task and social. Although assessing program outcomes has consistently been an area of focus, the lack of appropriate diagnostic tools and measures for assessing program outcomes is problematic. Commonly used measures focus on task outcomes such as organizational performance (e.g., increased profit, fewer customer complaints) and demographic indicators (e.g., increased representation of underrepresented groups, reduced turnover). There is a need for additional measures for assessing the efficacy of diversity programs regarding social outcome dimensions, such as increased awareness or awareness development.

The cycle of awareness development (CAD) model is helpful for analyzing awareness development regarding a transitional issue, understanding differences in reaction to the same transitional issue, and planning interventions that support awareness development through the cycle (Kormanik, 1999). The effective management of workforce diversity is one such transitional issue. Kormanik and Sturdevant (2001) demonstrate the practical utility of using the CAD model for analyzing change at the organizational level by showing that the examination of individual employees' awareness development around the transition issue of planned organizational change provides a distributed view of organizational-level awareness development. The purpose of this paper is to demonstrate the practical utility of using the CAD model to take a distributed view of organization-level awareness of workforce diversity issues and assess the change in awareness over time (i.e., social outcome). Data collection and analysis from a diversity training initiative provides empirical evidence.

Research Question

Two research questions guide the study: What is the practical utility of using the CAD model for analyzing the level of awareness of workforce diversity issues at both the individual and organizational levels? Can longitudinal analysis using the CAD model provide a social outcome measure of diversity program effectiveness through a distributed view of organizational change in awareness of workforce diversity issues?

Theoretical Framework

Awareness development is a construct for describing the changes that occur in an individual as he or she goes through life transitions (Kormanik, 1999). The transitional issue inducing awareness development may be anticipated (e.g., marriage) or unanticipated (e.g., job layoff). It may be positive (e.g., adopting a child, starting a new job) or negative (e.g., death of a loved one). Regardless of the issue, the transitional change and its associated awareness development is an integral part of every adult's experience, yielding cognitive, psychosocial, and behavioral effects. Kormanik describes the CAD as a five-stage model drawing from multiple disciplines, including adult development and learning. The model is helpful in the analysis of an individual's awareness development in relation to a transitional issue, understanding variance in different individual's reaction to the same transitional issue, and planning interventions that support an individual's awareness development through the cycle.

Through the course of any organization's existence it also experiences transitional issues that effect development and learning. Bridges (1991) describes an organizational transition as "the psychological process people go through to come to terms with the new situation" (p.3). Transitional issues include planned change initiatives (e.g., reorganization) as well as unanticipated events (e.g., workplace violence). The issue may be obvious and discrete (e.g., merger with another organization) or subtle and chronic (e.g., process improvement). As with individuals, the CAD model may be helpful for analyzing organizational awareness of the transitional issue, understanding changes in reaction to the issue, and planning organizational interventions that support awareness development.

Application of the process of awareness development at the organizational level emerges from the concept of organizations as social systems (Parsons, 1951), where making meaning tends to be done through the social interaction of individuals (Mezirow, 1985). Awareness development parallels the process of making meaning, with the process yielding cognitive, psychosocial, and behavioral effects. The management literature provides examples specifically linking the individual and organizational levels of analysis. Robbins (2000) makes a fundamental case by defining organizational behavior as the study of individuals' attitudes and actions so as to understand, predict, and control individuals' behaviors in the organizational context. Huber (1991) provides a thorough discussion of the contributing processes and the literatures linking adult learning theory with organizational learning. In particular, Callahan (2000) demonstrates a linkage similar to that described in this paper in a study using emotion work actions by individuals to take a distributed view of organization-level phenomena.

Awareness Development as a Construct

Awareness development is grounded in the adult development and psychology literature, particularly life transitions (Kormanik, 1999). Life transitions occur when "an event or non-event results in a change in assumptions about oneself and the world and thus requires a corresponding change in one's behavior and relationships" (Schlossberg, 1981, p. 5). Two individuals confronted by a transitional issue will likely differ in their perception of the issue based on their perspective or meaning schema (Schon, 1987). Central to the construct of awareness development is
Potential behaviors represent learning. The individual will remain at integration only until the next issue comes along. The individual may have already need for control is basic to self and describe research showing depressed individuals are hyper-realistic about their cognitive approach to organizational learning. Organizational inertia impedes development (Newman, 2000). The intellectualization stage is evident in the rational routines remain unchallenged. Does not involve fundamental change" (Newman, 2000, p. 604). First-order change is incremental and convergent. It helps firms maintain reliability; it may involve adjustments in systems, processes, or structures, but it does not involve fundamental change” (Newman, 2000, p. 604). Existing mental schema and organizational routines remain unchallenged. This echoes Cook and Yanow’s (1996) view of change without learning. Organizational inertia impedes development (Newman, 2000). The intellectualization stage is evident in the rational cognitive approach to organizational learning. Intellectualization at the organization level reflects Huber’s (1991) stipulation that gaining knowledge does not necessarily imply learning. Encounter, the third stage of awareness development begins reflecting the issue. He or she moves from the pre-encounter stage into intellectualization, the second stage of awareness development. The individual begins to recognize the issue, yet there is little or no emotional involvement. The individual in the intellectualization stage spends a great deal of time on mental gymnastics, repeating a pattern of single loop learning and enjoying the intellectual discourse on an issue that does not really affect them. Argyris’ (1982) description of single loop learning focuses on cognitive development using existing routines and mental models, causing self-reinforcing patterns rather than developing new solutions for presenting issues. Single-loop learning also plays out at the organizational level, in tandem with first-order organizational change. “First-order change is incremental and convergent. It helps firms maintain reliability; it may involve adjustments in systems, processes, or structures, but it does not involve fundamental change” (Newman, 2000, p. 604). Existing mental schema and organizational routines remain unchallenged. This echoes Cook and Yanow’s (1996) view of change without learning. Organizational inertia impedes development (Newman, 2000). The intellectualization stage is evident in the rational cognitive approach to organizational learning. Intellectualization at the organization level reflects Huber’s (1991) stipulation that gaining knowledge does not necessarily imply learning. Encounter, the third stage of awareness development, begins when the individual has the primary experience with the issue. This may be sudden, due to a critical incident, or it might be a gradual slide after an extended, low-level exposure to the issue. The individual in the encounter stage has total and extended immersion in the issue, resulting in intense emotional involvement. The individual often perceives his or her social power has been threatened, eroded, or taken away. The feeling of powerlessness and loss of control are paramount in the “rage stage” or “valley of despair” of the encounter stage of awareness development. Gurin and Brim (1984) suggest the need for control is basic to self and describe research showing depressed individuals as hyper-realistic about their...
lack of personal efficacy. Personal efficacy means “judging the self as capable, as a person able to produce acts that should lead to desirable outcomes” (p. 283). Individuals in the encounter stage perceive their capability is substantially diminished, with the total immersion in the transitional issue creating a blindness that inhibits further progression in awareness development and growth. Similarly, the organization might move into the encounter stage due to a crisis or critical incident, or it might slide into the encounter stage due to performance below aspiration level. In both instances, the encounter stage of the CAD model represents a substantial restraining factor (Lewin, 1951), impeding organizational growth and development.

The fourth stage of awareness development is empowerment. This stage includes seeking and finding strategies for securing enough power to make necessary changes while managing risks. The empowerment stage requires reflection, where negative judgment is suspended. The individual begins to use his or her discretion in a more rational manner. During the empowerment stage, the feelings of powerlessness and loss of control generated during the encounter stage are reconciled. Individuals begin to recognize the extent of power they have within their span of control and, even if that power is limited, use that power to regain a sense of control. A critical aspect of the empowerment stage involves enlisting the aid of others through the development and maintenance of support systems (e.g., mentors, confidants, networks). The feedback learning loop that support systems provide fulfills the need for coaching the individual in the empowerment stage. Feedback as a strategy to use in the empowerment stage requires a discourse or dialogue. It serves as the making-meaning piece, enabling the individual to move beyond the frustration, anger, and misperception of the encounter stage. Mezirow (1985) suggests making meaning tends to be done socially. Gurin and Brim (1984) identify “attention and processing of social information as the first step in change” (p. 312). For the organization, Kram (1988) notes the importance of workplace social systems for supporting individual development and reconnecting an individual, such as one experiencing the isolation of the encounter stage.

Integration, the fifth stage of awareness development, represents “being whole.” The individual has regained his or her sense of control. The effects of the issue that precipitated the encounter stage dissipate. The individual knows “what” they do and “why” they do it as a result of the cognitive and psychosocial development during the preceding stages. The individual is capable of helping himself or herself, as well as others, be effective and successful in their coping and adaptation efforts. For the individual, the cognitive and psychosocial development represented by moving through the empowerment stage into the integration stage represents the growth piece. As the individual moves into the integration stage, he or she has in place new and more effective ways to resolve or at least cope with the issue that precipitated the encounter stage. In the integration stage there is practical application of strategies for moving beyond the crisis of the encounter stage. Sternberg (1985) defines pragmatic intelligence that emphasizes experience and real-world context, where problem solving in everyday life occurs naturally. Awareness development through the integration stage is also similar to the double loop learning suggested by Argyris (1982). Perspective transformation is a fundamental change in the way the individual views the world (Mezirow, 1985; Schon 1987). Movement to the integration stage around a particular transitional issue embodies the concept of perspective transformation. The integration stage at the organization level represents ongoing adaptive organizational change (Brown & Eisenhardt, 1998) and organizational transformation (Newman, 2000), where awareness development leaves the organization better able to compete in its changing environment. Strategies put in place during the empowerment stage enable the integration stage focus on second-order learning (Lant & Mezias, 1996) or double-loop learning (Argyris & Schon, 1978) involving the search for new routines and schemas. Argyris and Schon suggest double-loop learning is most likely when existing routines become ineffective or when new information cannot be understood within the currently accepted schema. A consistent overarching theme has been the movement toward organizational learning to promote successful navigation of change (Schwandt & Marquardt, 2000). Second-order learning facilitates second-order organizational change (Newman, 2000).

Methods

Empirical application of the CAD model at the organizational level was demonstrated through study of a single entity bounded by time and activity. The site was a U.S. Government agency with a technical mission. Personnel included engineers, technologists, and tradesmen, along with administrative and clerical support employees. As part of the organization’s diversity program, it undertook a training initiative focused on increasing diversity awareness and skills-building for effectively working with and through others, in an increasingly diverse workforce. The multi-day training was mandatory for all employees, including managers, supervisors, and nonsupervisory personnel. The organization conducted 43 training sessions between December 1994 and February 1997, with 886 employees participating in the training. To maximize diversity, each training session included a representative mix of employment levels and occupations, as well as other demographic diversity factors, such as race and gender.
The fieldwork for this study was completed in conjunction with the training initiative. Subjects were the training participants. As part of each training session, the trainers provided an overview of the CAD model, applying it to workplace issues. Quantitative data came from a survey instrument included in the training materials asking each participant to identify where he or she perceived the organization in its awareness development of workforce diversity issues and where each participant perceived his or her own individual awareness development around workforce diversity issues. After the overview, each participant completed the instrument during the training. Frequencies for response sets from all participants were tabulated using statistical software. Additionally, analysis of variance (ANOVA) was conducted to compare the means between the first three and last three training sessions. Qualitative data augmenting the quantitative data came from participants' discussion of the agency's awareness development around diversity, as compared to their own individual awareness development. Qualitative data also came from conversations with the Diversity Program Manager, the organization's Board of Directors, and the employees' Workforce Effectiveness Advisory Council. The qualitative data included first-hand observations from the author's meetings and telephone conversations with agency representatives. Other data came from the organization's strategic business plan, diversity program plan, internal memoranda, and related documents.

Limitations

This study is limited in several ways. It is an analysis of one organization. The self-reported data came from asking members of the organization about their perceptions. Although the responses were anonymous, the survey instrument was completed as part of a mandatory training initiative. This study did not take into consideration the organization's other previous and concurrent diversity program initiatives. There were no assumptions about the benefits of workforce diversity programs, or workforce diversity itself. There was no attempt to evaluate the agency's diversity program. Lastly, although organizational diversity programs are often multi-focused, with initiatives on career development and planning, employee involvement, legal and governmental mandates, culture change, organizational and interpersonal communication, training and education, and community outreach (Lobel, 1999), there is no distinction among discrete diversity program initiatives.

Results

Usable data was obtained from 837 subjects. In relation to the first research question regarding the practical utility of using the CAD model for analyzing the level of awareness of workforce diversity issues, participants recognized that the organization exhibits all levels of awareness development around the issue of workforce diversity. Participant responses indicate that in some regards the agency does not understand the need for managing diversity (i.e., pre-encounter); that the majority of the agency "talks a good game" but really isn't serious about addressing workforce diversity issues (i.e., intellectualization); that in many regards the organization is struggling in encounter around the impact of workforce diversity; that in some instances the agency is trying to develop strategies for adaptation and coping with diversity (i.e., empowerment); and, that in a few ways the agency is effectively managing workforce diversity without any problem (i.e., integration). Frequencies for responses are shown in Table 1.

</table>

* Percentages do not total 100% because some respondents identified more than one stage.

Participants also recognized that agency employees exhibit all levels of awareness development around workforce diversity. Participant responses indicate that there are those who are not aware of workforce diversity issues; those who can intellectualize and understand workforce diversity issues on an impersonal level; those who are struggling in their personal encounter with workforce diversity; those who are developing strategies for adaptation and coping with workforce diversity; and, those who have developed their awareness level to where they can deal effectively with workforce diversity. Participants perceived themselves as further along in their own awareness development than they perceived the organization. This finding was consistent with Kormanik and Sturdevant's (2001) findings on awareness development around the transitional issue of planned workplace change.
Regarding the second research question, longitudinal analysis using the CAD model provided a measure of diversity program social outcome through a distributed view of organizational-level change in awareness of workforce diversity issues. Although not statistically significant, ANOVA comparison between the data from the first three and last three training sessions showed a discrete overall shift in the means for each level of analysis. The data indicate that individuals and the total organization moved through the CAD; there was change in awareness development around workforce diversity. This finding also echoes Kormanik and Sturdevant’s (2001) findings, yet the findings differ in the stage of awareness development. The majority of participants in this study saw themselves individually at the empowerment stage regarding workforce diversity awareness development (46%) and placed the majority of the organization at the intellectualization stage (35%). Kormanik and Sturdevant’s (2001) findings show the majority of participants saw themselves at the integration stage around the issue of planned organizational change (48%), yet placed the majority of the organization at the encounter stage (37%).

Conclusions

Diversity initiatives in the workplace take careful forethought, and with a similarly thoughtful implementation yield positive results when there is organizational commitment and awareness of the impact of diversity. Identifying organizational needs, choosing a diversity strategy that includes rather than alienates employees, and integrating diversity into the business strategy are key steps in making sure that any diversity program starts off on the road to success. Commitment to diversity programs, however, is wavering (Lobel, 1999). Identification of adequate measures for assessing the task and social outcomes of diversity programs is essential. Measures of effectiveness enable comparison between the current state and the desired state, providing indications of individual and organizational change. The empirical results of this study demonstrate the practical utility of using the CAD model as a social outcome measure of effectiveness for analyzing awareness of workforce diversity issues at the organizational level. Longitudinal examination of individual employees' awareness development around the transition issue of diversity provides a distributed view of organizational-level change in diversity awareness.

Contribution to New Knowledge in HRD

In application at both the individual and organizational levels, CAD provides a useful theoretical framework that helps predict, explain, and interpret attitudes and behaviors associated with workforce diversity. The framework provided by the CAD model may be helpful in a variety of organizational settings to analyze both discrete perceptions about workforce diversity issues, as well as progress made in transforming an organization toward a desired state. The CAD model may suffice as a diagnostic tool and measure for assessing organizational change.

Implications for Practice

The CAD model has utility for application as a diagnostic measure for practitioners. Wilson (1997) stresses the importance of measuring progress in accomplishing diversity program objectives. Linking CAD data to program objectives may be helpful for assessing current diversity program initiatives and for planning subsequent initiatives. The validity of CAD as a measure of effectiveness should be determined directly from stakeholder expectations. Once CAD is linked to program objectives and validated as an appropriate measure of effectiveness, specific metrics for assessing change should be determined (e.g., a 5% increase in awareness development). It is worth noting that the literature shows a trend toward diversity programs that provide employees with awareness and tools for transforming the organizational culture over time. Unfortunately many stakeholders look for significant and immediate organizational change. Assessment should be longitudinal; multiple readings over time with appropriate metrics that benchmark incremental change.

The data from this study indicate employees’ differing levels of awareness development around workforce diversity; some understand it while others do not. Much of the inequity in organizations occurs because employees are treated the same and differences are ignored (Wilson, 1997). Effectively managing diversity means acknowledging differences, including “acknowledging individual employee needs and then accommodating these needs” (p. 18). Treating all employees as if they have the same awareness of workforce diversity may prove problematic. Instead, practitioners should ensure that diversity programs plan for addressing differing levels of diversity awareness development. The diversity strategy should include provisions for helping employees move through the CAD model. Those who are in the pre-encounter stage of awareness development need help in understanding that workforce diversity is a legitimate issue. Those in the intellectualization stage need learning opportunities to move beyond only cognitive to psycho-social and emotional learning. Those in the encounter stage
need a safe harbor for constructively venting their frustration, anxiety, anger, and fears regarding the changing workplace. These individuals need help in making sense of the changed workplace and in regaining their sense of personal control, so they can move out of the encounter stage to the empowerment stage. Communicative learning through social support systems can foster movement through the empowerment stage to the integration stage.

Much of the research on organizational learning and change focuses on strategies that would be useful for facilitating movement out of encounter into the empowerment stage of the CAD model. These include critical reflection (Brooks, 1999), informal learning (Volpe, 1999), preserving morale (Mishra et al., 1998), using the manager-as-trainer approach (Watkins, Ellinger, & Valentine, 1999), developing emotional capability (Huy, 1999), and encouraging extrarole efforts (Morrison & Phelps, 1999). Hedberg (1981) highlights the need for the unlearning of existing cognitive maps and frames of reference that affect organizational routines before new learning can occur.

Practitioners must be ready to assist employees and management in moving through the cycle, while recognizing that some work groups and individual employees will need additional help in moving beyond the encounter stage. Diversity training programs, for instance, should focus on moving employees out of the pre-encounter stage to enhance their understanding of what one of their coworkers might be going through as a result of his or her individual diversity. Practitioners must recognize that confrontational diversity training forces people into the encounter stage. While this training method may be appropriate, the training design must also move the participant out of the encounter stage, through the empowerment stage, to the integration stage via skills building and development of support systems and networks.

Areas for Further Study

Any number of questions remain regarding awareness development and the variety of dimensions of diversity. Are there awareness development implications in cross group comparisons? Can a male fully understand the encounter stage precipitated by gender inequities experienced by a female coworker? Would the dynamic be similar between two minority employees? How can a clerical employee who has regained his or her sense of worth and contribution to the organizational mission by moving into the empowerment stage, effectively interact with the core occupation employee who has no concept of his or her careless dismissal of support personnel? How can the single employee move beyond the rage stage of encounter when, yet again, he or she is expected to go on travel or work late because other colleagues need to get home to their families? Can generalized expectancies for diversity awareness development be discerned regarding ingroup/outgroup members?

The construct of awareness development is ripe for further empirical study demonstrating transition through the cycle at the individual, group, and organizational levels of analysis. While this paper has shown that the CAD model provides practitioners with an organizational assessment tool, its utility should be explored further. Both qualitative and quantitative analyses of where the organization is in the CAD model can be determined through the collection of discrete and longitudinal data examining change in awareness development over time in a variety of other organizations. Cause/effect of awareness development should be explored. We need more compelling arguments regarding the cycle, particularly the variables that affect progression through the cycle. Much remains to be done before the practical utility of the concepts presented in this paper can be realized.

Diversity Dialogues in the Workplace: A Study of Implementation Issues

Martin B. Kormanik
Kim S. Apperson
O.D. Systems, Inc.

The structured process of dialogue encourages self-reflective conversation and inquiry that breaks through tension and conflict created by difference. The process has primarily been used in a social or civic context. Some organizations have begun exploring dialogue as a discrete initiative in diversity programming efforts. This study provides empirical data examining the workplace implementation of a structured dialogue on diversity. Discussion highlights strategies for maximizing participation and effectiveness in a workplace implementation. Implications for practitioners and suggestions for further research are noted.

Keywords: Dialogue, Diversity, Training

Studies of United States (U.S.) demographic changes indicate that the American workforce will continue to grow more diverse (Tsui & Gutek 1999). Lifestyle and societal attitude changes that impact the workplace are occurring at such a rapid pace that they are difficult to manage (Ingrassia, 1993). Workforce diversity has become a major area of focus in the contemporary organizational environment, with many organizations striving to increase the understanding and effective management of a diverse workforce through formalized diversity programs (Wilson, 1997). The “increasing awareness of how our melting pot society affects business has increased the demand for diversity” programs to help organizations deal with change (Caudron, 1993, p. 51). Organizational effectiveness requires viewing broad diversity issues (e.g., communication, teambuilding, interpersonal relations) as systemic in nature (Beer & Eisenstat, 1996). A diversity program, therefore, represents a long-term change process, not an isolated event (Caudron, 1993; Johnson & O'Mara, 1992).

Formalized diversity program objectives generally focus on three areas of change: increasing representation of underrepresented groups, increasing awareness and sensitivity, and developing an organization culture that supports change (Washington, 1995). Each of these foci have implications for planning specific diversity program initiatives. Consequently, programs generally include multiple initiatives (Wilson, 1997). A training course may be only one of several initiatives sponsored under an organization’s diversity program. Other initiatives may include a “diversities day,” formal recruitment programs, poster campaigns, seminars on legal issues, brown bag discussions, guest speaker series, focus groups, and teambuilding retreats.

Recently, some organizations have begun exploring structured dialogues on diversity (Kormanik, Krieger, & Tilghman, 2000). The theory and practice of dialogue provides a process for opening up conversation that enhances awareness and understanding of controversial and divisive subjects (Roth, Herzig, Chasin, Chasin, & Becker, 1995). The structured dialogue process is now being applied as a model for enhancing awareness and understanding of workforce diversity issues (Todd, 1994). In these instances, the dialogue process is primarily designed to enhance individual growth through personal development and understanding, rather than focusing on diversity programs’ traditional objective of organizational or work group effectiveness.

Problem Statement

Embarking upon a diversity program initiative without having clear goals in mind can often create more problems and tension than if nothing had been done at all (Rynes & Rosen, 1995). Careful planning is needed to ensure alignment with the organization’s diversity program strategy and to optimize the success of each program initiative, including diversity dialogues. Also problematic is the lack of information on optimal strategies for conducting structured diversity dialogues in a workplace context, given the amount of resources (e.g., time, money) that would be allocated to the implementation of a large-scale diversity dialogues initiative. For example, Kormanik, Krieger, and Tilghman (2000) show that drawing dialogue participation from an intact work group may be problematic due to mission priority. The organizational culture may not support pulling a critical mass of employees away from doing “real work” so they can have a “rap session.” Fear of reprisal is an additional deterrent to using the dialogue process in a workplace setting with a group of participants from an intact work group. This
differs from Karp & Sutton's (1993) recommendation that effective diversity program initiatives include intact work groups to maximize the likelihood of cultural change.

This paper presents a study of the workplace implementation of a structured diversity dialogues initiative. The purpose of the study is to provide a narrative of the process and provide empirical data collected from dialogue participants regarding participation, implementation, and effectiveness issues.

Research Question

One question drove the research process: What strategies should be used for implementing structured diversity dialogues in an organization whose culture places priority on mission accomplishment to the detriment of attention to workplace diversity issues?

Theoretical Framework

The theory and practice of structured dialogue focus on opening up conversations to enhance awareness and understanding of controversial and divisive subjects (Roth, et al, 1995). The dialogue process is often applied to discussions of polarizing societal issues like abortion, capital punishment, and gay marriage (Study Circles Resource Center [SCRC], 1993). Dialogues as a workplace diversity program initiative most directly address the diversity program objective of increasing employee awareness and sensitivity.

Dialogue, however, is different from sensitivity training, active listening, debate, and other such communication processes in that it is collaborative, with two or more individuals working toward finding common ground (SCRC, 1993). Dialogue "emphasizes the idea of a 'meaning' that flows between people from which emerges a greater understanding—possibly even a shared meaning" (Weinstein, 1995). Dialogue requires temporary suspension of one's beliefs, opening up to critical reflection, and reevaluation of underlying assumptions (SCRC, 1999). The open-ended nature of dialogue suggests that there are no "right" answers, nor is there a need to find a solution. It is the process of engaging individuals in the dialogue that is most important to the learning process.

One of the distinctions of adult learning is that adults have a life of experiences to draw from. An adult's "frames of reference" represents the assumptions through which they understand their life experiences (Mezirow, 1997). Frames of reference define the adult's life world and shape the adult's mental and behavioral activity. Adults tend to reject factors (e.g., ideas, values, associations, feelings, responses) which are not in sync with their frames of reference. Mezirow identifies "point of view" and "habits of mind" as two dimensions of frame of reference.

"Habits of mind are broad, abstract, orienting, habitual ways of thinking, feeling, and acting influenced by assumptions that constitute a set of codes. These codes may be cultural, social, educational, economic, political, or psychological. Habits of mind become articulated in a specific point of view—the constellation of belief, value judgment, attitude, and feeling that shapes a particular interpretation" (p. 5).

Mezirow (1997) identifies four processes of learning: elaborating on one's existing view, identifying new points of view without changing one's own, transforming one's point of view, and transforming one's habit of mind. A diversity dialogue focuses on the transformative learning processes identified by Mezirow.

"We can have an experience in another culture that results in our critically reflecting on our misconceptions of this particular group. The result may be a change in point of view toward the group involved. As a result, we may become more tolerant or more accepting of members of that group. If this happens over and over again with a number of different groups, it can lead to a transformation by accretion in our governing habit of mind" (p. 7).

The dialogue process is designed to transform point of view, reveal assumptions for reevaluation, and cause introspection on one's own position (i.e., challenge habit of mind) (SCRC, 1993).

The dialogue process is structured to encourage the active involvement of all participants (Roth et al, 1995). Abella (1986) shows that getting people involved and showing application to day-to-day life, versus didactic presentation of theoretical or legal information, is the more effective methodology for a diversity program initiative. The dialogue structure also entails a dialogue group meeting at regular intervals to continue the questioning, listening, and reflection processes (SCRC, 1993). Part of the structure comes from a prepared package of materials comprised of a statement of the purpose of the dialogue, ground rules for participation in the dialogue, and an array of articles on the dialogue topic that provide a diversity of perspectives (SCRC, 1999).
Individual and Organizational Change

The dialogue process indirectly addresses the diversity program objective of systemic culture change. Hersey and Blanchard (1982) identify knowledge (i.e., facts, information), individual attitude (i.e., mindsets, values, biases, stereotypes), individual behavior (i.e., actions), and group behavior (i.e., mores, norms) as four building blocks of change. Hersey and Blanchard's (1982) individual attitude construct is emblematic of Mezirow's (1997) habits of mind and point of view. Group behavior in this context corresponds to Hofstede's (1980) collective mental programming and Schein's (1992) organizational culture. Hersey and Blanchard suggest that change occurs in one of two cycles. Change is either participative, based on personal power (e.g., personality, education, experience, expertise), or directive, based on position power (e.g., law, regulations, guidelines, rank, title).

Optimally, a diversity program includes initiatives that entail participative and directive change cycles. Management has the power to mandate that all employees participate in diversity program initiatives (i.e., directive change). The structured dialogue process, however, is traditionally oriented toward participative change, rather than directive. Participation in the process increases the individual's knowledge base, providing motivation for the individual to change (Abella, 1986). Knowledge gained from participation leads to individual attitude change, which theoretically leads to individual behavior change. Using Hersey and Blanchard’s (1982) model for change, once a critical mass of individuals change their behavior, group behavior change occurs (i.e., organizational culture change).

Although dialogue is primarily oriented to the individual level of analysis, the process is also applicable to the organizational setting as a way of cutting through the communication barriers separating organizational subcultures (Schein, 1995). Over time, individuals within the same organization who engage in dialogue will develop shared mental models (i.e., frames of reference), including assumptions about the world, the way the things gets done, and the way things should get done (Boyett, 1995). Organizational learning occurs through the development of these shared mental models. Without shared mental models, organizational learning may be stifled because individual efforts might not be directed towards group or organizational goals.

Many authors suggest that a structured dialogue process involving critical reflection should be the foundation of effective action within any organization (Marquardt, 1999; Schein, 1995; Weinstein, 1995). Schein (1993) argues that "dialogue is necessary as a vehicle for understanding cultures and subcultures, and that organizational learning will ultimately depend upon such cultural understanding. Dialogue thus becomes a central element of any model of organizational transformation" (p. 40). Unlike many diversity initiatives, diversity dialogues move beyond shaping behaviors to changing personal attitudes and challenging prejudice and stereotypes. This change process is ideally suited to a diversity program initiative.

Methods

This was a study of a single entity bounded by time and activity. Lincoln and Guba (1985) suggest that such a study be conducted in a natural setting, noting that phenomena "take their meaning as much from their contexts as they do from themselves" (p. 189). The organizational context provided the natural setting.

The Site

The site for the study (the Agency) is a 3,200-employee U.S. Government agency. The Agency's mission is scientific and extremely technical in nature. Primary focus and priority is given to technical issues. Technical proficiency is highly valued, and the Agency has enjoyed a history of leading in technical competence. The high focus on technical competence has greatly de-emphasized the importance of "people" issues, leaving the perception that mediocrity on people issues is acceptable. As a result, the Agency has faced difficulty in recruiting and retaining employees. This compounds the issue of not having a representative workforce, and has brought the larger issue of workforce diversity to the forefront. A 1997 employee opinion survey and focus groups conducted in 1998 and 1999 also increased attention to diversity issues.

Since 1987, the Agency has conducted many diversity program initiatives, addressing all three areas of diversity program objectives (e.g., demographic representation, awareness and sensitivity, systemic culture change). Specific initiatives have included training programs; the establishment of a multi-cultural advisory team; the initial development and timely revision of a Diversity Management Plan; diversity "celebrations" with educational speakers, ethnic food, and entertainment representing different cultures; and, several seminars that dealt with specific aspects of diversity in the workplace.
Diversity Dialogue Groups

Diversity dialogue sessions were envisioned as a follow-on training initiative that could have implications in various workplace settings. One such application was for intact work units to come together and engage in dialogue about diversity and related topics that affect the local work climate. Another was for “change agents” from across the organization to have a forum to discuss their experiences at the organization from a personal perspective and to be able to work together to make the organization more inclusive and effective in the future. These two perspectives resulted in two pilot diversity dialogue groups. The pilot diversity dialogues were conducted in 1999, with the finding that cross-organizational participation was preferred (Kormanik, Krieger, & Tilghman, 2000). The purposefully-chosen sample for the pilot groups was small, with a total of 25 selected to participate, 16 completing the pilot dialogue series, and only 13 completing the survey at the completion of the pilot dialogue series.

Seventy-five dialogue participants were invited to participate in the new dialogue series. Participants were assigned to one of five groups, maximizing the diversity in each, using such diversity factors as gender, age, race, national origin, and occupation. The same OD approach used in planning the pilot initiative was used for the new groups. Discussions with Agency representatives helped to assess the current state of the organization, clarify the desired state, identify the barriers to attaining the desired state, and a plan of action for implementation of the new dialogue groups. The initiative was intended to enhance personal growth and development, provide an opportunity for surfacing diversity issues, foster individual perspective and behavior change, and help participants understand and model appropriate workplace behaviors. The initiative was intended to provide an organizational solution to diversity issues, remedy the past, or replace other diversity program efforts.

Using a structured framework to guide discussion, the diversity dialogues included 10, two-hour sessions scheduled every other week at the same time. All dialogue sessions were conducted on-site, at various buildings in the Agency’s campus-like setting. The first session was an orientation for all dialogue participants. Participants were given a dialogue package which included the initiative purpose and objectives, expectations, framework, schedule, excerpts from the Agency’s Management Plan and values statement, and articles illustrating differing perspectives on diversity. Before each subsequent session, a summary of the previous session was e-mailed to each dialogue participant. Participants were encouraged to provide feedback on the summaries. The facilitators opened each session by reviewing the summary and the expectations for the current session. The articles were used to stimulate thought and discussion. Several management models were also used to examine the individual’s approach to change surrounding diversity in the Agency’s work environment.

Data Collection and Analysis

Qualitative data was collected from multiple sources. The summaries of each of the dialogue sessions, developed by the dialogue participants and dialogue facilitators, were the primary source of data. The qualitative data also includes first-hand observations from the facilitators’ journaling during the duration of the study. Data came from other stakeholders, including the equal employment opportunity (EEO) Program Office, human resources, and management representatives. Physical artifacts were examined, including the organization’s strategic plan, employee opinion surveys, diversity statement, and other documents. Data analysis included description and identification of themes in the findings and assertions. This study used a highly participatory mode of research, involving dialogue participants in every phase of the study.

The qualitative data was augmented with descriptive statistics. Quantitative data was collected after the last dialogue session, using the same instrument administered at the conclusion of the pilot dialogues. The instrument asked for participants’ reaction to the diversity dialogues initiative, as well as their perceptions on the dialogue process, its applicability to the organizational context, and whether the stated objectives for the diversity dialogues were met. The body of the instrument consisted of 32 statements. Participants responded to the statements by indicating “Strongly Agree,” “Agree,” “Undecided,” “Disagree,” or “Strongly Disagree.” Frequencies for response sets from all participants were tabulated using statistical software. Additionally, analysis of variance (ANOVA) was conducted for cross-group comparisons.

Results

The findings show that the culture of the Agency gives priority to the technical mission, almost to the exclusion of all other activities. Participants’ data show that managers and employees do not see diversity as an integral part of mission accomplishment. Participant comments indicate that in this scientific environment diversity is seen as amorphous, without easily calculated metrics or solutions. Participant observations of management reaction to
diversity issues have included denial, disregard, and avoidance. Discussion of diversity detracts from mission accomplishment and should be avoided. Diversity issues are ignored unless there is an associated problem with the task at hand. When data indicates a diversity problem, there follows a request for more data for analysis rather than any attempt to understand and address the issue.

Given the Agency’s culture, employees are quick to use the scientific method, collecting and analyzing data to solve a technical problem. When faced with a diversity issue, they take a different, more cautious approach. Discussion of diversity in the workplace is difficult, takes time, and involves risk, making it hard to do in a risk-averse environment where time is a highly-guarded resource. The Agency’s culture leaves employees doubtful of the importance of diversity to the overall business strategy and to mission accomplishment. Dialogue participants continually talked about mixed signals when examining the Agency’s response to diversity issues. The value of the diversity dialogues initiative was questioned. One participant summed it up with, “I have to get my job done, so my interest in coming to the sessions doesn’t matter, just like my diversity doesn’t matter.”

Several participants noted that the dialogues were the only option for open discussion of diversity issues in their workplace. Even though participants may have perceived the need to participate in the diversity dialogues, they opted for work-related meetings when given a choice. The data indicate that individuals want to talk about diversity issues but, at work, they see the emphasis on mission accomplishment; they think they’ll be rewarded more for, and would rather spend time on, work directly related to “mission essential” activities.

Survey Responses

There were no significant differences between the data from the pilot dialogue groups and the new dialogue groups. This enabled combining the data to increase sample size (n=87). The survey covered three areas: participation, implementation, and effectiveness. In terms of participation, three statements received a high level of agreement: participants in a diversity dialogues group should be drawn from across the Agency (85.7%), be representative of the diversity of the Agency (91.1%), and participants thought their supervisor should participate in a diversity dialogues group (73.2%).

Participants responded to statements regarding the implementation of the initiative. In terms of scheduling, participants agreed that two hours was sufficient time for dialogue (87.5%) and that diversity dialogues sessions should be scheduled at regular intervals (80.3%). Participants agreed that the examples shared by the facilitators were helpful in providing a deeper understanding of diversity issues (87.5%). They also agreed that diversity dialogues should continue as a vehicle to allow employees to share perspectives on work force diversity issues at the Agency (96.4%).

There was a substantial amount of agreement that diversity dialogues was effective. Over three-quarters (78.6%) of participants agreed that the stated purpose and objectives of the diversity dialogues were met. Participants felt that there was a mood of openness among the participants (91.1%) and that diversity dialogues made discussing diversity issues less risky (85.7%). Also, participants said they heard different perspectives on work force diversity (92.8%) and now have a deeper understanding of diversity issues among Agency employees (92.8%). The diversity dialogues sessions also helped participants examine the role of individual employees in creating positive change (87.5%). Finally, diversity dialogues helped participants identify behaviors that promote mutual respect for divergent perspectives in their work environment (91.1%) and to confront assumptions, perceptions, and stereotypes that impede their effectiveness (73.2).

Cross-Group Comparison

Cross-group comparison included demographic categories of age, race, gender, occupation, and tenure. Surprisingly, there were no statistically significant differences in survey responses based on gender, occupation, or tenure. ANOVA results indicated that significant differences were found in mean ratings of certain items based on race. Specifically, Black participants rated higher than all other racial categories the desire to have their supervisor present at the diversity dialogues sessions (F=3.87, p<.01). Also in terms of race, Hispanic participants rated higher than all other racial categories that the diversity dialogues sessions should be limited to one hour (F=2.76, p<.01). ANOVA results also indicated that there was a statistically significant difference in survey responses based on age. Participants over the age of 60 rated higher than all other age groups that two hours was sufficient time for dialogue (F=6.95, p<.01). They also indicated in their responses that they were now more aware of the impact of diversity in the workplace (F=3.58, p<.01).
Conclusions

This study looked at the issues of implementing diversity dialogues in an organizational setting. It could be inferred that the Agency's culture was not conducive to the diversity dialogues process. The workplace focus on task to the exclusion of other activities, the de-emphasis on discussing non-work issues, the limited communication skills of employees and managers, and the inability to see the nexus between diversity and mission accomplishment surfaced as challenges to effective dialogue implementation in a workplace setting.

Fundamentally, a diversity initiative must create awareness of diversity, its impact on the workplace, and its impact on the bottom-line (Johnson & O'Mara, 1992). Diversity initiatives generally must link the diversity program to the corporate culture and business objectives of the organization to be successful (Wilson, 1997). The dialogue process represents a major shift from this philosophy. It also represents a major change for an organization's task-oriented employees. Clearly, organizational learning was impeded by the lack of shared mental models linking diversity program initiatives and mission accomplishment. In this study, the Agency's focus on task was detrimental to dialogue attendance.

Dialogue participants wanted tools and the "right answers" to questions about diversity issues. This expectation is anathema to the dialogue process. Studies show failure of diversity initiatives is often due to unclear expectations (Delatte & Baytos, 1993; Karp & Sutton, 1993). Even though participants understood the purpose, they sometimes viewed the dialogues as "training" and were frustrated at times when there were no "right answers" available. Despite the occasional frustration, participants commented that they learned about self and had a greater appreciation for other participants, as well as a better understanding of the multitude of diversity issues through the dialogue.

The data from this study show that an organization's management can increase participation in a structured diversity dialogue initiative by increasing the status of the initiative. One way to accomplish this is by directive change, making dialogue participation mandatory. Alternative options, such as showing visible support and personal participation from management may prove more beneficial to changing the culture through a participative change cycle, similar to that described by Hersey and Blanchard (1982). Mezirow (1997) suggests that in attempting a transformative learning process, an individual's "points of view are more accessible to awareness and to feedback from others" (p. 6). Transforming habit of mind requires heightened awareness and critical reflection of generalized bias. This commonly indicates the need for participative change. While mandating the program for all employees may improve attendance, the quality of that participation may not support transformative learning.

Contribution to New Knowledge in HRD

This study contributes new knowledge in HRD by addressing the issues for implementing structured dialogue in a workplace setting. Arguably, there are numerous reasons for the failure of diversity program initiatives. Kormanik and Geffner (1995) show three primary restraining factors: a lack of personal responsibility and accountability, a lack of positive leadership at all levels, and a lack of visible management commitment. All three of these barriers surfaced in this study, and must be strategically addressed in any workplace implementation of diversity dialogues. Specific strategies, however, may enhance the success of dialogue implementation. Strategies include visible management endorsement making diversity an integral part of the "real work;" senior management participation, direct involvement, and scheduling flexibility; increased positive communications throughout the workplace to give the activity greater status and priority; and an increased premium on developing "soft" skills (e.g., communication, interpersonal relations, teambuilding). All of these may promote systemic organizational culture change.

Limitations and Areas for Further Research

The purpose of the study was to provide an explanatory narrative of the implementation of diversity dialogues. It was not intended to examine the effectiveness of diversity dialogues as a specific diversity program initiative. Rather, this is a study of the implementation process, and a discussion of the lessons learned from that process. Also, this was not a study of the trends which may emerge from a structured dialogic process (see Kormanik, Krieger, & Tilghman, 2000). Further research is needed to address the larger issues of diversity program effectiveness and the linkage between diversity programs and organizational performance. A comprehensive analysis of the efficacy of a diversity program or a discrete program initiative would require a long-term, posttest evaluation to ensure validity (Dixon, 1990). Because this study was limited to one organizational context and the
dialogue focus limited to the issue of workforce diversity, comparison of these results with research in other organizational contexts and focusing on other dialogue topics is warranted.

Using a multiple case study approach, the author investigated leading university graduate HRD programs focusing on history and institutional characteristics; norms and values of administrators, faculty, and students; and present status and visions for the future. The analysis reveals convergent and divergent themes related to the genesis of programs and subsequent theoretical orientation, their standing within their academic homes, the reach and comprehensiveness of curricula, and issues and concerns faced by faculty, administrators, and students.

Keywords: HRD University Programs, Case Study

Human Resource Development (HRD) university programs form important parts of national systems of HRD by educating future practitioners, providing continuing professional development, and preparing the next generations of researchers and teachers. While HRD and related curricula played relatively minor roles in many university departments in the 1970s and early '80s, their enrollments and stature have increased over the past 15 years to a point where they are now the “bread and butter activity” (Gray, 1997, p. 80), drawing large enrollments of certificate, masters, and doctoral students. HRD programs and courses experience strong demand, also from non-education undergraduate students who are seeking employment skills. While most programs were established in the 1980s, the decade of the 1990s saw an increase by about 15% (Kuchinke, in press), and by 1997, some 250 U.S. colleges and universities were offering certificates and degrees in HRD and related fields, such as instructional technology and performance technology (ASTD, 1996). Despite the fact that HRD programs are firmly established in the Academy, both in the US and abroad (Chalofsky & Larson-Daugherty, 1996), there is little systematic research on them.

This present study emerged from a need sensing process conducted with a panel of 21 leading HRD scholars in the US and Great Britain in 1999 that surfaced as one of three most pressing areas requiring investigation questions about institutional characteristics and arrangements of academic programs (Kuchinke, 2001a). A subsequent survey of 83 prominent university programs yielded important insight into institutional and curricular features (Kuchinke, 2001b). The results of the study reported here represent a second stage in this line of inquiry using a multiple case study approach to gain in-depth insight and information on three purposefully selected US HRD graduate programs located in the eastern, southeastern, and midwestern parts of the country. This qualitative study focused on three primary areas: institutional features; genesis, present status, and future plans; and norms and values of administrators, faculty, and students. These areas were selected because they reflected the consensus of the expert panel as needing investigation and had emerged as important areas of investigation from both available literature and the survey of HRD programs. The information gained from this study are deemed to be important for current and future HRD academic program administrators, faculty, and students of the field as well as those interested in the evolution of HRD as a field of research and teaching.

Review of Literature

When conducting a review of literature of HRD programs, the dearth of existing empirical work became evident. The listing of programs published by the American Society for Training and Development annually until 1997 is often cited as the authoritative source for the population of programs (for example, Chalofsky & Larson-Dougherty, 1996), but it is likely to be incomplete (Kuchinke, in press). Early work by Pace (1984, 1988) focused on the comparison of HRD curricula. More recently, two large-scale surveys addressed issues of curriculum, program names, and enrollments (Gaudet & Vincent, 1993; Kuchinke, in press) but were based on convenience samples and failed to provide qualitative program-level information. Survey work by Peterson and Provo (1996) profiled the HRD and Adult Education professoriate and included responses of some 140 faculty members. In the related field of Adult Education, Milton, Watkins, Spears Studdard, and Burch (2000) used a mixed-method approach to investigate recent changes in adult education graduate programs focusing enrollment and faculty growth.

Several single-program studies have been presented at national conferences, and these include Willis and Kahnwiler’s (1995) account of the genesis and continuance of an HRD program within a general systems framework. The authors chronicle the evolution of a single program over a six-year period and report on curriculum development and implementation, alumni and student survey results, market analyses, and alumni interviews. There are also a small number of studies investigating the adequacy of the academic curriculum when compared to professional roles and competencies (for example, Baylen, Bailey, & Samardzija, 1996; Leach, 1993; Dare & Leach, 1999).

Research Questions and Methodology

The lack for systematic information on academic programs leads to uncertainty among faculty and administrators about the scope and endurance of the field, among students who seek targeted career preparation, and among employers who want clear information about prospective employees. To begin to answer these and related questions, three overarching research questions were pursued in this study.

1) What are the historical development and institutional characteristics and arrangements of HRD programs?
2) What are the norms and values of HRD program administrators, faculty, and students?
3) What are the current challenges of and future plans or visions for HRD programs?

Because the main purpose of the study was to gain an in-depth understanding of HRD programs, a case study design was selected which allowed to investigate these programs in their real-life contexts and include relevant contextual factors (Yin, 1994). For the purpose of this study, each of three HRD programs was framed as a case or unit of analysis in a multiple case study approach that allowed for comparison and contrast of major themes. The three programs are large, highly visible, and regarded as prominent in the HRD scholarly community. The three were located in the eastern, southeastern, and midwestern parts of the U.S. and each is classified as a Carnegie Extensive Doctoral/Research University. Three primary data collection methods were used: interviewing, document analysis, and observation. In spring and early summer of 2001, I conducted a total of twenty-two interviews of about one hour each during site visits to the three programs of about two days each. Conversation partners included 18 faculty members—three of whom also had administrative responsibilities in their respective departments, one full-time administrator, and 25 graduate students. Interviews were recorded and transcribed and later analyzed using open coding for thematic analysis (Corbin & Strauss, 1990). Questions for faculty and administrators centered on the history and status of the programs, on successes and challenges, and plans for the future. Student interviews addressed student’s professional and educational backgrounds and goals, their reasons for applying to the program, and their experiences in the HRD program.

I used printed and on-line documentation on each program to prepare for the site visits and to obtain program information. I used observational techniques during each visit for additional contextual information. I used a two-stage validation process (Van Manen, 1990): During the interview process, I ensured accuracy of understanding through questioning and rephrasing and by summarizing the information at the end of each interview. In a second stage, program descriptions and summaries of the thematic analyses were sent via e-mail to participants at each site with the request for critique and comments, and their reactions are incorporated in this report.

The primary limitations of this study result from its design within a case study framework using largely qualitative data. The three programs, while prominent, present a purposeful sample and are not likely to be representative of the population of HRD academic programs. Thus, the findings may lack external validity and do not generalize. Further, time limitations and scheduling conflicts restricted the number of interview partners. In particular, missing from the analysis are part-time and adjunct faculty, faculty on leave, and part-time students. Third, the design did not incorporate stakeholders beyond the particular program, such as those at the school, college, and campus levels, and alumni or employers. These limitations clearly indicate the need for further research.

Results

To provide contextual information, a brief summary description of each program is given at the beginning of this section, followed by results and findings related to the three overarching research questions: history and institutional characteristics, norms and values, and challenges and visions for the future.

The HRD program in the eastern part of the country (Eastern) is located in a major metropolitan area on a largely residential campus with some 23,000 students, the majority of whom are graduate students. The HRD program is housed in one of three major departments in the Graduate School of Education. It offers masters and doctoral programs in several different formats on the main campus, off-site, and internationally. A certificate option
of three courses is also available. Overall enrollment is about 100 students, with some 40 enrolled in the doctoral program, and the majority of students are working adults who attend part-time. There is a research center affiliated with the program focusing on issues of learning that provides a research-to-practice link with corporate and institutional clients. The program was established some 30 years ago and has ten full-time faculty with backgrounds in education, management, psychology, and other social sciences. Eastern's program mission is to "enhance critical thinking skills by examining organizational processes and structures to improve workplace performance" and is structured around three pillars: people, organizations, and learning.

The HRD program in the southeastern part of the country (Southeastern) is located near a major urban center and belongs to one of several schools within the College of Education. The program draws on faculty, resources, and expertise from two departments, Adult Education and Occupational Studies who combined offer a master's (M.Ed.) in Human Resource and Organizational Development and two certificates (off-site, part-time) in training/HRD and instructional design and technology. A doctoral emphasis in HRD is offered as part of the Adult Education or Occupational Studies departments. There is a joint curriculum committee, and currently there is a program head and one faculty member from each of these two departments with primary focus on HRD. There are about 30 HRD masters' students, 15 doctoral students with an HRD emphasis, and 20 students enrolled in the weekend certificate options. The program's emphases are on learning within organizations as well as on career and organization development, group facilitation, globalization, and workplace educational technology. Conceptually, the program is focused on the integration of development, training, and technology for the purpose of promoting learning in organizations. Its vision is to educate graduates to become "reflective practitioners with excellent interpersonal helping skills, strategic business partners with the ability to link [human resource and organization development] to the needs of global, complex human systems".

Located in a university town about 2 hours away from three major urban centers, the program in the midwestern part of the country (Midwestern) forms one of two emphases within the department of Human Resource Education that, in turn, is one of six units in the College of Education. It offers masters and doctoral degrees as well as a graduate level certificate requiring a minimum of eight courses beyond the master's degree. Active graduate enrollment in the HRD emphasis is about 120, and this includes two part-time online master's cohorts. There are two primary programmatic emphases in the HRD program: teaching and learning—focused on instructional design, delivery, evaluation, and technology—and organization and leadership development. Over the past several years, increasing emphasis has also been placed on international HRD. The program's mission is "global leadership in the generation and transmission of knowledge for educational training and development, professional preparation in the development of research, teaching, and leadership capabilities of individuals and organizations, and quality professional services to public and private organizations and agencies interested in life-long learning at local, state, national, and international levels."

History and Institutional Characteristics

When looking at the genesis and histories of the three HRD programs, three alternative patterns of evolution can be discerned that appear to affect the program signatures and standing within the school/college environment. In the case of Eastern, the program was established as human resource development by one of the field's founders as early as 1970, focusing on program planning and design. In the mid-1980s the program expanded as new faculty members joined, adding organization and career development expertise, new program format options, and the international doctoral cohort and executive leadership programs. Thus its identity as and focus on HRD was never questioned. As one faculty member put it, "we are who we are and we were never something else". This undivided focus and continuity of direction on HRD appears to provide the program at Eastern a degree of legitimacy and freedom in staffing and curricular matters not found in the other two programs. As a matter of policy, for example, new faculty are recruited from the core social sciences, such as psychology, or from schools of management with expertise in organizational behavior, rather than from other HRD programs or schools of education. The breadth of faculty expertise in the social sciences is organized around the three pillars of organizational development and change; leadership development; and individual, group, and organizational learning. Eastern's HRD curriculum includes—in addition to HRD and adult learning content—foundational courses and course content in anthropology, psychology, sociology, and management science, as well as applied organization science topics. As a result of this broad focus, Eastern attracts students with a wide range of academic and professional backgrounds and goals. Eastern's program brochure states the intended career paths for its graduate as follows: "Because of the enhanced knowledge and skills, many students find that the degree program serves as a springboard to attain professional goals—entry into management consulting positions and challenging HR jobs, or promotions into higher levels of HR and management responsibility."
When Eastern’s program reflects a broad multidisciplinary approach, the institutional history and resulting program structure at Midwestern followed a different pattern. The HRD program evolved within a unit that until about ten years ago focused on the preparation of vocational teachers in a variety of subjects, including technical, business, agriculture, and home economics. Business and industry training played a relatively minor role in the department until recently when the vocational teacher preparation programs were closed or moved to other units on campus and the department changed its name to Human Resource Education. The HRD curriculum at Midwestern reflects its institutional tradition with a strong focus on instructional design and development, program evaluation, and instructional technology, although in recent years expertise in organization development and international HRD has been added through new hires. Still, the program is focused on the educational aspects of HRD. Faculty reported a degree of ambiguity towards HRD as a field and its role within a college of education. One faculty member reported: “Colleagues in the college and even in our department are skeptical over the role of an organization science based approach to HRD.” While enrollments in the HRD are strong with two introductory courses regularly attracting well over 200 students from across the campus, faculty reported difficulties in developing HRD curriculum that reflects the broad interdisciplinary nature of the field. Applications for new courses, which require approval at college and campus levels, need to be clearly reflective of education-related content and cannot include openly any organization-science materials to be approved.

Despite these difficulties, however, the program appears to be thriving; once the bureaucratic hurdles of course approvals and reviews are passed, academic freedom ensures that teaching and research reflects current HRD theory and practice. The traditional orientation towards vocational education leads this program to explore linkages and integration between HRD and career and technical education. In non-traditional program offerings, such as the online program and the international course offerings in Africa and Eastern Europe, the focus on HRD within the context of the organizational sciences seems less problematic.

While the program at Eastern was focused from its start on HRD and the one at Midwestern emerged from a traditional vocational teacher preparation program, the program at Southeastern was created as a collaborative effort between two departments—Adult Education and Occupations Studies—both of which maintain their traditional focus but also contribute faculty and share in the governance to the HRD program. Historically, there had existed in both departments some course work, teaching, and research focused on HRD—with emphasis on organizational learning in Adult Education and on training and development in Occupational Studies. Initial plans for a cross-campus program in HRD in the early led to the plan for a cross-departmental program and the creation of one faculty position in each of the two departments focused specifically on HRD under the leadership of a program director. A curriculum committee with members of both departments is involved in course and program planning, and this joint governance is viewed as a source of strength in ensuring theoretical and intellectual breadth and richness. Despite philosophical differences of Adult Education faculty who focus on a broad range of issues, populations, and theoretical perspectives and faculty in Occupational Studies with a primary focus on public schooling and teacher education, the joint governance, in the words of one adult education faculty member “keeps the program honest.”

The creation of the cross-departmental master’s HRD program has resulted in an expanded and revised core curriculum of HRD courses including organization development, strategic HRD, and globalization and diversity. Student further select from additional coursework in technology and action learning. There is some course taking in other schools within the College of Education, especially in instructional technology and counseling, and students, on occasion, take classes in other units on campus such as industrial psychology, political science, and social work. As in the case of Midwestern, faculty at Southeastern commented on the need to “hide the term organizational from course titles and course descriptions and instead emphasize the link to education.” Whereas the master’s and certificate programs are offered through the HRD program, doctoral level students formally enroll in either the Adult Education or the Occupational Studies departments and develop a program of study with a focus on HRD in their home units.

The three programs, thus, have evolved in different ways—focused on HRD from the start, from the closing of a traditional teacher-training program, and a collaboration between two independent departments. These different histories appear to contribute to different institutional signatures with respect to staffing, curriculum, and the degree of acceptance of HRD. All three programs, while successful and expanding, indicated that HRD, as a subject matter and academic program, appeared to be a contested domain that needed to be justified and defended. While all three program contributed strongly to the instructional mission of their respective home institutions, there was a sense that its acceptance was, to a larger degree than for other programs, conditional on continued strong enrollment and generation of instructional units. A senior administrator shared the following observation: “Enrollments are needed but what really matters are the number of full-time faculty in HRD. Also, deans and administrator tend to look to other universities. The closure on one HRD program can have strong negative effects on the entire community”.

3-1
Norms and Values of HRD Faculty, Administrators, and Students

The theme of marginality of HRD programs also extended to their relationships with other units in the college and on campus. To some degree, members of all three departments observed a lack of integration and collaboration with and a lack of recognition of other campus units. Within Education, HRD faculty commented on ideological disagreements, real and perceived. “HRD is seen as pro-capital and exploitative, I think other [Education] colleagues feel that we are selling out to big business,” commented one faculty member. Another observed: “Colleagues in other departments often see the role of education as levying criticism on the existing political and social system, in particular those with a postmodern orientation. The fact that HRD is often defined as advancing organizations is often misunderstood to mean that we are corporatist.” Relationships with related units on campus are also difficult, except for occasional bonds with faculty units built on personal relationships. As one administrator said: “Colleagues in business and labor relations often are surprised to learn that we focus on learning in business organizations. By and large, Education is associated with teacher training for public schools.”

In this difficult institutional climate, HRD administrators and faculty at all three universities commented on the high level of entrepreneurial spirit that had led to the inception of the program and maintained it. In all three cases, the programs was built with much energy by one or two founding faculty who developed the curriculum, marketed the program, built relationships with the local business community, recruited students, and, overall, provided guidance and direction. As one faculty member observed: “We are very much operating in an entrepreneurial mode here, building the program, promoting it, working with extramural. Nothing is taken for granted.” This level of commitment among HRD faculty and administrators is based on an intense desire to build up the programs and advance the field of HRD. Where other academic fields may rest on more established roles and support structures, HRD faculty acted much like business organizations in the early stages of their life cycle by expanding a high level of energy and commitment to establishing, growing, and expanding their programs in terms of curriculum, enrollments, staffing, and university internal and external relationships and linkages.

While this passion for the program and the field offered a unique characteristic and source of strength for each of the three programs, it also presents liabilities in terms of workload, continuance, staffing, and succession. With relatively small numbers of full-time faculty and a high degree of commitment to teaching, service, and research, heavy workloads appear to be the norm. In relatively small departments, turnover presents a real concern related to continuity and sustainability. Although none of the administrators interviewed appeared fearful of losing tenure lines, replacing senior faculty who were often also the founders of the respective programs was seen as a difficult challenge. As one faculty member observed: “All of us here are comfortable wearing these different hats and putting in long hours to build and grow the program. But I am not sure if we can expect that new faculty will have the same level of drive and commitment. This is not something you can write into a job description.” A related theme concerned succession of senior faculty and program founders. With most universities having experienced lean years in the early and mid-1990s, several participants spoke of the missing middle. “We have a group of senior people who have been here for a long time. But we have almost no mid-career people because of the hiring freeze in the 1980s and 1990s. In recent years, we’ve been hiring again, but only at the assistant [professor] level. We now evenly split between full and assistants. Sustainability is a real issue here.”

Individual and group interviews with masters and doctoral students at the three universities offered additional insight into these three leading HRD programs. The interviews focused on students’ professional and academic backgrounds, their reasons for selecting an HRD program at the particular university, and their future professional plans and aspirations. In addition, students offered insights into the strengths and liabilities of their programs from their unique perspectives.

Many students had stopped out of higher education after their initial degrees and pursued full-time careers before returning for advanced studies. While some had worked in human resource related fields, many were career changers. Students came from areas as diverse as teaching, management, broadcasting, and counseling, and from religious and community-based organizations. When asked why they had selected the particular program, most students mentioned the reputation of faculty as a primary reason. Students had become familiar with the work of individual faculty members through books, journals, consulting work, or conference presentations. When asked why they had selected an HRD program instead of a related one in psychology, management, or industrial relations, students often cited the value congruence of the program with their own convictions and plans. As one student summarized: “Studying HRD in the School of Education gives me a degree of freedom and flexibility I would never have in a college of business. The approach here is developmental, and this fits with my personal philosophy and values.” The two most prominent reasons for selecting an HRD program were related to the cross-disciplinary and
systemic nature of the curriculum and its base in a humanistic, development-focused approach to business organizations. Several students, in fact, applauded the fact that the program was linked to education rather than business. One student explained: “I believe that the future of organizational development is in learning, and so [HRD] belongs in the School of Education. The economic and behaviorist approaches to business [taught in other departments] are simply too narrow. That’s not what I want to do.” While students were attracted to the broader philosophical base of HRD, several also voiced concern that this orientation might not fit well into a highly competitive business world and indicated that they were seeking a thorough grounding in business principles in order to be effective as HRD professionals.

Students also valued the fact that HRD curricula tended to be applied and focused on real world issues and that HRD faculty had much practical and current experience. Students further commented that faculty were very supportive of their professional development, and that the programs were flexible so that students could tailor it towards their individual needs. Several also commented on supportive and student-focused departmental cultures that made collaboration among students and between faculty and students easy.

Students identified several areas for improvement. Among them were limited opportunities for student funding, a relatively weak network between their department and the local business community for internships and job placements; a limited departmental infrastructure in terms of libraries, classroom equipment, meeting spaces, graduate research assistant offices; and relatively weak alumni networks. None of the three departments appeared to have formal job placement offices or formalized job search processes. While companies regularly recruited at business schools for talent, far fewer appeared to target HRD graduate programs. Instead, students reported job search strategies focused on personal and professional networks or through faculty contacts. All, however, expressed optimism about their career prospects and were looking forward to moving through the program and into professional positions. Interestingly, the vast majority of doctoral students appeared to be headed for consulting and business/organizational careers, with only the occasional student aiming to obtain an academic position in HRD university programs.

The Future of HRD Graduate Programs

The study also focused on future goals and visions by faculty and administrators. Despite the many challenges related to building and maintaining the programs, faculty and administrators appeared confident for the future of their respective programs and the field in general. While the role of HRD programs in schools of education was at times problematic, there was not doubt that the departments were secure and that, in the words of one senior administrator, “we have a home in Education and we are here to stay.” Enrollments in all three programs had been strong and were predicted to remain so. Certificate programs, in particular provided a steady stream of students and served as a feeder to the degree programs. One program is planning to focus on the professional development needs of HRD professionals working in business and industry and in public and private organizations. Administrators voiced concern over being able to staff their departments with qualified faculty, and several used part-time instructors on a regular basis.

As they grow, the three departments stated similar choices with respect to enrollments and selectivity. As one faculty member observed: “I see two options for our program: Either grow the program—and this will require adding faculty who are entrepreneurial and energetic—or to grow smaller and focus more on research.” A similar choice was observed by another faculty member at a different program: “I see our future as having strong masters and certificate programs and be able to run smaller doctoral cohorts and educate first-rate researchers and leaders in the field.” In the third program, several faculty indicated the desire to become more stringent in their selection criteria for doctoral students in order to attract high caliber doctoral students who will want to assume leadership as future HRD faculty.

In terms of programmatic and curricular emphases, all three departments were continuing to evolve and change. This took the form of adding online courses and educational technology related content; of seeking ways to capture the complexity of HRD work in teaching and instruction; of theorizing the multifaceted and multidisciplinary nature of the field; of understanding and incorporating into research and teaching the implications of advancing technology and globalization for HRD; and of seeking to be proactive and leading the field rather than reacting to trends already in place. True to the spirit of entrepreneurialism of a young field and young departments, the level of commitment and energy among students and faculty were high, and so were the desire to excel and the passion to drive the field forward.
Conclusions and Recommendations

Framed within an institutional theory framework, this study sought to establish detailed profiles of three leading HRD programs by focusing on their genesis and current status, norms and values, challenges and plans for the future. Using site visits, individual and group interviews, document review, and observation, convergent and divergent themes emerged.

One summary observation is the uniqueness of each program in terms of curriculum focus and institutional form, which might be explained by their differential histories. One program had been established as HRD and had evolved around a cross-disciplinary body of knowledge from a variety of social and organizational science fields united by a focus on learning. A second program had emerged out of a vocational teacher preparation program and was firmly anchored within an educational context, trying to build on the connections between HRD and career and technical education. The third program had been established as a cross-departmental effort, drawing on two fields of study with a clear emphasis on organizational learning and transformation. These three program forms speak to the diversity of traditions in the field and to the breadth of HRD graduate education. Far from providing uniform program signatures, the three programs had established unique and distinct approaches to HRD. This diversity of approaches reflects the multi-faceted nature of the field and also the multiplicity of definitions of or approaches to HRD. It is upon the individual departments to clarify their approaches to HRD for their own development efforts and towards students and employers and to situate their approach within a theory of HRD that is currently underdeveloped.

In this diversity there was also unity, and this was found in process and content. There was ample evidence of passions for the field, for the development and growth of programs, for the development of students, for broadening the reach of their departments through off-campus offerings, for exploring new ways of program delivery, and for advancing theory, research, practice, and teaching in HRD. There was a sense of excitement and pride shared by faculty, administrators, and students about past accomplishment, current program status, and the possibilities for the future. Although the standing of a business-focused program within schools of education is not unproblematic (see, for example, Birema, Cseh, Ellinger, Ruona, & Watkins, 2001), the three programs appeared firmly established and secure in their academic homes, and they thought of themselves as being on the leading edge of education conceived as life long learning by individuals, groups, and organizations throughout the life span and in multiple formal and informal settings. Faculty and administrators voiced a sense of pride for their contributions to their home institutions in terms of enrollments, reach to populations not traditionally served, and breadth of curriculum content. Common goals were focused on the implications of information technology, alternative delivery methods, improving curricula in response to the complexity of contemporary organizations and institutions, and the increasingly global application of HRD. The three programs also showed a strong sense of entrepreneurial spirit, characteristic of dedicated faculty and administrators in an emerging field and relatively young departments. All participants in this study performed numerous roles as researchers, instructors, consultants, and mentors, and invested much time and energy into building and expanding the department, its curriculum offerings, and its enrollments. There was a sense of vibrant energy and optimism about the future of the field and its potential. With this energy, however, come concerns over continuation, especially with departments that will experience waves of retirement among senior faculty without sufficient mid-level academics to move into leadership positions. Careful and long-range succession planning and career development needs to be implemented to assure continuing success.

The sense of energy and passion for the field was shared by graduate students many of whom had selected HRD--after carefully considering alternative academic options--because of the multi-disciplinary curriculum and the holistic and systemic value preference of HRD. Students recognized the limitations of the program's location in schools of education but voiced strong opinions about the high quality and dedicated academic and professional preparation they received. The lack of infrastructure and support, however, may deter qualified candidates to enter the field, thus raising concerns over the lack of future academics in HRD.

The programs' plans for the future were incremental and evolutionary rather than revolutionary and included expanding program offerings, rethinking their policies regarding doctoral admissions and curricula, incorporating instructional and internet-based technology, and expanding the regional, national, and global reach of curricula and program offerings. Here, again, staffing and resource issue surface that will require careful and creative solutions.

HRD is an emerging field in the early stages of its life cycle, and a field that offers great promises in contributing to personal and organizational economic and social progress. This study contributes to new knowledge by examining institutional and curricular characteristics of academic programs and profiling three leading programs in terms of their genesis and current status, norms and values, and visions for the future. It responded to the call for increased knowledge on academic program issued by a panel of senior HRD experts and should offer insight to the
academic HRD community, current and future on salient features, issues, and challenges of three leading US programs.

Evaluation of a Human Resource Development Degree Program

Dale E. Thompson
Kit Brooks
Elizabeth S. Lazarraga
University of Arkansas, Fayetteville

This study examined students and their work supervisor's perceptions of an undergraduate degree program (with a Human Resource development concentration), specifically how the program benefited them personally and professionally as well as how their organization had gained from their participation. Results identified four specific themes, program expectations, challenges, strengths/benefits and recommendations.

Keywords: Evaluation, Perceptions, Qualitative

The result of a formative evaluation, this study examined participants' perceptions of how a degree program with emphasis in Human Resource Development (HRD) benefited them personally and professionally. Popham, (1993) suggests that affect assessment, which deals with attitudes, values, and interests is an important evaluation use. While not specifically targeting feedback regarding the programs delivery method, compressed video, the evaluation did garner data that related to the increased presence of technology in delivering educational programs. Evaluation and feedback theory provide the theoretical framework for this study. These concepts are intertwined and integral to establishing and sustaining effective programming and performance improvement efforts.

The benefit of assessing educational programs is well documented in evaluation literature. As budgets are tightened and return on investment is closely scrutinized, measurement of individuals, businesses, and institutions is a vehicle for establishing accountability (Fenwick & Parsons, 2000). Perskill and Russ-Eft (2000) note that evaluation has become urgent for both internal and external customers who are asking for evidence of programs effectiveness. They also state that there is a demand for systematic useful evaluation within for-profit and non-profit local, state and federal agencies. The increased demand for evaluation is further complicated by the intangible and abstract qualities of that which is to be evaluated.

In reviewing evaluation literature numerous definitions and related methodologies can be found (Patton, 97; Chen & Rossi, 83; Scriven, 93; Whitmore, 98; Preskill & Russ-Eft, 2000). The literature provides numerous philosophies regarding the very purpose of evaluation. For example, Harles, (1986) considers evaluation to be a structural element of the process of improving the human performance, Human Performance Technology (HTP). Mark, Henry & Julnes (2000) identify four distinct purposes of evaluation as assessment of merit and worth; program and organizational improvement; oversight and compliance; and knowledge development. Preskill and Russ-Eft (2000) discuss the use of evaluation in an instrumental, political and symbolic sense.

Evaluation is often grouped into two distinct categories, formative and summative. Formative evaluation is conducted intermittently with the purpose of giving feedback to learners about their progress and providing valuable information for program developers. Formative evaluation is a recursive process focuses on trying out and revising process as a means of self-correction (Geis, 1986). Stolovich, (1978, 1982) suggests that evaluation is inherent to a well-designed system and functions within that system rather than a discrete act or a step in program development. The formative aspect of this evaluation serves to help determine what programmatic changes are indicated to meet the stakeholders' needs. Summative evaluation occurs at the end of a particular event with the purpose of summarizing what has been accomplished (Fenwick and Parsons, 2000). In addition, evaluation may consist of a look at affect assessment, which deals with attitudes, values, and interests (Popham, 1993). Whether summative or formative, the reason for educational/program evaluation is to improve the quality of the educational enterprise (Popham, 1993).

Webster's New World Dictionary (1970) defines feedback as “a process in which the factors that produce a result are themselves modified, corrected, strengthened, etc. by that result.” In discussing systems thinking, Senge (1990) describes two distinct types of feedback: reinforcing and balancing. Human Performance Technology uses the general systems model to describe human performance systems. Both models include evaluation and feedback loops as design elements. Evaluation and feedback contribute to HPT's recursive dynamic, and self-correcting
functions. Feedback is intended to affect the quantity and quality of performance. If feedback is directed at affecting, the quantity it is summative, while feedback directed at affecting the quality of performance it is formative. While both forms of feedback are critical tools for maintaining or changing performance, either will impact the quality of the behavior or the way people perform (Tosti, 1986). This summative evaluation received feedback that provides information regarding the quality and quantity of various aspects associated with participation in the program.

Background

In response to a comprehensive needs assessment that was conducted to identify the educational needs of business and industry, a degree program with a HRD concentration was introduced in the fall of 1996 at the University of Arkansas. The degree is available only to adults who are working full time, have worked at least five years and have 40 to 60 college credits which will transfer to the University. The program requires a total of 125 credit hours. The general studies section of the degree consists of 56 credit hours of English, science, social studies, fine arts/humanities, math, health and wellness and media/computers. The technical requirement section of the degree consists of 33 credit hours which can be obtained by transferring business coursework, receiving credit for work experience through the testing procedure of the National Occupational Competency Testing Institute (NOCTI) and receiving credit for work experience or industry training by the development of a portfolio based on guidelines developed by the Council for Adult and Experiential Learning (1996), the American Council on Education and the National Program on Non-Collegiate Sponsored Institute. The portfolio is based on Kolb’s experiential learning model. This model concentrates on including work experience in to the following 4 areas, concrete experience, observations and reflections, formation of abstract concepts and generalization and testing implications of concepts in new situations, (Kolb, 1984).

The HRD component consists of eight specific courses and a work-based internship/project. The HRD courses are skills and strategies in HRD, theory and principles in needs assessment/evaluation, communication in HRD, strategic design of HRD, theory and principles in adult education, theory and principles in team building, strategies in professional development, and leadership in HRD. The internship is a 12-credit work related project built around the HRD coursework.

The degree program, which began in fall 1996, was structured as a partnership between the University of Arkansas and community colleges throughout the state. The students completed their general studies and many of their technical requirements at the local community college then transferred to the University of Arkansas where they begin the HRD part of the program. The eight HRD courses were offered by interactive audio/video in an accelerated format meeting nine weeks rather than the standard 15 weeks. The courses met weekends to accommodate working adults. Each course was offered at one host site and three or four remote sites. After beginning with approximately 40 students at 4 sites, the program has grown to 10 sites with an enrollment of approximately 175 students, all of which are nontraditional students ranging in age from 25 to 60.

Purpose of the Study

This research explores student and supervisor perceptions regarding the strengths and weaknesses of the undergraduate Human Resource Development program. Specifically, the research question examines participant’s feelings about how the program benefited them personally and professionally and how their organizations benefited from their participation.

Methods

This study used qualitative methods as the primary research design. A fundamental characteristic of qualitative research is its in-depth exploration of a phenomenon and its context (Densin & Lincoln, 1994; Fryer, 1991; Patton, 1990). In accordance with qualitative methods, research participants were selected using purposeful sampling. Patton (1990) suggested that the power of purposeful sampling methodology is selecting information-rich cases for the purpose of learning a great deal about issues of central importance to the research. Criterion-based purposeful sampling was used to select individual participants. To be included in the study, the participants had to meet the following requirements: (a) student participants were from the first and second program cohort, (b) student participants had completed all the HRD courses, (c) student participants had the same workplace supervisor throughout the program, (d) student participants consented to be interviewed, and (e) students consented to having their supervisor interviewed. Workplace supervisors were selected if (a) they consented to participate in the
interview, and (b) if they had supervised a student throughout the program. Eighteen students and their supervisors met all of the criteria. This represented approximately 20% of the total program participants. Participants represented the following fields: banking, health care, manufacturing, public utilities, and post-secondary education. Participants represented both supervisory and non-supervisory positions.

Telephone interviews were conducted with each student and their workplace supervisor from the sample. A structured, open-ended interview guide (Appendix A) was used for each telephone interview. The interview guide consisted of questions that explored student and supervisor evaluation of the multi site distance education degree program. Interviewees were instructed as to the purpose of the research and informed how the anonymous information would be used. Consent to participate, interview questions and responses were audio taped with the permission of the participant. Each interview averaged approximately 30 minutes and was conducted by a researcher who was familiar with the program and the instructors, but not familiar with the interviewees. While the researcher had essential understanding regarding the context of the interview questions, she had less bias regarding the participants' responses than researchers directly involved in the program. Both student and supervisor interviews were tape recorded with participant consent. Numerical codes were assigned to each interview to protect anonymity of the participants during data analysis. All interviews were subsequently transcribed and analyzed using QSR NUD-IST (1997), computer-based qualitative data analysis program.

**Data Analysis**

While the interview guide did not include specific questions regarding the challenges associated with participating in the program or recommendations that students and supervisors had to improve the program, these themes emerged from student and supervisor responses. These "indirect" themes included student and supervisor expectations of the program, the perceived challenges inherent to the program, strengths/benefits of the program, and recommendations for the program.

Data from each interview were coded to identify patterns in the data associated with each theme. Each student and supervisor response has been coded to provide an audit trail that describes the context of the comments. Miles and Huberman (1994) describe an audit trail as a method of logging and describing our procedures and data clearly enough so that others can understand them, reconstruct them, and scrutinize them. The trustworthiness of the study is contingent upon the audit trail being (a) complete, (b) comprehensible, and (c) systematically related to methodological approaches (Lincoln & Guba, 1985).

**Results**

**Expectations**

Students identified two major expectations of the program. First was obtaining a Bachelor's degree. All students indicated this was their top priority. They had high expectations about the program because it was associated with a major university with a good reputation. The convenience of the program, the multi site locations through out the state and the weekend scheduling added to their enthusiasm about the program. The second expectation was program content. Students expected to obtain new information and/or skills. They felt the new information would be helpful in their current careers and jobs. They also indicated that they hoped the course content would help them better understand the organization they worked for. They specifically expected to obtain Human Resource theory and apply it to the job by accepting more responsibility, extending current job duties and bringing more knowledge, ideas and creativity to their organizations.

Supervisors supported students obtaining a degree mainly because they anticipated benefits to the job and the organization. They felt the degree would aid the students in managing on-the-job projects, meeting job specifications, advancing within the job/organization, developing better understanding of people, policies and procedures. The supervisors also felt that the content would be beneficial because of its focus on HRD. They indicated they expected the students to obtain a broad background in HR theory, concepts, and principles. They also felt students would be able to apply the knowledge obtained to practice and to utilize the program as a resource for networking in the larger community and with their peers. The supervisors had a strong feeling that the student's job skills would be enhanced. They specifically thought the students would gain in the ability to bring knowledge, ideas and creativity to their organization, learning new concepts that would help their organization and to extend their current duties into the development of additional training within the organization.
Both, students and supervisors expressed some degree of uncertainty with the program. They indicated that they did not know what to expect since it was different than traditional programs. The program content and the distance education method of delivery were unknowns and therefore of some concern.

**Challenges**

Students reported time as a major challenge to participating in the program. They indicated that attending class on Friday night and Saturday mornings caused conflict with family activities and duties. The extended times of the program, fall, spring and summer for two or three consecutive years also added to the pressure of family and job related responsibilities. The nine-week duration of the weekend classes consolidated course content, which made students rush assignments and add further to an already busy schedule. The added responsibility of attending classes and completing homework in conjunction with family and work related responsibilities made for a time management nightmare.

Students also viewed their own attitudes as a challenge. That is, they were challenged to stay focused and on task, to stay motivated to getting to class and getting the work done. They had to overcome the fear of going back to school after being out so long. Adjusting to the HRD classes was also a challenge. These classes were different from traditional classes because they were designed for the non-traditional student, the adult learner. The design of the classes allowed for more student involvement, participation and group work. Some students indicated that some team members did not participate which created problems since all group members shared a grade. Also the use of technology in the classroom caused concern. None of the students had any experience using the technology that is involved in distance education. They reported that it took time to get used to the cameras, microphones and other equipment in the classroom.

Supervisors reported very little in the way of challenges. They did however; mention that sometimes work schedules and load had to be adjusted to allow for class attendance. They also indicated that they felt the major challenge was on the shoulders of the student.

**Strengths/Benefits**

Students perceived benefits fell into three categories. First was learning environment. They indicated that the nontraditional nature of the program and students was a positive factor. As nontraditional students they had many and varied experiences and backgrounds which contributed to the overall learning in the classes. They felt that nontraditional students were more serious about doing course work, wanting to do their best, getting things done, not getting sidetracked or off task and working with group activities. Academic teachers and advisors were also viewed as a positive. Students thought that the instructors were caring, knowledgeable, and involved in the program because they wanted to be and were interested in helping students learn and finish the program. They perceived that they could talk to their instructors at any time about class or professional concerns and felt that the instructors were very good about explaining assignments and other class tasks to the point that they were easy to understand. Students felt that access to the portfolio process, which allowed them to receive credit for prior work experience benefited them by reducing the time needed to finish the degree.

The second category of perceived benefits was personal. Students felt a high degree of personal accomplishment and satisfaction by their involvement in the program. They indicated they had gained skills, knowledge and maturity. The overall personal benefit was gaining a bachelor’s degree. Many of them had a long time goal of finishing their degree. They found it very fulfilling to finally obtain a degree.

The third category was personal/professional. The focus of this area was on benefits that were personal but could also be defined as professional. Students felt the program helped them with promotions, pay increased, more job responsibilities, and improving self-concept. However, some students indicated they had received no promotions or recognition from being involved in the program. They viewed the program as helpful in forming networks of other professionals from throughout the state. They felt that this networking helped keep up with the profession as well as gain insight into how different agencies and organizations operated. Students indicated they benefited from the program because it was set at a time and day that did not conflict with work, which motivated them to stay with the program, and enabled them to finish the program more quickly.

Supervisors commended the university and the professors for offering this program statewide to students with such a wide background and experience. They indicated that they admired the students for the time and effort they were willing to put into obtaining their degree. They also felt the class scheduling, on weekends, was a great benefit because it did not interfere with job performance. Supervisors reported that the students increased knowledge benefited the organization through more participation in training and other activities. One supervisor indicated that
several concepts and theories learned in class were integrated into their organization. Others stated that student performance had improved since involvement in the program.

Recommendations

Students made several suggestions for improving the program. These suggestions could be grouped into three categories. First were entrance requirements and program policies. Students indicated their belief that access to the program should be limited to students that had completed the equivalent of an associate's degree. Students viewed this as a minimum requirement because it enhanced the probability of graduating in a two-year period. Students indicated that it was difficult to complete the HRD courses and have general education requirements to fulfill.

Students also suggested there should be separate "tracks" for those who have managerial or supervisory experience and those who do not. They felt this would accelerate the pace of the courses and provide a more homogenous class profile. They felt that students with no managerial experience find it difficult to comprehend the discussions of those who have supervisory experience. Likewise, students with substantial supervisory work history felt that the courses were less stimulating when elementary concepts had to be discussed for those who had no managerial experience.

The second category was teaching methods. Students recommended that the program incorporate more subject matter experts from area business and industry. They felt that this would provide a practitioner's perspective that would be beneficial. They felt that each topic should include the perspective of a full-time practitioner working in that topic area. They felt this would help the content become more relevant. Group work and practice was viewed as beneficial to learning. Students felt that this practice should be extended to each course and teaching at the "technical" level should be minimized. They valued the "hands on" approach and wanted to see it expanded. Likewise, some students indicated that various program parts should have been geared toward more "practical, everyday things" and less emphasis on the book.

The third category was course content. Students indicated that the program should include course work regarding the legal issues associated with HRD. Specifically, they suggested including labor law studies as part of the curriculum. They indicated that this was an area of growing concern for themselves and their supervisors. Some felt that there was too much emphasis on training and needs assessment. Students wanted broader exposure to assessment topics rather than an in-depth view of training needs assessment.

Conclusions

This study speaks to the unanticipated benefit associated with incorporating qualitative data collection in programmatic evaluation. While the interview guide provided a framework for eliciting programmatic information from participants, interviewers took great care not to lead participant responses. Not only was constructive data gathered regarding the perceived effectiveness of the programs structure and content the respondents allowed us to peak into the affective issues that students and their supervisors associated with the program. This in turn gives the evaluators to better understand the program content.

Both students and their supervisors reported that students became a “better worker” as a result of involvement in the University of Arkansas Human Resource Development program. Specifically they agreed that students had more knowledge, focus, confidence and initiative as a result of the program. This in turn gives the evaluators to better understand the program content.

Assessment of the Graduate Human Resources Development Program, St. John Fisher College

Erin Glanton,
Marilynn N. Butler,
St. John Fisher College

The first formal assessment of the Graduate Human Resource Development program at St. John Fisher College in Rochester, NY is conducted. This assessment from the learners' perspective is examined at five levels: Kirkpatrick's four levels of evaluation and the fifth by Hamblin. The assessment is conducted using self-report information about learners matriculated into the program. The findings suggest that there are significant differences between groups of Learners in Level 2: Learning and Level 5: Ultimate Value.

Keywords: Human Resource Development, Levels of Evaluation, Program Assessment

Academic program assessment is a key element for a college or university's continued accreditation. It also plays a significant role in the status of professional accreditation. Assessment allows academic programs to document the quality and success of their curriculum and identify new opportunities for growth and development (Schwindt, 1995). The purpose of this preliminary study is to conduct a program assessment of the Master of Science in Human Resource Development program at St. John Fisher College in Rochester, New York. This study is a first attempt to establish a model for discovery of the impact that the current curriculum presented in this program-of-study has on the current student population and the alumni of the program. This examination is not designed to validate the data collection instruments used nor is it intended to compare outcomes with other graduate academic programs. It is designed to conduct an academic program assessment utilizing a model typically employed in training evaluation.

St. John Fisher College graduated its first class of six Masters of Science candidates from the Graduate Human Resource Development (MSHRD) program in 1999. These six individuals led the way for what has grown to be an expected graduating class of 17 in the year 2002. Started in fall of 1997, the program is still in its infancy. As with any new instructional program, it requires assessment as an essential component of its development to provide continuous improvement.

Satisfaction with the program, the acquisition of knowledge (learning), the application of learning (behavioral changes), changes in the workplace due to students' behavioral changes, and the benefit's recognized by students' workplace are at the center of this inquiry. Kirkpatrick's four levels of evaluation with the addition of Hamblin's fifth level were used to guide this examination. This framework provides a set of standards that are within the scope of the inquiry.

For the purposes of this study, program effectiveness is determined by the extent to which Learners, defined as students who matriculated into the MSHRD program, perceive themselves as successful. Learners are separated into three groups: (a) graduates of the program; (b) current program candidates; and (c) candidates who matriculated into the program but have not taken a class in the previous year and examined through self-report data. Analyses of the data on these groups are conducted using Kirkpatrick's (1998b) four-level hierarchy of evaluation model with the addition of Hamblin's fifth level of focus. The five levels are Level 1: Reaction, Level 2: Learning, Level 3: Behavior, Level 4: Results, and Level 5: Ultimate Value. This examination seeks answers to six questions:

Q1. Is there a difference in satisfaction levels between the three groups of Learners?
Q2. Is there a difference in perceived learning—skill, knowledge, and attitudes—between the three groups of learners?
Q3. Is there a difference in perceived behavioral changes—both in the classroom and on-the-job—between the three groups of learners?
Q4. Is there a perceived anticipation and recognition of changes, contributions to the workplace learning and demonstrated leadership between the three groups of Learners?
Q5. Is there a difference in career advancement and earnings increases between the three groups of Learners?
Q6. What is the demographic composition of program participants?

Conceptual Framework

Assessment is clearly the preferred term for this process of an academic program. However, the means with which the assessment is conducted is through evaluation; the terms for this study are intertwined. The literature on the two
terms in the educational context, however, is not consistent. The terms have been defined in varying ways and may be distinctly different, yet one author's definition of one term may be the definition another author uses for the other term.

The key is not in definition, but in how the gathered information is used and its relationship to practices on campus (Palomba & Banta, 1999). It is important to recognize that the terminology has been, is, and will most likely continue to be used in varying, confusing, and sometimes contradictory ways, and that colleges are free to use the terminology they find most suitable. It is within this spirit that this assessment of the MSHRD program is conducted. For the purposes of this study assessment refers to the overall process of program appraisal to determine its effectiveness and value using the means of evaluation. Evaluation is the appraisal of each of the five levels—reaction, learning, behavior, results, and ultimate value—from the perception of the Learner to determine Learner success. The value and responsibility in conducting both (or either) assessment and (or) evaluation is the use of the information to improve the program and benefit the Learner (AAHE, 1996; Farmer & Napieralski, 1997; Haworth, 1996).

**Why Assess?**

There is no question that the concept of assessment has been around for many years (Farmer & Napieralski, 1997; Madaus & Kellaghan, 1992). Since the 1980's, however, there has been increased emphasis to use assessment to improve the quality of learning (Angelo, 1999; Banta, Lunt, Black & Oblender, 1996; Lipschultz & Hit, 1999; Weise, 1992). Students, faculty, courses, programs, departments, and institutions have all been the focus of assessment and evaluation efforts.

The assessment movement is increasingly becoming more important (Donald, 1997; Banta, Black, & Ward, 1999). At the post-baccalaureate level, ensuring quality and improvement through program assessment is somewhat rare (Banta, Black, & Ward, 1999; Haworth, 1996). Ongoing assessment activities should be about improving learning and for the ultimate benefit of the student (Angelo, 1999; Baird, 1996; Palomba & Banta, 1999; Syverson, 1996).

**The MSHRD Connection to Evaluation**

The selection of the means with which to conduct this assessment by using levels of evaluation is one particularly suited to use for the MSHRD program. Kirkpatrick (1998a) explains:

> The four levels are all important, and they should be understood by all professionals in the fields of education, training, and development, whether they plan, coordinate, or teach . . . . whether the programs are conducted in education, business, or industry . . . . In human resource development (HRD) circles, these four levels are recognized widely, often cited, and often used as a basis for research and articles dealing with techniques for applying one or more of the four levels” (pp. xv-xvi).

Incorporation of the five levels of evaluation in this assessment study is program appropriate, while seeking to address the complexities of learning with an imaginative and individualized approach, one that reflects the character of the individuality of the program and local conditions (Banta, 1997; Farmer & Napieralski, 1997; Palomba & Banta, 1999).

**Relevance to the Field of HRD**

The pursuit of graduate education is becoming a trend among HRD professionals. However, not all are attending programs that specialize in HRD. For lack of program availability, incompatibility of curriculum with organizational needs, many enroll in programs designed for allied fields such as business, sociology, education, and human services. Thus, it becomes critical for academic programs specializing HRD to conduct various forms of assessment activities to determine whether or not the curriculum meets the needs of the learners and the workplace. Employer sponsored tuition assistance programs scrutinize these programs to determine the return on their investment—will the employee/student learn relevant information that can be applied in the workplace? Individuals making the educational investment must also be satisfied with the experience and, at minimum, believe that they have learned and can demonstrate competence after completing a program-of-study.

**Levels of Evaluation**

The standard and most prevalent evaluation model in the field of HRD is the four-level Kirkpatrick model (Reynolds, 1998; Rothwell & Sredl, 2000). This model was chosen to guide this study as a first step in program
evaluation for three reasons: (a) it is the most familiar in the field; (b) it is intended to measure the areas of interest to the specified academic institution; and (c) the four levels guide the development of questionnaire domains. Kirkpatrick (1998a) originally introduced his concept of the four levels of evaluation in 1959; although he makes some changes to his guidelines, he currently concludes that the four levels—reaction, learning, behavior and results—to evaluate training programs have remained the same. Questions associated with each level explored are provided:

Level 1: Reaction. “What did the participants like or dislike?”

Level 2: Learning. “How did the participants change by the end of the program?”

Level 3: Behavior. “How much did the participant change subsequently affected job behavior or performance?”

Level 4: Results. “What are the results produced by behavioral change?”

Hamblin’s 5th: Ultimate Value. How do results affect the organization or individual over time? (Rothwell & Sredl, 2000).

Here, we define learning as changes in attitudes, improvements in knowledge, and/or increases in a skill that participants (Learners) experience because they have attended a program (Kirkpatrick, 1998b). Level 2 evaluation measures not only the learning of the program participants, but also the effectiveness of the instructors. If failure occurs, it provides the opportunity to look for ways of being more effective in the future. The third level of evaluation measures the use of learning on the job; in other words, how well did the learning transfer? This study measures perceived behavioral changes—both in the classroom and on-the-job—from the perspective of the Learner. Kirkpatrick (1998b) defines his fourth and final level of evaluation as the final results due to participants’ attendance at a program. The Learners’ perceived anticipation and recognition of change, contributions to workplace learning, and their demonstrated leadership are measured in this study via the surveys completed by Learners. Hamblin (1974) takes the concept of evaluation to an even higher level than did Kirkpatrick. The ultimate value level or fifth level of evaluation examines the valued ends, which Hamblin equates to financial and economic outcomes—an organization’s profit and loss. For the Learner, financial and economic outcomes are most evident through career advancement and earnings increase. Furthering their career is the reason most people undertake the costly and challenging quest of an advanced degree (Baxter, 1993).

Methodology

Population

The population (N = 70) consists of three categories of Learners: (a) graduates of, (b) current candidates for, and (c) candidates who matriculated in, but have not taken a class in the previous year, the Master of Science in Human Resource Development (MSHRD) program at St. John Fisher College. For the purposes of this examination, this entire population was surveyed. Participants in category (a) graduates, are referred to as Program Graduates; participants in category (b) current candidates, are referred to as Program Candidates; and participants in category (c) candidates who matriculated, but have not taken a class in the previous year, are referred to as Program Leavers.

Data Collection

Data were collected using two questionnaires from Program Graduates, Program Candidates, and Program Leavers of the Master of Science HRD. One questionnaire assesses Program Graduates and Program Candidates (Questionnaire 1) and the other instrument assesses Program Leavers (Questionnaire 2).

Questionnaire content and structure. Questionnaire 1 is composed of two sections: (a) 10 questions and (b) 12 agreement statements. The 10 questions asked for demographic information to determine age, race and ethnicity, gender, date of program completion or expected completion, salary upon program entry and current salary or respondents. The 12 statements assessed respondents’ agreement using a five-point Likert-type scale: (a) Strongly Disagree; (b) Disagree; (c) Neutral; (d) Agree; (e) Strongly Agree. Here, participants were asked to rate statements regarding content areas presented in Table 1.

</table>

Similar to Questionnaire 1, Questionnaire 2 has two sections: (a) 12 questions and (b) 12 agreement statements. The 12 questions asked for demographic information to determine age, race and ethnicity, gender, date of program completion of undergraduate degree, undergraduate degree major, date of entry into the MSHRD program, date of last course taken in the MSHRD program, number of credits earned in the program, perception of matriculation status in the program, area of employment when they entered the program, and current area employment. Program Leavers were then asked to respond to the same 12 statements assessing their agreement using the five-point Likert-type scale: (a) Strongly Disagree; (b) Disagree; (c) Neutral; (d) Agree; (e) Strongly Agree (Table 1).

Survey Administration

Surveys were administered as unsupervised mail-response-questionnaires. Program Graduates, Program Candidates, and Program Leavers received their surveys in a packet containing a letter of introduction that included consent, instructions for the process to complete and return the survey, and a postage-paid return envelope addressed to the researcher's home. Packets were sent via first-class mail by the US Postal Service.

Data Analysis

Data were analyzed using quantitative and qualitative methods. Descriptive statistics were calculated. ANOVA was employed to determine statistical differences.

Survey Response Analyses

Demographic information for the entire population and each of the three groups was summarized to provide descriptions of their characteristics. Attributes such as gender, age, year of undergraduate degree receipt, and field of work were examined.

Limitations

This study has five primary limitations. First, the population is small. A total of 70 matriculated Learners have entered the program since its inception in 1997. Second, the primary researcher is one of the Learners—a Program Candidate—which leads to the possibility of bias in both the creation of the survey instruments and in the reporting and interpretation of the results of the study. Third, since this is a preliminary examination with the intention of developing a model for program evaluation, the survey instruments used in the study were not tested for content and construct validity. Fourth, data were collected through self-report surveys therefore bias responses are expected. In other words, this inquiry, most likely, reflects primarily Level 1 results. Finally, the questionnaires employed in this examination were not tested for content or construct validity. The purpose of this study was to conduct pilot research that will lead to more rigorous examinations in the future.

Findings

Response Rate

The overall response rate from the Learners is 64.29% (N = 45). The combined response rate for Program Graduates and Program Candidates is 76.00% (n = 38). There was a low number of responses from Program Leavers.
The response rates for this evaluation of the program from Program Graduates and Program Candidates are 86.67% and 71.43% respectively. In contrast, the Program Leavers have a low, but probably more typical, response rate of 35.00%. Program Leavers comprised 20 of the 70 Learners, producing an attrition rate for the MSHRD program of 28.57%. However, 42.86% of the Program Leavers that responded to the survey indicate that they plan on completing the MSHRD program.

Demographic Information

Answering Q6, the demographic data from the study provides a demographic description of the typical MSHRD student at St. John Fisher College. The population is predominantly female, although the Program Candidate group is fairly evenly split. A much higher percentage of the Program Leaver group are female—71.43%. This area is one that deserves further study. It should be noted that the numbers of Learners graduating each year are increasing. This finding is an indication that the program is growing supporting the notion that the demand for master's degrees is increasing in general (Baxter, 1993). This growth in the number of Learners reinforces the importance of assessment as a tool to improve the program.

The population is 80.00% Caucasian with. To date, there are no African American MSHRD program Graduates. This information seems to point to considering ways to increase the diversity of the Learner base with incoming Learners.

The range of ages is dispersed somewhat equally among three groups: (a) the Between 26 and 30, (b) the Between 31 and 40; and the Between 41 and 50 groups, with the final quarter of Learners being either 25 or under or Over 51. This information doesn't focus on the fact that 42.22% of the Learners are under 30. The program is heavily drawing the under 30 Learner.

To date, 92.10% of Learners do complete or plan to complete the program in less than three years, with 68.42% finishing in two years or less. The program seems to fit the need for obtaining a degree in a relatively short time period.

Furthermore, findings indicate that there is an increase in the number of Learners entering the program who are already in the field of Human Resources, either in development or management (i.e., compensation, benefits, labor relations, employee assistance) or in a combination of both development and management. This finding may indicate increasing interest in and acceptance of the program by professionals already in the field. Graduates, based on the responses, are finding jobs in the field. When they started the program, only 23.07% of Program Graduates were employed in the HR field. Now, 61.54% of them are currently employed in the HR field. There is a less dramatic, but nevertheless actual, shift by Program Graduates moving into HR related positions, indicating that they are finding new positions in the field prior to completing their degrees. It seems logical to assume, based on this evidence, that Learners are realizing enhanced career opportunities by being in the MSHRD program. This outcome is born out in their responses to Level 5: Ultimate Value statements, as well.

It seems reasonable to expect the Program Graduates rate highest in their responses to the twelve statements on the survey (Table 1) and the Program Leavers to rate lowest in their responses to the twelve statements on the survey, with the Program Candidates somewhere in between. The quantitative findings do indeed bear this out overall. Within the Program Candidates group are Learners who began the program recently and have thus far have had one semester of classes. It may be premature to survey these individuals as part of the evaluation. The group of Program Candidates also may contain individuals who may, at some future date, become Program Leavers, deciding to complete the program.

Table 2 presents a summary of means and standard deviations for responses to survey statements by Program Graduates, Program Candidates, Program Leavers, and Learners. Here, responses to all statements for all groups with only one exception were above the midpoint of 3.00, indicating an overall positive measure of Learner success. Program Leavers have the one exception in the area of increased earnings in which they did not rate as highly as either Program Graduates or Program Candidates. It may be reasonable to conclude that increased earnings are a longer-term result of the program. The high standard deviations within Level 3: Behavior and Level 5: Ultimate Results are an indication of the variety within the responses of Program Graduates and Program Candidates, as well as for Program Leavers. All three groups, Program Graduates, Program Candidates, and Program Leavers, had their highest ratings—means of 4.85, 4.46, and 3.86 (which tied with two other statements for Program Leavers), respectively—in knowledge improvement. Level 2: Learning, was the highest rating of the five levels for both Program Graduates and Program Candidates. Perhaps these ratings are tied to expectations of a college education. Program Leavers had their highest rating in Level 1: Reaction, indicating a high level of satisfaction.

For the group classified as Program Leavers, the name is misleading, at least for those who responded. Had more of those that have not taken a class in the last year responded, the results may have indicated otherwise.
Although almost 43.00% of the Program Leavers responding to the survey plan to complete the program, it seems reasonable that there would be a lower rating from the group as a whole when compared to Program Graduates and Program Candidates. Because so few Program Leavers responded, it is difficult to identify any trend in why Learners leave the program. Obtaining this information through some other means may provide valuable insight.

Although the overall mean ratings for the statements and the levels of evaluation decrease from Program Graduates to Program Candidates and decrease further from Program Candidates to Program Leavers, there is no statistically significant difference between the groups in perceived satisfaction levels; perceived behavioral changes; and perceived anticipation and recognition of changes, contributions to workplace learning, and demonstrated leadership.

Summary Analysis of Research Question

Q1. Is there a difference in satisfaction levels between the three groups of Learners? According to these data, all Learners rated their perceived satisfaction levels highly on the survey.

Q2. Is there a difference in perceived learning—skill, knowledge, and abilities—between the three groups of learners? The results from the ANOVA identified statistical differences between Program Graduates and Program Leavers (Where SS= 4.52, df = 2, MS=2.26, F= 4.36, P= .02) supporting the idea that Program Graduates are perhaps more learned, possessing more advanced skills, increased knowledge, and improved attitudes than Program Leavers. However, Program Candidates who are in the middle and not statistically different from either group.
seems the best strategy to increase perceived learning for the Program Candidates to continue to move toward graduation and become Program Graduates.

Q3. Is there a difference in perceived behavioral changes—both in the classroom and on-the-job—between the three groups of learners? Findings indicate that there is no significant difference in perceived behavioral changes between the three groups of Learners. Both Program Graduates and Program Candidates rated themselves highly in the area of behavior. It’s important to keep in mind that, according to Kirkpatrick (1998b), even if the Learner has the opportunity, he or she may not apply the learning immediately, or indeed, ever. Changes in future behavior need to be measured in subsequent studies.

Q4. Is there a perceived anticipation and recognition of changes, contributions to the workplace learning and demonstrated leadership between the three groups of Learners? The three statements on the survey used to answer Q4 are drawn directly from the mission of the program. The findings show no significant difference in perceived anticipation and recognition of changes, contributions to workplace learning, and demonstrated leadership between the three groups of Learners. Although Program Graduates rated themselves just slightly lower than Program Candidates rated themselves in the means for contribution to learning, the job requirements or workplace situation for the Program Graduate may be a limiting factor.

Q5. What is the demographic composition of program participants? The study finds a statistically significant difference in career advancement and earnings increase between the groups of Learners, the topic of Q5. Program Graduates and Program Candidates, although not significantly different from each other, are both different from Program Leavers. As was mentioned earlier, more Program Candidates are entering the program already in the field of HRD and entering at higher salaries than did Program Graduates. The positive response to statement S12 is verified by the examination of salary information from the demographic portion of the study. While career opportunity and growth cannot necessarily be measured in increased salary dollars, a study of the data shows that Program Graduates have, indeed, advanced their careers and increased their median income by 45.50% since beginning the program. Because Program Candidates are entering the program with higher median salaries to start, future increases may not be as dramatic. On the other hand, graduates of the program have had, at most, two years since graduation. It may be that Ultimate Value takes time to ascertain. Examination of the increase in earnings for Learners is an area for ongoing assessment.

Relevance of Findings

The findings of statistically significant differences between groups of Learners at two of the five levels of evaluation, indicate benefits of the MSHRD program in the areas of learning and ultimate value. Although there are no found significant differences between Program Graduates, Program Candidates, and Program Leavers in satisfaction, behavior, or results levels, the study provides evidence of agreement on all levels of evaluation from both learners, indicating learner success (especially for Program Graduates in learning and ultimate value) and program effectiveness.

Conclusion

Based on the findings of this preliminary examination, we conclude that there are statistically significant differences between Program Graduates, Program Candidates, and Program Leavers at certain levels of evaluation. We further conclude that on all five levels of evaluation—Level 1: Reaction, Level 2: Learning, Level 3: Behavior, Level 4: Results, and Level 5: Ultimate Value—the Learners, based on their perceived success, rate the program’s effectiveness highly. The MSHRD department at St. John Fisher College must keep in mind that in spite of the positive responses in this study, recommendations were offered to improve the program and the department. Thus, they should not become complacent as Schwindt (1995) advises based on his study. Possible program improvements are presented and recommendations for future improvements to subsequent studies are noted.

Developing an assessment program is complex and time consuming (Banta, Lund, Black, & Oblander, 1996; Barker & Folger, 1996; Gray, 1997). Barker and Folger go on to point out that consistency in leadership is a crucial factor. This paper provides an example of a program evaluation design, implementation, outcomes and lessons learned. Assessment is a non-linear, continuing, and circular process (Farmer & Napieralski, 1997; Wright, 1993). This study is the first in the MSHRD program assessment plan, but it is just one part of that ongoing iterative process.

National Comparison of Graduate Level Human Resource Development Programs

Cheryl. Klein,
Marilynn N. Butler,
St. John Fisher College

The field of HRD is evolving into a discipline that is increasingly recognized in organizations and the educational community. The rapidly changing professional world, coupled with shifting demographics, technological advancements, and opportunities for lifelong learning, has placed high expectations on HR practitioners. In order to provide a standard for best practices, continual assessment and evaluation of the educational preparation for the HR professional is essential. This study provides benchmarking information for graduate level HRD programs.

Keywords: Human Resource Development, Graduate Education, Accreditation

Human resource and workforce development is increasingly an essential component of an organization's strategic planning processes and overall success. Experienced and educated human resource professionals are needed in this evolving field. In order to prepare individuals to meet the increasing demands of the workplace, developmental and educational opportunities must be available. These learning experiences may take the form of on-the-job training and development, a coaching or mentoring situation, cross-functional training, or formal education. Often, human resource development (HRD) professionals become the stewards over the training, education and development of an organization's workforce. Thus, HRD professionals must be highly competent and well educated themselves. To support this need, the number of academic programs designed specifically for human resource practitioners specializing in training and development, Organization Development and career development steadily increased over time.

This study examines 68 of these programs to determine similarities and differences in program design. As the field of HRD matures, standardization and consistency in professional practice becomes critical. HRD academic programs provide practitioners with foundations by which to practice. Thus, an examination of HRD academic program design is imperative.

The purpose of this study is to compare and contrast graduate level programs in human resource development (HRD). In other words, "How do graduate HRD programs compare to one another with regard to program details, curriculum, admission and graduate requirements, student demographics, and mission statements?" Specifically, programs that include organization development (OD), training and development (T&D), and/or career development in their curriculum are examined.

Theoretical Framework

Organizations in every sector have been impacted by the changing trends over the past 50 years. These changes have increased the need for competent, knowledgeable HRD professionals. Mergers, downsizing, reorganizations, and technological advances have created work environments that are continuously evolving. Trainers, organization development consultants, labor relations specialists, and career counselors are just some of the positions that are becoming needed and prevalent in the modern workforce. In order to develop trained, competent professionals, a combination of experience and education must be applied. A discussion about workforce needs, professional roles and required competencies provides a foundation for this examination.

Workforce Needs Linked to HRD Roles and Competencies

It is important that the HRD practitioner not only be able to adapt to change and diversity in organizations, but to become a champion of change efforts. In order for HRD professionals to be taken seriously and considered credible, a combination of theoretical background and practical experience must be applied to organizational circumstances. In this sense, a distinct educational experience may be the deciding factor in one's competence and broad knowledge. Understanding the needs and expectations that organizations have will enable HRD professionals to assume the role of strategic partner. In order to become effective in an HRD role, understanding the industry the organization serves is a critical component of success. Gaining the attention of an organization's population can only
be accomplished when one is credible and articulate. The successful professional is able to speak to and work with the culture and mission of both employees and management alike. More recently, understanding technology and the changes it brings to the industry has become imperative. One important role that HRD is increasingly assuming in organizations is assisting in solving internal performance problems (Laird, 1985). In order to become effective in developing solutions to these issues, an understanding of the organization is essential. Weighty expectations come with this involvement in an organization's climate and culture. The HRD function must develop a reputation to be highly responsive, knowledgeable, and continually successful in its undertakings. Frequent and consistent communication is an essential trait for promoting this view of the HRD team. It is also important for the HRD effort to reflect the organization's culture and mission (Rothwell & Kazanas, 1994). This alignment shows consistency with executive management and reinforces the organization's view on how it should support those it serves.

The Role of Strategic Partner. As the field of human resources evolves into the role of strategic partner for an organization rather than "just the personnel office," there is a heavier emphasis on the professionalism of HRD practitioners that was not as prevalent in former decades (Chalofsky & Reinhart, 1988). The ability to address strategic business needs is a concept that elevates the HRD professional to a position of influence within organizations. Unlike the personnel director of years ago, the opportunity to participate in business decisions and advise from an HRD standpoint has been a long sought-after role by the human resource arena. This responsibility must be accompanied by strong problem solving skills and diagnostic capacity. Among these traits, a sense of leadership and the ability to project long-term goals is another critical factor that businesses are seeking in HRD professionals today. More and more, organizations are looking to human resource professionals to participate in strategic planning initiatives (Flores & Fadden, 2000). This reaction raises the bar in terms of skills and abilities that practitioners should hone.

McLagan (1989) lists five key roles that effective HRD professionals must possess. These include competency assessment, performance management, professional development, job design, and career planning. Related literature also notes the link between human resource practices and financial success of organizations (Rynes & Trank, 1999). Organizational culture, employee relations, and organizational learning contribute greatly to the workplace environment, employee attitude and morale, and consequently to customer satisfaction. Focusing on the three primary components of HRD frames the need for advanced degree programs: Training and Development, Organization Development, and Career Development.

Training and Development. Trainers come in frequent contact with employees and management staff. The trainer's role is no doubt a highly visible one. Noe (1999) identifies several competencies that trainers must reflect in their interactions. These include industry understanding, adult learning knowledge, feedback and writing skill, objective preparation, knowledge of training and career development theories, delegation skill, coaching, and effective group facilitation. Behind the scenes, trainers must also be able to rely on computer competence, data analysis, research ability, facilities assessment, project and records management, cost benefit analysis, and business understanding.

In response to the shifting demographic of the workforce, changes from traditional curriculum to one based on the theory of multiple intelligences have been found to have a positive impact on learning (Mettetal, Jordan, & Harper, 1997). It is important for instructional designers to be aware of different learning styles and to provide opportunities for the learner to focus on individual strengths in reaching desired objectives. From a strategic standpoint, it is desirable for these training and human performance practices to be linked somehow with compensation (Bassi & Van Buren, 1999). In order to maintain a competitive advantage, organizations must be committed to reward and recognize employees who regularly perform at a higher level after acquiring new skills and competencies. In this example, compensation and training and development practices are connected to achieve maximum success of a joint HR function.

Organization Development (OD). With massive changes in the workplace, considerable attention has recently focused on developing and changing organizations to perform at peak levels. OD "...consists of long-term change efforts directed toward individuals, groups, and organizations that are designed to improve decision making, problem solving, and group or organizational culture" (Rothwell & Sredl, 1992, p. 9). OD consultants may be internal or external professionals asked to function as change agents. A study conducted by Church, Waclawski, and Burke (1996) embraced the idea of OD practitioners as facilitators of change. Here, business leaders identified three critical competencies. These competencies included (a) an awareness and understanding of aspects of organization change management, (b) a style conducive to influencing the organization and its decision-makers, and (c) the capacity to deal with the change process and the ambiguity it brings. Dealing with change can often be demanding by itself and dealing with change inside an organization is particularly challenging to an external consultant. In their research, Church et al. found two significant trends in the experiences of OD practitioners. First, a strong positive correlation was made between level and years of experience in the OD field and attaining a higher tolerance for the
ambiguity related to continual change. The second finding showed a significant positive correlation between more academic courses and professional training and a higher tolerance for this ambiguity. These results relate to the state of the field in that ambiguity is encountered in the majority of HRD positions. While practical experience shows to be a critical necessity in implementing and continually dealing with the issues faced in this challenging profession, education is extremely important in possessing the knowledge behind effective HRD efforts.

**Career Development.** As a result of increased training opportunities and a focus on improving the quality of work life for employees, career development specialists are often needed to assist the workforce in making career decisions. The focus on lifelong learning has shifted the responsibility of individual professional development from organizations to individuals (Hall, 1986). The changing demographic of the workforce has prompted ‘flatter’ organizations and thus, less chance for traditional advancement. Employees must assess their current positions, career options, lifestyles, and the likelihood of advancement within the organization in selecting a self-directed plan. In this sense, the involvement of the employee and the employer is ideal in achieving the most individualized support of career goals. Employers may offer training opportunities, company certification programs, cross training options, educational assistance, or a career resource center. The career development professional may assist the individual in selecting the development options that are most suited to their specific interests and goals.

In implementing career resource options for employees, organizations should align three primary areas: the company vision, the problem or initiating reason, and any foreseen changes (Koontz, Theis, & Audette, 1998). Executive management and HRD staff must also be involved in the communication of a career resource effort. If career consultants are available for employees, it is essential that these consultants are trained and experienced professionals. An effective career counselor should develop skills in observing, questioning, coaching, feedback, relationship building, and competency identification (Rothwell & Sredl, 1992). Other competencies such as self-knowledge, business and adult learning understanding are necessary to develop a well-rounded ability to assist individuals in their personal and career growth. In career counselor roles, HRD practitioners must possess the experience to effectively interact with employees. However, a theoretical background in career development links practical application to educational knowledge base.

The need for HRD professionals to engage in advanced studies is clear. Moreover, in order for these professionals to function effectively in their varying dynamical roles and responsibilities competently, a comprehensive curriculum that provides a discrete learning experience is required.

**Graduate Education for HRD Professionals**

The human resource development field involves continual changes and needs in today’s professional world. Research suggests that there are several key connections that relate to the importance of competent, educated HRD professionals (Dixon, 1990; McLagan, 1989; Rothwell & Sredl, 1992, 2000). So as to develop competencies that are necessary to become a strategic partner within an organization, HRD professionals are turning toward graduate education to help them achieve a higher-level competitive advantage. Horn (1998) notes that 50% of all graduate students, a higher number than ever before, are 30 years and older. Greenberg (2000) contends that HRD graduate students are often seasoned professionals in the field experiencing an increasing need to earn a graduate level degree. Many of these students have reassessed their career goals and recognized that continuing education is needed to advance and to remain competitive. These findings align with correlating research suggesting that 50% of all graduate students, a higher number than ever before, are 30 years and older (Horn, 1998).

The need for business knowledge in the human resource field is identified as a key reason for choosing management and business oriented graduate programs such as MBA and business management programs (Sunoo, 1999). It is interesting to note that the opportunity and added responsibility of becoming a strategic partner in organization development are cited as examples of increased credibility. The need for credible perception is critical if HRD professionals are to be considered key leaders in their roles within organizations. With such weighty expectations in the minds of organizational leaders, it is important to examine how educational programs develop and prepare graduate students for the expectations that lie ahead in HRD careers.

**HRD Specific Graduate Programs**

While the pursuit of graduate education is becoming a trend among HRD professionals, not all are attending programs that specialize in HRD. For lack of program availability, incompatibility of curriculum with organizational needs, many enroll in programs designed for allied fields such as business, sociology, education, and human services. Employer sponsored tuition assistance programs scrutinize these programs to determine the return on their investment—will the employee/student learn relevant information that can be applied in the workplace?
Nevertheless, numerous graduate programs claiming to specialize in curriculum for the HRD professional are opening in colleges and universities and gaining popularity with learners and organizations across the United States and around the world. When studying the emergence of specialized academic programs, the consistency of primary variables must be observed. This study analyzes similarities and differences of these programs by program descriptions, curriculum, admission requirements, and program mission statements.

Related Research. Hatcher (1998) compared demographic data of graduate level programs, focusing specifically on where HRD programs are housed in colleges and universities offering such degrees. His findings show that the two top contenders for HRD programs are the education department at 32.5% and the business management department at 18%. Other departments that support HRD programs include psychology, liberal arts, and technical and applied sciences. Hatcher also looked at practice-related influence, which gathered actual HRD competencies and business and industry requirements. His findings showed that management teams identified nine essential competencies for HRD staff. The following competencies are identified in order of ranking: adult learning understanding, organization behavior understanding, presentation skill, coaching, project management skill, industry understanding, visioning skill, computer competence, and negotiation skill. Theory-related influence to the programs was also studied to address which areas of emphasis embody the programs in respect to theories of HRD and HRM.

In addition, Kuchinke (2001) studied institutional characteristics, student population, and core curriculum. Fifty-five programs were examined, which included master's, doctoral, and certificate programs. Curriculum categories were assigned and percentages calculated. Kuchinke's finding reflected the five most commonly required courses were in the areas of instructional design, instructional delivery, evaluation, adult learning theories, and needs/performance analysis respectively. Several other subject areas received high rankings as well, with 13 out of 31 in the over 50% category. Again, these findings illustrate the diversity of HRD as a field reflected in educational programs.

Methodology

Target Population and Sample

The target population for this study consists of graduate level programs in human resource development/workforce development, career development, organizational development, or training and development. The sample consists of master's level programs housed within public or private colleges and universities throughout the United States.

Sampling Procedure

Purposive sampling was employed to include graduate programs that met guidelines within the scope of this study. Purposive sampling is a non-probability method that follows specific criteria to collect information (Cooper & Schindler, 1998). The programs included in this study are those in the field of human resource development/workforce development, career development, organization development, and training and development. Each program included one or more of these subject areas in their degree title. Specifically, judgment sampling, a technique of purposive sampling, is used to select each graduate program based on the specified screening criteria. Judgment sampling is a method of selecting those that conform to the specific criteria that the researcher wishes to obtain.

Data Collection

This study is an examination of extant data. To obtain relevant information, admissions, graduate, and/or department offices were contacted by telephone or electronic mail to request program materials. University and college web-sites were also accessed to obtain like information. A total of 193 programs in human resource related fields were initially examined and considered. Only colleges and universities with human resource/workforce development, career development, organization development, or training and development were chosen for inclusion in this study. Programs were selected based on their degree title and curriculum requirements. These criteria were established to narrow the scope of the study to the field of human resource development, specifically to master's level programs.

Data Sources.

Three primary resources were utilized to collect the necessary data. These resources include Peterson's Guide to Graduate Study 2000, http://www.peterson.com, and http://www.gradschools.com. Peterson's Guide was referenced specifically to human resource development programs that were listed. The two primary web-sites were accessed to obtain information regarding graduate level human resource development, career development, training and development, and organization development programs. By utilizing the program information obtained from
these sources, a thorough investigation of university and college web-sites was conducted. Additional program information was requested from career development offices and graduate program departments, through e-mail and telephone communications. The materials sent from these academic institutions included official course catalogs, curriculum requirements, admission packets, graduate bulletins, and college brochures. All relevant information obtained via direct mailings, electronic mailing, or course information available from college and university web-sites is included in this study.

Data Analysis

Data were collected and entered into spreadsheets and tables for organizational purposes. Program details, curriculum, admission and graduate requirements, student demographics, and mission statements were assessed employing conceptual content analysis. In conceptual analysis, a concept is chosen for examination, and the analysis involves quantifying and tallying its presence (Krippendorf, 1980; Palmquist, Carley, & Dale, 1997). The focus here is on looking at the occurrence of selected terms within a text or texts. Here, key phrases and words in the each of the five areas were tracked and counted. These data were then aggregated and summarized using categorization of each topic. This analysis approach allows for summarization of important points in each of the programs examined (Stewart & Shamdasani, 1990).

Limitations

While established criteria aide in developing consistency in reported data, a good amount of interpretation in content analysis is subjective to the researcher's background, experience, and perspective. One challenging aspect of this study is in the mass amount of information that was recorded and summarized. Limitations include availability of complete information for each examined subject area.

Program Details. The general information for this topic area was relatively accessible from admissions offices or via the Internet. One limitation may be the existence of HRD programs that were not listed in primary resources. Programs that do not list in the accessed primary resources would thus not be included in this study. Another similar limitation may be the omission of programs whose degree titles may fall outside the scope of the established criteria. Some of these programs may be consistent with the curriculum of an HRD program, but may be listed under titles such as adult education, human resource management, industrial relations, etc. While every effort was made to include relevant programs, it was necessary to establish limits in order to define the scope of the study.

Curriculum. When analyzing curriculum, several programs offered specific information about the course description. Other programs did not provide such detail. This lack of detail may have resulted in overgeneralization of a course's main focus. In some cases, programs did not offer complete details regarding course requirements or elective options. In such cases, the remaining courses were recorded into the 'other' category. This situation may have resulted in the omission of information. Finally, all research was based on the most current information available. If coursework requirements have changed and not yet been updated, reported data will only include that which was available to the researcher at the time of the study.

Admission Requirements. One factor encountered in the collection of admission requirements was again the detail of information available. While some educational institutions were very specific about admissions processes, others did not provide such detailed information. For instance, one college may list the application, fee, and personal statement as a requirement. Another may note only the application and fee. The personal statement may be a part of the actual application, but since it was not noted specifically, it would not be recorded. Thus the two programs may require the same materials from the student candidate. However if the programs displayed requirements differently, it would appear as such.

Mission Statements. Limitations to this section include the unavailability of mission statements for each program examined. Some degree programs had mission statements for their individual field, while others had only one mission statement for the entire educational institution. Many of the non-specific mission statements were reviewed, but not recorded or included in this study due to their broad nature.

Findings

Of the 68 programs examined, 35 offer master of science degrees, 12 offer master of arts degrees, and 11 offer master of science in education degrees. The distribution of degree titles is similar to degree types with 34 programs with the degree title of HRD, nine programs titled Organization Development, and eight entitled Training and Development.

The department or school in which HRD and HRD-type programs find residence are distributed in eight areas with the majority residing in Education/Human Services/Workforce Development (29), Graduate and Professional Studies (13), and Management/Business (12). This finding is consistent with a similar study conducted by Hatcher.
these professionals to guide organizations through transitions and thus compete in a global marketplace. Providing their organizations. Not only will this goal provide career advancement opportunities to graduates, it will enable implement, and evaluate HRD programs is essential in preparing graduates to accept leadership responsibility within the statements for HRD programs focus on several key areas. Providing students with competencies to design, the statements are providing competencies and promoting career advancement for students. The content of mission points are connected in some way. It is interesting to note the two most frequently mentioned topics in the mission points are connected in some way. It is interesting to note the two most frequently mentioned topics in the workforce today. With the continuous advances in technology, HRD practitioners must be able to adapt and utilize available technological resources. Diversity is increasingly a focus of training due to many differences in cultural background between employees. Coupled with the integration of several generations of workers, diversity plays a big part in the workplace. Other curriculum options involve human resource management topics such as personnel assessment, labor relations, and compensation. While the roles of HRD professionals do not focus on HRM issues, a general understanding is often important to obtain (Nadler & Wiggs, 1986).

Curriculum
The curriculum analysis includes data collected from 65 programs. While 68 programs are included in this study, two programs were missing specific curriculum information and were therefore omitted from the curriculum analysis. A third program was omitted based on its similarity to a directly related program within the same university. This university currently offers two degrees for the same degree title. One degree is a Master of Science (MS) and the other a Master of Education (M.Ed.). The curriculum requirements are the same for both programs with the exception of the capstone experience. Here, the MS capstone is a thesis, essay, or paper and the M.Ed. capstone consists of an independent study and a comprehensive study. The categories displayed in Table 1 presents percentages of (a) programs offering one or more courses in the subject area; (b) programs requiring one or more courses; (c) programs offering one or more electives; and (d) programs requiring one or more courses and offering one or more electives. Curriculum requirements encompass a variety of subject areas in this study. Twenty-five of the most frequent topic areas are examined. The eight most commonly offered courses are those in training and development, research methods and statistics, organization development, overview of the HR/HRD field, management and leadership, organization assessment/consulting, program assessment, and adult learning. Each of these course categories is offered by more than 50% of master’s level HRD programs.

These results are consistent with many common themes presented by Kuchinke (2001) in related research. Kuchinke notes instructional design, instructional delivery, evaluation, adult learning theories, needs/performance analysis, history and philosophy of HRD, instructional technology, and organization development, as the top eight content areas required in curriculum of graduate HRD programs. Some variations to these findings are noted in this study, perhaps due to the different analysis methods employed. Nonetheless, similar themes present themselves. The range in course curriculum demonstrates a wide breadth of competencies that the graduate level candidate must develop over their course of study. An integration of a soft skill set and a business skill set are demonstrated. It is important to consider the impact of this finding to the field of HRD and to academic program and curriculum developers as well as proponents of accreditation measures.

Breadth of Course Offerings. The range in other course offerings is important to address. Group development and organization behavior are two topic areas that are offered in more that 40% of programs. The offerings show that soft skills are still an essential part of the field of HRD. Diversity and technology are more areas that require attention in the workforce today. With the continuous advances in technology, HRD practitioners must be able to adapt and utilize available technological resources. Diversity is increasingly a focus of training due to many differences in cultural background between employees. Coupled with the integration of several generations of workers, diversity plays a big part in the workplace. Other curriculum options involve human resource management topics such as personnel assessment, labor relations, and compensation. While the roles of HRD professionals do not focus on HRM issues, a general understanding is often important to obtain (Nadler & Wiggs, 1986).

Admission Requirements and Mission Statements
Admission requirements most likely reflect the standards of the institution, standards set forth by associated accrediting bodies as well as the department or school of residence. Admission requirements in the programs examined have a range of levels for entrance. All programs require the application and undergraduate transcript. The majority of programs (>60%) also require letters of recommendation and a testing requirement (GRE, GMAT, etc.). Some departments require more extensive detail into a potential candidate’s current skills, experience levels, and professional interaction ability. Others assess the bare essentials of an application and transcript. Most programs do set one or more standard of evaluating a candidate aside from the application and transcript. While the field of HRD is a highly visible one in organizations, it is logical to conclude that personal interaction and ability to communicate effectively are essential components to succeed in HRD programs.

The mission statements reviewed in this study demonstrate an integration of goals for HRD programs. Many of the mission points are connected in some way. It is interesting to note the two most frequently mentioned topics in the statements are providing competencies and promoting career advancement for students. The content of mission statements for HRD programs focus on several key areas. Providing students with competencies to design, implement, and evaluate HRD programs is essential in preparing graduates to accept leadership responsibility within their organizations. Not only will this goal provide career advancement opportunities to graduates, it will enable these professionals to guide organizations through transitions and thus compete in a global marketplace. Providing
these competencies promotes advancement of the field of HRD and serves to promote the high quality of work life for employees. The educational setting also allows practitioners to network with other professionals as they share practical information, resources, ideas, and strategies. The combination of educational and professional experience allows the student to participate in an integrated setting and serves to encourage a supportive learning community.

Conclusions and Recommendations

This study provides important information for those working with or attending HRD academic programs to observe. Assessing standards and determining best practices provides room for growth, development, and debate. Those founding new programs need benchmarks and examples of how other programs are designed and areas considered in their development. Established academic programs involved in program evaluation and assessment activities can use this information for competitive analyses or to determine curriculum upgrades or changes. The accreditation debate is an ongoing argument that requires considerable study, evidence, and support.

The Accreditation Debate. While program assessment and continuous improvement is important, the area of accreditation is the subject of ongoing debate among professionals and administrators in the field of graduate education. Accreditation programs are sometimes viewed as limiting or too defining in some areas of specialization (Dill, 1998). Other colleges and universities prefer not to 'answer' to such an affiliation, but would rather strive towards their own mission and project the goals of their stakeholders and their communities. Accreditation, however, does hold an attractive lure for many student candidates and organizations. When evaluating programs based on the prestige of accreditation, it is essential to learn about the accrediting body and its standards (Abernathy, 2001). Some institutions develop their own accrediting bodies to impress prospective students. Looking at admission requirements, testimonials from graduates, and instructors’ profiles may provide more clues to make an informed decision about a program.

While HRD programs have advanced over the last few decades, an accrediting body is not currently in place for the field. Since accreditation is an option for some academic programs, it is important to consider the following questions: Would an accrediting body lend greater recognition and acceptance to the HRD field as a whole? Could established curriculum criteria develop professionals conducting ‘best practices’ nationwide? Do organizations today warrant and demand competent HRD professionals with common bodies of knowledge, skill, and aptitudes? These questions are currently under investigation in the HRD field and link to the further evaluation of educational programs. This study lays a foundation for the exploration of many more areas of relevance in the HRD field. Educational assessment, leadership competencies, and expectations of the professional workplace are topics that require further research. The constantly evolving nature of the business world and the workforce itself prompt practitioners to continually reassess and reevaluate needs. The academic field must do so, as well, to take a proactive role in the education of professional HRD students.

A Study of the Organizational Learning Profile

Rae Dorai
Adela J. McMurray
Australian Graduate School of Entrepreneurship
Swinburne University of Technology

R. Wayne Pace
Brigham Young University

The purpose of this research was to determine the content validity and reliability of the Organizational Learning Profile (OLP) instrument that was designed by Pace et al. (1998) to measure factors of organizational learning. The 34-item scale was administered to 169 respondents working in both the manufacturing and service industries yielding a response rate of 100%.

Keywords: Organizational Learning, Learning Organization, Validity and Reliability

Organizations acknowledge that learning is crucial for their survival; however, attempts to understand how organizations learn remain obscure even though the 1990s saw a dramatic growth of publications both reviewing and evaluating the concept (Crossan and Guatto, 1996). The literature on organizational learning has viewed the concept from different perspectives and abounds with various conceptualizations and definitions (Nicolini and Meznar, 1995). The seminal definition for learning was provided by Argyris and Schon (1978) who defined it as the process of detection and correction of problems.

Their definition is based on two premises: firstly, that organizational learning is anthropomorphic, that is there is a lack of evidence showing that organizations can learn; and secondly, that problems in organizations do not have permanent solutions and only give rise to new problems. Subsequent definitions have viewed the concept from the content and the process perspectives.

Cyert and March (1963) viewed learning as a change in behavior in response to a stimulus. Fiol and Lyles (1985) defined learning by organizations as the process of improving actions through better knowledge and understanding and agreed that it is essential to include both cognitive and behavioral elements in the definition of organizational learning. Miller (1996) defined organizational learning as the acquisition of new knowledge by actors who are able and willing to apply that knowledge to making decisions or influencing others in the organization. Dodgson (1993) and Crossan (1999) viewed organizational learning as a construct that is used to describe certain types of activity (or processes) that may occur at any one of several levels of analysis, or even seen as a part of the change process as suggested by Schein (1996). Kilmecki and Lassleben (Sadler Smith, 2001) defined organizational learning as changes in organizational knowledge that are induced by information processing and enable an organization to find new ways in order to survive and be successful in new situations.

Organizational learning as defined by Leavit and March (1988) is routine based, history dependent, and target oriented, meaning that organizations are seen as learning by encoding inferences from history into routines that guide behavior. This definition is expanded in further detail by Nicolini and Meznar (1995) who assert that organizational learning is socially constructed and dependent on a person’s ability to transform practical knowledge into abstract knowledge.

Four theoretical views of organizational learning are identified by DiBella (1995): an outcome or economic view, a developmental view, a normative view, and a resource based or capability view. The economic view sees learning as that which accords to experience and collective production. The developmental view looks at the learning organization as a stage in the evolution of the firm. While the normative perspective looks at an optimal way of achieving organizational learning, the capability view looks at learning as endemic to all firms, which is grounded in individual learning and embedded in the structure of internal relationships.

Huber (1991) looks at organizational learning as shared knowledge involving knowledge acquisition, information distribution, information interpretation, and organizational memory. Knowledge acquisition, according to Huber, is essentially information acquired by the organization while monitoring the environment; distribution, interpretation, and memory involve using information systems to store, manage, and retrieve information. Carrying out research and development is a way to acquire information. Some of the unique conclusions drawn by Huber include the idea that learning does not always increase the learner’s effectiveness and learning need not always result in change in behavior. According to Huber (1991) learning occurs when an individual processes information that results in a behavior change.

Copyright © 2002, Rae Dorai, Adela J. McMurray and R. Wayne Pace
Several different approaches to the study of organizational learning have been identified. For example, DiBella, Nervis and Gould (1996) recognize organizational learning capabilities along different learning orientations. Each of these orientations is conceived as a bipolar continuum that reflects the learning processes. In a more recent study, DiBella (2001) goes beyond the individual to address groups such as departments within organizations. He suggests there are seven different bipolar orientations to learning which result in fourteen learning approaches. These learning approaches are measured by the Organizational Learning Inventory (OLI) intervention tool where a group's learning capabilities are identified and may be used in the improvement of the creation, dissemination or use of knowledge to facilitate their alignment with the organization's strategic direction. Like the OLP, the OLI deals with knowledge and learning processes, however it differs from the OLP in that its focus is on organizational group learning and not individual learning.

Watkins, Yang and Marsick (1997) identified five different approaches to organizational learning: (1) the conscious detection and correction of errors, (2) a change in organizational memory, (3) a change in mental models, (4) a culture of inquiry and generativity, and (5) extracting and building knowledge.

Leavitt and March (1988) in their change-in-organizational-memory approach view organizations as learning by encoding inferences from history into routines that guide behavior. Routine-based conceptions of learning assume that the lessons of experience are maintained and accumulated by translating them into routines. In this view, learning is defined as a process rather than an outcome.

Leavitt and March's (1988) explanation of organizational learning is based on three classical observations drawn from behavioral studies of organizations.

First, behavior in an organization is based on routines that are based more on the past than anticipation of the future; second, organizational actions are history dependent; and third, organizations are oriented to targets, which means their behavior depends on the relationship between outcomes achieved to outcomes expected.

The notion that organizational learning results in a learning organization is a taken-for-granted-assumption. The learning organization can be described as an environment in which organizational learning is structured so that teamwork, collaboration, creativity, and knowledge processes have a collective meaning value (Watkins and Marsick, 1993, 1996).

Watkins and Marsick (1996) identify six factors that characterize organizations that move towards becoming a learning organization. These are to create continuous learning opportunities, promote dialogue and inquiry, promote collaboration and team learning, empower people towards a collective vision, establish systems to capture and share learning, and connect the organization to the environment and provide strategic leadership for learning.

Sadler-Smith, Spicer and Chaston (2001), using Extant theory, established the relationship between organizational learning and performance, at both the individual and the collective level, by examining the active-passive learning orientations of 300 smaller manufacturing and service firms. Active and passive learning orientations were measured using a prototype scale that consisted of 30 items that measured zero loop learning, single and double loop learning. Cronbach alpha for the instrument was 0.70. The instrument was administered to 1000 owner managers and managing directors of small businesses in the south and west of UK. Size of the business was a variable. The response rate was 30%. Findings showed a positive relationship between growth and learning orientation. The results further showed that the greater the learning orientation the higher the sales growth. However, there was no significant relationship between growth and core rigidity in business service firms. Sadler-Smith et al.'s (2001) approach to learning, to some extent, is similar to Pace et al.'s (1998) approach in that both view organizational learning as a process that may be performance related.

The preceding paragraphs share a commonality in that organizational learning is behavioral and involves action based on experience. However, these organizational learning definitions are based on different perspectives and, therefore, different theoretical frameworks. The major problem is that they appear to lack convergence. This is because organizational learning is embedded in different schools of thought (Bell, Whitwell, and Lukas, 2002). For example, DiBella, Nervis and Gould (1996) take a normative perspective and define learning as a collective activity that only takes place under certain conditions. Huber (1991) on the other hand notes that an organization learns when through its processing of information, it increases the probability that its future actions will lead to improved performance.

Pace (2002 in press, pp. 109-121) views organizational learning as the acquisition, retention, and distribution of information quickly and efficiently through an institution's social and technical networks in order to systematically solve problems and to experiment with new approaches to working and managing to avoid problems in the future.

Theoretical Framework

The theoretical framework of the Organizational Learning Profile is based on the change-in-organizational memory approach described by Levitt and March (1988). They state that "organizations are seen as learning by encoding inferences from history into routines that guide behavior" and that routine-based conceptions of
learning presume that the lessons of experience are maintained and accumulated with routines despite the
turnover of personnel and passage of time."

According to Levitt and March, learning is defined as a process rather than an outcome. Knowledge
acquisition is the process by which knowledge is obtained. Information distribution is the process by which
information from different sources is shared and thereby leads to new information or understanding. Information
interpretation is the process by which distributed information is given one or more commonly understood
interpretations. Organizational memory is the means by which knowledge is stored for future use. Huber (1991)
comments that an organization learns if, through its processing of information, the range of its potential
behaviors is changed. This paper reports the development and analysis of an instrument designed to measure
factors of organizational learning.

Based on the above framework, this research attempts to answer three key research questions: First, what
factors describe organizational learning? Second, can an internally reliable instrument measuring aspects of
organizational learning be developed? Third, does the instrument have content validity?

**Methodology**

The purpose of this study was to further establish the reliability and content validity of the Organizational
Learning Profile. The development and validity of the original instrument may be found in Pace et al’s (1998)
report.

This study was designed to reevaluate the OLP and test the instrument’s reliability and content validity in a
different culture and multiple contexts. It was administered to 169 respondents working in diverse contexts
ranging from banks, hospitals, insurance companies, hotels, finance, education, and automotive manufacturers.
The reliability of the instrument was calculated using the Cronbach Alpha test, resulting in a value of 0.95, a
high reliability score.

Sample for the study was a convenience sample consisting of full time employees working in diverse
industry backgrounds such as banks, hospitals, insurance companies, hotels, finance, education, and automotive
manufacturers. The respondents were drawn from local industry (60%) and the remainder (40%) part -time MBA
students. This explains the 100% response rate.

**Analyses**

**Demographic Analysis**

Respondents were drawn from diverse industry backgrounds with 67% from service and hospitality and
15% from manufacturing. The majority of the respondents belonged to the managerial cadre (38.4%) and 26.2%
were workers. The ethnic background of the respondents was predominantly Australian (59%), but 15% were
Asians.

**Principal Components Factor Analysis**

Responses to the thirty-four items of the Organizational Learning Profile were subjected to a principal
components analysis (PCA) using SPSS. Prior to performing the PCA the suitability of data for factor analysis
was assessed using the Kaiser-Meyer Olkin Measure of Sampling Adequacy (KMO) and Bartlett’s Test of
Sphericity. Orthogonal rotation was chosen because it is the simplest case of rotation of factors, which is viewed
as being an important tool in interpreting factors. Results, Tables 1 and 2, showed that the data were suitable for
further analysis. Principal components analysis was carried out using Varimax with Kaiser Normalization. The
VARIMAX method has proved very successful as an analytic approach to obtaining an orthogonal rotation of
factors (Hair et al, 1998)". A forced four-factor solution was obtained from the data. Principal component
analysis with variance rotation yielded a total variance of 64.3% explained across three factors.

The PCR revealed the presence of four factors with items having Eigen values exceeding 1.0. The analysis
resulted in factors that were slightly different from the original study, but provided support for the original
pattern of factors.

Results

Comparisons, as shown in Table 3, between the original OLP factors and the revised OLP factors reveal certain similarities and differences. They are similar in terms of information storage and memory (Items 1-6). They are different in terms of information dissemination and channels of dissemination. In the revised version individual members (men and women) of the organization have a role to play in the

Source: Authors
storage and sharing of information; in addition, this version also highlights the importance of information sharing in creativity and innovation. The original OLP scale has a skewed distribution of items where the majority of the items loaded on factor 1 and factor 2. On the other hand, the revised OLP has an equal distribution of items, thereby showing that organizational learning is a process of influence on the learning practices that prevail in organizations, the achievement mindset of the individuals, the information sharing patterns that occur across the organization, and the inquiry climate that is created in the organization.

Individual factors of the original OLP and the revised OLP were tested for reliability. Factor 1, Learning Practices, of the revised scale showed a Cronbach Alpha (\(\alpha\)) of 0.93. Factor 2, Information Sharing Patterns, had 10 items and showed a Cronbach Alpha score of 0.92. Factor 3, Inquiry Climate, had a reliability score of 0.88. Factor 4, called Achievement Mindset, had a reliability score of 0.90. This shows that the reliability scores of individual factors were high. The names of the revised factors were refined to account for the new clusters of items that were loaded on each of them. Factor 1 was labelled Information Sharing Patterns. The items were analyzed in terms of what type of information patterns they represent. This label is consistent with Huber (1991) and Levitt and March's (1988) definition of organizational learning as the processing of information, and that organizations learn if any of their units acquire knowledge that they recognize as potentially useful to the organization. Factor 2 was labelled Inquiry Climate. Most of the items have something to do with inquiring, challenging, and experimenting as elements of organizational climate. This factor is supported by many studies of organizational climate and creativity (Amabile, 1997). Factor 3 was labelled Achievement Mindset. The items relate to the mindset workers regarding the desire to achieve. The items were grouped on the basis of how they contribute to achievement. This factor is consistent with the premise that individuals are the unit of learning in the organizational learning process (Cummings and Worley, 1997; Argyris and Schon, 1978). Factor 4 was labelled Learning Practices. The items all appear to represent learning practices that contribute to learning. This factor highlights the importance of organizational variables like structure and culture and their role in the organizational learning process.

Renaming the factors creates a more specific view of organizational learning, but at the same time it tends to retain the basic approach visualized when the OLP was originally developed. The next task in developing the OLP will be to refine the items to more clearly reveal each of the basic concepts and to make each item simple to understand and easy to respond to. The factor coefficients appeared to meet acceptable standards (all except one above .50), and the Cronbach Alpha score of .95 is high. In addition, the Test of Sphericity is significant at the .000+ level of confidence.

Conclusion

This study identified four factors associated with organizational learning referred to as Information-Sharing Patterns, Inquiry Climate, Achievement Mindset, and Learning Practices. The findings in this study show that the OLP is a reliable instrument for measuring organizational learning and that its content validity is high. Thus, the higher organization members score on the Profile, the more they are in tune with the principles and practices of organizational learning. Therefore, it may be argued that this study makes a significant contribution to the understanding of organizational learning. The results show that organizational learning is a holistic process that encompasses learning practices, information sharing patterns, an inquiry climate, and an achievement mindset of individuals.

The Organizational Learning Profile approaches organizational learning as a process and focuses on factors that affect learning in an organization. On the other hand, Dimensions of the Learning Organization Questionnaire measures seven dimensions of a learning organization. Both measures describe aspects of some phenomena associated with learning and organizations. The Organizational Learning Profile provides a description of factors that affect learning in an organization; on the other hand, Dimensions of the Learning Organization Questionnaire describes organizations that have evolved sufficiently to be called learning organizations.

The Dimensions of the Learning Organization Questionnaire is based on the model of the learning organization developed by Watkins and Marsick (1993, 1996). It has six dimensions—create learning opportunities, promote dialogue and inquiry, promote collaboration and team learning, empower people towards a collective vision, establish systems to capture and share learning, connect the organization to its environment, and provide strategic leadership for learning. Together, these instruments provide a measure of two facets of learning and its relationship to organizations. Although different in approach, they should have some compatible aspects and provide a more comprehensive analysis of learning and organizations than either does alone.
Contribution to New Knowledge in HRD

This study contributed to the refinement of the original OLP, and identified four factors that characterize organizational learning. They were labeled Information-Sharing Patterns, Inquiry Climate, Achievement Mindset, and Learning Practices. Future research could further validate the OLP by refining items for greater clarity and administering it to other populations. This research has furthered our understanding of the specific items that comprise the four factors of organizational learning.

The findings suggest that organizational learning and learning organizations may evolve from similar concepts, but differ as a result of the individuals who operate within them and the environment that is created by them. It might be worthwhile to examine the extent to which the OLP and the DLOQ correlate with one another. The findings in this study indicate that the two instruments should not correlate because they measure different aspects of learning: learning in the organization versus organizations that learn, but that the two instruments should be complementary.

The Ability to Change: A Holistic Model of Organisational Change

Olivia Kyriakidou
Mike Riley
University of Surrey

This paper introduces one set of ability to change measures developed to study whether change occurred during the operational and business culture change process of a single case company. Results show that a supportive learning context as well as employee perceptions of discrepancy, efficacy, personal significance, appropriateness and moderation as the main characteristics of change indicate a strong organisational and individual ability to change and are strongly related to employees commitment to the introduced change.

Keywords: Change, Learning, Measurement Model

In the words of Van de Ven and Poole (1995) “it is of a great challenge for scholars in management and many other disciplines to find ways of explaining, understanding and analysing how organisations change” (p.510). The ability to change and learn is expected to create the major source of competitive advantage for organisations (Armenakis, 1999), since organisations continuously need to change internally, as well as to adapt to changes they meet in their organisational environment. However, although the literature abounds with evidence of change efforts that have gone wrong (e.g., Cummings & Worley, 1997; Dunphy, 1996; Kotter, 1996), theorists have been relatively silent on why organisational change often is unsuccessful. In this sense, there is a growing need to understand the most favourable conditions that enhance organisations’ ability for change, the processes of both organisational change and learning, as well as organisational inability to change or inertia, in order to improve change effects.

A feature of the literature is diversity of viewpoints regarding the nature of organisational change. The emphasis on organisational change research has clearly been based on either individual process research (micro-level) or on organisational conditions for change (macro-level). No successful attempts to create a holistic model of organisational change ability have been accomplished, although the elements for its construction should already be in existence. The aim of making a clear-cut separation between change as a process and the elements of a ‘changing’ organisation (i.e. an organisation that can exhibit the ability to constantly transform itself), and thus studying them whilst disconnected from each other has not, in our view, furthered the building of a holistic picture. Those concerned with the organisational change processes, implicitly at least, tend to link organisational change with learning by assuming that the more an organisation develops certain characteristics (such as participative decision-making culture or innovativeness) the more change therefore will take place. Paradoxically, at the same time, they ignore the other factors of the change process, such as individuals’ ability to change or unfreeze their cognitive schemas. In our view, the loosely coupled perspectives can offer no more than pieces of theory and cannot create synergy but rather cause conceptual confusion. Therefore, there is a need to develop a holistic model of the organisations’ ability to change that operates with clarified and sensemaking concepts.

Moreover, despite vivid discussion and the development of consultation tools for turning companies into changing companies (e.g., Armenakis, 1999; Cummings & Worley, 1997; Senge, 1990), one cannot avoid the feeling that little has been done to develop valid measures for organisational change. This might be due to, but also the reason for, a lack of comprehensive research in this area (Huber, 1991). Another reason for the shortage of methodological discussion and the underdevelopment of measures of organisational change is the fact that the very concept and the process through which organisations actually change still is vague. It is of course impossible to measure the phenomenon without knowing what is. This paper will attempt to develop a holistic model addressing the ability for organisational change based on the ‘grounded’ analysis of a case study trying to explore how organisations change. This paper also participates in the methodological discussion on organisational change, by introducing one set of organisational change measures developed to study whether change occurred during the operational and business transformational change process of a single case company.

What is organisational Change Ability?

According to change theorists, organisational change is initiated and carried out by individuals in organisations (Bartunek, 1984; Porras & Robertson, 1992). Senge (1990) argues that it is only through the learning of individuals that organisational routines are changed and it is individuals who create organisational forms that enable change and facilitate transformation (Dodgson, 1993). Therefore, improving organisational change ability should first mean the creation of favourable conditions for change and learning by individuals (Cummings & Worley, 1997). The more extensive the change in the organisation is, the more it calls for a total change in dominant logics and cognitive frameworks, not only in behaviours (Prahalad & Bettis, 1996). In other words, a high degree of a context enabling organisational learning that includes individuals adopting new mental models and corresponding behaviour is needed (Hedberg, 1981; Senge, 1990).

In the change management literature, the concept of learning is there. It is seen as something that increases an organisation’s ability to implement planned change and reach its objectives. It is not only through learning of the new but also unlearning of the old that is needed in order to make the change successful. In the organisational turmoil learning reduces uncertainty and thus inevitable also helps in reducing change resistance (Geertz, 1964). Because organisational learning thus improves the organisation’s efficiency and performance, it is a vital part of every change process (Cummings & Worley, 1997). In this sense, learning can be seen as a mediating factor between change objectives and business results.

However, one of the shortcomings of the change management literature is that the mechanisms through which change and learning translates into an organisation’s performance are ignored (Cummings & Worley, 1997). This is mainly due to the fact that the literature ignores that employees often resist change and learning in order to maintain the status quo and feel secure.

Therefore, according to the present framework, in order to enhance the organisation’s ability to change and learn, aspects such as organisational power structure, values and culture, individuals, technology and goals need to be considered and any unfavourable conditions negatively affecting change and learning should be removed before the implementation of change starts. When members of an organisation learn what the change actually requires and participate to its formation, it reduces both collective and personal insecurity (Coopey, 1995). At the same time, when change is implemented and presented in a way that enhances employees’ perceptions of their organisational membership (e.g., their organisational identities), it reduces feelings and perceptions of threat. If learning does not occur, employees then develop defensive routines which help them to resist change (Argyris, 1992).

The present paper tries to grasp the core of the organisation’s ability to change. From our point of view, organisational change is represented by changing associations, frames of reference and programmes and not just by behavioural adaptation. In order, therefore, to distinguish between change and behavioural adaptation, one needs to know if association development has occurred (Fiol & Lyles, 1985). Consequently, measuring change and learning at one and the same time, without trying to strictly distinguish them from each other, is meaningful because it offers the possibility of seeing the whole picture. We argue that change and learning are also interactive processes, as learning has a mediating role in the change process. Consequently, they should not be isolated from each other (Lahteenmaki et al., 2001).

A Holistic Model of Organisational Change Ability

The holistic and dynamic model of organisational change that is suggested here, brings together the concept of procedural change processes and the concept of learning both at organisational and at individual levels suggesting a constant interaction between both the individual and organisational levels. Reaching an organisational level in the change process means, in practice, organisational changes, which in turn affect the individual level and call for more individual change and learning.

According to this model then, one commences by establishing a necessary context enabling individuals’ ability to learn, i.e. supportive conditions and a favourable attitude towards personal development and the adoption of new behaviours (Pedler, Burgoyne, & Boydell, 1991; Tannenbaum, 1997). Individuals’ ability and willingness to learn are necessary conditions for organisational change. It is assumed here that learning takes place when the organisation supports the change process in a proper way and obstacles to individual’s learning are removed. Within the context of a learning organisation,
employees accept that the formation of the organisation's identity is never closed and that it will develop a series of identities through time that reflect the organisation's and its members' evolving self-concepts.

Learning involves a reintegration of the processual, structural, and content aspects of the organisation (Senge, 1990) promoting thus organisational change and confining perceptions of threat (Argyris, 1990). Hirschhorn (1988) argues that in order to promote acceptance of change, a new work context is needed that challenges the suppression of doubt and ambivalence in the modern organisation and is single minded in the pursuit of its goals and in its one-dimensional understanding of its unchanging and fully formed identity. The changing organisation is characterised by a “culture of being open to others”, that “uses doubt as a springboard for learning” (Hirschhorn, 1997, pp 17-18). Only after establishing the supportive context for learning can employees participate in the goal-setting process as well as in the building of strategies by the company.

The ability to change then involves the development and acceptance of new cognitive models, which is facilitated by the learning context. The adoption of new mental models indicates the level of commitment to the new working practices. Individual change of mental models indicates that individual-level cognitive and the subsequent attitude changes are becoming an organisational-level phenomenon. Cognitive reorientation of organisational members is involved at the essence of organisational change. From this perspective, the organisation’s ability to change depends not only on the organisation’s ability to undergo a significant shift in direction, vision, and values, but also the cognitive ability of organisational members to understand, interpret as attractive and develop a new conceptualisation of the organisation (Smircich, 1983).

The development of new cognitive models supported by a climate of a learning organisation will contribute to change rooted in the organisation through the enabling of changes at the organisational level. Without change at the organisational level, i.e. new procedures, structures, routines, systems and so on, it is difficult for an organisation to be more efficient or change and adapt to environmental changes.

Organisational change is a dialectical process where building the ability to adapt to changes and develop new cognitive models is in dialectical relationship to implementing changes (Lahteenmaki et al., 2001). As argued by Kyriakidou (2001), to be effective, the implementation of change should incorporate at least the following components: a) discrepancy (i.e. we want to change), b) efficacy (i.e. we have the capability to successfully change), c) personal significance (i.e. it is in our best interest to change), d) appropriateness (i.e. the desired change is right for the focal organisation), and e) moderation (i.e. the discrepancy is large enough to create the stress necessary for employees to desire change but the dissimilarities are not so great that change is perceived as unattainable). In this way, the implementation of change further contributes to employees’ development of new cognitive models and internalising change.

Internalisation of change however, is not always problem-free even in the most suitable learning environments. Organisational changes are not fully accepted at an individual level. If the implemented change is subjectively interpreted as being threatening it is bound to provoke resistance to change. Respectively speaking, if the change is internalised, the employees involved commit to the mission and relinquish their resistance to change.

When this occurs, internalised organisational change then create favourable conditions for change and learning and enable the ability to adapt to these changes, adopt new behaviours and, thus, change. This is turn relates back to the collaborative setting of strategies and gradually to second-order change in terms of accepting and creating new structures again (Senge, 1990) (see Figure 1).

Referring back to the measurement problem one has to ask, how can we measure this type of ability to change? Here we share the views of Collins (1996) who states that due to the complicated nature of the change process, the existence and effectiveness of organisational change ability cannot be measured directly but only in the long run, through business results. However, it is possible – at least in theory – to measure the process of change step by step. Therefore, focusing on the process and the people instead of the organisational change reveals more of the ability to change itself, no matter how difficult this might be (Starkey, 1996). Building the ability to learn and change should be revealed through attitudes towards change (internalisation versus coercion) within the organisation, whereas the capability to set objectives and collaborate towards their future could be measured through adopted new behaviours (Argyris & Schon, 1996).
The aim of the present study has been to develop measures for testing the dynamic model of organisational change, a dynamic model in which the three approaches of change research, i.e. the individual and organisational levels of change and the contextual factors of change, are utilised. An initial battery of measures was derived from theories concerning factors which were expected to enhance the organisation’s ability to change (Pedler, Burgoyne & Boydell, 1991; Cummings & Worley, 1997, Tannenbaum, 1997), and from the measures used in previous studies concerning change processes and learning (Argyris & Schon, 1996; Kline & Saunders, 1993; Senge, 1990; Tichy, 1983). These measures assessed attitudes on such organisational conditions as changes in routines, the organisation of work processes, feedback and reward systems, climate and culture, management support, information flow, the openness of communication, participation in decision-making, teamwork, cooperation, HRD and so on.

Participants

Questionnaires were distributed to 224 members of the industrial electronics section of a large electronic communications company based in the UK. In the year before the realisation of the current project various changes had been made to the identity, strategy, culture, and structure of the company. 203 participants responded.

The Materials

The Change Survey was comprised of scales addressing the organisational learning context, the collaborative setting of strategies (Lahteenmaki et al., 2001), the elements of implementation and the development of new cognitive models.

The Organisational Learning Context

The development of a learning context that supports and enhances the individuals’ ability and willingness to learn is a necessary condition for organisational change. In our model we assume that change takes place when hindrances to individual’s learning are removed and the organisation supports the process in a proper way. Thirty items were developed on theoretical grounds, informed by the learning model (Kyriakidou, 2001), integrating ideas from the literature on communication, trust, learning modes (Pedler et al., 1991), innovation, personal development, and an open culture.
**Collaboration**

Structural elements constitute the very essence of change as they contribute to the organisation's ability to change, because by them, change is rooted in the organisation. Without new structures, i.e. new enabling organisational arrangements, routines, systems and so on, it is difficult for an organisation to develop an strong ability to change. Eight indicators have been chosen for the measurement of this stage forming a 24-item scale (Lahteenmaki et al., 2001). Some of them include ability to cooperate, ability to use teamwork, fluent and efficient information flow, efficient strategic planning.

**Commitment to change**

Commitment to organisational goals and strategies is a necessary condition for organisational change. Committed people are apt to accept the new mission which in turn indicates that individual-level attitude changes are becoming an organisational-level phenomenon. Ten items relating to commitment to change process, awareness of business objective, commitment to objectives, and active participation in decision-making were chosen to operationalise the internalisation of change in the form of developing new cognitive models. Commitment to change may indicate that cognitive reframing and the adoption of new cognitive models has been initiated (Albert & Whetten, 1985).

**Implementation**

The implementation scale included fourteen items for discrepancy, moderation, efficacy, personal significance, and appropriation.

**Results**

**Construct Validity**

To ascertain the degree of construct validity and examine the relative independence of constructs within the Change Survey a factor analysis was performed using a confirmatory principal components solution. As it could not be assumed that the factors were uncorrelated, an oblique rotation to simple structure was specified. The analysis predicted and yielded five factors, converging in 16 iterations, explaining 53.45% of the variance within the data. Only four of the five factors were meaningful in psychological terms, and moreover, did not in the main confirm the predicted factor structure or item composites. Factor 1 accounted for 29.7% of the variance and comprised 25 items. The highest loading items were about tolerance of discontinuities, open communication, personal development and innovation. The factor was labelled 'The Learning Context'. Factor 2 accounted for 7.8% of the variance, and comprised 17 items predominantly about collaboration and setting a future together. It was labelled 'Collaboration'. Factor 3 accounted for 6.3% of variance and comprised 11 items pertaining to change implementation and was thus labelled 'Change Implementation'. Finally, Factor 4 accounted for 5.3% of variance and comprised 8 items pertaining predominantly to 'Commitment to Change'.

**Reliability**

The internal consistency of items comprising each factor was assessed using α Coefficients for each of the change factors. In all instances, satisfactory coefficients of either .70 or above (Kline, 1996) were obtained making it viable to compute an average score for each factor or item composite.

**Concurrent Validity**

All composite items were intercorrelated prior to the appliance of linear regression analysis to ascertain the degree of covariance across the data. Table 1 reports the obtained bivariate correlations. In summary, the factor Learning Context was found to correlate positively with the factors labelled Collaboration, Implementation and Commitment. Collaboration correlated positively with Implementation and Commitment and finally Implementation correlated positively with Commitment to Change.
Table 1. Correlations across variables

<table>
<thead>
<tr>
<th></th>
<th>Learning Context</th>
<th>Collaboration</th>
<th>Implementation</th>
<th>Commitment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Learning Context</td>
<td>0.175</td>
<td>0.477**</td>
<td>0.444**</td>
<td></td>
</tr>
<tr>
<td>Collaboration</td>
<td>0.477**</td>
<td>0.259**</td>
<td>0.293**</td>
<td></td>
</tr>
<tr>
<td>Implementation</td>
<td>0.477**</td>
<td>0.259**</td>
<td>0.506**</td>
<td></td>
</tr>
<tr>
<td>Commitment</td>
<td>0.444**</td>
<td>0.293**</td>
<td>0.506**</td>
<td></td>
</tr>
</tbody>
</table>

To identify the factors which best predict the development of commitment to change, a regression analysis was carried out using the Enter method. This method was selected as the most appropriate as a calculation of bivariate correlations indicated the existence of significant covariance between a number of the identified factors. The regression analysis took the 'Commitment to Change' ratings as the dependent variable. All the other independent variables were entered into the regression equation. These variables were found to account for 35% of the overall variance, as the regression analysis produced an adjusted R2 value of .348, F = 5.772, p<.001, d.f. = 12.95 (these are the properties of the predicted model identified). The β weights (indicative of the proportion of this 35% each factor accounted for) for each factor are provided in Table 2.

Table 2. Results of Regression Analysis

<table>
<thead>
<tr>
<th>Predictor factor</th>
<th>β weight</th>
<th>P-value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Implementation</td>
<td>0.477</td>
<td>P&lt;0.05</td>
</tr>
<tr>
<td>Learning Context</td>
<td>0.321</td>
<td>P&lt;0.05</td>
</tr>
<tr>
<td>Collaboration</td>
<td>0.223</td>
<td>P&lt;0.05</td>
</tr>
</tbody>
</table>

The above table shows that the best predictor of commitment to change – as independently assessed – is the mode of implementation and to a lesser extent the learning context and the degree of collaboration. More analysis to indicate the specific effects of the sub-factors within each scale will be performed.

Discussion

In this article our main goals was to uncover the organisational elements or factors that enable change and enhance the organisations' ability to change. Suggested elements of organisational change have been introduced by various practitioners and researchers, although a clear verification through empirical research of these elements is still scarce. Most of these contextual factors of learning and change are expected to improve organisational change ability by sharing knowledge (e.g., information systems, shared visions and team learning). However, one has to recognise here that organisational members do not necessarily share one common frame of reference, but each have their own history-bound frames of reference. The individual is emphasised here also because the question of empowerment of the individual is a crucial one in this context. In order to increase the empowerment of the individual, attention is focused on organisational culture and leadership, structure and HRM questions. Organisational change can be realised or prevented by different organisational elements of factors.

Finally, the present paper has also introduced one possible set of measures and offered suggestions for the measurement of an organisation's ability to change. According to the understanding so far, when an organisation's ability to change is evaluated using these measures, the following interpretative rules could be applied. If indicators on each of four three levels are strongly positive using the scales mentioned here, the organisation then shows a strong ability to achieve second-order change (Bartunek, 1984). Individual and organisational change takes place at the same time as the development of the context and conditions needed in the future. Conversely, when all indicators are negative, the organisation in question cannot be considered a changing organisation. This model however, is based on one single empirical study and should therefore be re-tested, by gathering more data from different change processes in other organisations.

Integrating an Interactionist Perspective into the Theory of Organizational Socialization

Monica M. Tuttle
University of Minnesota

The prevailing theory of organizational socialization, presented by Van Maanen and Schein, describes activities used by organizations in the socialization of employees. Some argue this theory does not address individual differences as affecting employee responses to that context. This paper discusses the viability of integrating a more inclusive perspective, called an interactionist perspective and provides implications for HRD in the research and discovery of the phenomenon of organizational socialization.

Keywords: Socialization, Interactionist, Theory-building

In a society plagued with shades of gray in each life situation, some squint to make out the black and white of it, while others embrace and mull over each shade of cloudy gray. Those that are determined to differentiate the thin line between the black and the white, inevitably end up falling victim to a dualistic argument, such as nature versus nurture or upholding corporate values versus pursuit of profit. When a dualistic argument is exposed, individuals mass on either side of the debate, feeling strongly about one side. It has been stated that when one only sees the dualistic nature of circumstances, he or she falls victim to the "tyranny of the OR". Conversely, when one is able to discard the dualistic argument and pursue knowledge along both avenues he or she achieves the "genius of the AND" (Collins & Porras, 1994). Collins and Porras state that organizations that have been successful, profitable, and have shown longevity, are able to achieve the "genius of the AND."

This paper will explore one particular dualistic argument that has surfaced concerning the topic of organizational socialization. In its most general form, organizational socialization looks at the context that surrounds an individual's adjustment process during transitions into and within the workplace, with the ultimate purpose for the organization being to facilitate the individual becoming a contributing member to the cause. The black and white argument surrounding the topic is whether an individual's prior socialization experiences, or personal differences, are relevant to the socialization of the individual within the organization. Those who would argue individual differences are not relevant look for the most invariant components of the phenomena and seek to construct the theory around those components, hoping that the propositions will transcend individual differences (Feldman, 1981; Van Maanen & Schein, 1979). Moreover, incorporating individual variables reduces the efficacy and precision of the theory by creating a situation of relativism. This means that if one believes that all individuals have their own experiences and differences, that there can be no conclusions or patterns derived about human phenomena, thus making it very difficult to create a theory about anything. Those who believe individual differences should matter argue that one cannot make conclusions about individual responses to socialization efforts without first understanding their previous socialization experiences. This view is called an interactionist perspective (Jones, 1983; Louis, 1980; Ostroff & Kozlowski, 1992). Interactionists would argue that it provides a more inclusive lens through which to analyze the resulting responses to organizational socialization tactics.

The topic of socializing individuals to their host organization is of utmost importance to the field of Human Resource Development (HRD). Organizations today consider human knowledge, human expertise, in effect, human capital as the constrained resource in today's business economy (Boudreau & Ramstad, 1997). The ability to attract, develop, and maintain the right human capital for one's organization is viewed as a powerful strategic advantage. One might ask, does an organization have to be able to pinpoint and bring in the perfect talent to accentuate the organization, or can the organization itself mold the individual to fit its needs? The prevailing theory of organizational socialization suggests the possibility that organizational tactics can be used to affect the incoming talent in a fashion that makes them more valuable to the organization. The entire process of actions taken by the organization during an employee transition to ensure effective adjustment is called organizational socialization. Facilitating this process effectively to help ensure strong performance at the individual, process, and organizational levels is paramount for the HRD professional. Researching the units, framework, and propositions about this theory so that it may be used in practice, is paramount for the HRD scholar.

The purpose of this paper is to examine the viability of integrating an interactionist perspective into the prevailing theory of organizational socialization, in effect magnifying the shades of gray to get rid of the dualistic argument that exists now. First, it will provide a description of the prevailing theory of organizational socialization.
presented by Van Maanen and Schein (1979) by delving into the propositions concerning organizational action and resulting individual responses. Second, this paper will further present the interactionist perspective and how some theorists have reconciled the criticism of creating a relativist situation. Third, this paper will present some of the advantages and disadvantages that exist for integrating an interactionist perspective with organizational socialization theory. Finally, the author suggests possible research directions for the field of HRD.

Prevailing Theory of Organizational Socialization

The interest in the topic of socialization in the workplace stemmed from a concern about matching individuals with organizations to reduce the amount of unnecessary turnover, costing companies much time and money (Wanous, 1980). The field of Industrial Psychology focused its attention on the organization's perspective about how to reduce this turnover effect, tackling topics such as measuring individual aptitudes, skills and abilities, personality, as well as job and task analysis, recruitment, selection, job placement, and training (Wanous, 1980). The work on socialization took this information and started to construct schemes for determining their combined affect on individuals. Van Maanen and Schein were some of the first to put together a comprehensive picture of the phenomenon.

Prior to the publication of Van Maanen and Schein's theory article in 1979, each published several works concerning organizational socialization (Schein, 1968, 1971, 1978; Van Maanen, 1976) which built off of previous research on socialization, work adjustment, and career transitions (Berlew & Hall, 1966; Brim, 1966; Manning, 1970). Therefore, while not the first authors to address the topic of socialization in the workplace, Van Maanen and Schein were forerunners among those attempting to formulate a coherent description of organizational socialization in such a way as to facilitate the empirical research to come. In their article they state, "we offer the beginnings of a descriptive conceptual scheme which we feel will be useful in guiding some much-needed research in this crucial area [...] we are interested consequently in generating a set of interrelated theoretical propositions about the structure and outcome of organizational socialization processes" (Van Maanen & Schein, 1979, p.214).

The theory itself explores the socialization context created by the organization by the tactics it uses and it also looks at the response from the individual to this context. However, the gap that remains is that it does not examine the actual process of adjustment an individual would go through during that time of organizational socialization. The theory illuminates the organization's actions and the individuals' response; yet, a large black box remains in the place that would show the activity in the middle, the activity in between receiving the organizational context stimulus and the resulting response. In essence, Van Maanen and Schein (1979) argue in their theory that the experience of organizational socialization, given a predetermined set of organizational context variables, is a relatively invariant experience for the individual. Black and white—organizational context variables are relevant and individual differences are not (see figure 1). The units of the theory are described below.

Figure 1. Representation of the Prevailing Theory of Organizational Socialization

[Diagram of the theory]

Five Units of the Theory of Organizational Socialization

Van Maanen and Schein (1979) describe several elements of their theory, which can be loosely grouped into five general units. Admittedly, this brief presentation does not do justice to the elegance of the entire theory, but it is
Fixed versus variable tactics refer to the degree to which there are definitive time frames established for the organization, which affects their level of inclusion socialization. Each organization will differ in the number and their hierarchical socialization. Finally, employees are faced with the need to interact with the social fabric of the organization at a certain hierarchical level. As employees adjust and gain experience, they increase different requirements and expectations of that role are one aspect of functional socialization. Second, employees are aspects of his or her role in the organization. First, employees are designated to be in a functional role. Learning the over the working life of the individual, as he or she enters the new organization and as he or she makes seek out materials and draw on personal experiences to help them adapt to their new surroundings. Passive in this process (Jones, 1983, 1986; Morrison, 1993; Schein, 1968, 1971) and that most individuals actively and unconsciously affecting that individual's experience. Part of the purpose of this paper is to argue that the targets form or informal, used by the organization. Additionally, existing employees interact with the targets, consciously and unconsciously affecting that individual's experience. The authors show that the employee experiences movement along three different aspects of his or her role in the organization. First, employees are designated to be in a functional role. Learning the different requirements and expectations of that role are one aspect of functional socialization. Second, employees are hired into the organization at a certain hierarchical level. As employees adjust and gain experience, they increase their hierarchical socialization. Finally, employees are faced with the need to interact with the social fabric of the organization, which affects their level of inclusion socialization. Each organization will differ in the number and types of boundaries that exist given its societal, industrial, and organizational culture contexts.

Agents. The agents of the socialization process are the existing employees within the organization. Their decisions about how to construct socialization experiences for the targets determine the socialization tactics, whether formal or informal, used by the organization. Additionally, existing employees interact with the targets, consciously and unconsciously affecting that individual's experience. Part of the purpose of this paper is to argue that the targets themselves are also their own agents of socialization. Many authors have begun to argue that the individual is not passive in this process (Jones, 1983, 1986; Morrison, 1993; Schein, 1968, 1971) and that most individuals actively seek out materials and draw on personal experiences to help them adapt to their new surroundings.

Process. Van Maanen and Schein view the organizational socialization process as one that occurs continually over the working life of the individual, as he or she enters the new organization and as he or she makes various transitions within that organization. The authors show that the employee experiences movement along three different aspects of his or her role in the organization. First, employees are designated to be in a functional role. Learning the different requirements and expectations of that role are one aspect of functional socialization. Second, employees are hired into the organization at a certain hierarchical level. As employees adjust and gain experience, they increase their hierarchical socialization. Finally, employees are faced with the need to interact with the social fabric of the organization, which affects their level of inclusion socialization. Each organization will differ in the number and types of boundaries that exist given its societal, industrial, and organizational culture contexts.

Content. As Van Maanen and Schein are viewing the process primarily through the lens of the organization, the idea of content refers to any organizational action that drives the process. In essence, the context for socialization is created by all of the formal and informal activities and the conscious or unconscious messages that are delivered by the organization. Van Maanen and Schein (1979) argue, “what people learn about their work roles in organizations is often a direct result of how they learn it” (p.209). In other words, the tactics organizations use can relate to what messages transitioning employees will retain about their role, the culture of the organization, and how they fit in. The authors present their conceptualization of several tactics in the form of six continuums, each showing an extreme on either end of the continuum. They are: (1) collective vs. individual, (2) formal vs. informal, (3) sequential vs. random, (4) fixed vs. variable, (5) serial vs. disjunctive, (6) investiture vs. divestiture.

The first continuum of collective and individual tactics refers to the way in which the transitioning employees are either grouped together for a common socialization experience, or are isolated from one another to be paired up with a more seasoned member for their socialization experience, respectively. Referring to the second continuum, organizations that use formal tactics have clearly defined activities for transitioning employees that separate them from existing members. The third continuum of sequential versus random tactics refers to the way in which activities for the transitioning employees are either structured sequentially, or not structured at all, respectively. Fixed versus variable tactics refer to the degree to which there are definitive time frames established for the socialization process. The fifth continuum of serial versus disjunctive tactics refer to whether or not transitioning employees are groomed by their predecessors, or if they have no one in the position to walk him or her through the way it should be accomplished. The final continuum, investiture versus divestiture tactics refers to the degree to which the organization supports or attempts to break away from individuals’ prior socialization experiences and identity.

Role Responses. The final unit of the theory is the outcome of the socialization process. Logically, the more proximal outcome of the process would be the level of socialization as measured by the response of the individual. This response could be individual perception (Chao, O'Leary-Kelly, Wolf, Klein, & Gardner, 1994), internal changes in the social construction of self (Schein, 1971; Wanous, 1980) or behavioral changes (Van Maanen & Schein, 1979), all of which are either effective or ineffective for the new role. Because Van Maanen and Schein were looking through the organizational lens, they chose to focus on outwardly observable behaviors from the individual. These were termed role responses. The possible role responses were grouped into a few categories; the responses were either custodial, meaning compliant, or they were innovative. If the transitioning employee accepts the socialization process and its tactics without question, the response is determined to be a custodial one. However,
if the transitioning employee feels that some of the values, norms, or practices do not align in some way with his or her ideas, that individual will likely question and want to make changes. If the individual’s response is to make substantive improvements or changes to the “knowledge base or strategic practices of a particular role” (Van Maanen & Schein, 1979, p.227) then the response is termed content innovation. However, there can also be an almost complete rejection of the organization’s socialization process and the practices of his or her role. This role response is termed by the authors as role innovation. The authors argue that organizations benefit from the response of content innovation. Conversely, organizations are vulnerable if they are only able to see custodial responses, which would limit the possibility of progress, or role innovation responses, which may eat away at the very core essence the organization wishes to preserve.

In their theory of organizational socialization, Van Maanen and Schein are not proposing that individual variables do not play some role in how the process unfolds. However, they are arguing that the organizational variables supersede the individual variables, due in part to the drive to reduce anxiety through absorbing the immediate information presented by the organization. The authors make the decision to focus their theory building efforts on aspects of the organizational socialization experience that transcend organizational, individual, cultural, and societal differences. The authors hoped to provide a theory that was not only an attempt to model some aspect of the empirical world but also one that would have practical utility in the world. As stated previously, there are scholars who have started to argue that such a perspective is not possible, that the theory is not complete without taking into account individual variables (Jones, 1983; Morrison, 1993; Ostroff & Kozlowski, 1992).

Defining the Interactionist Perspective

Researchers such as Jones (1983) argue that an individual’s, “subsequent orientation towards the organization cannot be adequately explained until the socialization process is analyzed from an interactionist perspective in which newcomers are accorded an active role in mediating personal and role outcomes” (p. 464). This perspective argues that analysis of the socialization process cannot be complete unless three things are taken into consideration, “(1) the effects of individual differences and (2) the effect of the attributional process involved in organizational learning” (p. 464), and (3) individuals as active participants in their own socialization experience. The way these factors interact during the process of socialization can be likened to a game between the target employee and the other existing members of the organization. Jones (1983) describes some elements of this interaction. To begin, the individual learns patterns of behavior and develops values through experiences with work and through interactions with others in life. Now, faced with a boundary transition, either entering a new organization or changing roles within the organization, he or she calls upon past knowledge and patterns to deal with the surroundings. The individual monitors the surroundings and the existing members looking for clues about norms and values; the individual makes a first move based on attributions he or she has made about the surroundings.

The game continues with the reward and punishment contingencies from existing members based on the behavior of the individual. Existing members do not always have the same perception of organizational reality and, therefore there is often a conflict of meaning of intended behavior and the perceived behavior. The individual goes through a sense making process, first analyzing his or her own behavior, second, analyzing how others perceive the behavior; the individual makes a second move based on the perception of acceptance or non-acceptance of the first move. Often the discrepancies in behavior and organizational norms are worked out through these interactions. However, it is not necessarily so; there is the possibility that the individual and existing members are never aware of the disparities between their worldviews (Brim, 1966). The individual’s previous notions of acceptable behavior are what will continue to guide actions. In sum, while individuals may be subjected to the same organizational context of initiation or orientation content, the way in which they experience that context may be greatly divergent.

Can These Perspectives be Integrated?

The above discussion has presented, in an abbreviated form, the foundational theory of organizational socialization presented by Van Maanen and Schein (1979), as well as theory development by Jones (1983). While perhaps having rival or competing theories around the same phenomenon is not a bad thing, it makes sense to consider each thoroughly, both separately and in concert, to see if they are truly rivals, or whether a “genius of the AND” can be achieved by combining the elements of each to explain the same phenomenon. So, the questions are:

1. What are the advantages and disadvantages of hailing one perspective as the most accurate depiction?
2. Are the two points of view even different enough to warrant being called rival theories?
3. If not, what are the ways in which the two theories can be merged to work in concert?

To address the first question, if the field of HRD has to decide on one theory in order to make more headway in
research and practice, there would be consequences of choosing one perspective over the other, such as (1) theoretical, (2) moral, and (3) practical consequences.

Theoretical Consequences. One of Patterson's criteria for assessing a theory is comprehensiveness, meaning that a theory should be complete and include all data that are known (cited in Gradous, 1989). If the theory of organizational socialization does not take into account all of the necessary variables, such as an individual's previous socialization experiences, then perhaps it does not meet this criteria for being comprehensive. Using the criteria of comprehensiveness, those seeking to utilize the theory of organizational socialization in their workplace would benefit from this broader description of the phenomenon.

Moral Consequences. Organizations may view the process of socializing employees as a means to an end, the end being an individual who is an effective contributor to the organization. Kantian ethics state that humans may be viewed as a means to an end, as we would use a taxi cab driver to take us to our destination; yet, it states humans should not be treated as a means to an end (Beauchamp & Bowie, 1997). Treating each human that walks through the door as part of a homogeneous pool that would all respond to stimuli in the same manner and could therefore each be molded and crafted to the organization's desire, would be treating humans as a means to an end. Valuing each individual for his or her experiences and understanding how those influence their current experience of socialization, more closely satisfies Kantian ethics. Thus, excluding research and discussion around the affects of individual differences on socialization would be to ignore possibly significant variables, and would continue to allow organizations to think their actions were the only factors that would determine a socialization outcome.

Practical Consequences. While theoretically and morally inclusive, using an interactionist theory in the workplace brings about several concerns about its practicality. Organizations trying to incorporate this more comprehensive perspective may bog down already effective socialization processes, whereby decreasing the effectiveness curve and increasing a cost or time curve. It may not be practical or fiscally prudent to design and administer assessments to transitioning employees to determine the intricacies of their individual differences or their previous socialization experiences.

From the above discussion points, it is clear that integrating an interactionist perspective into the HRD rhetoric for organizational socialization would mean more research. However, it is the opinion of this author that integrating the two lenses means seeing the phenomenon more clearly. Van Maanen and Schein's (1979) lens through which to view the phenomenon of organizational socialization could be described as a process of formal and informal activities by the organization to direct the individual in the process of adjustment to and acquisition of roles, tasks, knowledge, and values. However, the lens Jones's (1983) work describes is one in which individual context variables play a large role in how the activities by the organization influence the individual's process of adjustment to and acquisition of roles, tasks, knowledge, and values. Upon consideration on how to answer the second discussion question, it is apparent to this author that these two lenses are looking at the same phenomenon only from two different vantage points. In effect, the work of Van Maanen and Schein (1979) and the work of Jones (1983) are not rival theories; rather, they are merely two sides of the same coin. In sum, the theoretical and moral consequences should overtake the practical consequences in the initial phases of discovery. Once such information is available, how practitioners allocate corporate dollars to improve socialization processes should be up to them.

Merging the Prevailing Perspective with the Interactionist Perspective

Figure 1 visually represents the gaps that remain from Van Maanen and Schein's (1979) theory. Their theory illuminates the different boundary movements that individuals experience throughout their careers entering into and moving within an organization. The theory explains different socialization tactics employed by organizations during these boundary movements. It also explains the behavioral responses that can be expected from individuals in reaction to the organizational socialization tactics. The large black box represents what is missing from this theory, the individual experience of socialization and all of the intervening variables. In effect, merging Van Maanen and Schein's (1979) work with that of Jones's (1983), would help to illuminate what is inside the black box. Bringing to light the individual experience of socialization, would have to include two elements, (1) a general stage theory model of an individual process of adjustment, and (2) an explanation of the various effects of human differences on that process. Some progress in the literature in these areas is presented here as possible material to advance the interactionist discussion of organizational socialization.

Necessary Element I: A Stage Model of Organizational Socialization

A few researchers have presented stage models of socialization. Wanous' (1980) three critical areas of an effective stage model are used here in determining which would be most applicable and effective for use in an
interactionist perspective of organizational socialization. First, Wanous states that either the passage of time or the occurrence of events should determine the organization of a stage model. He states that in this case the occurrence of events is most applicable. Second, he states that the model must explain how each stage relates to the others. Third, the model must explain what defines movement from one stage to the next.

Out of the models examined (Feldman, 1976; Schein, 1978; Van Maanen, 1976; Wanous, 1980) one presented by Van Maanen (1976) appears to be the most parsimonious for inclusion here. The first stage in Van Maanen’s model is Anticipatory Socialization. This stage includes the knowledge and experience that the individual collects throughout the lifetime with regards to work, meaning attitudes towards work in general and prior experiences of socialization with previous organizations. The second stage is Encounter. This stage can refer to an individual entering a new organization, or making a boundary change, as previously defined by Schein, within the organization. Van Maanen describes this moment of encountering the new boundary as a reality shock for the individual. He states that the severity of the shock is in part related to the congruence or disparity between how the individual anticipated the expectations of the organization and what is actually experienced. It is during this stage that environmental, organizational, group, task, and individual forces combine to determine the movement, or lack of movement, of the individual to the next stage of the model. To describe a few of the forces in more detail, relevant group forces are those that are created by the participation of the individual in a smaller subgroup of the organization, the smaller subgroup lies, “outside the control of the formal organization” (p. 90). It is in this group that the individual tests most of his or her perceptions of the organization. Elements of the tasks assigned to the individual influence the socialization process; often there is a disparity between what was assumed by the individual to be the task and what is experienced. Finally, personal characteristics, or individual differences also affect the socialization process. The interaction of these forces influence the “game” that ensues between the individual and existing organizational members, determining the next moves of the individual.

The third stage presented by Van Maanen is Metamorphosis. This is the stage where the individual tests new solutions to the problems initially faced within the organization. It is also in this stage that the individual accepts or rejects the socialization efforts of the organization. Several theorists have discussed what “acceptance” means for the individual. In short, the prevailing attitude is that individuals are composed of an, “integrated set of social selves organized around a basic image or concept of self. His basic temperament, intellectual equipment, learned patterns of feeling expression, and psychological defenses underlie and partially determine this self-image and the kinds of social selves which the individual constructs for himself to deal with his environment” (Schein, 1971, p. 409). It is, therefore, the work portion of the social self that is changed when the individual accepts the norms, behaviors, values and patterns of the organization, and not the foundational concept of self.

**Necessary Element 2: Accounting for Individual Differences in Organizational Socialization**

Van Maanen’s (1976) three-stage model of socialization makes it clear that individual differences, including previous socialization experiences, influence current socialization experiences; these factors are woven into each stage of his model. Similarly, Jones (1983) states that along with previous socialization experiences, attributional processes will affect each individual’s ability to make sense of the organizational context. As stated previously, the individual experience is complex and there are many variables that could be brought to bear on the experience of socialization. However, work by Louis (1980) provides some direction in this area. While not all inclusive, as a framework, it would help to guide further research in this area. In his model, Louis describes how the elements of change, contrast, and surprise are what trigger varying individual responses based on individual differences.

The boundary transition the individual is encountering may be entering a new organization completely, a promotion, a transition into a new functional role, or a change to a new level of inclusion or acceptance into the social fabric of the organization (Schein, 1971). Regardless of which boundary transition it is, there is an element of change. Here, *change* is defined as “an objective difference in a major feature between old and new settings” (Louis, 1980, p.235); it is the physical and the knowable changes between the old and the new. A few of such examples would be the job location, job tasks, or new coworkers. Logically, the more physical elements of change present in the boundary transition, the greater the degree of change the individual is required to cope with.

While the first element of change is concrete and external to the individual, the second element of *contrast* is experienced internally. Each new piece of information is compared with a previous understanding about work and is felt by the individual only to the degree that it contrasts with prior conceptions. An organization that encourages and models risk-taking behaviors may or may not be seen as a contrast to previous experience. If the contrast is great between previous experience and the new surroundings, the individual may take longer to let go and accept the new norms of risk-taking in his or her new surroundings. Louis (1980) states that the individual, “may evaluate aspects of the new role using old-role experiences as anchors on internal comparison scales. Or the newcomer may try to
incorporate aspects of the old into the new role or resist the new role in favor of the old role” (p. 237).

The third element, surprise, reflects the difference between anticipations and subsequent experiences and encompasses the affective or internal reaction to change or contrast. Overmet or undermet expectations about the job, about one’s own abilities, or about the culture of the organization can lead to an affective response of surprise. Each individual would have a different degree of surprise based on how his or her preconceived notions and interpretation schemes matched with the settings encountered. In essence, “discrepant events, or surprises, trigger a need for explanation, or post-direction, and correspondingly, for a process through which interpretations of discrepancies are developed. Interpretation, or meaning, is attributed to the surprises. Based on the attributed meanings, any necessary behavioral responses to the immediate situation are selected” (Louis, 1980, p.241).

Taking into account how previous socialization experience and attributional processes influence the stages of socialization for individuals, we now would have a more complete model to work with. Figure 2 depicts an integration of the new pieces, chosen by this author, into a new theoretical model of organizational socialization (see figure 2). As the individual enters a new boundary transition into or within the organization, an array of forces are already at work. The organization, in its societal and industrial context has determined the socialization tactics it will employ to ensure that those within it are content innovators, accepting the vital norms, values, and roles, and innovating that which will make the company more successful. The individual, in his or her societal and cultural context, has been exposed to a variety of socialization experiences that help to inform, for better or worse, the actions and responses to the boundary transition. As these forces interact in real time, the individual moves through the socialization process. For each individual, and for each organization, there are different collections of forces. As we begin to take into account the set of forces that exist with considering the individual experience of socialization, it is apparent that research is required to determine the interaction of all of these elements.

Figure 2. The Process of Organizational Socialization Using Interactionist Perspective

Conclusions and Research Directions for HRD

"Indeed, from the time individuals first enter the workplace to the time they leave their membership behind, they experience and often commit themselves to a distinct way of life complete with its own rhythms, rewards, relationships, demands, and potentials” (Van Maanen & Schein, 1979, p.210). As organizations struggle with the tension between protecting their core essence and adjusting to the demands of the market, they must incorporate new members into that journey in the most effective ways possible. What has been revealed here is that the prevailing theory of organizational socialization and the new interactionist perspective are merely two lenses through which to view this complex human phenomenon. By overlaying the lenses, our view of the phenomenon becomes clearer. There are some steps, however, that must be taken in order for this integrated theory to be viable in HRD practice.

First, a complete synthesis of the literature on organizational socialization would need to be done. The purpose if this step would not only be to bring to the surface all of the work mounted on the sides of the organizational lens and the interactionist lens, but also to begin to sort through what empirical research has supported or refuted claims presented in the theoretical literature. It has been more than two decades since the publication of the prevailing theory by Van Maanen and Schein, and not all of their claims have been empirically tested. Second, in line with
Dubin’s (1983) stages of theory building, this stage requires the development of new propositions about how all of the elements of the theory affect one another. Van Maanen and Schein (1979) developed propositions about how the tactics of socialization utilized by the organization affected the role response of employees. One example would be the proposition that having an organization utilize an individual socialization tactic would be more likely to produce the specific outcomes that were desired by the socialization agents because of the greater control found in an individual context versus a group context. These would have to be reevaluated given the integration of individual variables. Finally, HRD scholars and practitioners need to remain in touch on this issue in order to communicate about the viability of this more inclusive view in practice; scholars cannot become too engrossed in the theoretical intricacies of socialization forgetting its practicality in organizations.

HRD is a messy field. We muck around in shades of gray with every move we make; after all, we are dealing with people. This paper has presented the need to continue to wade through those shades of gray to have a more inclusive and informative view of the phenomenon of organizational socialization.

The Relationship Between Workplace Learning and Job Satisfaction in U.S Small to Mid-Sized Businesses

Robert W. Rowden
Mercer University—Atlanta

Although a great deal of attention is given to HRD in Fortune 500-type firms, little is known about the nature and extent of workplace learning in small to mid-sized businesses in the United States. Also, workers in SMEs have been found to have higher levels of job satisfaction than do workers in large organizations. This study measures the nature and extent of workplace learning in SMEs; delineates the nature and extent of job satisfaction; and examines the relationship between them.

Key Words: Workplace Learning, Job Satisfaction, Small Businesses

By any measure, small to mid-sized businesses are critical to the economic well being of the United States. They create new businesses (and the new jobs that go with them); bring new and innovative services and products to the marketplace; and provide business ownership opportunities to diverse (and traditionally underrepresented) groups (Headd, 2000). Of the approximately 5,797,500 U. S. businesses with employees in 2000, roughly 99.7 percent were small to mid-sized businesses (2001 Small Business Profile, U.S. Small Business Administration). Not only do these small to mid-sized business create a wide variety of jobs for the employment sector, but they also keep the U.S. economy churning (Headd, 2000).

Small businesses are playing an increasingly important role in the world economy as well. Small businesses (those employing 100 people or less) “are responsible for 82 percent of the jobs created in the United States” (Meggison, Scott, Trueblood, & Megginson, 1995, p. 247). Yet, of the more than 600,000 small businesses started each year in the U.S., 80 to 85 percent fail in the first five years (Small Business Handbook, 1990). The economic well-being of some regions of the United States is dependent upon small businesses where the majority of businesses (88 percent) employ fewer than 200 people (U.S. Department of Commerce, 1990-91).

Even so, it seems that even defining what constitutes a small business is not without difficulty. The U. S. Small Business Administration defines a small business as one having fewer than 500 employees in the manufacturing and mining sector, and 100 employees for all wholesale trade industries (Headd, 2000). Storey (1994) reports that the European Commission breaks the definition into three components based on number of employees: micro-enterprise with between 0 and 9 employees; small enterprise with between 10 to 99 employees; and medium enterprise with 100 to 499 employees. A later report by the European Commission redefined its original categories as: micro-enterprise with between 0 and 9 employees; small enterprise with 10 to 49 employees; and medium enterprise with 50 to 249 employees (Curran, Blackburn, Kitching & North, 1996). The U. S. Department of Commerce (1990-91) discusses small businesses in terms of businesses with fewer than 200 workers. Others, for example Meggison, Scott, Trueblood, and Megginson (1995) and Daly and McCann (1992), define small businesses as those with 100 or fewer workers. Despite the varied definitions and regional differences, the most consistent definition of small to mid-sized businesses seems to be a business with fewer than 200 employees.

Regardless of how small to mid-sized businesses are defined, certainly, they are a dynamic force in the economy, bringing new ideas, processes, and vigor to the marketplace. They fill niche markets and locations not served by larger businesses. Small firms are often younger than large firms, more likely to be outside major urban areas, and more apt to be in industries with lower economies of scale such as service. Small firms can represent a life stage before economies of scale are reached (or hoped-for future growth is attained), or they can be a stable anchor in the marketplace. These age, location, and industry effects constitute the basic differences between small and large businesses and can lead to different workforce needs and different resources to attract workers of various education levels and occupations (Anderson & Skinner, 2000).

Increases in competition, globalization, and the speed of change have helped to highlight the importance of the capacity for learning in small to mid-sized businesses as a key to both survival and success (Dumphy, Turner & Crawford, 1997; Easterby-Smith, Snell & Gehardi, 1998; Fulmer, Gibbs & Keys, 1998). The capacity to learn is one of the fundamental attributes of human beings and involves them developing and changing as time passes (Arnold, Cooper & Robertson, 1995). Much of this development is informal and randomly experienced, a feature highlighted particularly in Kolb's experiential model of learning (Kolb, 1984). Marquardt (1996) argues that learning (as distinct from training or instruction) assumes continuous change and focuses on values, attitudes, and innovation.
Developing the human resources of a company would seem to be key to increasing production and closing the gap between the level of worker skill and present and future needs. Businesses that have made learning, education, and development a priority have seen it pay off through greater profitability and increased worker job satisfaction (Coblentz, 1988; Filipczak, 1989). Recent studies have found that job satisfaction is rarely tied to pay and promotion; but rather, workers are more interested in such things as feeling appreciated, being “in on things,” and career development (Buhler, 1994; Dolan, 1996) all of which have linkages to workplace learning.

Job satisfaction is simply how people feel about their jobs and different aspects of their jobs. There are important reasons why organizations should be concerned with job satisfaction. First, the humanitarian perspective is that people deserve to be treated fairly and with respect. Job satisfaction is to some extent a reflection of good treatment. It also can be considered an indicator of emotional well-being or psychological health (Haccoun & Jeanrie, 1995). Second, the utilitarian perspective is that job satisfaction can lead to behavior by employees that affects organizational functioning, as well as a reflection on organizational functioning. Differences among organizational units in job satisfaction can be diagnostic of potential trouble spots (Beatty, 1996). Each reason is sufficient to justify concern with job satisfaction. Combined they explain and justify the attention that is paid to this important variable.

Indeed, Buhler (1994) emphasizes the point when she talks about the continued effort organizations must place on employee satisfaction and the economic importance to the company. “Organizations that believe that workers are easily replaced and do not invest in their workers send a dangerous message. This often results in high turnover, which is accompanied by high training costs, as well as hiring costs. . . . It fosters the same type of attitude in the employee, that the company can be replaced and little loyalty is felt” (1994, p. 10). Even in times of near-full employment, these studies make it clear that companies must take advantage of all workplace learning opportunities if they are to remain successful.

However, until recently, most studies of workplace learning like the ones by Coblentz (1988), Beatty (1996), and Hitt (1998), for example, have been conducted in large corporations. Few firms in the samples have had annual sales of less than US$1 billion. Most U.S. businesses are small to mid-sized with annual sales well under US$10 million (Anderson & Skinner, 1999; Lee, 1991). How learning is orchestrated and how skills and knowledge are acquired and developed in small to mid-sized organizations should be matters of major interest. There has been little attempt in the HRD literature to differentiate between larger and smaller organizations and to address the impact that size and associated resource constraints might have upon both actual and desired approaches to workplace learning. Most of the mainstream literature seems to have assumed that HRD activities take place in organizations where training, development, and learning issues are addressed by specialist staff operating within a dedicated functional unit. The majority of small to mid-sized businesses have no such specialist function or department, and not even a dedicated member of management or staff (Walton, 1999).

To date, little is known about the relationship between workplace learning and employee satisfaction in small to mid-sized companies. Studies by Des Reis (1993) and Rowden (1995) have found that such firms may not even be aware of the nature and extent of learning in their workplaces. Yet it is likely that the success of such companies is at least attributable to the ways in which employees are attended to, formally and informally trained, and developed.

Statement of the Problem

Conventional wisdom says that small businesses do not have the financial resources nor the time to do very much, if any, human resource development or workplace learning. These views on training in small businesses have generally been supported each time quantitative research has been conducted in a variety of small businesses. However, a qualitative study (Rowden, 1995) found that, in fact, U.S. small businesses do engage in a considerable range of formal, informal, and incidental workplace learning activities. The information gleaned from the interviews, observations, and documents provided the foundation upon which a questionnaire for assessing the extent of workplace learning from a perspective that small businesses truly understand. In fact, a study by Rowden and Ahmed (2001) employing the questionnaire in Malaysia further established the presence of workplace learning in small to mid-sized businesses.

We have known for some time that more learning occurs in the workplace than just what happens in formal training classrooms. Watkins and Marsick (1992) have identified the different forms of workplace learning as formal, informal, and incidental. Formal learning (training), of course, is discrete planned events (experiences) used to instruct people how to perform specific defined jobs. Informal learning is defined as any learning that occurs in which the learning process is not designed or determined by the organization. Formal learning includes both an expressed organization goal and a defined process. Informal learning can occur whether or not there is an expressed goal, and can serve individual as well as corporate objectives. For example, informal learning might best occur...
when a coworker shows a new employee how to use a machine through an actual demonstration rather than through a classroom presentation. Although interconnected, informal and incidental learning are not necessarily the same. Incidental learning occurs as an unintended by-product of some other activity such as trial-and-error experimentation. The intention of the activity is task accomplishment, but serendipitously increases particular knowledge, skills, or understanding. Formal and informal learning tend to be intentional whereas incidental learning is not. Learning, as opposed to training, is more appropriate to a business environment in which jobs are constantly changing (Marsick & Volpe, 1999).

Another recent study (Anonymous, 1997) found that workers in U.S. small businesses were generally more satisfied with their employment situation than were workers in larger companies. The study found that 44 percent of the workers in small businesses said they were "extremely satisfied" with their jobs, compared with 28 percent at companies with 1,000 or more workers. It was speculated that factors such as job security, empowerment, and the ability to do what they do best might explain job satisfaction. While workplace learning was not one of the indicators in the study, the respondents reported that they could learn and grow on the job.

An assumption of this study is that a sense of satisfaction a person feels about his or her employment can be directly linked to the three types of workplace learning. That is, employees who have opportunities to grow and learn in their job will express higher levels of job satisfaction. To test this assumption, this study first established the nature and extent of workplace learning in small to mid-sized businesses; established the level of job satisfaction reported in the same small to mid-sized businesses; and established the relationship between these learning opportunities and the level of employee satisfaction in these organizations.

**Purpose and Research Questions**

The overall purpose of this study is to understand workplace learning in the context of the small to mid-sized business. The specific research questions are:

1. What is the nature and extent of workplace learning in small to mid-sized businesses?
2. What is the relationship among three types of workplace learning (formal, informal, and incidental) in small to mid-sized businesses?
3. To what extent do those three types of workplace learning explain job satisfaction?

**Methodology**

The qualitative study by Rowden (1995) was successful in identifying the key concepts of workplace learning in small to mid-sized businesses. A quantitative study was deemed to be an appropriate way to operationalize those findings. Since a survey provides a means to capture large amounts of data over a wide range of possibilities, an instrument was developed that captures the essence of the findings on workplace learning revealed by the Rowden (1995) study. The resulting survey instrument was combined with the Spector Job Satisfaction Survey (1997) in order to measure the level of job satisfaction in the same organizations.

To aid in the investigation of the possible relationships among the types of workplace learning and the constructs of job satisfaction without trying to influence those variables, a correlational procedure was deemed the most appropriate statistical technique. Correlational procedures show the extent to which change in one variable is associated with change in another variable. When a correlation is found to exist between two variables it means that scores within a certain range on one variable are associated with scores within a certain range on the other variable (Fraenkel & Wallen, 1996). Using a correlational (Pearson r) procedure establishes the relationship among the variables for workplace learning and job satisfaction.

**Description of the Sample**

Twelve small to mid-sized companies agreed to participate in the study. Participating companies were located through a variety of methods including personal contacts, colleagues, and "cold calling." A total of 439 surveys were returned. The 6 companies consisted of a timber products company (102), a manufacturing company (89), a healthcare facilities (61), an engineering firm (53), a paving contractor (78), and a general construction firm (56).

Over ninety percent of the respondents work full time. Nearly sixty-eight percent are male. Seventy-five percent are between the ages of 19 and 49. Sixty-eight percent are married. Nearly fifty percent work at companies with fewer than 100 employees and nearly eighty percent work for companies that employ less than 150 employees. Over eighty percent have been employed by their current company for less than 10 years. Just over seventy percent
are non-supervisory and over seventy-five percent earn more than $10 per hour. Forty-seven percent work in service industries while thirty-two percent work in manufacturing.

Instrument

There is limited research on HRD in small to mid-sized businesses. Most people believe that small businesses do little, if any, development of their workers. For example, Training Magazine, which annually conducts a study of the training industry in the U.S., does not even attempt to contact businesses with fewer than 100 employees and only 16 percent of their sample consist of companies with between 100 and 500 workers.

Several attempts have been made to determine the nature and extent of workplace learning in small business. Invariably, the studies concluded that, in fact, little HRD occurs in small businesses (for example, Des Reis, 1993; Hill & Stewart, 1999). A review of several of the studies determined that a likely cause of the lack of discovery of workplace learning in small businesses was due to the design of the surveys. A qualitative study by Rowden (1995) did reveal numerous indices of workplace learning in small to mid-sized businesses. By looking at the field notes and transcripts of interviews of workers, it was believed that previous attempts to capture workplace learning in small to mid-sized businesses was due in large part by the language of the questionnaire. Making every attempt to stay as close as possible to the language and references used by actual workers in small to mid-sized businesses, a survey was developed to attempt to capture the nature and extent of workplace learning in these businesses.

The research on job satisfaction in small businesses mirrors that of HRD in small businesses. Until a study by Anonymous (1997), little attention had been paid to worker job satisfaction in small businesses. This study found that workers in small businesses, generally, were more satisfied with their work than were workers in larger businesses. The study did not, however, seek to determine why the workers were more satisfied. The study mentioned ideas like better communication, a feeling of being in on things, and a smaller power distance—but no factors were actually measured. Again based on the Rowden (1995) study, a possible connection could be made between workplace learning and job satisfaction. To determine if this hypothesis were true, workplace learning and job satisfaction would have to be measured in the same small businesses. Then, correlational measures could be made to determine if small to mid-sized businesses with high measures of workplace learning also had high measures of job satisfaction. The Spector (1997) Job Satisfaction Survey was determined to be the best-validated and reliable instrument for determining job satisfaction. A modified version was incorporated into the questionnaire along with request for background data. Once developed, the Small Business Workplace Learning Survey (SBWLS) was subjected to critique sessions by content area experts as well as graduate HRD classes to ensure for content validity. The process was continued until saturation was reached; that is, until no more distinct categories could be ascertained.

The result of the development process was a six-page self-administered questionnaire that utilized a 1-6 (Disagree Very Much—Agree Very Much) Likert scale. The instrument is divided into three sections—workplace learning, job satisfaction, and background information. The three constructs or independent variables for the workplace learning portion were formal, informal, and incidental learning. The reliability for each measure was conducted using Cronbach’s alpha. The formal learning scale (6 items, alpha = .81) included items measuring respondent’s perceptions of planned, organized, training activities. The informal learning scale (8 items, alpha = .73) included items measuring respondent’s perceptions of unplanned or spontaneous activities that lead to perceived learning on the job. The incidental learning scale (7 items, alpha = .78) included items designed to measure respondents perception of normal workplace activities that resulted in learning even though that was not the purpose of the activity. The overall learning scale (all 21 items, alpha = .89) combines the three aspects of workplace learning.

The Spector Job Satisfaction Survey (1997) was embedded into the instrument. The 27 items were designed to measure nine separate aspects of job satisfaction. However, after the data collected were subjected to preliminary analysis, it was found that none of the nine measures yielded adequate reliability. This may have been because some items on the JSS carry different meanings in different businesses, or it could simply be an artifact of too few indicators per construct being measured. Consequently, it was decided to subject those 27 items to exploratory factor analysis to determine the underlying constructs that constituted those nine measures. During this process, numerous solutions both octagonal and oblique were explored ranging from two through eight factor solutions. The ultimate criteria were conceptual meaningfulness.

As a result of the exploratory factor analysis of job satisfaction, the dependent variables were identified as supportive environment, recognition, benefits, and enjoyment. The items comprising each of these factors were combined into additive indices and the reliabilities were calculated. Supportive Environment (11 items, Cronbach’s alpha = .88) included items measuring meaningful work, feeling “in” on things/knowing what is going
on, and satisfaction with the quality of supervision. Recognition (6 items, Chronbach's alpha = .76) included items measuring communication, getting ahead, and promotion. Enjoyment (4 items, Chronbach's alpha = .75) measured if the respondent liked his or her work, supervisor, and coworkers. Benefits (4 items, Chronbach's alpha = .72) included items measuring satisfaction with benefits, and if the benefits were equitable. The overall measure of job satisfaction received an alpha of .83.

The third section of the instrument contains nine ordinal and nominal scale items designed to capture additional information about the respondents. These items were also subjected to analysis with some minor correlations noted. However, they were not germane to the study and are not reported here.

Data Analysis

The data were analyzed in a variety of ways. First, simple descriptive statistics (means; measures of variation—standard deviations; frequencies) were employed for the surveys from each company to determine the nature and extent of workplace learning in the companies. Then, the Pearson product-moment correlation was conducted to determine the inter-correlation among the three types of learning, and to determine the strength of the relationship between workplace learning and employee satisfaction across the companies.

In order to assess the relationship among the three types of workplace learning, two different analyses were conducted. In the first analysis, the mean-item mean for each of the three was calculated and compared so that the relative extent of each can be compared. The inter-correlation among the three was examined. They were different but related, which is what one would expect.

In order to answer research question 3, the correlation between the three workplace learning measures and the five (4 + overall) job satisfaction measures were examined. Additional analyses examined the relationship between background variables and measures of job satisfaction and workplace learning.
Findings

Examination of the responses on the SBWLS revealed sufficient evidence to conclude that learning is pervasive in these small to mid-sized businesses. Table 1 shows the means, standard deviations, and percent responding at the top of the "Agree Scale." The means and standard deviations indicate strong positive responses to the questions in all three arenas of learning. Findings support the notion that small businesses have a substantial amount of human resource development occurring in the workplace. In fact, the only questions that received somewhat low ratings dealt with whether or not the organizations reimbursed tuition for formal education and professional organizations. All other questions dealing with formal, informal, and incidental learning received strong support from the respondents.

The formal, informal, and incidental learning measures were examined for the mean item effect. The mean-item means are: informal = 4.66; incidental = 4.69; formal = 3.98. Incidental learning has a greater place in the workplace by these numbers, followed closely by informal learning. Table 2 shows the inter-correlation among the three workplace learning variables which is further evidence of validity. These measures provide further understanding of the nature and extent of workplace learning in small to mid-sized businesses.

Table 3 shows the relationship between workplace learning and job satisfaction. All three measures of workplace learning were significantly correlated with each of the four measures of job satisfaction. Certain background variables exhibited weak but significant correlations with the three forms of workplace learning, and the four variables of job satisfaction. They were not included as part of this discussion.

These findings have a profound bearing on our understanding of workplace learning in small businesses. It also establishes strong linkages between workplace learning and job satisfaction in these same small to mid-sized businesses. The summary of the relationships contained in Table 3 are key to this new understanding.

Table 3. Relationship Between Workplace Learning Measures and Job Satisfaction Measures

The coefficient of determination of the three types of learning as they relate to overall job satisfaction, allow us to predict that 19 percent of the overall job satisfaction these workers experienced is accounted for by Informal learning; that another 19 percent is accounted for by Incidental learning; and that 9 percent of the variance is accounted for by Formal learning. This indicates that a large part of the workers sense of job satisfaction comes from workplace learning. While other factors affect job satisfaction, no other known study has so directly tied a satisfied workforce to the learning that occurs within the work setting.

This study also indicates that workplace learning has linkages to an employee's satisfaction with his or her perception of recognition. The coefficient of determination allow us to predict that 41 percent of the satisfaction
with being recognized for a job well-done is accounted for by Incidental learning; that 34 percent is accounted for by Informal learning; and 15 percent is accounted for by formal learning. This supports the belief that workplace learning positions one for advancements that lead to recognition, promotion, and pay increases.

The mean-item means analysis indicates that of the three measures of workplace learning, incidental learning has the greater place among them. Again, this has significance as to where we place our time and money. Formal learning—the one that gets all the attention and money—has the lowest place of the three.

Conclusion and Discussion

Previously, conventional wisdom has held that small to mid-sized businesses do little to develop the human resources in their organizations. This study does not support that thinking. The respondents in this study reported extensive incidents of formal, informal, and incidental learning in the workplace, with incidental learning having the greater place among them. In addition, the respondents also reported a feeling of overall job satisfaction with recognition, work enjoyment, benefits, and supportive work environment a big part of their perception of satisfaction. Not only that, they attributed a large part of their job satisfaction to the availability of learning opportunities on the job.

These findings have some significant implications for theory and practice:

- No longer can there be denial that the development of human resources occurs in small businesses. Studies such as the ones by Des Reis (1993), Morse (1984), and Training (1998) that found an absence of HRD activities in small businesses are placed in question. This study firmly establishes the nature and extent of workplace learning in small to mid-sized businesses.
- There is now support for the findings made by Anonymous (1997) in U. S. small businesses that found workers generally had a higher level of job satisfaction than did workers in large enterprises. The workers in this study indicated a very strong sense of being satisfied by the work they were doing.
- Workplace learning is now directly linked to employee job satisfaction. No known previous U.S. studies have undertaking the connection between the two variables. This can have huge implications as to where managers place their emphasis to ensure content workers. Rather than focusing almost solely on pay to enhance job satisfaction, companies can begin to focus on enhancing learning opportunities.
- Informal learning and incidental learning each have a significantly higher place in the learning network than does formal training. As Jacobs and Jones (1995), and Rothwell and Kazanas (1994) encourage, greater emphasis and financial support needs to be placed on on-the-job training as a learning tool in organizations.
- This study supports previous findings (Kovach, 1987) that being appreciated for one's work, feeling "in" on things, and enjoying the workplace and coworkers are a significant part of job satisfaction. Workers indicated that workplace learning contributed significantly to these aspects of job satisfaction.

While this study clearly does not represent the entire global workplace, even so, these findings are significant for exploring the relationship between workplace learning and employee job satisfaction. It is the first known empirical study conducted in the United States to establish the nature and extent of workplace learning in small businesses. It is also the first U.S. study to delineate the relationship between workplace learning and job satisfaction. A companion study conducted by Rowden and Ahmed (2001) in Malaysia found very similar results.

A number of practical implications can be drawn from this study that are of interest to HRD and managers in companies, small and large, in day-to-day operations. Additionally, it also establishes a new understanding for teachers of human resource development, human resource management, and management. This material provides techniques to promote operational methods to help assure organizational success.

Can One Size Really Fit All? A Study of the Relationship Between Learning Needs and Learning Satisfactions of Non-Traditional Students in Taiwan

Hui-Chin Chu, Ed.D.
Shu-Te Technical University

Chi-Jung Fu, Ed.D.
Kai Nan University

The purpose of this study was to investigate the learning needs of non-traditional adult students in college extension degree programs and the relationship between their learning needs and learning satisfactions. Participants who had stronger desire for improving their competence tended to have higher satisfaction toward environment-related factors. Those who had more desire for self-accomplishment and social needs were more satisfied with instructional-related and interpersonal-related factors. Additional findings are discussed.

Key words: Non-traditional Students, Learning Needs, Learning Satisfactions

The Taiwanese government has been making their efforts to promote adult extension education, returning education, and continuing education in order to prepare their workforce for today's highly competitive international environment. The Ministry of Education passed the "College Extension Education Implementation Statute" in 1998. College extension education, which allows universities and colleges to offer degree programs, has become one of the mainstreams of higher education in Taiwan (Ministry of Education, 2000). According to the statistics released from the Department of Education, there were 61 colleges and universities offering extension programs with 115,721 students in 2000 compared to 52 schools with 91,761 students in 1999 and 40 schools with 91,048 students in 1998 (Ministry of Education, 2000). The increasing number of extension students is an indicator that adult continuing education is getting more attentions in Taiwan.

Chinmin College is considered as one of the typical Taiwanese 2-year colleges in middle Taiwan where 3,125 students enrolled in the weekend extension degree programs during the school year of 2,000. The classes are conducted in evenings and weekends, and the students are mostly working adults. The instructors involved in these programs have experience primarily in the traditional college environment. Teaching one or two extension courses is required in order to meet their required teaching load.

The growth of nontraditional adult student enrollment in higher education demands a different and more flexible delivery system in order to meet the students' need (Chu & Hinton, 2000). However, most of the programs offered in college extension programs in Taiwan are still identical with the programs designed for traditional college students. Adult students' characteristics and needs are not taken into consideration accordingly. Thus, it raises a question: Can this "one size fits all" curriculum really fit all?

Most of the research studies in Taiwan have focused on students' satisfaction to the programs they are involved in but have not addressed the relationship between students' individual learning needs and their learning satisfaction. In order to serve these students effectively and actualize the purpose of adult education, a study in this field is needed.

Theoretical Framework

According to a survey done by Lee and Luo (1992), adult students' learning needs include improving professional skills, increasing income, pursuing personal fulfillment, and changing career and so forth. Dr. Carole Fungaroli suggested in her book Traditional Degrees for Nontraditional Students that adult students return to school for the following reasons: career change, better jobs, promotions, or higher income, social needs, greater self-esteem, self-fulfillment, and cognitive satisfaction (Fungaroli, 2000).

Different from traditional students, adult students return to school by their own choice; therefore, learning satisfaction is extremely important (Tzai, 1997). According to Houle (1961), learning satisfaction occurs when learning activities meet the students' goals/needs. Knowles (1970) and Tough (1982) both stated learning satisfaction occurs when the students are fulfilled and motivated when they are engaged in learning activities.

Copyright © 2002 Hui-Chin Chu and Chi-Jung Fu
There are many factors that influence learning satisfaction such as: the instructor, the contents, learning materials, teaching styles, learning climate, and curriculum (Urdan, 1979). Cheng (1983) proposed that teacher's characteristics and teaching styles, social interaction, work-related skills learning, and personal development are the factors that influence learning satisfaction. Ma (1989) believed that learner's personal factors such as: social background, psychological characteristics, learning motives; teacher's factors such as: personality, teaching styles, teaching methods, learning contents, and attitudes toward students; and school factors such as: school environment, administrative services, and policies are factors influencing students' learning satisfaction.

Research has identified adult learning barriers that cause adult students dissatisfaction to learning. Those barriers included informational barriers, procedural/institutional barriers, situational barriers, and psychological barriers. Financial barriers, which is classified as one of the institutional barriers, is one of the biggest problems for adult students' dissatisfaction (Pinkston, 1987).

Dewey, and subsequently, Knowles proposed that the adult teacher should provide physical conditions that are comfortable and conducive to interaction; accept each student as a person of worth and respects his feelings and ideas; seek to build relationships of mutual trust and helpfulness among the students by encouraging cooperative activities and refraining from inducing competitiveness and judgmentalness; and involve the students in a mutual process of formulating learning objectives (Dewey, 1933; Knowles, 1990).

**Methodology**

According to the information provided by Chinmin College, there were 3,125 students enrolled in the extension education programs during the school year of 2,000. Based on the suggestion of Creative Research System (2001), the sample size of 350 students was determined. "Cluster sampling" was selected as the sampling technique to ensure that the samples were equally selected based on two variables: "major" and "years in school." There were 59 classes in the programs. Six students were randomly selected from each class. Therefore, the sample size in the present study was 354 students. 294 students responded to the survey, which led to a response rate of 83 percent.

The survey questionnaire used to collect data in the present study contained 3 sections and 45 corresponding questions. These sections are demographics, learning needs (their purposes of attending extension programs), and the learning satisfactions. A five-point Likert-type scale ranged from 1 (strongly disagree) to 5 (strongly agree). was adopted in both learning needs and learning satisfaction sections. There were 15 scaled-item questions in learning needs and 22 scaled-item questions in learning satisfactions (Wiersma, 1991).

In the demographic section, there were 8 multiple-choice questions which included: (a) Gender; (b) Age; (c) Marital status; (d) Occupation; (e) Position level; (f) Personal income; (g) Major; and (h) Years in school. The learning needs section included four factors, which were: (a) Job Advancement; (b) Competency Enhancement; (c) Career Change, and (d) Self-Accomplishment. The learning satisfactions section included five factors, which were: (a) Instructional-related Factor; (b) Environment-related Factor; (c) Curriculum-related Factor; and (d) Interpersonal-related Factor.

**Data Analysis**

The research questions were expressed as null hypotheses. A series of descriptive analyses was conducted before an inferential statistical test for each null hypothesis. All the data were quantified with descriptive statistics by using the Statistical Package for the Social Science (SPSS), version 8.0. Inferential statistical tests (t-Test, one-way ANOVA, and Correlation) were performed to test the research questions. All of the data was tested at a significance level of .05 (Gall, Borg, & Gall, 1996).

To ensure internal consistency of the survey instrument scaled items, a series of reliability analyses were conducted. The results indicated that the survey instrument had highly reliable Coefficient Alphas with a minimum of .85 in the 15 questions of the learning needs section and a minimum of .91 in the 22 questions of the learning satisfactions section.

Factor analyses were performed on the Learning needs section and the Learning satisfactions section to reduce survey variables to a minimum number of factors. An eigenvalue cut off point of 1.0 is considered as it was the most often used (Norusis, 1990). In order to provide a better interpretation of the factor matrix, a Varimax rotation technique was conducted. In addition, scaled items that had a factor loading less than .40 were omitted (Stevens, 1986).

Based on the factor analyses, questions in the learning needs section were extracted into four factors with a
minimum eigenvalue of 1.12 that led to a total of 62.7 percent of variance. All the factors have a minimum loading of more than .40, which were .44; .44; .58; 46, respectively. Question in the learning satisfactions section were extracted into four factors with a minimum eigenvalue of 1.22, which led to a total of 61.1 percent of variance. The minimum loadings were .45, .55, .42, .71, respectively.

Results and Findings

The majority of participants were male (68.9%). Most of the participants (73.5 %) were older than 30 years old, while only 4.8 percent of participants were younger than 20 years old. More than half of the participants (56.5 %) were married. More than half (50.7%) of the participants were working in manufactures, while fifteen (5.1%) of the participants were unemployed. The highest percentage (35.4%) of the participants were clerks, while seventy-nine respondents (26.9%) were line workers; forty-five respondents (15.3%) were supervisors; twenty-eight respondents (9.5%) were management; and thirteen respondents (4.4%) were business owners. Fifty-three participants (18.0%) had monthly income less than NT$20,000, while only 18 participants (6.1%) had monthly income more than NT$50,000. However, the largest monthly income group (43.9%) fell into NT$30,000 to NT$40,000.

In summary, by using modes as a guideline, a typical survey participant was described generally as follows: A 30 to 39 year-old married male, who worked as an administrative clerk in a manufacture environment with monthly income of NT$30,000 to NT$40,000.

According to the statistics test results, every item in this section has a mean score greater than 3, which indicated that all of these needs were somewhat important to most of the participants. In which, “increase competitive advantages”, with a mean score of 406, seems to be the most importance need. There were four items (career development, chance of promotion, self-assurance, and fulfilling and enjoyable) having mean values larger than 4.

According to the test results, all items in this section had mean scores less than 4, which indicated that none of these factors really satisfied most of the participants. In which, “relationship between teachers and students”, with a mean score of 3.84, seems to be most satisfied by the participants, while “tuition fee”, with a mean score of 2.17, seems to be least satisfied. Items that were related to instructors, curriculum, and learning materials had higher satisfaction levels than environment-related items did.

Research Hypothesis 1:

H1: There is no relationship between demographic factors and the learning needs of the non-traditional students in college extension programs.

Gender difference caused significant difference to the variable Career Change. The t-value was 2.02 (p=.04). Female participants had stronger desire to change their careers. However, gender did not cause any difference among the other three variables. Participants who were not married tended to have higher desire to the need of Competency Enhancement. The t-value was 3.26 (p=.04). However, the results indicated an opposite direction for the variable Career Change. Married participants tended to have stronger desire for career change. Variables Competency Enhancement, Self-Accomplishment, and Career Change were different among different age groups. Their F-values were 5.27, 2.83, 4.24, respectively (p<.05). Variables of Income and Position were significantly different on the factor of Self-Accomplishment. Their F-values were 3.92 and 2.24, respectively (p<.05). The results indicated that participants with lower income and lower level of positions had stronger desire for competency enhancement.

The test results showed that there were relationships between demographics and learning needs, therefore, the null hypothesis was rejected.

Research Hypothesis 2:

H2: There is no relationship between demographic factors and the learning satisfactions of the non-traditional students in college extension programs.

Four independent variables in the category of Learning satisfactions were tested separately according to the characteristics of the selected demographic variables. Participants of different gender significantly differed in all aspects of learning satisfactions. Among the four variables, female participants tended to have higher satisfaction with a lowest t-value of 2.73 (p<.01). Marital status affected participants’ attitudes toward instructional-related Factor with a t-value of 2.07 (p<.05). In which, participants who were not married were more satisfied.

Both variables of Age and Personal Income affected participants’ attitudes toward instructional-related factor.
The younger the participants are, the higher the satisfactions they have. The participants who make the highest income tended to have higher levels of satisfaction. Although the test results showed that the levels of learning satisfaction differ significantly among different income groups, there was no pattern found.

The test results indicated that learning satisfaction differed significantly among occupation groups. Participants who had no jobs had the higher level of satisfaction with a mean score of 3.55 toward instructional-related variables while the businessmen were the least satisfied group with a mean score of 2.84.

This study also revealed that most of the respondents were not really satisfied with curriculum-related variables, since there was not any group's mean score higher than 3.0 except manufacture workers. The test results showed that there were relationships between demographics and learning satisfaction, therefore, the null hypothesis was rejected.

**Research Hypothesis 3:**

H3: There is no relationship between learning needs and the learning satisfactions of non-traditional students in college extension programs.

Four variables in the learning needs section and four variables in the learning satisfactions were paired and performed paired-sample correlation analysis. Six paired-samples were significantly related (Table 1).

The variable Competency Enhancement was positively related to the variable Environment-related Factor. Participants who had stronger desire for improving their competence tended to have higher satisfaction toward environment-related factor.

The variable Job Advancement was negatively related to the variable Interpersonal-related Factor. Participants who had stronger desire for increasing their opportunity to promotion or getting higher pay tended to have lower satisfaction toward interpersonal-related factor.

The variable Self-Accomplishment was positively related to the variables Instructional-related Factor and Interpersonal-related Factor. Participants who had stronger desire for self-accomplishment and social needs tended to have higher satisfaction toward instructional-related and interpersonal-related factors.

The variable Career Change was negatively related to the variables Instructional-related and Curriculum-related Factors. Participants who had stronger desire for changing their careers tended to have lower satisfaction toward instructional-related and curriculum-related factors.

The results indicated that there were relationships between learning needs and learning satisfaction, therefore the null hypothesis was rejected.

**Conclusions**

Female adult learners were more satisfied with their learning than their counterparts. They also were concerned more about career change, which supported the previous study made by Malin in 1980 that female adult students are more satisfied with their learning compared to males. Younger adults (29 years old and younger) showed stronger tendency on pursuing competency enhancement while the older adult learners (30 years old and older) were more concerned
about career change. Age only showed differences toward learning satisfaction on instructional-related factors in that the satisfaction levels dropped as age increases. This finding seemed opposite to the literature that older adult learners are more satisfied with their learning. This might be attributed to Taiwanese culture and the educational practices in Taiwan that is still traditional. Therefore, a further study in depth on age is needed.

Married adult learners had higher tendency to change their career while unmarried adult learners were more concerned about competency enhancement. It can be assumed that married adults are more likely to have needs to make more money in order to support their families. Current jobs might not be sufficient to meet the requirements of increasing expenses on children's education and other needs. Lower income students had stronger tendency to improve their competency levels which is consistent with the assumption that lower income students are more likely to seek for job advancement and career opportunities. Higher income students in this present study showed higher satisfaction levels than lower income students.

Previous studies found that occupation is a factor that affects student's learning satisfactions (Ma, 1988; Yu, 1998). The finding of the present study is consistent with the literature. None of the groups were satisfied with the environment-related factors. This revealed an important issue that financial concerns are a big problem for adult students re-entering schools. The mean score on Item 16 in satisfaction section was only 2.17, which indicated that tuition fee was one of the reasons that respondents were not satisfied. Financial burden has always been a problem for adult students (Chu & Hinton, 2000).

Position was also a factor affecting student's satisfactions. This study found that the business owners were the most satisfied group toward instructional-related factor, curriculum-related factor, and interpersonal-related factor. There is a negative relationship between Job Advancement and Interpersonal-related Factor. The higher the desire for job advancement, the lower the satisfactions.

As described earlier, Younger groups tended to have strong desire for self-accomplishment. This study also found that students who were seeking self-accomplishment tended to have higher satisfaction levels toward instructional-related factor and interpersonal-related factor. Therefore, it could be concluded that participants who were younger and pursuing self-accomplishment were more satisfied with their learning. Students who cared about their careers were less satisfied with the instructional-related factor and curriculum-related factor. Those students were older with more experiences in life and work. Taiwanese educational practices, which tend to be more traditional than non-traditional, might not be able to meet their learning needs. This could be attributed to the fact, as discussed earlier, that older students were less satisfied with the educational practices in Taiwan. Therefore, one can conclude that the participants who were older and were seeking career changes had unfavorable attitudes toward factors related to instruction and curriculum.

How This Research Contributes to New Knowledge in HRD

1. Learning needs of Taiwanese adult students were significantly different among different groups in almost every aspect of demographic variables. Therefore, the philosophy of "one size fits all" toward adult extension education definitely does not work. Practitioners of adult education in Taiwan have to make their efforts in curriculum design and instructional methods to enhance adult learning.

2. Most of the older learners did not accept traditional teaching techniques. To improve the efficiency of teaching processes and to obtain better learning results, instructors have to learn the concept and applications of andragogy, and to improve their relationship with those adult learners. The Taiwan government should take it seriously and develop an implementation plan such as providing training, workshops, and seminars to instructors who are involved with teaching adult learners.

3. Most adult students considered financial issues. In order to provide opportunities for adult learners to re-enter school, the government might need to provide more help such as student loans for adult learners, and other means to help adult learners to return to schools. Business employers also should provide financial reimbursement for the workers who are seeking advance training and education.

4. Compared with other three factors, learning environment-related factor received lowest satisfaction. Institutes may need to alter their strategies for creating a more suitable learning environment for adult learners. Simplify registration processes, a special hotline for providing information and services for adult learners, A & Q section online service are suggestions to this area.

5. Age has been a factor to adult student's satisfactions on learning, and most of the studies on learning satisfaction indicated that the older the adult learners, the higher the satisfaction levels toward learning. However, this particular study did not show the same pattern. The researchers assumed that this might be attributed to cultural
differences and traditional educational practices in Taiwan. Therefore, further study is needed on cultural issues and educational practices in Taiwan.

Work/Family Variables Influencing the Work Satisfaction of Tennessee Extension Agents

April B. Martin  
Michael Lane Morris  
The University of Tennessee

This study explored the relationship between the work and family life of 539 County Extension Agents employed by The University of Tennessee Agricultural Extension Service. The purpose of the study was to examine how the Extension's Agent's family life affected their work satisfaction. The life and parental satisfaction scores of the Agents were the only predictors for work satisfaction. Work satisfaction was not predicted by marital satisfaction or the selected demographic variables including job title, gender, income, employment responsibility, years in present position, length of marital status, age, and education.

Keywords: Extension Agents, Work Satisfaction, Family-work Conflict

Human Resource Development (HRD) has been defined as "the integrated use of training and development, organization development, and career development to improve individual, group and organization effectiveness" (McLagan, 1989). One common area that all employees can relate to is the conflict between family and work or family-work conflict (FWC). In the last twenty years, research in work-family conflict (WFC) has moved beyond family and psychology fields and begun to be implemented in business, management, and human resources. Professionals who strive to improve HRD functions in an organization should develop a better understanding of work-family conflict (Madsen, 2001).

The Extension Service was established in 1914 with the passing of the Smith-Lever Act. It was designed as a partnership between the land-grant universities and the United States Department of Agriculture (USDA). The organization consists of agricultural and family and consumer science agents who work with in either an adult and/or youth audience at the county, district, state, and national levels. While there are countless studies focusing on the relationship between work and family life among other occupational groups, the number of published studies examining the relationship between work and family life of extension workers has been limited (Fetsch & Kennington, 1988; Igodan & NewComb, 1986; and St. Pierre 1984). Thus, this study explored the relationship between the work and family life of County Extension Agents employed by The University of Tennessee Agricultural Extension Service. The purpose of the study was to examine how marital, parental, and life satisfaction influence the work satisfaction of Extension Agents in Tennessee, and also, to make recommendations for how HRD professionals can assist this unique occupational group in maximizing their performance.

Theoretical Framework

Several theories have been offered as a basis for examining and better understanding the relationships existing between work and family. Because the dynamics within the relationship of work and family can be an important source of stress, it can lead to negative and detrimental consequences affecting both home and the workplace (Hammer, Allen & Grigsby, 1997). For this study, two theories (i.e., Family Systems Theory, Spillover Theory) will serve as guiding frameworks.

Family Systems Theory

A primary tenet of the Family Systems Theory suggests that when one member of the system is impacted, the entire system is affected, including all individuals and levels (e.g., micro-system, macro-system, exo-system) of that system (Broderick & Smith, 1979). In reviewing the issue of WFC, the family systems theory gives a set of general principles to assist researchers in making predictions that can be tested. The interactions of individuals within the family system with external contexts (i.e., work) is the primary principle being examined in this study (Boss, Doherty, LaRossa, Schumm, & Steinmetz, 1993).

Spillover Theory

Spillover theory seeks to explain the bi-directional influences between the dynamics of work and family life. This theory explains how positive and/or negative experiences in one domain (e.g., family) can exceed the boundaries of that domain and cross over into the experiences and interactions of another domain (e.g., workplace)
(Foley & Powell, 1997). For example, when positive feelings and experiences in the home are perceived, then those same attributes can be carried into the workplace. Similarly, when negative feelings and experiences are perceived at home, then dissatisfaction, distraction and/or preoccupation, strain, loss of energy and unhappiness are experienced in the workplace.

**Review of the Literature**

**Parental Satisfaction as Influenced by Work and Family**

Parental satisfaction is a parent's overall feelings about the quality of his/her relationship with their children (Umberson, 1989). A dominant theme in parenting research is that the demands of individuals who juggle multiple roles produce more stress, and consequently, this results in a decline of well-being (Barnett, 1994; Bedeian, Burke & Moffett, 1988; Kinnunen, Gerris, & Vermulst, 1996; MacEwen & Barling, 1994; Majewski, 1986; Morris & Blanton, 1994; Schulz, 1993).

**Work Satisfaction as Influenced by Work and Family**

Globally defined, work satisfaction or job satisfaction is a fulfillment of an individual's needs associated with their work. Initial research on job satisfaction was done to improve productivity. Later research was more humanistic in its approach by trying to improve employees' lives by improving their job satisfaction (Hopkins, 1983). According to Adams et al. (1996), much of the literature concerning the relationship between work and family has focused upon two variables. One area of focus has been on work-family conflict. This type of conflict can produce stress that induces psychological and physical problems. The relationship between work and family is bi-directional as work can interfere with family and family can interfere with work (Foley & Powell, 1997). The second area of focus has been on social support. Social support is usually emotional in nature such as listening, being empathetic, or helping to solve a problem. Researchers have asserted that when there is social support given by individuals at work and/or in the family, the workers' general health and well-being can be positively affected (e.g. Beehr & McGrath, 1992; Cohen & Wills, 1985).

**Life Satisfaction as Influenced by Work and Family**

Empirical research on life satisfaction as influenced by work and family is very limited. A review of the literature produced only five articles related to life satisfaction. Life Satisfaction is an individual's overall feelings of the quality of their day-to-day life related to his/her work, place of residence, way of life, activities done for enjoyment, and health (Spanier & Thompson, 1984). The relationships between work and family can have an important effect on life satisfaction of an individual (Adams et al., 1996). In a meta analysis study of all published studies that measured work-family conflict and job and life satisfaction, Kossek and Ozeki (1998) concluded that regardless of the type of measure used ("bidirectional, work-family conflict, work to family, or family to work") a negative relationship was consistently found for all types of measures; however, family to work conflict was slightly less strong. In addition, they found that the job-life satisfaction and work-family conflict was stronger for women than men.

**Marital Satisfaction as Influenced by Work and Family**

Marital satisfaction is the global subjective evaluation of one's feelings about his/her marriage (Sabatelli, 1988). Orbuch, House, Mero, and Webster (1996) found that marital satisfaction tends to be at its highest levels in the early years of marriage and then declines until mid-life at which point it steadily rises as age and length of marriage increases. They also found that reduced work and parental responsibilities in later life are related to the increase in marital satisfaction. The literature has often reported that the predictors of marital satisfaction are different for women than men (Bochner, Krueger, & Chmielewski, 1982; Crago & Tharp, 1968; Kotler & Hammond, 1981; and Terry & Scott, 1987).

**Work, Life, Parental and Marital Satisfaction of Extension Agents as Influenced by Work and Family Life**

While there are countless studies on the relationship between work and family life among other occupational groups, the number of published studies examining the relationship between work and family life of extension workers has been limited (Fetsch & Kennington, 1988; Igodan & NewComb, 1986; and St. Pierre 1984).
Researchers have found differences for agents according to their area of employment responsibility or job title more than any other variable (Boltes, 1995; Bowen and Keyser, 1994; Fetsch & Kennington, 1997; Igodan and NewComb, 1986; Kelser, 1989; Riggs & Beus, 1993; St. Pierre, 1984).

The purpose of the study was to examine how family life affects the work satisfaction of Extension agents. Specifically, the focus was on how parental, marital, and life satisfactions influence the work satisfaction of Extension Agents in Tennessee. In this study, four null hypotheses will be tested: (1) There is no difference in the reported work satisfaction, parental satisfaction, life satisfaction, and marital satisfaction of male and female agents; (2) There is no difference in agents' work satisfaction, parental satisfaction, life satisfaction, and marital satisfaction scores by employment responsibility; (3) The agents' work satisfaction, as measured by the Work Satisfaction Scale (WSS), is not predicted by life, marital, and parental satisfaction; (4) The agents' work satisfaction, as measured by the WSS, is not predicted by the demographic variables including age, length of marriage, income, educational level, job title, length of service, area of employment responsibility, have children, or number of children.

Methods

The total number of Extension Agents participating in this study was 298. This provided a response rate of 55%. By area of employment responsibility this number represented 90 (30.4%) agents in Adult Agriculture, 34 (11.5%) in Adult Family and Consumer Sciences, 68 (23%) in 4-H Youth only, 36 (12.1%) in Adult Agriculture and 4-H Youth combined, 33 (11.1%) in Adult and 4-H Youth Family and Consumer Sciences combined, 6 (2%) in Expanded Food-Nutrition Education Program (EFNEP), and 29 (9.8%) in other. The agents worked a mean of 49 hours per week, had been in their present position for a mean of 9.53 years, and had been employed with the Tennessee Extension Service for 15 years. The mean age of the respondents was 43 years. Gender within the sample included 168 (56%) male and 130 (44%) females. The racial composition was 277 (93%) White Americans, 17 (6%) African Americans, 1 (.3%) Latin Americans, and 1 (.3%) other.

Instrumentation

The four instruments used as part of the present study were the Work Satisfaction Scale (WSS), Kansas Marital Satisfaction Scale (KMSS), Parent-Child Relational Quality Scale (PCR-Quality), and the Life Satisfaction Scale (LSS). In addition to these instruments, a personal history instrument was used to collect sociodemographic information.

The Work Satisfaction Scale (WSS) (Blanding, 1993) was used to measure the degree of job satisfaction, happiness in the job environment and satisfaction with the supervisor. The WSS is a three item, 4-point Likert-type scale that utilizes a response format ranging from "1 = Not Satisfied At All" to "4 = Very Satisfied. The reliability alpha coefficient for the WSS in this study was .70.

The Kansas Marital Satisfaction Scale (KMSS) (Schumm et al. 1986) was used to measure perceived marital satisfaction. The KMSS is a three-item, seven-point Likert-type questionnaire used to assess satisfaction with 1) marriage as an institution, 2) the marital relationship, and 3) the character of one’s spouse. The KMSS utilizes a response format ranging from "1 = Extremely Dissatisfied" to "7 = Extremely Satisfied" with higher summed scores representing higher levels of satisfaction. Cronbach’s alpha for the KMSS in this study was .97.

The Parent-Child Relational Quality Scale (PCR-Quality) (Umberson, 1989) measured the positive content of parent-child relationships. The PCR-Quality Scale is a 4-point, three item Likert-type scale. Responses may range from "1 = Very satisfying, Very happy, or Very well" to "4 = Not satisfying at all, Not Happy at all, or Not at all well". Scores on the scale were recoded to yield higher scores on the PCR-Quality indicating more positive parent-child relationships. For this study, the PCR-Quality Scale reported an alpha of .79.

The Life Satisfaction Scale (LSS) (Spanier & Thompson, 1984) contains five Likert-type items and utilizes a 3-point response format. One sample item is "How satisfying is the work you do?" Responses range from "1 = Not satisfied" to "3 = Extremely satisfied". For this study, the alpha reported by the Life Satisfaction scale was .70.

Results

Results from hypotheses one through four are presented below.

Hypothesis 1

The first null hypothesis stated that the mean for work satisfaction, parental satisfaction, life satisfaction, and marital satisfaction of males would be no different to that of females. The scores for marital satisfaction were highly skewed to the left. Because of the distribution problems, this hypothesis was tested using the Mann-Whitney test. The Mann-Whitney U test is a non-parametric test equivalent to the t test.
For work satisfaction, the Mann-Whitney test gave a test statistic score of $10051.5$ (p $< .116$); marital satisfaction, a score of $5506.5$ (p $< .340$); life satisfaction, a score of $10213.5$ (p $< .252$); and parental satisfaction, a score of $3863$ (p $< .373$). Mean marital, parental, work and life satisfaction scores did not differ between males and females. Thus, the first null hypothesis could not be rejected.

**Hypothesis 2**

The second null hypothesis stated that the subjects' work satisfaction, parental satisfaction, life satisfaction, and marital satisfaction scores would show no differences when comparing the agent groups by employment responsibility. As in the previous hypothesis, a non-parametric test was used because of the distribution problem with marriage satisfaction. The Kruskal-Wallis H test (a non-parametric equivalent to the one-way ANOVA) was used to determine whether several independent samples are from the same population. There were no differences in work satisfaction (p $= .162$), parental satisfaction (p $=.962$), life satisfaction (p $=.069$), or marital satisfaction (p $=.150$) when comparing the agent groups by employment responsibility. Since the significance value for the tests on each of the satisfaction scores was $>.05$, the null hypothesis could not be rejected.

**Hypothesis 3**

The third null hypothesis states that the subjects' work satisfaction as measured by the WSS cannot be predicted by life, marital, and parental satisfaction. Correlation and stepwise regression analyses were used to test this hypothesis. The correlations between work, marital, life, and parental satisfaction and age, length of marital status, hours worked per week, years in present position, years of employment, parents (have children) and number of children. Correlation analyses showed a moderately positive linear relationship between work satisfaction and marital satisfaction ($.221$, p$<.001$), life satisfaction ($.399$, p$<.000$), and parental satisfaction ($.290$, p$<.000$).

A forward stepwise regression analysis was first used to predict work satisfaction using marital, life, and parental satisfaction scores. Only life and parental satisfaction were retained. The model F-test was $15.05$ a p-value of $<.001$. Consequently, the hypothesis of no regression effect can be rejected. Individual tests on regression coefficients (Betas) in this model indicated that both life satisfaction and parental satisfaction were significant predictors of work satisfaction (see Table 1).

Hypothesis 4

The fourth null hypothesis was that the subjects' work satisfaction as measured by the Work Satisfaction Scale cannot be predicted by the demographic variables including age, length of marriage, income, educational level, job title, length of service, area of employment responsibility, have children, or number of children. For the overall regression model, the ANOVA F-test was 1.36 with a significance of .142. Since the p value was $>.05$ this
the overall satisfaction of an employee. targets for support, encouragement, and quality of life improvement as they are often a critical variable influencing studies. Family Systems Theory suggests that spouses and children might be a rich source of responses as they are resource development researchers should consider recruiting the spouses of Extension Agents to be involved in their encounters with the global measures of marital, parental, and life satisfaction. However, in previous studies, this hypothesis could not be rejected and it can be concluded that, in this sample, none of these variables are good predictors of work satisfaction.

**Discussion**

In conclusion, data analysis procedures in this study indicated that Tennessee Extension Agents’ work satisfaction could be significantly predicted by a reduced model for life satisfaction and parental satisfaction. In terms of sociodemographic variables, it can be concluded from this study that number of children, job title, gender, income, employment responsibility, years in present position, length of marital status, age, and education were not significant predictors of work satisfaction. Specific conclusions for HRD professionals and researchers are identified and discussed below.

The subjects’ marital satisfaction, parental satisfaction, life satisfaction, and work satisfaction showed no gender differences. This is partially consistent with past research in other occupational fields. There has been some gender differences found for marital satisfaction in previous studies unrelated to the Extension field (Barry, 1970; Blood & Wolfe, 1960; Bochner et al., 1982; Brinley, 1975; Crago & Tharp, 1968; Kotler & Hammond, 1981; Lee, 1977; Tharp, 1963; and Terry & Scott, 1987). There have also been some gender differences for work or job satisfaction (Bowen, 1994). According to this study, all of the agents are equally satisfied with all satisfaction levels regardless of gender. This could be perceived as a positive finding by some as the findings might suggest that the majority of the employees are equally satisfied in regard to the satisfaction areas analyzed regardless of gender. Other researchers (Kinnunen & Mauno, 1998) have found similar results when examining gender. Future researchers exploring gender differences might consider using multi-method data collection procedures.

It was surprising to find that there were no differences in work satisfaction, parental satisfaction, life satisfaction, or work satisfaction when comparing agents by their area of employment role responsibility. In previous studies, the majority of research has found significant differences for agents according to their area of employment responsibility (Boltes, 1995; Bowen 1994; Fetsch & Kennington, 1997; Igodan and Newcomb, 1986; Kelser, 1989; Riggs & Beus, 1993; St. Pierre, 1984). Again, future researchers using multiple methodologies (i.e., mixture of qualitative and quantitative methods) for data collection might capture subtle nuances not always found with single methods. For example, an area of investigation that might be productive would be to qualitatively examine a complex network of work/family interactions that include how an individual with a larger number of salient roles perceives those roles in relation to their expectations and values in other salient roles (Edwards & Rothbard, 2000). Aaron-Corbin (1999) found that the more roles a person acquires and is expected to effectively perform, the more complex and difficult it becomes to fulfill with high satisfaction the responsibilities of other roles.

Life satisfaction and parental satisfaction were found to be significant predictors of work satisfaction. Extension Agents with higher life satisfaction and parental satisfaction scores tended to have higher work satisfaction scores. Findings from this study seem to support other scholarship efforts which has suggested that individuals who more optimistically perceive several of their salient life roles (e.g., spouse, parent, employee) tend to view other roles more optimistically (Aryee & Luk, 1996).

Surprisingly with past research, none of the demographic variables were found to be significantly related to work satisfaction. In previous research, antecedents like age of child, childcare arrangements, education level, gender, number of children, personality type, and length of service have been determinants of work/family stress and conflict (e.g., Aaron-Corbin, 1999; Aryee &Luk, 1996; Carlson, 1999; Eagle, Miles, & Icenogle, 1997).

**Implications and Limitations for Research and Practice**

Implications for research can be developed from the limitations of this study. Distribution problems were encountered with the global measures of marital, parental, and life satisfaction. However, in previous studies, this instrument, like many other global assessments of satisfaction, has been noted for its inability to produce greater score distributions among non-clinical populations (Fincham & Bradbury, 1987). In addition, this sample was from primarily rural areas type. In future studies, it is recommended that Extension Agents be studied on a broader scale with a national sample. This study would have been enhanced if the spouses had participated. Future human resource development researchers should consider recruiting the spouses of Extension Agents to be involved in their studies. Family Systems Theory suggests that spouses and children might be a rich source of responses as they are also impacted by the resultant stress and conflict stemming from work. Methods that might possibly be used to carry this out include questionnaires mailed to the Extension Agents’ homes or telephone interviews. Regardless, these non-work-related satellite members (i.e., spouse, children) should be included by human resource personnel as targets for support, encouragement, and quality of life improvement as they are often a critical variable influencing the overall satisfaction of an employee.
In the past, Corporate America tended to focus on productivity while ignoring the employee and their families. Companies who have operated from this paradigm report issues like decreased individual performance, higher work dissatisfaction, higher rates of tardiness, absenteeism and turnover, higher emotional exhaustion, increased rates of chemical use/abuse, and higher rates of employee reported health problems (e.g., Abbott, DeCieri, & Iverson, 1998; Boles & Babin, 1996; Boles, Johnston, & Hair, 1997; Cohen, 1995; Frone Russell, & Cooper, 1993; Frone Russell, & Cooper, 1997; Kossek & Ozeki, 1998).

More recently however, many companies, through the efforts of human resource development professionals, are beginning to realize that one of the keys to productivity leading to increased profit margins are to provide work environments and education programs that foster the employees’ happiness and satisfaction in other salient roles (e.g., parenting workshops, relationship wellness programs) and dimensions of their life. Cohen (1995) and Kirchmeyer (1995) have found in their studies that the way employees perceive their performance in nonworking domains greatly impacts their work attitudes.

Companies and organizations that have embraced more supportive and work/family friendly environments have observed lower levels of depression, somatic complaints, reduced levels of blood cholesterol, reduced economic costs for health insurance claims, lost work days, and productivity (Thomas & Ganster, 1995; Yang, 1998). HRD professionals could be extremely helpful to organizations like Extension Services by helping their administrators recognize the relevant work/family stressors experienced by their employees (i.e., agents) as contributing sources of their work/family conflict. HRD professionals could also assist in the development, design, and implementation of work/family initiatives and programs that would promote satisfaction, encouragement, commitment to their demanding jobs.

The Extension Service has made some strides in this philosophy, but there is still room for improvement. There are many good benefits for an Extension Agent in Tennessee. For example, as a University of Tennessee employee, Agents receive 24 paid days of annual leave and 12 days for holidays. Programs are available such as medical flexible benefits, a sick leave bank, and employer retirement contributions. In most counties, Agents are allowed flexibility in their work schedule which helps to alleviate some of the stress that employees encounter in this job. However, there is no compensation for the many hours of overtime, little recognition or awards for achievement, few opportunities for advancement, and a low salary pay scale.

As an occupation group, Extension Service Agents are clearly identified as helping professionals who work long hours in assisting others meet their life demands and expectations. Similar to occupations with a “calling” (e.g., clergy), many agents exceed normal employment expectations in rendering service and support to their respective communities. Such demands place them at risk for exhaustion, burnout, and higher attrition rates.

In response, several Extension Service organizations in other states have addressed the problem of balancing work and family with their employees and have begun incorporating some of the following:

- Modified organizational policies/practices that added to high stress levels.
- Created programs that increase Agent’s coping skills and productivity.
- Funded well-designed program evaluation studies to determine which balancing work and family programs work best with whom.
- Included time and stress management strategies into one’s daily life (Fetsch & Kennington, 1997).

What are the advantages to businesses and organizations for implementing WFC initiatives? Research has demonstrated that employees will be more productive and effective if WFC/FWC is managed properly (Madsen, 2001). According to Bond, Galinsky, and Swanberg, (1997) and Thompson, Beauvias, and Lyness (1999), workers who enjoy supportive workplaces and organizational cultures (i.e., flexibility in work arrangements, supervisor support, supportive workplace culture, positive coworkers relations) are more productive, more loyal, have higher levels of job satisfaction, commitment to their employers, and retention. It is hoped and believed that HRD professionals could be instrumental in assisting occupational groups like Extension Services go further in maximizing the human and intellectual capital of its employees.

The Development of a Competency Model and Assessment Instrument for Public Sector Leadership and Management Development

Sharon S. Naquin
Elwood F. Holton III
Louisiana State University

Traditional job analysis methods used for competency model development can be quite costly and time-consuming. This paper reports on a streamlined methodology and process used to develop a competency model for management development in the public sector. The streamlined methodology for developing the competency model and assessment instrument is fully explicated so that other governmental agencies or organizational entities electing to adopt a validated competency framework might learn from our experiences. The final instrument is also provided should other organizations choose to adopt or modify the model.

Keywords: Instrument Development, Leadership Development, Competency Models

To be competitive in today's results-driven society, both private organizations and governmental entities must build and develop intellectual and knowledge capital. A competent workforce can have a significant impact on the effectiveness and efficiency of an organization. In fact, well-trained, competent workers are critical to the success of any [public or private sector] entity (Snell & Dean, 1992). Employees' ability to integrate their knowledge and skills with the core business processes provides the competitive advantage required in today's workplace (Prahalad & Hamel, 1990).

Organizations are increasingly turning toward competency-based programs to meet the demands of today's knowledge-based economy. According to Hamel and Prahalad (1994), competence represents the synthesis of a variety of skills, technologies, and knowledge streams. A competency-based approach to employee development ensures that all training programs are integrated to produce the desired results. One of the primary reasons for the increased level of competency-based program usage is that these programs can easily assimilate learning activities or initiatives into the daily business processes, rather than traditional training which is often totally isolated from daily business operations. Green (1999) summarized their value by stating, "robust competencies help you define what was done, what is being done, and what needs to be done" (p. 8).

Competency-based training programs are also referred to as skill-based or performance-based training programs. Such programs focus on employees' ability to demonstrate capability. According to Hamel and Prahalad (1994), competence represents the synthesis of a variety of skills, technologies and knowledge streams. A competency-based approach to employee development ensures that all training programs are integrated to produce the desired results. One of the primary reasons for the increased level of competency-based program usages is that these programs can easily assimilate learning activities or initiatives into the daily business process, rather than traditional training which is often totally isolated from daily business operations. Green (1999) summarized their value by stating, "robust competencies help you define what was done, what is being done, and what needs to be done" (p.8).

Characteristics of competency-based training programs include the following (Burger, 1975; Dunn & Mitchell, 1979; Leonard & Utz, 1974; Tromley, 1998).

1. Employees' knowledge and skills are certified through competency-testing rather than credits [courses] taken.
2. Competency-based training is centered on behaviorally stated and measurable objectives.
3. Trainee assessment or evaluation of learning is criterion-referenced rather than norm-referenced.
4. Assessments can take the form of written exams, oral exams, or skill practice demonstrations.
5. In the event of failure, trainees have an opportunity to retake competency-based tests.
6. Trainees receive immediate feedback on assessments.
7. Various forms of media are used in the instructional process to meet trainees' individual learning needs.

Job analysis is typically the first component or step in the process of developing competency-based training. Job analysis identifies the specific tasks that are required. The second step requires identification of the skills necessary to perform each task identified. The criteria for the competency evaluation are based upon these skills. The evaluation criteria clarifies what should be measured or the level at which an employee should demonstrate a
competency. Assessment instruments are a key element in this process. The assessment instrument can be used to identify both individual and group level skill gaps. Specific training initiatives can be developed and implemented to target these skills gaps. Employees begin the process of training and testing until they reach the desired level of competency.

However, job analysis can be a lengthy and complex process, especially when applied to managerial positions. The challenge is often to find an economical approach that retains the integrity of job analysis without the enormous expense. The focus and purpose of this paper is to report on the methodology and process used so that other governmental agencies or organizational entities electing to adopt a validated competency framework might learn from these experiences. The streamlined process of developing the competency model and assessment instrument is fully explicated. And the instrument is provided should other organizations choose to adopt or modify the model.

The Project

Studies show that in both public and private sectors, organizations led by individuals who demonstrate effective leadership competencies are able to maintain competitive advantage. A competency-based model of sustainable competitive advantage designed by Lado, Boyd & Wright (1992) strongly emphasizes managerial competencies and their impact on the focus and success of the organization. Thus, it is understandable that managerial and supervisory training initiatives have become commonplace in business and industry. Trend setting organizations go to great expense to identify their strategic goals and instill the required leadership/managerial competencies (NAPA, 1997).

The State of Louisiana approached the Louisiana State University School of Human Resource Education and Workforce Development with a request to redesign and restructuring of their management development programs and processes. The primary goal was the desire to incorporate key performance drivers that were based on a set of core competencies with training initiatives, thereby improving the quality and efficiency of state operations. To accomplish this, the project had to link best practices and meet individual and agency needs for training at both fundamental and intermediate levels.

This time consuming effort resulted in a fully implemented an integrated system of supervisory and managerial training that is competency-based and designed to promote best practices throughout the state. The result is a training program that seeks to transform learning experiences into performance-based outcomes. To accomplish this result, the project team had to first identify all competencies required for state managers and supervisors and develop an effective assessment instrument to measure those competencies.

Due to the enormous scope of this project, the work was conducted in phases. The dynamic process was a four-phase process consisting of competency model development; needs assessment; curriculum development; and course design and pilot delivery. This paper, however, will focus only on the first two phases of the project as they serve as the underlying foundation for the success of the entire project. These phases are the competency model development phase and the needs assessment phase.

Phase I: Competency Model Development

The development and integration of competencies in an organization is a process that requires systems thinking and strategic planning. True competency-based systems are cyclical, built around a series of well-defined tasks. It is therefore understandable that this phase, competency model development, involves a multi-step process.

Step 1.1: Beginning with the U.S. Office of Personnel Management managerial competency model -- The process began with an extensive search of managerial competency models that met two basic criteria. The first criterion was that the model had to be well-validated using accepted competency model validation techniques. It turned out that quite a few of the popular models did not meet this criterion. Second, the competency model had to be validated for use in the public sector. After an extensive search, it was determined that the model developed by the U.S. government was the one best suited for use in Louisiana.

More specifically, the model used was the Leadership Effectiveness Framework developed by the U.S. Office of Personnel Management (OPM) Personnel Management Center, and was available free of charge. In 1991, OPM developed the Leadership Effectiveness Survey (LES), "an empirically-based continuum of individual and organizational competencies that are important for effective performance by supervisors, managers and executives" (Eyde, Gregory, Muldrow, & Mergen, 1999). The research basis for this project included a comprehensive review of public and private sector literature (Corts & Gowing, 1992). The development of the LES was based upon information obtained in this literature review. This instrument was administered to a stratified random sample of approximately 10,000 Federal executives, managers, and supervisors (Gregory & Park, 1992). Information obtained from the survey enabled the identification of competency requirements across the three employment levels --
supervisory, managerial, and executive, which ultimately led to the development of the OPM competency model, the Leadership Effectiveness Framework (LEF) (Gregory & Park) (Eyde, Gregory, Muldrow, & Mergen, 1999).

**Step 1.2: Customizing language for Louisiana State work environment** — The next step was to adapt the language of the task statements used to construct the U.S. competency model. The team of experts from the University and the State spent many days analyzing the language (i.e., stakeholders, work groups, etc.) and making changes where necessary while being careful not to violate the integrity of the original model. The outcome of this process step was the initial version of the Louisiana Managerial/Supervisory Survey LMSS instrument.

**Step 1.3: Pilot testing and validation** — The resulting competency statements were field tested in focus groups with nine different departments in Louisiana state government. Each focus group included 15 - 25 members, representing a cross-section of managerial levels. These participants were selected by departmental level mid- and upper-level management in conjunction with the project team members. The following criteria were used in the selection process:

1. Employees selected had to be considered high performers within their work groups.
2. Employees selected had to be able to clearly distinguish between the technical competencies (the what) and the performance competencies (the how) of their jobs.
3. Employees selected had to be able to articulate the necessary KSAs for managerial and supervisory positions.

These supervisors and managers were given an opportunity to critique the writing as well as the content of the competencies in these all day meetings. After carefully reviewing the wording and content of each existing statement, the focus group participants were also asked the following questions:

1. Do you think that these competency statements are representative of the tasks that state supervisors and managers must perform?
2. Are there competency statements included on this list that should be eliminated?
3. Are there competency statements that should be added to this list?

Their suggestions and comments were compiled, sorted and reviewed by the project team members. The approved revisions were integrated into a revised version of the LMSS instrument. This instrument was comprised of 24 competencies, each with series 311 task statements or sub-competencies that described an element of managerial behavior from basic to strategic levels.

**Step 1.4: Developing alternate versions of the LMSS** — Once the core LMSS model had been developed, its value was leveraged by developing specialized versions of the instrument. Because there was the basic competency model to start with, it was relatively easy to develop versions that were more focused to special situations in state government, further enhancing the value of this project. For example, versions were developed for first line supervisors in the Department of Transportation and Development and the Department of Health and Hospitals. Additionally, the basic version was used as a starting point to create a new supervisory competency model for Department of Corrections supervisors. This model is being recognized nationally for its innovativeness. Using job analysis data from the needs assessments, departments have the option of developing their own customized version of the LMSS instrument.

**Step 1.5: New competency identification** — Through the two-year test period it became apparent that some additional competencies were needed. In particular, the State had initiatives in areas such as strategic management, customer service, and reengineering. Thus, new competencies were needed to achieve the strategic goals of the State. For example, in the general LMSS competencies related to process management, improvement and redesign were added. In addition, the first line supervisor version needed competencies related to safety and “caretaker” roles. Focus groups and survey methodology were used to collect data for this task.

**Step 1.6: Develop other administration formats** — The model and assessment tool have been adapted for a variety of administration formats (i.e., self-rating, dual rating, 360 degree rating). This enhances supervisors' and employees' abilities to set performance improvement goals. Employee participation increases buy-in and enhances commitment to achieving performance goals. Dual rating (employee and his/her supervisor) and 360-degree feedback (employee, supervisor, peers, and subordinates) versions allow for more complete assessment, particularly for individual development and coaching. The 360-degree version (see Appendix A -- Other variations may be obtained by contacting the authors) and the dual rating version enable the employee to actively participate in seeking supervisor feedback and assessing past performance. Self-scoring versions have been developed so that departments and agencies can use it without the University’s assistance. The competencies are also being adapted for pre- and post-training assessments and for Internet administration.
Phase 2: Training Needs Assessment in Nine State Agencies

The initial competency model was field tested in needs assessments conducted in nine Louisiana state government agencies over a two-year period. Due to space limitations, this phase is not discussed in detail but has been partially documented elsewhere (Holton, Bates, & Naquin, 2000). Briefly, for three years extensive training needs assessments were conducted in eleven departments within Louisiana government. They encompassed a wide variety of training needs and job types. However, most departments identified managerial and supervisory training as a key need. As a result, resources could be pooled and the work described in this article undertaken.

Over 5,000 managers completed the revised survey instrument that asked their individual perceptions of both skill level and job importance of the 24 competencies. The later scale gave the state the most complete job analysis data on government managers it had ever had. In addition, six of the agencies elected to conduct multi-rater needs assessment in which each individual manager and his or her boss completed the instrument.

Survey data was summarized on both state and agency levels. Each participating agency received summary reports documenting their training needs. The agency level data was retained for development of customized versions of the instrument and curriculum. The state level data was used to refine and validate the LMSS instrument.

Importance of This Research Project

This project represents a very important step in the re-creation of management development programs in state government. To achieve high-performance, private sector businesses and state governments must closely examine their management and leadership competency models and development processes. Doing so provides both individual and organizational level benefits. Both the project team and the State recognized the potential organizational and individual level benefits of this competency model. The organizational level benefits of the LMSS instrument included:

- It aligned work behaviors with organizational goals.
- It served as a means to allow departments to communicate desired work behaviors.
- It helped to create an awareness of performance expectations.
- It identified and emphasized work behaviors that contribute to organizational effectiveness.
- It identified training areas that are compatible with organizational strategies.
- It can be used to increase the competency level of the supervisory and managerial level workforce.
- It can be used to provide ongoing skill development and career enhancement opportunities.
- It enables customizing workforce development systems to ensure that departmental and agency employees have the necessary KSAs.
- It enables departments to create knowledge workers by developing skills in core competencies.
- It can be used to improve performance through structured performance discussions.
- It can be used to design succession-planning strategies.
- It can be used to design career development opportunities.

There are individual level benefits of the LMSS in addition to the organizational level benefits. These include:

- Ability to create an individual development plan for professional growth.
- Ability to receive feedback from superiors, peers, and subordinates if the 360 version is used.
- Dual rating version allows individual employees to gauge their performance against their superiors’ rating to determine gaps in perception.
- Ability to receive individualized assessment of management and supervisory competencies.
- Ability to assess potential for advancement.
- Increase level of understanding of the relationship between personal behaviors and organizational goals and strategies.
- Helps individuals identify the competencies they must develop to advance in state culture.
- Increase awareness of individual strengths and weaknesses.

There is also an important ancillary benefit of this project, which perhaps is the most important benefit here. That benefit is the process that was developed that any other state or business entity can use to re-create its management and leadership development programs.

APPENDIX - LMSS 360° RATING SURVEY

Directions: As you read each managerial/leadership competency, think about the current job of individual that you are rating, and make two ratings. Rate his/her current level of skill and how important that competency is to his/her job. Use the scales provided below to make your best estimates.

<table>
<thead>
<tr>
<th>SKILL LEVEL</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>

* NOT APPLICABLE - Mark if skill is not applicable at all to the job.

* DON'T KNOW - Mark if you do not know enough information about the job or individual to respond to this item.

**ORAL COMMUNICATION**
1. Communicates ideas and facts verbally in a clear and organized way.
2. Adjusts style, tone, and level of verbal communication to fit the audience and situation.
3. Listens to others and shows understanding of what they are saying.
4. Anticipates the implications of words and actions inside and outside of the workgroup.

**WRITTEN COMMUNICATION**
5. Communicates ideas and facts in writing in a clear and organized manner.
6. Adjusts style, tone, length, and level of written communication to fit the audience and situation.
7. Reviews and critiques others' writing in a constructive way.

**NEGOTIATING**
8. Identifies and understands interests and positions of others (e.g., co-workers, citizens, customers).
9. Applies appropriate negotiation approaches to find mutually acceptable solutions to problems or conflicts.
10. Persuades others to commit to action when appropriate.
11. Gains cooperation from others to get information and to accomplish department/office goals.

**PARTNERING**
12. Builds productive working relationships with key individuals and groups.
13. Works with a variety of individuals and groups from both within and outside the department/office.
14. Identifies concerns of other interested parties (e.g., program users, community, stakeholders, etc.) to find common ground.
15. Works to overcome barriers to partnering.

**INTERPERSONAL SKILLS**
16. Provides positive feedback in a way that reinforces or encourages desirable employee behavior.
17. Considers and responds appropriately to the needs, feelings, and capabilities of all individuals.
18. Provides negative feedback constructively.
19. Treats all individuals with sensitivity and respect.

**ACCOUNTABILITY**
20. Takes personal responsibility for work products and services of his/her group.
21. Assures that his/her workgroup's results are measured.
22. Tracks results of programs or activities and takes corrective action when necessary.
23. Encourages subordinates to take responsibility for work products and services.

**PROBLEM SOLVING**
24. Recognizes and defines problems and issues.
25. Gathers enough relevant data about problems and issues to conduct a complete analysis.
26. Uses appropriate methods to analyze and interpret data.
27. Generates multiple solutions based on data analysis.
28. Recommends appropriate solutions to problems.

**DECISIVENESS**
29. Acts decisively when quick action is required, even in uncertain situations.
30. Makes difficult or unpopular decisions when necessary.
31. Exercises good judgment by making sound and well-informed decisions.
32. Considers all factors when making decisions (e.g., legal aspects, political implications, organizational culture, media, special interests).
<table>
<thead>
<tr>
<th>CUSTOMER SERVICE</th>
</tr>
</thead>

INTEGRITY/HONESTY
81. Models and encourages high standards of honesty and integrity.
82. Promotes ethical practices in all organizational activities.
83. Applies department/office policies in a consistent manner.
84. Demonstrates consistency between words and actions.
85. Exercises power, authority, and influence appropriately to achieve department/office goals.

PLANNING/GOAL SETTING
86. Creates a direction for the workgroup that fits with department=s vision.
87. Motivates employees at all levels to work toward the department=s goals, values, and strategies.
88. Recommends changes based upon a strategic plan for the workgroup.
89. Initiates changes within the scope of the job that are based upon a strategic plan for the workgroup.

EXTERNAL AWARENESS
90. Keeps current with laws, regulations, policies, trends, and other developments that impact the workgroup.
91. Keeps current with general trends and developments that impact the department/office.
92. Analyzes and applies Alessons learned= from other organizations to improve workgroup results.

INNOVATION
93. Identifies need for new approaches, services, and capabilities.
94. Designs new approaches, services, and capabilities to meet identified needs.
95. Takes necessary action to implement new approaches, services, and capabilities.
96. Designs/implements new approaches to improve workgroup effectiveness.
97. Creates a work environment that encourages and recognizes creativity and innovation.
98. Recommends innovative or cutting edge programs and processes.

LONG-RANGE THINKING
99. Recommends effective strategies that fit the external environment which the department/office faces.
100. Applies a long-term perspective when developing strategic plans.
101. Develops goals, objectives, and strategies that fit with the department/office=s long-term vision.
102. Adjusts strategic plans in response to changes inside and outside the department.

CONTINUAL LEARNING
103. Evaluates personal strengths and weaknesses, and assesses their impact on others.
104. Seeks feedback from others and uses it for self-improvement.
105. Invests time and energy in self-development and professional growth.
106. Creates an environment where learning and developing new skills is part of day-to-day work.
107. Develops and implements methods to share knowledge with others who need it.

A Definition of Work Process - A particular method of doing something, generally involving a number of steps or operations and often including multiple jobs. A process may well extend across workgroups and departments. For example, an application process might begin with paperwork submitted by a citizen, which is then routed through multiple people, possibly in different offices, for various checks and actions before being approved.

WORK PROCESS MANAGEMENT
108. Manages and plans work as a process rather than focusing only on individual jobs.
109. Defines goals for each work process that they control.
110. Measures and monitors outputs of work processes.
111. Manages work that flows between people and other workgroups.
112. Designs work processes to meet the needs of "customers" of the workgroup.

WORK PROCESS IMPROVEMENT
113. Uses work process performance measures to identify problems.
114. Eliminates work steps that do not add value to the desired outcomes.
115. Changes work processes when a new approach appears to be better.
116. Works to insure that work processes are as simple as possible.
117. Evaluates process performance regularly to determine if changes are needed.
118. Uses process analysis tools (e.g., flowcharts, fishbone diagrams, etc.) to identify and correct problems.

WORK PROCESS REDESIGN
119. Redesigns work processes and procedures when a total change is necessary.
120. Discards old methods of doing things when they no longer work.
121. Evaluates new approaches to work processes continuously.
122. Makes sound decisions about which processes to redesign instead of just improving.
123. Creates a sound rationale for process redesign projects.
Competencies of the Distance Education Professional: Self-Assessment and Authentication Measures to Document Learning

Kim E. Dooley
James R. Lindner
Larry M. Dooley
Texas A&M University

This study used a self-assessment instrument and authentication measures to document growth in distance education core competencies of professionals in Costa Rica. The results include: individual and average growth in core competencies, comparisons of authenticated distance education competency scores to self-assessment scores, and comparisons based upon personal characteristics.

Keywords: Training Competencies, Distance Education, Latin America

Competency modeling has emerged as an important human resource development tool and is being widely used in public and private sectors. Professionals have used competency models to “clarify organization-specific competencies to improve human performance and unify individual capabilities with organizational core competencies” (Rothwell & Lindholm, 1999, p. 104). Organizations provide training so that individuals will become more competent and therefore, more effective in their jobs. It is often assumed that training provides the condition for effective learning, however, “from the individual’s perspective, training cannot be assumed to produce learning, nor that learning is always an integral part of training” (Antonacopoulou, 1999, p. 17).

Transfer of learning and the ability to measure learning outcomes as a result of a training program have become major issues in training and development (Antonacopoulou, 1999; Kellie, 1999; Smith, 1999). “Currently, the individual’s perspective is relatively under-researched, thus much remains unclear about the way individuals perceive the association between training and learning and more significantly whether individuals actually learn from training” (Antonacopoulou, 1999, p.14).

Burchell and Westmoreland (1999) discuss Tomlinson’s (1995) interactive model of competence between three interrelated aspects—performance, schema and intellectual processes, located within a particular cultural context. “The schema represents the student’s way of thinking about the role and its constituent elements, and signals what will be attended to and valued in the development of practice” (Burchell & Westmoreland, 1999, p. 157). This framework has three functions: 1) assessment (both formative and summative), 2) development (providing a map and strategies based upon the formative self-assessment and reflective participation in the process of learning, thus providing a basis for self-management of learning, and 3) communication and reflection concerning the development and assessment for competence analysis.

Often formative and summative self-assessment instruments are used to determine work roles, outputs and competencies. Other researchers have considered competency identification, modeling, and assessment in Australia, Ireland, the United States, England, the Netherlands, Italy, Germany and Finland (Lindner & Dooley, 2001; O’Brien & Thompson, 1999; Rothwell & Lindholm, 1999; Smith, 1999; Valkeavaara, 1998). These research studies did not include Latin America or Spanish speaking countries, nor were they based upon the core competencies for the distance education professional. This study, therefore, adds to the growing body of literature on using self-assessment instruments to measure perceived growth (learning) in competency-based training programs. It is unique in providing authentication measures to compare self-assessment to evaluation rubrics of observable skills. It was also necessary to determine if the self-assessment instrument would transfer in a cross-national training situation, with simultaneous translation and training materials based upon research and practice in North America.

Theoretical Framework

Rothwell & Lindholm (1999) warn against the ambiguity of terms and definitions. It is important to clarify terminology as we consider the theoretical framework for this study. Knowledge is a body of information applied directly to the performance of a given activity. Skill is a present, observable competence to perform a learned psychomotor act. Ability is a present competence to perform an observable behavior or a behavior that results in an observable product. Competencies, therefore, establish the behavior requirements needed to be successful in a given activity.
profession or task. Buford and Lindner (2002) define competencies as a group of related knowledge, skills, and abilities that affect a major part of an activity. Competency models can be used: as a recruitment and selection tool; as an assessment tool; as a tool to develop curricula and other training material; as a coaching, counseling, and mentoring tool; as a career development tool; and as a behavioral requirement benchmarking tool (Yeung, Woolcock & Sullivan, 1996).

Based on a competency model developed by the American Society for Training and Development (ASTD), Thach and Murphy (1995) identified roles, outputs, and competencies of distance learning professionals within the United States and Canada. Their top ten competencies portray the dual importance of both communication and technical skills in distance learning. These competencies in rank order were: 1) Interpersonal Communication, 2) Planning, 3) Collaboration/Teamwork, 4) English Proficiency, 5) Writing, 6) Organizational, 7) Feedback, 8) Knowledge of the Distance Learning Field, 9) Basic Technology Knowledge, and 10) Technology Access Knowledge. Williams (2000) replicated this study with similar results. Others have built complete Masters degree programs (Ally & Coldeway, 1999) and Certificate Programs (CDLR, 2001) to provide the coursework or professional development (competence) to work in the growing field of distance education.

Determining, measuring and verifying competencies needed for a given profession are difficult but necessary tasks. HRD professionals are continuously seeking appropriate techniques to document professional growth and learning over time. One method for addressing this problem is to develop and use competency-based and behaviorally anchored rating scales to measure growth. In this study, behavioral anchors are defined as characteristics of core competencies associated with the mastery of content. Competency-based behavioral anchors are defined as performance capabilities needed to demonstrate knowledge, skill, and ability (competency) acquisition. Competency-based behavioral anchors require considerable time and effort to develop, however, they provide more accurate judgments than item-based scales (Buford & Lindner, 2002). Further, such anchors provide trainers and other expert raters with behavioral information useful in providing assessments and feedback to learners. Such information can help learners understand their unique bundles of competencies and increase satisfaction, motivation, learning, and ultimately success on the job (Drawbaugh, 1972). Competency-based feedback can provide a foundation for individual learning plans. Behavioral anchors can also be used to describe minimally acceptable knowledge, skills, and abilities on identified core competencies, thus, giving managers tools and information needed to improve curricula, training materials, evaluation processes, and instructional delivery methods.

Research Questions and Propositions

The purpose of this descriptive study was to authenticate growth (learning) in distance education core competencies of adult professionals who participated in a training and development program in Costa Rica. The study further sought to replicate the use of competency-based behavioral anchors, developed by Dooley and Lindner (2001), as an expert authentication tool for documentation of growth in distance education core competencies. The research questions were: 1) How much perceived growth did learners report in the self-assessment instrument (behavioral anchored scores) for distance education core competencies as a result of participation in the training program? 2) How did the self-assessment instrument (behavioral anchored scores) compare to the authenticated distance education competency scores determined by the trainer using an evaluation rubric? 3) Were there differences in growth based upon personal characteristics (gender, age, years as a trainer/educator, and years of experience in distance education)?

Methodology

The context for this study was a 5-day training program sponsored by the Inter-American Institute for Cooperation in Agriculture (IICA) headquartered in Coronado, Costa Rica. The training program, including all written and oral communications were delivered using simultaneous translation (English and Spanish) at IICA’s Center for Distance Training in an interactive video classroom with desktop computers available in a lab format.

There were 28 respondents who were professionals in various fields including health care, engineering, social service, local government, and human resource management. Participants were enrolled in a continuing education course, Course Design for the Digital Age: Instructional Design and Materials Conversion. There were 13 female and 15 male participants, most with no previous distance education experience. Respondents were coded based upon gender (F/M), age (1=less than 30, 2=30-39, 3=40-49, 4=50-59), years of experience as a trainer/educator (0=0, 1=1-5, 2=6 or more), years of experience in distance education (0=0, 1=1-3, 2=4 or more), and a one to two letter unique identifier to determine any trends in the data, but still provide confidentiality.
The content for the training program was developed based upon the competencies for the distance education professional (Thach & Murphy, 1995). The researchers clustered the distance education competencies into six major themes or “core” competencies needed by practitioners (See Figure 1).

The self-assessment instrument was developed by Dooley and Lindner (2001) and has been found to be valid and reliable. The instrument was used as a tool for the trainees to measure growth (learning) in the six core competencies. The researchers chose a stair-step approach (rather than a continuum or Likert scale) to visually represent progression from novice (0) to expert (7). The numbers were intended to measure perceived growth rather than any statistical significance.

Participants were given the instrument the first day of the training program and again after completion of the program. Respondents provided open-ended verification of the numerical ratings along the side of each core competency “step” at both viewings of the self-assessment instrument. An example of verification was included in the instructions. Participants were also asked to describe any attitudinal changes as a result of participation in the training at the completion of the program. A professional translator hired by IICA translated the instrument into Spanish.

The researchers used competency-based behavioral anchors at level 2, 4, and 6 and trainees’ written verifications to authenticate ratings (Dooley & Lindner, 2001; Smith & Kendall, 1963). A person with a score of seven demonstrates expertise in the core competency area. A person with a score of four would be considered average and a score of one would be novice. Additionally, an assessment rubric was used to evaluate training participants on the last day as they presented a lesson delivered using interactive video equipment. The rubric served as an authentic assessment tool to document demonstrated competence in the core competency areas. Trainees were evaluated on eight constructs using a five-point scale. Summing scores and multiplying by 2.5 to convert to 100-points calculated a weighted final score.

**Results and Findings**

The results of this study were reported in four areas: (1) individual behavioral anchored scores and total growth in core competencies, (2) individual authenticated distance education score, (3) average distance education score by personal characteristics and, (4) authenticated growth by personal characteristics. In Table 1, the individual, average, and total growth is indicated for each of the six core competencies.
Table 1. Individual Behavioral Anchored Scores and Total Growth in Core Competencies (N=28)

Note: Respondent Code = one or two letter unique identifier; Bb=Before; A1=After

Before the course, 24 of the 28 participants rated their level of competence in Adult Learning Theory below average; 18 trainees rated their competence above average after the course. The average Adult Learning Theory beginning score was 2.1 and finishing score was 4.9. The participants provided open-ended verification of their current core competency level. The researchers made authenticated assessments by comparing self-reported data with the competency-based behavioral anchors. One trainee who grew, from below average before the course to above average after the course, indicated that his instructional design team lacked knowledge in adult learning theory. As a result of the training program, he acquired the knowledge base necessary to incorporate adult learning theory into online training (M322H). Another participant who grew from novice to average indicated “I have learned new training methods and styles that will serve to further me along in my career” (M100N). Yet another participant who grew from average to above average already had previous education in adult learning theory and experience in training adult learners. This training program “refreshed her understanding of adult learning theory” (F301Z).

For Technology Knowledge, 19 rated their level of competence below average at the beginning of the training program and 23 rated their competence above average by the end. The average starting Technology Knowledge score was 3.1, and the ending was 5.5. One respondent who was below average at the start of the program and above afterwards stated that she knew “the basics on the use of videoconferencing equipment” but now has “more confidence in the equipment and how to act in front of it” (F302K). Another who was average before and above at the end stated that she was responsible for the “organization of a teleconference course directed at 550 persons at 22 centers” and by the end of the course she learned more interactive strategies to “permit me to use the course adequately” (F312L). A third participant who was a novice at the start and average by the end stated that she “only has email to communicate internally at the institution” and now adds knowledge and skill on the use of videoconferencing (F211D). As a final example, a trainee who was already a “6” and grew to a “7” stated that “I have experience working with web equipment and tools but not as applied to education. What is left is applying it directly at the institution and seeing its results” (M112Y).
In the core competency area of Instructional Design, 19 participants were below average as they started the program and 23 were above average at the conclusion. The average change in score in Instructional Design was from a 2.7 to a 5.4 by the end of the training. A participant who was below average at the beginning of the training program and above afterward noted “I have planned a course (even though it’s just a practice) with all the stages and I will take with me many new ideas for my institution” (F200C). Another who was already above average at the beginning and grew only slightly indicated that she had “prepared various training [materials] for different audiences and objectives with different formats” but now she has “learned the difference of preparing educational content, both traditional and at a distance” (F301Z).

Communication Skills had the fewest number of participants below average at the beginning of the program (16) and had 21 above average by the end. The average score in this area went from 3.1 to 5.4 over the course of the program. One participant who was above average at the beginning and above after training noted that she “understands the concepts and has applied them to her work” but now has “improved the use of communication” (F110G). Another noted that “after the course without a doubt I will make the presentations and ask the questions more according to the objectives” (F211B). One trainee who grew from a “2” to a “6” verified that “adaptation has not been easy...There are major considerations at a distance to make the videoconference more versatile and interactive” (M322H).

Graphic Design had 20 participants below average as they began the program and 19 above average at its completion. The average score changed from 2.3 to 5.1 from beginning to end. A respondent who was a novice at the beginning of the training replied, “I don’t have experience with technology, only with audiovisuals, posters, transparencies, blackboard, and some video.” She verified that she “advanced a lot on the preparation for TV material” (F301Z). Another began with some skill in the development of WebPages and PowerPoint presentations. By the completion of the training program she was able to “use and design materials for a videoconference” (F201S).

For the last core competency, Administrative Issues had 19 trainees below average at the start and 23 above average at the finish. The average growth changed from 2.7 to 5.4 as a result of attending the training. Many respondents mentioned new knowledge gained in the area of intellectual property and copyright (F312L, M100N, F211B, F211D). “After the course I will include in my presentations and creations some indication as to the author’s rights, something I didn’t realize for these cases” (F211B). Trainees’ total growth ranged from 0 to 35: seven trainees had a growth between 0-11; nine had a growth between 12-14; five between 15-19; and seven between 20-35. The average total growth for a trainee was 15.7.

At the end of the training workshop, trainees developed and delivered a “lesson” via interactive video. The purpose of the activity was to synthesize and integrate the core competency areas and to demonstrate level of expertise. A rubric was used to evaluate trainees on the constructs delivered in the training program. As shown in Table 2, authenticated distance education competency scores and level of expertise results were calculated to document learning and professional growth. A result score (based upon the rubric) was assigned to each trainee to indicate their level of expertise and to identify areas needing further growth. For example, a rubric score of 95-100 would mean the participant demonstrated overall expertise and would be given a result score of 1. In contrast, a participant below a 70 on the rubric would demonstrate novice and receive a result score of 4.

At the end of the workshop, nine trainees demonstrated expertise or near expertise (result scores of 1-1.5). Five trainees demonstrated novice or near novice at the end (result scores 3.5-4.0). The researchers were also interested if personal characteristics or individual competency growth in the program was different by authenticated distance education scores (Table 3). Both males and females had equivalent distance education scores, however, females (17.7) had higher levels of overall growth than males (13.8). Younger trainees (39 and younger) had lower levels of individual growth (11.5-13.9) and demonstrated higher levels of expertise (85.3-86.3) than older trainees (40 and over) who had higher levels of growth (19.3-22.5) and lower levels of expertise (77.1-71.3). Distance education scores were similar based on years of experience as an educator or trainer. Participants with no experience as an educator demonstrated the highest levels of growth. Trainees with one to three years of distance education experience demonstrated higher levels of competence than those with four or more years of experience. Trainees who had the highest (20-35) and lowest (0-11) overall growth by score, demonstrated a higher need for overall growth and training (result scores of 3), than trainees that demonstrated growth from 12-19. Those that had the highest authenticated distance education score demonstrated the lowest levels of individual growth.

Conclusions, Recommendations, and Contributions to New Knowledge

As we examine whether adults are learning as a result of training programs, there is a continued need to evaluate and authenticate growth. The findings of this study contribute to the body of literature related to assessing distance education competencies for adult learners within various organizations in Costa Rica and within a cross-national context. Although the researchers were native English speakers with education and training in the United States, the simultaneous translation of distance education competencies transferred effectively, demonstrated by multiple data sources and authentication measures. The self-assessment instrument and verifications were translated from Spanish to English for interpretations in this study. It is believed that the researchers adequately captured the essence of respondents' perceptions, although it is recognized as a limitation of the study. It is recommended that this model be replicated in other distance education training programs and cross-national settings to evaluate the extent the results presented here would be similar and applicable.

Although individuals' distance education competencies varied, results of this study showed that on average participants were below the average (4) at the beginning of the training program and above afterward. Participants increased approximately two steps in each of the core competency areas. At the end of the workshop, some trainees demonstrated expertise or near expertise (result scores of 1-1.5) while others were novice or near novice (result scores 3.5-4.0). While nearly all participants showed growth in distance education competence, there remains a need for specific training for some and overall training for others. The authenticated distance education score and result score provides outcome assessment measures useful for trainers and managers for comparing results of self-assessment and observable behaviors of competence.

Viewing the data by personal characteristics provided interesting discussion, and poses more questions for further research. It is understandable that younger trainees would have lower levels of individual growth and higher levels of expertise than older trainees due to the nature of the content delivered (distance education). Attitudinal issues would also come into play because of techno-phobia or lack of experience with technology in older participants. Additionally, participants with no experience as an educator demonstrated the highest levels of growth. What was surprising was that trainees with one to three years of distance education experience demonstrated higher levels of competence than those with four of more years of experience. This finding is incongruent with
expectations of years of experience and level of competence. In general, these individuals (F312L, M212Q, and M322H) indicated that they possessed above average levels of competence and showed the lowest levels of overall growth. The authenticated distance education scores and result scores refute the trainees' self-assessment of their competence indicating that they may be more confident than competent.

Note: Score4w = Authenticated Distance Education Score Out of a Possible Score of 100; Result5, 1 = Demonstrates Expertise, 2 = Suggests Growth in Particular Areas, 3 = Suggests Overall Growth Needed, 4 = Demonstrates Novice; Growth6c = Authenticated Student Growth Based on Competency-Based Behavioral Anchors

Trainees who had the highest (20-35) and lowest (0-11) overall growth by score, demonstrated a higher need for overall growth and training (result scores of 3). Trainees who grew at the highest rates were unable to assimilate the entire competency set presented during the training program and therefore, had authenticated scores that suggested a continued need for training and development. As mentioned previously, authenticated scores of trainees with the lowest overall growth refute the trainees' perception of their competence. One of the reasons why it is so important to authenticate results of trainees, rather than depend on self-assessment scores alone, is to document learning rather than perceptions. Those that had the highest authenticated distance education scores also had the lowest levels of individual growth, suggesting that the training content may not have been challenging for their level of expertise.

Without a way of documenting competencies as trainees enter a program, trainers cannot develop individualized instruction. At best, trainers would be forced to teach to "the middle." Unfortunately, this is often the case thereby providing training material that is too challenging for some and too simple for others. For example using this model, a trainer could design and deliver individualized instructional sequences to provide the greatest opportunity for growth when confronted with a learner with little to no competency on any of the measurement items, and one that has high levels of competency on most of the items.

This competency model worked well as a trainee self-assessment tool and as a behavioral benchmarking tool (Yeung, Woocock & Sullivan, 1996). What is not known is the numerically acceptable level for competence. Is a step 4 or 5 acceptable or should participants be at a step 6 or 7? Obviously in HRD, trainers and managers must make judgments on acceptable levels of competence in order to transfer the newly acquired knowledge, skills, and abilities to the work environment. This model can be used to document minimally acceptable levels of competence, competency growth, or a combination of the two.
Competency-based behavioral models have been used to help adult learners understand their core competencies, and may subsequently increase satisfaction, motivation, learning, and ultimately success in training programs (Drawbaugh, 1972). This study included all three functions as indicated by Burchell and Westmoreland (1999): 1) self-assessment (both at the beginning and end of the training program), 2) development of a learner-centered training program based upon the self-assessment and reflective participation and management of learning, and 3) communication and reflection through the use of feedback given from the results of the self-assessment and evaluation rubric (authentication). The competency-based, behaviorally anchored instrument used in this research provides a credible, transferable, and dependable model for evaluating and authenticating trainee growth (Dooley & Lindner, 2001). Use of anchors to authenticate results overcomes limitations of self-administered rating scales that are typically used to measure perceptions of competencies. This model can serve as an additional tool for HRD managers to measure the quality of training and addresses public and political pressure to explain learning.

Human Resource Development Competencies for Effective Performance in a Knowledge-Based Economy: A Study of HRD Professionals in Singapore

A. Ahad M. Osman-Gani
Nanyang Business School
NTU, Singapore

This paper presents empirical findings of a study conducted to identify the key competencies required by modern HRD professionals to perform effectively in a knowledge-based economy. It also attempted to identify the appropriate training and development strategies used to develop those competencies. It was found that most respondents associated KBE with knowledge management, lifelong learning and intellectual assets. The identified key HRD competencies were contrasted with the findings of ASTD’s latest study.

Keywords: HRD Competencies, Knowledge-Based Economy, Singapore

The accelerated phase of transition from “industrial age” to the new “information/digital age” in a knowledge-based economy (KBE) demands new management and human resource development (HRD) competencies of managers in today’s competitive and dynamic business environment. KBE has received much attention recently, and many countries, like Singapore, USA, Canada, and Malaysia, are making relevant adjustments in their national policies on economic infrastructure and human resource development in order to cope with the new demands of the KBE.

Why is there so much hype about KBE? Is it like what Greenspan (1998) said, the economy is now different from the past? Knowledge Economy or New Economy/Digital Age has evolved due to the emphasis on the importance of knowledge in the changing business world. In this new millennium, the key to survival is through intellectual capital, and only those with knowledge and information will succeed. In the past, the main sources of wealth were from natural and physical resources. However, in business world today, wealth is determined by intangible assets - knowledge and information (Dunning, 2000). As new business models evolve everyday, having new knowledge and information is essential to remain competitive. Thus, under-skilled employees face difficulties in getting or retaining jobs, and even the highly qualified professionals face challenges now in updating themselves continuously. Therefore, to acquire and update knowledge is critical for survival in today’s KBE.

Some people advocate the significance of KBE by attributing it to technological innovations and breakthroughs as well as to the globalization of business. Singapore’s Economic Development Board (EDB) thought likewise, referring KBE to two broad trends - globalization of business, and revolution in technology. However, no consensus has yet been reached on the meaning and interpretation of KBE. KBE has been defined as one “that is directly based on the production, distribution and use of knowledge and information” (OECD, 1996). Browning and Spencer (2000) mentioned, KBE is a world in which people work with their intellectual assets. Different perspectives on KBE could now be found in the literature.

Knowledge Based Economy (KBE)

Although there has been much discussion on KBE in the popular media, there is still no consensus among scholars and practitioners regarding its definition and its key features. Dunning (2000) referred KBE “essentially to the increasing importance of knowledge as the source of wealth creation in society”. This contrasted to the times when richness was built on ownership of land and raw materials (Solveill & Brinkinshaw, 2000). KBE is also envisaged as one “based on the application of human know-how to everything... (where) more and more of the economy’s added value will be created by brain rather than brawn” (Ong et al., 1999). Alee (2000) defined KBE as one based on ideas, and infinite resource. Sunoo (1999) stated, “KBE increasingly requires workers who demonstrates basic literacy, occupational skills and winning personality traits”. Furthermore, the transition of an industrial economy to KBE was described as the process of “creative destruction” (Chua, 2000). In addition, O’Leary (2000) said that information and speed are the oxygen of New Economy. KBE was also defined as “the product of rapid progress in digital technologies, combined with accelerated economic globalization” (Liikanen, 2000). Sachdev (1998) characterized KBE as rapid technological change, the continuous restructuring of organizations towards higher value-added activities, and changing job requirements. Chase (1997) referred KBE as the new knowledge age “characterized by a global economy in which knowledge is becoming the key resource”.

Copyright © 2002 A. Ahad M. Osman-Gani
Most authors agreed that knowledge is the source of competitive advantage in KBE. Bawany (2000) mentioned, "KBE is one in which information and knowledge, rather than material resources, drive business activities while creating key sustainable competitive advantage". As there were different views on KBE, this study aimed to unravel the common views and interpretations of KBE.

**Competencies**

KBE requires knowledgeable workers. Therefore, to be successful in KBE, individuals need to acquire new combinations of skills and competencies (Abell, 2000). Moreover, to perform effectively, they must possess and use appropriately a wide variety of competencies (Dubois, 2000). Spencer et al. (1993) defined competency as an underlying characteristic of an individual, causally related to criterion-referenced effective and/or superior performance in a job. Competency is defined as "an underlying characteristic of a person" (Boyatzis, 1982). Individual competencies are the applied skills, knowledge, abilities and behaviors of the organization's workers that are critical to its success. There were many studies on individuals' competencies. One of the significant studies (Boyatzis, 1982) aimed to determine characteristics of managers related to effective performance in different management jobs of various organizations, and divided the competencies into different clusters. Boyatzis also did an analysis by sectors and management levels. Competencies in this study were also categorized into different clusters, where the data was analyzed according to different individual contributors like professionals, managers, etc. For instance, the key competency for technical professionals was achievement orientation, which focused on measuring performance. In addition, LOMA's *Competency Dictionary* found that willingness to learn, stress tolerance, initiative, adaptability, multitasking and motivating others were important (Anonymous, 2000). In another study by MOHR Development Inc. (Kaydo, 2000), eight competencies were identified with regard to top-performing sales managers.

Studies were also conducted on HRD professionals' competencies (McLagan, 1983; 1989; Rothwell et al., 1996), most of which was sponsored by the ASTD. A recent study used McLagan's (1989) findings as a basis for identifying new competencies in today's workplace (Rothwell et al., 1999). However, this approach was different from the previous studies as the authors attempted to identify the required competencies before grouping them into roles.

In Singapore, increased attention has been drawn recently to the relevant issues of KBE, when government undertook actions to prepare the people for the new age. Singapore's Senior Minister said, "unlike a worker in the repetitive machine-based age, tomorrow's worker must depend more on his own knowledge and skills" (STa, 2000). The Minister of Manpower also emphasized that, "in the new millennium, it is the intellectual capital which will determine the outcome of economic competition" (http://www.gov.sg/mom). To help prepare the workforce for KBE, Singapore Productivity & Standards Board (PSB) launched a nation-wide critical enabling skill training (CREST) program. CREST encompasses seven critical enabling skills targeted at all levels of the workforce - from managers to supervisors and workers. These critical enabling skills were also identified by the ASTD through intensive research. Many countries like Britain, Canada and Japan had endorsed these critical enablers. To assess their relevance for Singapore, these skills were field-tested and confirmed with over 300 organizations here (Sachdev, 1998). With the launch, future training programs are expected to concentrate on developing these skills. Some recent publications have highlighted overall T&D practices as well as HRD strategies in Singapore (Osman-Gani and Tan, 1998; Osman-Gani and Tan, 2000). But KBE issues were not specifically addressed in those articles.

Although much has been said about the KBE, No study has yet been found, especially in the field of HRD that identified critical competencies for effective performance in a KBE. Very little research has been done on how new competencies will affect HRD professionals' job performance. Furthermore, no study was found that has investigated this issue in Asian context. Therefore, a significant research gap exists in this field. This paper attempts to contribute to the literature by bridging this research gap. As KBE issues are increasingly surfacing among companies in Singapore, empirical information on this is in high demand from managers and HRD professionals. This paper presents some empirical findings of a study conducted to identify the key competencies required by modern managers and HRD professionals for effective performance in KBE. The study also attempted to identify the appropriate training and development strategies used to develop those competencies.

**Research Questions**

In order to address the above objectives, the following research questions are formulated:

1) What are the key features of a KBE?
2) What key competencies are required from HRD professionals for effective performance in a KBE?
3) Are there significant differences among the respondents’ views by their company size, business sectors, and types of ownership?
4) What types of training programs are appropriate for developing the HRD competencies in a KBE?
5) What training delivery methods should be used for developing the HRD competencies in a KBE?

Research Methodology

This study was conducted using an exploratory field design method. A two-pronged approach consisting of interviews and survey were used to gather primary data. It was conducted in collaboration with Singapore Training and Development association (STADA). As an institutional member of ASTD (American Society for Training & Development), STADA provides T&D services to its members, consisting mainly of HRD professionals working in diverse industrial sectors of Singapore. It is the only local HRD professional body, which offers professional development programs (e.g. Diploma in Strategic HRD). The study was targeted at Singapore-based companies’ HR managers and practitioners. The sample size consisted of 700 HRD professionals randomly selected from STADA’s membership database. The respondents were General/Administrative Managers, HR managers/professionals working in MNCs and local companies. Besides the primary data, secondary information was also gathered from published materials. Prior to the survey, intensive face-to-face interviews were conducted with eight HRD professionals from different industrial sectors in order to gather their first hand views on the relevant aspects of KBE, which were useful in drafting the questionnaire. Together with the findings from the literature review, the interview findings were incorporated into the survey instrument development. The questionnaire was divided into several parts: features of KBE, general management competencies (Boyatzis, 1982; and Page et al. 1994), HRD competencies (McLagan, 1989; Brock et al., 1996; Piskurich and Sanders, 1998; Rothwell et al., 1999), and T&D strategies (O’Connor et al., 1996; Noe, 2000). The other two parts consisted of: (a) company information, (b) demographic information of respondents. A five-point Likert-type interval scale was used to collect the response data. Pilot testing of the questionnaire was done during a regional HRD Conference where 60 copies of the draft questionnaires were distributed to the delegates. The feedback were then compiled and incorporated into the final questionnaire. A panel of experts comprising of STADA’s training professionals and the professors of NTU was used in order to test for the content and face validity of the questionnaire. A test-retest method was used to test for the reliability of the instrument. The questionnaires with cover letters and self-addressed envelopes were sent out via local mail to the sample STADA members. Some questionnaires were also sent through e-mails as attachment files. Due to the initial low response rate, two rounds of follow-up emails were sent out. In order to achieve a higher response rate, incentives such as a small gift bag was promised for prompt and complete responses. Subsequently, three rounds of additional follow-up calls were made by the STADA personnel. Personal administration of the questionnaires to selected HRD professionals were also made. The returned questionnaires were checked for completeness and consistency before data analysis. The collected data were compiled into a database using the Statistics Package for Social Science (SPSS). Descriptive and multivariate statistics were computed and frequency tables were generated for responding to the research questions.

Results and Discussions

Profiles of Respondents

A total of 100 completed responses were obtained, providing a response rate of 14.3%. The responses represented eight different business sectors, with the primary areas being, management consultancy (25%), manufacturing (23%), finance and business services (FBS) (12%), transport and communication (T&C) (12%). The companies were reclassified into MNCs and local companies, and most of the respondents (63%) were from the local companies. The respondents represented organizations of varying sizes: most companies (51%) had more than 200 employees. In terms of the demographic characteristics of the respondents, majority (55%) of the respondents was found to be less than 40 years of age, and about 53% of the respondents had at least 15 years of job experience. With regard to their HRD experience, majority (69%) had at least five years of experience. A large majority of respondents (83%) had at least a bachelor degree, and most respondents (70%) held positions of senior and middle management levels. The gender composition of the respondents was well balanced (48% female; 52% male).

Research question 1: What are the Key Features of a KBE?

The responding managers’ views on the interpretation and key features of KBE were identified. The descriptive statistics are presented in Table-1. The top five key features of KBE are found to be: (a) knowledge management, (b)
lifelong learning, (c) "KBE is a world in which people work with their intellectual assets", (d) "KBE involves the changing of people's mindsets" and (e) "KBE involves rapid change".

Knowledge management was rated very highly as a key feature of KBE, which is consistent with the findings of the literature review. Knowledge management is about encouraging people to share knowledge and ideas to create value-adding products and services (Chase, 1997). Therefore, it is critical that companies manage knowledge efficiently by sharing the new knowledge among its members in order to be successful in a KBE. In addition, "life-long learning" and "working with intellectual assets" were also highly rated by the respondents. People have to constantly upgrade themselves and learn to gain ‘updated’ knowledge so that they do not become 'obsolete' in today’s competitive business world. This view might have been further influenced by Singapore leaders' recent emphasis on life-long learning. The above findings have significant implications for today’s HRD professionals.

Research Question 2: What Key Competencies Are Required From a HRD Professional for Effective Performance in a KBE?

In order to identify the key competencies of a modern HRD professional in a KBE, descriptive analysis was conducted, and the results are presented in Table-2. The top five competencies for HRD professionals are found to be: (a) adaptability to changes (mean=4.66), (b) ability to see "big" picture (mean=4.64), (c) communication skills (mean=4.56), (d) visioning skills (mean=4.54) and (e) knowledge of own strengths and weakness (mean=4.48).

Among the top ten competencies identified through this study, five competencies were found to be similar with Rothwell et al. (1999) findings, although the top competency was not found in Rothwell’s list (see Table-3). Adaptability to changes was identified as the top HRD competency. It may be due to the impacts of rapid changes occurring among organizations in the KBE, which HRD professionals have to continuously deal with. In Singapore, workforce is getting increasingly diverse and more educated (STc, 2001). Corporate restructuring and downsizing is becoming a common phenomenon. Increased usage of IT and Internet in offices is also very evident today. All these could affect the training methods and its composition. These trends were not limited to Singapore only. ASTD had also identified some of these trends that would affect the nature and scope of HRD (Rothwell et al, 1999). Some of these competencies identified were from the interpersonal grouping. The importance of such competencies was

* Common competencies in current & Rothwell's findings
** Not listed in Rothwell et al., (1999)
# Simplified meaning of performance gap analysis
evident in Rothwell's (1999) study. It could be because HRD professionals are primarily service providers. They need to have constant interaction with the employees to assess, understand and evaluate the training needs of the organization. This involves the building of trust and rapport through communication and relationship building.

Another key HRD competency identified by the respondents was the ability to see “big picture”. To survive in today’s competitive global business environment, an organization has to break away from its conventional thinking boundaries and strategies. Thus HRD professionals would need to expand their horizon and focus beyond their own organization and should identify the trends that would help in making relevant decisions for developing employee skills. They would also need the ability to analyze the differences observed between the expected and actual performance of the employee. Hence, the analytical competency, performance gap analysis, arises. In this study, these have been rephrased into understanding of improvements in human performance.

The respondents also reported a need for leadership competency (i.e. leadership and visionary skills), which is in line with the findings of other studies. This is due to the expected changes from the traditional roles of HRD professionals. Recently, an idea has emerged that HRD professionals need to be organizational leaders so as to work with senior management as advisors/partners and get them to understand the advantages of HRD. To do so, they will need to be able to project trends and visualize possible and potential future performance scenario and its implications (McLagan, 1989). They must also be able to creatively think of the ways to influence the organization (Rothwell et al, 1999). Hence, creative thinking skills were needed, for example using innovative methods of training.

Another competency not listed in Rothwell's study was "knowledge of own strengths and weakness" (mean=4.48). As the saying goes, “know yourself, know your enemy”, the respondents felt that in order to be able to meet any challenges ahead, they would have to know themselves thoroughly. This was to ensure that their strengths could be put into good use and fully utilized to overcome the shortcomings in order to help the organization in gearing up for the challenges of KBE.

Research Question 3: Are there Significant Differences Among the Respondents' Views By Their Company Size, Business Sectors, and Types of Ownership?

Comparative analyses were conducted on the data using the ANOVA procedures to identify the significant differences existed among the responses of managers from various business sectors, sizes, and ownership structures. No significant differences were found among various business sectors. This could because the emergence of KBE affects the whole business community irrespective of the sectors they belong to. However, statistically significant difference was found in one feature: globalization, where local companies reported a higher mean than foreign companies. This may be because globalization has a greater impact on local companies than MNCs, due to the extent of their international experience. In terms of company size, significant differences were also found in two features: globalization and information technology. Large companies had higher means in both features. This could be because large companies are more likely to expand globally and invest more on information technology. Hence, the effects felt would be greater than small companies.

Comparative analyses were also conducted to identify the nature of statistical significance existing among the responses by the above mentioned categories. Significant differences were found among the respondents from various business sectors on the key HRD competencies. Each industry had its own distinct characteristics and training requirements would have to be adjusted accordingly to suit the industry. Thus HRD professionals would need to have different levels of each competency. For example, for T&D methods application, those in financial and business services (FBS) and commerce sectors reported the lowest means among the sectors. This could be because in these sectors, more emphasis on job-related knowledge was needed. For these two types of industries, law and regulations govern their operating framework, like Bank Regulation Act. Thus the employees were trained in these guidelines to ensure adherence to them. A major portion of the training would be more “fixed” in nature, leaving less room to apply different T&D methods. Hence, it also explained why the means for creative thinking skills, one of the key competencies, for these two industries were among the lowest.

Among the 11 competencies where significant differences were found, four were among the top competencies identified in this study. For adaptability to changes, ability to see “big picture” and understanding of improvement in human performance, consultancy sector reported the highest mean compared to other sectors. This may be because of their competitive nature of jobs, as they need to be flexible and be able to identify important trends, advise and assist their clients on T&D. Significant differences were also found among MNCs and local companies in two competencies. For understanding of industry, the local-owned companies' respondents reported a higher mean than those from foreign-owned companies. This difference could be due to the globalization effects brought about by KBE. Locally owned companies' respondents would have to understand the whole industry thoroughly, considering
the similar industries beyond Singapore’s geographical boundaries. Whereas for the foreign-owned companies, such understanding would have already been incorporated.

As for ethics modeling, locally owned companies also reported a higher mean. This could be because the foreign owned companies operated in different countries, and the standard of ethics varied. What was considered as ethical in one country may not be so in another. Whereas, for local-owned companies especially in Singapore, business ethics is very important and of less varying standards as they were confined only to Singapore. ANOVA results showed that no significant differences existed between small and big companies and among different job experience categories of respondents.

Significant differences were found among respondents’ views by their management levels in two competencies: questioning skills and performance observation skills. Senior managers reported higher importance for both competencies than those in other levels of management. This may be due to different levels of management’s work nature. Questioning skills were important to senior managers because they would have to question their subordinates frequently to know the mechanics of daily operations. The need for questioning skills decreases as the level of management decrease. Senior managers also reported a higher mean for performance observation skills than other management levels. Managers need this competency to observe their subordinates’ performance, assess and reward them accordingly. Senior managers have to appraise their subordinates’ performance regularly. The frequency and importance of appraising task seems to be much more among senior managers than that of middle managers. By HRD experience of managers, significant differences were obtained in one competency: technological awareness and understanding. Respondents with HRD experience of over 20 years reported a higher mean compared to the others. This could be because senior people felt the need for learning and updating their technological skills much more than the younger HRD professionals. (All tables with the ANOVA results will be provided later)

Research Question 4: What Types of Training Programs are Appropriate for Developing the HRD Competencies in a KBE?

The results indicated the importance/appropriateness of the following five training programs: (a) communication skill courses (mean=4.35), (b) lateral thinking courses (mean=4.34), (c) attitude training (mean=4.33), (d) team building courses (mean=4.33) and (e) problem solving courses (mean=4.33), and management skills training (mean=4.33).

* (1= Least appropriate, .... 5= Most appropriate)

From the above findings it may be concluded that HRD professionals highly emphasize training on communication skills, creative thinking skills, problemsolving skills and management skills. Among these, communication skills and creative thinking skills were identified as key competencies that are considered to be crucial for effective performance in a KBE.

Research Question 5: What Training Delivery Methods Should be Used for Developing the HRD Competencies in a KBE?

The five most effective training delivery methods identified were: (a) OJT (mean=4.38), (b) games and simulation (mean=4.12), (c) adventure/outdoor learning (mean=3.96), (d) role play/interaction (mean=3.91) and (c) discussion and report (mean=3.85).

*(1= Least effective, ..... 5= Most effective)

The finding that OJT was considered the most effective training delivery method was not surprising as most Singapore organizations conduct their training on-the-job due to the strong encouragement from the government (Jacobs & Osman-Gani, 1999). In this context, the great success of Singapore’s OJT21 program should be mentioned. Moreover, it was less costly and less time consuming. Games and simulation, adventure/outdoor learning and role play/interaction were rated highly as they were found to be very effective in developing creativity, managerial skills, communication skills and teamwork. These were found to be essential features of HRD competencies in a KBE.

Conclusions and Recommendations

As far as we know, this is the first study in Singapore that sought to identify competencies required by managers and HRD professionals for effective performance in a KBE. In other countries of America (McLagan 1989; Rothwell 1999, etc.), and Europe (Van Ginkel et al. 1994; Nijhof et al. 1997 etc.), studies have been done to identify relevant competency models.

This study identified some key features of KBE, which includes knowledge management, life-long learning, usage of intellectual asset, managing rapid changes, etc. Dealing with all these issues requires a paradigm shift from the conventional way of thinking. It is not surprising to find that adaptability to changes was ranked as the top factor in both sets of competencies (general management and HRD) in a rapidly changing economy (KBE).

Some competencies like relationship building identified in the past by McLagan (1989) are still regarded as highly important by the respondents. Therefore, regardless of the changes taking place in the new economy, some generic/core competencies are still necessary for HRD professionals. On the other hand it was also observed that some competencies that were once not regarded as core competencies, are considered to be increasingly becoming significant now such as, visioning skills and self-knowledge acquisition. Furthermore, communication skills is also of foremost importance in the competency ranking. As HRD professionals’ work involves people management and skills development, being able to liaise, coordinate and communicate effectively with people will make them more successful in their job. That is why communication skills courses were considered to be the most appropriate training program by the respondents. In addition, courses focusing on team-building skills and creative thinking are highly regarded as important, and such skills are crucial for survival and growth to in today’s competitive world.

In the next era, knowledge will be a source of competitive advantage for all organizations. HRD professionals will have to face the challenge of linking competencies and resources to create such advantage (Hodgetts et al., 1999). Further integration of HRD with information technology will also be expected and will gradually transform into eHR. As a result, HRD professionals will need to balance between business strategy, HR mastery and technology (Ulrich, 2000)

As an exploratory study, findings of this research will help HRD scholars and professionals to better understand and reflect on the need for new competencies in a new KBE. The empirical information of this study could be useful in planning for future studies in this area. Also, the information would be useful to the practitioners in making appropriate decisions in the areas of training and employee development, recruitment and selection and in other relevant areas of professional practice. More works need to be done to uncover the underlying dimensions of the findings, such as the underlying causes for differences in perception among various industries, company size, ownership etc, which were not explored in details in this study. Future research may include more management and HRD variables, (such as career development, organization development, etc), to provide more comprehensive coverage of HRD competency study.
This study may be replicated in other countries of the region in order to identify the nature of similarities or differences with these findings, which would contribute to the development of an Asian model that might be different than the HRD competency models developed in Europe and America.

Mastering the HRD Matrix: Generating ROI by Linking to Business Strategy

Erica D. Kalata
Mary Ellen Satterfield
Phyllis Klees
Deloitte & Touche, LLP

This innovative session will provide a vehicle for facilitating dialogue and practical application of effective tools for linking HR Strategies with Business/Organizational Strategies. The primary goal is to provide an increased understanding of and skill using practical, researched-based approaches and techniques to build organizationally aligned training and HR Strategies resulting in increased return on investment.

Keywords: Strategy, Return-on-Investment, Human Capital Theory

This paper is structured to provide a theoretical framework, followed by objectives for the session, and a session structure. The paper concludes with sections on the outputs of the session and contributions to HRD.

"As a primary means of sustaining an organization's competitive advantage, HRD serves a strategic role by assuring the competence of employees to meet the organization's present performance demands" (Torraco and Swanson, 1997, p. 11).

Theoretical Framework

This session has a foundational base in micro-economic theory, specifically human capital theory. Human capital theory suggests that people possess the knowledge, skills, and abilities that provide economic value to firms (Weinberger, 1998; Youndt, Snell, Dean, and Lepak, 1996). An investment in human capital is a source of sustainable competitive advantage for firms (Thurow, 1997), particularly if that investment ensures that the pool of human capital is a resource, both difficult to replicate and difficult to substitute (Huselid, Jackson, & Schuler).

Deloitte & Touche made a significant investment in the development of their Technology and Communications (Tech.Comm) human capital to ensure that these resources have the unique knowledge and skills to support strategic initiatives and increase overall economic value. Because of this investment and the process used to develop these resources, the organization has seen many returns such as:

- increased revenue
- decreased turnover
- increased employee networking and morale
- increased recognition in the marketplace
- increased employee commitment in an arena (the Technology and Communications business sector)

where this commitment is not the norm

Increased revenue growth is a strategic initiative for the firm and participants that responded to the ROI evaluation reported approximately $8.5 million in increased revenue that they felt could be directly linked to the Tech.Comm training event. Participant respondents also reported a $1.7 million increase in revenue from cross-functional services sold, which is one of the top strategic priorities of the organization. In the present economy, talent retention, employee commitment, and employee development are of utmost importance to organizations, and the Tech.Comm training and related cultural events resulted in comments such as:

- "Overall the course was demanding, BUT well worth it. One of the best conferences I have attended - the theme was excellent."
- "Outstanding! The best course I have attended from the firm in my 25 years with D&T."
- "Nothing less than brilliant; shows how all the pieces in the puzzle fit together."
- "Great conference. Congratulations! Finally a training conference that is extremely relevant to providing great client service!"

Purpose

It is evident from the literature that few organizations have successfully learned how to effectively link their training and HR Strategies to organizational strategy in a way that produces measurable increases in human capital and return on investment. In the war for talent, CEOs and top leadership's primary concerns are not in the traditional administrative areas related to personnel. They want to know how to attract, retain, and most importantly develop human capital that will provide high gain at the individual, team, and organizational level. The onus is upon us, HRD researchers and practitioners, to begin building effective approaches to increase human capital that supports organizational strategy. HRD must understand several implications in this area:

- HRD researchers should increase their understanding of human capital theory and strategic HR contingency theory and begin performing more focused and effective research directly in the area of HR development practices across industry, size, and strategy type. They need to communicate their research findings in multiple forms and through multiple mediums for practical application.
- HRD practitioners need to provide critical input and feedback to researchers on best practices and constraints in the field. Practitioners must take the time to interact with researchers, such as in this innovative session, to uncover the realities of putting research into practice and work together to create innovative solutions for the future.
- HRD researchers and practitioners alike must partner with and learn from other disciplines such as socioeconomics, organizational behavior, and industrial psychology to gain insight and integrate knowledge.
- HRD researchers and practitioners must continue to find better ways to partner around knowledge sharing and visioning for the future of HRD. Together, we must continue to develop sound methodologies and techniques that increase human potential and organizational effectiveness.

Objectives for Generating ROI by Linking HR Strategies to Business Strategy Innovation Session

This innovative session is designed with the overarching objective of:

- Facilitating a dialogue between HRD researchers and practitioners on innovative methods to effectively link HR strategies to business strategy for measurable results.
- Providing hands-on practice with several tools proven effective from defining organizational strategy and cultural attributes, to defining competencies necessary to support that strategy and culture, to building employee selection tools, lesson plans, and evaluation tools to measure return on investment.

Within those overarching objectives, the session will provide a forum where participants:

- Identify the visioned strategy and culture of their own organization.
- Determine a sampling of the needed competencies to support that visioned strategy and culture.
- Work in teams to identify appropriate behavioral-based questions to use in selecting for these competencies.
- Utilize tools for needs analysis and training development linked to the competencies.
- Explore strategic communication messages and media aligned with organization and training objectives.
- Outline effective production and performance support options.
- Develop an evaluation plan to measure the return on investment.
- Discuss effective project management and knowledge transfer approaches and tools.

Session Organizers and Facilitators

The session will be led by a team of Deloitte & Touche Human Capital Advisory Services practitioners who will compile the necessary material for the session and serve as facilitators. These facilitators have worked closely together to implement a variety of projects aimed at the alignment of HR strategies with organizational strategy for increased return on investment.
Session Content and Structure

The session is designed in six parts:

(A) Introduction
(B) Strategy and Culture Development
(C) Competency Development
(D) Selection, Training, and Communications
(E) Evaluation for ROI
(F) Project Management & Knowledge Transfer

The objectives and design of each of these sections follows:

Part A: Introduction

Facilitators: Erica Kalata, Mary Ellen Satterfield, Phyllis Klees

Objectives:
- To welcome the participants with elements of the theme (e.g., outfits, online invitation, beginning video, music, etc.) which was critical to the success of the culture transformation and training
- To provide an overview of the session, and to introduce the facilitators
- To describe the theoretical framework
- To illustrate the importance of strategic alignment research, practice, and education
- To identify teams of similar sectors (e.g., academia, private, public, consulting, etc.) for increased knowledge sharing and transfer; assign team names from the characters in the Matrix movie (e.g., Trinity, Switch, Cypher, Tank, Neo, Morpheus, etc.) to demonstrate interactivity early in the session

Length: 10 minutes.
Mechanism: Presentation and demonstration.

Part B: Strategy and Culture Development

Facilitators: Erica Kalata, Mary Ellen Satterfield, Phyllis Klees

Objectives:
- To discuss one model used to link training, along with other HR strategies, with business strategy to produce high ROI
- To have participants utilize a research-based tool (i.e., Lominger Cultributes™) to identify the desired culture for their own organization
- To conduct an exercise to help participants identify an important training need in their organization that would have strategic impact
- To lead participants in completing templates to creatively address the training need they have identified in a way that will link to business strategy and increase their chances for high ROI
- To discuss methods used in other organizations

Length: 30 minutes.
Mechanism: Large group hands-on practice.
Part C: Competency Development

Facilitators: Erica Kalata, Mary Ellen Satterfield, Phyllis Klees
Objectives:
- To demonstrate the importance of early competency identification and development that is aligned with business strategy
- To demonstrate a method for translating cultural attributes into needed competencies
- To lead participants in an activity using a research-based tool (i.e., Lominger Career Architect™) designed to help them prioritize the competencies
- To discuss various applications of this method in others in organizations and discuss research focused on strategic competency development

Length: 15 minutes.
Mechanism: Large group hands-on practice and discussion.

Part D: Selection, Training, and Communications

Facilitators: Erica Kalata, Mary Ellen Satterfield, Phyllis Klees
Objectives:
- To demonstrate the method used for Tech.Comm to create behavioral-based selection tools, training, and communications linked to the business strategy and culture
- To illustrate the web-page used to support Tech.Comm
- To review selection, training, and communications templates for use in their own organizations
- To review effective production and performance support options
- To lead participants in the beginning identification of selection questions, training components, and communications that will support the development of competencies linked to strategy
- To elicit ideas for multi-disciplinary research in this area

Length: 15 minutes.
Mechanism: Small group hands-on practice; Large group discussion.
Part E: Evaluation for ROI

**Facilitators:** Erica Kalata, Mary Ellen Satterfield, Phyllis Klees

**Objectives:**
- To review evaluation theory and the importance of moving beyond level 1, 2, and 3
- To illustrate the evaluation method and ROI results achieved from the Tech.Comm training
- To lead participants in an activity to help them design their own evaluation plan to measure ROI linked to their business strategy
- To discuss research-to-practice collaboration needs in training ROI and evaluation

**Length:** 10 minutes.

**Mechanism:** Small group hands-on practice; Large group discussion.

Part F: Project Management and Knowledge Transfer

**Facilitators:** Erica Kalata, Mary Ellen Satterfield, Phyllis Klees

**Objectives:**
- To present the project management approach used for the Tech.Comm training development
- To illustrate one effective “toolkit” designed for comprehensive knowledge transfer
- To emphasize the need for strong project management and the integration of multiple, disparate contributors
- To discuss the communication methods, timeline management, program management approach, and real ownership of component parts by individual team leads
- To summarize learning points gained throughout the innovative session

**Length:** 10 minutes.

**Mechanism:** Presentation and summaries of discussions by spokesperson of each small group.

**Key Outputs**

The planned outputs of this innovative session will be:

1. Understanding of the role that culture creation has in creating employee loyalty and overall learning linked to business strategy
2. Outline of positive outcomes, including ROI, that result from strategic alignment
3. Visioned strategy and culture for participants’ own organization
4. Sampling of the needed competencies to support that visioned strategy and culture
5. Sampling of behavioral-based questions to use in selecting for these competencies
6. Familiarity with tools for needs analysis and training development linked to the competencies
7. Template to use for strategic communication messages and media aligned with organization and training objectives
8. Outline of effective production and performance support options
9. Draft evaluation plan to measure the return on investment
10. Outline of effective project management and knowledge transfer approaches and tools
11. Practical ideas for future, innovative research to be summarized and communicated to the AHRD membership

**Is this New and Innovative?**

This session is innovative in several ways. It focuses on starting from the business imperative to determine training needs. It shows how tools can be used to determine what knowledge is required to make human capital a competitive advantage. It also promotes the concept that a cultural event contributes to learning and internalization of knowledge, and it shows how a concerted plan can be put into place to measure ROI. Most importantly, it brings academics and practitioners together in one place for scholarly dialogue on not only practical methods, but also critical research needs as HRD is increasingly expected to demonstrate their strategic value in organizations.
Contribution to HRD Knowledge

Empirical research has shown some support for a contingency perspective of strategic HR practices suggesting that the linear implications of a universal, or "best practices," perspective are too simplistic (Kalata and Wentling, 1999). Research indicates that effective HR practices are actually contingent upon the business strategy of the firm rather than common to all. However, the research offers little insight on methods of how to effectively link HRD and business strategy for increased return on investment. This session will help practitioners and researchers understand an approach to tap into leadership, link training and business strategy, and transfer the knowledge to their own organizations for increased return on investment. It will also help uncover important research needs critical to advancing the HRD profession as a strategic partner in organizations.

The Impact of Awareness and Action On the Implementation of a Women's Network

Laura L. Bierema
University of Georgia

This case study investigated the process and results of a corporate women's network charged with improving women's standing in the organization. The network ultimately failed. This research explores women's concerns and level of gender awareness as related to the women's network initiative.

Keywords: Women's Networks, Gender Consciousness, Human Resource Development

Exploring knowledge creation about gender in the workplace is important since women make up approximately 50 percent of the workforce and are slowly moving into positions of power. There are many pleas for research on women in work context, but few published studies. Caffarella & Olson (1993) call for more data-based studies to develop the ideas, concepts, models, and theories about women's development. They ask: "How would raising the consciousness of women about the 'glass ceiling' for women in organizations affect their life dreams and what they believe they can achieve?" (p.145). This is an important question since women have been found to exhibit low levels of gender awareness when reflecting on their career experiences in previous studies (Bierema, 1996, 1999, 2001; Caffarella, Clark and Ingram, 1997). The story of this research project illustrates the problems not only for women in corporations, but in studying women's experiences in these contexts.

The purpose of this research was to examine how gender consciousness emerges through the formation of in-company networks to promote women's status. I have privileged access to a group of executive women in a Fortune 500 consumer products company. This group created a Women's Network (Network) with the support of the CEO that was dedicated to advancing women in the organization. I have worked as an external consultant with this group since 1998 when the Network was formed. Since that time the organization has weathered unprecedented change and uncertainty. One year into the project the long term CEO retired, a new CEO was appointed, the headquarters was moved across the country, many people were laid off as a result of the move, and the company experienced poor stock performance. The organization has been through a downsizing and the Network fizzled out.

The theoretical frames underlying this study fall into three areas: Women's career development, learning, and feminist research. Career development literature sheds some light on how adults progress through their careers, but it has been criticized for basing models on men's careers, and being insensitive to the multiple roles and responsibilities of women across the life span. The second area is a learning frame, which serves to evaluate and understand how women learn about gender in the work context with particular focus on the role of reflection, reflective practice and action, and transformative learning. Finally, this research was approached from a feminist perspective in that the goal was to create knowledge for women that might begin eroding the patriarchal nature of most organizations.

Methodology

The participants were members of the Women's Network that was made up of approximately ten of the top executive women in the organization. The number fluctuated as membership changed over the course of the study. The Network began meeting in 1998 when a focus group was held to initiate the Network. And evaluate recruitment and retention issues specific to women in the company. This group named itself the "Women's Network" and established its mission to: "Provide a focus for ongoing leadership, advocacy, and support for the development of women and minorities and to ensure workplace equality remains a vital part of the [company] corporate strategic plan" (Women's Network notes 6-17-98). The Network met again in January 1999 and refined its mission to focus on the recruitment, development, and retention of women. The last meeting of the group was in 2000.

Data were initially gathered via the focus group. After the group had been operational for over one year interviews were held. Interviews were tape recorded and transcribed verbatim when permitted by the participants. The interview was separated into two parts: 1) reflections on the network, and 2) reflections on their career experiences and learning. The topic of the Women's Network caused a great deal of trepidation and reluctance to speak about it on tape. One of the executives did not want to be tape recorded whatsoever on either topic. Two of them spoke about the network without being recorded, but allowed recording to proceed when discussing their own experience.
careers. Participant observation was also used as a data collection method at all meetings of the Women's Network. Data were analyzed according to the constant comparative method. This study is limited by its purposeful sample of the Women's Network. The findings are not necessarily generalizable to all women or women's groups. Additionally, I bring my experiences as a woman in corporate context, as well as my positionality as a white, middle class, heterosexual researcher to the research.

Findings

The findings have been organized according to the Concerns Based Adoption Model (Hall and Hord, 1984) and a Gender Consciousness Continuum (Brody, Fuller, Gosetti, Moscato, Nagel, Pace, and Schmuck, 2000). The findings will be presented in the frameworks of these two models and then discussed according to a model of awareness and action derived from the data analysis.

Stages of Concern

The Stages of Concern model was proposed by Hall and Hord (1984) as a tool for assessing the personal side of change. The model was developed using a concerns based approach and conceptual framework known as the Concerns-Based Adoption Model (CBAM). The model assumes that effective change implementation requires that individuals successfully address their concerns. The change or innovation in question in this study was participation in the Women's Network. The CBAM model was selected since it provided a consistent progression on which to evaluate the adoption of the network, and it speaks directly to how individuals experience innovation and change. The model clusters six concerns into three hierarchical levels of adopting change including: unrelated (awareness), task (information, personal, management), and impact (consequences, refocusing).

0. Awareness. All of the network members were obviously aware of the Women's Network. There was little awareness however, about the network among other members of the corporation, which caused significant anxiety among the members.

1. Informational. This stage of concern assumes a general awareness of the innovation and interest in learning more detail, without much concern about how the innovation will impact the individual. Initially, participants felt that increasing awareness about women's experience in the organization was important and the "right thing to do," and that it renewed the spirit of the women in the corporation. Although the Network's existence increased awareness in the organization, many observed that "awareness was clearly not enough." Another participant explained, "I've noticed-I don't know if its just the political atmosphere here, or maybe its a feeling that it's the right thing to do, and especially as a woman I'm not going to say, 'I'm opposed to helping women in my company.'" She continues, "I like to see women advance; I'd also like to see qualified men be advanced."

2. Personal. Personal concerns arise when the individual becomes uncertain about the demands of the innovation, her inadequacy to meet those demands, and her role with the innovation. Personal concerns were the most significant ones participants raised about the Women's Network. Concerns fell into three general categories including corporate structure and culture, network agenda, and differing perceived needs.

Corporate Structure and Culture. The corporate structure was highly decentralized and the organization was experiencing significant changes. The network was in an infancy stage when the drastic corporate changes began and it was difficult to recover from the distractions. There was also a high degree of suspicion of the Network in this male-dominated corporation. One participant complained, "When you hear by way of the grapevine, that there are suspicions held by certain men at the operating companies as to 'well what are these women doing?' Or, where you have some of the women on the network who have so assimilated a male way of working that they do not necessarily see the value in a women's organization. So I think given those different sorts of perspectives it was difficult to establish an agenda for change that one could have a commitment to."

Every participant in this study cited the culture as a key barrier to the Network having impact. The nature of the business is male-dominated with product lines in liquor, plumbing and recreational sport goods. One participant explained the delicacy of supporting a Network in this context, "Women, whatever their level are feeling like you know, I don't know if I exactly if I want to stand up and be counted on women's issues when my organization is primarily run by and features men or products most likely used by men."

Network Agenda. The Network claimed it lacked clarity on the purpose and mission of the group, which was intensified by a belief that management support was wanting. Although the group felt this way, the group received moral and financial support from the CEO who retired and general support from the new CEO. One participant noted, "What role does it play and how does it move things forward has never been answered. I don't really know where the support is or what it's perceived to be doing anymore." Another lamented, "It failed to have an agenda or
change that was meaningful.” One participant suggested that, “The group itself could not define its function, its role, and I don’t think we could get any consensus on that [because] everybody is struggling at different levels with different needs and different agendas and without kind of a guiding principle.” Some sensed that the group was “going through the motions” and “kind of petered-out.”

Differing Perceived Needs. The group could not agree on an agenda and was also stifled by some women who did not see the need for such a Network. This problem was illustrated by one participant, “I think that was part of the issues with the women’s network is that when you have some women sitting in there who are saying, ‘oh we don’t have a problem at all around gender issues or any diversity issues at all, and they don’t have any women in a position higher than a manager, then you know, there’s something wrong there.” At times the Network meetings resembled strategic planning sessions rather than opportunities for women to network and support each other. Some members shared their frustrations during interviews that the group did not provide a reflective space for its members and also expressed dismay at the women who felt they had no need for the assistance of a Women’s Network. During the interviews Network members opened up and engaged in a more critical analysis of the Network’s focus. One explained, “I don’t think we addressed enough of how the Network could have been a self-help group for its members.” Another participant shared, “It scares me when I sit in a room of women and I listen to women tell me that, ‘you know, I never really needed this stuff.’” Another noted that it was difficult to sit in a meeting, “when you look at the executive that sits there and says, ‘oh we have no problems at all.’” In many ways there was an unspoken assumption that nothing would happen as a result of the network.

3. Management. Management concerns tend to focus on the processes and tasks of using the innovation and the best use of information and resources. Similar to personal concerns, management was a significant area of unease for the Women’s Network. The concerns fell under leadership, purpose, and unimpressive results.

Leadership. There was a strong conviction that leadership was lacking both from upper management and within the group. It was noted that the initiative needed a corporate sponsor so its reception would move beyond “grudging compliance.” Leadership was also a concern within the network. Quotes like, “I don’t think most of the women that were involved in the group aren’t going to be prone to being lead anyhow,” or “I think leadership with the group would be the only barrier except when people are willing to do something” were common during the interviews.

Purpose. The lack of vision and mission could also be considered a management concern, since creating one is an administrative task. One participant describes her frustration: “Well, I’ll be honest, I really don’t understand its point. I don’t know what the mission is of it anymore...I don’t feel as if we have a direction that we’re going in. I don’t feel as if there’s leadership to it.”

Unimpressive Results. Finally, there was a sense that the efforts were perfunctory in that the potential of the group had not been tapped. The leader of the Network observed, “My perception on it is that it’s a good first effort yet I’m disappointed because it hasn’t evolved into much of anything.” Generally the group felt it had taken a step in the right direction but failed to have any impact.

4. Consequence. Concerns in this category focus on the impact of the innovation on the women’s immediate sphere of influence. Three concerns that emerged include those related to identity, voice and energy.

Identity. Since the inception of the women’s network there have been grave concerns about how the group’s existence would be perceived by the men in the organization. The women were extremely reluctant to identify with the Network. One member observes, “I know jokingly that people in the company say if we have a women’s network we should have a men’s network then too. Well, go ahead. Knock yourselves out.” Identity issues also surfaced for Network members who feared being perceived as “needing help” or “bashing men.” One participant noted, “I don’t need any help, but appreciate the networking.” Another mused, “I think even the women in the group sort of share that perception and no one wants to be thought of as someone who needs extra help. And, I don’t think any of the women in that group need extra help.” Another observed, “I just think there’s an undercurrent of feeling that you don’t want to be thought of getting advancement or getting something special by virtue of either your gender or your race.” The women did not want to stand out based on their participation: “I don’t want to be the only one beating the drum, even though I do think all those things are important.” One participant explained, “There’s this perception that you’re trying to advance people by virtue of their gender and that’s wrong because, what about men?”

Voice. The women also described concern about voicing their disagreement with policies and issues related to women. One executive reflected on being silent because the cost of speaking up was too high. Another shared, “Sometimes I’ve had to accept less than what I thought may have been right and I don’t mean that in terms of money necessarily, although that may be part of it.” She further observes that it is a necessity at times to be political which she finds difficult since she tends to be direct. To counter her style she explains, “Sometimes you just have to
I don’t like any of those things, and I will fight them till the death, probably until my death.” She have a lot of passion about a lot of different issues...All the ism... racism, sexism, genderism, you know I don’t like women. The consequences were viewed as too negative.

There was great reluctance to raise voices either individually or collectively to advocate on behalf of agree with. It’s kind of scary.” She was worried about being viewed as “too strong for a woman.”

bite your tongue and not say anything I guess. Look the other way when certain things are being done that you don’t agree with. It’s kind of scary.” She was worried about being viewed as “too strong for a woman.”

There was great reluctance to raise voices either individually or collectively to advocate on behalf of agree with. It’s kind of scary.” She was worried about being viewed as “too strong for a woman.”

Energy. The women also described a lack of energy as responsible for the lackluster performance of the women’s network. After fighting other battles they simply did not have the energy to push one more issue. “I still have a lot of passion about a lot of different issues...All the ism... racism, sexism, genderism, you know I don’t like bullism, I don’t like any of those things, and I will fight them till the death, probably until my death.” She continues to say her passion hasn’t changed, “but I guess what has changed is maybe my energy level.” The women cited not only the culture but also themselves as to blame for not moving the work of the Women’s Network forward. One executive noted, “The people themselves, the women themselves, don’t feel like they have time, don’t feel like they have the background, don’t feel like. . . pick something, therefore they couldn’t possibly stand up and be counted on this.”

5. Collaboration. This concern is preoccupied with aspects of coordination and cooperation with others regarding use of the innovation. The concerns at this level were very few, since the innovation of the women’s network was not embraced to the level where it had impact beyond concerns about the individual career consequences. The participants who looked ahead to collaborating to make the Network more successful also exhibited a high level of gender awareness and willingness to take action on behalf of the network.

6. Refocusing. This concern stage explores potential universal benefits from the innovation, including the possibility of major changes or replacement with a more powerful alternative. Since the innovation had little impact in the organization, and ultimately failed, the instances of refocusing were few, but expressed by two of the participants.

Gender Consciousness Continuum

The second framework for understanding the data was to transpose it on a modification of Brody, Fuller, Gosetti, Moscato, Nagel, Pace, and Schmuck’s (2000) continuum of gender consciousness and privilege. This study sought to understand how executive women develop gender awareness while experiencing the creation and maintenance of a women’s network. As Brody et al. (2000) observe, “Society has a collective gender consciousness [or unconsciousness] and unidentified and unspoken assumptions about male privilege” (p. 1). Their study examined how collective consciousness permeates the experiences of both educators and students in both single sex and coed institutions.

Based on the work by Brody et al (2000), I devised a continuum of gender consciousness in organizations. “Gender consciousness refers to a person’s readiness to recognize how sex differences and privilege are deeply embedded in the assumptions, expectations, practices, and manifestations of the society. Such a recognition is necessary to authentically teach students to openly examine and respond to issues of unearned privilege in order to achieve equity” (Brody et al, 2000, p. 26). A modified continuum appears in Table 1.

Position 0: Gender “Unconscious” Thoughts and Behavior. This position includes unquestioning acceptance of social assumptions and stereotypes for females and males on the basis of sex. Organizations operating at this point on the continuum intentionally or unintentionally implement different standards, policies, and behavioral consequences for females and males. Position Zero sentiments were captured in the quotes like this woman indicating she did not need extra help: “From my chair looking forward it’s not as though I need the corporation to really help me much, assuming that my bosses all stay the same.” Another was asked how she felt being a women affected her career. She replied, “I really don’t think it has at all. I never have.” Yet, she also indicated that, “I’m very used to being the only woman in the room. Definitely doesn’t hurt me. And I don’t really think it’s helped me either.” The participants generally blanched at the idea of identifying with feminists and when asked exclaimed, “Oh boy, I don’t think so [consider myself a feminist], because I don’t think I’ve been very vocal in supporting women, or women’s rights. I probably haven’t had to.” Position Zero is characterized by strong identification with the dominant patriarchal organizational culture and a lack of recognition or awareness of its power and influence. Gender unconsciousness tends to be characterized by deference to the patriarchal culture. One member had a boss who told her she had to use her married name, and he didn’t like her wearing pants. When I asked what she did in that situation she replied, “I used my married name and I stopped wearing pants.”

Position 1: Sex Equity. Individuals and organizations at this position recognize that females and males are treated differently because of their sex, and they may make some corrective actions based on this recognition and advocate equitable treatment for women and men. Equal treatment is advocated, but it is not evaluated to determine whether equal treatment leads to equal outcomes. Identity is still tied to fitting in and not upsetting the men.
Position one thoughts and behaviors also include a reluctance to participate in activities that benefit women more than men. One participant noted that although the Network seemed the "right thing to do," she would "like to see women advance; I'd also like to see qualified men be advanced." The women also uncritically modified their behavior and tolerated inequitable treatment as noted by this woman, "As I've worked with higher levels of management I've had to watch my style. I've always tended to be kind of enthusiastic...animated...I've had to learn to tone that down so I'm not seen as flightly, because I'm a woman." She further explained, "I'm not sure I'm really happy about that kind of thing, but that seems to be what's needed. You do it."

<tr>
<th>Position 0: Gender “Unconscious” Thoughts and Behavior</th>
<th>Position 1: Sex Equity</th>
<th>Position 2: Gender Consciousness</th>
<th>Position 3: Critical Transformation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Individuals operating at this point on the continuum unquestioningly accept social assumptions and stereotypes for females and males on the basis of sex. Disparate treatment is accepted as the status quo. Such individuals believe treating people the same is treating them equitably. Men and women might be viewed as “genderless.” Career success or failure is viewed as entirely up to the competence and tenacity of the individual. Women accept that they must work harder than men to get ahead. Women will also deny that being female has any affect whatsoever on their career experience. Often women attribute their career success to luck.</td>
<td>Individuals recognize females and males are treated differently because of their sex. Individuals may make some corrective actions based on this recognition and advocate equitable treatment for women and men. They do not question, however, whether equal treatment leads to equal outcomes. Women do not consider themselves feminists under any circumstances (although they may exhibit feminist values and behaviors).</td>
<td>Individuals recognize same treatment is not always equitable and become aware of gendered power relationships. Individuals recognize that the cultural meanings of being female or male are deeply embedded in everyone's thinking and behavior. Organizations question the assumptions guiding hiring and development. Critical assessment of how policies and procedures privilege certain groups is examined.</td>
<td>Individuals recognize the unspoken assumptions of social privilege, which is determined by valued position in the society. They see that one's sex, social class, and race enable some individuals to have privilege and access to societal rewards, while other do not have the same privilege or access to rewards. Organizations help members question unearned privilege and social dominance in the community and society; the policies move toward understanding multiple perspectives on reality and encourage students to question critically interpretations of world events. Organizations at Position 3 routinely use a critical-theory perspective as an integral part of the curriculum.</td>
</tr>
<tr>
<td>Organizations operating at this point on the continuum intentionally or unintentionally implement different standards, policies, and behavioral consequences for females and males. Examples might include different pay scales, promotional opportunities and gendered treatment (harassment).</td>
<td>Organizations change standards and policies that differentiate on account of sex and provide deliberate compensatory opportunities to redress past inequities on account of sex.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

There is also a significant reluctance to identify oneself as a feminist at the Sex Equity position on the continuum although the women (in contrast to the gender unconscious) espouse feminist values even if they dislike the word. A participant notes, "I don't think by today's standards I would consider myself a feminist....I think that the world feminist today brings with it some sort of radical element." She further explains that she believes that women should have the right to choose the career they want and be free from discrimination. She finishes with the remark that if her beliefs, "make me a feminist, I am, but I don't think I would use that word to describe myself." Another offers, "I'm a very strong supporter of women. And women's advancement and, I don't know really, what is a feminist?? I really don't, I mean, a radical, no. A strong supporter of women, yes, absolutely." Another explained that although she cared deeply about things affecting women, many of the things she cared about affected both genders and thus "I do not consider myself an avid feminist, I consider myself as a humanist." Only one of the participants identified herself as a feminist. Identity issues were primarily related to how the women would be perceived by others (particularly male colleagues) in the corporation. Women were uncomfortable with being identified with the committee or being regarded as feminists.

Position 2: Gender Consciousness. This position is characterized by an awareness that the same treatment of women and men is not always equitable. There is also an awareness of gendered power relationships and that the cultural meanings of being female or male are deeply embedded in everyone's thinking and behavior. This position is also typified by questioning assumptions about the treatment of women and men. One participant explains, Well to be perfectly frank, which I am, [gender discrimination] is certainly an issue here. Women are not viewed in the same way and so how you approach a problem, how you approach responding to an issue.
You're very conscious of – I'm very conscious of. But it would be different if it was a guy. It's awkward.

It's real.

The women noted, however, that being “other” also can have it's advantages: “Being the first woman actually, I think, gave me some opportunities that other people didn't have.”

**Position 3: Critical transformation.** This stage involves individuals recognizing the unspoken assumptions of social privilege, which are determined by valued positions in the society (such as whiteness and maleness). This position on the continuum involves viewing that one's sex, social class, and race enables some individuals to have privilege and access to societal rewards, while it marginalizes others causing inequitable access to privileges or rewards. Critical transformation cannot occur, however, without action on inequalities. This action might manifest in questioning unearned privilege and social dominance in the community and society and challenging the policies that prevent understanding multiple perspectives on reality, and encourage employees and leaders to question critically interpretations of world events. Organizations at Position 3 routinely use a critical-theory perspective as an integral part of the management process. There was little evidence that the individuals were at this stage along the continuum.

**Discussion**

An issue that continues to rear its head in my research is a pattern of women with power who tend toward “gender unconsciousness” in thought and action. These women are accomplished, intelligent and caring. They have worked often to assist others in their careers. Yet, they seem to be wearing blinders when it comes to facing the true nature of the patriarchal organizations in which they dwell. Their words, beliefs and actions suggest that they do not consider how gendered power relations impact their work environment, nor do they take action to challenge or change them. This study begins to offer explanation about the characteristics of the pattern of “unconsciousness.”

The findings presented show that the executive women had many concerns about the innovation of the Women's Network. The concerns fell most significantly into the Stages of Concern model’s task areas of personal and management and the impact cluster of consequence. Further, the women demonstrated a moderate progression along the gender consciousness continuum, with the majority adopting a “Sex Equity” perspective on gender dynamics and power relations. To a lesser extent the participants demonstrated gender consciousness in private conversations. This section strives to synthesize these findings with a model of how gender awareness impacts action. The model is summarized in Table 2. The table is based on the axes of awareness and action, assessing the degree of each aspect from low to high. The four quadrants will be explained.

**Low Action—Low Awareness**

This quadrant is characterized by gender unconsciousness about gendered power relations and little or no action to address inequity. Concerns about the Network initiative in this realm are either unrelated or task oriented with concern about information, personal and management issues. There is little critical reflection in this space, and thus little learning about gendered power relations. The learning would be similar to Argyris’ (1993) single loop learning. There is no questioning about the structure and culture, and thinking and action serve to reinforce the current power structures. Functioning in this quadrant does not provide an impetus for women to gain perspective or take action. In other words, it reinforces the status quo by default. The women in this study were all aware of the initiative, but some exhibited little awareness of the plight of women in organizations. One participant explained that she once had a boss who “just didn’t seem to like women for some reason.” When pressed about how she handled the situation she shared, “I just rode it out until he was gone. Sometimes it takes a while though... I think I’ve been pretty lucky that I’ve been treated fairly in general.” I asked her what she meant by fair treatment and she explained, “I’ve never really been looked at as a woman in the room, and in fact, I forget that I am. I’ve never been looked at differently than anybody else.” This participant relays an instance of receiving ill-treatment based on gender, yet in the same breath explains she’s never been treated any “differently than anyone else.” Since there is minimal awareness and action, there is no significant learning when operating in this quadrant.

**High Action—Low Awareness**

This perspective is characterized by some awareness of gendered power relations and high action aimed at improving circumstances for women in the organization. While contradictory on its face, this perspective is quite common among individuals and organizations espousing sex equity along the gender consciousness continuum, and functioning at task levels of concern. This thinking and behavior may manifest in generating actions in a non-
critical sense that only reinforce current power structure such as adding mentoring programs that produce protégés who accept the patriarchal culture unquestioningly. High action may also occur through the development of policies that are gender insensitive such as the unwritten rules about hours of work, which tend to discriminate against women with family responsibilities. Activities in this quadrant also tend to focus on the deficiency of others where problems of women in the organization are viewed as “something I don’t have—others do.” A non-feminist identification would also fall into this quadrant. Essentially, the Women’s Network is a perfect example of an initiative that generated a great deal of action, but fell short in truly raising the awareness beyond sex equity. The women’s identity is tied to the male dominated culture and consequently there is little critical reflection on the impact of the culture on women’s experience. This group could not get beyond doing something specifically to benefit women. There was too much concern about how it would be perceived by the men. So, several meetings were held, visions were discussed, action plans devised (and abandoned), and money was spent.

High Awareness—Low Action

The majority of the women in this study fell into this quadrant. They were “gender conscious” and privately offered critique of power relations and understood how they were affected by these dynamics. Their inaction was grounded in overwhelming personal and consequence concerns. The problem with thought and behavior in this quadrant is that awareness without action only serves to reinforce existing power relations. A question that remains to be answered is, do these women only share their awareness in private, safe spaces, particularly with other women or those less powerful? They did not share their awareness in group sessions for the most part rather, it was shared in the privacy of a one-on-one interview. Quotes illustrating high awareness and low action follow: “How have I used [my awareness of gendered power relations]? How have I tolerated it? I haven’t used it ... that may be the problem! I don’t know how have I used it? I don’t even know how to answer that.” She further explained that having awareness “allows you to kind of get around it...so that people are not looking at you as a woman, but you as a smart person who’s trying to advance the company.” Another explained, “I don’t want to be known as the woman who keeps beating the drum on women’s issue, and no one else is beating it.” Another reflects, “I’ve probably had to work harder; put in more hours. Just to kind of maintain an even playing field because you know, as a woman anyway, you don’t have a buddy system going...or you don’t often have a mentor.” Another considers “It took me longer it seemed to get to the same place regardless of the responsibility. And because it is generally, well totally, a male-dominated place, there wasn’t very many places you could go to take that issue. Cause that would be a woman just complaining.” Women tend to share their awareness in private spheres. Gender consciousness was not talked about in the public meetings of the group. It was only broached from the safety behind closed doors.
High Action—High Awareness

The final quadrant is characterized by high action and awareness. Women in this quadrant function as “Change Agents” who publicly discuss and act toward improving the culture for women in the organization. These women’s concerns are more focused on the consequences of failure of the initiative, improving collaboration, and refocusing the Network to be more effective. They functioned according to the gender conscious level on the continuum. This is the only quadrant that truly challenges asymmetrical power relations. The leader of the Network observed, “I started [it]. ...I’m trying to keep it alive, so that’s my role creator, champion and sustainer.” Another reflects on her role in the organization, “Whether I like it or not, I am still a role model for women....I was one of the first women in the organization ...very conscious in the fact that I was maybe setting an example for women to follow.”

This level of action and awareness is accompanied by a shift away from focus on the self to a wider concern about other individuals in the organization. Perhaps this is attributable to the women’s confidence in their positions. Unfortunately, the woman who was responsible for instigating the Network recently resigned from the corporation and it is doubtful that any further effort will continue on behalf of women in this corporation.

Contribution to HRD

The dominant discourse on women’s networks is that they work, all women should get involved, and organizations should support them (Catalyst). Unfortunately, it is not that simple. To be effective at eroding structural inequality and creating atmospheres that are conducive to women requires that both networks and their organizations function with high awareness and action around issues of gendered power relations. The network study demonstrates that many corporate women are aware of the obstacles their gender presents to advancement, yet they are unable to raise their voices or take action addressing such problems due to fear or denial. The women in the network study were incapacitated by worries over personal and consequence concerns. Their functioning was not in the high awareness and action mode; the only quadrant of the awareness/action matrix that provides leverage toward meaningful organization change for women. Women members of networks and their organizations need to identify strategies and policies that help move toward quadrant four, or a high awareness and action state.

This study has begun to shed light on the complex process of thinking and action as related to gendered power relations in the workplace. While it still is not clear how women progress to gender consciousness and critical action on women’s issues in the workplace, it is apparent that patterns of thinking and action exist. There are important identity issues to be resolved since women tend to identify more with the male culture than their femaleness. Leveraging meaningful change for women in male dominated organizations can only happen when individuals and organizations progress along the continuum of gender consciousness to the point of critical transformation of thinking and action and resolve concerns about doing so. Change will only occur when the levels of awareness and action are high and focused on the organizational level.

The Process of Women’s Gender Consciousness Development

Laura L. Bierema

University of Georgia

Women’s gender consciousness development was explored and found to be impacted by three key dynamics. The first is identity development through learning “the hidden curriculum” that teaches girls and women subordination to the dominant patriarchal system of power. The second is becoming aware of gendered power relations as described above, critiquing them, and ultimately rejecting them. The third dynamic is taking connected action to change gendered power relations.

Keywords: Women’s Development, Action Research, Gender Consciousness

Women make up half the human race and over half the U.S. workforce. Despite 50 years of exponential gains in workplace participation women trail men in pay, promotion, benefits and other economic rewards (Bowler, 1999; Elder and Johnson, 1999; Kim, 2000, and Knoke & Ishio, 1998). Women are slowly moving into positions of power, yet their single-digit percentage representation at the top ranks of organizations is grossly disproportionate to their sheer numbers in the workforce. Women who succeed in scaling the corporate ladder often do so by emulating men and reinforcing patriarchal systems that discriminate against women and people of color, one possible explanation for the dearth of women at the top.

Women’s learning at work is challenging because it happens in a context that has been largely created, maintained, and controlled by white men. Success for many women often means accepting and even imitating male dominated organizational culture. Yet, this type of acculturation does not help eliminate systemic discrimination or asymmetrical power distribution, nor does it balance gender representation among the ranks of executives. Understanding how knowledge is created about gender in the workplace is important because it helps us understand the dynamics of gendered power relations in organizations. It yields clues as to why women have been relatively unsuccessful in breaking through the “glass ceiling.” It also helps us understand how to begin eroding patriarchal systems that serve only to reinforce the status quo.

Women’s learning at work must be considered in the broad social context that dictates gender roles, cultural norms, and expected behaviors. Although it is argued that women lack voice, visibility, and power, the question remains: how does their learning at work deal with these disadvantages? Hayes and Flannery (2000) charge that researchers have failed to move beyond mere description of learning, integrate feminist perspectives into their research, or consider how sexism and power relationships impact learning. Further, they observe that research lacks diversity and wide social, economic, and political analysis. They also suggest that women respond to their social contexts as learners and learn different ways of responding to oppression. They wonder, however, if any of these responses are “self-affirming and growth enhancing” (p. 51). There is evidence that many are not. A striking feature of previous studies is that some women exhibited a low level of gender awareness when reflecting on their career experiences (Bierema, 1994; Caffarella, Clark, and Ingram, 1997). Women in these studies reported experiencing gender based hardship, discrimination, and harassment. Yet, often these women did not attribute their experience to gender, even when asked directly. Learning that some of these women broke through the glass ceiling by “playing by the rules,” ignoring sexual harassment, tolerating exclusion from the men’s network, and accepting less qualified men being promoted over them was startling. Moreover, some of these women continued to follow a non-critical stance toward the patriarchal organization after achieving power and success.

Workplaces are social institutions, and thus, mirror the power structures and oppressive forces in society. Organizations are primarily male-dominated and success normally involves emulating the successful (Diekman and Eagly, 2000; Fagenson, 1990; Maniero, 1994). Hayes and Flannery (2000) suggest that like education, the workplace has hidden curricula that reproduce power structures. Evidence of this assertion is found in many studies suggesting that masculine traits help women advance at work. For instance, women at senior hierarchical levels in organizations scored significantly higher on measures of masculinity scales (Fagenson, 1990); feminine personality or physical attributes have been found more essential for success in female-dominated occupations, while masculine personality or physical attributes were thought more essential in male dominated occupations (Cejeka and Eagly, 2000); and women’s access to top male-dominated roles depends on their personality, cognitive, and physical
attributes becoming more like those of men (Diekman & Eagly, 2000). Kolb (1999) found that the sex and personality trait of femininity had no significant effect on leader emergence, but self-confidence, attitude toward leadership, prior leadership experience, and the personality trait of masculinity did. Mainiero (1994) interviewed 55 high-profile executive women about key events in their early careers that led to success. She concluded that fast tracking was dependent upon assignment to a high visibility project, demonstration of high performance, attraction of top-level support, display of entrepreneurial initiative, and accurate identification with company values.

According to these studies, career success is dictated by assuming masculine attributes, stereotyping gender roles, and following a set of "rules" for success. The result of these dynamics is the acculturation of women into male work culture, devaluation of women's gender roles, and deprivation of women's identity. Women's need or desire to buy into the "old boy" network may be explained by either suppression or unawareness of themselves as gendered beings (Bierema, 2001; Caffarella, Clark and Ingram, 1997). Women's uncritical career development not only causes them to adapt to a masculine model, but also prevents them from addressing power differentials or claiming a career on their own terms as women. There are many pleas for research on women in work context, but few published studies. Caffarella & Olson (1993) call for more data-based studies to develop the ideas, concepts, models, and theories about women's development. They ask: "How would raising the consciousness of women about the 'glass ceiling' for women in organizations affect their life dreams and what they believe they can achieve?" (p.145). This study attempts to explore the effects of women's consciousness of gendered power relations.

**Theoretical Framework and Purpose of Study**

The theoretical frames underlying this study fall into three areas: Women's career development, learning and feminist research. Career development literature sheds some light on how adults progress through their careers, but it has been criticized for basing models on men's careers, and being insensitive to the multiple roles and responsibilities of women across the life span. Thinking about women's career development has been dominated by male-oriented theories that inadequately illuminate women's careers. The second area is a learning frame, which serves to evaluate and understand how women learn about gender in the work context with particular focus on the role of reflection, reflective practice and action, and transformative learning in the women's work context as it relates to gender awareness. Finally, this research was undertaken from a feminist perspective with the goal of creating knowledge that is useful to women as they learn to challenge oppressive social systems. The purpose of this research was to study women's gender consciousness development through action research project with a group of eight women, the majority of who are employed as domestic violence prevention and treatment policy makers and service providers in the Midwest. The action research group functioned to reflect on our learning about gender, use new knowledge generated to take action, and return to the group to share our learning.

**Data Collection and Analysis**

An action research project was conducted with a group of eight women including myself. This group was purposefully selected based on their evolved awareness of gendered power relations, and their willingness to act to change discriminatory practices affecting both women and minorities. I gained access to this group through a consulting project. We collaborated for one year on a state wide training project before the research began. All participants joined the group voluntarily and were research partners throughout.

Dickens and Watkins (2000) identify involvement and improvement as the two vital objectives of action research. Action science approaches engage people in a process of internal critique of their own thought and action (Putnam, 2000). The action research design was ideal as it lends itself to both generating knowledge and producing action (Park, 2000). This group critiqued their thinking and action about gendered power relations at group meetings were used to both generate and analyze data. I served as the data recorder and initial analyzer, and the group analyzed and critiqued my preliminary findings during meetings. The meetings were held at a quiet bed and breakfast on twenty-seven acres overlooking a brook. The group met in the library and agreed that the setting contributed to creating a sense of ease and helping the group be open and vulnerable during the sessions. All sessions were tape recorded and transcribed verbatim. Data collection began in May of 2000. The group has met four times formally, one time informally, and keeps in touch between meetings.

The data were analyzed according to the constant comparative method and evaluated according to stages of gender consciousness development (Brody, Fuller, Gosetti, Moscato, Nagel, Pace, & Schmuck, 2000) and a Gender Consciousness Action and Awareness Matrix (Bierema, 2001). Member checks have been conducted both during group meetings and through electronic mail communications. Limitations include the purposive sample. Findings are not necessarily generalizable to the population at large. I was also a participant in the action research process.
however, the group was actively involved in both data collection and analysis. I also bring my lenses as a white, middle class, heterosexual female who formerly worked in corporate America to the study.

Findings

Women's gender consciousness development is impacted by three general experiences. The first is identity development through "the hidden curriculum" that teaches girls and women subordination to the dominant patriarchal system of power. Lessons learned from exposure to the "curriculum" include gender roles, a devaluing of women, silence and invisibility, submission to male power, and acceptance of role contradictions (e.g., use feminine wiles to get what you want—but don't be too feminine—while simultaneously playing by the men's rules). Girls and boys, and women and men learn and reinforce these gendered power relations throughout their lives. The rules and roles accompanying gendered power relations are so ingrained in the culture that they are practically invisible, neither questioned nor challenged by most people. These findings are discussed elsewhere and this paper will focus on the next two areas of findings which include gender awareness development and connected action.

Gender Awareness Development

This section addresses how the women in this study became aware of gendered power relations and began unlearning the hidden curriculum. Learning played an important role in helping women question the status quo, which is a key ingredient in fostering consciousness. Learning was grouped into the categories of individual and connected based on the differences in awareness generated by each. The developmental impact of individual and connected learning on gender awareness will also be discussed.

Individual Learning. Individual learning about gendered power relations included formal learning, self-directed learning, experiential learning, reflective learning, affective learning, and transformative learning. Individual learning verified an intuitive sense that the hidden curriculum was not right and helped the women reject socially dictated roles and power relations. Formal learning played an important role in dawning awareness about gendered power relations. Traditional gender roles and stereotypes were taught and reinforced through both formal and informal learning channels as detailed in the previous section. Many of the women were not encouraged to pursue higher education, and in some cases did so without familial support. All of the participants are highly educated college graduates. Several encountered progressive teachers and received exposure to feminist and women's studies in college. They were also voracious readers and cited several works as pivotal in their thinking about themselves as gendered beings.

The women also learned about gendered power relations experientially, particularly through discrimination. An attorney in the group recalls that in her first firm, "some of the partners weren't sure about working with me, they weren't sure that their wives would be happy having this young person with them...[working] until ten or eleven at night, and ordering a pizza." She also continued to receive unglamorous assignments while her male peer was getting better cases. Experiences with racism, homophobia, anti-Semitism, and sexism contributed to the women's experiences of learning about oppression. Childbirth was another pivotal learning experience that ranged from empowerment to exhaustion across this group. Several also had negative birthing experiences where they did not feel listened to by their doctors. Through their learning, the women rejected socially dictated gender roles and began to explore alternatives. They questioned the legitimacy of their "female role" and rejected the socially dictated roles. Although they individually reached a point of rejecting the status quo, acting upon this new viewpoint was generally facilitated by participation in collective learning.

Connected Knowing. Group learning was repeatedly cited as essential to raising awareness. Speaking about the action research process and the camaraderie that developed among the group, one participant emphasized, "I'm thirsting for this." Another noted, "I have always learned more from others." Connected knowing was also a necessary ingredient in moving the women toward deeper awareness and was important in at least three ways. First, it provided a safe space for women to compare experiences in depth. Second, it allowed the women to name their oppression and realize that they were not alone in experiencing the damaging effects of patriarchy. Finally, it began to give women the courage to move from awareness to action. One member shares, "I really think its difficult to learn individually, because whether it is through writing or talking personally with individuals, that's how we hear other perspectives...that's how we get the validation." Although connected learning is important, the women belonged to some women's groups that were unsatisfactory to them in advancing their learning about gendered power relations.
The Developmental Impact of Learning about Gendered Power Relations

Awareness of gendered power relations developed through a transformative learning process that was a combination of individual and connected learning that challenged the "hidden curriculum's" content, values, structures, and rules. Through both individual and collective processing, gender consciousness emerged and expanded based on questioning the hidden curriculum, rejecting the status quo, reclaiming voice, and reframing identity. These four developmental shifts do not happen in isolation of each other. Rather they overlap and influence one another.

Questioning the Hidden Curriculum. Women begin questioning the hidden curriculum in various ways. Group members noticed and objected to the invisibility of women, or discovered and lamented the fact that society defined them through their husbands. Some learned that their income was neither welcome nor valued in their family systems. Yet through their learning they began questioning these dynamics. Often the questioning was prompted through the media by books such as Betty Fredian's, The Feminine Mystique or Ms. Magazine. Publications such as these were regarded as "defining moments that you can point to." One participant recalled a woman's she belonged to that questioned the status quo. It was a church group called "Women in Religion." This group read Woman's Spirit Rising. This member, who eventually became a Unitarian Minister, describes her learning, "It was like my jaw was just dropping open all the time about how women had been excluded from the stories in religion and theology." Later she attended a conference on feminist theology and heard a speaker who was a Catholic critiquing the Catholic Church. She recalls that someone asked her, "Well how can you stay in the Catholic Church with these viewpoints?" And she said, "Nobody ever asked the Pope how he can stay in the Catholic Church with his viewpoints." The idea that women or even herself could form their own ideas was novel to her.

Rejecting the Status Quo. In addition to questioning the way things are, gender consciousness development involves making the decision to reject the status quo regarding gendered roles. One participant moved to a new community shortly after getting married and recalls, "Suddenly I didn't have a job...I'll never forget going to the grocery store and realizing that I couldn't even get a card to cash checks without putting my husband's name on it...and that was devastating to me." She decided not to accept being defined by her husband. There was anger about the programmed images of women. One woman notes that people often brush off these messages. She observes, "And you know here's the argument. It's just one ad in a magazine. Or it's just one line in an article. But when you are bombarded with those one little experiences they really add up to reinforce the status quo." As the women questioned and rejected the status quo, they began to reclaim their voices.

Reclaiming Voice. A key learning process that accompanies the rejection of the status quo is the act of reclaiming voice. Participants described not only reclaiming voice for themselves, but also helping others be heard. There was also a fear of not being heard, particularly around gender issues as noted by this member, "My fear is that no one would ask us." Another laments not having voice as "this insidious nature of how women just are silenced and how we are expect to be silenced. And we're conditioned that way over time and language is a huge part of that as I understand it and I've experienced it." She is talking about how language is gender neutral or sexist and how it renders women invisible. She has been an activist to change this invisibility.

Speaking up and being heard takes many forms for these women. Staying silent is far worse than any fear or regret they might have over speaking out since some of them know "that there are times when you can no longer be passive. There are situations when you have to actively speak to overcome or to overturn injustices." One member tells the story of reclaiming her maiden name. "Shortly after going to [a] conference I decided to change my name—I was married at the time—and I took own my birth name back and hyphenated it." This is a brave act required explanation to family, friends and co-workers.

Another member notes how difficult it is to have a voice. She laments, "We're not encouraged to care a lot about certain issues." She notes that sometimes on a professional level the resistance is an impression that "'you're just taking this gender thing too seriously' and I think that's part of the struggle...but there's [this] thing in our culture where we're not encouraged to really care about issues too much, or too seriously, if we are it's like over the top or something." As these women began to challenge gendered power relations their identity began to shift.

Reframing Identity. As women in this study questioned the hidden curriculum and decided to reject the status quo, they began to define themselves as gendered beings. They reframed their identity in a way that brought gendered power relations into the foreground. Awareness is the essence of their being, affecting their career choices, intimate relationships, parenting, and interactions with family, friends and co-workers. Identity development is the result of multiple experiences over time and is defined as how women identify themselves (i.e., as African American, Certified Public Accountant) and measure their self worth (i.e., positive or negative evaluation) (Hayes and Flannery, 2000). Gender awareness happens much the same way as pointed out by this member, "Awareness happens with multiple incidents versus one definitive moment characterized [by] daunting awareness." Another refers to her
gendered awareness as “just a way of being, that I probably incorporated into myself without even thinking about and realizing.”

Awareness of gendered power relations permeates the lives of these women. Consciousness is a way of being. Many have chosen careers devoted to women’s issues. A participant speaks about her decision making process, “I know for me that my career decisions, my latest career decisions were certainly based on that awareness.” Another shares, “My career choice was a result of my awareness of gender issues. But in addition to choosing career to address the issues, what has happened is that as a result of the career I can also address it in other aspects of my life....So the career has resulted in my being able to even talk individually with other people about [gender] issues. And the issues come up as a result of a situation that they are going through in their personal relationships. And it’s gone from my awareness, to choosing a career, to the career, to going back to that personal relationship.

This group is proud to call themselves feminists and is more concerned about working against sexism than over what people might think of them. One person captured this sentiment by quoting lyrics from a Neil Young song saying, “it doesn’t mean that much to me to mean that much to you.” She explains, “I love that line and I can’t ever get there, but ... it sort of reminds me of what we are talking about that as long as you are comfortable with yourself, you make your own decisions, you know why. It doesn't matter what those people think unless we let it impact us.” Another member considers, “I don’t know if I came to activism because of a dawning gender awareness that motivated me...to like start doing activist work or and then my activism like real solidified and deepened my convictions of the feminist, or if it was the other way around.” During the group sessions one participant likened her persistence in defending women’s issues to a favorite quote, “And then the day came, when the risk of just staying tight in a bud was greater than the risk it took to blossom.” She shares that she loves the quote because it “helps me frame that I don’t want to be in this place anymore, and it is risky to leave it, but I don’t want to be here anymore.” She views the process of awareness as “it’s like you’ve gotta get to the point where you don’t want to be there anymore.” This also describes how the women use their identity to take connected action.

From Connected Knowing To Connected Action

The women experienced important learning leading to gender consciousness through testing their questions and rejecting of the status quo with the support of other women. This type of learning is similar to Belenky, Clinchy, Goldberger, & Tarule’s (1986) description of connected knowing. New insight, however does not foster social change without action. Awareness without action is futile. A consistent pattern among these women was that their awareness of gendered power relations manifested in feminist activism, on their terms. They strove to make the invisibility of women and women’s oppression visible. They worked to protect other women from discrimination and pain. In fact, for this group, gender consciousness is at the heart of their being, a part of who these women are and how they define themselves. They are not without struggle, however, and work to use their awareness to achieve life balance. They also make deliberate decisions to be “consciously unconscious” at times when the personal cost or pain is too high to act on their awareness. Their activism assumes several forms, both overt and “stealth.” They also use their knowledge to teach others about gendered power relations and work for change. This section describes the connected action of the women in this study by sharing stories about how they asserted themselves to make the invisible oppression of women visible, adopted a “conscious/unconscious” strategy, and demonstrated consistency between though and action.

Making the Invisible Visible. The women shared stories about speaking up and bringing attention to issues that disenfranchise women. One notes, “I think it should be that gender consciousness is the purpose of saying that ‘this is what’s happening to women.’ It’s to bring it to your attention. I think it is important to call people's attention to something.” They take risks to address gendered power relations and view themselves as teachers to help others learn about oppression. One considers the judges she works with sharing, “my role is to instruct [and] most of them are male. Taking action in the name of women’s oppression involves making the invisibility of women’s oppression visible. Discrimination and oppression of women has become such a part of our culture we often don’t see it.” These women work to teach others about oppression. There was frustration at patriarchal systems that privilege its members to not “see” oppressive forces as explained by this woman, “My point is that, you have those who feel so arrogant or so privileged that they don’t ... think it’s necessary for them to do it [be aware].” Another notes, “we have all made it [sexism] visible within our lives, but that so many others haven’t.”

These women describe their willingness to confront others sexist behavior. One participant emphasizes that she takes action “When there’s been a violation of a very clearly defined area.” Another raised concerns with her son’s first grade classroom about fairy tales with very sexist roles. She notes, “Part of what’s hard about making the invisible visible, [is] you see it and then you have to decide on how you’re gonna deal with it.” She notes that it might be easier for a greater part of society to keep oppression invisible because it’s so hard to deal with. She shares,
“all these different emotions can tire you out constantly, it’s easier not to see it.” These women have taken stands in their children’s schools, the workplace, volunteer organizations, and churches. One member talks about her church explaining, “I think all the women at my church and the men, are in a totally different place, but they think I’m the crazy feminist, I always speak my mind...it’s very, very important to me.” Providing reminders and subtle challenges to gendered power relations is viewed as promoting change.

**Adopting a “Conscious/Unconscious” Strategy.** Most of these women are feminist activists, yet they make conscious decisions at times to adopt a “conscious-unconscious” stance as a strategy for dealing with sexism when the cost of taking action is too high personally or professionally. In essence, “you pick and choose what you are going to do, and be comfortable with that.” This dynamic is explained: “You do a little bit at a time, and then you slide back, and then oh shit, to do it again, you start over again. But you can’t react to all of them, or you’d be angry and you’d be fighting daily, so, I guess the best metaphor is, ‘you pick your battles.’” Sometimes this conscious-unconscious behavior is simply a means of preserving energy or life balance. Another member explains, “There’s probably a lot of things that I run into that I just say, it’s not worth it, it’s just not worth it. I can’t fight everything and everybody all day, or I’ll be so negatively focused that I can’t get anything done.” What distinguishes this behavior from gender unconscious behavior is that there is a deliberate choice made not to act, versus ignorance or denial. One member who toned down her activism when her children were small emphasizes, “It wasn’t an unconsciousness, that I kind of denied or put it aside. It was a conscious decision of ‘I know how society reacts to this type of behavior’...so I stepped back.”

**Consistency in Thought and Action.** What distinguishes these women from the gender “unconscious” is not only their consciousness, but the consistency between thinking and action, or as Argyris termed it, espoused theory and theory-in-use. Typically, Argyris (1993) found many professionals to say one thing and do another. The apparent, yet unrealized inconsistency was viewed by Argyris as a flaw in reasoning and resulted in failures or unexpected outcomes. The women in this study generally did not fit Argyris’ pattern when it came to gender issues. The women consistently viewed themselves as activists for women’s issues and shared their beliefs. “To me it’s critical that [gender consciousness’s ] definition is [grounded] in activism.” To this member “that’s part of becoming aware... activism [is] trying to go against the status quo.”

**Contribution to HRD**

This action research project has provided insight into the process of developing gender consciousness. The primary conclusions of this study include that gender consciousness is a result of connected knowing and action, identity development is impacted by gender consciousness, and developing gender consciousness is a transformative learning process.

**Connected Knowing and Action Result Dually Foster Gender Consciousness**

A key contribution of this research is that is shows the result of connected knowing: connected action. Knowledge about gendered power relations is not enough and must be accompanied by actions if change is to occur. Connection was important to the sustained activism of the women in this study. Many participants noted that it was taxing to be the “lone ranger” because it was too difficult to sustain prolonged activism on behalf of women’s issues. Belenky et al. (1986) concluded that connected learning is most effective when members of a group meet over long periods of time know each other well. They define it as learning that is grounded in relationship, reciprocity, and conversation. It is also a means of identifying common ground among learners. Other scholars have argued that fostering a sense of connection is very important for women’s development (Giesbrecht, 1998; Gilligan, 1979; MacRae, 1995; Ruddick, 1996). Caffarella & Olson (1993) note in their critical review of the literature on the psychosocial development of women that: “What surfaced as central to the developmental growth of women was the web of relationships and connectedness to others” (p.135).

**Identity Development is Impacted by Gender Consciousness**

Developing consciousness is difficult and does not happen in a systematic or orderly fashion. Many fields have broadly conceptualized the self in terms of multiple identities, with individuals holding perceptions of themselves such as traits and values, attributes, experiences, thoughts and action, physical appearance, demographic features, and dispositions of various sorts (Leonard, Beauvais & Scholl, 1999). Gender is socially constructed and a part of human identity development that is based on life experience. Self identity has been found to be created through participating in work, private life, community, and other social entities. Gender socialization may result in both...
identity development and identity conflict. For instance, women and men may be socialized to fulfill sex role expectations that conflict with their self image, goals, or occupation. MacRae (1995) suggests that women’s identity has been conceptualized in terms of formal roles in the paid work arena dominated by male experience while their informal roles, such as relationships and care giving, have been ignored and made invisible. When women try to challenge formal or informal roles, resistance is high and leveled from friends, families and co-workers. The women in this study struggled to forge an identity that contradicted the hidden curriculum of life and work and fought resistance from family, coworkers, and friends. The two African American women spoke more often of developing a strong identity from their families. Yet being a strong feminist evokes resistance and impacts identity development. The women in this research succeeded in withstanding the resistance, and as a result forged a new self-identity, higher self esteem, and ultimately gender awareness. Zane (1999) found that women began to place more importance on their identity as women as their understanding of gender issues increased. Indeed there is significant social pressure to become socialized as females who are unaware and inactive regarding addressing gendered power relations. Learning in groups of other women was crucial in fostering ongoing identity development and a movement toward feminist activism among the women in this research.

Developing Gender Consciousness is a Transformative Learning Process

Developing gender awareness is a process of transformative learning that occurs both individually and collectively. Daloz, Keen, Keen, and Parks (1996) examine the nature of transformative learning that occurs as a person develops a sense of social responsibility and outline four conditions of transformation: presence of the other, reflective discourse, a mentoring community, and opportunities for committed action.” Daloz’s (2000) conclusion that consciousness is impacted by recognizing one’s “otherness” is relevant to this study. “Otherness” is defined as a process of constructively engaging with the political and social consequences of perceiving yourself as “other” (and usually marginalized) from the dominant culture (Daloz, 2000). I suggest that gender consciousness depends on understanding the “otherness” that accompanies being female. The women in this study were relatively secure with themselves as women before they began acting to change gendered power relations. They also came to define their otherness individually through questioning the hidden curriculum and rejecting the status quo. A group was needed, however, to further develop their awareness. Incidentally, failure to regard oneself as “other” may be one explanation for why some senior level women in management see neither gender differences, nor the need to reorganize power relations. The climb up the corporate ladder may have left them insecure in their own identity after years of striving to conform to a male image and ultimately resulted in gender unconsciousness.

Future Research

This study has begun existing the gap in the literature regarding how gender consciousness develops. Few research articles exist documenting this phenomenon. The existing research lacks a systems perspective, and has been conducted in school or political contexts. Gender consciousness development needs to be explored in a variety of contexts such as non-profit, higher education, community groups, corporations, and small business, to name a few. It would also be useful to examine factors that inhibit learning about gendered power relations. There is significant resistance when gendered power relations are challenged and new information for battling resistance would make an important contribution to restructuring gender relations. This study has also underscored the importance of connection and relationship when learning about gender. Although this study has examined the process of gender consciousness development, it would also be useful to explore factors that inhibit learning about gendered power relations in context among both women and men. There is significant resistance when gendered power relations are challenged and new information for battling resistance would make an important contribution to restructuring gender relations. This study has also underscored the importance of connection and relationship when learning about gender. Future research might explore the learning processes associated with connected action of women.

The words of Gloria Steinem, “The first problem for all of us, men and women, is not to learn, but to unlearn,” aptly capture the first action women and men need to take in developing their own consciousness about gendered power relations. Perhaps then, steps toward true gender consciousness and connected action can be made.

Gender, Power, and Office Politics
Ya-Hui (Bella) Lien
National Chung Cheng University, Chia-Yi, Taiwan

This interpretive study explores the experiences of Taiwanese female clerical workers how they deal with the office politics. The hermeneutic phenomenology was used to describe and interpret the participants' experiences. Three major themes were emerged about their powerless experiences: (a) powerlessness and frustration result from the structural barriers, (b) powerlessness and frustration result from the behavioral barriers, and (c) powerlessness and frustrations require accommodation and rationalization.

Keywords: Power, Hermeneutic Phenomenology, International HRD

Although more women have enter the global workforce than ever before, many of these women are over represented in entry-level positions and staff positions (Ammstead, 1994; England & Browne, 1992; Lowe, 1987; U. S. Department of Labour Women's Bureau, 1993). Despite the increased numbers of women holding administrative and professional positions, the vast majority of senior-level positions continue to be held by men. According to Hsieh (1993), Taiwanese female workers have played important roles in each stage of Taiwanese economic development and growth, same as most of countries; women's voices are still missing in the social science research. Nielson (1990) suggested that traditional research methods both render women invisible and remove them from the context of their lives. The hermeneutic phenomenology was used to gain a thorough understanding of the Taiwanese women's experiences in order to contribute to the body of the knowledge of the human resource development discipline and women study.

Problem Statement

Virakul (2000) indicated that ambitious and capable women have always, from time to time, met with work obstacles resulting from their incompatible relationship with powerful men for whatever reasons. In the Human Resource Development (HRD) field, women still need to have strong mind to win over the obstacles in the workplace in order to get career advancement. Although growing number of western companies, especially the American companies, have been declaring themselves "equal opportunities employer", Taiwanese women in workplace still underrepresented in positions of power and authority and underpaid compared to their male colleagues across employment sectors and professions (Chang, 1994; Ku, 1998; Lien, 1989). Office politics is essentially about power (Kenig, 2000). Since entry-level clerical works were mostly held by Taiwanese college-graduates and as their first job (DGBAS, 1999), sometimes, their first work experiences further influence later career choice (Ku, 1988; Moore, 1985). This study intend to understand these young college-graduates' work experiences, especially when they need deal with the gender, power, and office political issues on the daily bases.

Background of the Study

In order to have better understanding of this study, the following sections intend to describe the labor market and business background of Taiwan.

Labor Market in Taiwan. Currently, 46 percent of all Taiwanese workers are women (DGBAS, 1999). However, even though a greater number of women have entered the job market, women are still considered a minority in Taiwan's workplace. Although in recent years, both women and men have increasingly pursued jobs that have traditionally been dominated by the other sex, the job market in Taiwan is still segregated to a great extent (DGBAS, 1999; Taiwan Executive Yuan, 1995; Tsai, 1994). Despite a focus on the country's economic and structural changes, women workers are still employed mainly in clerical, service, and retail sales jobs. In addition, most management positions held by females were distributed among the lower ranks of managers (Hsiu, 1994). Criteria for most clerical jobs in Taiwan can be found in the classified advertising section of daily newspapers, which lists one employment category as being for "female only". This is contrary to classified advertisements in the US, cannot discriminate among employment candidates based on paid careers. The primary job category for college educated women in the white-collar labour market is "professional and related jobs," with 62.43 percent, which includes mostly school
teachers and health care professionals. The second largest job category for college-educated women is "clerk," with 33.99 percent (DGBAS, 1999), (see Table 1). However, clerical positions in all industries still employ the majority of Taiwanese female workers.

Business Environment. Due to Taiwan's dense population, government policies, and economic strategies, small- and mid-sized companies are encouraged to help develop the nation economy. These small- and mid-sized companies form the foundation of Taiwan's job market. There are four typical business organizations in Taiwan: (a) family-owned businesses, which usually are managed by the owner; (b) foreigner-owned businesses, which usually adopt the overseas parent company's policies; (c) corporation with western management style, which usually have clear policies; and (d) government and public owned organizations (Wu, 1995). Many newly graduated female workers enter family-owned businesses as their first step into the workplace. Family-owned organizations are unique and dominate among Taiwanese business styles, especially with regard to small- and mid-sized businesses (Hwang, 1992). The main characteristics of family-owned businesses are their small size and tendency to employ the owner's relatives. The management style of a family-owned business has more focus on authority than does a western business. Because the family-owned business employs relatives and may lack clear work policies, further, the work atmosphere of a family-owned business may rely more on the employer owner's tastes than would a western-style company.

Theoretical Framework

Chinese Cultural Values and Gender-Role Stereotypes

According to Smith (1992), Confucian philosophy is not based on religion, it is rather based on relationships. Harmonious social institutions and collegial behaviour are important to Chinese people. Chinese society historically was authoritarian and patriarchal, traditionally women were confined to activities in a domestic setting. However, different gender have different social roles (Eagly & Mladinic, 1989) are shaped by cultural values. Specifically, social structures underlie beliefs, which presume that women are homemakers and must behave selflessly, while men are workers who must behave with self-assertiveness. To date, even with the large number of women entering the workplace, society still maintains certain expectations for female workers. The Gender Role-Expectations Theory (Higgins, Duxbury, & Lee, 1994) is based on traditional sociocultural role expectations, which prescribe that men take primary responsibility for the breadwinner role, while women assume primary responsibility for the family. This stereotype shapes social expectations for women working outside the home.

Power and Office Politics

Due to the scarce resources and differences among interest groups, power and conflict are central features of organizational life (Hathaway, 1992). Although power has been defined in many ways, one way to describe the power...
is "the potential ability of a person of group to exercise control over another person or group" (Moorhead and Griffin, 1998, p.385).

Power and politics are close related. Office politics is essentially about power. Playing politics is about attaining and retaining power. Political behavior, after all, is by definition an informal attempt to protect one's self-interest, meet personal needs, and advance personal goals (Barney & Griffin, 1992; Hellriegel, Slocum, & Woodman, 1995; Pfeiffer, 1981). In office, people usually use power and other resources to control over another people and obtain their preferred outcome. Women in office, due to the position they held, most of time lack of the power officially. Or women in office, due to the scarce resources, they need to use some office political behaviour to gain their preferred goals. These situation happened especially the company has unclear policy. Although office politic is an unavoidable issue, few studies explain the effect of office politics among workers in the workplace. However, "office politics" is a fact of life. Refuse to recognize this fact, and you leave yourself open to victimization (Hathaway, 1992).

Methodology

Since this interpretative study attempts to explore the office work experiences of Taiwanese young college graduates. In-depth interviews and on-site observation were served as the methods of this study. The study used hermeneutic phenomenology as the research methodology through which to understand the inherent phenomena (phenomenology)--the underutilized role of Taiwanese female clerical workers--and to interpret the lived experiences (hermeneutics)of Taiwanese female clerical workers who claimed that they are underutilized and powerless (Hultgren, 1989).

There are nineteen participants who are college-educated females with fewer than five years working experiences and doing office work. In order to get rich and purposeful information, the participants were selected by using snowball technique (Patton, 1990). They expressed their working experiences to reflect the relationship among gender, power, and office politics. Every participant accepts at least two hours in-depth interview along with on-site visit of their workplace to collect the data. Based on the verbatim transcripts, the text was analysis. According to Van Manen (1998), three approaches towards uncovering themes: (a) the holistic or sententious approach, (b) the selective or highlighting approach, and (c) the detailed or line-by-line approach. First of all, above thematic analysis approaches were used interchangeably. Second, a cross-case analysis was examined to discover the common themes.

Findings

Powerless and frustration are the major themes, reflected the participants thoughts. In order to survive on the labour market, these female clerical workers try to assimilate to the climate. Whether they take it or leave it. Three groups of themes are described below: (a) powerlessness and frustration result from structural barriers, (b) powerlessness and frustration result from behavioural barriers, and (c) powerlessness and frustrations require accommodation and rationalization.

Powerlessness and Frustration Result from Structural Barriers

The structural barriers, which lead these young college-educated Taiwanese female clerical workers to feel powerless, include (a) society treats men and women differently, (b) job restrictions exist, and (c) company policies are unclear.

Society Treats Men and Women Differently. According to Reskin and Ross (1992), employers assume that women's primary attachment to their future families limits their efforts at work. Thus, corporations would rather promote male workers than female workers. Therefor, men have more opportunities and power than women have in the workplace.

Orpha said:

I have a friend who cannot get promoted. She has a good performance record, but just because she is a girl, she cannot get promoted. A man got promoted, even though she was his mentor, and he used to be her subordinate. The boss just told her she should be sorry because she was a girl. Being a girl was a reason for her not being promoted.

Pam said:

I think it is really painful to be a female worker. In the same situation, if a woman wants to get
promoted, she must try harder than her male counterpart. The current situation is that when a promotion opportunity opens, the boss will favor promoting a male employee over a female employee. In fact, if the female is to get the chance to be promoted, she must be far superior to her male counterpart. To be honest, there are still different treatments for men and women.

According to Lin (1989), wages and occupations show differences between sexes at the entry level. Her study suggested that sex discrimination in the labor market existed and cannot be rejected in Taiwan. The idea that “men deal with outside work, women deal with domestic work” is still a common concept in Taiwanese society. As a result, different treatment of men and women—discrimination—occurs both consciously and unconsciously in Taiwan.

Jane said:
[In Taiwan], because men went to military service, they wasted two years, so employers think they should get much more salary than women [to make up for that lost time]. It doesn’t matter whether they [men] have work experiences or not. When they enter our company, they get NT 2,000 dollars more than women get. The employers think that way, so what can you say? I also know that not long ago, we still had a regulation, which we called the “single law.” It meant that when women got married, they should automatically leave their jobs, because they might ask for marital or maternity leave, and may no longer be young and beautiful enough for a position as a teller. In addition, women may pay more attention to their families than to work, which employers wouldn’t like. Because it causes too much trouble, they prefer that women leave work after they get married. That is what we call the “single law.”

Grace said:
My boss is very narrow-minded; he was educated under Japanese rule and influenced by Japanese business, as well. Japanese thinking, which says that men are always superior to women, influenced him and we do a lot of business with Japanese corporations. They are very typical; they all think that “males, as bread winners, should take care of business and women should take care of domestic matters.” As a result, women in the business world are always in secondary roles... One of the problems is the thinking of the company’s leader. It really affects girls’ development in the business world.

Job Restrictions Exist. Some participants reported that Taiwanese businesses are basically sales oriented. There are some restrictions for females getting into the labor market and becoming salespersons in some trade companies. In Taiwan, females are able to find clerical work easier than other work, especially if these women do not have any professional degrees. They may not easily get sales jobs in some industry or trade companies, so this type of job segregation keeps females restricted to clerical job categories. For example, females can easily be placed as sales assistants or management assistants in any industry. Yet, most of the time, there is not enough room for them to become salespersons.

Grace said:
We have a manager that proposed that we should have two girls do sales jobs, and one of them was I. But our boss turned down this experimental proposal. In fact, our boss thought that it was inappropriate for girls to do sales jobs. He is stubborn; he doesn’t want to be responsible for girls’ safety if girls are sales people and go outside the city to do business. Actually, I was honoured to be mentioned as one of the girls in this proposal, even though my boss didn’t approve that proposal. Anyway, sales are the foundation of a company. I mean, sales people can make money, and directly profit the company. So males as sales persons more easily get promotions than women, who usually do office work. Women may need to work seven years to become a co-leader in a department. Men may just need three or four years, and then they can be co-leaders... My point is, that women are only doing office work; they don’t have opportunities to create visible profit for a company. All women can show businesses are reports, not how many products they sell. We have good filing skills, so what? The boss won’t see those skills.

Rachel said:
When you read the newspaper, you find 90 percent of the jobs you can do are secretarial jobs.
So if I go for a secretarial job, it will be easy for me to get it. Other jobs may require some specific major or requirement. I guess a secretarial job is all I can get.

Company Policies are Unclear. Due to the low corporate level of clerical workers, they have restrictions on what they can do at work. They rarely have the power to do things they need to do; they must follow the boss’ or supervisors’ orders. In Taiwan, since a lot of companies are mid- or small-sized, the hierarchy in management depends on managers, and the age of managers is a factor, which should be considered. Older managers, who are usually influenced by the Japanese management style, are more negative about women and their capabilities to do business (Wilen & Wilen, 1995). In addition, this type of company may lack clear policies to regulate its own bureaucracy. As a result, the participants blamed the institutions instead of their bosses. If you do not know how to play office politics under this kind of ambiguity of company, you will experience powerless more than ever before.

Ingrid said:

This company has a bad system; I should say, they don’t have a good labor policy. I feel that the boss always thinks about himself…. I think a company cannot only follow the boss’ decisions, it should be concerned about employees as well. In fact, there is nothing more that we can learn except office policies.

Jane said:

Actually, working in a local Taiwanese company is not good for me, because a local company cares about employees’ seniority more than about their performance. I mean, the employees’ promotion opportunities are based on how long they work for a company; the performance is a minor criterion for promotion. In addition, some people care about some other factors, such as your title. It seems that if you have a good title, then you can speak up more. Things like that. However, in a local company, you should not only handle work tasks, but people, too. Doing things well may not guarantee that you will get good feedback.

Powerlessness and Frustration Result from Behavioral Barriers

Some feelings of powerlessness and frustration occurred because these workers faced difficulties with other people, including their bosses and co-workers, about different work expectations. Both employers and employees may have had different thoughts or attitudes about the nature of work. In my study, some themes about powerlessness were the result of bosses’ personalities and their attitudes about how to treat their workers and how they perceived these young, college-educated, female workers’ jobs.

The Boss Won’t Let Go One of the complaints related by my participants’ experiences was that they didn’t have power and autonomy to do their work. They needed to follow orders all the time. Moreover, they needed to ask their bosses’ permission for almost every move they made. They needed to rely on their bosses to give them authority to do things; otherwise, all they did was waste time. However, neither the boss nor the department would acknowledge that fact.

Teresa said:

I am a secretary, so first of all, I do a lot of detail and trivial work. Since the boss won’t give me any leeway, my authority is really limited. And the boss asks me to do more than I can handle [because I have too little authority]. Sometimes, there is just no way to do it; that means I cannot get done what he wants, due to the limited power I have. Eventually, if the boss can give me more room to handle things, then I will do things better. Even when I discussed the situation with the boss, he still didn’t get it. It just didn’t help.

Rachel said:

I couldn’t learn anything at all. My boss didn’t give me any authority. He held the power. I worked as a secretary, as a “small office girl.” What I did was more lousy work, compared to real and meaningful work…. We were a small export trade company with just four people--two managers and two employees--and it was a family-owned business. I was a secretary and a “small office girl.” I just felt unhappy. I learned nothing, and the boss didn’t give me any power to do my job…. It is hard to deal with things when you have little power. The power I had was so limited; the work that I did was so little. There was just no way out.

They Exploit Labour Market Freshwomen. Although my participants felt they had the skills and talents to do their
jobs, they also felt that their bosses just took advantage of them. Their bosses did not care how educated they were; they only saw these young, college-educated workers as newcomers in the labour market. The employers thought they were new, lacked work experiences, and knew nothing about the workplace. So, the bosses used these young workers to do labour-intensive work instead of creative work. In addition, the bosses did not need to pay them as much as they paid experienced workers. The bosses even saw themselves as trainers to help these young workers get experiences. These kinds of attitudes made the young workers feel exploited and further feel frustrated.

Ellen said:

The boss is very smart. He hired me and told me that I didn’t have any experience, so he would give me only a certain amount of salary. In his mind, he thought he was using lower pay to hire a college graduate to do more work. I didn’t like the way he acted, but I didn’t have any work experience, so what could I say? I feel that it is unfair that they exploit new graduates. They give us a small salary because we lack work experience. I just feel that they exploit “labor market freshwomen.”

They Do Not Use My Talents. Many of my participants felt that they had the talents to handle a lot of things. Yet, since clerical workers’ skills are invisible, their work seemed trivial and “replaceable.” These college-educated female clerical workers felt that they could not use what they had learned in college or what they knew to contribute to the workplace. They felt they had great talents, but no one cared.

Florence said:

I felt that anyone could do this job. Some tasks may need some time to become familiar. Most of these tasks don’t need a lot of talent to do them.... To tell you the truth, I didn’t feel bad about that, but when people keep questioning me about why I waste my talent doing this kind of job, then I start to think that I am making little use of my talent.

Sharon said:

Of course, I think that I am “Ta Chi Hsiu Yu” [someone with good capability but little usage]. This is no fun at all. So I keep my eyes open to look around for other opportunities.

The Boss Gives Credit To Others Without Rewarding Me. When the employees feel disrespect and lack appreciation from their bosses, a common feeling is worthlessness and frustration. They see themselves doing things for other people without benefiting themselves. According to Gutek (1988), a secretary is like an “office wife” (p. 232), a person who is not promoted for her own talents and accomplishments. Most of the time, a secretary is tied to her boss’ title and promotion ladder. If a secretary helps the boss, makes the boss look good, and the boss gets promoted, then the secretary has a chance to get promoted along with the boss. Sometimes, because management did not acknowledge the secretaries’ contributions to the company; only their direct supervisors and bosses knew about their contributions. If their bosses did not give them appropriate feedback, these clerical workers usually felt that nobody recognized what they did. Moreover, they felt that they were invisible and did things without any reward.

Grace said:

It is worthless. Working for other people without profiting yourself is not really smart. Also, the boss won’t appreciate you. The boss even thinks that he can run the business well without you, although I don’t think he is right about that.... I think that I work for someone else without profiting myself. That is too painful and frustrating. In addition, the boss doesn’t appreciate me.

Deb said:

I feel they fool me. I feel like I work for people to whom I am not responsible. I don’t know where my efforts go. I don’t need to put all my efforts into it. It is wasting my time.

Powerlessness and Frustrations Require Accommodation and Rationalization

Even though these workers experienced powerlessness and frustration, they still needed work experiences for their resume. If they could not leave their jobs right away, they coped with their situations by assimilating into the culture or rationalizing to accept what was happening to them.

We find it Easier to Assimilate Into the Environment. One method these workers used to accommodate their powerlessness and frustrations was to assimilate into their organization culture. This strategy may occur either consciously or unconsciously. Regardless, in order to survive in the workplace, assimilation into the environment was
used to accommodate their frustration and powerlessness. Just as Jane said, “I better change myself to suit the environment.” On the other hand, if these workers could not stand their situations, they thought about leaving their jobs.

Jane said:

Changing yourself to suit the environment is easier than changing the environment to suit you.
I better change myself to suit the environment.

Deb said:

I think I was assimilated into our company already.... Sometimes, I felt that there was some “lazy grain” spread in the air of our workplace. Nobody really wants to fight for his or her own rights. Everybody just listens to the boss; whatever he says, we follow. I think I assimilated into the organisational culture unconsciously.

We Need to Accept Our Fate. Since secretaries’ work is considered trivial and they lack control over their work, some workers experienced a feeling of “acceptance of fate.” They tried to tell themselves to adjust to their current jobs, especially when they needed their current jobs for various reasons. They may have needed to accumulate work experiences, or they could not find better jobs, or they were tired of looking for suitable jobs. According to my observations and conversations with my participants, the ones who experienced powerlessness and expressed acceptance of their fates were more fatalistic, and their attitudes toward life were more passive than that of others.

Florence said:

Even now, what I am doing is trivial work. I must tell myself to adapt to the situation I face. It seems everyone is like that. Even to a secretary in a big company, the work is as trivial as it is in a small company. The power you have is limited also. My point is, a secretary deals with trivial things and holds limited power, so we should learn to accept our fate. Ha! Ha!

We Need to Accumulate Work Experiences. As I listened to how these workers dealt with powerlessness and frustration, I found that they had one very practical problem. As newcomers to the workplace, they needed to accumulate work experiences. So, even though they faced powerlessness, they still needed to “hang in there” in order to accumulate those experiences. When they experienced powerlessness, sometimes they tried to accommodate their feelings and rationalize with their needs, such as “we need to accumulate work experiences.”

Rachel said:

What can I say? I need to accumulate work experiences. I need to stay here at least one year to accumulate work experiences.

Kandace said:

I need to accumulate work experiences. They count how long I work for the company by the year, not by the month. That is why I need to stick with a company even if I don’t like it. That really wastes my time, but I need to accumulate enough work experiences.

Conclusion and Recommendation

Feelings of powerlessness and frustration are common themes in these workers’ daily lives. According to Gherardi (1994), we are “doing gender” in our everyday work lives. For female clerical workers, some tacit norms exist in the organization, and that may explain why females were treated differently. The powerlessness I saw resulted from the limited nature of their powers, the unclear policies of their companies, and the manner in which the bosses treated their employees. There was too much office politics that they needed to observe if they wanted to break through the system. Since the bosses sometimes did not know what was going on, why should these newcomers—who are young college-educated clerical workers—do things differently? However, if they were too eager to change the system, sometimes they would lose even more power and experience more frustration. Listening to and understanding my participants, I accompanied them as they talked about the powerlessness what they faced and their confusion about the next stop in their lives.

This study has implications for both research and practice in human resource development. Listening to their voice can accumulate the knowledge of the female workers’ work experiences. To better understand their real life experiences can help us to reflect the concept of the human resource concept especially on female workers. To reveal their experiences can also help both Taiwanese practice and academics have insightful thoughts in female workers in Taiwan. In addition, this study provides opportunities to international human resource development field for
“vicarious experience” (Patton, 2001) in order to contribute to the social construction of knowledge. Further, this study serves a foundation on which to build theory in Taiwan, which is interest to Taiwanese HRD practitioners, researchers, and educators, as well as international HRD researchers.

Challenges and Strategies of Developing Human Resources in the Surge of Globalization: A Case of the People’s Republic of China

De Zhang

University of Minnesota

Yichi Zhang
Peking University

This paper analyzes challenges and strategies of human resource development (HRD) in China. As a developing country, China faces unique challenges at the age of globalization. Many HRD issues and problems come from economic reform, development, and globalization. The paper also identifies several effective HRD strategies that have been or will be implemented.

Keywords: Globalization, Developing Country, P. R. China

After nearly 15 years of negotiations, the People’s Republic of China (PRC) became a member of the World Trade Organization (WTO) on December 11, 2001. Most reactions to this news tend to be positive because many believe it is an inevitable event during the age of globalization. The WTO means different things for different people around different sections of the world. China’s leaders believe a WTO membership will lead to dramatic improvements in the health of its already growing economy and the standard of living for its people. For many multinational companies, China’s formal membership in WTO implies already promising investment opportunities. WTO entry means that Chinese tariffs will be cut on average from 24% to 9% by 2005, while most of the restrictions the state presently places on foreign companies will be lifted. House (2000) comments that whether a company is already in China or a newcomer, any enterprise with multinational aspirations is now looking in that direction.

Unaffected by the global economic slowdown, China is among the fastest growing economies in the world. Since economy reform launched in 1978, China’s economy has expanded at the annual growth rate around eight percent, and the country’s per capita income doubled every ten years, faster than almost any country in recent history. At the same time, China’s economy has been increasingly become an important force of globalization. According to WTO’s statistics, China was the seventh leading exporter and the eighth largest importer of merchandise trade in 2000. China has been consistently one of the hottest investment spots in the world with annual foreign direct investment around US$40 billion (Ahlstrom, Bruton, & Chan, 2001).

As China has been successfully transforming its rigid social and economic systems and increasingly involved in the global economy, there tends to be a need to understand how the country has been managing and developing its human resources in the surge of globalization. It is both a theoretical and practical issue to identify challenges and strategies of developing human resources in developed and developing countries as well. Marquardt and Engel (1993) contend that human resource development (HRD) professionals are facing conflicting forces in the age of globalization: global vision and thinking versus local and culturally specific action and productivity. They maintain that HRD has been used as the lever for strategic success in the global economy.

Problem Statement

Globalization is not a new concept. There are increasing discussions about the effects of globalization on various aspects including human resource practice. Majority of the literature tends to examine the impacts of globalization from perspective of developed countries. Little is known or documented about the unique issues and challenges faced by developing countries. Given the current success of China’s economic reform and open-door policy, it will be a valuable work to analyze the impacts of globalization with China as a case. Atiyah (1992) comments that most conceptual and empirical studies in the field of management education and training are conducted in developed countries. HRD methods and techniques were also developed in organization based in these countries. Few studies have been conducted to investigate how these concepts and techniques are applicable to developing countries. Little has been documented about unique issues and challenges faced by developing countries in the age of globalization.

No systematic effort has been made to identify effective HRD strategies used by China in its modernization process started from its economic reform in early 1980s. The major purpose of this paper is to explore how globalization affects human resource development in China. It also identifies strategies that can be used for a developing country facing huge challenges of globalization in utilizing and developing its human resources.

This study has two implications. First, the modernization experience of China may be beneficial to other developing countries. Though China is the world's most populous country with own characteristics and each country has its unique developmental issues and challenges, most developing countries do share some common issues and similar histories such as Western imperial influences and lack of adequate financial and technological support. For example, one of the consistent human resource issues faced by many developing countries is brain drain (Payenne, 1985). Every year, thousands of well-trained professionals left their home countries in search of a life in developed countries. An investigation of Chinese HRD strategies and particularly its effective measures in attracting oversea professionals might offer practical implications of HRD strategies and policy making for other countries.

The second implication of this study is for HRD scholars and practitioners in developed countries. For scholars, the findings of this study will offer a global perspective, particularly issues and problems unique to developing countries. As an academic discipline, HRD field needs to include a broad range of theoretical perspectives and effective methods to address various issues in the face of globalization. For HRD practitioners who plan to work in the developing countries, it is important to be aware of some practical issues. Furthermore, it is also important for human resource professionals to recognize emerging strategies and policies of the country in which they work.

Research Questions

This study was designed to examine the impacts of globalization on a developing country's HRD practice with R. P. China as an example. The following research questions guided the study:

1. What are major challenges and issues faced by the P. R. China in the surge of globalization?
2. What are practical HRD strategies that have been used in the P. R. China as a developing country?
3. What are some viable HRD strategies that China can adopt in competing in the global economy?
4. What are some of the unique characteristics of HRD that have been demonstrated in a transitional economy from centrally planned to free market system?

Theoretical Framework

Most HRD theories and models are developed at the individual and the organizational levels, few of them were designed at the national level. We found that Baruch's (1995) framework of human resource management relating to the globalization was helpful in guiding our discussion. Baruch (1995) posits that the main aspect in global human resource management (HRM) is the need to move people between countries. Such movements happen in two categories: one is within multinational companies and the other is in migration on global scale. The proposed framework is called push/pull model because there are two kinds of driving forces: (1) one force that pushes human resources from their original countries; and (2) the other force that pulls human resources to the desired destination. This model consists of two groups of variables: three participants and three social factors. The participants in the model are individuals, organizations, and countries. The social factors are the economy, the law/rights and the culture. These social factors and three participants, together with their values, beliefs and needs, are involved in the process of global human resource, affecting and being affected by the participants’ decision on global business operation. The outcomes of such decision can be identified at individual, organizational, and country levels. In sum, Baruch's framework is a comprehensive model as it identifies three major participants and social factors that determine the process of global human resources. Although this framework was presented as an HRM, we think that it is suitable for the current study for the following two reasons. First, at present there tends to be no distinction between HRD and HRM in the P. R. China (McLean and McLean, 2001). Second, a theoretical framework with a global perspective of HRD has not yet been developed in the literature.

In order to identify major issues and challenges of globalization for a developing country as well as to outline strategies for growth, we also borrowed theories of developmental economy to guide the analysis. We take an emerging view that HRD is a strategic intervention to provide competitive advantages for organizations, industries, and nation states (Grieves, 2000).

Method

Two research methods were used to identify major challenges of globalization imposed on developing countries in general and China in particular, and to discover viable strategies of developing human resources at the national
level. The first method is the content analysis from the literature. A thorough literature search was conducted via current databases in business and education. The following key words were used either singularly or in combination during the search: "globalization", "human resource development", "developing country", and "P. R. China". Only those titles revealed in the search with relevant contents to the topic were analyzed and categorized.

The second method was a participants-observer approach. Three authors of this paper formed a research panel and shared their personal observations and experiences in developing the current article. The senior author of this paper is a professor of management in a Chinese university and has more than twenty years of experience in research and consulting in China. The second author is a native Chinese and currently teaching HRD in an American university, and frequently travels across the Pacific. The third author is a professor of management in a Chinese university and currently a visiting professor in an American university. All of the three authors are familiar with the HRD literatures in Chinese and English and have first hand experienced the impacts of economic reform and globalization. Three authors used modern technologies such as e-mail, fax, long-distance calls to communicate their ideas and form the current article.

The analysis of the data involved the content summary of literature and three researchers' personal reflection on the literature. All of three researchers participated in discussion and debate to generate emerging themes. Conclusions were drawn and speculations were made from these themes.

Issues and Challenges

The major challenges and opportunities have been emerging since China begun its economic reform in 1978. The economic reform and open-door policy has resulted in tremendous challenges due to three transitions: (1) from a centrally-planned to a market-oriented economy (2) from a rural and agricultural to an urban and industrialized country, and (3) from a closely self-contained society to an active participant in the global economy.

Challenges of Reform: Developing Market-Oriented Human Resources

The first major challenge for China to developing human resources stems from incompatible but co-existing economic systems. The traditional system is a centrally-planned one and established on the concept that the entire economy system is a large enterprise. While the traditional system is gradually vanishing, a free-market economic system has not yet been fully established. Under the traditional economic system, education, employment, property, production, supply of materials and markets were all arranged by government’s plan. Enterprises were subordinated to government administration and had little power in allocating resources and conduct long-term plans. There were two major types of employment: one was permanent employment (so-called “iron rice bowl”, i.e., secure lifelong employment) and the other was temporary. The overwhelming majority of the labor forces were permanent employees. With the reform of economic system, enterprises are given more autonomy to adjust market changes. Firms have gained the decision power in many human resource activities such as recruiting, training, and firing.

Even though the economic reform has been launched for more twenty years, traditional system has not been totally replaced and perhaps some of the elements will continue to exist. The dual systems have put challenges for Chinese managers. For instance, most new employees are normally hired on contract with newly created social security while the remaining permanent employees are still on the old system with special privilege (Zhu, 1995). A considerable portion of employees in state-owned enterprises (SOEs) has kept the mentality of traditional economy system by relying on the government or state agency assigning their jobs rather than actively participating in the labor market. Many enterprises, particularly those of state owned ones, are struggling in the new market economy and tend to neglect the importance of human resource development. A non-random survey of 100 firms revealed that only 5% of them increased their investment on training and development (Zhang, 1999).

China faces a trade-off between the full employment (the condition that the old system strived for) and the modernization (the system that was newly introduced for) (Warner, 1996). On one hand, modernization implies an increased efficiency and the utilization of fewer employees. On the other hand, China has an increasing workforce pool because of the huge population. It is estimated that China’s labor market is going to be added 11 million workforces every year during the next five years (Chen, 2000). Consequently China has to maintain a considerable growth rate in order to create considerable jobs that can absorb new workforces.

Another issue of great concern is the poor performance of the SOEs. A large number of former SEO workers are laid off from their jobs. A considerable number of workers are still employed but have no work to do (“Xia Gang”) with only portion of their basic wages. But these people have little experience in a competitive market environment and often exhibit poor work habits. While majority of them have broken their old “iron rice bowls” and still maintain the mentality of “being arranged by the government”, an increasing number of them have learned new
workers are drifting from the countryside to the cities looking for all kinds of job. It has been noticed that Zhu (1995) points out that the under-served floating population is an important problem. Each year millions of people in rural areas have few chances to be served. 49% of admission rate and representing 10.5% of the total population in the age group (Li, 2000). In 1999, college freshman recruitment doubled with 2.8 million students, resulting 4% of young Chinese that could get into college or university for higher education during the past few years. When the new China was established, 80% of the population were illiterate. Right now, 92% of adults complete the elementary education, 73% the secondary education (nine-year) (Minister of Education, 1999a). However, educational opportunities are very limited due to the huge population and the limited resources. There were about 4% of young Chinese that could get into college or university for higher education during the past few years (Ministry of Education, 1999b). In 1999, college freshman recruitment doubled with 2.8 million students, resulting 49% of admission rate and representing 10.5% of the total population in the age group (Li, 2000).

Since the reform, the government’s roles have changed and the labor market has been gradually established. The Labor Bureaus at various levels have changed their role of assigning workers to firms to introducing (or recommending). Different kinds of employment service agencies are introduced. While most people in urban areas can access many employment and skill development services, people in rural areas have few chances to be served. Zhu (1995) points out that the under-served floating population is an important problem. Each year millions of workers are drifting from the countryside to the cities looking for all kinds of job. It has been noticed that unemployment and a floating population might cause problem of social instability. Chang (1997) estimates that there are over 150 million of surplus workers in the countryside.

One major challenge that China faces in developing its human resources is the unbalance between natural resources and human resources across the regions. Ninety percent of the people are living in the east side while 94% of the country’s natural resources are located in the west (Chang, 1997). Different regions are in the different developmental stages and there exist a tremendous gap among the regions. While the east part of the country is concentrated on industrial firms with growing high-tech, the west region is relatively less developed.

Challenges of Globalization: Developing Competitive Human Resources

One of the major challenges that many developing countries face is that they have to compete the talent with developed countries. The United States is the country that obtains the most world talent. The employment-based immigrant in the USA ranged from 58,192 to 147,012 between 1990 and 1998, significantly higher than the figures in 80s (US Immigration and Naturalization Service, 2001). In 1998, INS admitted a total of 77,517 employment-based immigrants, and of which developing economies in Asia constituted largest suppliers (India, 8,694; China, 7,598; Korea, 4,030; and Taiwan, 2,366). Since the open-door policy was implemented in 1978, about 300,000 Chinese students went to Western countries for study only about 96,000 of them come back (Ministry of Education, 1999b). There is an increasing number of graduate students who went abroad. In 1998 there were 5.6% of the graduates with master degree or above went abroad, 1999’s figure was 7.74, and in 2000 that the figure reached
8.86%. Like many developing countries, China is facing the issue of brain-drain when it integrates with the global economy. Many Chinese students seek permanent residency in their host countries after having finished advanced degrees.

The globalization process has changed the arena for competing global human resources. Many multinational companies begin to establish their research institutes in China in order to utilize local talents (e.g., Intel, Microsoft, Motorola etc.). Chinese enterprises are facing tough competition with those well-established firms from the developed countries. Even many China-based foreign-invested enterprises (FIEs), normally offering much better compensation packages than the SOEs, also face the challenges of losing their brightest young manager to better avenues such as going to top MBA programs in the US (Melvin, 2000). In Chinese newspapers, it has been reported that the overall turnover rate in Beijing ranges from 12% to 30%. For those multinational companies including IBM, Motorola, the turnover rate is around 20%. An increasing number of high education institutions in the developed countries also take the advantage of globalization in order to take certain share of educational and training market in China (Chen, 2000). Some scholars point out that China will face a “zero distance competition” in the global human resource market after it enters into the WTO (Wu, 2001).

Experienced managers and professionals are in extreme shortage. Ahlstrom, Bruton and Chan (2001) report that foreign firms operating in China are facing a labor market with shortage of skilled individuals and increasing job mobility. Bjorkman and Lu (1999) conducted a study in 65 Chinese-Western joint ventures to investigate how these firms manage local managers and professionals. They conclude that the major challenge comes from the recruitment, development, motivation and retention of competent and high performing Chinese professionals and managers. It is revealed that a variety of western human resources management practices have been implemented in China. However, few Western companies make a total transfer of policies and practices from the foreign company's home country operations to the joint-venture firms.

As China moves to enter WTO, not all of Chinese managers are well prepared to lead their enterprises to enter into the global market (Anonymous, 2001). China has closed its door to the Western world so many years. The globalization brought managers with many issues such different cultures, languages, different social and political systems, and working values. Managers with international experiences and those who can communicate well in the global area are in real shortage. Yan and McLean (1997) noticed that Chinese had little cross-cultural education and tend to judge global issues on their own standards. Before the new China was established in 1949, the country suffered from famines, civil unrest, military defeats, and foreign occupation for almost a century. Most Chinese perceive to have been victimized by Western imperialism. It was until very recent that China launched economic reform and open-door policy, and consequently the country begun to regain its superpower position in the world.

Chinese managers and enterprises thus face a tremendous cultural barrier when they integrate the business with global marketplace because of social, cultural and historical factors.

Although Western-style management education has been introduced since early 1980s, there is a shortage of qualified managers. An effort to build up qualified managers was established through formal educational programs for business administration started in 1991. However, the development of management education tends to be slow and cannot meet the needs of growing market demands. Right now, only 56 universities have been authorized to award MBA degree. The whole country has awarded 7,142 MBAs by the summer of 2000, comparing to the figure of over 80,000 annually in the USA (Management in the 21st Century, 2001). Warner (1992) observed that the university management schools lack distinctive approach. Management education in China appears to have a less coherent strategy than that of developed countries. There is a critical shortage of trained managers and management educators in all of the Chinese business schools.

**Strategies of Developing Human Resources in Face of Globalization**

China has adopted a national strategy to revitalize the country based on science and education. Consensus seems to be established that human resource development is one of the vital factors promoting economic development and societal progress (Chen, 2000). There is a growing consensus among Chinese leaders, scholars and business executives that we are in the stage of globalization and the only competitive advantage that China has is its human resources. China has to be integrated into the global economic activity. If Chinese enterprises fail to integrate an international perspective, their ability to compete successfully in the global marketplace will continue to be encumbered. We have identified the following strategies of developing human resource in the face of globalization that have been implemented or should be used in China.

First of all, the government should spend great efforts in establishing adequate human resource policies and improving the current system in realizing its long-term objectives. When the market is gradually established, the governmental interventions into the enterprises should be kept in minimum. The main role for the governmental
agencies should be leading the economic growth and human resource development. For example, current laws and policies on education and human resources should be enhanced. During the past two year, private funded education is expanding rapidly. It is reported that there are over 45,000 non-governmental schools and 37 are higher education institutions (Chen, 2000). There are serious problems related to these private funded schools such as high tuition fees and low quality of teaching staff. Instead of direct intervention of the private institutions, government should rely more on the leverage of policy to guide the development of education and training market. It was reported that a new law is now under consideration by the legislature with regard to the private funded education institutions.

Other laws are also needed such as the funding for schools ranging from kindergartens to higher education institutions. The current funding sources tend to be ad hoc and rely on the senior leaders' commitment. The current primary minister committed an annual increase of 1% of the total expenditure of the central government on education since he took the position but it is not clear how long this increase will last and what percentage of the GDP on education is adequate. Laws regarding the financial responsibilities by central and local governments need to be established. The proportion of education expenditure out of GDP has been raised from 2.41% in 1995 to 2.79% in 1999 (Chen, 2000), but it is still considerable low comparing to 5% in all lower and middle income countries.

Second, there is a need to promote national wide efforts in lifelong learning and human resource development. Even though the term of human resource has been introduced for several years, a considerable number of enterprises fail to recognize the importance of lifelong learning and HRD. The generally used terms are "personnel management" (Ren Shi Guan Li) or "labor and personnel management" (Lao Dong Ren Shi Guan Li). The terminology of human resource has not been widely accepted and used for many enterprises, particularly those of state-owned ones. Warner (1997) notices that the notion of personnel management implies control and conformity with a stress on the value of work in the Chinese context. The notion of personnel management carries beliefs and philosophies of management in the traditional centrally planned economy. On the other hand, Western notion of human resource management and development tend to be linked to organizational effectiveness. Benham (1999) maintains that the difference between personnel administration and human resource management is more than semantics. The new concept calls for human resource department to be a strategic partner in transforming HR functions from a low-level expense center to a more visible and responsible investment center. He suggests that globalization is the key dimension of this transformation in incorporating the perspectives, customers, work values and laws of other countries into effective HR policies.

Third, efforts need to be made to improve the current education and social systems and to enhance the market of human resources. For example, a social security system has been gradually established and there are many areas need to be improved. Although the enrollment in formal higher education institutions has dramatically increased, educational opportunities are quite limited due to the large population. Government is still the dominant provider for all levels of education. Encouragement should be given to various social and private agencies in setting up different kinds of educational entities. All enterprises should be given certain tax incentives for their investments on training and development. Moreover, vigorous efforts are needed to standardize and legalize the human resource markets, particularly talent market. Those government sponsored educational institutions need to change traditional administration model and actively participate in the market. Competition needs to be introduced in education and training market to raise the quality.

Adequate HRD strategies need to be developed in accordance with other reform efforts and subsystems. For example, the current compensation policy in the SOEs does not match the HRD effort. Many talents quit their positions in the SOEs for more attractive opportunities once they receive some training and skill improvement. Consequently, some enterprises become training centers of other firms, especially their rivals. HRD strategies need to be consistent with other policies in order to develop the best and keep favorable talents.

Government sector must play an example role in developing human resources. In fact, local governments have set a benchmark for the training investment for firms. For instance, Beijing municipal government requires that 3.5% of the payroll should invest in employees' training activities each year.

Fourth, building an effective management education and training system, so it becomes a leading force in developing national human resources. The shortage of qualified and skilled management talent remains a major problem for many developing countries and China is no exception. The current direction and trends of reform and open-door practice make it very reasonable to expect a consistently increasing demand for training managers and formal management education (Warner, 1992). Formal programs such as MBA and EMBA have been developed in a speedy way during recent years to offer management education for upper- and middle-level executives. With the increase of international business, more and more multinational corporations and domestic companies as well are asking their executives to obtain MBAs. This type of formal management education can assist Chinese managers in understanding the global economy, developing new businesses, and preparing for increased competition in the face of globalization. University of Minnesota's Carlson School of Management has recently announced to launch an
executive MBA in China with Lingnan College of Zhongshan University (Hanson, 2001). It is the first MBA degree program offered by an American institute.

Because management education is relatively a new concept in China and the literature of management and there is also a lack of organizational research in China, management education should include theories and experiences from the developed countries with the consideration of Chinese contexts. Care should be taken in simply borrowing or “Westernization.” Bu and Mitchell (1992) presented a heuristic framework to help Western educators and consultants compare and contrast management in China and the West. They called for attention to particular national characteristics of China and substantial adjustment of both the contents and methods of management training used in the West. For example, Western organizational theories tend to neglect the role of the government. Such perspective has limited its relevance in a hierarchical and vertically-structured country. Moreover, Western management theories assign a much lower priority to the welfare of organizational members and society than the Eastern philosophy. The authors also list other factors that need to be taken into account including the impact of the traditional Chinese pedagogy and the different cognitive styles between the West and the East. It is concluded that Western management methods should be presented as no more than one possible approach to problems. Carlson School's approach to localize the MBA program is to have each course delivered in English by one faculty member from the Carlson School and one Chinese faculty member from the partner college.

Conclusions

As a developing country, China faces unique challenges at the age of globalization. We have analyzed issues and problems that result from economic reform, development, and globalization. Unlike those developed countries that have major interest in globalizing their products and services, China has to deal with issues from these sources simultaneously. Since the reform was launched in 1978, China has made a great effort to integrate its economy with global marketplace. The main challenge is to convert its huge population from a burden with the less educated status to fully developed human resources. The economy success in China during the past twenty years has proved that some strategies and practice are effective and viable for developing countries. As the country being increasingly integrated into global economy, China needs to pay more attention to its human resource strategies. We have identified several areas that are crucial for competing in the global market including: 1) improving human resource policies and structures, 2) promoting lifelong learning among all citizens, 3) developing human resource market, and 4) building effective management education and training system.

Contribution to New Knowledge of HRD

The above analysis about the impacts of globalization on HRD in a developing country provides a unique perspective in the field. McLean and McLean (2001) contend that HRD definition and practice vary across different countries. They conclude that HRD definition is influenced by a country's value system and many other contextual variables. This paper starts to identify some important contextual variables that shape a developing country's HRD strategy and thus will contribute to the HRD knowledge base.

The China is among the most successful countries that have experienced or been experiencing transition from a centrally planned to a free market economy. China has set an excellent example for many developing countries in terms of economic growth. There is certainly a need for analyzing China's experiences, which consequently will offer invaluable lessons and illuminations for those countries with similar social and cultural contexts. China's strategy of human resources development might be considered for adoption in other countries.

This paper contributes to new knowledge of human resource development by focusing on major challenges and common issues in a developing country. The paper identifies a number of unique issues and approaches that might be valuable for interested scholars to conduct further study. The Chinese approaches to HRD also might be valuable for international firms to adapt their human resource policies and practice in China. Many believe that human resource area is a key contributing factor for the difficulties faced by foreign companies operating in China (Weldon & Vanhacker, 1999; Wong et al., 1999). This paper suggests that foreign firms that are interested in operating in China need to understand many contextual variables that are unique in a transitional economy. As Bruton et al. (2000) have noticed, “Western human resource management techniques are useful in China, they need considerable adjustment for the local environment” (p. 11). This paper is a first step toward mapping out the major elements of human resource environment in China at a macro-level.

The findings of this study also provide valuable information for human resource professionals working for multinationals companies that have business in China. Many multinational companies have shifted their human resource practice from expatriate-heavy to local experts and talents (McComb, 1999), an increasing challenge comes from the strategies to develop and keep local managers with more socially and culturally relevant programs. Most
multinationals hire senior managers from the Asian-Pacific regions, usually from Hong Kong, Taiwan, or Singapore, with western managerial experiences as the pioneers in setting up their business in the P. R. China. Gradually, more and more local managers are getting into the mid to high-level positions. McComb (1999) predicts that the entry and middle-management levels of most foreign firms in China will consist entirely of local staff by 2009. There might be one or two Western expatriates working on a short-term base. Nevertheless, pushing too hard on localization sometimes causes problems. Melvin (2000) reports that many joint-ventures fail due to the local control of HR functions. Heenan and Reynolds (1975) analyzed several significant driving forces for localization including integration of key business decisions, intense competition for talent and need for managerial conduit. They observed that one of the key success factors for local human resource office is to maintain regional integrity and balance. Consequently, information about local issues and policies will provide foreign HR professionals better understandings about the host country. By outlining the uniqueness of HR characteristics in China, this paper suggests that future studies are needed to investigate effective techniques for maintain regional integrity and balance between foreign firms and local culture.

Succession Management in China and America: A Theoretical Comparison and Implications for Developing Global Human Resources

Baiyin Yang
University of Minnesota

Feng Lu
Peking University

This paper compares and contrasts succession management in China and America in the context of globalization. It is found that Chinese enterprises have different approaches to succession from the American counterparts. The paper then traces social and cultural influences on the succession management. It is concluded that even though succession management is a crucial HRD function, the process of knowledge transfer during the succession of senior management has been neglected in the literature. The paper also offers several propositions for future empirically-based study.

Keywords: Global Human Resources, Succession Management, P. R. China

Succession management, or sometimes is called succession planning, is one of the major functions of human resource planning. It is also considered as one of the important career development practices in human resource development (DeSimone & Harris, 1998). Succession management is a major activity for management development. DeSimone and Harris contend that the succession planning is usually done for senior management positions. Senior managers are required to identify employees who should be developed to replace them in this process.

Liebman, Bruer and Maki (1996) differentiate the concept of succession management from succession planning. They maintain that succession management is a way to move succession planning to better serve organizations in a rapidly changing environment. Proper succession management should include the identification of the goal of the process and the creation of a cadre of candidates who have the competencies needed to work in a senior management team. It is posited that senior management needs more than simply-to-identify individuals to replace them. More important part of the succession management is the development side. Senior management needs to identify developmental opportunities, to create challenging assignments that are central to business, to build a team/network orientation, and to mentor and serve as a role model for those who are being developed.

Problem Statement

Given the increasingly impacts of globalization on human resource activities, a better understanding of succession management in different countries would be helpful. Bartlett and Ghoshal (1998) observe that the success of globalization depends much on the capacity of local human resources to respond to individual national markets. Based on a survey research conducted for nine multinational companies, they concluded that human capital investment is the key to success. The headquarters-based management of the multinational companies could provide only basic technology and management systems. Investment and working capital can be procured either at home or abroad, but a large number of employees and managers have to be recruited, trained, developed and motivated in each of subsidiary nations to meet national market requirements. The benefits of building a business in the Chinese market are enormous. Over the past few years, a number of multinationals have made investments in the hundreds of millions of dollars in China. There are many success stories of investing the world’s most populous country. For example, a recent issue of Far Eastern Economic Review reported that America-based photo specialist Eastman Kodak held 63% of China’s roll-film market, up from single digits a decade ago (Gilley, 2001). It is, thus, not a surprise to see the movement of “localization” in many multinational companies (McComb, 1999). Most multinationals hired Hong Kong or Taiwan-born Chinese with western managerial experiences as the pioneers in setting up their business in the mainland China. Gradually, more and more local managers are getting into the mid to high-level positions. One major reason for the localization comes from the assumption that local managers should have better understanding about culture and other context related aspects. Studies have shown that higher rates of localization lead to higher profits (McComb, 1999). Another reason is the regulatory environment. As multinational

Copyright © 2002 Baiyin Yang and Feng Lu
companies have introduced new products to China, officials' expectations concerning product quality have been raised. Having people based in China makes it easier to demonstrate to the local officials that the company's products meet specifications and standards (Walfish, 2001).

While many multinational companies have shifted their human resource practice from expatriate-heavy to local experts and talents, an increasing challenge comes from the strategies to develop and keep local managers with more socially and culturally relevant programs. Literature in global human resource development seems to lack of discussion on succession management in the context of cross-country business. Siemer (1995) argues that organizations have not traditionally paid much attention to international staffing issues in general and expatriate executive succession in particular. There has been little academic research on expatriate top management succession in foreign operations. Little is known about the uniqueness of traditional Chinese way of succession management. It is one of the theoretical interests for the HRD field to examine the social and cultural differences in succession management between Western and Eastern countries. Purpose of this paper is to compare and contrast succession management theory and practice in China and America. The paper also seeks to draw implications for human resource development by revealing social and cultural influences on succession management.

The following research questions were imposed to guide the current study:
1. What are the major characteristics of succession management in America and China respectively?
2. Are theories and practices of succession management in China different from that in the United States?
4. What are the social and cultural factors that influence succession management in different cultural contexts?
5. What are the roles of human resource development in succession management?

Theoretical Framework

The theoretical framework that guided this study was based on a model of cross-cultural study of organization as presented in Figure 1 (Yang & Zhang, 2001). This framework posits that human resource theory and practice is part of organization theory and practice. It suggests that cultural and social variables are in the dynamic relationship and they have direct impacts on human resource theory and practice. On one hand, HR theory and practice is part of broadly defined organizational behavior. Cultural orientations and social variables determine organizational behaviors in general and human resource practice in particular. On the other hand, organizational behavior has a reinforcement function that perpetuates its contexts such as cultural and social structures.

Figure 1. A Theoretical Framework of Cross-Cultural Study of Organizational Behavior

The above theoretical framework has been used to compare Western and Chinese human resource theory and practice (Yang & Zhang, 2001). It was argued that organizational behaviors are largely determined by social and cultural factors.

Method

The method used in this study was a conceptual analysis based on a review of related cross-cultural research and human resource literature both in English and Chinese.

It is the purpose of this paper to compare succession management theory and practice in American and Chinese
contexts. Through the means of literature review, analysis and synthesis of related succession theories and concepts are presented in four parts. The first part discusses succession theory and practice in the United States. The second part highlights characteristics of succession management in China. The third part presents major differences in succession management between the two countries and identifies social and cultural influences. Finally, the fourth part offers some conclusions and possible implications of the insights gained from this paper for HRD research and practice.

Findings

Succession Management in the United States

Literature on succession management in the USA tends to center around several issues. First, there is a frequent debate about the preferable source of top management successions (external vs. internal). Proponents of internal successions emphasize the importance of continuity (Carlson, 1961; Chung, Lubatkin, Rogers, & Owes, 1987). It is assumed that insiders’ greater knowledge of the firm and their established network will facilitate a smooth transition and stability. It is also believed that internal successions promote loyalty. Low to mid level managers tend to be loyal and commit to the company because of the opportunities of upward mobility. External successions have been prescribed as a remedy for firm difficulties (Helmich & Brown, 1972; Datta & Guthrie, 1994). Studies suggest that organizations that are performing poorly or wish to change strategic direction are more likely to select executive successors from outside the organization (Guthrie & Datta, 1992; Helmich & Brown, 1972; Schwartz & Menon, 1985; Virany & Tushman, 1986).

Ocasio (1999) analyzed the competing risks of insider versus outsider CEO succession in U.S. industrial corporations and suggested that boards rely on both past precedents and formal internal labor markets for executive succession and the selection of insiders versus outsiders as CEOs. Lauterbach, Vu and Weisberg (1999) examined 165 top management successions in the US firms and revealed that external successions are more likely in small firms, in poorly performed firms, and in firms that offer several top positions.

The second heavily studied area is the relation between succession and firm’s financial performance. LaSalle, Jones and Jain (1993) demonstrate that executive succession is related to both firm success and the likelihood of accounting changes. Mahajan and Lummer (1993) examine the impact of various types of changes in senior corporate management on shareholder value. Evidence has been revealed that instability resulting from executive succession adversely affects organizational performance. The market has demonstrated a clear preference for a change in composition of the previous management team over its further entrenchment. Studies have shown that external succession tends to have positive and significant effects on investors’ expectations (Lubatkin, Chung, Rogers, & Owes, 1989).

The third area of research interest in the literature of succession management is the successor’s specialization and experience. Because inertial pressures make it difficult for organizations to adapt their strategies and structures in response to environmental changes, organizations may attempt to overcome these inertial tendencies is by selecting executive successors with different career specializations than their predecessors. White, Smith and Barnett (1997) argue that different specialization may enable the executive successors to better cope with changing environmental contingencies. A study conducted by these researchers suggests that organizations often chose successors with different career specializations than their predecessors, and that previous corporate strategy was a relatively poor predictor of successors’ specializations.

The fourth research area tends to focus on the outcomes of senior management succession. Denis, Langley and Pineault (2000) propose a framework of succession outcome for senior management based on socialization and role theory. They argue that the integration of new leader and the organization may lead to four possible types of integration outcomes: assimilation, transformation, accommodation and parallelism. Studies have been conducted to examine the effects of succession on a wide range of outcomes, including growth (Helmich, 1974), financial performance (Beaty & Zajac, 1987; Lauterbach et al., 1999; Reinganum, 1985; Virany, Tushman & Romanelli, 1992), organizational mortality (Carroll, 1984; Haveman, 1993; Singh, House & Tucker, 1986), structural changes and strategy-making (Miller, 1993).

The fifth approach to the studies on succession management is to examine the social and political contexts that affect the succession process. Drazin and Rao (1999) investigated factors that influence the succession among strategic business units (SBU) managers of open-ended mutual funds. The results showed that the main effects of tenure, portion of revenues controlled, managerial exits and entries, and leverage on succession. Mediating effects were found for tenure, portion of revenues controlled, market share, leverage, and managerial exits, but not for managerial entries. Kakabadse and Kakabadse (2001) identified five critical considerations for executive succession:
the need to respect context, effectively managing the dynamics of top teams, being realistic about the transition experience, and hiring search consultants who challenge and establishing a cadre platform.

Succession Management in China

Succession management has become a major issue that many Chinese enterprises have to face nowadays (Chen, 2000). There are two major types of enterprises: state-owned enterprises and private-owned enterprises. For the state-owned enterprises, succession management is conducted by responsible government agencies and party office. For the private-owned enterprises, succession management tends to be ad hoc. After 20 years' opening and reform, the elites of first generation in many of Chinese enterprises basically fulfilled the historical task either based on their age or on their talents. Facing an increasingly competitive world, they must seek out the successors who can carry on and run the painstakingly built-up business of them successfully. It is an extremely urgent yet difficult issue with distinctive Chinese feature.

Even though there is an increasing demand for theory to guide managerial practice, study of organizational behavior and leadership is in its infant stage in China (Lu, 1999). In comparison with the Western leadership theory, China’s leadership theory differs greatly from the form to the content, especially in its nature (Peng, 1987; Wang, 1992). Studies on succession management are also in the initial stage. One of the main reasons for the stagnation of China’s enterprise leadership theory is that in Chinese traditional ideology, the word “leader” has something more to do with politics. The following analysis attempts to identify research interests and major issues of succession management in the Chinese enterprises.

The first research field is related to the government’s role-playing. The selections for the leaders of large and medium state-owned enterprises are normally carried out by the local government (Chen, 2000), normally without a professional organization to arrange for the selection of the successors. For example, in 1996, Shanghai government began to administrate enterprise leaders based on different industrial categories and different firm scales, to lay down job specifications for the management to compete the post, to invent diversified ways for running the post, and to build up management talents market. The government agencies are also responsible for the arrangements of the training and evaluation of the management. Candidates for senior management are normally sent to party school (“Dang Xiao” in Chinese) to get adequate training. The leaders of the state-owned enterprises are said to be another kind of administrative officials rather than entrepreneurs (Qin, 2001).

In addition, government behavior usually carries the will of the high-level officials and the top officials normally make the final decision for succession selection. Subjectivity does no good for the handing over of the enterprises (Chinese Industry and Commercial Times, 2001). The former CEO of Sichuan Changhong Electronic Company, the largest TV manufacturer in China, Ni Runfeng, has been transferred to another job because of his incapability to accomplish the task. His successor, the new CEO, is forced to leave the office after taking up the post for less than eight months. Because all of the decision-making are done by the government, the profit of the company has been negatively influenced. In such situation, political influence and consideration of social harmony have been over weighed the organizational financial performance.

There are several issues related the current succession management practice. One of the key problems in China's succession management lies in the lack of system and policy guarantee. Therefore, in the succession management of senior management, how to precisely position the function of the government has become a very important research topic.

The second issue extended from the first one is what the criteria for selecting a CEO and other senior managers are. In the state-owned enterprises, the government does the job of selecting. Therefore, "from the viewpoint of China and the Party's long-term interests, the successful selection of the successors turns to be the major as well as the most difficult and urgent issue in the organization work" (Chen, 2000). The traditional selection criterion is a combination of virtue and competency while the former one is always given heavier weights. After the economic reform was launched, Deng Xiaoping outlined four major criterion for the selection and promotion of senior managers: "revolutionary, young, knowledgeable and professional." Among the above criterion, "revolutionary" holds in the first priority because "state-owned enterprise leaders are like the bridge and bond between the Party and government and the enterprise staff, linking them together like the middle part of a chain." (Economy Daily, 2000). The "professional" is the last to be considered, which is commonly known as "having both ability and political integrity". In the determination of the successor, the "political integrity" is normally put into the first place.

The third issue is about the source of the successors. The leaders in the state-owned enterprises are normally selected by the local government, which is basically endowed with strong regional feature. They are either selected from within the management team of the enterprises or from the local area. The best candidate or most qualified manager might be excluded for the consideration. Therefore, the government is like a large company while the
enterprises seem to be the departments of the company without adequate communication because of the lack of market for senior managers. Li (2001) points out that "the concept of the family has been and still is the behavior core of Chinese people handed down from the profound and richest culture soil... Familism or Pan-familism tendency is extremely similar in China's all sorts of organizations and units and exists extensively". The influence from culture has greatly determined the selection of the succession management. The selection of the successors from the inside of the enterprises has become the main source, but such practice has been questioned by some enterprises due to the lack of innovation (Yang, 2000). Therefore, the merits and shortcomings of selecting the successors from the inside or from the outside of the enterprises have not been fully examined in the Chinese enterprises. Little is clear about the determining elements that influence the succession.

The fourth issue is the particular phenomenon of "59-years phenomena" in Chinese enterprises. It means that in the year before retirement (Chinese enterprise leaders are mandated to retire at the age of 60), an increasing number of CEOs take advantage of their power to seek personal benefits. "Some managers can not gain the reward by what they contribute while in the post and they own almost nothing after their retirement" (Qu & Zhao, 2000). Therefore, the big gap in their income before and after the retirement pushes lots of people into the road of committing crime. Studies are needed to identify effective factors that establish adequate management incentive system to guarantee the successful handing over of the power.

Social and Cultural Influences on Succession Management

The above brief synthesis of the literature suggests considerable variations of succession management theories and practices between America and China. Such variations seem to be resulted from social and cultural differences. In the following section we will identify the social and cultural factors that determine the succession process in American and Chinese contexts. We will also summarize the findings by proposing a set of propositions for the future study.

First of all, in selecting candidates for senior management American enterprises tend to place heavy emphasis on previous performance and personal competence while their Chinese counterparts tend to emphasize virtue and faithfulness. The cultural influence on succession management is evident through the above analysis. Chinese traditional method of managerial selection has placed emphasis on virtue and morality ("De") above adequate competency ("Neng") and excellent performance ("Ji") (Warner, 1996; Yang & Zhang, 2001). Consequently, we suggest the following two propositions:

Proposition one: Candidates' virtue and faithfulness receive higher weights than technical competency and previous performance in the process of senior management succession in Chinese enterprises.

Proposition two: Candidates' technical competency and previous performance are placed with higher weights than virtue and faithfulness in the process of senior management succession in American enterprises.

Secondly, the social influences on the senior management succession are evident. In America, free-market oriented enterprise system has been established for hundreds of years. Accordingly, there are a body of literature on succession management and an increase in the number of empirical studies on this topic. Government plays minimum roles in economy and daily business of the enterprises. American enterprises enjoy considerably greater flexibility than their counterparts in China in decisions to expand capital plant, to lay off surplus workers, and to develop new products. Americans enjoy making their own personal decisions with minimum interference from the society and government. On the other hand, Chinese enterprises receive much greater influences from government and local politics. Such influences are placed not only for the state-owned enterprises but also for the private-owned enterprises. Consequently, we propose the third and fourth propositions:

Proposition three: Chinese enterprises receive greater influences on their senior management succession from government agencies and local politics than their American counterparts.

Proposition four: In the Chinese enterprises, successors with greater social and political connections and those with experiences in higher level of government agencies or broader social connections are more likely to perform better than those who are from inside and those who have fewer connections.

Thirdly, human resource development has played different roles in succession management between American and Chinese enterprises. Formal management development experiences and specialty in the enterprise's business have been considered as major factors in succession process in the American enterprises. On the other hand, management development is relatively a new concept in China. Traditionally, Chinese government mandates candidates for senior management to be educated in party school and to learn Marxist and Maoist principles (and some of such management education methods are still practicing). Management skills are supposed to gain through various ways of individual comprehension such on-the-job training, hands-on experience, and executive assistant experience. During the past several years, however, formal management development has gained increasing attention in China. Senior managers in large enterprises are more likely to access newly developed management education.
Proposition five: Small and private enterprises in China are more likely to have internal successors, particular from who have strong family and social connections, than larger enterprises and SOEs.

Proposition six: Large enterprises in China are more likely to have external successors, particularly those who have formal management education, than the smaller enterprises. And the external successors in the large Chinese enterprises are more likely to initiate changes in organizational structure and business strategy.

Conclusions and Implications

This paper compares the characteristics of succession management of America and China. The content analysis of the relevant literature revealed that there is a substantial body of literature on the topic of succession management. A number of empirical studies have been conducted to examine factors that are related to the succession process. On the other hand, Chinese literature on succession tends to concern about the lack of systematic study on succession management.

The content analysis suggests that Chinese enterprises tend to have different approaches to succession from their American counterparts. Factors of candidate's virtue, morality, social and political connections tend to be the major determinants for successors in Chinese enterprises. American enterprises tend to place higher weights on previous performance, specialty and strategic growth in selecting the candidates. There is no mentioning at all about candidates' virtue or morality in English literature. Such difference can be traced to different cultural backgrounds.

Research interests on the succession management between America and China are also different. In a well-developed free-market, financial performance (pre- and post-succession) appears to be the major interest for American enterprises and scholars. Chinese enterprises and scholars, however, are interested in how to establish valid succession management system. Because of the social and economic transformation, the succession management in Chinese enterprises tends to be ad hoc. Government agencies begin to lose their control power but are still able to maintain a considerable control.

There is little explicit discussion on the role of human resource development for succession management in the literature. Chinese enterprises tend to emphasize on the value of individual virtue and faithfulness and thus has established the party school system to educate senior executives. American enterprises value formal management development activities and individual specialty. Studies are needed to identify the impacts of management development on the succession process. Management development or related senior executive development programs are one of the major HRD activities. Surprisingly, no empirical study that examines the relationship between management development and senior management succession has been found. HRD professionals, particularly those who work in management development, certainly need to understand whether their programs have impacts on senior management succession. Or put in a simply research question: does greater learning in management development activity lead to better post-succession performance?

Succession is a process of transferring knowledge between two senior executives within the corporate world. Little is known on how adequate knowledge is transferred during this process. There is a need to investigate the knowledge transfer process during the succession. HRD professionals need to understand how their programs can facilitate succession management.

This paper contributes to the literature of human resource development by identifying characteristics and issues of succession management in America and China. First, this paper has a number of theoretical implications offering several propositions for future research. Furthermore, cross-cultural comparisons are value-added activities in the age of globalization. HRD scholars need to better understand the impacts of national culture and contexts on organizational behavior. Even though the process of globalization is speeding up in an unprecedented way, our cross-cultural understanding is limited. The recently terrorist attacks on the World Trade Center in New York city and the Pentagon demonstrate a tragedy partially attributed to misunderstanding. This paper also has implications for HRD practice by offering different perspectives and revealing different practice of senior management succession. As more and more multinational companies are entering into Chinese market and localizing their management, HRD professionals working for these firms need to better understand contextual variables. It is also more important to understand the historical contexts of the human resource practice in China and its dynamic development because the country is moving from a centrally-planned economy to a free-market system. For Chinese HRD scholars and practitioners, this paper offers an update on the research topics and common practice in the succession management and thus they can borrow some of those proved to be valid and effective practices.

Globalization has been generally controversial. This paper explains globalization from the perspective of Islam, which was intended to be a global religion. Some Moslem scholars are generally supportive of the process, while some authors are generally negative. Based on the Islamic work ethic and the reality of Islam's growth among diverse ethnic populations and into many countries of the world, the role of HRD is explored, recognizing that the movement toward globalization is inevitable.

Keywords: Globalization, Islam, Theory

The protests in Seattle (Protesters launch..., 1999) and Friedman's (2000) best-seller, The Lexus and the Olive Tree, popularized the debate about globalization. McLean (2001) recently argued, from a human resource development (HRD) perspective, that the movement to globalism is inevitable. Many people, however, including Moslems, are suspicious about this phenomenon and view it as a threat to their beliefs, traditions, culture, and even identity. Given the size of the Moslem religion and its rapid growth (Major religions..., 2001), it is important for the field of HRD to understand globalization from Moslem perspectives.

Statement of the Problem

In this paper we explore the meaning of globalization, with a particular emphasis on the global nature of Islam, emphasizing both historic and present-day perspectives. This includes a discussion of how Moslems view globalization and why some of them oppose it. Then, Islamic work-related values and ethics are discussed and implications for HRD, including OD, are presented. Given that much of HRD is offered within organizations that are moving toward globalization, such a question is critical for the field of HRD in understanding the context in which it operates.

What is Globalization?

While globalization emerged as a popular concept in the late 1980s, Friedman (2000) argued that it is a much older issue, perhaps as old as the invention of the wheel or sailboat that enabled movement across borders to do business, to conquer others, or to spread ethics and religion. Thus, Alexander the Great, the Romans, Moslems, and many others at some point established some form of globalization.

According to Friedman (2000), the invention of the steamship, telephone and telegraph, and the completion of railroad lines across countries in the mid-1800s to the late 1920s, caused the world to shrink from large to medium, while recent technologies, such as satellites, microchips, fiber optics, and the internet, have caused the world to shrink from medium to small. Schuh (1999) claimed that “globalization is rooted in three significant technological revolutions: ...transportation...communication...and...information technology” (p. 5).

Globalization seems to be a recent term. The etymology of the word shows that the earliest recorded use of the word, “globalize,” meaning “to make global” or “to make worldwide in scope or application,” was in 1944 (Mish, 1991, p. 521), probably during the International Trade Organization set up. While normally associated with doing business, it has to do with economic, political, cultural, educational, social, and behavioral aspects of human life. In its broader sense, it refers to the expansion of global linkages, the organization of social life on a global scale, and the growth of a global consciousness, perhaps, ultimately, to the consolidation of world society.

The following definitions represent current influential views and demonstrate how controversial the issue is.

1. "[T]he inexorable integration of markets, nation-states, and technologies to a degree never witnessed before—in a way that is enabling individuals, corporations and nation-states to reach around the world farther, faster, deeper and cheaper than ever before ... the spread of free-market capitalism to virtually every country in the world" (Friedman, 2000, pp. 7-8).

Copyright © 2002 Musa S. Rabba and Gary N. McLean
2. "A social process in which the constraints of geography on social and cultural arrangements recede and in which people become increasingly aware that they are receding" (Waters, 1995, p. 3).

3. "The historical transformation constituted by the sum of particular forms and instances of . . . [m]aking or being made global (i) by the active dissemination of practices, values, technology and other human products throughout the globe (ii) when global practices and so on exercise an increasing influence over people's lives (iii) when the globe serves as a focus for, or a premise in shaping, human activities" (Albrow, 1996, p. 88).

4. "Globalization of the economy is a new kind of corporate colonialism visited upon poor countries and the poor in rich countries" (Shiva, 2000).

While the economy is the dominant issue, there are other factors that make the impact of globalization much broader politically, socially, and culturally. Ideas, customs, and cultural movements all follow closely after the exchange of goods across boundaries. International trade has been the vehicle by which many religions, for example, have spread, including Islam and Buddhism to East and Southeast Asia along the Silk Road (Gonzales, undated).

Some Arab/Islamic writers, such as Amahzoon (2000), Odeh (2000), and Balqazeez (1998), have argued that this process might be termed "Americanization" or "McDonaldization." Others, like Amin (1999), Aruri (1999), and Hanafi (1998), have considered globalization to be an ongoing effort of the U.S. to dominate the world and achieve a global hegemony, organizing the world's economic, political, and military dimensions and promoting capitalism as the sole economic system.

Islam: A Global Religion

Islam is one of the monotheistic faiths, along with Judaism and Christianity. Although usually associated with the Arabs of the Middle East, only about 20% of Moslems are in fact Arabs (The World Factbook, 2001). According to Adherents.com (2001), Islam is the world's second largest religion, with nearly 1/5th of the world's population (1.3 billion) Moslem.

Islam from its beginning was considered a universal religion, valid for all times and all places. Even before his conquest of Makkah (Mecca), Muhammad approached all of the potentates in Arabia, inviting them to adopt Islam. The early Moslems branched out like a bush fire. Upon Muhammad's death, his successors enthusiastically started a continuous process of globalizing the world, spreading the new faith among people of various ethnic backgrounds. In the early days of Islam, merchandise and interaction with Moslem traders was the main factor for the spread of the new theology.

Although revealed in Arabic, the Quran explicitly portrays the global nature of Islam since it is addressed to all human beings regardless of their color, race, language, ethnic background, or culture. The following verses from the Holy Quran clearly support this argument:

1. "We sent thee not, but as a Mercy for all creatures" (The Prophets: 21:107).
2. "Verily this is no less than a Message to (all) the Worlds" (The Overthrowing: 81:27).
3. "We have not sent thee but as a universal (Messenger) to men, giving them glad tidings, and warning them (against sin), but most men understand not" (Saba: 34:28).

The sayings of the Prophet Mohammad (Hadeeth) support his international message: "Every Prophet used to be sent to his nation only, but I have been sent to all mankind" (Saheeh Al Bukhari: Volume 1, Book 7, Number 331).

The weakness of the once great Moslem state encouraged other nations to invade, leading, for example, to the Crusades in 1095 and subsequently during the next few centuries. Further reductions in Moslem influence occurred with the 1258 invasion of Baghdad by the Mongols. The Turks, who had already adopted Islam, established the Ottoman Empire. It reached its peak in size and splendor under the sultan, Suleiman the Magnificent, who ruled vast areas in Asia, Africa, and Europe from 1520 to 1566. However, encouraged by the weakness of the Ottoman Empire, Europeans started the preliminary development of globalization by colonizing most of the Islamic world during the 19th century. Thus, it was Christianity's turn for global dominance. England controlled world trade, and English colonies were found all over the world. Many Arabs and Moslems underwent a westernization process that transformed their individual behaviors, arts, curricula, media, economy, law, clothing, food, and habits.

Arab/Islamic countries have followed two different paths: some countries, such as Egypt, Syria, and Iraq, chose to embrace protective economic practices, while others, including the rich oil countries, Jordan, and Lebanon, opted to be involved more widely in the western business world. However, during the three decades that followed, globalization has flooded almost all Arab/Islamic nations. Many Arab states, including Egypt, Bahrain, Kuwait, Mauritania, Morocco, Qatar, Tunisia, the United Arab Emirates, and Jordan, have signed the GATT agreement. The world's political leadership and transnational corporations celebrated the recent passage of the Uruguay Round of GATT (General Agreement on Tariffs and Trade), with its associated WTO (World Trade Organization). "The new rising tide will lift all boats" has become the dominant economic-political homily of our time (Mander, 1996).
Globalization in the Eyes of Moslems

Most published Moslem scholars identified who have addressed globalization lean towards opposition. Yet, Moslems in general can be categorized into opponents, supporters, and those with a neutral position.

Opposition

Those who oppose globalization, usually conservatives, consider it to be a western invasion via trade, media, and the internet. Supporters are concerned with the exploitation of workers, environmental impact, and disturbance of income distribution. They are concerned about the future of Third World countries. They believe that such countries will become exporters of cheap goods to satisfy the needs of western markets but will have to import their food from the west in return. They believe that globalization penetrates all cultural, political, religious, traditional, and economic structures, with the aim of removing barriers to the free flow of uncensored information.

Amahzoon (2000) argued that globalization is a continuation of the wars initiated by Alexander the Great and resumed by the Crusaders—a war in which bombs, guns, and airplanes are replaced by words, terms, and web pages. This war is launched softly while pretending to spread glittering issues, such as democracy and human rights.

Opponents of globalization have called for preventive measures against satellite TV and the internet, both of which are considered plagues, but how can this be controlled today? There have been calls to boycott U.S. products and encourage the purchase of local products, especially food and clothes; and to remove satellite dishes from the roofs, but the response has been limited. Will people turn their backs on current trends and live in isolation? Nothing can stop globalization as it can enter any house anywhere with the permission only of the occupants.

The real question is whether all our boats are floating? Do benefits go to a minority of people while the rest of humanity is left landless and homeless? Are the only boats that will be lifted those of owners and managers? “This tide shall raise the yachts of the rich and may swallow the boats of the poor” (Mander, 1996). Even in the United States, the gap between the poor and the rich continues to widen (Madsen, 1998).

Among many arguments about the misuse of economic theory to support globalization, Alloush (2000) argued that a true laissez-faire approach necessitates that labor be also allowed to sell its services anywhere in the world. This means that if TNC’s should be allowed to invest and sell freely in the Third World, workers and professionals from the Third World should be allowed to freely travel to work in North America, Europe, and Japan. In fact, while capital has become increasingly mobile, and while goods, services, and information are exchanged across international borders at higher rates than ever, restrictions on the migration of labor have increased.

There are many Moslems who believe that, by embracing Islam as a way of life, wealth will be guaranteed by the Creator who said, “If the people of the towns had but believed and feared Allah, We should indeed have opened out to them (All kinds of) blessings from heaven and earth....” (The Holy Quran, 7:96). This is historically true because, about fifty years after the death of Prophet Muhammad, it was difficult to find a needy person to collect the Zakat (the alms), one of the five pillars of Islam. The contributions are taken in spiritual fulfillment for purification purposes. In Islam, the rich can become richer and that will be hailed and blessed by the poor who know that they are going to get their share and thus hide no envy or bad feelings. The concern, today, though, is whether those who profit from globalization will be willing to share their Zakat with the poor.

Today, many Moslems, as well as the majority of the world, watch American movies, listen to American music, speak with an American accent, dance to American tunes, wear American jeans, drink American soft drinks, and eat American junk food, after having learned to distinguish, through the globalizing media, the trademarks of American brand names. This has created tension within traditional Moslem societies, such as allowing youth access to vastly different world views. Fascinated by the shiny new trends, young people started to turn their back on their cultural and ethical heritage. The spread of fast food restaurants is a real concern in the Islamic world. Odeh (2000) drew attention to the social and cultural damage that follows the spread of hamburgers and special delivery service. Ismail, Rateeb, and Ismail (2000) warned that many young Saudis queuing for hamburgers, fried chicken, ice cream, and doughnuts at fast food restaurants know nothing about the many once famous Saudi traditional dishes.

Supporters

Those who fully support globalization are usually those who financially benefit from the use of the new technology, freedom, transportation, and means of communication to find cheaper products or new markets. Courses on how to handle e-commerce have become available in many parts of the Islamic/Arab world. Many large companies may soon have no place in the emerging global arena. Unless they go global themselves, they will vanish
in this highly competitive world, taking with them not only the investments and profits, but also the employment opportunities for their workers. Thus, many argue that globalization is good for businesses, employees, and the countries in which they operate. They think that their companies should decide to go global for reasons similar to those suggested by McLean (2001): new markets, economies of scale, production efficiency, access to the world talent pool, technologies, and competitive resources, among others. Supporters also include liberal/non-conservative advocates who encourage secularism and advocate whatever is new in life, and who are inclined to oppose their traditions, thinking that these traditions are the reason for the lack of modernization in their societies.

Neutral

The third group takes a neutral stand. It views globalization as a double-edged sword, whose onward march can never be stopped. As in the case with the internet and satellite dishes, one has to be eclectic and choose what suits his or her objectives and needs. Islam encourages scientific research and inventions that benefit humanity as the first verse that was ever revealed said in a direct order: “Proclaim! (or read!) in the name of thy Lord and Cherisher, Who created” (The Holy Quran 96:1). Sheikhs (theology scholars) cannot forbid the use of the internet, videos, or TVs because they can be either used or misused, and it is up to individuals to decide how to use them.

Although he has dedicated much of his book to discussing the dangers and vices of globalization, Bakkar (2000) did argue that globalization provides great opportunities for measuring Islamic nations’ achievements against those of others, allows benefits from others’ achievements, helps in identifying what can be improved in the Islamic culture, and provides an excellent tool for the propagation efforts and spread of Islam. Agreeing that globalization is a sweeping process whose forward march can never be stopped, he stated that only when God permits a catastrophic accident to the whole universe, such as an atomic war or a severe climate change, will globalization be stopped. As with others in the Arab/Islamic World, he called for common grounds among Moslems so as to face the negative effects of globalization by enhancing deep faith in Allah and the hereafter, consultation with Islamic rulings in every aspect of life, and by reviving basic Islamic values, such as generosity, openhandedness, sacrifice, asceticism in this world and williness for the hereafter, care of relatives on the maternal side, respect for human rights, cooperation, enjoining Al-Ma’ruf (i.e., Islamic monotheism and all that Islam orders one to do), forbidding Al-Munkar (polytheism and disbelief in all that Islam has forbidden), justice, consultancy, indulgence, and kindness to the needy. A similar approach is held by Al-Osaimi (2001) who ends his article, dedicated to discussing the drawbacks of the WTO, by stating that no one can deny the merits of joining the WTO, such as lowering living costs due to decreases in customs duties, easier passage of exports from the developing countries to the advanced ones, and less burden for merchants due to unification of trading procedures, and surprisingly concluded by calling for hasty joining of the WTO as that will indirectly unify all Moslem countries.

HRD in the Islamic World

Faced by a globally changing world, leaders and scholars have begun to realize the importance of human capital or resources and are giving them more value than natural resources. Dr. Mahathir Muhammad, Prime Minister of Malaysia (Ahmed, n. d.), said: “In our desire to move vigorously ahead, nothing is more important than the development of human resources....It is blindingly clear that the most important resource of any nation must be talents, skills, creativity, and will of its people.” Ajarimah (2001) stated that the “implications of this shift from physical to human resources have far reaching effects for national and local leadership” and that “leaders at all levels, in all organizations, need to put human resources at the heart of their strategic planning and day-to-day operations” (p. 16). In fact, government five-year plans in several Islamic states have explicitly called for upgrading the knowledge and skills of the labor force, promotion of managerial competence and initiatives, and other HRD issues. Likewise, large companies, like Saudi Aramco, the major Saudi oil company and one of the biggest in the world, allocate large portions of their annual budgets to the training and development of their human assets.

Islamic Work-Related Values

Nobody can deny the effect of values, beliefs, and norms on the individual’s work and management style. Since Islam is very influential in the daily practices of its followers, it can be taken as a framework for HRD. The following work-related issues can be found as characteristic of Islam:

- Equality before God. Islam promotes the concept that all people are equal and the off-spring of the first couple, Adam and Eve: “O mankind! We created you from a single (pair) of a male and a female, and made you into nations and tribes, that ye may know each other…” (Holy Quran: al-Hujurat 49:13).
Solidarity and unity of the group, whether at work or in society; Al Bukhari narrated the Prophet's saying, "You see the believers as regards their being merciful among themselves and showing love among themselves and being kind, resembling one body, so that, if any part of the body is not well, then the whole body shares the sleeplessness (insomnia) and fever with it" (Saheeh Al Bukhari: Volume 8, Book 73, Number 40).

Overall change in organizations is not possible unless it is intrinsic and self-driven: "...Verily never will Allah change the condition of a people until they change it themselves (with their own souls)." (Holy Quran: The Thunder: 13:11).

Wrong discretionary decisions are rewarded, not punished. Moslems believe that, if one is confronted with a situation where a person has to make a decision and makes the right one, then there will be two rewards: once for making the decision and another for being right; otherwise, the person will still be rewarded for trying. This encourages people to act on their initiative.

Learning (self-development) is an ongoing process and mandatory. Each Moslem is asked to seek knowledge from cradle to tomb and to seek even in China, the farthest place for the early Moslems.

Individual accountability, according to Ajarimah (2001), falls under the concept of itqan, which translates as high quality or perfection. He argued that "Islamic culture teaches that ‘itqan’ is to be pursued in every action taken without any exception" and that "in some modern-day business operations this term is used synonymously with total quality management (TQM)" (p. 10).

Encouragement of consultation (Shoura) at all levels of decision making emerges from the Prophet being ordered to consult with his followers on every affair in the Quran. "Pass over (their faults), and ask (Allah's) forgiveness for them; and consult them in the affairs" (Holy Quran: Al-Imran 3:159). Furthermore, the believers are described as "... those who answer the Call of their Lord and perform As-Salat (prayers), and who (conduct) their affairs by mutual consultation" (Holy Quran: Ash-Shura: 42:38).

Individual responsibility within a framework of cooperation with others supports the value of teamwork as an engine of survival and prosperity. Ajarimah (2001) stated that "many verses in the holy Quran admonish the faithful to work together in harmony while assuming their individual responsibility with due consideration given to accountability as well" (p. 10).

Kind treatment of subordinates with family-like relationships with them.

Fatalism but with individual responsibility. Moslems believe that their fate is in the hands of their Creator. They are ordered to address all possible causes and take all precautions when performing a task, but when something happens that is outside one's control, it is attributed to fate.

Commitments to honor, honesty, respect for parents and older persons, loyalty to one’s primary group, hospitality, and generosity are held deeply by a majority of the population (Ali, 1996).

Responsibility for others is supported by the Prophet, who stated that each one is a (shepherd) who is accountable in front of God for whatever he or she supervises.

Sherif (Tayeb, 2000) identified nobility, patience, self-discipline, good appearance, abstinence, resolve, sincerity, truthfulness, servitude, and trust as major Islamic values, but he provided no implications for the workplace. In addition, Endot (Tayeb, 2000) identified 11 major values of Islam that lead to a "respectable nation": trustworthiness, responsibility, sincerity, discipline, dedication, diligence, cleanliness, co-operation, good conduct, gratefulness, and moderation. These values have consequences for organizations and are incorporated by the Malaysian government as part of its Islamization policy.

Islamic work values prevail on the micro and macro levels. Certain organizations in Malaysia are reported to have placed a great emphasis on worship. In one company, Endot (Tayeb, 2000) found that "management urged their subordinates to understand that they were accountable for their work not only to the organization, but to God (Allah), and that their work was considered by Islam as a form of worship of God." This implication has tremendous potential effect on the individual's conduct at work. There is a stereotype that the work ethic is weak in countries where Islam dominates. Unfortunately, this is true of many Moslems who underwent a kind of westernization process or those who have been exposed to other cultures.

Implications for HRD

Opponents of globalization are pretty sure that this process with its merits and defects cannot be stopped as it has become inevitable. We cannot stop the internet and throw the satellite dishes off the roofs of all the people. Thus, HRD practitioners in the Islamic world have a role to play in helping their people absorb globalization and benefit from it. One major role would be to create learning organizations. Related to this is the task of changing the type of training that is still dominant in the region. Globalization requires systematic, not haphazard, on-the-job training and
self-development to provide highly skilled workers. Bakkar (2000) argued that Moslems can never develop their countries unless they encourage scientific research, which requires a major change in curricula and delivery methods at schools, hence a major change in the education system. Workers, supervisors, and managers should receive training to prepare them for thinking and acting globally. Encouraging global mindsets is necessary not only for strategic planning, but also for training that enables workers to deal with other workers from other countries.

Based on the work values discussed above, the following implications can be useful for global companies that plan to do business in the Islamic world, especially for their HRD professionals:

- Hiring employees who strongly support the IWE means hiring employees who believe in hard work, cooperation and competitiveness in the workplace, meeting deadlines, and justice and generosity in the workplace.
- Understanding managerial values will help organizations in assigning the right person to the right managerial role. When there is an alignment between managers' and organizational values, there will be a greater chance for organizational goal attainment and success.
- Having similar value systems allows people to work more harmoniously and be more satisfied with their jobs. HRD will need to develop similar values in their employees (Hunt & At-Tawajri, 1996).
- Developing managers with global value systems and mindsets is critical as more companies in Islamic countries move to become global. This involves strategic thinking on a global level with regard to markets, resources, and clients. Such companies should change the role of their HRD officers to be more strategic in creating a process for development of their human assets. Workers need to be intrinsically receptive to change.
- Planning proactively to be ready to deal with complexity and ambiguity, which are characteristic of the global marketplace, is essential.
- Constantly learning requires the use of all available resources. Self-development and learning, especially of soft skills, should be incorporated into work processes using coaches when necessary. Lifelong learning and self-development can be encouraged not only as a requirement for job survival, but also as religious fulfillment.
- Developing the ability to work in environments where hierarchy is dissolving supports teamwork.
- Developing skills in forming virtual teams via e-mail, phones or videoconferencing is important.
- Taking charge of developing core competencies will help define the companies themselves. These competencies may change according to the emerging needs in the changing global market.
- Making on-the-spot business decisions without having to wait for instructions from headquarters will assist in meeting the challenge of short cycle times imposed by global competition and fast technology. This requires that empowerment, decision making, risk taking, and innovation be embedded in the work processes, keeping in mind that Moslems expect to be rewarded even for making the wrong decision.
- Working with solidarity in mind clearly implies a shift from task-based to process-oriented training. It also requires training in common team skills and systems thinking.
- Establishing incentives for high achievers through special recognition and reward programs will retain such employees.
- Continually developing workers to be multi-skilled, re-skilled, and even become teachers who are ready to teach and certify other employees in a learning organization setting.
- Freely and easily communicating with anyone throughout the company is supported by Moslem values.
- Inspiring workers by finding ways to retain intellectual capital.
- Developing employee multilingual capability will meet the growing demand for an international language. While English dominates international business and technology, Arabic is an option for globalizing within Moslem countries, such as Malaysia, Pakistan, Saudi Arabia, Jordan, Bangladesh, etc.
- Addressing the loss of skills from retiring employees has become critical as many retirees who have accumulated wisdom are forced to leave their jobs to open vacancies for young ones.

In addition, Ali (1996) suggested that strong commitment to the IWE has the following implications for OD practitioners:

- First, emphasis on hard work, meeting deadlines, and persistence in securing work supports establishment of a timetable and the clarification of goals and responsibilities are essential for carrying out successful change interventions. In a culture where saving face is important, meeting OD goals takes on an added value.
- Second, work is viewed not as an end in itself but as a means of fostering personal growth and social relationships. In this context, group interactions and team activities, if designed appropriately, could result in the optimal facilitation of intended changes. Moslems tend to have very good relationships, and social links after work can be fostered and utilized for the benefit of the job.
- Third, dedication to work and creativity are seen as virtues. OD practitioners should utilize these values in their interventions.
Fourth, justice and generosity in the workplace are necessary conditions for society's welfare. This has three implications:

1. The OD practitioner must show that he/she is attentive to and concerned about human needs.
2. Social skills and effective public relations are essential to the success of a change intervention. Once commitment is obtained, there will be smooth implementation.
3. Goals for change should be directed towards serving the community or the society as a whole. OD practitioners should demonstrate the fruits of the results to both the organization and the society. (See also McLean & McLean, 2001, for more on the role of HRD in community or society building.)

Finally, the IWE places more emphasis on intention than on results. Thus, the OD practitioner should articulate change goals and make sure that personal interests are not pursued at the expense of the group or community. This point is consistent with a core OD value favoring a process orientation over a results orientation.

HRD professionals who work for global companies will face difficult ethical questions. Should one work for an organization that makes money by paying low wages in a developing country, takes advantage of low labor costs and few labor laws (e.g., health and safety, child protection, etc.), or ignores the environment? Should one choose to work from within the organization, hoping to influence the organization to improve its treatment of employees, or should one choose to resign in protest (knowing that the organization will continue regardless and probably without change)?

HRD's role in answering these questions can be found in McLean (2001) who suggested that HRD can support globalization while working to minimize exploitation. He stated that, given the value systems that exist within HRD, and in OD in particular, HRD professionals can serve as a conscience to an organization that does not understand the implications of exploitative actions. This does not insure that such activities will not take place, but it does help to know that someone does have the ethical task.

(p. 360)

Recommendations and Conclusion

Globalization is not a temporary phase, and its effects and consequences are going to last forever. In addition, the impact of globalization on nations is not the same; it varies from nation to nation. Europeans, for example, may benefit from globalization because they share many of the same roots, values, and opportunities as U.S. Americans, while the gap between the Islamic culture and that of U.S. Americans is vast.

This review cries for the collection of empirical data, both quantitative and qualitative. How do Moslems in various country cultures feel about the issues related to globalization? How do these views differ from views held by those from other religious backgrounds and from other countries? Do religious and country cultures affect how people feel about solutions to the concerns about globalization? Such research will add considerably to the debate presented here.

Opposition to globalization is not unique to Moslems. Yet, Islamic companies should go global to find a place under the sun. Moslems possess the ethics and values that can influence the globe as they did a few centuries ago. Concerns of those who oppose globalization should be respected, but implications to sail with the tide—not against it—are to be encouraged. Finally, the interesting paradox of globalization is that this paper could not have been written had there been no access to the many useful articles on the web, as is obvious from the references, and the ease with which the authors could share drafts through the internet.

New Technologies, Cognitive Demands and the Implications for Learning Theory

Richard J. Torraco  
University of Nebraska

The cognitive demands of new technologies are poorly understood for many reasons. This paper identifies the cognitive demands of tasks involving the use of new technologies. The paper examines how well theories of learning address these cognitive demands. Four theories—those of Scribner, Schon, Wenger, and Hutchins—are analyzed for their power to explain human cognition and learning as they relate to the use of new technologies. Finally, the implications of this study for further research on theory building and the role of technology in augmenting human performance are discussed.

Keywords: Theory Building, Cognitive Demands, Learning Theories

New technologies have been shown to place unique cognitive demands on those who use them. Four specific characteristics of tasks involving the use of new technologies have been identified. They are contingent versus deterministic tasks, distancing technologies, stochastic events, and systemic interdependence.

- **Contingent versus deterministic tasks.** When applied to what were once routine, predictable tasks (deterministic tasks), new technologies have substantially increased the contingency of these tasks by reducing their transparency and increasing their speed. Technicians and customers can no longer see the flow of information and materials and must infer from outputs what occurred earlier in the work process (Pentland, 1997).

- **Distancing technologies** such as digital displays, controls, and sensor technologies, remove the operator from the operating location and eliminate the physical cues and sentient information from which knowledge can be derived (Woods, O'Brien, and Hanes, 1987; Zuboff, 1988).

- **Stochastic events** are randomly occurring and unpredictable events that are properties of new technologies (Weick, 1990) and flexible manufacturing systems (Norros, 1996). Dealing with the disruptions from new technologies increases the cognitive demands placed on technicians who must use them.

- **Systemic interdependence** is the system of relationships needed to assure that one’s work is coordinated with the work of others (Adler, 1986).

Each of these task characteristics places unique cognitive demands on those who use new technologies. The cognitive demands of these task characteristics are discussed next and summarized in Table 1. (See Table 1., The Cognitive Demands of Task Characteristics).

<table>
<thead>
<tr>
<th>Task Characteristics</th>
<th>Cognitive Demands</th>
</tr>
</thead>
</table>
| Contingent versus Deterministic Tasks | - Mental reconstruction of problem and causes  
                                     | - Capability for systematic search and pragmatic solutions  
                                     | - Ability to go beyond scripted procedures |
| Distancing Technologies      | - Capabilities for inference, imagination, and mental modeling to understand what is going on elsewhere  
                                     | - Reconciliation of mental representation of work process with actual work process |
| Stochastic Events            | - Movement from emotional arousal to constructive thought and action  
                                     | - Memory (information storage and retrieval) to reconsider means-ends relationships and desired end-states  
                                     | - Improvisation—the abilities of the bricoleur |
| Systemic Interdependence     | - Interpersonal skills  
                                     | - Transactive memory |

Cognitive demands of contingent tasks. New technologies have substantially increased task contingency by reducing their transparency, increasing their speed, and expanding the menu of options available for task accomplishment. Work processes that were formerly separate and observable have been combined through process engineering (Davenport, 1993) and have disappeared into computer-controlled machines and communication technology (Weick, 1990). Technicians and customers can no longer see the flow of information and materials and must infer from outputs what occurred earlier in the work process. New technology also feeds social pressures for rapid transactions, especially in customer service situations. Pre-determined procedures are frequently abandoned to expedite customer requests. As witnessed in equipment repair (Orr, 1996), software support (Pentland, 1997), science laboratories (Barley and Bechky, 1994), insurance claim processing (Wenger, 1999), automobile assembly (Graham, 1993), and military operations (Weick and Roberts, 1993; Hutchins, 1995), new technologies have made technical tasks more contingent than ever.

Since technical work is filled with novel or poorly defined problems that cannot be fully anticipated in advance (Barley and Orr, 1997), technicians are often confronted by technology breakdowns of ambiguous origins that cannot be resolved with schematics and procedural knowledge alone. Since their problemsolving algorithms are inadequate for the variety and unpredictability of these problems, technicians must rely instead on pragmatic rules of thumb and other short cuts afforded by the task environment. To understand and respond to ambiguous situations, workers must make use of improvised materials, local conditions, and social circumstances, thus deploying contingent work strategies that reflect the changing properties of the task environment.

Cognitive demands of distancing technologies. Distancing technologies are present in work environments ranging from industrial factories (Zuboff, 1988) to high technology settings (Pentland, 1997). Digital displays, controls, and sensor technologies at the operator's workstation are symbolic representations that distance workers from the physical and sensory referents present at the actual sites of operation. In the pulp and paper mills studied by Zuboff, instrumentation formerly was located on or close to the operating equipment, allowing the operator to combine data from an instrument reading with data from his or her own senses. Distancing technologies removed the operator from the operating location and eliminated the physical cues and sentient information in which knowledge was based. The problems created by physical distance are magnified by the computer controls of most distancing technologies that display indicators on separate screens of a computer monitor. To recognize irregular patterns among the data or to initiate novel search sequences, the technician must remember what earlier screens have shown and hope that the readings have not changed while subsequent screens are accessed. However, human factors research has shown that it is easier to recognize patterns when data are presented simultaneously rather than serially. Technicians in production control rooms who use this technology can easily create novel search sequences when they are able to sweep visually across an array of dials that present data at the lowest level of detail (Woods, O'Brien, and Hanes, 1987).

Separation from the operating environment requires workers to interpret symbolic, electronically-presented data. This increases cognitive demands to understand what is going on at remote operating sites. Software support technicians and production control room operators have to imagine the conditions in the operating environment that cannot be displayed by their information systems. Before attempting to solve problems, they must first mentally visualize the conditions the give rise to the problems Thus, the physical and psychological separation created by distancing technologies increases cognitive demands for inference, imagination, and mental modeling to understand what is happening elsewhere.

Cognitive demands of stochastic events. Complexity is added to the task when it is interrupted by stochastic events. Stochastic events are randomly occurring and unpredictable events that are properties of new technologies (Weick, 1990) and flexible manufacturing systems (Norros, 1996). When new technologies are implemented in industrial work processes they frequently produce system disturbances to which operators must respond, even though they have not yet developed expertise in the use of these technologies (Norros, 1996). Today's technologies present problems due to their instability, reduced transparency, and tendency to breakdown. For example, many software-dependent systems are intentionally pushed through product development and quickly delivered to market. Product testing is short-circuited since implementation is often the means by which the technology itself is designed. Such development-delivery tradeoffs result in "buggy" software, incomplete information networks, and password-activated technologies that won't start. Dealing with the disruptions from unfinished technologies and prototypes increases the cognitive demands placed on technicians who must use them.

When a sudden, unpredictable event disrupts a task, it triggers emotional arousal (Weick, 1990). Once emotion is stimulated it increases as long as the interruption goes unexplained, especially when work stoppage is costly or risky. Stochastic events require rapid movement from emotion to action—from arousal, to the search for explanations, to actions that produce information about possible causes. This occurs as the worker tries to subdue emotional interference with thought and action.
Cognitive demands of systemic interdependence. The interdependencies needed to assure that one's work is coordinated the work of others have been termed systemic interdependence by Adler (1986). Systemic interdependence requires "ongoing and flexible integration of hitherto distinct functions of operations, systems, design, and training. The reciprocal nature of this interdependence in operations is exemplified in the reliance on common databases. Users thereby become dependent on others' data input accuracy" (p. 19).

Systemic interdependence requires interpersonal skills and the ability to work effectively with others on the same project despite different social and technical backgrounds. Such interdependence is strengthened through the use of transactive memory systems (Wegner, Erber and Raymond, 1991). Transactive memory is based on the premise that we need not know a particular subject ourselves if we know where to find information about it. Transactive memory systems are integrated and differentiated structures in which related information is held by different group members. It is the sharing of relevant data that yields the higher-order insights and generalizations that are valued in these work environments.

These four task characteristics—contingent versus deterministic tasks, distancing technologies, stochastic events, and systemic interdependence—place unique cognitive demands on those who use them. How well do current theories of learning address these cognitive demands? The next section discusses the extent to which four selected theories explain human cognition and learning as they relate to the use of new technologies.

Theories of Learning and the Cognitive Demands of New Technologies

The theories of Scribner (Tobach et al, 1997), Schon (1983, 1987), Wenger (1998), and Hutchins (1995) are analyzed for their power to explain learning processes related to new technologies in the following sections.

Scribner's model of practical thinking at work. Scribner used activity theory as developed by Leont'ev (1981) to bridge the conceptual relationship between knowing and doing in her cognitive studies of work. Scribner's model of practical thinking is strongly influenced by the notion of activities as mediators of knowing and doing. The collection of Scribner's cognitive studies of work concludes with a paper that presents her model of practical thinking (Tobach et al, 1997). The model is organized around four principles synthesized from Scribner's studies of dairy workers (Scribner, 1984), industrial machinists (Martin and Scribner, 1991), bartenders (Scribner and Beach, 1993), indigenous literacy in West Africa (Scribner and Cole, 1981), and practical and theoretical arithmetic (Scribner and Fahmeier, 1983). Scribner's research sought support for the premise that cognitive skills take shape in the course of participation in socially organized practices. Her results are embodied in the four principles of her model: (a) economy of effort functioned as a criterion distinguishing skilled from amateur performance. The "least-effort strategy" was consistently followed whether mental or physical effort was minimized and regardless of resource constraints in the work environment; (b) problem-solving strategies were dependent on specific knowledge about materials and conditions in the immediate task environment; (c) diversity and flexibility of solution modes distinguished expert problem-solvers from beginners; (d) more experienced workers replaced all-purpose algorithms with a menu of solution modes fitted to properties of specific problems in changing environments. Scribner summarized the four principles in this way: "Thinking in the dairy was goal-directed and regulated by a principle of economy which, operating under changing conditions and on the basis of knowledge and information in the environment, generated flexible solution procedures adapted to particular occasions of use" (Tobach, 1997, p. 380).

Scribner's work and the cognitive demands of new technologies. Scribner's work demonstrated that workers seek pragmatic solutions through economy of effort regardless of the contingent or deterministic structure of the task. Her study of working intelligence (Scribner, 1984) fully accounts for task unpredictability and the need to go beyond scripted procedures to accommodate the changing demands of the task environment. For example, since each dairy order was different, delivery drivers modified their problem framing and arithmetic solutions to conform to the benefits of either their calculators or paper and pencil computations. Ways of solving problems followed means of arriving at solutions.

Scribner's model emphasizes that successful work strategies are goal-directed and vary adaptively with the changing properties of the problems and resources encountered by workers in the task environment. It explains how workers might respond to stochastic events by relying on flexible solution strategies and improvising with available tools and materials. Task disruptions might trigger the reassessment of means-ends relationships and solutions would reflect Scribner's concept of mental and physical effort saving. Contextual factors would strongly influence how workers in a production environment learn and adapt their skills on-the-job.

Scribner's model was developed twenty years ago before technologies considered new today were developed. While today's workers may use Scribner's least-effort strategies and context-specific solutions, it is unclear how well Scribner's model of practical thinking would address the cognitive demands of new satellite or internet-based
distancing technologies or explain the roles of inference and mental modeling to enable more effectively use these technologies.

Schon's theory of reflection-in-action. Schon (1983) argued for a new epistemology of practice that takes as its point of departure the competence and artistry already embedded in skilful practice—especially, the reflection-in-action through which professionals think about what they are doing while they are doing it. Reflection-in-action is a theory of learning that explains how reflective practitioners use knowledge and problem solving in their work. Reflection-in-action is an iterative process that moves through (a) assessment of the situation, (b) testing of one's preliminary sense of the problem through experiments, (c) examination of results, and (d) reassessment leading to another cycle of problem reformulation. Learning occurs through an iterative process of purposeful actions, discovered consequences, implications, reassessments, and further actions. We conduct experiments to examine the validity of our judgments and, in the process, expose ourselves to new possibilities for learning. According to Schon (1983), "the situation talks back, the practitioner listens, and as he appreciates what he hears, he reframes the situation once again" (p. 131). This theory of learning prompted Schon to raise a critical question: What kind of professional education would be appropriate to an epistemology of practice based on reflection-in-action?

His subsequent work (Schon, 1987) answered this question by proposing that university-based professional schools should learn from such deviant traditions of education for practice as studios of art and design, conservatories of music and dance, athletic coaching, and apprenticeship in the crafts, all of which emphasize coaching and learning by doing. Professional education, Schon argued, should be redesigned to combine the teaching of applied science with coaching in the use of reflection-in-action strategies. He proposed a generalized educational setting, the reflective practicum, as a model for professional development in which learning occurs by doing, with the help of coaching, especially through a dialogue of reciprocal reflection-in-action between coach and student.

The reflective practicum is a methodology for implementing reflection-in-action in the sense that it brings together the necessary material and contextual resources, along with the coach's personal and technical support for critical reflection. It provides an environment in which students can learn by doing, not simply through trial and error, but through critical reflection as students are coached in reflection-in-action strategies.

Reflection-in-action begins with a situation that yields spontaneous routinized responses. As long as the situation appears normal, our responses are tacit and spontaneously delivered without conscious deliberation. Yet routine responses sometimes produce a surprise—an unexpected outcome, pleasant or unpleasant, that does not fit our present knowledge schema. This unexpected consequence triggers reflection. We think about the consequence and ponder why it occurred and, at the same time, we ask "How have I been thinking about this?" Our thoughts turn back on the surprising phenomenon and, at the same time, back on itself. Thus, reflection-in-action is a critical function through which we consciously or unconsciously question the assumptions of our present knowledge.

Schon's work and the cognitive demands of new technologies. Schon's theory accounts for contingent tasks by acknowledging that professionals are frequently confronted by novel situations and must construct their interpretations and responses accordingly. Schon recognized that procedural knowledge and problem solving algorithms have limited applications in practice, where most problems are contextual and difficult to predict. The capability for reflection-in-action addresses these cognitive demands by allowing workers to bypass scripted procedures to arrive at solutions for problems that cannot be fully anticipated in advance.

Reflection-in-action also explains the cognitive processes needed to respond effectively to stochastic events. A sudden disruption arouses emotion and triggers reassessment of means-ends relationships. Schon's discussion of mental experimentation explains how workers might respond to a sudden systems failure by probing the unexpected disruption, forming a tentative understanding of the event, testing their understanding, and reframing the problem to arrive at a solution. Thus, workers respond to emergent situations by constructing new knowledge through reflection-in-action.

Although Schon's theory can be used to explain how workers meet these cognitive demands, its applicability to non-professionals and in non-university settings is less apparent. Schon's theory reconceptualized teaching and learning in the professions. What about technicians, supervisors, and skilled personnel who may not be considered "professionals?" Are these people considered capable of learning through "reflection-in-action?" In addition, Schon's work provided a new model of education for university-based professional schools. What about the learning that occurs outside of schools as one develops on the job? Does Schon's model for educating the reflective practitioner apply to learning in the workplace that may occur after a university-based education? These questions remain unanswered.

Communities-of-Practice. Communities-of-practice are informal associations of workers who share common work problems and seek the benefits of learning from one another. In such communities, learning occurs primarily through participation in social practice (Wenger, 1998). Underlying communities-of-practice as an observable...
phenomenon is Wenger's theory of social learning. The theory embodied in communities-of-practice builds on previous work in social learning theory and situated cognition. Social learning theory explains learning as a product of the reciprocal interactions among behavior, cognition, and environmental factors. Learning can occur directly, especially when one's learning self-efficacy is high, or vicariously through behavior modeling by others (Bandura, 1977). Situated cognition starts with engagement in the activity itself, not with a preconceived model of how learning should occur. Situated cognition follows an "activity—perception—representation" model, in which the cognitive dynamics of learning appear less open to the predetermined knowledge schemas that are dominant in formal instruction (Brown, Collins and Duguid, 1989). When people lack experience with a situation or are introduced to a new concept, presenting a relevant model may catalyze the formation of mental representations of what is learned. Along with new perceptions and relevant past experiences, the model becomes part of the present context for learning, in which the learner's activities and perceptions precede mental representation.

Four constructs comprise the framework for Wenger's theory of learning: practice—the shared historical and social resources, frameworks, and perspectives that can sustain mutual engagement in action; community—the social configurations in which our enterprises are defined as worth pursuing and our participation is recognizable as competence; identity—how learning changes who we are and creates personal histories of becoming in the context of our communities; and meaning—the ability to experience our life and world as meaningful. Wenger's assumptions about learning and the nature of knowledge include the premise that meaning—our ability to experience the world and our engagement with it as meaningful—is ultimately what learning is to produce. Another assumption that grounds communities-of-practice is that engagement in social practice is the fundamental process by which we learn and so become who we are. Thus, communities-of-practice provides a broad conceptual framework for thinking about learning as a process of social participation.

The concept of practice is carefully defined by Wenger as experiences that include both the explicit and the tacit. Practice involves the language, tools, documents, images, symbols, well-defined roles, specified criteria, codified procedures, regulations, and contracts that various practices make explicit for a variety of purposes. But it also includes the implicit relations, tacit conventions, subtle cues, untold rules of thumb, and so on. Most of these are never articulated, yet they are unmistakable signs of membership in communities of practice and are crucial to the success of their organizations. Learning in practice addresses the need for members to acquire skills and information, but learning goes beyond gaining competence. Members use competence to form an identity of participation. "Practice connotes doing, but not just doing in and of itself. It is doing in a historical and social context that gives structure and meaning to what we do. In this sense, practice is always social practice" (p. 47).

Identity in a community is fostered by allowing members to participate peripherally, yet legitimately in practice. Legitimacy and peripheral participation in practice are often mutually exclusive. Newcomers seeking to participate in the work of a community of practice are granted peripherality (for example, as students) but denied legitimacy. Conversely, newcomers may be granted legitimacy but are denied the opportunity for development through peripheral participation. The periphery of practice is not only an important site for learning, but it can be a valuable source of innovation. Sustaining the peripherality of members' perspectives is sought increasingly as a way to generate fresh insights into current practice and new directions for the future.

Wenger's work and the cognitive demands of new technologies. Participation in communities-of-practice allows each member to draw on collective knowledge to construct responses to unanticipated or poorly-structured problems. Wenger illustrates his theory with ethnographic accounts of insurance claims processors who had to respond to customers' questions about claims coverage given only standardized forms and procedures and without full knowledge of how contested claims were ultimately resolved. The tasks they faced were made more contingent by customers' concerns about co-payments and company concerns about overpayments, especially in cases of multiple coverage. Workers tried to make sense of these ambiguous situations primarily through social configurations—the networks that claims processors spontaneously formed with each other, not by following claims processing procedures. Communities-of-practice allowed workers to go beyond standardized procedures and reach pragmatic solutions through mutual engagement.

The creation of identity is at the core of how communities-of-practice enable members to meet the cognitive demands of new technologies. Wenger maintains that who we are and what we can do are transformed through the process of becoming members of communities-of-practice. Identity and membership permit further engagement in social practice and access to collective knowledge. Although a member may lack specific knowledge about a problem, communities-of-practice provide collective knowledge that enables a response to the unpredictability and ambiguity of new technology (Orr, 1996). Legitimate peripheral participation (Lave and Wenger, 1991) and identity (Wenger, 1998) allow members of communities-of-practice to share the insights and generalizations that help them meet the cognitive demands of new technologies (Weick and Roberts, 1993).
Although Wenger's theory addresses the cognitive demands of new technologies, other questions about the theory remain unanswered. The theory's main concepts—meaning, identity, community, and practice—are defined as vehicles through which individuals can find fulfillment through their membership in communities of practice. Each is defined in a personal way as a phenomenon that, if experienced as part of a community of practice, can change who we are and how we interpret the world around us. However, there is an intimacy about communities of practice that seems removed from the realities of work and the turmoil of the marketplace—the environment in which communities of practice must survive. In this way, the theory does not fully explain organizations as system in which the learning of members is directly influenced by the demands of forces and stakeholders external to the system.

Cultural cognition. Hutchins (1995) conceptualized cognition as a complex phenomenon in which practice, learning, and the work environment are all simultaneously transformed. "The very same processes that constitute the conduct of activity and that produce changes in the individual practitioners of navigation also produce changes in the social, material, and conceptual aspects of the setting" (p. 374). These changes occur at different rates and degrees of intensity and reflect histories of different lengths, but they all intersect during any moment in human practice. In the course of task performance, learning occurs and these activities create elements of representational structure (for example, written notes or an improvised tool) that survive beyond the end of the task. It is because these processes interact simultaneously that Hutchins considers cognition at work a fundamentally cultural process.

Hutchins argues that as sociocultural systems, work environments have cognitive properties that are distinct from the cognition of those who perform the work. He confronts contemporary thinking in cognitive science by challenging the adequacy of symbolic processing alone to explain how we use cognitive abilities to solve environmental problems: "Notice that when the symbols are in the environment of the human and the human is manipulating the symbols, the cognitive properties of the human are not the same as the properties of the system that is made up of the human in interaction with these symbols. The properties of the human in interaction with the system produce some kind of computation. But that does not mean that the computation is happening inside the person's head" (p. 361). This appreciation that knowledge can only be created through human interaction with the sociocultural system is the foundation for Hutchins' theory of cognition.

Hutchins' work and the cognitive demands of new technologies. Hutchins opens Cognition in the Wild (1995) by describing a stochastic event—the USS Palau loses all power and risks running aground in a narrow channel while entering San Diego harbor. Only through expert navigational skills and some luck is the crew able to recover the vessel and safely come to anchor.

To meet the cognitive demands of these situations, workers must quickly overcome emotional arousal and construct solutions from procedural knowledge, environmental short-cuts and bricolage (Levi-Strauss, 1966). Hutchins shows that this process is strongly shaped by the tools and techniques of practice, themselves historically-developed. Learning is made easier in work settings where tools are used in public and the details of technology are observable, as they are in the practice of navigation. Hutchins describes how the difficulty of piloting large ships is made easier by implementing the fix cycle—a series of procedures in which representations of the position of the ship in its environment are propagated across a series of representational media from initial telescope sightings to correcting of the ship's course. These tools transform the task of navigators by mapping it into a domain, using the navigation chart and other artifacts, where the answer or the path to the solution is apparent.

The fix cycle illustrates a central premise of Hutchins' theory of cultural cognition—the cognitive demands of complex tasks are best met by using technology to simplify the task, not to amplify cognitive ability. Illustrating the same point, Norman (1997) gives the example of using a computer for writing. Instead of designing computers and software programs to help the author create ideas with dialog boxes, menu choices, and other symbolic clutter, the computer should be used as a word processor to simplify the output process. Rather than extending one's cognitive abilities, technology should transform what are normally difficult cognitive tasks into easy ones.

Implications for Further Research

This study has several implications for future research. This section summarizes key ideas from the preceding discussion and offers directions for future research on theory building.

Some features of sound theories. The four theories of learning discussed in this paper provide comprehensive and meaningful explanations of learning at work. Why is this? Considering the need to reflect the workplace, what are the features of a good theory of learning? Five features of the learning theories covered in this paper are summarized next.

Each theory describes specific cognitive processes. Schon describes the dynamic of learning as iterative cycles of reflection-in-action. Hutchins explains learning as a sociocultural process that occurs simultaneously with the
activities of practice and changes in the environment. Scribner described the specific solution strategies that were devised by experienced workers. Wenger described how learning in practice is generated by the dynamic tension between experience and competence. All four theories describe specific cognitive processes and clearly explain how learning relates to other aspects of the theory.

Each theory addresses learning as an enabler and product of work practices. Rather than treating either learning or work practice as dominant, each theory reflects their reciprocal relationship by grounding learning in the conduct of practice. Work practice is one of four central concepts in Wenger’s theory of social learning; Schon proposed the reflective practicum as the setting to operationalize his theory; Scribner showed how cognitive skills were dependent on the materials and conditions of practice; and Hutchins proposed practice as the intersection of work activity, learning and the environment, where all are simultaneously transformed.

Each theory explains how learning occurs in authentic work settings. Each theorist relied on ethnography or intimate knowledge of practice to describe the work settings and define the tasks in which learning was studied. None of the studies from which these theories were derived were purely theoretical or carried out in laboratories or other experimental settings.

Each theory is comprehensive in its treatment of the behavioral and environmental influences on learning. These theories include concepts that cover the full range of ways in which working knowledge is created and used. Each theory accounts for personal and experiential knowledge, knowledge derived from practice-specific tools, techniques, and conditions, knowledge from relationships with others, and knowledge associated with the larger system, organization, or environment.

Each theory offers propositions that can be generalized to other settings. Although each theory is based in studies of specific work environments and occupations, all theories offer principles of learning that have been applied elsewhere. Scribner’s “least-effort strategy” has been demonstrated in non-industrial settings (Scribner and Cole, 1981; Scribner and Fahrmeier, 1983). Schon’s reflection-in-action has been applied to the preparation of architects, urban planners, artists, musicians, and athletes (Schon, 1987). Wenger’s theory has been used to explain communities-of-practice among photocopier repair technicians (Orr, 1996), refrigeration technicians (Henning, 1998), and insurance claims processors (Wenger, 1998). Hutchins’ work has been applied to airline pilots (Hutchins and Klausen, 1996) and to the design of the human-computer interface (Hutchins, Hollan and Norman, 1986).

These five features of the learning theories discussed in this paper provide a template for developing better theories of learning. In addition to the criteria for evaluating theory offered by Bacharach (1989), Patterson (1983), and Whetten (1989) that can be applied to all theories, the features listed above are specifically applicable to theories intended to model the dynamics of learning and working.

A Study of Technology Transfer for Thai Workers in Thailand

Palapan Kampan
Boon-Anan Phinaitrup
National Institute Development Administration

The paper will show how to make an effort toward the transfer of technology as major issue in Thai manufactures. The paper intends to provide some insights into the transfer of technology from skilled foreign workers to Thai workers in Thailand. The managers, government, and educators have played an essential support role in the transfer of technology and have encouraged Thai workers to absorb and adapt the new technology.

Keywords: Transfer of Technology, Skilled Labor, Training

Since industries in Thailand are growing, there is an increasing need for the transfer of technology from overseas. Thailand wants to approach industrialization with an open-economy and to promote exports. In order to do this; many researchers have recognized the importance of obtaining the appropriate technology. Chantramonklasi (1994) stated that the transfer of technology could assist the country in achieving its economic goals and could also improve the standard of living of Thai people. The government has also strongly promoted foreign investment in the industry. For instance, the government has provided some training programs, has promoted industries, reduced taxes, established government units such as the Board of Investment (BOI) to look after foreign investment, and has promoted exports. In addition, the government has encouraged some high technology small businesses, which need the most modern technology in order to manufacture goods or provide service. This means that the investment policy of the government is increasingly concerned with the entry of domestic firms into the industrial market. The country needs to invest in innovative Thai industries, which must compete worldwide, and also to encourage more technology transfer.

Such an investment policy is needed in order to convince foreigners to invest in Thailand. Some concern has been voiced regarding the investment policy of the Thai government, which allows foreign labor to work here. Firstly, there are more and more foreign workers coming into the country and this means Thai workers have less opportunity to get a job. The second concern is that the transfer of technology has not been accrued including the limited transfer of technology for local staff. Yet another concern is the scarcity of skilled local labor and the restrictions found in technology transfer agreements imposed by technology suppliers.

Unfortunately, few studies have looked specifically at how technology has been transferred to Thai skilled-workers. Some studies reported that Thai people were poorly trained. The manufacturer may be aware of the technology requirements for established products but it is still difficult to obtain or develop new product design. In addition, some studies have shown that even where information on technology is available, lack of relevant skills and low levels of education make the use of new technology difficult.

In addition, some universities were not sufficiently equipped to supply skilled manpower to the labor market. Even though many research activities by Thai universities were encouraged, they still are not successful. This is partly because of the poor co-operation between public and private sectors and partly because of a lack of explicit policy and effective measures on the government sector. Tambunlerchai (1980) had showed his survey that Thai partners of Thai-Japanese joint venture investment did not receive much of the technical know-how even they wanted to do so. The technology transfer has been neither sufficient nor effective since the shortage of basic training for the manufactures. Thai labors’ effort has not been as productive as they should be since the education has not been geared to the real need of manufactures. There is less commitment from Thai labor. Furthermore, teachers have fewer experiences to transfer the knowledge to students. Students in universities are taught theoretically more than the actual practice. The curriculum doesn’t modern. There is less workplace for training/practical training.

Therefore, this research focuses on the effectiveness of technology transfer in the manufacturing sector. The researchers will apply a quantitative and documentation approach including interviews, observations, and surveys. Moreover, data collected for the project will be analyzed to provide a broader picture in terms of the effectiveness of technology transfer and how to develop Thai workers.

Literature Review

Thailand’s economic growth since the late 1980s has increased. This makes technology a more important element for national development. The current industrial policies of Thailand are designed to promote manufactured exports, labor-intensive industries and agriculture-based industries. The BOI is responsible for...
these activities. The organization is empowered to offer incentives, guarantees, and measures to protect industries against competition, and special exemptions from various laws. Then, many manufacturers have imported technology from abroad in order to assist them in production and management. For instance, there are many manufacturers in Thailand which are Thai-Japanese joint-ventures such as Toyota (Thailand) Co. Ltd., Nissan (Thailand) Co. Ltd, and Isuzu Motor Co. (Thailand) Ltd. Large and medium enterprises in the machinery industry have also formed joint-ventures, Thai investors holding about 50 percent of the total investment or less. In the electronic and electrical appliances industry, there are now about twenty large companies producing television sets, radio, refrigerators, integrated circuits, and parts of computers; companies such as Korat Denki Company, Minebear Company, Magnecomp Group Corporation. Many machines and equipment have been imported from abroad (Cooper, 1994) showing that industrial development has relied heavily on imported technology.

In Thailand, modern science and technology have involved the promotion of direct foreign investment and the encouragement of applied research activities by local universities. Foreign direct investment is seen by policy-makers as a way by which technology can be brought into the country, while the local research institutes and universities provide skilled human resources to absorb the new information. The general perception, however, is that the strategy of building capacities in local institutions has not met with much success, in part because of the absence of effective linkages between the public and private sectors, as well as the lack of explicit measures and schemes to promote technological literacy.

This situation has created some concern about technology transfer including

Limited transfer of technology to local staff, restrictions found in technology transfer agreements which were imposed by technology suppliers, the stated and hidden costs of technology agreements, the inappropriateness of the technology introduced, and the scarcity of skilled local labor. For instance, the Thai-Japan joint ventures have failed to transfer the know-how technology to Thai local partners. (Chantramonklasri, 1994)

Another concern is that the report traces the vicious cycle within which many local companies are caught. It begins with a market for technology in which a small number of suppliers face a large number of buyers, with whom costs, terms and conditions are determined individually on the basis of crude bargaining power rather than competition (Chantramonklasri, 1994). Moreover, the buyers are usually uninformed and lack the technical and legal expertise to evaluate alternative sources of technology and to negotiate effectively with suppliers. As a result, contracts are concluded to the advantage of the supplier and the buyers accept restrictions, which have the effect of increasing their dependence on the technology suppliers.

Although the transfer of technology is usually identified with the inflow of foreign capital, there have been questions raised about the prices paid for technology. The disadvantaged position of the buyer and his ignorance about the costs of alternative sources has resulted in unreasonably high profits for the owners of technology (Cooper, 1994). The government study reports that the evaluation of an offer to supply technology grows in complexity when the technology is offered in packaged form, with technical assistance and management provided (Kanthachai, 1987). The offer may contain many hidden costs. In addition, some reports provide information to support the contention that the outflows of funds (foreign remittances and expenses for import receipts) have exceeded fund inflows (foreign capital infusions and export receipts) among Thai joint ventures that have been paying copyright fees and royalties (Ng, 1986).

The technologies that foreign firms have introduced are generally inappropriate or excessively capital-intensive, given the labor surplus conditions in these countries as mentioned earlier. Moreover, these technologies are seldom adapted to make better use of local factor endowments. Some foreign companies have introduced second-hand equipment and pass it off as “labor-intensive, appropriate technology” (Chantramonklasri, 1994, p.49). These are usually machines that have become less efficient and have to be replaced in the supplier’s country. The unfortunate impact on the host country or on the technology buyer is usually high maintenance costs, which offset the benefits gained from increased employment, and cheaper equipment costs.

The shortage of skilled labor is regarded as another major problem to the effective transfer and absorption of technology. The various skills training programs are unable to cope with the needs of the extremely large labor pool and the requirements of industrial firms (McLeod, 1988). Moreover, the educational system has thus far failed to keep up with the demands for more science-based, technically grounded, and relevant educational programs. The potential for technological absorption and control is related to the availability of qualified and experienced technical personnel. Although such individuals are to be found in most Thai research institutions, the report showed that such institutions have been unable to adequately supply the requirements of private industry (Kanthachai, 1987).

The limited utilization of R&D capability is isolated and disconnected in the real world. The researchers carry out technology activity in an improper manner. Even though there is an attempt to commence R&D programs, they are often unable to have an impact on the industry. A well-known argument often used to explain this ineffectiveness is that industrial firms have a tendency to utilize proven technologies from foreign sources, thus limiting the demand for local scientific and technological capabilities (Ng, 1986). This argument
remains highly questionable because it presumes that those “centers of excellence” have available the kinds of products which are relevant to the needs of their potential clients. As noted by an empirical study, “industrial firms tend to doubt the ability and effectiveness of universities and public technical institutes to solve practical industrial problems” (TDRI, 1992a, p. 85).

According to some statistics in the country report, advanced countries have a higher level of national investment in R&D. For example, Japan spent about 3 percent of its GNP and newly-industrialized countries like Korea, Taiwan and Singapore spent about 1 to 2 percent of their GNP in R&D (TDRI, 1992). The R&D investment in Thailand in recent years was less than 0.2 percent of GNP. It shows that Thailand is less interested in R&D investment which, in turn, causes the country to develop slowly.

Another problem is that many firms can draw sources of technology from foreign sources and that lead the firms to feel that there is no need to invest in R&D. Since the firms receive efficient technology, they then assume that everything will be fine. They tend to remain passive until the new production system has arrived and engage in limited technological training. They remain unaware of industrial firm’s need to develop in-house technology.

For the reasons mentioned above, Thailand is not ready for the transfer of technology and therefore remains less competitive. Moreover, there are many new market economies with lower wages and more resources. There are also many developed countries, which have researched new production techniques and are able to make new products. This makes Thailand even less competitive and could become a serious problem in the future. It is thus highly possible that without substantial effort to develop better capability in science and technology and to support industrial development, Thailand may face a major economic and social crisis in the near future.

Furthermore, transfer capabilities and motivation of the enterprises supplying industrial technology have an important bearing upon the effectiveness and efficiency of technology transfers. The competence of the transfer agents, including their ability to design an easily transferable technology package, is an important factor. The supplier enterprise and its transfer package report a combination of documentation, training and technical assistance. Motivation of the technology supplier depends in large part on the transfer mode and the potential return the supplier hopes to realize by an effective and efficient transplant.

Conceptual Framework

The transfer of technology between developing and developed countries has been happening for long time. It has caused the technology gap to get wider and wider. There are a few countries in Asia, which have crossed the gap and developed a national technology of their own. The essential question is why. Why has so little worthwhile know-how flowed to developing countries? The researchers believe that there is no one answer to the question. There are some studies focusing on the success and failure of some factories. Some failures in the transfer of technology result from poor negotiating technique and poor contract drafting, poor English language, and poor skilled-labor. Some successes occur because the negotiators knew what they wanted, knew how to bargain for it, and knew how to draft the necessary contract.

This paper studies the effectiveness of transfer technology for Thai workers. The technology transfer may be described as the “diffusion of the complex bundle of knowledge which surrounds a level and type of technology” (Charles and Howells, 1992, p.3). In this case, the technology transfer refers to the movement or passing-on of technology or know-how from one party to another via the use of investment or agreements for cooperation between two or more parties in the manufacturing industry in Thailand.

This study uses the above definition and views that technology can be transferred and various distinct mechanisms for effecting the transfer. This paper will be beneficial to international human resource managers, policy-makers, Thai workers, and educators. After they read the paper, they will find that the research studies focused on the effectiveness of technology transfer for Thai workers. They will learn that the technology transfer is a main key for Thai development and sustainability. It will assist Thai manufactures to know their problems and learn about technology transfer. They will know the trend to produce Thai workers to replace the workers from abroad and determine the criteria for bringing in foreign workers.

The questionnaires were divided into four groups. They were human resource managers/entrepreneurs, Thai workers, foreign workers, and institution administrators. The questions were divided into two sections in each group. They were general questions such as position, responsibility, gender, and so on. The second section was about how the technology had been transferred, what type of training were employed, how long they worked in the group. They were general questions such as position, responsibility, gender, and so on. The second section was about how the technology had been transferred, what type of training were employed, how long they worked in the group. The questions for investigation are:

- In using which technologies are Thai workers’ skills are not as good as they should be?
- Does the manufacturer provide training to Thai workers?
- How does the manufacturer develop Thai workers after they have transferred the technology?
- What are the advantages and disadvantages of hiring foreign workers?
- How can the government assist with the transfer of technology?
This, in turn, will assist Thai manufacturers to know their problems, and to learn about the transfer of technology.

Research Methodology

Methodology

This paper is based on a multi-method component and design research methodology. Under this design, the combination of components occurs since the earlier stage launched the literature review, data collection, data interpretation, and analysis. Many books, journals, and other documents on the transfer of technology were reviewed. The sources were Thai human resource and technology journals, organizational development journals, and the Internet.

The questionnaires were discussed by the team researchers many times in order to clearly define and make sure that all details were covered. The questionnaires were pre-tested and modified.

In this study, we utilized stratification in order to have a variety of sampling in four groups. Further, we showed the questionnaires to committee members at the BOI for comments and suggestions. The advisory committee for the study determined that the most knowledgeable and most likely to provide insights into the subject under investigation would be: Foreign workers (150 persons), Thai workers (100 persons), senior administrators in schools (50 persons), and entrepreneurs or human resource managers (50 persons). The people were drawn from five provinces: Rayong province, Ayuttaya province, Chonburi province, Lumpun province, and Songkla province. The manufacturers were selected from a list of participants who were willing to participate in the research.

While the questionnaires were being distributed, key workers were interviewed because they were the most knowledgeable about the topics being researched, could provide a current perspective, and were able and willing to communicate with the research team members.

Research Question/Proposition

What is the effectiveness of technology transfer for Thai workers?

Research Limitation

The research is to study a technique the effectiveness of technology transfer for Thai workers.

Words of Definition

Transfer of technology is defined as a knowledge transfer from supplier (usually a developed country) to the receiver (a developing country).

Foreign workers are defined as foreigners who are granted a work permit by the BOI to work in Thailand.

Thai workers are defined as Thai workers who work in the manufacturing sector.

Human resource managers are defined as the manager who is responsible for personnel management.

Institution is defined as Thai higher education institution.

Entrepreneur is defined as one who organizes a business.

Results and Findings

The questionnaires were distributed to four groups. They were 50 HR managers/entrepreneurs, 100 Thai workers, 150 foreign workers and 50 institution administrators. The research took about one and a half months in the field. The study included twenty-four manufacturers from four regions of Thailand and ten institutions.

This section will discuss some important issues on the effectiveness of technology transfer for Thai workers.

The first set of questionnaires was distributed to HR managers/entrepreneurs. Every factory had hired a foreign worker with a work permit. Most of them came from Japan, China, Taiwan, Korea, Philippines, Malaysia, Singapore, Pakistan, and India. A few of them came from the United States, Canada, Britain, France, Italy, and Australia. These people hold positions of senior and middle managers and technicians. Examples of positions are mechanical manager, marketing manager, managing director, quality audit manager, shift supervisor, maintenance supervisor, R&D manager, production manager, tooling design specialist, process development manager, and information system manager. Many managers stated that some of these workers have transferred technology and increased the experience and knowledge of Thai workers. They also mentioned that there is an organizational policy to reinforce the transfer of technology in more than 76% of the companies.
The reasons are that Thai workers are cheaper and are able to do the job. The four types of transfer of technology are shown in Table 1 and the method of transfer of technology in Table 2 as shown below.

### Table 1. Type of Transfer of Technology

<td>61.7%</td>
</tr>
<tr>
<td>Training in Thailand</td>
<td>51.1%</td>
</tr>
</tbody>
</table>

After transfer of technology has occurred, 76.6% of the respondents are willing to replace foreign workers in middle management positions such as plant manager, control manager, mechanical technician, safety and environment manager, and production technician. The factory also has a plan to continuously develop Thai labors in order to keep up with the new technology. They will provide coaching, in-house training, and simulations, and will also require self-evaluations and portfolios.

In addition, the respondents also provided what they believe to be the advantages and disadvantages of hiring foreign workers. The advantages include: technology transfer to Thais, exchange of culture, improving communication with their mother company, providing new technology and knowledge, experience and specialist knowledge, and receiving suggestions and recommendations. The disadvantages include: high cost, cultural conflict, language barrier, little transfer of technology, difficulty in obtaining Thai visa, and concreted opinions about Thai people.

On the government side, responses indicated a need for some assistance from the Thai government are to encourage Thai people to learn foreign languages, train Thai people to understand foreign cultures, improve the school curriculum including teaching and learning, send students for training, reinforce the law requiring foreign labor to help Thai society, coordinate between the government and industry, provide training packages, establish a center providing advice about experts in technology within Thailand and abroad.

The second set of questionnaires was distributed to foreign workers. The responses from the survey showed that the average age of the foreign workers is 41 years old, the average years of experience is 14 years and the average salary is 80,080 baht ($1,777 per month). The respondents were 98% male and 2% female. Their education details appear in Table 3.

### Table 3. Level of Education of Foreign Workers in Thailand

<table>
<thead>

<td>7.2%</td>
</tr>
</tbody>
</table>

The foreign workers were 79.9% Asian, 11.4% European and 6.7% American. Most Asians came from Japan. Others came from Taiwan, China, Korea, Malaysia, Singapore, and India. Their positions are president, vice president, manager, assistance manager, and technician. Their main jobs include quality control, audit, organizational management, safety, production design, contacting customers, supervise workers, product marketing, investment planning, coordination, and maintenance. These people came to Thailand because their mother companies sent them to help Thai team members improve their skill and learning. This has created an opportunity for training and transfer of technology to Thai workers. However, there are some difficulties. For example, the language barrier, ineffective communication, and cultural conflict. Others problems include Thai staff quitting their job after training in order to get a better job, Thai workers not paying attention to what has been taught, and foreign and Thai workers sometimes misunderstanding each other.

The third set of questionnaires was distributed to Thai workers. The survey showed that the average age of Thai workers is 31 years old, the average years of experience are 5, and the average salary is 20,262 baht ($406 per month). The responses were 83% male and 17% female. Their education details are shown in Table 4.

</tbody>
</table>

The respondents hold positions as middle managers, for instance, head of technicians, and Directors of production. According to the respondents, Thai people for several reasons can hold these positions. Thai people have more experience, work hard, are responsible, and are willing to do the job, like a challenging job, and always develop themselves. In addition, many respondents stated that Thai workers have the same opportunity to progress in their job as foreign workers do. They work and coordinate with foreign staff and learn techniques from them. The Thai respondents all stated that they attended a variety of training courses such as for industrial orientation, professional management, internal auditing, foreign languages, manufacturing, ISO 9000, ISO 14000, safety and energy-saving, and time management. The technique for effective transfer of technology is to work closely with foreign workers, practice by yourself, do tests, coordinate projects, train on the job, and do training abroad or in professional conferences.

The fourth set of questionnaires was distributed to the institutional administrators. Almost all (95%) of the respondents are from public institutions. Their courses are in the fields of engineering, food technology, industrial technology, ceramics, computers, economics, food science, accounting, marketing, hotels and tourism.

The institution’s policy is to produce graduates who can think, work, be responsible, and communicate, including using a foreign language. A question related to whether the institutions knew about the need for the number of Thai workers in the manufacturing sector. Many of them didn’t know (52%). The question asked further about how they knew about the needs of factories. The result shows that the institutions knew about the need from provincial labor council’s (5.45), announcements by the factories (13.5%), and from the BOI (5.4%). There was no answer from 75.7%.

In order to help manufacturers find qualified workers; all institutions have a counseling unit where they work closely with students and manufactures. The name of the unit differs: counseling department, counseling unit, career and development section, careers information section. Their jobs are to provide counseling, help students find jobs, coordinate with the Ministry of Education, and provide career information.

The respondents also state that students in the institutions have an opportunity to learn and practice their skills in a factory in order to increase their experience, and sometimes attend training courses which last from 2 months up to 2-3 years. The techniques to train students in Thailand are summarized in Table 5.

Table 5. Techniques to Train Students in the Institutions

</tbody>
</table>

Some problems for Thai institutions producing graduates are: unclear national policies for higher education, a lack of personnel and equipment, inexperienced teachers, insufficient budget, lack of private coordination, lack of language and culture skills, outdated curriculum, insufficient activities for students to participate in the field.

The final question was to ask whether the government can help to improve the transfer of technology to Thai workers. The responses were to determine how to transfer the technology, encourage more development of technology, provide training and more education, provide scholarships for further education, coaching and mentoring lectures and participation, a clearer policy on the transfer of technology, improve quality of education. Furthermore, the responses mentioned that there should be coordination with foreign investors, a focus on specialists, support for the exchange of technology among the industries, a transfer of technology center, enough budget, a new curriculum with an emphasis on foreign languages, more foreign investors in Thailand, more seminars, workshops, conferences, and other activities that involve the transfer of technology.

Conclusion and Recommendation

In this paper, we analyzed the effectiveness of technology transfer. The findings show that the majority of foreign and Thai workers are male. Foreign workers hold positions of senior managers in the manufacturing
sector while Thai workers are junior managers. Foreign workers have an average experience of about 14 years while Thai workers have an average experience of about 5 years. This might be because the average age of foreign workers is much higher, 41 years, while the average age of Thai workers is only 31 years. The research displays that should distribute their new and advanced knowledge for Thai workers who have less experience. The technique mostly used by foreign workers for knowledge transfer is on-the-job-training.

The methods used for transferring technology include on-the-job training, in-house training, training abroad, and training in Thailand. This relates to engineering, production, management, and marketing. It shows that there are four main methods for the transfer of technology that most manufacturers in Thailand have implemented and found to work well. Manufacturers still feel that it is necessary to hire foreign workers because they would like to hire their own people to do their job. They feel that their people can do a better job and can be trusted more. In addition, there is the recognition that the Thai government and manufacturers play a major role in facilitating and supporting the process of technology transfer. The government is encouraged to support the process through the provision of required incentives, educational infrastructure and support institutions. It must be a strong collaboration between the manufacturers and the government for the transfer of technology to be successful.

Educational institutions offer courses that are out of date and not geared to keep up with the changes in technology. The responses from the manufacturers state that graduates can't do the work. However, the institutions have tried to help by providing practicum and have students do the actual work while in school. The equipment in schools for students to practice with is old. There is also a lack of qualified teachers. There is also a high turnover among skilled workers resulting in incomplete technology transfer to the local manufacturers. Consequently, the ability of Thai workers to absorb and adapt technology is weak.

New Knowledge to HRD

This research can contribute to the new knowledge in HRD by showing there is a growing awareness by manufacturers of the skills available to increase productivity and growth in industrial production. It shows the importance of educational and training opportunities to Thai workers so that they can improve their skills and compete in the world market. Education and training play an essential role in developing workers' skills. In addition, the government must be a strong supporter for the process of technology transfer.

Impact of Technological Change on Human Resource Development Practices: A Study of Singapore-Based Companies

A. Ahad Osman-Gani
Nanyang Technological University

Ronald L. Jacobs
The Ohio State University

Technological change is commonplace in contemporary organizations. How to prepare employees for technological change has increasingly become an issue for human resource development theory and practice. This study investigated the human resource development practices of organizations in Singapore, a nation that has been subject to many changes in order to stay competitive. The results show similar patterns of responses across business sectors, however some differences were found in the transport and communications sectors. On-the-job training was reported as the most frequently used training method to address organizational change needs. The discussion and recommendations focus on the need for improved change management approaches.

Keywords: Technology, Organizational Change, Singapore

Technology can be classified into three types: 1) product, 2) process, and management (Osman-Gani, 1996). Briefly, product technologies are when ideas are incorporated into a concrete object. Process technologies are the sequential steps used to produce a product or deliver a service. Management technologies are the actions taken to optimize resources to achieve business goals (Osman-Gani, 1991). Regardless of the type of technology, its appearance in organizations has definitively changed the nature of work (Connor et. al., 1996). Indeed, the greatest impact of technology has been suggested to be on the nature of work and the abilities of employees to meet the new requirements.

Responding to technological change ultimately places pressure on the costs of the organizations (Nankervis, Compton, & McCarthy, 1999). However, no research has been found to determine to what extent the effect that technology has had on human resource development practices, particularly in the Asian region. For instance, Singapore, being resource-scarce, naturally needs to invest in its people on a continuing basis. The following research questions were formulated to guide the study:

1. What are the major technological changes experienced by Singapore companies during the last three years?
2. What is the impact of technological changes on Training and Development practices of Singapore companies?
3. What is the nature of the resistance to technological changes experienced by Singapore companies?
4. What is the nature of differences among companies from various industrial sectors in using the T&D strategies to cope with the technological changes?

Methodology

The sampling frame of this study was from the 1999 “Singapore 1000” database. It was used because technological changes are more likely to impact dynamic organizations. A sample of 908 companies was selected randomly for each stratum, according to their representation in the sampling frame. The sample was selected using a proportionate stratified random sampling method with the strata being the five primary business sectors namely, manufacturing, construction, financial and business, transport and communication and commerce. Respondents were either HR managers or general managers. Preliminary interviews were conducted on a sample of 30 HR managers drawn from various companies. Interview findings were incorporated into the questionnaire design, which encompassed specific technological changes and the possible impact faced by companies on the various HR issues. Research findings from existing literature were also integrated. The questions were carefully worded to avoid misinterpretation. Technical terms were also explained.

The questionnaire layout was formatted in a logical and aesthetically pleasing manner to ensure higher response
rate. The structured questionnaire was designed using five-point Likert-type response scale and some categorical items provided for choosing frequency of use. A cover letter was attached to the questionnaire describing the purpose of the study with anonymity and confidentiality emphasized to increase the response rate. No identification such as company name or email address was requested from respondents. In order to verify the reliability and validity of the questionnaire, test and retest methods were used. The questionnaire was administered twice to a sample group within two months to check for accuracy and consistency. A panel of experts comprising of senior managers of companies and professors of Nanyang Business School, were consulted to check for adequacy and relevancy of the questionnaire items. The questionnaires were mailed to the HR managers and general managers of the sample organizations. Managers were requested to complete and return the questionnaires within two weeks either by mail or fax. Due to the initial low response rate, a second mailing was carried out, and follow-up calls were made.

Results

A total of 147 responses could be used for the analysis after screening the returned questionnaires for their completeness. The responses had the following demographic breakdowns: 51 percent of the respondents were from local companies and 49 percent were from foreign companies; 52 percent were from the SMEs and 48 percent were from large companies; 46 percent of the respondents were from the Financial and Business Services sectors, 21 percent were from the Manufacturing sector, 14 percent were from the Commerce sector, seven percent were from the Transport and Communication sectors, six percent were from the Construction sector and seven percent were from the remaining sectors. Finally, 70 percent of the respondents had business experience of more than ten years.

What are the major changes experienced by Singapore companies during the last three years? The results showed that in terms of information technology, in 1997 the introduction of new hardware affected approximately one-third of the companies. In 1998 and 1999, approximately one-half of the companies reported introducing new software. In terms of product technology, in 1997, 1998, and 1999, approximately one third of the companies introduced electronic telecommunications equipment. In terms of process and management technology, total quality management and accounting tools were the most frequently introduced areas of technology for all three years.

What is the impact of technological changes on human resource development practices of Singapore companies? The results showed that on-the-job training was the highest ranked training method used by Singapore companies to cope with technological change. The results also showed that most companies during this time used external consultants and vendors to provide human resource development expertise. The average length of time for the training was from one to three days in length. Surveys and questionnaires were the most frequently used training evaluation method used.

What is the nature of the resistance to technological changes experienced by Singapore companies? The results showed that psychological and emotional attitudes were the most frequent type of resistance encountered as a result of introducing new technology. The human resource development strategies used to reduce resistance to change. Communication and education, employee participation and involvement, and facilitation and support were the most frequently used human resource development strategies used.

What is the nature of differences among companies from various industrial sectors in using the HRD strategies to cope with the technological changes? Table 1 shows that overseas training was the most frequently used training method (p.< .01) and that the difference was found among companies in the transport and communications sector. Table 2 shows that there were no differences across the business sectors in terms of the nature of training providers used by companies. Table 3 shows that there were no differences in the training duration across business sectors. Table 4 shows that trainer feedback was significant in terms of the training methods used by companies in different business sectors. Again, the difference was found in the transport and communications business sector.

Discussion and Conclusions

Changes in information technology were most frequently experienced technological change in Singapore organizations. Recruitment and selection did not play an important role in helping a company cope with technological changes. Singapore companies were using other means such as training and development to cope with technological change. Employee training helped companies cope with technological change. However, tight training budgets constrained the type and frequency of training programs. Employees can be motivated to accept changes through the use of annual increment, medical benefits and training opportunities. Motivational strategies enabled employees to face technological changes more positively. The role of planning change lied mainly in the top management.
Companies can consider using contract workers on a temporary basis of six months to relieve current workload. This is because workers need not be trained since they can take over simple tasks and are relatively more cost-effective. This allows employees to focus on critical job aspects that are technology dependent while leaving non-critical work to contract workers. With the increasing usage of the Internet by Singaporeans, the applicant pool will increase and thus companies should consider the use of e-recruitment. This can be achieved by setting up a company website or by using e-recruitment services such as RecruitAsia.

Training can be used as an effective tool for motivating and retaining the employees. For example, scheduling an employee to a one-year overseas training program can help to boost morale. The use of stock options can be useful in companies that faced many technological changes, which demands the full attention and energy of employees to innovate in order to survive. This increases the employee’s commitment to the company and motivates him to work harder for mutual benefits. Non-monetary, innovative and valuable incentives could be used more frequently to enhance employee motivation. For example, a point-scheme based on work performance can be devised to replace overtime pay. Points accumulated can be redeemed for incentives such as free staff lunch and reduced working hours.

It is recommended that companies increase their training budgets to accommodate more training programs for employees. Training should be taken as an investment and not an expense. Training programs are needed to upgrade employee skills. Thus, there is a vital need for more resources to be allocated to training. Training programs should be structured to include technical training as well as management training. Of equal importance is the need for good change management and communication skills to ensure successful changes. Companies should continue using on-the-job training as emphasized by the Singapore government in their recent OJT21 initiative and seminars/workshops. Computer-based training should also be considered to enable employees familiarize themselves with computer-related and Internet applications. However, the use of specific training methods would depend on individual company’s needs.

Outsourcing of non-proprietary training could be a good strategy as the management can focus on more important issues and redirect the training programs to people who have the expertise and knowledge about the change. This is especially so with the increase in information technology. Shorter training duration allows company to adapt to new technological changes and this enables companies to gain an edge over their competitors. Thus, duration of training sessions should be appropriate to allow employees sufficient time to absorb new knowledge. Companies should conduct some form of training evaluation. This is because it would prove to be valuable to the HR personnel in shaping and improving the company’s future training programs.

Recommendations

As this study sampled only 908 companies, future researchers could use a larger sample of companies to improve on representation. The study only covered technological change and its impact on HR strategies, hence, researchers may want to consider studying other types of changes, such as organizational changes. Reasons driving technological changes and the frequency of changes can be investigated to determine an appropriate period for companies to retrain workers to cope with new changes. Techniques such as cascade training might be used to address institutionalization issues (Jacobs & Russ-Efty, 2001). Other HR issues such as career development, performance appraisal and industrial relations can be explored into. Organization variables affected by technological changes such as organization structure, job design, authority, responsibility and communication patterns could also be included.

To obtain a more comprehensive and in-depth study, employees could also be included as respondents to show the impact of various HR strategies on different interest groups. The length of business experience can also be incorporated to see if there are significant differences among companies of different years of experience in their use of human resource strategies to cope with technological change. Analysis between government-linked and private companies, as well as between listed and non-listed companies can be conducted. A comparison between technology firms such as Internet and software companies and non-technology firms could be examined for differences in HR strategies with regards to technological changes.

Future research should focus on more detailed interviews and focus groups to obtain more comprehensive views of the current situation. Specific case studies could be conducted on representative companies to gain an in-depth knowledge of technological changes’ impact on HR within each company. The study may be replicated in other countries with an additional variable, national culture considered. It would be a valuable finding to prove that national culture varies from country to country hence enabling an Asian model depicting the impact of technological changes on HR strategies to be developed.

Validating a More-Dimensional Conception of Self-Directed Learning

Gerald A. Straka
Cornelia Schaefer
Bremen University, Germany

In theory and practice of human resource development self-directed learning is receiving increasing attention. An indicator is the large body of research in adult education and training. However, there are concerns linked with the theoretical underpinnings of the concept and the instrumentation of self-directed learning in this field. This was the reason to develop and validate a more-dimensional conception which defines self-directed learning as a process in which a person has contentual and procedural interests, is using learning (acquiring, sequencing, organizing) and control (concentration, monitoring, reflection, regulation) strategies, accompanied with emotions (joy, anger, boredom).

Keywords: Self-Directed Learning, Motivation and Emotion, Control Strategies

"Lean production", "re-engineering", "learning organization", and "knowledge management" occupy a large area in theory and practice of human resource development. These considerations have led to more competence being shifted back to the place where a piece of work is machined or a service provided. At the same time, they imply and indeed demand, though not explicitly, a continuing process of learning during the whole working life. In this context, self-directed learning is receiving growing importance as a complement to other forms of further and in-service training around the globe.

Problem Statement

In the meantime, a lot of research has been going on in the field of self-directed learning, especially in adult education. Indicators for that are: the 16th International Self-Directed Learning Symposium held in Boynton Beach, Florida/USA in 2002; the “6ème Colloque Européen sur l’Autoformation” (self-formation) held in Montpellier/France in 2001; and the Second World Conference on Self-Directed Learning which took place in Paris/France in 2000. In these arenas, Knowles’ conception of self-directed learning, the Oddi Continuing Learning Inventory (OCLI) (Oddi 1984) and particularly the Self-Directed Learning Readiness Scale (SDLRS) (Guglielmino 1977) are widely used in business and industry.

Knowles defines self-directed learning “in its broadest meaning (...) as a process in which individuals take the initiative, with or without the help of others, in diagnosing their learning needs, formulating learning goals, identifying human and material resources for learning, choosing and implementing appropriate learning strategies, and evaluating learning outcomes” (Knowles 1975, 18). However, this view is not followed up by more extensive theoretical derivations or systematic descriptions of what ‘initiative’ means and of which activities, from establishing the need to learn up to evaluating the learning outcomes, may take place. Conceptual and empirical evaluations of the OCLI and the SDLRS raised concerns about (a) how self-direction was defined (Candy 1991), (b) the theoretical underpinnings of the concepts (i.e. weak relations to results of cognitive sciences, unidimensionality) (Brockett and Hiemstra 1991), and (c) the quality of the factor solutions (i.e. Straka 1996, Straka and Hinz 1996). This critique was the occasion to re-conceptualize self-directed learning to refer explicitly to validated concepts from the field cognitive learning strategy research, to include different dimensions in the model, and to investigate the impact of selected perceived environmental conditions on this type of learning.

Theoretical Framework

During her/his lifetime, the individual interacts with her/his socio-culturally shaped environment. The individual enters this process with his/her internal conditions, like abilities, skills, and motives. From the perspective of the individual – the focus of this conception – the environment includes supervisors, colleagues, technical equipment, etc. subsumed under environmental conditions, and it is the individual’s behavior which maintains this interaction made possible by her/his internal conditions (Gagné 1973). Examples for such activities are viewing a picture, comprehending a statement, handling a workpiece. With words such as “viewing”, “comprehending”, “handling” we are – albeit vaguely – describing behavior. In this context behavior is directed at something: a picture, statement, work.
piece. From a cognitive perspective this something means information generated by the individual’s (cognitive) behavior on the basis of her/his internal conditions and/or perceived signs or symbols from the environment.

When asked why an individual realizes, maintains, discontinues or avoids behavior in a particular way or which reasons are behind the behavior (conscious or unconscious), then we are dealing with the motivation side of the individual-environment relation. Motivation embraces that dimension which relates behavior to something (e.g. content), which aligns it (turning to or turning away) which associates a certain strength and intensity. There is still another dimension being part of the interaction. It is the emotion embracing the subjective experience from an affective and non-rational angle, which can be pleasant or unpleasant, connected with impressions such as joy or anger, or to physical processes such as sweating, shuddering or accompanied by expressional behavior such as facial expressions or gestures (Pekrun and Schiefele 1996, Boekhaerts 1999).

All four dimensions presuppose and necessitate each other. They do not exist separately by themselves, but instead only come into being through mutual action, that is to say they generate each other, which however does not mean that in different phases during the course of an event, one or other of the dimensions can be at the forefront (Becker, Oldenburger and Pichl 1987). Example: A person is so irritated that she retains nothing when reading a text she considers very important and interesting. After a while her irritation subsides and she reads the text attentively; she compares what she has read with what she already knows, sees here and there additions to her previous knowledge and is pleased at having learnt something new. This does not surprise her, however, for she knows that she easily understands and retains things that interest her.

The individuals interaction with socio-culturally shaped environmental conditions result in consequences relating to the environment and/or the individual (cf. Fig. 1):

Figure 1. Learning

Environment-relative consequences arise for example out of the handling a workpiece or the giving potential information. Individual-relative consequences exist in the fact that her/his knowledge, her/his abilities etc. are permanently changed and therefore learning has taken place. Accordingly, learning has taken place when, and only when the individual-relative consequences of the interaction between behavior, information, motivation and emotion lead to a permanent change in the internal conditions of the acting individual.

A More-Dimensional Conception of Self-Directed-Learning

According to these considerations self-directed learning is a dynamic interplay between behavior, information, motivation and emotion under the experienced control of the learning person. Referring to cognitive theory the dimen-
tion “behavior” is differentiated into “learning” and “control strategies”. The dimension “motivation” is modeled with the concept of “interest” (Krapp, 1999) and the dimension “emotion” subsumes specific types of emotions taking place during learning (Pekrun 1992). The differentiation of the dimensions “behavior”, “motivation” and “emotion” into concepts, constructs and their operationalizations by the instrument used, will be given in the following paragraphs, referring to especially theoretical conceptualizations like those of Boekaerts (1999), Pintrich et al. (1991), Weinstein and Mayer (1986), and Zimmerman (2000).

Learning Strategies

When interacting with the environment, the following activities may be differentiated: the learner structures the generated information; s/he establishes similarities and differences between that which s/he already knows and that which s/he would like to learn (elaboration). If necessary, s/he will repeat in order to safeguard the permanence of what has been learned. Structuring, elaborating and rehearsal is learning behavior with which a person is acquiring that which is to be learned.

Figure 2. Constructs of the concept “learning strategies”

<table>
<thead>
<tr>
<th>CONCEPT</th>
<th>CONSTRUCTS</th>
<th>SELECTED ITEMS</th>
</tr>
</thead>
<tbody>
<tr>
<td>organizing</td>
<td>When I discover that I lack of information I know where to get it. (information seeking)</td>
<td></td>
</tr>
<tr>
<td></td>
<td>I have the most important papers ready at my place of work. (workplace structuring)</td>
<td></td>
</tr>
<tr>
<td></td>
<td>When I need help solving a task I consult other colleagues. (cooperation)</td>
<td></td>
</tr>
<tr>
<td>sequencing</td>
<td>I keep to a time-table when learning. (time planning)</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Before tackling a task I think about the order in which I will carry it out. (steps planning)</td>
<td></td>
</tr>
<tr>
<td>acquiring</td>
<td>I write short summaries of the subject I have to learn. (structuring)</td>
<td></td>
</tr>
<tr>
<td></td>
<td>I try to imagine practical applications of new training content. (elaboration)</td>
<td></td>
</tr>
<tr>
<td></td>
<td>I memorize a subject by reciting it silently. (rehearsal)</td>
<td></td>
</tr>
</tbody>
</table>

With self-directed learning, those activities which may occur before acquisition, are given a higher status. The learner is sequencing by planning her/his steps and time she would like to acquire that which is to be learned. Furthermore, she has to seek information needed for learning; whether the learner would like to cooperate with colleagues, as well as how she structures her/his place of work in a way that it promotes learning. Acquiring, sequencing and organizing are components or constructs of the concept learning strategies.

Control Strategies

These activities, subsumed to learning strategies are controlled either cognitively or metacognitively. Concentration, monitoring, reflection and regulation are in this context subsumed under the concept control strategies.
### Figure 3. Constructs of the concept “control”

<table>
<thead>
<tr>
<th>CONCEPT</th>
<th>CONSTRUCTS</th>
<th>SELECTED ITEMS</th>
</tr>
</thead>
<tbody>
<tr>
<td>cognitive</td>
<td>When I am learning I do not allow myself to become distracted. (concentration)</td>

</tr>
<tr>
<td>Control</td>
<td>When I solve a task I check from time to time whether I have understood it correctly. (monitoring)</td>
<td></td>
</tr>
<tr>
<td></td>
<td>I sometimes interrupt my learning in order to consider what I have so far achieved. (reflection)</td>
<td></td>
</tr>
<tr>
<td></td>
<td>When I have to carry out a complex task I adapt my way of learning. (regulation)</td>
<td></td>
</tr>
</tbody>
</table>

### Interests

The motivational dimension is focused on the concept of “interest”, differentiated between contentual and procedural interest (Krapp 1999). The contentual interest is a combination of the value a person attaches to the content and the expectancy of being able to enter into a meaningful relationship with this content. As far as procedural interest is concerned, the individual value-expectancy-assessment refers to much the same thing regarding the above mentioned learning and control strategies.

### Figure 4. Constructs of the concept “interest”

<table>

<td></td>
</tr>
<tr>
<td>Interest</td>
<td>I consider it important to ask colleagues for information when necessary. (value) I find it easy to ask colleagues for information when necessary. (expectancy)</td>
<td></td>
</tr>
</tbody>
</table>

### Emotions

In order to define the emotional dimension of the individual-environment-relationship, we will refer to the concept of the general learning emotions (Pekrun 1992, 1998), which embraces those emotions often found in learning situations like joy, anger and boredom.

### Figure 5. Constructs of the concept “emotions”

<td>I find carrying out exercise tasks boring.</td>
<td></td>
</tr>
</tbody>
</table>
Perspectives Perceiving Environmental Conditions

Learning is on the one side, when all is said and done, the individual's business. However, on the other side it is embedded in environmental conditions. They are perceived by the individual according to his/her internal conditions which determine the aspects and ways of reconstructing and constructing the environmental conditions. According to Deci and Ryan, the experience of competence, autonomy and social relatedness are important conditions of self-determination (Deci and Ryan 1985, 1991, Straka 1997). The assumption is that these three types of experiences also contribute to self-direction in learning.

Related to the environmental conditions of the workplace, the three concepts are defined as follows:

- **Experiencing autonomy** at the place of work is when a person has the impression s/he has scope, that is to say that s/he is able to carry out her/his work tasks according to her/his own schedules.
- **Experiencing competence** at the place of work is when a person has the impression s/he carries out her/his work tasks competently as well as successfully and when s/he feels her/himself to be effective.
- **Experiencing social relatedness** at the place of work is felt by a person when her/his tasks are acknowledged by superiors and colleagues and s/he feels integrated in the works community.

Research Questions

On the basis of these conceptual considerations and the postulated more-dimensionality of self-directed learning, the following questions are to be investigated:

1. Are there interrelations between emotions, interests, learning and control strategies?
2. Are there impacts of the workplace conditions, perceived under the perspectives of autonomy, competence and social relatedness, via the dimensions of interests and emotions on the learning and control strategies?

Methodology

To collect the necessary data the Motivated Self-Directed Learning in Business (MOSLIB) self-rating questionnaire was used. This modularized instrument consists of the concepts and constructs mentioned in the preceding paragraphs (Straka et al. 1996). It was validated in different settings in business and industry with principal components factor analyses and varimax rotations. Only items with single structure and a loading >0.40 are included in the instrument (cf. Nenniger et al. 1998).

The sample of the survey included 295 employees from a business administrative field of different small and medium sized enterprises in the Bremen area, of whom 20% had a lower and 34% an average secondary school education and 46% a grammar-school education and above. 26% were female and 41% under 40 year of age. Availability and readiness to take part in the study were the criteria of “selection”.

In order to get answers to the questions stated, structural models were validated with LISREL8. The input data were the correlation-matrices for the constructs of the structural models calculated on the basis of the factor-scores.
Results and Findings

The results of the LISREL-analyses according to the questions focusing on the more-dimensionality of self-directed learning and the impact of perceived aspects of the work condition will now be presented.

The More-Dimensionality Self-Directed Learning

The more-dimensionality of self-directed learning was investigated for the assumed relations between the concepts interests, emotions, strategies (cf. research question 1). It could be validated with the following structural model:

*Figure 7. Relations between interests, emotions, learning and control strategies*

| GFI   | 0.96 |
| AGFI  | 0.92 |
| RMSEA | 0.07 |

A relatively strong correlation between interests and emotions (.62) and a smaller one between strategies and control (.39) could be established. The relation between interests and emotions is in congruence with the Munich interest concept (Krapp 1999) which encompasses the aspects emotion, value, subject-relatedness. There is a fairly strong standardizes path-coefficient from interests to strategies (.50) and a smaller one to control (.37). The impact of emotions on strategies (.12) and control (.12) is minor and supporting the cognitive view of this conception of self-directed learning. The correlation between control and learning strategies (.39) expresses interrelation of these concepts. In sum the model fits and the relations between these four concepts give a differentiated answer to research question one.
Impacts of Perceived Workplace Conditions on Selected Dimensions of Self-Directed Learning

The impact between perceived workplace conditions via interest and emotion on learning and control strategies, postulated with research question two, could be reconstructed with the following linear model:

Figure 8. Experienced workplace conditions, interests, emotions, learning and control strategies

There are paths from workplace conditions, perceived under the perspectives of autonomy, competence and social relatedness to colleagues and superiors, to interests (.34) and emotions (.35). Experienced workplace conditions explain a little more than 11% (e.g. 0.34²=0.116) of the variance of emotions and of interests as well. It should be further noted that the inclusion of this concept of experienced workplace conditions has only a minor impact on the structure of the first model (cf. Fig. 7), which is a strong indicator for the stability of the postulated multidimensionality of self-directed learning.

Conclusions, Recommendations

Based on the concepts and constructs introduced, their structural modeling and the empirical validation, self-directed learning will take place, if a person has contentual and procedural interests (dimension motivation), s/he is using learning (organizing, sequencing, acquiring) and control strategies (meta-cognitive) – both parts of the dimension behavior –, and s/he is driven by joy and not by anger or boredom (dimension emotion). The interrelations between these concepts may give persons in charge of human resource development some hints for interventions. First they may focus on the interrelated learning and control strategies by realizing explicit and implicit interventions. Explicit interventions include methods focusing on learning and control strategies. However, the application of them is up to responsibility of the person her/himself. Implicit interventions are focusing on the self-organized acquisition domain specific declarative and procedural knowledge with the assumption that by doing this, the person will acquire learning and control strategies simultaneously. Between these two poles, the “starting with guided reflection on one’s own working and learning on the shop floor” may be an alternative (Cseh, Watkins & Marsick 2000).

A second point for intervention might be the interests from which strong paths go to learning and control strategies. According to the conceptualization of interests as a combinations of value and expectancy calculations human resource development people have to demonstrate persons the work-importance of the information and strategies to be acquired. The expectancy aspect could be supported in figuring out that the employee already mastered similar demands in her/his work biography.

The third angle for intervention consists of the arrangement of workplace conditions with high learning potentials. An important one might be the feedbacks used by colleagues and superiors in order to confirm continuously the competence of the employee.
How this Research Contributes to the New Knowledge in HRD

In research and especially in practice, self-direction in learning is focusing more on the “what” and far less on “how” to learn the “what”. Referring to research findings from neighboring disciplines a more-dimensional model of self-directed learning was developed, validated and some ways perceiving workplace conditions supporting this type of learning have been identified. The findings demonstrate that learning new things in a self-directed manner requires a certain repertoire of learning and control strategies and interests, i.e. the main result is, that the often neglected “how”-question is equally important as the “what”-question, and that aspects of perceived workplace conditions have a distinct impact on some dimensions of self-directed learning.

The Balance in Learning

Hanneke Koopmans
Universiteit Nyenrode

This study examines the way informal learning is organised at the workplace by employees. The balance between the input of the employee and the input of relevant actors, such as manager or colleagues will be clarified. Besides this balance this research also looks at the opinions on this balance of the organised learning, in order to clarify what employees consider optimal organisation of the learning. This research is a starting point for stimulating the organisation of informal learning at the workplace by employees.

Key-words: Self-organised Learning, Workplace Learning, Informal Learning.

Life long learning has received increased attention in the last few years. The continuous development of employees has become more and more important for organisations. The continuous learning of employees offer organisations an advantage in dealing with changes. Continuous learning is therefore one of the goals of the learning organisation (Drucker, 1995). Organisational learning takes place when employees generate their own knowledge in a reaction on the organisation and the environment (Baets, 2000). Organisations want their employees to be able to deal with the change that an organisation is confronted with.

The learning support for employees is usually organised by professionals, who organise a learning program. During the design of the program, different actors are more or less consulted about their ideas; but the responsibility of the program usually lies with the professional.

Most of these programs are aiming for the transfer of knowledge. Since the value of a program is the use of the learned knowledge at the workplace. This transfer is problematic and doesn’t always take place. In American industries $100 billion is spent on training; according to a review on transfer of training. Actual 10%, of this $100 billion results in transfer to the job (Baldwin & Ford, 1988). In the Netherlands also 10% of learning in a program results in transfer on the job; according to an overview on learning within organisations in the Netherlands (Van der Zee, 1995).

It seems the learning programs don’t offer the results we want. Informal learning and learning at the workplace are strong alternatives. They will be discussed in more detail later.

Baldwin and Ford are using a model for transfer. This model clarifies that the following elements influence transfer in a direct or indirect way:

- Trainee characteristics: ability, personality and motivation influence transfer in a direct and indirect way.
- Training design: principles of learning, sequencing and training content influence transfer in an indirect way.
- Work environment: support and opportunity to use influence transfer in a direct and indirect way.

The indirect way is via learning and retention to transfer. Trainee characteristics and work environment both influence transfer in a direct way. Whereas training design only influence transfer via learning and retention. Although the research is on transfer of training; the above findings can be integrated to aim at better results from informal learning.

We now look at the different elements that influence transfer. Although we take the three elements into account, we make certain choices. First of all the employee is the starting point of this research, the individual is the central focus. This means that we look upon informal learning from an individual perspective. We deal with training design in a more nuanced way. Since informal learning is the subject and not the more formal way of learning, we can’t speak about the design of training. In this research the influence of the informal learning will be based on environmental elements. Where training design is more about moulding this environment.

Now starting to discuss the different elements of transfer, I begin with employees.

The programs are being designed for employees, for adults. These adults are hardly consulted during the design of the program. When it comes to creating a program the general assumption seems to be that an employee does not have many ideas about learning. This is inconsistent with the knowledge we have on adults as learners. Knowles identified the following characteristics of adults as learners (Lieb, 2001):

- Adults are autonomous and self-directed.
- Adults have accumulated a foundation of life experiences and knowledge.
- Adults are goal oriented.
- Adults are relevancy oriented.

Copyright © 2002 Hanneke Koopmans

10-2
- Adults are practical, focusing on the aspects of a lesson most useful to them in their work.
- As do all learners, adults need to be shown respect.

The above characteristics offer guidelines for the design of learning for employees. Adults want their learning to be relevant for their work. They want it to be useful for their work. Adults are able to define goals and to direct their learning. It seems that adults know quite well what they want to learn, it must be relevant, with a practical focus. They are also able to direct themselves in learning.

Yet despite this knowledge most programs are not designed according to the above characteristics. In most programs professionals decide about the goals, the activities the organisation and the evaluation.

Besides the characteristics of the employee there is a second issue concerning transfer, which is the work environment. When the work environment influences transfer of learning; learning at the workplace seems a good option.

In a research about effectiveness of learning at the workplace a few reasons where given for the increased attention for this form of learning (Van der Klink, 1999). There are three reasons;
- Better transfer, since the learning situation is identical to the work situation.
- Cost reduction, learning is organised at the workplace, no costs for travelling, to stay over, and no complete cut off from the production process, and
- Flexibility, workplace learning can be organised any time when needed by the learner.

Most learning at the workplace is informally. Callahan, Watkins and Marsick estimate that 60-80% of learning in today’s workplace occurs informally. In this research we look at informal learning at the workplace.

The last element that influences transfer is the design of the training. In this research we look at informal learning at the workplace; so there isn’t a real design possible.

In this research we connect as closely as possible with adults learning at the workplace to enhance and stimulate learning. The focus of this research is on the organisation of the learning at the workplace by employees and the influence of relevant other actors concerning this organisation of learning.

The term organisation of the learning is mentioned here. This term is used, since design of the learning usually implies a certain order in steps to take, beginning with the definition of a learning goal. Most learning at the workplace is informal and not ordered. Therefore we use the term organisation of the learning.

Main question is: How do employees organise their learning and what is the influence of relevant actors upon this organisation?

Theoretical framework and previous research

This research fits within a framework of literature on; informal learning and learning at the workplace, transfer and self-organised learning. The organisation of the learning at the workplace will be analysed by the steps that are made in the design of a program. First we start with the constructivist learning theory in order to clarify the view upon learning.

Constructivist learning

In this research we take a social constructivist view upon learning. The constructivist approach can be defined as followed (Duffy & Jonassen, 1992):

"There are many ways to structure the world, and there are many meanings or perspectives for any event or concept. Thus there is not a correct meaning that we are striving for". Kessels (2000) sees learning, from a constructivist point of view, as building up experiences.

There are many different views within constructivism. Moshman (1982) gives a comparison of these different views. He distinguishes different types of constructivism: exogenous, dialectic and endogenous. If you draw a line of constructivism, both exogenous and endogenous are two opposite ends of the same line.

Exogenous ------------------------------- Endogenous

Exogenous constructivism sees knowledge as external to the individual. Knowledge is internalised and reconstructed from external reality.

Endogenous constructivism sees knowledge as constructed by mental structures. So knowledge is reconstructed from internal reality. This form of constructivism is associated with Piaget and his theory of cognitive development.
Exogenous constructivism lays too much emphasis on the external environment and endogenous constructivism lays too much emphasis on the internal environment.

Dialectic constructivism sees knowledge as the result of an interaction between the learner (internal environment) and the external environment. In this research the focus is on the employee as a learner at the workplace. He or she organises his or her own learning. During the process other actors will help him of her with this organisation. It is an interaction between the learner and the other actors, the environment. So both the internal environment, the learner, as the external environment, the actors, are relevant for this research. Dialectic or social constructivism therefor fits this research best. Like Palinscar (1999) says: 'Social constructivist perspectives focus on the interdependence of social and individual processes in the co-construction of knowledge'.

**Learning at the Workplace and Informal Learning**

Hereby follows an overview of literature on learning at the workplace and informal learning in order to clarify the place of this research.

The following description offers the view within this research upon learning at the workplace (Onstenk, 2001): "Learning at the workplace is experience based learning, an active, constructive and largely self directed process, that occurs in real professional situation as a learning environment with real problems coming from professional practice as a learning object".

In general learning at the workplace seems to be more unplanned, unstructured and not regulated (Onstenk, 2001). Within these forms of informal learning Onstenk gives an overview; based on a dissertation literature review of different kinds of learning at the workplace (1997).

He divides four clusters of approaches in learning at the workplace:
- Immanent and expansive learning, learning directly integrated with work.
- Situated learning, learning in and from a physical, symbolic and social work environment.
- Independent learning, self regulated and intentional learning at his workplace, and
- Job and professional socialisation, learning as job socialisation.

Informal and incidental learning is defined in contrast with formal learning by Marsick and Watkins (1990) as: 'Formal learning is typically institutionally sponsored, classroom-based or highly structured. Informal learning, a category that includes incidental learning, may occur in institutions, but it is not typically classroom-based or highly structured, and control of the learning rests primarily in the hands of the learner. Incidental learning, a subcategory of informal learning, is defined by Watkins as a by-product of some other activity, such as task accomplishment, interpersonal interaction, sensing the organisational culture, trial-and-error experimentation, or even formal learning. Informal learning can be deliberately encouraged by an organisation or it can take place despite an environment not highly conducive to learning. Incidental learning, on the other hand, almost always takes place in everyday experience although people are not always conscious of it'.

Marsick and Watkins are looking at the individual learning in an organisation where learning and change is taking place.

The following themes of informal learning are being summarised by Marsick and Volpe; based on a dissertation literature view by Cseh (In: Marsick, 2001):
- Integrated with work and daily routines.
- Triggered by an internal and external jolt.
- Not highly conscious.
- Often haphazard and influenced by chance.
- An inductive process of reflection and action, and
- Linked to the learning of others.

Onstenk describes learning at the workplace in terms of active behaviour. This behaviour is placed within the organisation as an environment. He characterises the environment with elements relevant for the learning; real problems coming from professional practice. In the end of his definition he characterises the learning; 'it is unplanned, unstructured and not regulated' (Onstenk, 2001).

Marsick and Watkins define informal learning in contrast with formal learning. The explanation of incidental learning clarifies what it is that people do; 'task accomplishment, interpersonal interaction, sensing the organisational culture, trial-and-error experimentation, or even formal learning' (1990).

It seems that Onstenk is also describing incidental learning; while he is using the term workplace learning. In this research we try to find out what individuals do when they learn incidentally. We prefer the definition on Onstenk on workplace learning. But in this research we use the term informal learning; since it is the aim of this research to deliberately encourage this form of learning.
Now follows a further explanation on the different clusters that Onstenk (1997) divided. The first cluster immanent and expansive learning, is learning directly integrated with work. Main characteristic of this form of learning is that it is closely related to problems that occur during work. There is a relation between development of competencies and the design of future work in all researches within this cluster.

The next cluster focuses on situated learning, learning from work environment, either a physical, symbolic or social work environment. There is a lot of attention for the social organisation of the learning process in different situations related to practice. The main characteristic of this research is the attention to practical skills.

The cluster on independent learning is about self directed and intentional learning. Central to this approach is the focus on the independent forms of learning, with an accent on the learner. Within learning at the workplace, there is a lot of attention on the informal ways of learning. It is more intentional, autonomous, spontaneous, and self directed by the learner.

The last cluster described by Onstenk is about job socialisation and professional socialisation, with a view on learning as job socialisation. The workplace is a social environment where culture plays a role. Learning is seen as 'educating at the workplace'. This form of learning is about internalising culture, values and beliefs of a profession and the organisation of the professional group.

This research focuses on situated learning and independent learning. These aspects touch on two characteristics of learning that are important in this research, namely that the learning is situated and that learning is self-organised. The constructivist view upon learning coheres with the above points. From the themes that are mentioned by Marsick and Volpe; based on the dissertation literature review by Cseh; the following are relevant for this research (In: Marsick, 2001):
- Integrated with work and daily routines.
- Triggered by an internal and external jolt.
- An inductive process of reflection and action, and
- Linked to the learning of others.

Transfer

The transfer of knowledge or experiences from one moment to another, the reusability of the knowledge or the experience, makes it valuable. Based on the constructivist theory we acknowledge that knowledge is recreated over and over again by individuals. Therefor we can't speak of exact or objective knowledge; we talk about subjective knowledge. Individuals give meaning and value to knowledge.

Baldwin and Ford, in a review study on transfer of training, define that transfer has occurred when 'learned behaviour is generalised to the job context and maintained over a period of time on the job' (1988). They include two conditions of transfer:
1. generalisation of material learned in training to the job context
2. maintenance of the learned material over a period of time on the job

The model that they used, as explained earlier in this paper, was based on three elements:
- Trainee characteristics: ability, personality and motivation influence transfer in a direct and indirect way.
- Training design: principles of learning, sequencing and training content influence transfer in an indirect way.
- Work environment: support and opportunity to use influence transfer in a direct and indirect way.

The indirect way is via learning and retention to transfer. Trainee characteristics and work environment both influence transfer in a direct way. Whereas training design only influence transfer via learning and retention.

Self-organisation of Learning

There is very little literature on learning that focuses on self-organisation by the learner. In an attempt to define self-organisation of the learning and the different activities concerning self-organisation of the learning we look at literature on self-directed, self-regulated learning and the design of a learning trajectory.

Self-directed learning is about educating and teaching oneself. There is a focus on the initiative of the learner and the learning goals he or she makes explicit. In an overview by Onstenk (1997) research on self-directed learning is described as concentrating on the interaction between the learning individual and the organisation. Employees need to have specific learning projects and learning strategies.

Self-regulated learning has its background in psychology. Zimmerman (1989) describes self-regulated learning in general as follows:
"Students can be described as being self-regulated in the way they are metacognitively, motivationally and behaviourally active participants of their own learning process."
The definition of self-regulated learning from Simons (1993), within constructivist learning comes closer to the view upon self-regulated learning within this research:
"the learner is able to prepare the learning themselves, make the necessary steps within the learning, regulate the learning, take care of feedback and criticisms and make sure that concentration and motivation stay in tact".

A difference between the definition of Zimmerman (1989) and Simons (1993) is that Zimmerman (1989) describes self-regulation mainly in terms of internal processes. Where Simons (1993) describes self-regulated learning mainly as different activities performed by the learner. This last definition is more in line with this research. Since the focus is on the organisation of the learner, as in activities performed by the learner. These activities can be compared with the activities that professionals take in the design of a learning trajectory.

Visscher-Voerman (2000) in a overview of this design process, explains that every approach has four core activities:
1. Analysis
2. Design and Development
3. Evaluation
4. Implementation

We compare the following elements of the definition by Simons with the core activities described by Visscher-Voerman. The preparation of the learning can be compared with the analysis of the problem. Preparation of the learning can start with an analysis, either an analysis of a problem or something else related to work. It is also possible that it is not an analysis but an activity or something else. Since the starting point of this research is informal learning, it is possible that the learning is not prepared at all.

Making steps in the learning and regulating the learning can be compared with design and development. To decide at a certain moment of time how to proceed with the learning or any to be taken steps can be seen as design of the learning. Where the improvement of changes within these planned steps can be seen as development of the learning. Receiving feedback and criticisms can be compared with the evaluation phase.

Learning is seen as organised by an employee when he or she:
- prepares the learning
- regulates the learning
- evaluates the learning

Simons states in his explanation of self-regulated learning that the five elements, named in his definition, can be taken care of by a second person. During a learning process there is usually a second person involved. In school settings this is the teacher, but it can also be a book. A book can be seen as a representation of a 'second' person. In this research we try to find the second person in the process and in the three, different elements. We call these 'second' persons actors, actors relevant for the learning of employees. This can be manager, colleagues or even customers.

In this research there is a search for the organisation of the learning at the workplace by the learner. This might be an unconscious organisation that the learner is unaware of during the learning. We try to find a structure, or elements of a structure, within this learning. Thereby the relevant actors concerning ones learning will be discovered and involved in this research. With the different elements as a guide the input of the learner and the input of the other actors the organisation of the learning will be analysed as well as their opinion on this organisation. This is in search of the balance in learning. Where does the input of the learner ends and the input of the actor starts?

Methodology and Research Design

This is exploratory research in the field of informal learning or learning at the workplace. Exploratory in the sense that the aim of this research is to find a structure in which we can place the organisation of learning by employees. Based on this structure an analysis is made of the involvement of the learner and the involvement of the other actors in the organisation of the learning. The main question is how self-directed learning is organised and where the balance is between the direction given by the learner and the other actor.

The next step in the future of this research will be to discover and implement different ways of organising learning at the workplace by directing and supporting learners and relevant actors to certain elements of the organisation of the learning.

We take an interpretative view upon research opposite to the positivistic view. The positivistic view states that there is one true knowledge, that this knowledge is 'hard' and can be transferred to everyone else. The interpretative view states that knowledge is connected to persons and is interpreted by persons, therefore there does not exist one true objective knowledge. Consequences for this research are that we will gather my data by asking people their perceptions on certain issues.
Since it is the learning of employees that is going to be intensified, the choice was made to start with their input. The results of the interviews will be compared with literature on this subject. But the starting point was perceptions of individuals on their own learning.

This starting point was taken for a couple of reasons:
- The interpretative view on learning, that defines knowledge as being subjected and connected to the individual.
- The constructivist theory that defines learning as recreation of knowledge over and over again, influenced by the environment and interaction with others.
- Individuals taken as a central starting point in this research, and letting them define what elements play a role, and
- The characteristic of what was researched, the way individuals organised their learning, which is closely connected to the individual and therefore could be different per person.

Based on the interpretative view upon the acquisition of knowledge and the characteristics of what knowledge is, combined with the constructivist theory, the way to research this form of learning is by interviews.

This research follows the principles and methods of development research. Development research is used a lot for design problems. This research can also be seen as a design problem. The aims of development research are (Van den Akker, 1999):
- Providing ideas (suggestions, directions) for optimising quality of the intervention to be developed.
- Generating, articulating and testing design principles.

To get an idea about the learning that occurs and the elements in the organisation of the learning we will interview professionals in different contexts. Professionals here are defined as: employees with complex tasks within their work. We choose professionals for two reasons. Their job is rich enough for the occurrence of learning. And because these professionals have some freedom in their work to organise their work and therefore probably more freedom to organise their learning as well. So the learning potential of these professionals is high.

In order of the future work of this research, the implementation of different ways of organising learning at the workplace by employees, will be looked upon by the following existing structures within organisations:
- POP, personal development plan
- Coaching trajectories
- Innovation and improvement trajectories

These starting points are chosen because they all give rich opportunities to learn. These are formats already existing in organisations with the possibility that the learner can organise his or her own learning.

A personal development plan is a plan in which the employee can explain what he or she wants to develop. A lot of employees use coaches to help them with different aspects their dealing with at work. This as well is a format with rich possibilities.

Innovation trajectories are new developments in organisation. This can be the development of a new product as well as an organisation going to the stock exchange.

These trajectories are trajectories where a lot of people usually have to learn new things, which they partly organise themselves.

Improvement trajectory is a trajectory where products or services can be improved. For example an IT department has to improve herself constantly. Since the development within this field takes place in a fast way, the employees are learning constantly.

There will be three cases developed. For each format three professionals will be approached. There will take a semi-structured interview place. Based on this interview other actors will be revealed and interviewed as well about the same incident.

The interview will take place according to the critical incident technique. This technique is “an appropriate tool that can be used to analyse jobs in the social context in which they occur” (Stitt-Gohdes, Lambrecht & Redmann, 2000).

After analysing the first interviews a list of steps or elements in the organisation of the learning is being made and the perception on the input from the learner and other actors on the organisation has become clear.

To avoid uncertainty in the interpretation of the data a questionnaire will be send to the interviewees with questions based on the outcomes of the interviews. With the intention to check whether same outcomes are receive.

How This Research Contributes to New Knowledge in HRD

This research will contribute to knowledge on how employees organise their learning and what preferences they have in informal learning. Based on the outcomes informal learning in organisations can be intensified according to the preferences of employees.

Self-Management and Labor Market Outcomes

Jasper B. van Loo
Maastricht University, The Netherlands

In this paper, the relation between self-management and labor market outcomes is addressed. Insights from both the current debate on employability and the economic training literature suggest that training and self-management are important factors for labor market success. The goal of this paper is to theoretically and empirically address this issue. A framework for analyzing the relation between self-management, training and labor market outcomes is presented and applied to survey data.

Keywords: Self-Management, Labor Market, Empirical Analysis

The changes in the relationship between workers and firms regarding careers have had important implications for both HRD theory and practice. The emergence of new psychological contracts have resulted in a shift from the traditional organizational career to what has been termed the 'protean career' (Hall and Moss, 1998), which is a career that individuals, not organizations are managing. The need for the new relation between workers and firms has been created by various developments taking place in modern societies: technological innovations, organizational developments, quality management and increased competition (Bishop, 1997; Collin, 1994; Watkins and Marsick, 1993; Stasz, 1998).

In the resulting employability debate, the need for individual worker flexibility is often stressed. It is assumed that workers that are more employable will be more successful in terms of labor market outcomes than their less employable colleagues. In the training literature, which is mainly inspired by the economic benefits of training, the need for continuing updating of skills is the main issue. Here, the determinants and effects from training participation have been extensively addressed and training participation is usually related to individual and work characteristics (see e.g. Blundell et al., 1996). Some of the empirical results obtained in economic studies on training participation have become standard results. For the United Kingdom, Shields (1998), and for the United States, Altonji and Spletzer (1991), Lillard and Tan (1986), Lynch (1992) and Lynch and Black (1995) summarize most of these findings: training decreases with age, training participation is lower for females and people with children; qualifications have a positive effect on training participation; union members are more involved in training than non-union members. This paper tries to integrate concepts from the employability debate and the literature on training effects by looking at the impact of self-management on labor market outcomes while taking account of training investments.

Specifically, the relation between perceptions on self-management and labor market outcomes will be discussed. This type of research is important in the HRD-field since it enables the identification of factors that make people successful in their careers. If self-management turns out to be one of the key factors explaining career success, the stimulation of self-management might become one of the new tasks of modern HRD-professionals.

The central research question in this paper is: In what way are self-management and labor market outcomes related? The paper will be structured as follows. In the next section, the theoretical framework for the relation between self-management and labor market outcomes will be discussed. We then present our specific research questions. In the next two sections the data used are discussed and four empirical analyses are presented. The final section concludes and summarizes.

Theoretical Framework

Psychological Contract and Self-Management

Self-management is an important characteristic of a modern psychological contract, since it plays an eminent role in the discussion on 'modern' psychological contracts. Argyris introduced the psychological contract as a concept in 1960 and defined it as an implicit agreement to respect each other's norms. Later on, it was defined as a product of mutual expectations that are implicit and unspoken, which may antedate the employment-organization relationship (Levinson et al., 1962). In general, psychological contracts are considered to be dynamic in nature, implying that changes in individuals, organizations or in the broader context have a direct effect on the contract and its outcomes.

Copyright © 2002 Jasper B. van Loo
Many authors have noted that the psychological contract has changed considerably during the last decades (see e.g., Hall and Moss, 1998). Whereas the traditional psychological contract is concerned with trading job-security for loyalty, in a modern contract employees offer flexibility while firms offer possibilities to remain employable. An important element in the behavior of employees resulting from the psychological contract is the degree of self-management. The degree of self-management may be characterized by four career management competencies (Ball, 1997): a) optimizing the current situation, b) using career planning skills, c) engaging in personal development and d) balancing work and non-work activities. In this paper, the focus will be on b) and c). In a modern psychological contract, the individual perceptions on self-management determine the outcomes of the psychological contract. It may be expected that individuals with a higher degree of self-management will also be more successful on the labor market. In line with this theoretical assumption, employees' self-management perceptions influence labor market outcomes.

When the degree of self-management is discussed, often a distinction is made between a) self-management perceptions on initiative and b) self-management perceptions on responsibility. As a result, in the context of this paper, self-management consists of four elements. Training-related self-management initiative, training-related self-management responsibility, career-related self-management initiative and career-related self-management responsibility. (see also Delf and Smith, 1978). Training-related self-management initiative is defined as taking the lead in initiating training participation. Training-related self-management responsibility may be defined as the perceived obligation to be liable for training outcomes. Career-related self-management is defined as taking the lead in career development. Finally, career-related self-management is defined as the perceived obligation to be liable for the outcomes of career development. The relation of these four self-management elements to labor market outcomes is, however, not straightforward a priori. The goal of this paper is to investigate this issue from both a theoretical and an empirical perspective.

**Labor Market Outcomes**

Measuring someone's success on the labor market has long been an area of research that has been dominated by labor market economists. Starting with the pioneering work of Becker and Mincer in the 1960's, the concept of Human Capital was introduced. The main theme in their analysis is that the investment in human capital is comparable to the investment in physical capital (which had been studied extensively before), in the sense that an optimal decision for investment should be based on a careful examination of the returns and the costs of human capital investments. The relevant labor market outcome variable in most human capital literature is the wage. In countless articles that have appeared in the economics journals, economists have typically estimated wage equations, where human capital was related to different indicators for human capital investments, such as e.g. initial education, training and experience.

The classical human capital model takes wages as its sole explanatory variable. The assumption behind this is that wages are an unbiased estimator of productivity and that hence, all aspects of productivity are valued and can be summarized in a single indicator, the wage. Since many obstacles exist, the labor market is, however, far from perfect. There may be imperfect competition in markets for human capital, meaning that some types of human capital are only valuable in distinct situations, such as in the case of completely firm specific capital. But there may also be other reasons for a possible bias in the wage as an indicator for productivity. Firms may, for example, notice increases in workers' human capital with a lag, or they may wait rewarding it due to institutional constraints in wage-systems.

All this does not mean that wages are not suitable for analyzing labor market outcomes. We may continue to use the wage as an indicator for the valuation of human capital, but interpret it as the 'realized yields' from human capital investments. In addition, we may consider measures for the 'unrealized yields', which may be defined as an effect from human capital investments that is not yet reflected in the current wage. We consider two workers' labor market potential variables as indicators for the unrealized wage yields. The first one is the probability of finding a similar job outside the company one is currently working in (external labor market potential). The second indicator we use for labor market potential is the probability of keeping the current job (internal labor market potential). The emergence of the new psychological contract has also made these indicators for labor market success more important for employees themselves. Not only the success in the current job, which is traditionally measured by the wage, but also labor market potentials, which are important in times of (voluntary or forced) job changes, are important in a career.

A final labor market effect variable concerns bonuses: or sums of money that are rewarded for excellent work performance. These 'incidental monetary rewards' may be considered a somewhat more direct valuation of someone's performance than the wage, since wages are typically not instantaneously adjusted to reflect worker
performance, due to, e.g. wage regulations or efficiency wage arguments. Bonuses, on the other hand, are not part of formal agreements and provide firms with a flexible instrument to reward outstanding productivity.

Model

When the relation between self-management and labor market outcomes is modeled, some potential problems arise. Firstly, labor market outcomes are influenced by many more factors than just self-management. For instance, level of education and the (past) participation in training courses may also have their impact on labor market outcomes. In addition, self-management may have a direct effect on labor market outcomes, but it may also affect these outcomes in an indirect manner. For instance, although some aspects of self-management do not have a direct effect on wages, these aspects may make training investments more or less productive, thereby exerting an indirect effect on wages. These considerations imply that the relation between self-management and labor market outcomes must be modeled using various background variables and interaction variables.

Bearing these considerations in mind, the relation between self-management and labor market outcomes may be modeled using the following model:

Figure 1. Research model for the relation between self-management and labor market outcomes

Relation (1) depicts the direct relation between self-management and labor market outcomes. Relation (2) maps the second possible relation under investigation. It is based on the idea that the degree of self-management may make training more or less productive. In the empirical analyses, we allow for this effect by using interaction variables for training and various aspects of self-management.

Research Questions

From the previous discussion, the following research questions arise:

1. To what degree does the wage depend on perceptions on self-management.
2. To what degree does internal labor market potential depend on perceptions on self-management.
3. To what degree does external labor market potential depend on perceptions on self-management.
4. To what degree do incidental monetary rewards depend on perceptions on self-management.

All four research questions refer to both the direct effect from self-management on labor market outcome variables and the possible indirect interaction effects with training participation.

Methodology

In this paper we use data from a survey we conducted in 1999 among employees of a large firm in the Netherlands financial services sector. The reason for using survey data is that we have not found other data sources that cover a wide array of human capital variables, labor market outcome, and self-management variables simultaneously. The company we investigated consists of 2 divisions. These divisions only differ in that they work for different parts of the insurance market. We have sampled 100 employees, 50 from each division, from a population of about 480 people using a stratified random sampling procedure. This group is relatively homogenous since they all have the same job description. As our objective was not to point out differences in occupations when it concerns labor market outcomes or self-management perceptions, we were able to keep the sample relatively small. The used set-up has the advantage that we are able to focus on the key concepts in the model without having to correct for differences in occupations or firm policies. We surveyed the workers using a face-to-face interview where the interviewers entered the answers directly in a computer that used automated survey software.
The group of workers that are central to our investigation are the so-called 'administrative employees'. Their job mainly consists of dealing with insurance benefit applications, determining the amount of money a client is entitled to, dealing with the clients incidentally, and keeping the files of clients up-to-date. The work is mostly done using highly advanced computer information systems. The work is organized in teams, usually consisting of about 20 people and a manager. We surveyed employees in 11 of those teams. Thanks to careful consultation with the company and potential respondents beforehand, we managed to obtain a response rate of 91%. A non-response analysis revealed that there are no serious reasons that the data may be blurred by selectivity. In addition to the data from the employee interviews we were able to use information from the firm’s personnel information database, which contains many background variables.

Self-Management Variables

The employees were asked four self-management questions. The first two capture the perception on training-related self-management. Respondents were asked whether they felt that they are responsible for taking the initiative for their own training. They answered on a five-point scale, ranging from “completely agree” to “completely disagree”. A similar question was asked for the perception concerning training-related self-management responsibility: employees where questioned whether they feel that they should bear the responsibility for their own training. The same methodology was followed for measuring the degree of career-related self-management. Employees were asked whether they responsible for taking the initiative for career development and whether they feel that they should bear the responsibility for their own career development. Table 1 shows that the majority of employees have a positive attitude towards the various aspects of self-management.

Training Variables

In most empirical work concerning the relation between training and labor market success is analyzed using the total number of training courses or total duration of training. Since different types of training may yield different effects, we distinguish between different types of training activities. People take part in training courses for different reasons. They may take a training course to make up for lost skills, be involved in training to improve career perspectives, or take courses simply because they have a preference for learning new things. In this paper, training is split up according to whether it is meant to combat skills obsolescence or undertaken for career reasons (‘core’ and ‘career’ training, Bartel, 1992). Training for career reasons is expected to have a positive effect on job prospects, since it adds to the stock of human capital available to workers. Training in order to combat skills obsolescence may have either a positive or a negative effect on job prospects. Low incidence of this type of training may imply low skills obsolescence in the worker involved, leading to better job prospects. On the other hand, a high incidence of this type of training may imply that the worker involved undertakes many activities to combat his skills obsolescence, which might also lead to better job prospects. Evidence elsewhere (Van Loo, 2002) shows that training undertaken to combat skills obsolescence has no effects on labor market outcomes. We therefore leave this type of training out of the analysis.

The second distinction we make is the division between firm specific and general training. We expect different effects of these two types of training since firm specific training is less valuable outside the firm one is working in, and is less likely to have positive effects on external labor market potentials. On the other hand, general training is useful in a great number of circumstances, and may therefore have stronger effects on external labor market potentials.
Finally, we distinguish between recent and non-recent training. It seems logical to assume that training courses taken recently yield smaller effects than training that was taken many years ago. We consider recent training to be all courses taken in the last five years. All courses before that are considered non-recent courses.

Table 2 presents the distribution of different types of training for the different categories distinguished. It shows that the majority of training courses is undertaken for skills obsolescence reasons.

**Labor Market Outcomes**

In this paper, we use 4 different indicators for labor market outcomes: Wages, internal labor market potential, external labor market potential and incidental monetary rewards. Wages have been taken from the personnel information database, avoiding commonly reported measurement problems with this variable. Labor market outcomes are measured by using the answers on two questions in the survey that measure the self-rated career prospects. Both the probability to remain employed (internal) and the probability to find a new job (external) were measured on a 1-5 scale. Finally, the incidental monetary rewards have been measured by looking at the total amount of bonuses that employees have received over a two-year period (1998-1999).

**Background variables**

We include six background-variables in the analysis. Two commonly used indicators for human capital are tenure and educational background. In order to take account of a possible quadratic relation between tenure and labor market outcomes, we include tenure-squared as well. Another indicator for human capital is the quality of workers' competences. Since our database contains detailed information on employees and their managers, we are able to include a manager rating for the workers competences. In order to take account of possible gender effects, we include gender. Finally, a dummy for firm division captures possible differences between the two firm departments.

**Results**

In order to address our research questions, we estimated four labor market outcome equations, one for each labor market outcome variable. In a first step, all variables discussed above were included in the analysis. We find the following results: Tenure has a positive effect on wages, while tenure-squared exerts a negative influence. These results are consistent with those found in much of the human capital-wage literature. The effect from the manager's performance rating of employees is positive, indicating that employees with better abilities earn relatively more. The different types of training have no significant effects on wages. Training-related self-management responsibility, however, does have a positive effect, meaning that workers with a stronger tendency towards responsibility for their training related self-management earn more. Finally, two interaction terms have significant effect on wages: The interaction of general non-recent career training and training-related self-management responsibility has a negative effect on wages. On the other hand, the interaction effect of recent general career training and training-related self-management is positive.

External labor market potential is only significantly influenced by one variable in the full model: firm division. Internal labor market potential, on the other hand, is influenced by three: Gender (+), firm division (+) and non-recent general career training (-). The last results is surprising, since in general, investment in training is considered to have positive effects on human capital. The results here indicate that the acquisition of general human capital in the past does not have a positive effect, but rather punishes workers in the present. In the explanation of incidental monetary rewards, we find three significant effects. The managers' performance rating has an expected positive effect, firm division has a positive effect while recent general career training is rewarded positively as well.
Restricting the Estimations

A key problem in the estimations is that when some variables are strongly correlated, the estimation will fail to show significant results. In order to solve this, the four labor market outcome equations were re-estimated with fewer variables. We used a stepwise approach, where the least significant variables where subsequently deleted from the model. We stopped adjusting the equation once we found a result where all included variables were significant at a least the $\alpha=0.10$ level. We then obtain the equations shown in table 3.

*=significant with $\alpha=0.10$, **=significant with $\alpha=0.05$, ***=significant with $\alpha=0.01$, X=variable not included

The re-estimated labor market outcome equations show the following: For wages, tenure, tenure-squared, and the manager performance rating have the expected effects. General non-recent career training has a strong positive effect. Training-related self-management responsibility also has a positive effect. Finally, the interaction between general non-recent career training and training-related self-management is negative, indicating that the combination of this type of training with a strong sense of responsibility concerning training has a negative wage effect.

Interestingly, tenure has a negative effect on both external and internal labor market potentials. This might be due an experience of concentration, which occurs when people work the same job for a prolonged period of time. The highest achieved educational level has a negative impact on internal labor market potentials, which is somewhat surprising. Firm division has a negative effect on external labor market potentials and a positive effect on internal labor market potential, indicating considerable differences between the two firm divisions. When it concerns the
self-management variables, we find a negative effect from training-related self-management initiative on internal labor market potentials, a positive effect from career-related self-management initiative on external labor market potentials and a negative effect from career-related self-management responsibility on external labor market potentials. The interaction of recent general training and training-related self-management responsibility has a negative impact while the interaction of this type of training and career-related self-management responsibility has a positive impact on external labor market potentials. Finally, the interaction of non-recent general career training and training-related self-management responsibility has a positive effect on internal labor market potentials.

When we turn to the final column in table 3, it comes apparent that the manager performance rating has a positive effect on incidental monetary rewards (bonuses). Firm division has a positive effect as well. It is surprising that specific non-recent career training has a strong negative effect on bonuses. It might be that the weakest group of workers is more involved in this type of training than their more able colleagues, implying that being involved in such a training no longer signals human capital acquisition but rather employee weakness. Finally, four interaction terms have significant effects. The combination of training-related self-management responsibility and both non-recent general and recent specific training courses both have significant negative effects on bonuses. Non-recent general and non-recent specific career training combined with a high degree of career-related self-management initiative and training-related self-management responsibility respectively have a positive impact on the incidental monetary rewards.

Summarizing, we find that wages are influenced positively by both general non-recent career training and training related self-management responsibility. The interaction of these variables, however, has a negative impact on wages, suggesting a 'declining returns' mechanism. For external labor market potentials, we find that career related self-management initiative has a positive influence, while career-related self-management responsibility has a negative impact. The latter result might be due to the fact that employees with a high feeling of responsibility only take career steps that they are totally comfortable with, resulting in a somewhat less favorable external labor market potential. The interaction terms show opposite signs, and are somewhat hard to interpret. When internal labor market potential is considered, the analysis shows that it is influenced negatively by training-related self-management initiative. This type of self-management is not rewarded in terms of internal labor market potential. The interaction of general non-recent career training and training-related self-management responsibility, on the other hand, does have a positive impact. This implies that those employees that were involved in this type of training and also have a high degree of self-management responsibility have better internal labor market prospects. Finally, non-recent specific career training has a negative impact on bonuses. This implies that the firm does not perceive this type of as a human capital investment, but rather as a signal for weak employees. Four interaction variables also have significant effects, but the interpretation of these results is difficult.

Discussion and Conclusion

The emergence of new psychological contracts have resulted in a shift from the traditional organizational career to what has been termed the 'protean career'. The need for a different relation between workers and firms has been created by various developments taking place in modern societies: technological innovations, organizational developments, quality management and increased competition. As a result, an employability debate has emerged wherein the need for individual worker flexibility is often stressed. In the economically inspired training literature, the need for continuing updating of skills is the main issue. This paper has attempted to integrate concepts from the employability debate and the literature on training effects by looking at the impact of self-management on labor market outcomes while taking account of training investments.

A model has been developed that relates self-management perceptions, training participation and labor market outcomes. The model allows for both direct effects of self-management on labor market outcomes as well as indirect interaction effects with training participation. From survey data, we find that the different indicators for labor market outcomes are influenced by different explanatory variables. The results also lend support to the existence of direct and indirect effects of self-management on labor market outcomes. Not all found effects are, however, intuitively predictable. In this respect, e.g., the negative effect of general non-recent career training on internal career potential is quite puzzling. It could be due to the fact that a worker who is involved in many general career courses signals to the organization that he is willing to leave, which in turn makes organizations restrict further career possibilities. On the other hand, however, it could be that workers that take general career courses are candidates for dismissal, which causes a lower internal labor market potential. Among other issues, this question of causality needs further attention. Other possible future research should focus on validating the results using broader populations. Although the analyses show that self-management matters for labor market outcomes, the results found here hold for one
company only. It would be quite attractive to be able to generalize the results, since understanding the impact of self-management can improve both HRD theory and practice.

Characteristics Orientation of Emerging Professions: Implications for Research, Policy and Practice of Continuing Professional Education

William H. Young  
University of South Florida

Margot B. Weinstein  
Kingston Group Inc.

The purpose of this qualitative study was to examine emerging professions in American society through the characteristics orientation presented by Gilley and Eggland (1989), and relate the implications to Continuing Professional Education (CPE). The paper first defines the orientation. Second, it describes the fields of Information Technology, Real Estate, and HRD in relationship to the model, and third, it discusses the issues and trends for the research policy and practice of CPE.

Keywords: Professionals, Continuing Professional Education, Professionalization of HRD

“A central feature of North American societies in the 20th century has been the professionalization of their workforces” (Cervero, 1988, p. 3). It has been estimated that 25 percent of the American workforce claims membership in a profession (Cervero, 1988). There is little argument that professionals are central to the functioning of American society (Cervero, 1988; 2000; Houle, 1980; Curry, Wergin and Associates, 1993). Because of their importance in American society, it is assumed that professionals will continue to learn throughout their careers, and to meet this challenge, a tremendous amount of resources, both financial and human, are used to create education programs to improve practice for these practitioners (Cervero, 1988). These practitioners “present a picture of rapidly changing practice settings across the professions, and thus, the need for a continuing education response that is up to the task of preparing professionals for this world” (Cervero, 1998, p. x). Daley (2000) added, “although continuing professional education (CPE) has undergone significant changes in the past decades, yet there is little current literature that assists practitioners in developing an expanded understanding of the new issues, developing trends, and future needs of this important segment” p.1). Several authors believe that CPE providers can strengthen their programs by understanding the continuum from a pre-professional through professionalization in the literature (Gilley and Eggland, 1989; Young, 1998; Knox, 2000). The process practitioners, such as Human Resource Development (HRD), use to achieve professional status in American society as professions, and the trends and issues that arise for CPE is applicable to many if not all professions, and it will add to the literature of CPE (Gilley and Eggland, 1989; Young, 1998; Knox, 2000).

The purpose of this qualitative study was to examine how the fields of Information Technology (IT), Real Estate (RE) and HRD attempt to achieve professional status in North American society through the “Characteristics Model” explained by Gilley and Eggland (1989). The three fields were chosen because they represent varying stages in the professionalization process, and the researchers believed that the findings would add to the literature on the issues and trends for the research policy and practice of CPE.

Theoretical Framework

Although sociologist have done extensive studies on professions, professionalism, and professionalization, defining the term “profession” is still a challenge (Ruona and Rusaw, 2001; Gilley and Eggland, 1989; Cervero, 1988). Three approaches have dominated the literature about professions and professionalization. First, is the process approach, it states that professions move at different speeds toward full professional status through a process. Second, is the trait approach; this approach explains that professions all share traits or characteristics in common, and professions reach full professional status when they acquire specific characteristics, and third, is the power approach, “which differentiates professions based on the power relationships held by practitioners in their social exchanges with society and individual clients” (Ruona and Rusaw, 2001, p 221).

While the terms are difficult to define, all the definitions include several elements that are consistent with other definitions of a profession (Gilley and Eggland, 1989). A profession must have four components: (1) a specialized body of knowledge, (2) a set of competencies, (3) common principles, and (4) dedicated to the public interests.
Although there are many different definitions of the terminology in the literature, "the trait or characteristics approach has been the most commonly referenced in literature" (Ruona and Rusaw, 2001, p. 221). This approach is consistent with other definitions of a profession (Gilley and Eggland, 1989). Based on the importance of the occupation to American society, the occupation can be classified as: a profession, semi-profession, Para-profession, quasi-profession, skilled, and unskilled. Within each classification, there is a service component, "the difference between classifications of occupations is not the service itself, it is the nature of the service" (Gilley and Galbraith, 1987). An examination of professions such as HRD by the characteristics orientation, can provide insight into the evolutionary process, issues and challenges faced by the profession to gain professional status (Ruona and Rusaw, 2001; Gilley and Galbraith, 1987). According to this orientation, for an occupation to be viewed as a profession in American society, it must contain eight characteristics, although the importance each occupation gives to a characteristic can vary from one occupation to another. The eight essential characteristics are:

1. A Code of Ethics. "Professional groups share a common set of knowledge and a code of ethics for the purpose of providing high-quality services to people and working toward the betterment of society" (Cervero, 1988).
2. An organized and accepted body of knowledge. Each profession must establish a set of core knowledge or theory that is the foundation professionals must learn in a profession.
3. Specialized skills or identified competencies. In addition to general concepts and theories that guide practice, Bratton (1984) stated professionals must have specialized competencies that enhance practitioners in six ways: (a) they provide practitioners with tools for self-assessment and professional growth, (b) they give a common set of concepts and vocabulary to improve communication among professionals and professional groups, (c) they provide information that can be used to develop professional programs, (d) "they can be used as a foundation for a certification program, (e) they provide employers with information to identify qualified applicants, and (f) they provide a basis for defining an emerging field of study (pp. 1-2).
4. Minimum education requirements for members.
5. Certification of the proficiency members must achieve. Gilley and Eggland (1989) stated that the certification criteria that is commonly used by these societies involves three types: Professional certification is a voluntary process that measures the competence of practitioners in a field by a professional association or organization. Accreditation is term used to describe the regulation of voluntary programs in a field, and is usually administered by an association or agency. Licensure is a required credential received by individuals and is administered by a governing group or political body in the field (Gilley and Eggland, 1989).
6. An orderly procedure in the fulfillment of responsibilities.
7. Opportunities for dissemination and discussion of ideas among members. This open communication usually happens through organizations, associations and education programs.
8. Enforcement of disciplines of the profession, and failure leads to "malpractice" and to be "out" of the professions" (Gilley and Eggland, 1989. p. 307).

Professionalization refers to "the process that professions go through to move from the status of an occupation to that of a profession in society" (Gilley and Eggland, 1989). According to Gilley and Eggland (1989), three areas are: "(a) knowledge/competency required of each member in order to participate in an occupation, (b) level of importance that society places on the occupation, (c) level of control members of the occupation place on others prior to entering and practicing the occupation" (p.300).

Continuing professional education (CPE) refers to the education of professional practitioners, regardless of their practice setting, that improves their learning and ability to practice throughout their careers" (Queeney, 2000).

The following fields are analyzed in relationship to these eight characteristics: IT, RE, and HRD and the trends and issues that arise from this study are related to research, policy and practice of CPE.

Research Questions

In order to gain insight into issues facing the field for professionalization, three general questions guided the study:

1. Why does the field want to achieve professionalization?
2. What are the issues facing the field for professionalization?
3. How could these themes be utilized to improve the policy, research and practice of CPE in the professions?

Methodology
The study used qualitative research methodology as a primary research design. The fundamental characteristics of qualitative research is its in-depth exploration of a phenomenon in its context (Denzin and Lincoln, 1994). This methodology allowed the researchers to explore the subject through formal and informal interviews, and gain new insights from the themes that emerged (Denzin and Lincoln, 1994). The qualitative research methodology was used for the research because an intensive description and analysis of the phenomenon would uncover the interplay of significant factors that are characteristic of the phenomenon (Merriam and Simpson, 1995). The three fields were chosen because they represent fields that are at different stages on a continuum towards professionalization. RE practitioners have enacted all eight characteristics, but the field has not yet reached profession status in society; HRD practitioners are attempting to reach professional status by establishing characteristics, and IT is in the beginning stages of deciding with its members whether or not the field should seek professionalization. As fields moved towards professionalization, the implications for CPE are many. By examining these three fields, it is hoped to shed light on the implications of the policy, practice, and research of CPE.

By means accorded in the methodology, 36 participants were selected through purposeful sampling (Denzin and Lincoln, 1994). Six professionals and six educators were purposely selected in each of the three fields of IT, HR and RE. Participants characteristics were: (a) 18 men and 18 women, (b) between the ages of early thirties to early sixties, (b) who had each worked in the field for over ten years, (c) each had completed a minimum of a masters degree in their field, ten had a Ph.D., and (d) all took CPE regularly.

In addition to 12 formal taped interviews, 24 informal interviews, both face-to-face and telephone, were taped with consent of the participants. The research used structured, open-ended questions to explore participants' perceptions regarding the subject matter. The characteristics that emerged from the interviews were validated through documents, journals, a literature review and discussions with other professionals and educators in the field.

After the completion of the data analysis process, another phase of data analysis, a search for themes, was begun. The process used "concept mapping" (Smith and Associates, 1990) as a diagnostic tool. "A concept map depicts in a diagrammatic form, ideas, examples, relationships, and implications about a particular concept. The center or core idea is placed at the center or top of the page, and radiating from it are a number of spokes or lines leading to other concepts related to, or indicated of the central idea" (Smith and Associates, 1990, p. 49). Concept mapping enabled the researchers to group similar examples of large concepts together, and smaller concepts were set aside until they could be integrated into the larger themes; this process allowed the dominant themes to emerge from the data.

Limitations

Since the study was limited to interviews with 36 participants from the three professions of HRD, IT and RE, the study can not predict if this information is utilized by all emerging professions. The researchers believed that the insights gained in this study should be the first step to lead to further research on the subject.

Results and Findings

As indicated in the "Characteristics Model," in order for a field to become established as a profession, it must contain all eight characteristics. The three fields are presented based on where the field is on the continuum towards professionalization, beginning with the field of RE which has received the greatest number of characteristics, to the field of IT, which has established the least criterion as a profession. This section first presents the characteristics in each field, and then it provides a summary of the major findings from the research study.

Field of Real Estate Practitioner (RE)

Characteristics of the Field. Although the RE field has established all eight characteristics, the field has not yet been recognized as a profession in American society. A real estate practitioner is licensed by the state in which he/she practices, abides by all governmental rules and the code of ethics of the National Association of REALTORS® (NAR), and must take minimum education to acquire and maintain a license. NAR (2001) "has a membership of 750,000 real estate professionals, and it is the largest professional association in the United States" (p. 1). RE has a literature base that is accepted and utilized for licensure. Many university degree programs have been established throughout the country in the last 20 years with concentrations in finance, international RE, or some specialty field in RE; however, a degree based entirely on the field does not exist. RE, as in the other fields, has attempted for a number of years to obtain a consensus of opinions to determine its body of knowledge for university programs, but studies concluded that the body of
knowledge in degree programs at universities varies tremendously from one degree to another (Rabianski and Black, 1998; Epley, 1996; Weinstein, 1998). However, the field has a recognized knowledge base for licensure.

**Summary of the Findings.** All the participants interviewed in RE (12 out of 12) said they were interested in gaining professional status; they wanted the prestige, recognition and requirements for practitioners that comes with professionalism, and they believe that the field is doing everything in its power to establish itself as a profession. Participants said (12 out of 12) that there are two issues facing the field for acceptance as a profession: (1) The field has had difficulty in designing a knowledge base in a university that adequately responds to constant changes in specialized knowledge, technology, and expansion of its client’s growth. Participants statements reflected thoughts in the literature on RE that the majority of academic research is out of touch with the practitioners and the industry, and in most cases conflicts with the information that practitioners in the industry really want (Souza, 2000; Weinstein, 1998). In order to define a body of knowledge in universities that is acceptable by all users in RE, there needs to be more research and discussion on the subject (Epley, 2000). (2) RE practitioners must continue to establish the connection of the value of their services to society as expressed in their code of ethics in NAR. “Under all is the land. Upon its wise utilization and widely allocated ownership depend the survival and growth of free institutions and of our civilization” (NAR, 2001, p. 8). Participants commended NAR’s efforts to move the field towards professionalization by passing a mandatory ethics training course for members. Beginning in January of 2001, REALTORS® are required to complete one course every three years specifically in CPE in ethics to maintain a license. “The purpose of this training is not only to promote the professionalism of REALTORS®, but also to protect the public” (NAR, 2001, p. 1). Since RE practitioners are viewed by the public as more interested in making money instead of providing service, participants said that it will still be difficult for the field to reach professional status in American society.

**Field of Human Resource Development (HRD)**

**Characteristics of Field.** HRD has created Standards and Ethics and Integrity that are an important milestone of the field towards evolution as a profession (Ruona and Rusaw, 2001). HRD has professional societies and associations that promote research and interchanges of ideas from its participants: the American Society for Personnel Administration (ASPA), the American Society for Training and Development (ASTD) or the National Society of Performance and Instruction (NSPI). There are many degrees with concentrations in Human Resource Development, but they vary in many fundamental ways. Kuchinke (2001) analyzed data from 55 graduate programs in HRD; he found that HRD has not yet devised a core curriculum content. HRD has established several associations and societies to develop and implement professional certification procedures for their memberships to enhance professionalization. These programs were established to advance or increase the competency of practitioners within the field, mainly in areas of specialization as managers, instructors, instructional designers and consultants (Gilley and Eggland, 1989). Several HRD-related associations and societies have established professional certification procedures to enhance professionalization of the field (Gilley and Eggland, 1989). “The identified competencies can be used to develop guidelines, appropriate course work, internships, practicums, and independent projects” (Gilley and Eggland, 1989, p. 289).

**Summary of Findings.** The participants interviewed in HRD (12 out of 12) expressed a strong desire towards professionalization, and they said that the biggest obstacle for the field to become a profession lies on issues surrounding credentialing. Members need to agree on a basis for credentials, licensure and certifications. Due to the diversity of practitioners and areas of practice, generally participants (11 out of 12) believed that this presents a tremendous obstacle for the field. Furthermore, members in the field must first understand terminology, because confusion among the three terms accreditation, licensure, professional certification, creates enormous problems for practitioners. Practitioners often confuse the purpose, nature and delivery system related to each (Gilley and Eggland, 1989). Participants added further challenges for professionalization are: (1) Participants (12 out of 12) said that the field needs to better describe its service component to society to legitimize itself and its professionals. (2) Participants (11 out of 12) added that HRD must support a literature foundation that is accepted by the entire field, because “an HRD discipline around the proposed theories is fundamental to the maturation of the profession” (Swanson and Holton, 2001, p. 100). (3) Participants believed (12 out of 12) that more research should examine how to improve CPE on preceding subjects.

**Field of Information Technology (IT)**
Characteristics of the Field. IT practitioners are part of the newest field in this study to examine whether the field should or should not attempt to gain professional status. IT practitioners are in demand in the workplace due to recent changes in technology that impact everyone's lives. As a result, there has been a tremendous increase in number of practitioners and education programs in the field. IT has two professional organizations: The Association of Information Technology Professionals (AITP) which has established a code of ethics for the profession, and the Association of Computing Machines (ACM). There are no licensure procedures in place in the field, and practitioners do not need a degree to practice. IT has a voluntary certification and re-certification program by The Institute of Certification of Computer Professionals. Several vendors offer certification programs such as Microsoft's NT operating system, application development, or one of several Microsoft products. The classes are taught by Microsoft certified instructors and a test must be taken by participants to receive the certification; these certifications are highly valued by employers (Branigan, 1998). A degree in IT or information technology is usually required for most starting positions in the field, although degrees in associated fields such as mathematics, accounting, or engineering, are occasionally accepted (Branigan, 1998). Many degree programs have been established within the last twenty years, but there is no consensus of what needs to be curriculum. With wide utilization of technology Curry, Wergin and Associates (1993) referred to computer sciences practitioners as professionals because the field requires collegial education that is based on special knowledge, and the field serves the social good. IT is referred to by Branigan (1998), "as a discrete profession that needs for "content-related continuing professional education, applicable certification, and continuing professional education that goes beyond the specific content-related material applied directly to the improvement of computer technology skills" (p. 331).

Summary of the Findings. Of the 12 participants in IT, four were not interested in the professionalization of the field. The four participants who were not interested in professionalization of IT, stated that they had entered the field to make money, and they felt that professionalization would lead to increased restrictions and costs to do business. They said that although most IT practitioners seek a degree or credential to obtain a position in the field, the content of the field is changing so rapidly that most IT practitioners have little interest in establishing themselves as professionals if it means that they must have licensure and CPE within a subscribed curriculum. The eight participants who were interested in IT seeking professionalization said it would improve the field in the following ways: (1) IT would increase the prestige, the training required to maintain a license and the quality of education programs. (2) Professionalism would force practitioners to take CPE to learn important information as stated by Armour and Fuhrman (1993) to: (a) learn critical thinking skills, (b) create context areas that are valuable in field (ethics), and (c) and become skilled at communication skills. Participants said the two biggest obstacles towards professionalization are: (1) IT must connect the field to a service component that is acceptable by society, and (2) IT must maintain a knowledge base in a university that adequately responds to constant changes in the specialized knowledge, technology and expansion of its clients' growth.

Conclusions and Recommendations

This section discusses the conclusions drawn from the study for professionalization and CPE.

First, generally participants interviewed (32 out of 36) believed that professionalization should be the goal for their field, and that CPE providers, professional organizations and societies need to continue to discuss the process and its implications for CPE. The study suggests that professionalization of the fields would increase the prestige and credibility for its members and insure better trained practitioners and educators who must follow ethics, principles and standards to remain in the field. Six participants from HRD expressed difficulty for AHRD to establish the necessary characteristics professionals due to the diversity of practitioners and specialties in the field. Four IT practitioners believed that professionalization of IT would decrease opportunities for work and profit, would result in unnecessary restrictions for practitioners and creation of education programs that can not keep pace with changes in the business. Second, participants (32 out of 36) stated that in order for their field to reach professional status, practitioners must support a code of ethics that clearly explains the value of its services to society and the standards and ethics that guide its practice. Participants believed that "Professional groups share a common set of knowledge and a code of ethics for the purpose of providing high-quality services to people and working toward the betterment of society" (Cervero, 1988). Participants constantly stated that in order for their field to move towards professionalization, it must define value to society though its service instead of profits. Although all three fields in this study have established a set of ethics, participants believe that the fields have not made a sufficient argument for the value of their services to society. Each field must do further research studies to define the value of its services to society, and to insure that members practice principles that guide their field. In addition, CPE should examine trends towards mandatory CPE in ethics in addition to other CPE as was instituted by RE this year.

Third, participants agreed (32 out of 36) that to establish itself as a profession, a field must subscribe to an accepted body of knowledge that has been established in universities. However, several participants said that in each field there are so many areas of practice and diverse participants, that it is an almost an impossible task to design one body of knowledge that is representative of the field. All participants felt that generally universities do not have the ability to link theory and practice and to adequately respond to constant changes in specialized knowledge, technology, and expansion of it client's growth; this thought was fervently expressed by IT participants. Therefore, CPE providers must improve how they design and update programs to link theory and practice and to keep knowledge current with practice.

Fourth, participants (35 from 36) believed that for practitioners to be successful in today's workplaces, a field must establish a set of competencies that improves the practice of professionals. They suggested that "Competencies should be performance oriented rather than academic oriented, reflect the skills of the experienced practitioners as opposed to the entry-level of individuals and be reflective of the skills of professionals such as HRD, regardless of their position, title or academic degree held" (Galbraith and Gilley, 1986, p. 28). Participants said that for CPE to play a major role in their ability for continued competence in their field, it must address the following two issues: First, "The greatest challenge facing CPE is to address the application of knowledge and skills within a practice context that must go beyond simply providing information and teaching technical procedures; it must help professionals build their collaborative judgment, reflective, and integrative capabilities, (Queeney, 2000, p. 379)." Therefore, participants believe that it is essential for CPE to teach such competencies as: team work, collaboration, problem solving, critical thinking, reflection-in-action, skills as defined by (Schon, 1987; Houle, 1980, Cervero, 1988). Cervero (1988) expressed concerns that artistry maybe different in different professions. Second, several participants (16 out of 36) stated that it would be beneficial for CPE to develop a continuum system of professional education to assist in education for professionals from pre-professional throughout their careers. This continuum could address difficult topics such as the evolution of expertise as expressed by Knox and others.

Fifth, participants agreed (32 out of 36) that a field must establish a certification process for professionals, professors, trainers and educators to establish professionalism. Generally, participants articulated thoughts in literature by Gilley and Eggland (1989) that certification programs assist in providing feedback and evaluation of the competencies and skills attained by those individuals aspiring to practice in a field. Members must first understand terminology, because confusion among the three terms accreditation, licensure, professional certification, creates enormous problems for practitioners. Especially in HRD, because practitioners often confuse the purpose, nature and delivery system related to each (Gilley and Eggland, 1989). Further arguments on the subject were: (a) Ten participants expressed there is an increased trend for practitioners to be required to take recognized programs at universities for licensure and re-licensure to be a professional. "Towards this aim, there will continued to be a movement towards a convergence to require more and more degrees for entrance to the field; many fields want to require a doctoral degree for entrance" (Curry, Wergin and Associates, 1993 p. 302). (b) Two participants said that there are other questions that must be answered around
credentials in a field are as follows: Who would credential practitioners, and would instructors need the same credential as practitioners? What would be the minimum education requirements for members?

Finally, participants expect their associations, societies, governing bodies, and schools to play a vital role in their acceptance and maintenance to professional status; this has many implications for CPE. The majority of participants (33 from 36) added that with the knowledge explosion, new technologies, and increased calls for competence and accountability for professionals, there is a growing need for professional partnerships and collaboration across work settings to add to the research, literature, and education of practitioners. CPE providers need to join together to develop new strategies with employers, schools, professional associations, and/or regularly bodies and independent providers to provide improved CPE that ensures competent professional practice (Queeney, 2000; Curry et al., 1993).

Study Contributions to HRD

Although HRD professionals come from diverse disciplines, this research supports the literature in the field that most practitioners want to obtain professional status (Ruona and Rusaw, 2001; Swanson and Holton, 2001). Due to the efforts to increase the professionalization of HRD-related professional associations and societies, as well as to the importance placed on human resources with organizations, this research provides descriptive and comparative data on issues related to the professionalization of the field. By understanding where an area of work is on the continuum of becoming a profession as set forth by Gilley and Eggland and others, educators can more clearly understand the needs of the workers/professionals in the field. This understanding should lead to the development of educational strategies and programs to help people become and maintain themselves as professionals in a new and developing profession. This research supports literature that HRD should focus on the following areas: (1) “since HRD has developed a set of ethics and standards which will aid in development as a profession, a next step in this journey is for the Academy to use Standards to further commitment for members to act upon them” (Ruona and Rusaw, 2001 p. 227), (2) HRD must examine how it can better define its service component to society, (3) HRD must support a literature foundation of theories that is accepted by the entire field. “Fulfilling HRD’s performance improvement mission through building the HRD discipline around the proposed theories is fundamental to the maturation of the profession” (Swanson and Holton, 2001, p. 100), and (4) HRD must proceed to establish certification procedures for members of HRD.

As people in a field such as HRD take the painstaking steps to bring an area of work into professional status, the education necessary for professional entry, professional maintenance, and professional growth changes dramatically. Professional entry education requirements change from no requirements to certificate or degree requirements. In many cases multiple certification and multiple degree requirements are required to enter a new and developing field. These educational changes set forth new expectations within the field and within the professionals themselves. Certification and degree requirements lead to the need for HRD via CPE for re-certification, licensure, and re-licensure. For millions of people involved in RE, IT and HRD, transformations in the field will require more testing, more education, and more credentialing.

The road to professionalization is complex and demanding for the people involved in the transition of an area of work to a profession. The complexity can involve components that don't appear in the literature in any big way yet are very important to the development of a profession. For example, the field of information technology has mystery attached to it and; therefore, may move much faster into full professional status. Fields such as real estate move at a much slower pace because all of us at one time or another become a client and receive the services of these workers/professionals. This familiarity can bring about a condition in which there is little respect for people we have to work with frequently than judges, clergy, professors, and physicians.

However, it is estimated that billions a dollars per year are used on education of these groups from pre-continuing education through CPE, attention must be paid to establishing education programs that will aid all fields in practice (Cervero, 2000; Knox, 2000). As HRD continues to strive for acceptance as profession, the information from this research on other emerging professions can provide valuable insight to the research, policy and practice of HRD.

Managers’ Needs and Expectations of Management Education

Carole Elliott
Lancaster University, UK

This paper presents the findings of the first-stage of qualitative longitudinal research into the relationship between managers (as students) and educators. The paper discusses the needs of six managers on a part-time MBA programme, and their expectations of it. The findings that emerge pose a number of dilemmas for this particular form of adult education, including a questioning of the effectiveness of large-scale programmes of management development for individual managers that occur away from the workplace, and the role of assessment for adult learners.

Keywords: Management Education, Needs and Expectations, Qualitative Research

Within the last 10 to 15 years there has been a debate within UK and European management education circles concerning the purposes of management education programmes; particularly generalist programmes such as the MBA. Alvesson and Willmott (1992) position the Critical Management Studies (CMS) field as running counter to disciplines of management that "are generally understood to be devoted to the (scientific) improvement of managerial practice and the functioning of organizations" (p.1). CMS by contrast seeks to question "the wisdom of taking the neutrality or virtue of management as self-evident or unproblematical" (p. 1). Those who locate themselves within CMS emphasise the necessity of questioning the received wisdom of traditional management knowledge and practices given the influence that managers as a social group exercise. It challenges, from a number of theoretical perspectives, the existence of a body of objective scientific knowledge within disciplines of management that purports to be morally neutral and universally applicable. Critical Theory provides the basis for many contributions to it, but analyses from Foucauldian, poststructuralist, Marxist and feminist perspectives are also common. Their point of commonality can perhaps be seen to lie in a common 'agenda', described as "an agenda for research, teaching and (indirectly) organizational practice that understands management as a political, cultural, and ideological phenomenon." (Alvesson and Willmott, 1992, p. 8).

The research that this paper describes arose out of a CMS perspective, but approaches it from the position of individual managers who choose to undertake a management education programme, the content of which has been so heavily critiqued within the CMS literature. Little attention so far has been paid within CMS to managers as individual students. Managerial identity in general, with a few exceptions, e.g. Fox (1987), Watson (1994), Pavlica & Thorpe (1998), Watson & Harris (1999), has remained essentially hidden beneath their 'role', i.e. what they are reported to do as paid-for work. Management as a practice, as a technical and instrumental activity, has predominated. Managers have therefore come to be seen in this light, this characterization reaching its (most famous) nadir in Jackall (1988) and MacIntyre (1985), their individuality here having been completely obfuscated by their role. These characterizations have provided part of the contextual background for my research, which from the beginning was concerned with individual experiences and responses to an MBA programme. It is only from a position such as this, I argue, that CMS can justifiably support its assumptions concerning management education's role and purpose, particularly as perceived by those who seek to participate in it.

Whilst the research focuses on the relationship between students and educators within management education, the findings that arise are equally pertinent to HRD. Indeed, it is partly because HRD has not addressed the management education phenomenon that I bring this paper to the conference. I do not have the space here to discuss the artificiality of constructing boundaries between HRD and other areas of research, but what I hope this presentation of a specific student-educator relationship will do is to raise awareness of the expectations that adult education can create.

Purpose and Research Questions

This paper’s purpose is to share the findings from the first stage of a longer empirical study. The research was undertaken to explore the relationship between managers (as students) and a process of management education. Specific objectives that were posed in this first stage of a four-stage research process were:
1) To discover why, and how, managers had embarked on a management education programme;
2) To explore their work-life leading up to the point they started the management education programme;

Copyright © 2002 Carole Elliott
3) To find out about their previous experiences of education.
Subsequent stages of the research address in more depth issues raised during this first stage, including: managers' responses to programme content and design (including assessment procedures, and managers' perspectives on the transferability of their MBA learning to the workplace); the nature of the reception given to managers in their workplaces by colleagues not engaging in processes of higher education, and managers' future career aspirations.

Theoretical Framework

When designing the research approach I wished to take, my intention was to be lead by the data that arose from the findings. When I began I therefore did not have a particular organising framework against which I would analyse the findings. This decision, as a consequence, requires me to place my own findings in the context of other theoretical perspectives once the analytical process has been completed.

Methodology

This piece of research was exploratory in a subject area that has hitherto received little attention. The findings that I present in this paper arose from qualitative face-to-face interviews with six managers, interviewed separately. These took place within the first three months of a part-time MBA programme in a UK university. Whilst the interviews might be described as semi-structured, in that I had a number of key questions I wished to explore with interviewees, these questions were predominantly used as prompts to facilitate the conversation in this first meeting with the managers. My aim within each interview was to follow as much as possible the direction in which the interviewee wished to take it. That is, I wished the interview to be more akin to a conversation, in which meaning arose out of the dialogue between the interviewee and myself. I therefore attempted to approach each interview in isolation. That is, none of the interviews were analysed until all six interviews of each phase had been completed.

The conceptualisation of a dialogical process (in this case the interview setting) as creator of meaning is crucial, not just to the choice of method to gather empirical data, but is indicative of the epistemological basis of the research as a whole. That is, it is located within a social constructionist framework that recognises the influence of the research process on the nature of the data that arises. As such, it recognises the influence of the researcher on the researched, acknowledging that the research intervention is constructed not just by the researcher, but arises from the interaction between researcher and researched. It is characterised by the notion of reflexivity that requires researchers to be aware of the impact of their interventions. For example, in this study the managers knew I worked for the university where they were studying for the MBA (although I did not work on the MBA programme), thus I was conscious that this might affect the nature of the conversation between us. I continually posed myself questions such as how open would they be in critiquing the programme, or even the educators who worked on the programme? Another question focused on my own practice as researcher. I had to acknowledge that my other role as educator within the same university would impose certain assumptions on my conduct within interviews and my subsequent analysis of them.

Analysis

Recognising that my dual role as educator and researcher within the same institution imposed certain constraints, alongside the longitudinal nature of the research, I chose what might be described as a grounded theory 'approach' to the analysis of the data. That is, unlike a 'pure' grounded theory analysis, I did not begin the analysis with the belief that I would be able to do so completely free of theoretical assumptions. This would run counter to the epistemological basis of the research. In trying to manage the tension between a rejection of hypothesis testing against the recognition that the researcher brings certain assumptions to any empirical research intervention, I followed Hycner's (1985) guidelines to the phenomenological analysis of interview data. This involves several steps: transcribing the interview; bracketing as much as possible my own meanings and interpretations; listening to the interview for a sense of the whole; delineating units of general meaning; delineating units of meaning relevant to the general research question; determining themes from clusters of meaning; writing a summary for each individual interview. I added the extra step of comparing themes that arose within each separate interview, looking for commonalities and dissonances.

Upon completion of each phase of interviews (the findings presented in this paper arise from phase one only; there were four phases in total), I analysed the data before I interviewed managers in the next phase.
Findings: Routes to the MBA

I will now outline themes that arose from the first set of interviews, particularly within the context of questions regarding their journey along the path to the MBA. I describe these as: developing the work self; validating career choices; the business of organising; work as shaper of educational choice; plugging the gap, and anxieties. The theme that was common to all managers concerned the development of the working self.

Developing the Work Self

Broadly, the interviewees’ educational experiences can be described as either having been ‘front-ended’ by tertiary education prior to entry to the workplace, or a more evolving experience that has occurred mostly in response to work-based activities. Having recognised this as a general pattern, upon a closer examination of the interviewees’ working and educational lives we can see that the picture is much less clearly defined than this. So, even though one manager (CD) had entered the workforce with an undergraduate degree, and one seemingly suited for the type of work he was to be engaged in, he had undertaken another form of education to develop himself for his work role. This theme of self-development as a response to work activities, and as a means to improve oneself in the performance of these work activities, is a theme common to all interviewees. Indeed, this was occurring long before they had considered an MBA as the next stage in the self-development process. Also striking is the fact that in all cases the interviewees sought to develop their work selves through education of their own accord. MT describes his reasons for choosing to study part-time for a law degree:

To cut a very long story short, I got a job reluctantly. I didn’t want to go - (I went) kicking and screaming - as a decision maker. And on traffic matters originally and eventually I became more expert and got involved in criminal offences and had good working relationships with CPS (Crown Prosecution Service), got on quite well, and they said to me - ‘you ever thought of doing this as a job?’ I said well 'yes'. "Why don’t you do a law degree?" That’s how it came about and I said ‘yes, I think I will’.

Indeed, some even faced opposition from line managers when they expressed a desire to do so. PD describes his experience:

That was my choice (to do his first degree in mechanical engineering on a part-time basis). Nobody mentioned it. And actually at the time, my boss at that time – he was Oxford or Cambridge – from one of the two, couldn’t really understand why I was doing a degree and probably thought it was insignificant anyway because it was from a red-brick university. So again, it was my decision and really there was no support for what I was doing so I had to do that.

CS’s decision to move from being a practicing nurse to a nurse tutor required her to follow a teaching course. When I asked her reasons for doing so, she answered:

Well, I was health visiting, and I was dealing with people who were diabetic and there was a lot of teaching within that, teaching groups, teaching individuals, teaching staff, and it suddenly occurred to me that that was what I really liked doing and that was what I was good at. And from there I just decided that I would do a teaching course. So I did, I have no regrets. I enjoyed it and I have enjoyed being a teacher.

For only two of the interviewees was the MBA the first experience of a formal course of education since they had entered the workforce. JB was the most formally qualified of the interviewees, being the holder of both an MSc and a PhD, and had been in salaried employment for just four years. JW held a first degree and a PGCE and was currently working as a teacher within higher education in a management school.

A formal educational qualification as an outcome of working experiences was common to four of the interviewees, they were now brought together by a programme of management education. The diversity of work and educational experiences was notable, even within a group of six. The question as to how individuals with such wide-ranging experiences could all be undertaking the same management education programme is an interesting conundrum. I think it actually lies at the heart of the critiques from CMS concerning the role and nature of management education, and is a debate that needs to be more fully informed from the perspective of participants in these programmes.

Before doing so I would like to present in fuller detail some features of their working lives so far, focussing particularly on the choices and decisions they made regarding the shaping of their life in their organisation(s).
Validating Career Choices

In asking about interviewees' working lives up to the point of beginning the MBA, I wanted to discover the sorts of working backgrounds somebody choosing to do an MBA might have. I did not want only to discover the basic facts that could be gleaned from a CV, I wanted to hear them describe these working backgrounds and how these had lead them to the MBA.

My assumption before I began the interviews was that each interviewee would have worked for at least two, possibly three, organisations. My views had been formed by knowledge of the changing nature of the implicit employment contract that began in the 1980's following organisational 'downsizings', 're-engineering', and layoffs that has changed the central organizing principle of individual-organizational relations. This has lead to regularly expressed mantras in the media and within the academic literature concerning the death of 'one-company man', and the demise of a job for life'. Correspondingly, the working patterns of 'high flyers' (which those undertaking a part-time MBA might reasonably be considered to be) are characterised as generally involving stays of 2-3 years in an organisation before moving out, and 'up', the career ladder. This assumption was not borne out by the experience of the interviewees and so what became more interesting - and this arose only through the data analysis process - was individuals' validation of the decision, or more specifically series of decisions, that lead them to stay in the same organisation. I want to focus on this theme because it is interesting from a number of perspectives. First, it provides a mirror to contemporary perceptions of careers as being 'boundaryless'. Second, when analysing the interviews on paper, as well as listening to my tape recordings of them, I came away with the impression that interviewees felt the need to justify their decision to stay in one organisation. This was strongest amongst interviewees who worked within large organisations. They did so by explicitly pointing out the diversity of roles and types of working activities it was possible to engage in within these organisations. Those working in large organisations provided similar responses when I asked about their plans once they had completed the MBA; that is, did they plan to stay in the same organisation, or did they see the MBA as facilitating a route out of the organisation?

Following a question from me in which I simply wanted to verify whether he had worked for the same company since leaving school, PD replied:

Seventeen years, man and boy. I don't know, but I think the company, I think the company is good to work for anyway but it has been - so much has happened in that - I was doing an apprenticeship so that kept me there for four years, then I got the job in the design office, so really it is a change. And I enjoy the change, so I stayed for a couple of years. But before that couple of years was up, I started my degree so that kept me there for another five years. And then after the degree I got promoted and I have had another promotion since, so things seem to roll over and I have worked in different areas within the design office, or the project office as it is, so it's sort of - there's no time I feel that I've spent a lot of time stagnating - and that's probably why I don't feel as if I needed to move, because things are continually moving.

In the process of a much longer passage in which he described the various work roles he had performed since entering an organisation that re-processes nuclear waste, as a graduate management trainee, CD stated:

I was a shop(floor) manager proper in fuel storage points - that's where I really cut my teeth I suppose, in Ops Management, and it's from there I went into 'Lowe' commissioning the chemical plant then, so that took me six years to get a Chemical Engineering job. But there we are, it was all good experience on the way and it's very handy I think, albeit limited to 'Byacar' - it's such a big place anyway, I have got a good grasp of 'Byacar' - whereas some of the people have just got 'whatever they do', which is useful ... it's just another way of broadening your horizons a bit. Not that that was a conscious plan at the time but with hindsight it is quite good really.

Choosing the MBA: The Business of Organising

The reasons each interviewee provided for undertaking the MBA did vary, and all stated a variety of reasons for choosing to do so. Nevertheless there were some overarching themes. A response common to two interviewees who worked in the public sector framed part of their decision in terms of their work, and the work of their organisation, in the light of business (that is, profit making organisations) methods of organising.

When I asked CS to describe the nature of her job more fully, she explained:

We have very few HEFCE-funded courses. We have to get out there, basically, into the marketplace, and earn our money. You know, bring the business in.

Later in the interview, she described the 'problem' the Faculty she was employed in had with her role:
...the rest of the Faculty, has a great problem with my role in that they don’t even now, sort of two years on, really – well, I think they do understand the funding stream – but they don’t understand how tenuous it is and how much competition there is. And what will happen if we don’t actually get the, keep the business that we’ve got and generate more business ...

In response to my question about the number of student places funded by HEFCE, she replied:

...we have service level agreements with the (Health) Trusts so we do have a certain level of guaranteed business but in 1999 that is going to go. And you know, we are out on the old market.

As part of the interview in which MT was discussing his reasons for undertaking the MBA, in preference to going further with his legal studies, he replied:

... it’s business training you need now ... so I have done the wrong degree really in some ways.

When I checked with him his thoughts on why he needed business training, his view was:

It has to happen. I mean, there’s been, hasn’t there, up until now, my understanding is we had a very narrow look on business management and business cultures applied to profit making commercial organisations. Why should they? Because they ... you know, wherever there’s money involved, wherever there’s strategy involved, wherever there’s an efficient method of working you know, relating your business or company to the environment we are working in, those rules apply to whether it’s commercial or non-profit making. And that’s why we’ve changed, and the phenomenal cost of policing.

Work as Shaper of Educational Choice

What was a far more common response continues the theme I identified earlier in the paper that saw work as an impetus and shaper of educational choice. Most had relatively recently moved into new work roles, and most were seeking a body of knowledge and skills to support them in these new roles. Some were quite explicit about the knowledge and skills they hoped to gain. JW and CD for example, were looking for different ways of thinking through former and current work experiences.

Each interviewee had chosen personally to come on the programme, and some referred to the fact that they did not actually need the MBA to perform their work role. Rather, it was undertaken for a variety of reasons linked to their self-development needs, including – stated most explicitly by CS – as a means to increase confidence in performing her role.

JB had been working in product development, but was about to move into a marketing role, where he was looking to obtain some commercial experience that he felt he needed. His view was that he had come into his organisation too academically qualified, and believed the organisation had probably taken a risk when they appointed him, as “he could have been the archetypal boffin”. He had proved that he wasn’t and explained his reasons for doing the MBA:

I must admit my personal reasons for doing it are not to get three letters. They’re to get the training.

When I asked whether this meant it was for personal development reasons, his reply was:

Yes, absolutely, absolutely. You know, I couldn’t condone sort of doing a course, and just getting letters and not actually getting anything out of it.

He saw this approach to the programme as having some negative consequences however:

So, I think probably I’m putting too much into the assignments, or certainly too much background reading, which may cause me problems.

PD saw his move into a management role as the way he wished to develop his career, and believed the MBA would help him do this. His boss had wanted him to look at specialist Masters course in the field of mechanical engineering, however he stuck with the MBA as:

... if I ever wanted to get beyond that (a level above his current position) I would then have to, at a later date, come back and do an MBA. So the MBA offered me the managerial type of (or I felt it did, I have yet to fully understand what it is going to offer me!), but I felt with my limited knowledge that it would give me an advantage, ... it gave me an advantage to develop a career from where it is now.

In contrast to JB and PD, CD explicitly mentioned the management roles he had been performing for the last eight to nine years at Byacar. He was seeking to move away from working in operations after a ten-year period, and was looking to the MBA to:

... look at things you don’t normally look at in your job: i.e. think at another level, which makes you more adaptable and more useful to the organisation if you like.
He didn’t particularly see the MBA as being able to help him become a better operations manager. The one way in which it could do that would be to provide him with better “people skills”:

And I don’t get any of that off of this, other than sort of anecdotal help from other people in the lectures.

Similarly to CD, CS did not think she actually needed the MBA to do her current job and had not begun the MBA with a view to leaving her organisation. Her boss had remarked to her:

Do you really want to do this? You function perfectly well.

However, CS felt unprepared for her work both professionally and academically, and

... because the market is changing and because I think HE is changing really, and because I want to stay employable, I decided that I would do something about it.

In response to her boss’s comments above, CS explained:

... I talked to her about it and I said I think it is to do with the way that I feel about what I am doing and the way that I feel about my position with people who are also doing the same sort of jobs as I am. I want to able to hold my own.

She felt the MBA was giving her more credibility with colleagues, and even after the first module thought:

I’ve looked at things differently just from doing that, and I feel that I, I don’t know I just feel as if I’ve got something to back up what I am trying to say to the staff. Nothing that they would notice, I don’t think, but it’s the way... it’s the way I am looking at things and the way I am presenting things and the way I feel inside.

JW had worked for seven to eight years in business consultancy, and thought he understood in his “own language” the issues and processes he had been dealing with. His reason for doing the MBA was then:

... to try and learn some of the, I think, some frameworks on which to try and take five or six years’ experience and say well, how does this all fit together picture ... and so what I hope it will do is provide me with a much better, not necessarily strategic, but a much better overall view of the business world.

MT described his reasons for doing the MBA as:

I want to do what I’m doing now more successfully, more professionally. The real reason is that I do genuinely want to improve my knowledge of business management. That’s the truth of it.

Plugging the Gap

From this section we can see that the MBA is perceived as being able to fulfil a variety of needs. PD most clearly, but also JB, saw it as being particularly useful for their career development. It was seen to open up opportunities for career development, development here framed in terms of being an expansion of experiences, rather than upward promotion. This can be seen by their desire to seek further knowledge and skills. The variety of needs the MBA is being required to fulfil ranges from developing conceptual thinking skills to providing specific knowledge about private sector methods of organising. Whatever the specific reasons, all interviewees perceive a feeling of absence of some kind that needs to be rectified. The most common absence is of knowledge. CS is the most open about the MBA’s potential to provide her with more credibility amongst colleagues, but it also lies beneath the surface of other comments. PD is the one most clearly moving into a management role, in this case from an engineering background. But he would still be moving into this role even without the MBA. The MBA was not a precondition for this change in role; indeed his boss suggested that he consider pursuing a specialist Masters degree in his disciplinary field. Both JB and CD were about to move, or had just moved, to new work roles in their organisations. They too however, had been operating as managers before that, including responsibility for a number of staff. One of the key issues arising from the reasons given by interviewees for pursing an MBA is the sense that they lack something.

An awareness of the contingent nature of managerial work, in which a predominant role for managers lies in the management of meaning (Watson, 1994; Elliott & Reynolds, 2001; Cunliffe, 2001; Shotter & Cunliffe, 2001), raises our awareness of the uncertainty of managers’ lives. The findings arising from this research highlight that this uncertainty can overflow into perceptions of absence, or perhaps we can even say inadequacy that then carries some managers to seek succour and refuge in a university-based programme of management education. Whilst the majority of CMS writers recognise the complex and contingent nature of managers’ lives, they have not considered the consequences and impact of this lack of certainty upon management education and upon educators. If this particular manifestation of uncertainty identifies, at least in part, managers on management education programmes then this correspondingly has implications for the management educators from whom they are seeking guidance.
Anxieties

There are other concerns amongst the interviewees that we can perhaps categorise under the 'insecurities' heading. The ones I will present here are more specifically related to perceptions of the expectations placed on them by the programme itself. Many of these were unsurprising in that they related to concerns about the amount of time required to complete coursework, and MT and CS particularly were concerned about neglecting their families. MT states:

*But I think about it (the MBA) with the kids, if something happened to them or happened to me, I'd regret it. ... So, I've got to be honest about it, yeah, but when I'm at Lancaster, particularly when I hear the lecturers talking ... they just attract my interest, I've got to say. So when I get there, I want to be part of it, you know.*

One of PD's anxieties concerned the switch he was making from an engineering background to the MBA in which he had identified (the interview took place during the first module on Strategic Management) the lack of a certain answer:

*You get a few possibilities out, and those possibilities might be right, they might be wrong, they might work, they might not work. But it's not, it's not whatever you want to call it, it's not really the definitive answer, which engineering is. So it's moving completely away from what I've done before. It's very sort of in-depth, an analysis, and coming out with opinions rather than doing some calculations and coming out with a figure, an answer.*

For CS, it was the high expectations and high standards she had for herself.

*... and even though I sit here and say, I don't care what mark I get for my assignments as long as I pass, that is a lie. That is a lie, I would be devastated!* Underpinning CS's concern about level of marks lie questions about marking criteria and expectations from educators about what is required from a piece of coursework. JB felt he needed this information in order to judge his own understandings:

*I'll have less anxieties after the first assignment has been marked and I'll know exactly whether I'm pointing in this direction, or whether I'm pointing in this direction. Erm, you know, in terms of what's required. I'm finding it quite difficult to ... it's different to a report I'd write in industry.*

We can detect a certain air of vulnerability from these responses. Concerns about assessment alongside interviewees' search for missing knowledge, skills or belief in their abilities as mentioned earlier, reveal a heady brew of expectation.

It is beyond the remit of this research to ponder whether the particular group of management educators working on this programme were aware of any one of these factors. But what it can do is to consider the relationship between managers and management educators through the perspectives offered by the six interviewees. A number of issues arise from this. First, it reveals perspectives on the processes of management education – processes traditionally managed by educators – from the position of the manager-student. Second, and implicated in CMS's hitherto relative lack of attention to management education processes (Reynolds, 1999), it considers the objectives of management education as perceived by the manager-student. That is, what they expect to gain from engaging in this particular type of education programme. Third, the level of reflection from manager-students on pedagogical processes prompts significant questions around CMS's claims against management education.

Concluding Thoughts and Implications for HRD

This research into managers' motivations for undertaking a management education programme, and their expectations of it, raises a number of questions for educators and for HRD practitioners. As a process of adult education it reminds all educators that each individual adult, as student, returns to education with needs and expectations not always transparently evident to educators. Indeed, it is only by adopting an idiographic research approach that it is possible to begin to become aware of these needs and expectations. The findings reveal the large amount of commitment expended by managers in order to develop themselves for current and future work roles that reminds educators of their enormous responsibility in the relationship with adult learners, and warn us that assumptions about them require continuous challenge. The questions this raises for HRD include: the effectiveness for individual managers of large-scale programmes of management development that occur away from the workplace; the validity of more quantitative approaches to needs analysis that generalise and thus possibly miss the needs of all. Also questioned is the appropriateness for adult learners of methods of assessment generally based on conventional methods of assessment for undergraduate students. In subsequent phases of the research I will explore with managers their responses to systems of assessment. This is a little explored area, but asks educators whether...
current ways of assessing learning are fulfilling adult learners' needs, or rather simply fulfilling institutional bureaucratic demands.

Predicting Future Skill Needs in the Clothing Sector

Ian Taplin
Wake Forest University, North Carolina, USA

Jonathan Winterton
Groupe ESC Toulouse (Toulouse Business School), France

Ruth Winterton
Eldwick Research Associates, Bingley, UK

Clothing enterprises are still experiencing chronic skill shortages, despite the continued contraction of the sector and evidence that training is associated with business success. This paper reports on a project predicting future skill needs in the British clothing sector undertaken to implement the Government’s policies to avert skills shortages and remedy skills gaps.

Keywords: Forecasting, Performance, Recruiting

Recognising that the UK workforce is inadequately qualified in comparison with major competitor nations, the Labour Government that took office in 1997 introduced several initiatives to address future skills needs. The Skills Task Force was established to assist in developing a National Skills Agenda and the Learning and Skills Council was established to develop more coherence in post-compulsory learning. At sector level, National Training Organisations (NTOs) were charged with responsibility to establish mechanisms for forecasting future skill needs (Skills Foresight). This paper reports on such an initiative in the British clothing industry, which the authors were commissioned to undertake on behalf of CAPTIB Trust, the NTO for the British apparel manufacturing industry.

Theoretical Framework

The theoretical underpinning of this project derives from two sources. The first is an ongoing analysis of contemporary change in garment manufacturing (Taplin and Winterton, 1996; 1997; 2001) which provided a framework for examining the trajectories of restructuring and their impact on skills. The key drivers of change (product market fragmentation, liberalization, leading to import penetration, and de-regulation, leading to growth in the number of SMEs, which further intensifies competition) are represented as a range of external environmental influences acting upon clothing enterprises. Market fragmentation is driving the demand for quality and creating more demanding delivery requirements from retailers, while at the same time creating gaps in the market that manufacturers and importers can exploit. The globalisation of clothing markets, promoted by liberalisation in phasing out the Multi-Fibre Agreement, will act as an impulse that accelerates the restructuring of garment manufacture in high wage economies. Similarly, deregulation from the mid-1980s provided a permissive environment for start-up of SMEs and these offered similar low-cost, flexibility production to manufacturers and retailers by replicating within the indigenous industry some of the characteristics of overseas enterprises.

These external impulses impose limitations to the strategies that enterprises can adopt, modifying and accentuating the three imperatives that form intermediate objectives for enterprises in any market economy: quality, delivery and cost. The impulses having the most dramatic effect on the clothing industry are undoubtedly those that are exacerbating price competition, especially the growth of import penetration, promoted by liberalization. The growth in outward processing trade (OPT) reflects an inevitable response to overseas low-wage competition, whereby UK manufacturers can retain market share in the face of imports by outsourcing production. An alternative strategy involves sub-contracting production cut-make-and-trim (CMT) units competing largely on cost for a shrinking market. The delivery imperative is also addressed by sub-contracting production to small shops performing only a limited range of sewing operations and to home-workers, or through quick response and just-in-time methods that reduce production time and inventory. The quality imperative has led quality initiatives and team working, and forms a key part of niche marketing whereby companies have sought to exploit market fragmentation through focused differentiation.

The second source of theoretical underpinning is in the new skills strategy of the UK Government. The three

11-3
reports of the Skills Task Force (STF, 1998; 1999; 2000) supported with research by the Skills Task Force Research Group highlighted skills shortages and skills gaps in the UK economy. As a key part of the new skills strategy, NTOs were charged with responsibility for predicting future skills needs at sector level through a Skills Foresight approach, elaborated in guidance from the NTO National Council (NTONC, 1999). This paper reports on the exercise undertaken on behalf of the clothing sector, which employed the theoretical framework and methodological approach laid down for Skills Foresight.

Research Questions

The central question addressed by the Skills Foresight exercise was: 'In what skills areas of the clothing industry are there likely to be skills shortages and/or skills gaps in the future, and which of these are likely to be the most detrimental to the industry's future success?' This question, set by Government to all NTOs, was reformulated into three sub-questions, operationalised through the methodology described in the following section:

- What skills shortages and gaps currently exist, and which have the most detrimental impact on the sector?
- What changes are occurring in the sector which impact directly or indirectly on skill levels?
- How is the current picture of skills shortages likely to change in the future?

Methodology

The methodologies adopted in Skills Foresight for the Clothing Industry were a product of the good practice principles identified from the review of other sector Foresight studies and the limitations imposed by the resources available. The resultant methodological approach recommended and adopted comprised three main elements, each associated with an interim report. Figure 1 shows the relationship between the different elements.

Figure 1. Methodology for CAPITB Trust Skills Foresight

Each element of the Skills Foresight project resulted in an interim report to CAPITB Trust. The analysis of the sector, resulting in the first interim report Apparel 2000: The UK Clothing Industry in Transition (Callaghan, Taplin and Winterton, 2000), identified a number of drivers of change and anticipated changes in skill needs, which were
raised in the employer survey and focus group consultations. The review of methodologies used in other sectors, summarised in the second interim report, *Foresight Methodologies* (Leman, Winterton and Winterton, 2000a), influenced the approach adopted in the two main data gathering activities, the survey and consultation exercises.

The survey was undertaken as a telephone questionnaire administered on our behalf by a professional organisation with a target of 1,000 respondents, representing about one fifth of the number of enterprises in the sector. In addition to establishing a profile of the enterprises involved, the survey elicited a wide range of information about workforce characteristics, recruitment and recruitment difficulties, workforce skills (especially gaps and actual or anticipated shortages), future change drivers and their expected impact on skills and training activity. In the event, 1,022 enterprises participated in the survey, which covered 20,843 employees in the clothing industry, representing approximately 20 per cent of the estimated total number of employees. Findings from the employer survey were summarised in the third interim report, *Future Skill Needs in the Clothing Sector* (Leman, Winterton and Winterton, 2000b).

Discussions in focus group consultations with employers were structured to validate the findings from the analysis of the sector and the employer survey, as well as to elicit further information from employers as the beginning of an iterative process of forecasting skills needs. Validation with sector representatives was the main means of ensuring that skills forecasting in clothing was thoroughly grounded in the specifics of the sector. The validation process began with early dissemination at a National Clothing Conference and continued through discussion in focus groups of the change drivers outlined in Apparel 2000 and of our interpretation of the LMI survey results in *Future Skill Needs*. In all, six focus groups were held across the UK in November and December 2000 and supplementary information was obtained from 6 individual interviews with employers in London. Excluding the Conference, the consultation process involved a total of 31 employers and 4 industry advisors.

The final report, *Skills Foresight for the Clothing Industry* (Winterton and Winterton, 2001) integrated the analyses of the three interim reports with the findings of an employer consultation exercise involving focus groups and individual interviews. The final report was used by CAPITB Trust to develop a *Workforce Development Plan* for 2001-2005 (CAPITB Trust, 2001).

### Results and Findings

The research questions outlined above were addressed through developing a substantial amount of labour market information, only a small fraction of which can be presented here. Rather than presenting the results as a series of answers to the research questions posed at the outset, it is more logical to deal with the main findings from the different elements of the exercise integrated together thematically under the following headings:

- The clothing industry in transition
- Labour market characteristics
- Recruitment and recruitment difficulties
- Workforce skills
- Training activity

#### The Clothing Industry in Transition

The sector analysis identified key drivers of change in the clothing industry (deregulation leading to intensified international competition and increased imports, product market fragmentation leading to smaller production runs and shorter delivery times, and consumer demand for quality and value). In the employer survey, respondents were asked to identify which of these (or other) factors were likely to affect their business in the future. The five factors rated most highly were: import penetration; lack of skilled staff; changes in consumer tastes; quality issues; and local price competition. The survey captured employers' views on the levels of significance of each factor and the findings indicate a generally high level of concern about almost all future influences, especially import penetration, lack of skilled staff and quality issues. Training issues were relatively neglected in employers' responses. Import penetration was rated by the largest number of respondents and with the highest significance rating among all the given list of possible factors. One third of employers regarded quality issues as significant to the future of their business.

Employers also felt strongly about the impact of lack of skilled staff on their business in the future. However, it was surprising that approximately one third of those currently experiencing some kind of skill shortage (current vacancies, experience of hard to fill vacancies or skills gaps) did not rate lack of skilled staff as having an impact on the business in the future. The proportion of employers citing lack of skilled staff as having a major impact on the future of the business increased with firm size from 32 per cent (under 5 employees) to 60 per cent (25-99
employees). For the largest firm size of at least 100 employees, lack of skilled staff was cited by 53 per cent of respondents.

Although a large proportion of respondents regarded lack of skilled staff as important, far fewer chose the two factors addressing training issues. Compared with the 42 per cent of employers who perceived future skill shortage to be significant to their business, only 18 per cent thought funding for training was important in the future and only 17 per cent mentioned availability of training provision.

Employers were asked about skills that are lacking in parts of the present workforce and the main skills priorities were found to be similar across all the occupational areas, demonstrating that all respondents envisage skills priorities for the immediate short-term future to be very similar to present shortage areas. It is noticeable that IT is perceived as having a slightly less prominent role in the future, for all occupational areas, and has disappeared from the top three for trainees. Job-related skills on the other hand have become even more critical than before.

Labour Market Characteristics

Apparel 2000 traced recent changes in total employment in the clothing industry, comparing these with manufacturing as a whole, while the employer survey reported in Future Skill Needs in the Clothing Sector provided an up-to-date snapshot of the sample surveyed. Combining the two analyses provides an overview of the employment structure, demographic profile and occupational structure of the UK clothing industry.

While employment in the UK clothing industry has fallen since 1973, the rate of contraction accelerated in 1999 as production was increasingly sourced from abroad due to the strength of Sterling. Official projections for the sector (textiles and clothing) have consistently underestimated the decline. The survey covered 20,843 employees in the clothing industry representing approximately 20 per cent of the estimated total number of employees. Around 60 per cent of employees in the sample were drawn from three regions: the North West, East Midlands, and West Midlands; 23 per cent of employees in the sample were in Yorkshire and Humberside, London and Scotland; 17 per cent were distributed amongst the remaining six regional areas.

In demographic terms, clothing remains an industry with a mainly female workforce: women account for 70 per cent of the workforce in the official statistics (the reverse of manufacturing as a whole in which men account for 70 per cent of the workforce) and represented 69 per cent of the workforce in the survey. In the official figures, 16 per cent are part-time while in the survey the corresponding figure was 18 per cent. In terms of occupational structure, 61 per cent of employees were classed as operatives or manual workers, 16 per cent were in managing or supervisory occupations, 4 per cent were technical specialists and 1 per cent trainees.

Recruitment and Recruitment Difficulties

Respondents in the Skills Foresight survey were asked about recruitment methods, future recruitment plans, current and past vacancies and recruitment difficulties. The number employed by the 1,022 companies in the survey had increased by 5 per cent on the previous year's figures, with 37 per cent of companies accounting for the increase. These firms represent 73 per cent of firms with current vacancies, 71 per cent of those with hard to fill vacancies and 60 per cent of those anticipating recruitment difficulties. The key recruitment methods are: word of mouth (67 per cent); the Employment Service or Job Centre (42 per cent); and local press advertising (42 per cent).

Of the 1,022 firms in the survey, 17 per cent (33 per cent of the workforce) had vacancies; 22 per cent (35 per cent of the workforce) had experienced difficulties in filling vacancies. In the 247 firms that expected to recruit more staff, 64 per cent referred to sewing machinists; 10 per cent sales staff; 9 per cent hand-craft-tailors; 6 per cent cutters; 5 per cent designers.

Among the 220 organisations that had experienced difficulties in filling vacancies, 177 anticipated further difficulties. Recruitment of sewing machinists had caused most difficulty (73 per cent) and was expected to continue to do so in the future (68 per cent). Future difficulties were also expected in the recruitment of handcraft tailors (18 per cent), cutters (6 per cent) and pressers (5 per cent). Of a total of 826 hard to fill vacancies, 75 per cent were sewing machinists, 4 per cent were cutters, 3 per cent were pressers and 3 per cent were handcraft tailors. The main reasons for such vacancies being hard to fill were: lack of applicants with the requisite qualifications and skill (42 per cent); lack of applicants interested in this type of work (33 per cent); lack of applicants with the required working experience (26 per cent).

Firms anticipating recruitment difficulties over the next two years represented 17 per cent of firms (25 per cent of employment). Of these, 49 per cent had current vacancies and 66 per cent had experienced difficulty in filling vacancies. More white-owned firms anticipated recruitment difficulties (21 per cent), than firms with non-white owners (10 per cent). The effect of recruitment difficulties on current business performance was considered to be
significant by 55 per cent, noticeable by 15 per cent and negligible by 28 per cent. The major effects were: loss of business orders (48 per cent); restricting future business development (28 per cent); missed deadlines (24 per cent); and increased work in progress (13 per cent). To combat difficulties in filling vacancies, 43 per cent of companies surveyed had increased recruitment efforts; 16 per cent had retrained staff; and 23 per cent reported no action whatsoever.

It was a recurrent theme during the employer consultations that skills shortages and recruitment difficulties were part of a wider problem of labour turnover and retention, or that high labour turnover reflected the difficulty of recruiting skilled workers. Most clothing employers expected to provide on-the-job training, even for experienced sewing machinists, to get them suitably skilled to work on specific products. The main difficulty was attracting workers with the potential to learn and retaining them long enough to recoup the investment in training.

Workforce Skills

Respondents were asked a range of questions concerning workforce skills: whether skills needs are changing; the nature of skills gaps in existing employers; and the extent of multi-skilling. All respondents were asked whether the level or range of skills required to do the job was increasing or decreasing. Over all occupations, 42 per cent of firms felt that skills needs were increasing and 10 per cent felt that they were decreasing. Skill demands were thought to be increasing most significantly for apprentices/trainees, garment technologists, engineering technicians, IT specialists, managers and designers.

The tendency to report increasing skills needs is related positively to company size. Thus, 63 per cent of companies with 100 or more employees reported increasing skills needs compared with 40-41 per cent of enterprises in each of the three size bands employing fewer than 25 employees. In the smaller enterprises, for example, the key occupations in which increased skill needs are anticipated are the owner managers or directors and, to a lesser extent, sewing machinists.

The general perception seems to be that both the level and range of skills needed to perform a variety of occupations is increasing, yet of the 1,022 companies participating in the survey, only a very small proportion of those employing in specified occupations reported gaps between skills of the employees and those that the organisation needs to meet its future business objectives. The specific occupational categories mentioned were: sewing machinists (13 per cent); white-collar employees (9 per cent); supervisors (9 per cent).

The effects that respondents expected these skill gaps to have on their business operation included: loss of quality (32 per cent); loss of business/orders (29 per cent); restriction of future business development (28 per cent); increased work in progress (26 per cent); increased running costs (25 per cent). In the 124 establishments where initiatives had been taken to combat skills gaps, these included: training in house (53 per cent); recruiting staff with the required skills (14 per cent); using outside consultants/providers (11 per cent); or taking no action at all (19 per cent).

Extensive multi-skilling has already been introduced. Of the total sample, only 11 per cent of firms had no multi-skilled employees. The occupational areas where multi-skilling was the highest were: sewing machinists (45 per cent); owner managers (45 per cent); directors (12 per cent); cutters (12 per cent). Occupations in which there was less reported multi-skilling included highly specialised areas, such as handcraft tailors and designers, where multi-skilling could amount to a dilution of the skills deployed. Sewing machinists were again the main occupational category identified by respondents that intended to extend multi-skilling, with 22 per cent of firms targeting this group. Other occupations identified were: owner managers (8 per cent); cutters (6 per cent); and packers (6 per cent).

The survey was intended to identify the areas in which future skills need to be developed in order to support business strategies. Therefore, employers’ views on a range of generic and job-specific skills across all the occupational areas were explored. Respondents were asked to choose up to three occupational areas and identify up to two of the key (i.e. most important) skills that employees in these would require in the future. The highest number of respondents regarded job-specific skills as critical for the future. This applies across all occupational areas, although is less evident in the managerial occupations. Business or management skills are the second most important and proportionately high even in operative and manual areas. The core skills of literacy and numeracy are regarded as very minimal in terms of future priority.

Training Activity

The rationale of Skills Foresight is ‘to provide a structured way of thinking about future skill needs, to help meet them.’ An important part of this approach involves examining the match between current training demand and
provision, thereby providing information to help NTOs plan and coordinate training initiatives to meet the future skills needs of employers.

Despite evidence of the value of training and development from the People Skills Scoreboard (Winterton and Winterton, 2000), the BMG Survey confirmed the level of training activity in the sector is generally low. Overall, 3,492 full-time permanent employees in the sample workforce received on-the-job and 979 off-the-job training, representing 16.6 per cent and 4.7 per cent of the total sample workforce respectively. Of the companies surveyed, 77 per cent had not provided any kind of training in the past 12 months; 23 per cent had undertaken some kind of training (either on-the-job or off-the-job or both) in the past year; 20 per cent had provided on-the-job training; and 9 per cent had undertaken off-the-job training. Training activity is clearly related to firm size; firms with at least 100 employees are three times as likely to train as those with fewer than 25 employees and over ten times as likely to train as those with fewer than 5 employees.

For every category of skill shortage difficulty, less than half of those companies with difficulties had undertaken any training in the past year. Of those reporting no difficulty, a much smaller proportion had undertaken training. As might be expected, companies that had current or hard-to-fill vacancies, skills gaps or anticipated recruitment difficulties were doing more training than those who did not. It is surprising that training levels are not higher for those companies experiencing or expected to experience skills shortages. Respondents were asked about expenditure on training in the past 12 months, but 52 per cent were unable or unwilling to provide information on such expenditure.

Respondents from organisations that had provided on-the-job or off-the-job training in the previous 12 months were asked whether there were any barriers to the amount of training undertaken by specific occupational groups within their firm. Three key barriers were identified: within each occupation, the factor regarded as a barrier by the highest proportion of employers was cost of training to the business; this was followed by the cost of releasing the employee, for all but technical staff; and the times of day when courses are run.

Respondents were asked to identify those occupations for which either on-the-job or off-the-job training had been provided over the past 12 months. Of the 222 enterprises that responded, the highest proportion provided training for: sewing machinists; sales staff; white-collar staff and pressers. More than 50 per cent of employers also mentioned training provided for: managers; supervisors; engineering technicians; packers and cutters. The three main occupations for which respondents identified skills gaps (sewing machinists, white-collar employees and supervisors) feature among those in receipt of training.

Respondents were asked what skills had been developed through training in relation to broad occupational groups. Overall, specific job-related skills have been the main target of training across all occupational groups, and especially for supervisors, operatives and trainees, but significant other skills were evident in most groups. IT skills were mentioned by a higher proportion of employers than job-related skills for management, technical specialists and other staff, and were second only to job-related skills in the other categories.

The question on future training was concerned with whether those who had undergone training over the past year were likely to continue it in the future. For on-the-job training, 84 per cent of respondents expected it to either increase or remain the same as last year. Only 7 per cent expected the volume of training to decrease. For off-the-job training, 70 per cent expected it to either increase or remain the same as last year, while 10 per cent thought it would decrease. Overall, therefore, respondents expected that training activity in the coming year would be at least as high as, and probably higher than, the past 12 months.

Respondents were questioned regarding their awareness of various UK industry/business initiatives aimed at generating access to funding for training and development of employees. Although knowledge of NVQs/SVQs, Investors in People, New Deal for Young People, New Deal for Adults, and Modern Apprenticeships and National Traineeships was relatively high, 21 per cent of the sample had heard of none of the initiatives outlined. When asked which of these initiatives had been useful to the business: 73 per cent felt that none of them had been useful; 12 per cent thought NVQ/SVQs had been useful to the business; 6 per cent cited Investors in People; 5 per cent New Deal for Adults; 4 per cent New Deal for Young People; 4 per cent Modern Apprenticeships or National Traineeships. Of the 471 firms that had heard of Investors in People, only 15 enterprises (3 per cent) had achieved the award, 33 companies (7 per cent) were working towards the award, 50 per cent were not interested in achieving Investors in People.

Conclusions and Recommendations

The Skills Foresight analysis identified serious recruitment difficulties, skills gaps and skills shortages in the clothing industry, despite the job losses of recent months. Moreover, the study confirmed a reluctance to train in the face of difficulties with labour retention (Bond et al, 1999) creating a self-fulfilling prophecy of skills shortages and
skills gaps. In specific terms, the study demonstrated that clothing employers need support in developing the skills needed for the future, and the following specific recommendations were made:

- The training and development of apprentices and other trainees should be more extensive to meet the increasing skill demands of their jobs. The use of new training media should be encouraged and special attention should be directed to induction and transfer of skills from training to production.

- Although multi-skilling is already extensive, more operatives, especially sewing machinists, should be multi-skilled. Moreover, even within enterprises that have already introduced multi-skilling, both the breadth and depth of skills should be developed further. Operatives need training for team working and in quality processes as well as empowerment and time management skills.

- Designers need more training in the use of new technologies and, crucially, in the technical aspects of fabrics, garment technology and production. The key skills are those needed to translate designs into production. Retraining and conversion courses for designers should be introduced to address an acute shortage of garment technologists and an apparent oversupply of fashion designers in the labour market.

- Managers, and especially owner-managers in smaller enterprises, need better access to training in ICT, leadership, delegation and ‘people skills’ as well as job-specific clothing production skills. There is a need to introduce innovative forms of training at work to minimize absence. Management learning should focus on the skills necessary for the operation of the restructured global organisation, particularly developing competence in international trading, importing and exporting, dealing with clients, using new ICT, marketing and communication skills.

**Contribution to New Knowledge in HRD**

The Skills Foresight project was designed to meet the immediate needs of the sector for information about current and future skills shortages and skills gaps. To the extent that little labour market information of sufficient detail existed prior to the exercise, it achieved its objective of generating new knowledge as the basis for the sector Workforce Development Plan. In addition, the project made a wider contribution both in substantive and methodological terms to forecasting future skill needs.

**Substantive Contribution**

The UK clothing industry, in common with garment making in other high-wage economies, is in decline, yet despite making substantial numbers of skilled clothing workers redundant in recent years, employers report widespread skills shortages, difficulties in recruitment and chronic labour turnover. Moreover, the two main survival strategies, outsourcing and niche marketing, are each beset with skills problems. Enterprises that have developed outsourcing strategies and are therefore less dependent upon traditional production skills inside the organisation, are nonetheless experiencing skills gaps, especially among managers, who must now deal with networked organisations and different cultures. Enterprises, such as parts of the London fashion industry, that have succeeded in developing high quality, high-value added niche markets, have potential for growth and sustainable profitability, but their expansion is equally hampered by skills shortages and recruitment difficulties. Overall, the situation is made more serious by inadequate HRD strategies and the prevalent self-fulfilling prophesy among the industry’s leaders that investment in training cannot be recouped because of high labour turnover. Acute skills shortages, skills gaps and inadequate HRD, coupled with recruitment and retention problems, may be construed as symptoms of ‘market failure’, because if labour markets operated according to theoretical models, employers facing skills shortages and skills gaps would provide training to meet future needs and develop strategies to retain skilled labour. Since those participating in the survey and focus groups represent the more progressive and aware managers in the sector, there is evidently an urgent need for intervention and planning at sector level.

**Methodological Contribution**

In methodological terms, the project has taken further the qualitative methods first used in an earlier study of the future skills needs of managers (Winterton, 2001), demonstrating their generic utility in exploring detailed skills issues at sector level. The study also demonstrated both the efficacy and necessity of using a sector-based restructuring model as a framework to structure discussions on contemporary change and future skills needs. Moreover, the research has shown the value of combining qualitative empirical findings with quantitative labour market information, enriching and at the same time validating the survey evidence. There is, nonetheless, an
important caveat to be made. If the management respondents reporting anticipated skills shortages and skills gaps appear to be doing little to alleviate them, can we be sure that their perceptions are reliable?

Texas A & M University

Tom Chermack
University of Minnesota

This research reports on surveys of 55 HRD and HRD-related practitioners and academics and identifies trends, variables, and challenges that are affecting and will affect the profession during the next 15-20 years. The results show that those surveyed are most concerned with HRD's role, identity, credibility, value, and impact in the changing workplace of tomorrow.

Keywords: Future of HRD, Trends, Profession

Lyndon B. Johnson once said, "yesterday is not ours to recover, but tomorrow is ours to win or lose" (Cook, 1993). There is great wisdom to be revealed in that sage statement, especially for the profession of Human Resource Development (HRD). HRD is nearing a crossroads. A relatively young profession, a "teenager" if you will, compared to other professions, HRD is increasingly under pressure to legitimize and differentiate itself (Ruona, 2000). This is true in organizations where professionals scrap for recognition and resources, in journals where concepts, research, and emerging theories are increasingly scrutinized for rigor and contribution to a durable and distinct knowledgebase, and in countless other places and contexts where HRD professionals are trying to make a difference in the critical interface where learning, performance, and the workplace converge.

The profession has made great progress, and yet much of its foundation is quite fragile. Like most people today, especially teenagers, the profession is facing an uncertain future with increased pressure to be clear about who it is now and to equip itself for the frontier that lies ahead. A key competency for young people today is to be very adept at sensing and adapting to future trends, and so it is also with professions. To thrive tomorrow, HRD must earnestly contemplate the future and ready itself. The profession of HRD must consciously scope and plan for the future. One way to do that is to begin to identify and dialogue about assumptions and concerns underlying HRD's strategic thinking and vision and the variables that will fundamentally affect the profession during the next 15-20 years.

The importance of considering the future has increasingly come to light for HRD professionals, however the few available pieces about the future of the profession have been exploratory or theoretical in nature (Swanson, Lynham, Ruona, & Provo, 1998; McLagan, 1999; Streumer, Van der Klink & Van de Brink, 1999). In the spirit of continuing and furthering the dialogue about the future of HRD, this study has drawn from and attempted to build upon previous inquiries into the future of the profession. As has been the case with other professions such as psychology, economics, management, and political science, HRD professionals can expect a lengthy dialogue and building tensions as the profession and its leaders seek to solidify their foundations.

Theoretical Framework

The current study is situated in the context of scenario planning. Scenario planning is a process of positing several alternative future environments based on data and imagination, in which decisions about the future may be played out for the purpose of recognizing current forces and their plausible future implications (Porter, 1985; Schwartz, 1991; Ringland, 1998; Shoemaker, 1995). Scenario planning emerged in business and industry over 30 years ago (see Chermack, Lynham & Ruona, in press, for more detailed historical review) and has steadily grown to be a primary tool to enhance traditional strategic planning processes. Van der Heijden (1997) asserts that scenario planning ultimately seeks to integrate three paradigms of strategic thinking: the rationalist, the evolutionary, and the processural. Each of these paradigms carries its own sets of assumptions which together help to explain the complex reality of strategy making. However, scenario planning most heartily aligns itself with the processural paradigm which emphasizes individual and organizational learning. Van der Heijden (1997) conceptualizes the strategy development process as a learning process modeling Kolb's (1984) theory of learning which consists of four phases:

*Copyright © 2002 Wendy E.A. Ruona, Susan A. Lynham and Tom Chermack*
concrete experience, observation and reflection, formation of abstract conceptualization, and testing new implications in new situations.

There are many descriptions of how to do scenario planning in the literature. The Centre for Innovative Leadership (1995) identifies the following six steps, which mirror many of the methodologies available publicly today. These are:

1. Identification of a strategic organizational agenda, including assumptions and concerns about strategic thinking and vision.
2. Challenging of existing assumptions of organizational decision makers by questioning current mental models about the external environment.
3. Systematically examining the organizations external environment to improve understanding of the structure of key forces driving change.
4. Synthesis of information about possible future events into three or four alternative plots or story lines about possible futures.
5. Development of narratives to make the stories relevant and compelling to decision makers.
6. Use of stories to help decision makers “re-view” their strategic thinking.

One of the first steps of any scenario planning process is to elicit the strategic insights of the client. These include tacit and explicit ideas of what is strategically important, what drives (or should drive) the success of the organization, and concerns and anxieties about the future, etc... (van der Heijden, 1997). It is imperative to begin with the clients’ view to frame any resulting scenarios in a way that can have optimal impact. This research project begins to address this first step by eliciting the views of people who are actively creating and shaping the HRD profession in order to begin to outline a potential strategic agenda for HRD.

**Purpose**

The purpose of this study was to gather opinions, thoughts, and concerns about the future of HRD from those who are actively working in and with the profession. The study queried HRD practitioners and academics, as well as those directly and indirectly involved with HRD, about trends, variables, and challenges that are affecting and will likely affect the profession during the next 15-20 years. The guiding research questions for this study were:

- What future trends might affect the profession of HRD?
- What risks might challenge the future effectiveness of the HRD profession?

This study will provide data to help HRD professionals begin to answer critical questions that will help to improve their own strategic thinking as well as the strategic viability of the profession.

**Methodology**

This paper presents integrated findings from two separate open-ended question surveys. Each of these surveys is described below, including a discussion of how each set of data was gathered and analyzed.

**Survey #1**

A survey was administered by these authors via e-mail bewteen March-April, 2001. Participants were asked to answer 10 open-ended questions. These questions were created based on van der Heijden’s (1997) recommendations for individual interviews (pg. 146-148) and participants were asked to assess the health of the profession by addressing such things as the surprises and challenges the profession had or had not endured, if and how the profession had grown, and its distinctive competitive advantage in 2015. Participants were also asked 5 demographical questions. Reminders were sent to participants approximately three weeks after the initial survey was sent in order to enhance the response rate.

The participants solicited were randomly chosen from a pool comprised of 40 volunteer members of two organizations. That is, each potential participant was either currently serving as: (1) a member of the Research-to-Practice Committee of the American Society of Training and Development (ASTD) or (2) a member of the Board of Directors or a Chair of a committee of the Academy of Human Resource Development (AHRD). This sampling criterion was chosen because these entities are key associations in the field and the members of these committees are either elected or nominated by their membership. The participant pool was male and female participants from diverse professional backgrounds and varied in age from 26-65 years.

Fourteen people responded to this survey for a response rate of 35%. Although this response rate is less than ideal from a quantitative research perspective, it is somewhat understandable because of its entirely open-ended
nature. The results of this survey have thus been combined with survey #2 (described below) and seek only to provide an initial outline of themes emerging from these open-ended questions.

Survey #2

A separate survey was conducted by the ASTD Research-to-Practice Committee and the Academy of Human Resource Development in preparation for a Future Search Conference (Weisbord & Janoff, 1999) they sponsored in June, 2001. That conference brought together 70 individuals with diverse backgrounds and perspectives to focus on the emerging roles of HRD over the next fifteen years. As a part of pre-work for that conference, the committee sent out a survey asking the 70 invited participants to answer the following question: “What do you see to be the three greatest challenges for leaders of workplace learning and performance in the new Millennium?”

These participants included corporate chief and senior executives, researchers in HRD, HRD practitioners in both private and public companies, representatives of the field of Human Resources Management, consultants, line workers and students. Attendance was by invitation only and included representation from the United States, Europe, and Asia. The participant pool was male and female and varied in age from 26-65 years. 41 participant responded to this survey query for a response rate of 59%.

Analysis of the Survey Data

Each of the surveys asked open-ended questions, resulting in narrative data to be qualitatively analyzed. Data from the two surveys (55 respondents in all) was combined and analyzed to identify emerging themes. The process used was based on the constant comparative method (Maykut and Morehouse, 1994) and generic coding procedures. These included analysis of four surveys to develop an initial coding scheme, extensive review of all data, recursive evolutions of the coding scheme, and the use of an electronic database to facilitate queries and coding. One of the authors on this paper created the initial coding scheme and initially coded the data, while the other co-authors served as peer reviewers to help to ensure trustworthiness of the analysis by providing the initial coder with feedback on (a) how well the participant’s input was being understood and (b) how effectively meaning of the text was being interpreted given the coder’s biases. The results provided below were not unanimously held by all participants, but rather reflect the patterns that emerged from the 55 participants, with an emphasis on those themes that garnered either the most or the strongest responses. What follows is a descriptive and interpretive account of the current strategic thinking of those surveyed for these projects, with examples and quotes to support them as space allows. In addition, the 120 trends identified from the literature were then further analyzed in light of the themes emerging from the survey data. When relevant and or provocative, trends from the literature are incorporated in each of the themes reported below.

Results

The most prominent themes that emerged are presented below. This section first overviews respondents’ ideas on the forces affecting HRD in the future. The second section discusses what respondents identified as the primary role and work of HRD in the next 10-15 years. Finally, this section ends by outlining the challenges that respondents believed would need to be overcome if HRD were to thrive in the coming years.

Forces Affecting HRD in the Future

A few key driving forces emerged from the 55 respondents. Interestingly, one theme focused on whether and the extent to which HRD could keep up with changing conditions. Other respondents focused on globalization, technology, and changing organizations and workforce demographics as prominent trends on which to focus. Each is briefly reported on below.

Will HRD keep up? One of the biggest concerns about the future of the profession is its receptiveness and ability to adjust to changing conditions in organizations. Twelve respondents critiqued HRD for not changing with organizational and global demands, and certainly for not being at the forefront of them and taking leadership roles in organizational responses to trends. While a few people did applaud HRD’s fast maturation and for how it has grown so quickly, most worried about losing that spirit in the future.
Globalization. Globalization surfaced as a primary trend impacting organizations, and thus HRD, during the next 15-10 years. Overall, ten respondents discussed this theme, focusing primarily on the challenges of truly embracing the process of globalization with all its implications. There were many issues listed including: crossing boundaries of time, space, geography and culture, economic issues, culture clash, working virtually, coping with increased bureaucracy, and exploitation issues arising out of countries with fewer legal restrictions.

The HRD implications of globalization were well cited by 16 respondents. They discussed the need for the profession to better understand and integrate intercultural practices into global organization, rather than assuming or imposing a western view on the people and culture of other countries. And, three respondents called for HRD to reflect deeply about the effect of globalization on all aspects of work and culture, and only then to proceed in developing specific methods for workplace learning and organizational change.

Changing Organizations and Workforce. Organizations of today were consistently characterized by respondents as global, technological, highly flexible, and under great demands to change. Twelve respondents focused on shifting workforce demographics as a key force driving change in HRD. This increasing workforce diversity was characterized by an aging baby-boomer generation, more generations present in the workplace, second and third world countries joining with first world countries' organizations, and varied knowledge/skill levels.

Technology. Five respondents clearly identified technology as a force that will continue to fundamentally shape organizations. “E-everything”, one person predicted, was going to continue to change the way work is done and who’s doing it to such a degree that we may not recognize what we now call the workplace in 15 years. Twenty-one respondents directly discussed the impact of technology on learning practices such as e-learning and virtual offices. They wondered if HRD would harness and explode the potential of technology, while also effectively integrating it with learning theory premises such as social learning, adult learning, and learning styles. A few others reflected on the impact of technology on the workplace questioning the effect of “virtuality” on basic human needs.

HRD’s Role in the Future

There was discussion of the type of work that the profession would be doing and leveraging in future years. This discussion included issues related to identifying and developing HRD’s core competencies.

Learning. The responses of twenty-one people comprise the basis of one of the most prominent themes emerging from the two surveys. Learning and human (more specifically adult) development was identified as the most powerful competitive advantage of the field. Three people identified HRD as the discipline that takes care of people (including competency, motivation, helping people achieve success, and making work meaningful.) At least five participants warned the field to shift away from its strong emphasis on training and embrace a learning centered mission. Three respondents emphasized the importance of effectively using and integrating learning methodologies in a systemic way in organizations, urging HRD to focus on creating cultures that are truly conductive to learning, including structure, resources, challenging work assignments, and reward systems that foster learning.

Three other participants cited innovative learning practices such as action learning, informal learning, and the “unlearning” process as fundamental competencies for the future. Speed, too, was an issue that was stressed by two participants who underscored how rapidly skills sets will change.

Many respondents indicated their preference that learning be used to impact organizational performance, extending the learning and development theme and explicitly linking it to organizational systems and processes and stressing the importance of having an impact on the success and performance of individuals, groups, and organizations. A relative minority in this data set, a few other respondents did not so heartily embrace this “performance” mission, however even they seemed to agree that organizational constraints (such as time and resources) must be overcome in order to further the learning mission.

Change & Organizational Systems. Six people identified a key role for HRD in the future as that of helping people overcome resistance to and better cope with increasingly rapid change and its implications. In addition, one person emphasized that part of that role entailed building systems that support uncertainties. Related to this, three people cited the critical role of systems thinking and integrating what we do into business and organizational processes.
Knowledge Management/Capital. Four people asserted that HRD must fulfill a key role in knowledge creation and management in organizations. In addition, two people saw this as a way to protect people from information overload inherent in the new economy.

Challenges Facing HRD

Survey respondents identified many challenges facing HRD in the future. The strongest themes were those that focused on HRD’s credibility, influence, and impact in organizations.

Organizational Presence and Recognition. There was much discussion (over 26 respondents) about HRD’s absence in the “boardroom” and in organizational leadership positions. Other issues related to this problem included inadequate resources, inability to influence strategy and decisions in organization, and HRD’s continued “separateness” in the organization.

There were two voices that emerged here. Some respondents talked about these things as if they should simply be happening—as if organizations need to recognize us, allow us access, afford us more respect, etc.... While another critiqued that attitude. For example one person stated that this “belief that we can prove our worth simply by talking and writing a lot and that eventually others will see the light and recognize HRD as worthwhile” is one that constrains the field the most. Most of the respondents aligned with that second voice and attributed the current situation to our lack of relevancy, contribution, and impact on the strategy and/or bottom-line of organizations. These respondents also wondered whether practitioners would gain the skills needed to seriously contribute to the value chain of the organization, to speak the language of the organization, to work to convince organizational leaders that people in organizations and the HRD profession can be of strategic value, to have the courage and tenacity to make a difference in organizations, and to develop the methodologies that integrate HRD in to day-to-day organizational life.

Evaluation & Return on Investment. Twelve respondents more explicitly linked this issue with the profession’s inability to be market-driven and demonstrate return-on-investment. Some people talked about building methodologies that went beyond Kirkpatrick’s (1994) 4Level (satisfaction, learning, behavior, results) stronghold on evaluation, and instead fostering many more innovative models by which to judge training effectiveness. Others focused on cost-benefit methodologies and making connections that demonstrate cost-effectives, revenue growth, value, and specific bottom-line impact to stimulate increased investment.

HRD’s Identity. Some respondents largely attributed the above challenges to HRD’s inability to identify its core competencies and competitive advantage. Eleven respondents projected that the field would collapse due to its inability to define and differentiate itself. These people asserted the field does not know what it is and how it is different from other professions, especially those that are highly related. One question on the survey administered by these authors specifically solicited ideas on the professions that would likely be competitors in the next 10-15 years. Respondents identified Information Technology, Human Resource Management, Organization Development, Management, Knowledge Management, and Industrial/Organization Psychology. Respondents offered multiple reasons why these competitors would emerge, and very few reasons why they wouldn’t threaten the viability of the HRD profession.

Three respondents did highly value HRD’s openness to diversity and hoped that would continue in the future as a key competitive advantage. One person felt that HRD could not define a competitive advantage because it is a process, not an object. Largely, though, most who participated in these surveys felt that, in the words of one participant, “valuing diversity can also be seen as valuing obscurity” and, in the words of many others, was ultimately taking away from valuing focus, discipline, and relevance. One person asserted that it was “egalitarianism that would kill HRD.” These respondents argued for a more unified perspective on the profession’s identity, vision, and goals. Other people wondered whether this focus would demand a new name for the profession—one that better represents our core values and the work that we do. One person also called for increased internationalizing of the field. Another called for HRD to realize that the tripartite model of HRD (as Training & Development, Organization Development, and Career Development) is obsolete.

Identifying HRD’s Stakeholders. An analysis of the data also points to another challenge. While there was much discussion about increasing HRD’s presence and contributions in organizations, there was also a vocal contingency that questioned or wished to downplay an emphasis on the organizational context. Twelve respondents talked about expanding notions of whom the profession serves. A few critiqued HRD for being too focused on organizations, and
a large, corporate model of them (rather than small organizations for instance). Others wondered whether HRD would expand its role to working with the community, schools and educational institutions, nations, and society as a whole. For some this was akin to reframing our work in the context of workforce development throughout the lifespan while others focused on community outreach and protecting the most vulnerable in society as well as those that are exploited by organizations.

Standards and Professionalization. Seven respondents wondered whether steps toward professionalization would happen, and identified these as fundamental to future excellence. These included identifying general competencies, standards of practice, certification/credentialing, and increased use of the AHRD Standards on Ethics and Integrity. Of main concern here was that professionals need some way to differentiate between good and bad practice, practitioners, theory/research. And that, while we had made some promising progress in the last 10 years, it has not been enough. Highly related to this, four people wondered whether this lack of identity and movement towards professionalization had or would begin to affect the profession’s ability to attract the best and brightest leaders to the field.

Scholarly Leadership. There was much discussion about scholarly leadership in the field. Nine respondents highlighted the need for the field to become truly multi-disciplinary. This included welcoming many perspectives, most especially internationally, as well as being increasingly willing to explore theory and practice that has traditionally been on the fringes as a potential source of material and inspiration. Other people extended this reasoning and encouraged the field to maintain the eclecticism of its youth by attracting and embracing professionals from other fields who can add to HRD. One person foresaw the need to build more strategic alliances with related disciplines. While others envisioned maintaining and widening the diversity that exists in the field currently by increasing dialogue, valuing the dynamics tension of various perspectives, and tearing down barriers for a whole range of practitioners and researchers.

Eight people called for a genuine collaboration between practitioners and academics, and the professional organizations that represent them (i.e. ASTD and AHRD). According to these people, there must be efforts to elegantly connect theory and practice. Six respondents wondered whether HRD research would emerge as a guiding force for practitioners. While the growing number and quality of HRD-specific journals was applauded, many hoped for even more rigor and growth. Respondents also wondered whether HRD would identify its core theoretical bases and begin to develop theories of their own that are substantive and tightly integrated with practice.

Finally, while HRD is beginning to find an academic home in colleges of education, as one person pointed out, it is not always a comfortable one. Five respondents hoped for more academic support at all levels in universities, acknowledgement from colleagues in other disciplines, growth in the number of programs (especially in the western half of the United States), increased numbers of students seeking advanced education in HRD, and for enhanced research-orientation in these programs.

Conclusion and Recommendations

This research queried HRD practitioners and academics, as well as those directly and indirectly involved with HRD, about trends, variables, and challenges that are affecting and may likely affect the profession during the next 15-20 years. It is one of the first data-based surveys to inquire into professionals' ideas about the future of HRD and it, therefore, provides a compelling pulse of the profession's ability to look into the future and identify key future challenges facing the profession.

This research demonstrates that we have much to do if HRD is to thrive in the future. First, we must continue to delve into present trends and future predictions of how they might be amplified. The future cannot be predicted with any certainty. Yet, this is the main reason for studying the future, “to look at what may happen if present trends continue, decide if this is what is desirable, and, if not, work to change it” (World Futurist Society, 2001, pg.2). Knowing about future trends is what empowers us to act. The survey data was rather limited in terms of the projections and ideas that are available. Participants seemed to reflect a limited understanding of future trends. This is not surprising, nor it is a judgement of these participants. Most people tend to have their hands quite full focusing on today and do not think much about the future. However, ignoring driving forces at a profession-level is risky and will likely result in HRD being ill-positioned to make substantial contributions to work-related learning and performance in organizations in the future.

The surveys did point to the continuing prominence of globalization, technology, and shifting workforce demographics as key trends that will impact organizations. Most respondents who reflected on these trends felt that organizations (and HRD) had yet to really comprehend the far-reaching impact of these forces.
Learning was held up as the most powerful differentiator and competitive advantage that HRD has. Both the respondents and the literature agree that the importance of learning will continue to increase. The coming years will demand that learning occur faster, in more diverse places, across more cultural and national boundaries, and with more efficiency (O’connel, 1999; Flanagan, 1999). What is less clear is how this frenzy will be supported. The real challenge for HRD is to find new ways to implement learning technologies that are efficient and effective and that deliver immediate, strategic, and impactful results. The literature and some survey respondents also called for more critical attention from HRD on issues related to knowledge management. This has not yet been heartily embraced in HRD, however the future beckons that we play a dominant role in those initiatives.

There was less talk about the role of HRD in organizational development and change efforts than we had initially expected. The respondents of the second (Future Search) survey tended to identify more with a training/educational role, so this might have skewed the data. However, even in AHRD proceedings and journals we continue to see training issues dominate. One respondent suggested that HRD must accept the obsolescence of the traditional HRD tripartite (Training, Organization Development and Career Development). These authors would concur based on this data and urge the profession to ask itself whether “Human Resource Development” is synonymous with or different from “training”. Then, we must look at that in relation to the emphasis on learning in this data to explore how these ideas are connected.

The challenges facing the profession were overwhelmingly clear in participant responses. This data presents a paradox that must be faced—the profession is struggling to earn organizational respect and obtain influence and resources and yet, at the same time, is also struggling to define, delimit, and rigorously evaluate itself. As seen in this data, there is still some debate about whether HRD should limit itself to an organizational context and whether it should truly embrace a performance-improvement mission that addresses organizational systems as well as the traditional training role. This inability to articulate our strategic competitive advantage may necessarily restrict HRD’s potential and make the profession vulnerable in the future.

The participants also indicated that HRD’s strategic role is in great jeopardy. They felt that HRD must make its relevancy, contribution, and impact on organizational strategy and bottom-line clear, and build a research and knowledgebase that supports this, if it is to thrive in the future. The traditional people management functions of Human Resources Management (HRM), and more broadly Human Resources (HR), are coming under scrutiny in terms of their perceived and measurable strategic value in organizations of the future. It is imperative that HRD acknowledge that the impact of these trends will have significant, knock-on implications, including an increasing need for HRD to articulate and demonstrate its strategic competitive advantage and role in future organizational survival and performance (Anderson, 1997; Ferris, Hochwarter, Buckley, & Frink, 1999; Woods, 1999).

Furthermore, the literature clearly points to HRM as evolving towards a more development-oriented and consultative role. In times of scarce resources, HRM and other disciplines will figure out how to do what HRD does in their pursuit of strategic influence. While this is explicit in the literature surrounding future trends in HRD/HRM (Hogets et al., 1999; Brockbank, 1999; Wright et al., 1999) it is uncertain whether HRD professionals, as a whole, are truly aware of what is at stake.

Limitations of this Research

There are limitations to this research project. First, although the data reported here is qualitative in nature, it results from two separate surveys with response rates between 35% - 59%. Most survey professionals would agree that a response rate of less than 50% is inadequate and that open-ended questions “rarely assess the level of intensity or a given issue, feeling, or concern” (Church & Waclawksi, 1998, pg. 50). The results reported here are interpreted by these authors, and should be by the reader, as indicative only of the strategic insights of the 55 people who participated in the survey and not as a representative sample of those who were surveyed and did not respond. The results should be interpreted from a perspective rooted in the assumptions of qualitative research rather than quantitative. Secondly, it must be reiterated that this study is only an early mile-marker in a longer journey of understanding the strategic mindset of leaders in the HRD profession.

Implications for Future Research and Practice

This study should be interpreted by practitioners and researchers as a pulse of HRD professionals views of future trends and driving forces that may impact HRD, and the challenges that these present for the profession. It is hoped that the results of this study stimulate critical attention on the future as an issue that we must actively reflect and act on in both our practice and research. Practitioners can make more strategic and forward-thinking decisions with their critical eye on potential ways that the future may unfold, and not be surprised when things they’ve entertained begin to happen. HRD researchers might use this study to further research future trends and explore their effects at a much
deeper level than was possible here. Furthermore, this study could be used as a baseline for more extensive research about future-thinking in the profession and/or as a springboard to continue on in the scenario planning process.

Most importantly, it is hoped that this study empowers HRD professionals to inspect the current state of the profession given a future context—and, in so doing, act to ensure that 15-20 years from now the profession will be strong and viable and doing important work for people and organizations.

The Dynamics of the HRD Profession in the Netherlands

Wim J. Nijhof
University of Twente

Since 1990, studies have been carried out by the University of Twente to describe, compare and validate HRD roles, competencies and outputs between HRD practitioners in the USA and Europe. In 1993, a replication of the ASTD study was carried out in the Netherlands, which concluded that most of the ASTD roles were reflected in Dutch HRD practice. Findings indicate that the HRD professional in the Netherlands is largely defined as a classical or typical type of trainer.

Keywords: HRD Competencies, HRD Roles, HRD Professional

"Is the HRD profession going to change?" This is the principal question of this replication study, carried out in the Netherlands between January 1999 and September 1999. Since the beginning of the nineties, many comparative surveys have been conducted in the UK, Italy, Belgium, Northern Ireland (Nijhof & De Rijk, 1997), Germany (Odenthal & Nijhof, 1996), and the Netherlands (Van Ginkel, Mulder & Nijhof, 1996). The main goal of these preliminary studies was to gain a picture of the HRD profession in Europe and to see whether the profession is similar to the ASTD roles and competencies described by McLagan et al. (1989). The original question is therefore descriptive and comparative. In most of the studies, a trial was made to validate the outcomes according to the "McLagan Model". In some cases, and in line with the original studies, the question of HRD profiles was expanded in the direction of professional development and relationships to organizational characteristics of companies and HRD departments (Valkkavaara, 1997) and related to theories of personal growth.

Because of the time lag between the first study in the Netherlands (1993) and the situation in 1999, some new insights into the profession and the changes in the world of HRD have stimulated new discussions and questions about the changes in the profession in the last seven years. The availability of a zero-base data set from 1993 provides the opportunity for a replication study, and to see whether the HRD profession has changed. The basic question is therefore whether the HRD profession has changed and, if so, how and why? The assumption is that, on the basis of new trends, new roles have appeared and older ones changed. The study has the character of a monitor, following the main effects of trends in a certain occupational group, to identify new roles and competencies. The study can also falsify theses about the effects of view of learning organizations and their expected impact of turning HRD professionals into coaches and guides, instead of professional trainers. This information can also help to update HRD courses and programs at universities.

The main question of this study is descriptive in nature, and can be broken down into a set of sub-questions:
• What roles do HRD practitioners play, and are these different from 1993?
• What competencies and outputs are related to the roles in 1993 and 1999? Is there any relevant change to be perceived?
• Do megatrends have an impact on the work of HRD practitioners? What, how and why?

The following sections describe the theoretical background of the role studies as well as the trends and their implications for the field of HRD.

Theoretical Background: Professionalization, Role Concept and Performance

"Professional development is [...] the process by which individuals increase their understanding and knowledge, and/or improve their skills and abilities, to perform better in their current positions or to prepare themselves for a position to which they can realistically aspire in the near future" (McCullough, 1987, p. 37). This definition underlines the individual aspect of the professional, the necessity to improve current skills, to perform better and to prepare for the future. This definition is different from professionalization as a process of a group of professionals, in order to gain recognition and accreditation in society, which some writers define as identity formation (Thijssen, 1988). According to Thijssen, this identity formation process consists of four stages:
• task concentration
• job differentiation
• job standardization
• identity profiling

The Dutch Association of HRD Practitioners (NVvO) is nowadays very active in supporting standardization...
and certification. This means that the membership is perceived as positioned at the second stage of identity formation, although in many cases steps toward the fourth level can be identified. The number of scholars and professorships at universities related to HRD has multiplied in the last ten years, as have journals and bulletins, conferences and organizations. At national and international level (European as well as global) not only have many new journals appeared in the last five years, but so have associations and conference organizations partly related to HRD, further education and vocational education as producers of initial jobholders. Alongside this process of identity formation, the field of research into HRD and HRM practice shows progress in terms of model evolution and model validation.

In Models of Excellence (McLagan, 1983), 15 roles of HRD practitioners were identified, which could be used for training and development and for describing the field of practice. The study was also criticized for lacking theoretical foundations and the absence of practical consequences. In 1989, McLagan & Sudolnik adopted the critique and replicated the study, using expert appraisals and validating panels. The result of this study was a total of 11 roles and 74 outputs; each role consisted of competencies in order to produce outcomes. In fact, human performance technology and role theory formed the theoretical basis of the study. Using cluster analysis and factor analysis, patterns of roles, competencies and outputs could be identified and validated. In 1996, however, McLagan reflected on these studies in the light of new trends, like information and communication technology, the rise of democracies, globalizing processes in business and industry, the trend toward core competencies of companies, outsourcing, views on the learning organization, and cost-benefit relationships, mostly leading to reduced HRD departments. On the basis of these trends, McLagan identified nine "new roles", which are, however, quite similar to those of 1989. Three roles that disappeared in her new scheme were carried out by more than 25% of the Dutch HRD practitioners in 1993, which is a substantial number.

From the viewpoint of Performance Improvement, Rothwell (1996) distinguished four new roles for HRD practitioners with the core competencies connected to these four roles:

1. Analyst, performing trouble-shooting procedures to diagnose gaps in human performance and identify opportunities for performance improvement;
2. Intervention specialist, selecting the right interventions to cover performance problems;
3. Change manager, being responsible for the implementation of interventions consistent with the intended results;
4. Evaluator, tracking the impact of the interventions and the consequences of the changes.

Rothwell defines 38 competencies and 158 outputs. The competencies are divided into 15 core competencies which are valid for all roles, and 23 competencies, each of which applies to a specific role. Outputs are split into enabling and terminal outputs. Terminal outputs are conditional upon enabling outputs. This is an important distinction when compared with the McLagan outputs. In McLagan's conception, all roles, competencies and outputs can have the same weight and relevance and have the same function. Rothwell takes the view of a workflow in which different competencies and outputs play different roles in different phases of the work process. Work is seen as a holistic pattern of activities to realize performance improvement. As a consequence of this conception, the ASTD entrusted to Rothwell the conducting of a new study in 1997 and 1998 of roles and competencies (Rothwell, Sanders & Soper, 1999). Instead of talking about HRD, the authors define workplace learning and performance (WLP) as "the integrated use of learning and other interventions for the purpose of improving individual and organizational performance" (p. xiii). The research is based on the question of which competencies WLP practitioners, senior WLP practitioners and line managers see as essential, now and within five years. Seven new roles have emerged from this study, with competencies and outputs. What is new is that the role of intervention specialist has been split into two new roles: intervention selector and intervention designer/developer. The sequence of roles is very dominant in this study: workflow is essential in this type of analysis. When looking at the outcomes of the McLagan and Rothwell studies, the differences prove to be marginal, although the differences between outputs in enabling and terminal are meaningful.

The European role studies of HRD by the University of Twente were greatly influenced by the ASTD studies. These studies show slight differences in culture and differentiation. The conclusion is that the role definitions are similar, but most of the time more competencies and outputs are selected per role. It could be said that the HRD roles of McLagan (1989) are valid for many European associations, but the content of the roles in terms of jobs and outputs seems to be broader (Odenthal & Nijhof, 1996). This might reflect the dominant role of small and medium-sized enterprises on the European continent, where jobs are more broadly conceived.

While the studies of McLagan et al. (1989), Rothwell et al. (1999) and Nijhof et al. (1997) have a lot of commonalities and show fairly stable results in time, the question is whether the original survey of 1993 should be changed on the basis of new insights into the world of work of the HRD practitioner. In order to make a decision on this, new trends in the field of HRD were analyzed to find indicators for new roles, competencies, and outputs. In the following section, an analysis is made of the trends and implications.
Trends and Implications

It is not easy to detect trends in HRD in a reliable and valid way. The distinction between a hype and a trend is not always unproblematic. When a trend is "a general tendency or course" (Webster's New World, 1997) and a hype "a promotion in a sensational way", it is clear that a trend in HRD is typified by its general character and can be identified in scientific journals and debates as serious scientific paradigm switches of thinking and research. Based on this notion, we will try to describe in a nutshell trends at the global level, at organizational level, at the level of an HRD department and at the level of the HRD professional. Some of these are based on empirical research, and some are idiosyncratic in nature. In all cases, there is some qualitative or quantitative argument to be considered.

Global Trends

Learning seems to be more important than training nowadays. This basic understanding shows a move away from the supply of standardized or customized training to employees, who are responsible themselves for lifelong or lifetime learning. Employability and transferability are becoming the leading motives for business and industry to see human capital as important resources with an exchange value. If employees invest in themselves through learning, the decision and organization about learning moves away from the organization to the individual. It is not too difficult to predict that the price to be paid for the 24-hour economy will be lack of loyalty, lack of commitment, and unstable organizations (Nijhof, De Jong & Beukhof, 1998).

The use of information and communication technology (ICT) in work and learning will have a great impact on HRD. "Just-in-time learning" seems to be one of the issues of learning at the workplace (Bastiaens, 1997). But ICT can also be used as a tool for learning outside the company and as a global communication tool. The role of HRD practitioners could change to that of coach.

Trends at the Organizational Level

One of the most influential concepts at the organizational level is the concept of the learning organization and organizational learning (Sege, 1991) and, as a consequence of this concept, a whole series of studies of knowledge management (Davenport & Prusak, 1998), knowledge creation, and boundary crossing as a new interpretation of transfer as expanded learning emerged (Engeström, 1994). In many cases, there is a convergence with the psychology of learning according to the concepts of constructivism (Billot, 2001; Phillips, 1995; Simons & Ruijters, 2001) and anthropology (Wenger, 1998). Critique (Philips, 1995), however, may help to distinguish between very naïve forms of learning. In many cases, behaviorism is alive in performance technology, and many learning processes can be organized quite effectively according to the principles of cognitivism. Situated learning, cooperative learning and team learning could be powerful means of learning from a constructive view. The consequence is a redefinition of learning and learning environments (Kaiser & Holton, 1998).

Trends at the Level of the HRD Department and the HRD Professional

Some writers see collective learning and the ability to do this as an organization as a precondition for the future. Based on the notions of Nonaka and Takeuchi (1991) of sharing tacit knowledge and expertise, many HRD staff should break away from their roles and competencies, which are based on traditional models of classroom learning and formal knowledge exchange (Eraut, 2001). The role of HRD practitioner, especially the role of trainer, will disappear, while the tendency is for employees to learn through experience at the workplace. If lifelong learning is a serious issue, employee flexibility and employability is placed on the political and business agenda (Brown & Keep, 1999; Nijhof, Van Kieft & Van Woerkom, 2001; Sprenger, 1998). The future role of HRD practitioners could change to that of coach.

The use of new technologies, like Electronic Performance Support Systems (EPSS), as tools for learning at the workplace is predicted to be one of the growing fields in HRD. Bassi, Cheney, Van Buren (1997) conducted a study on the use of ICT and the motives for its use. These are: cost effectiveness, higher instructional quality, customized learning and speed, less hardware and fewer constraints, decentralized instruction and just-in-time motives, and a "teacher" capable of teaching when necessary. Recent research, however, shows that however rational these motives might be the social function of learning should not be underestimated. One of the predictions is that Intranet and learning using networks will take pride of place in this millennium (Bassi et al, 1997). The use of the PC and e-mail is as high as 95% and 81% respectively, while the more advanced technologies like EPSS score as low as 2.5%.

New Trends - New Roles?

As a consequence of knowledge management and outsourcing, one might expect that a company would have to organize interface functions for producing learning events. As a consequence of these trends, the role of
purchaser of training became visible (Van Weele, Mulder & Nijhof, 1995). This role is defined by the following outputs: exploration and analysis of the market for training and development; communication within the organization; assessment of products and services; selection of providers, contracting; monitoring and control of quality, and customer satisfaction.

Trends in the field relating to the learning organization and competence management lead to a possible role of knowledge manager, whose main task is to fine-tune the knowledge needs of the organization and the available knowledge or expertise of employees. In terms of outputs, the knowledge manager produces the development of new knowledge, the targeted distribution of knowledge within the organization, the anchoring of relevant information in the organization, the effective combinations of knowledge, the identifying of information needs, and the fine-tuning of needs and available expertise.

Flexible organizations in combination with trends toward flexibility and employability will have managers in the near future who act more and more like coaches. A coach supports the employees, formulates targets and standards, delegates responsibilities, and provides a supportive shoulder when needed. He gives feedback and reinforces good results, including financial ones. The outputs of a coach are (Twilt, 1996): facilitating learning conditions; supporting learning processes; giving responsibilities; formulating targets and standards; organizing feedback and counseling and guiding to optimal performance.

Many writers perceive the competence manager as a possible new role for HRD practitioners. This role is the potential consequence of virtual organizational thinking and concepts of the knowledge worker and learning societies in which competencies have to be organized in such a manner that the organization as a whole will profit from the expertise. The basis of this role is to see in which direction the company is going to move in the near future. The competence manager has to play a major role in terms of strategy formulation and the definition of competence profiles, and the related skills and levels of mastery. This might lead to so-called personal development plans. It is clear that the knowledge manager and the competence manager have much in common. The latter is a more strategic role; the former a more tactical or operational one.

Quality management of training and development is still high on the agenda of companies. The implementation of quality standards occurs at local and international level. The European Foundation for Quality Management (EFQM) and ISO are organizations promoting quality in order to achieve excellence and to foster competition worldwide to do better. Benchmarking is one of the tools that can be used to compare the quality of companies. It is the duty and the task of quality managers to manage and monitor the processes to produce quality. In the field of HRD too, quality managers have to design, develop, evaluate and adapt HRD programs according to quality standards.

Role or Competence: Entrepreneurship?

On the basis of an analysis of the literature, entrepreneurship is seen as one of the possible consequences of a changing labor market, where employers select and screen candidates in the perspective of flexible labor contracts. Odenthal & Nijhof (1996) found in their study of German HRD roles a new phenomenon: the entrepreneur.

However, it is difficult to perceive entrepreneur as a role with special competencies and outputs. It seems to be more adequate to formulate entrepreneur as a new competence requested by the market, a competence needed by many jobholders. Entrepreneurship is seen nowadays as a condition for a job and for different task areas, especially for business people. Entrepreneurship in the framework of HRD means a competence in starting an HRD company, department or innovation. This is based on niches in the HRD market or on a specialized skill or expertise; setting up a business plan, and being able to stimulate and motivate colleagues to collective action is the entrepreneurial competence par excellence.

In the last ten years, some important trends and developments have emerged. On the basis of the foregoing analysis, five new roles were identified, which were not included in the McLagan et al. study or in the Rothwell studies: purchaser, knowledge manager, coach, competence manager, and quality manager. These roles will be integrated into the survey to check whether they exist in practice, and whether the classical roles of trainer and coordinator of training and development are disappearing.

Survey Design and Instrumentation

This study was set up on the basis of a survey design as used in 1993 to obtain an answer to the main question and to a number of special, more detailed questions. This meant that the key instrument for collecting data was a questionnaire. While data were collected in 1999 and were compared with those from 1993, the possibilities of comparison were expanded using the questionnaire of 1993. The five new roles, with new competencies and outputs as well as the competence of entrepreneurship, were added.

The population was the membership of the Dutch Association of HRD Practitioners (NVvO) (N=2476). In 1993, the size of the population was 1342. The response was seen as a sample of the population. Personal data was used to check the representativeness of the sample.

The questionnaire consisted of 7 parts:

- Part 1: The Job (formal label, tasks and duties)
- Part 2: Duty or role (experience, years, proportion of the workload, part-time/full-time)
Part 3: Outputs of the role (101 outputs were defined, practitioners had to select which outputs were essential for their role);

Part 4: Competencies of the role (relevance, expertise, level of mastery)

Part 5: Developments and trends in HRD (opinions of practitioners in terms of impact of trends on their daily work);

Part 6: Impact of new Information and Communication Technologies on their work and expectations for the next five years related to this;

Part 7: General characteristics of respondents

Data collection took place in May 1999. The response, even after a non-response search, in which lack of time was the most frequent excuse, was about 13% (n=326), which is rather low for a group of professionals, who might be expected to be interested in their profession and professionalization. However, the response for other national surveys is similar (see Table 1). In 1993, the response was 70%, but from a preselected sample of 425, from a population of 1342.

In 1993, the reliability of the different scales, based on Cronbach’s alpha, was very satisfactory (Van Ginkel et al., 1994). In 1999, the alphas were also very satisfactory. The scores are presented in the next table. (Table 2).

The representativeness of the sample was checked against the population. The sample did not differ significantly in terms of age, branch, size of companies and jobs (tasks). In terms of gender, a significant difference was detected (t (2798)=2.932; p=0.003), but there was no effect of gender on the selection of roles or tasks. The conclusion is that the sample is representative of the population. (Kieft & Nijhof, 2000, p. 61). 99% had enjoyed higher education (university or polytechnic); in 1993, this percentage was slightly lower.

Results

The main question of this study is whether the HRD profession is changing as a consequence of global trends. The underlying questions are related to changes in competencies and outputs related to roles and the time interval of 7 years. First, we address the question of changing roles.

Role Change

What does the HRD profession look like in 1999? Respondents stated that about 10 duties were a part of their role, with a standard deviation of 3.7. A large number of these duties or tasks reflected developing activities, such as reading recent literature, designing and developing training, organizing networks and contacts, providing advice and consultancy to the manager. Professionalization seemed to be one of the most important activities, followed by training and communication within and outside the company. Personnel management was the responsibility of 25% of the sample. Because of the number of tasks, there seems to be a great deal of overlap between the different roles.

What roles did Dutch HRD practitioners play in 1999 compared with 1993? Table 3 gives an answer to this question. Almost 25% of the sample were trainees. This is the highest frequency, followed by coordinator of training (15%) and organization developer (15%). The role of management and coordination of training covers 13%. About 67% of the roles were covered by the traditional roles of managing, planning, coordination and execution of training. The new roles of coach (2.5%), competence manager (2.2%), knowledge manager (1.2%), quality manager (0.3%), and purchaser of training (0.3%) were marginal or almost non-existent.

*** This role was not part of the 1993 survey
+ 'Other' means that respondents had chosen to take more than just one role.

A large number of the respondents were focused on training coordination and planning (almost 40%). OD and management of training were relatively high (almost 30%). About four roles covered 70% of the roles; in 1993, this was about 41%. What we perceive is an important change and even a concentration on four roles related to training.

Outputs

The role concept used by ASTD in 1989 and before concentrates on roles, competencies and outputs. Outputs are the consequences of actions based on competencies. Part of the problem is that outputs can have an intermediate effect or be an ultimate result of actions; ASTD does not distinguish between the two. Sometimes this concept may threaten the validity of the measurement. For the sake of comparison with the 1993 study, we maintained the concept of output and used 101 outputs for evaluation, based on all the roles, including the new ones.

Although ICT is growing in use in the professions, it seems that ICT barely penetrated the field of HRD in 1999. The output of "communication within the own organization" is very dominant.

Outputs connected with the implementation of training scored very high on the list. In Table 4, the top ten outputs are compared with those of 1993.

Competencies

The ASTD survey distinguishes between four groups of competencies: disciplinary or subject matter, business-related, communicative, and intellectual competencies. In the survey, a competency was rated as relevant when 60% of the respondents scored on these competencies. From the data, we learned that communicative competencies were the most important ones, while business-related competencies scored the lowest. The standard deviation, however, was the greatest in this last category, which means that respondents differed in terms of the relevance of these competencies. This result might be affected by the difference between entrepreneurs and internal officers of HRD.

1= very important/relevant, 5= not important/relevant

**Discipline or HRD Competencies.** Formulating learning objectives was the most important skill, followed by insight into the learning process of adults. Respondents felt relatively competent in these skill areas. Research skills or competencies were not perceived as important, which seems strange in a profession in which the orientation toward outputs is dominant.

**Business Competencies.** None of the business competencies taken up in the survey were felt to be really important, based on the criterion that at least 60% of the respondents had to name them as important. Their own mastery of business competencies was rated as average.

**Communicative Competencies.** Most competencies were rated as relevant, especially social skills, feedback skills, raising questions, presentation skills, coaching, and guiding team processes. These skills are very important in the professional job of trainer and were evidently not seen as part of HRD competency or discipline like competencies. The level of skills was rated as high, with the exception of team processes.

**Intellectual Competencies.** Self-efficacy, intellectual versatility, and perception seem to be relevant intellectual competencies for HRD practitioners. The respondents estimated their skills in this area as rather high. Competencies like setting up scenarios for the future or creating models were estimated as low.

**Outputs**

Besides the qualitative analysis in terms of relevance and mastery, it was important to know how the quantitative dispersion of competencies related to 1993 and to the original ASTD study of 1989. From the data we could conclude that the ASTD study no longer fitted the Dutch situation in 1999. In Table 6 (not included) the outputs were compared between 1999, 1993 and the ASTD study of 1989. The main areas of activities of HRD professionals as formulated in 1999 functioned as points of reference.

From Table 6 (not included), we learned that most respondents realized more outputs than in the ASTD study (1989). This outcome was connected to the different designs of the studies. In the Dutch studies, the respondents could indicate which outputs were related to task areas. The number of outputs was 101 in 1999, and 74 in 1993. Even in 1993 Dutch HRD practitioners indicated far more competencies per area than did ASTD respondents. This might indicate a broader conception of the area in question in the Netherlands.

Looking at the proportions of the competencies, we see that needs assessment scored quite high in 1999, as did HRD policy and management. In 1993 OD came top. One of the possible paradoxes now is that the sum of competencies is not necessarily the most important or frequent role, as described earlier.

Current HRD Trends in the Netherlands: Conceptualization and Practices

Kitty Kwakman
Beatrice van der Heijden
Jan Streumer
Ida Wognum
University of Twente

Simone van Zolingen
University of Nijmegen

This contribution reviews literature concerning current HRD developments. The resulting literature outcomes have been discussed with a group of experts in the field of HRD. The remarks of this group, consisting of both academics as well as practitioners, has been used to outline a conceptual framework on current HRD developments and to illustrate the conceptual framework with examples of practices concerning HRD developments in the (late) nineties.

Keywords: Trends, Organizational practices, Expert opinions

There appears to be a large discrepancy between the reality in HRD practices and contemporary theories on HRD developments. Firstly, training and intentional learning do not occur frequently, and development processes do not happen as systematically and consciously as assumed. Besides, there is evidence that learning opportunities are unequally divided across the workforce, with managers and higher level employees enjoying relatively privileged positions.

It seems obvious that changes in job requirements due to continuously increasing employability demands necessitate to pay attention to the fit between demands and supplies in the domain of professional development. Nevertheless, it may be questioned whether proposed theoretical solutions are applicable and emergent in practice, which is considered as a second discrepancy (Senge, 1990). Especially in the domain of organizational learning “too often, rhetoric and conceptualization do not seem to lead to any substantial progress in theory-building or in practice in the field” (Harrison, 2000, p. 254).

The discrepancy between HRD theory and practice urges us to confront theorizing in the field with empirical outcomes. It is important to find out to what extent attention is paid to organizing, shaping and managing the processes of learning and development within working organizations. In order to chart this attention, we will go into HRD developments both from some theoretical perspectives as well as grounded with data gathered during working conferences. The aim of this endeavor is to track down both examples of current developments as described in literature, as well as empirical evidence. Moreover, we want to raise opportunities for HRD practitioners to add new insights to (our) theoretical positions and to explore the potential of a powerful source in building theory within the HRD domain. Both in review and data collection we kept a focus on large companies as the infrastructure for human resource development was expected to be most prevalent in these.

Theoretical Outlines

In the coming sections the literature on HRD developments in the (late) nineties is reported. A division in three areas of description has been made, i.e. developments outside working organizations, developments inside working organizations, and developments within the domain of HRD.

Developments outside Working Organizations

During the last ten years our economy has transformed into a knowledge economy (McLagan, 1999). The implications this entails for qualification requirements are considerably. As the life-cycles of occupations and functions offered by organizations have shortened tremendously in the last twenty years, mastering learning and coping strategies and the transferability of these seem to be important topics for psychological and development research in organizations (Boerlijst, Munnichs & Van der Heijden, 1998).

Yet, only in the last two decades have career researchers started to pay attention to the idea of development
throughout one's career (Hall, 1986; Van der Heijden, 1998). This attention shows the growing concern about professional development throughout the working life. Because of the importance of continuously updating knowledge and skills, both the organization and the individual are held responsible for optimizing this development interactively.

Individuals who are able to survive the emergence of the information society, the internationalization of the economy and scientific and technological progress, are the ones with the most up-to-date knowledge and skills, but also with the capability to continuously build up new expertise requirements. Next to the computerization, the increasing globalization, internationalization, and continuously changing markets and products, one can detect changes in customer needs and behavior (see for example the increase in ecologically sound products). More and more companies privatize and are driven by market economy concepts. Obviously these changes too have many implications for the job requirements of individual employees, as innovation and technological changes poses strong demands on developing communicative and problem-solving skills (Horwitz, 1999; OECD, 2000).

Information and communication technology (ICT) is an aspect that burdens heavily on the necessary knowledge and skills to perform well in nowadays jobs. Also one can notice an increase in the use of ICT in training and development programs, both in schools as well as in company settings (Rosenberg, 2001). The latter, obviously, aggravates appeals to the individual employee in an era wherein workloads are already impressively high.

Demographic changes like the increase in women participating onto the labor market, the increasing participation of ethnic minorities, aging of the workforce and the ongoing dejuvenization have necessitated the attention for the guidance of life-long employability. Training and development programs ought to be tailored to the specific needs of classes of employees in order to increase chances of assimilation into the labor market.

Besides, more and more formal certifications are expected in order to guarantee the value of educational activities. This is why checks as to the content of educational programs and HRD programs, in general, deserve serious attention. In all sectors of higher education and vocational training one can see an increase in the attention towards customer needs. Besides, more and more one strives for a fine-tuning in educational programs with practice. For example developments like competence-based curricula, dualizing and contract education.

If the former is combined with the concerns of HRD professionals as to how to cope with the labor shortage in many areas, one can imagine the pressure that is felt by the profession as a whole.

Developments inside Working Organizations

In all sectors of the labor market one of the key changes has been the growing urge to monitor organizational aims in order to come to meet flexibility requirements, quality requirements and reduction of costs. A result has been an increasing flattening of organizations, working with business units and outsourcing of non-core tasks.

Besides, a number of developments have taken place, performance-orientation being the most far-reaching. Tayloristic modes of organizing have been changed with principles like job-enrichment and team working. In higher level jobs more and more employees telework which enables them a high amount of quantitative flexibility without losing the possibilities to keep in touch with colleagues both inside and outside the organization (E-mail, Internet, mobile telephones, fax).

The increased attention for performance enhancement has enlarged the popularity of the concept of the learning organization (Brinkerhoff & Gill, 1994). The perspective of the learning organization is aimed at optimizing learning processes of both individual employees as well as the working organization as a whole (Marsick & Watkins, 1999). Despite the fact that many organizations have faced difficulties in translating the philosophy behind the concept in concrete management activities (Garvin, 2000), attention for the subject has led to an increase in developmental activities (Senge, Roberts, Ross, Smith, Roth & Kleiner, 1999).

More and more top management really pays attention to on-the-job learning, implicit learning processes, knowledge sharing and improvements in working processes, products or services (Gourlay, 2001; Nonaka & Takeuchi, 1995). Middle management, on the other hand, is expected to guide individual career development by means of job evaluations, assessment of training and development needs, coaching and so on. Yet, in earlier studies we have found a scarcity and often a complete absence of managerial actions or measures taken to stimulate the employee's further growth and development of his or her flexibility or versatility. Supervisors often observe a declining learning value (that is to say the value which the function has as nutrient for the employee's further development) of the functions of their aging employees but do not seem to react to it by enhancing this value. The function becomes void of learning stimuli and new learning challenges. This can even happen in higher level jobs that are extremely important for the organization and perhaps highly complex and demanding.
Yet, guiding the individual career development is not only the responsibility of management in working organizations. Employees themselves are also expected to put a lot of effort and energy in improving their employability. Both the individual and his or her immediate supervisor should be engaged actively in the development of the individual's capabilities. In addition to training and development programs it is important to provide work experience with opportunities to use talents and to develop professional expertise, preferably in more than one area of expertise. The employees themselves are the ones who have to take an entrepreneurial approach to their own career development (Rhebergen & Wognum, 1996), and to display a learning attitude. It requires a 'hunger' for activities that benefit further growth.

Opposite to the need to enlarge one's employability, maybe even in an external sense implying that the employee's attractiveness for competitors increases as well, organizations try to guard the commitment from the employee towards the organization. More and more, flexworkers, part-time workers and knowledge workers question the need for a high amount of commitment to one particular organization. Next to the tension between the need to enlarging the amount of employability and guiding the commitment, problems entailed by increasing work loads and burnout issues force the different management layers in a continuing dialogue with the employees in order to deal carefully with the fit between the worker and the job (Kwakman, 2001).

Developments within the Domain of HRD

Obviously, the previously mentioned developments have implications for the performances that are required and thus for the job content and organization of individual jobs (Torraco, 1999). More and more job requirements have to be expanded with key qualifications like eagerness to learn, flexibility, and readiness to work together in teams. Besides, vocational training is not enough to enable the employee to function qualitatively well throughout the career. Life-long learning and competence development is considered to be the key answer (Garavan, Heraty & Barnicle, 1999). Short-term attention for career development in which employees are used to fulfill organizational goals that do exist in the here-and-now do not longer guarantee the individual employability in a longer sense. Due to enormous changes in professional fields life-long employment has been replaced by life-long employability which can only be reached in case both management as well as the employee anticipate as to which professional developments have to be attained (Kwakman, 1999). The latter can imply that short-term goals are no longer put in front in each and every case. This brings about the challenging though difficult to reach need for HRD specialists to find an equilibrium between organizational interests (need for high performances) and individual interests, e.g. the need for self-actualization (Confessore & Smith, 1998).

The increasing attention for life-long learning has led to a change in the way learning processes are organized. More and more HRD specialists start to recognize the value of other forms of training and development, for example 'training-on-the-job', computer-supported programs, web-based learning, coaching and support on the job (Bassi, Cheney & Lewis, 1998). Besides, training and development is no longer seen as the only solution in order to build up new knowledge and skills. More and more, changes in the organization of work, such as introducing autonomous teams are seen as a possibility to enlarge competence bases (Stahl, Nyhan & D’Aloja, 1993).

The developments that have been outlined so far have altered the role of the HRD specialist. More than before, he or she has to act as a counselor who facilitates line management and individual employees in carrying out the employability-enhancing and learning activities (Ellinger, 1998). In order to integrate knowledge management and competence management into the domain of HRD-practitioners, one has to translate strategic decisions into HRD-policies throughout all organizational layers (Bassi et al., 1998).

Research Methodology

In order to gain insight into the extent to which practitioners agreed on current HRD developments and their impact as outlined in the theoretical paper, the literature results were discussed with them, using principles of the Delphi method. The Delphi method was originally developed by the Rand Corporation in the 1950s as a data collection approach designed for structuring group opinions in order to enable group decision making. By gathering expert opinions (within a homogeneous group of experts) about complex problems consensus is striven for. Consensus is reached by using different rounds of data collection; the researcher organizes, analyzes, and summarizes the different responses and asks experts to respond again. Experts are also asked to provide an explanation for their responses and these explanations play an important role in summarizing and adjusting different responses (Holppple & Joshi, 2000). As the method is very useful to collect opinions about abstract and rather vague topics, the method is used frequently to anticipate future trends (Leirman, 1995; Ritchie & Earnest, 1999). However, most researchers use a variant of the original method, and a lot of variants have arisen in the literature (Leirman, 1995; Snyder-Halpern, 2001).
In this research we use the variant of the original method which is described by Leirman as a participatory Delphi. In a participatory Delphi an informed group presents all options and evidence for a specific line of reasoning or consideration in order to generate all possible opposing views. We used this variant as we aimed at consensus about the occurrence of current HRD developments in practice but we did not want to exclude opposing or new views otherwise. So, we decided to present the literature results to a group of experts in two rounds. In the first round we discussed our preliminary literature outcomes with a group of HRD practitioners and researchers. As we intended to verify and expand the outcomes, we asked for their opinions about the adequacy and validity of the current developments described. As a result of this, developments were refined, extended, and grouped otherwise whereas also more literature was studied. Then the final outline was written. In the second round we presented this theoretical outline to a group of experts during two working conferences. In these conferences participants were asked to state their opinions as well as reasons underlying their opinions. Participants were also asked to react as to what extent the outline sketches all relevant developments, as well as to sketch opposing viewpoints or experiences. The aim of the procedure was to answer the following questions:

1. To what extent are the developments that have been outlined in the research report significant for your organization?
2. Which developments in the domain of training and development have been taken place in your organization, during the last ten years?

Sampling was purposive, based on a “snowball” sampling strategy as one of the possible strategies in inductive, theory-building analysis (Miles & Huberman, 1994). We tried to compose groups of experts with equal job responsibilities but from different branches of organizations. Eventually, all experts involved were holding jobs, which involved large responsibilities for organizing and managing HRD within large organizations (in the profit-as well as the non-profit sector) in the Netherlands, so can be considered as a homogeneous group.

Results

In the following sections, the outcomes of the two working conferences will be reported. The categories of description are similar to the ones that have been used for the theoretical outlines.

Developments outside Working Organizations

The participating HRD specialists, when asked for external developments, mentioned on the one hand the importance of the ‘human factor’ and on the other hand the impact in the HRD field of the internationalization and globalization of markets as well as products. Next to these two main areas of change, some participants reported the influence of technological developments and the implications of the job market.

As far as the first factor is concerned, representatives of DAF and DaimlerChrysler gave a good illustration. Nowadays DAF offers solutions for mobility problems instead of producing cars, trucks etceteras. Because of the fact that unique products are created, individual employees are the most important organizational assets. Competencies have to be built up and quality management has to be a core part of HRM practices. At DaimlerChrysler the importance of the human factor has even been formalized. In order to reach high-quality Human Resource Management all HRM-instruments have been integrated and the responsibility for the employee development has been laid down with the employee him or herself. The individual workers are expected to formulate personal development goals and ideas to reach them. Secondly, the focus of the evaluation of the HRD professionals has been changed from their efforts in the area of training and development to the return of investments at the level of the behavior of the individual employee. The latter meaning that HRD-professionals have to make a connection between developmental needs of individual employees and organizational development goals.

As far as the internationalization and globalization are concerned we have five examples of the implications these developments have on a company level. ABN-AMRO has chosen for an approach that focuses on internationalization on an European scale. As a consequence, internal vocational training institutes have become smaller. Whenever possible, vocational training programs are outsourced and the department of training and development nowadays merely has directing and advising tasks.

For Toshiba Medical, the internationalization has led to an increasing pressure in terms of the time that is available to train employees. E-mail, globalization, a growing amount of foreign employees, and the need to commit higher level technicians to the company has led to the need for efficient training programs in much shorter time spans. The primary responsibility for assessing training needs has been moved to the line management in a continuous dialogue with the individual employee. The latter also applies to the TNT Post Group, a holding employing 120.000 people in 120 countries. This decentralization of the training and education function urges to a
The fact that internationalization and globalization do not automatically lead to a decrease in training and development activities has further been illustrated by the HRD representative of PriceWaterhouseCoopers. Currently, their training budget is around one billion dollar. Their programs are clearly aimed at enlarging the commitment of the employee towards the organization together with enabling the professionals, who are supposed to be highly employable, to perform qualitatively high. In order to ensure that an employee is suitable to perform services for the organization’s customers, a ‘license to audit’ has to be granted. Besides, team working is encouraged and is supposed to enlarge one’s competence base by exchanging valuable knowledge and skills. For the department of T&D these developments have led to the system of ‘contracting’, i.e. preliminary to the performance of activities, agreements are made regarding who, when and where and what subject will be trained.

For Polaroid Europe we can detect a centralization tendency as a result of the internationalization. Although the different locations are expected to work closely with the central training department in the United States, in practice it is not quite clear in how far one is responsible for formulating strategic goals.

As far as the third factor, i.e. technological developments is concerned, both the representative of Hollandse Signaal Apparaten and the one of the Dutch Air Force went into its consequences. It was reported that next to information and communication technology, advanced technological knowledge of material and products is indispensable for current functioning of these working organizations. At Hollandse Signaal Apparaten one signals the need to get hold of experts both for internal use as well as for their customers. In order to respond to this need three different types of educational programs have been developed, i.e. education for their own employees, education for customers who have bought their materials, and education for their future customers.

For the Dutch Air Force, training and education has always been a focal point. The technical and highly specific requirements for flying a certain plane and also the demands of quality and safety have forced them to large investments in training and development. The responsibility for making reliable assessments of the training needs has been laid down at the line management.

As regards the last mentioned topic of the influence of the job market, three organizations have referred to it and have indicated its consequences in the domain of HRD. Because of the fact that the University of Twente has a surplus of employees in relation to the available jobs and the costs that are brought about by this, the University has started to pay attention to retraining and job market preparation programs. Next to a mobility center that has been established with the aim of enlarging one’s knowledge and skills, outplacement programs have been developed.

In the Martini hospital, on the contrary, one has great difficulties to find qualified personnel. Part of the problem is due to the minor interest in health service jobs, but also the geographical location (in the North of the Netherlands). Aside from that, new strict laws concerning times to rest and recovery for health professionals have exaggerated occupational problems. Moreover, the dejuvenization and the aging of the working population necessitate paying attention to the implications of the increasing workload for the elderly. This urge the ARBO-dienst (services of conditions of employment) and the department of Training and Development to put the topic of the guidance of mobility and employability, and the ways this can be reached, high on the agenda. Similarly, the AWVN (General Employers’ Association in the Netherlands) has made the topic of the guidance of employability to be the central point of attention. More emphasis on the individual career development and a broader definition of training goals are elevated into the key points of attention.

Comparing the developments mentioned in the theoretical outline one can conclude that participants do stress the same three main factors lying behind the current developments, i.e. economy, technology, and labor market. Although the outline also describes developments in the area of legislation, vocational education, or social-cultural developments, the participants did not mention about these particular developments. This does not imply that these latter types of developments do not occur, but that they are regarded of minor importance in affecting the HRD field.

**Developments inside Working Organizations**

As indicated in the corresponding section in the theoretical outlines, many organizations are forced to reorientate on their organizational goals and to reconsider their present organization of jobs. Representatives from Generali Assurances, Canisius Hospital, Hoogovens and Connexxion give accompanying examples.

For Generali Assurances, the change towards a customer-oriented organization has led to a centralization of the output norms, i.e. customer satisfaction and cost awareness. Especially the focus on customer awareness has implied an enormous increase in training costs. At the Canisius hospital, the focus of customer satisfaction has led to multidisciplinary tasks for the medical staff. The department of training and education has been outsourced to the
ARBO-dienst (service of conditions of employment). Besides, a reorganization leading to a flattening of the organization has led to new HRD questions. Interdisciplinary team work for professionals and delegating management skills being two examples. In this hospital, competence management, broadening of tasks and learning strategies are key issues in current personnel management tasks.

At Hoogovens, a reorganization has led to the introduction of business units with their own responsibilities, and that are delegated to the line management, in order to upgrade the professional expertise of each individual employee. A problem one encounters is the lack of an overview of developments in the specific professional domains and in the training programs that are given. In order to enable the HRD function to facilitate business management in the different units, one should have more insight into the specific requirements in the jobs of the professionals in each business unit.

Connexxion, a transport company, which is the result of a fusion, concentrates on management development and education management in consideration of the guidance of competencies and in order to respond to the need for performance enhancement. Previously used job descriptions and performance evaluations are currently substituted by elaborated reports on systematically determining and developing competencies.

The perspective of the ‘learning organization’ forms the basis of the management philosophy of Gamma Holding, a textile industry company. Its philosophy is based on three conditions, i.e. delivering a high quality, using advanced technology and applying cunning logistics. In the Netherlands, Gamma Holding employs 2200 people, worldwide 10,000. A recent reorganization implied a change from a labor-intensive to a capital-intensive company meaning a change in range of products as well. At the moment one can characterize the company as process-driven and results-oriented, with a lot of investments in its innovative and technological capacities. Team building is used as a means to consciousness-raising for the philosophy of the learning organization. Competence management is one of the building pillars in this sense.

As far as the subject of commitment is concerned, a clarifying example can be found in the AKZO strategy where one, in order to enhance the individual commitment, puts a lot of energy in formulating norms and values people can identify with. Also at Connexxion one tries to establish longer term working relationships by investigating which factors are highly valuable for people. For Hollandse Signaal Apparaten, on the other hand, commitment is not conceived to be a problem. The representative reports relatively long terms of duration of the employees within the company.

Comparing these examples with the theoretical outline, it is obvious that theory and practice both stress structural as well as cultural changes taking place within work organizations in order to attain organizational goals as well as to improve the level of performance.

**Developments within the Domain of HRD**

Apparently, in the outlines that are given up to now, one can detect a change in main strategy that can be characterized by means of a transition from ‘education-minded’ towards ‘life-long learning-minded’. Many learning processes are founded on the need to enlarge one’s employability. For example, the Rabobank (a Dutch banking organization) academy has formulated as its aim; the transition from lifetime employment towards life-long employability. Besides, the representative reports that more and more attention is paid to working in multidisciplinary teams, guiding one’s own career, taking initiatives and pro-active thinking and acting.

The Dutch Railways has established a mobility center that both supports employees and prevents career problems. Each employee is enabled to have a career advice every three years. The Academic Hospital in Utrecht, nowadays, pays more attention to Human Resource Management activities because of the fact that there is too much outflow of personnel. Firstly, more training and education possibilities have been created. Secondly, a job satisfaction survey has been done and finally, measures to enlarge the amount of job satisfaction have been undertaken.

In all examples mentioned before one can detect a trend in which the responsibility for HRM activities are laid down with the line management. More and more HRD specialists act as advising partners (see for example at Start, an employment agency in the Netherlands). Training and education are more than ever outsourced while the existing departments of training and education are used especially for management development trajectories (see for example the so-called Business School at the AWVN (General Employers’ Association in the Netherlands).

At Vredestein, the HRD managers take care of signaling new developments, trying to find possibilities in the job market, formulating strategic plans and so on, while in the past they mostly spent a lot of time taking care of all training and education activities.

As far as competence management is concerned, the representative of PriceWaterhouseCoopers mentioned the birth of new jobs in the field, like knowledge managers, electronic learning experts and information technologists.
All these jobs are aimed at building up knowledge and skills bases in individual employees throughout the organization and in an on-going sense, i.e. during the entire career.

In comparison with the theoretical outline, a first impression of the developments mentioned by practitioners is that they resemble the developments determined theoretically to a large extent. However, a shift in the way learning processes are organized, as predicted in theory, can hardly be recognized in practice. Although the need for this shift is recognized in practice, examples of other ways of organizing learning are hardly given. This may lead us to conclude that the undertaken activities are not in line yet with the ideas and wishes in this respect.

Conclusions including Contribution to New Knowledge in HRD

The confrontation between theory and practice that was deliberately staged in the working conferences appeared to be fruitful as it yielded some new insights to our theoretical views. Firstly, a diversity of working organizations largely recognizes the developments as described in literature to a certain extent. So, the outline appears to be suitable to describe and further analyze HRD developments. Nevertheless, all experts agreed that it only suits large organizations or multinationals, and that it does not apply to small and medium sized enterprises as well as to non-governmental organizations. It was also remarked that the outline should pay more attention to international developments, as a lot of organizations will face an increasing globalization and internationalization.

Secondly, although the experts recognized and consolidated a lot of different developments, it became clear that not all developments are of equal importance within specific organizations in the same time period. Organizations do face several challenges, which may be provoked by developments as described, but precise implications of different developments vary from organization to organization. As illustrated one specific development can lead to a large variety of different consequences, dependent on the context and the extent to which other developments apply. This is partly due to the fact that many of the developments are intertwined, so that it is not easy at all to differentiate between the developments that have been outlined.

Thirdly, we also have to conclude that almost all HRD developments derive from developments both inside as well as outside organizations because of the fact that HRD activities and goals do change as a result of these developments. Consequently, developments regarding the HRD-domain hardly arise from the domain itself, as the domain is mostly reactive to outside changes and to new demands and challenges. What makes it even more complex is that responses of the HRD-domain seem to vary according to the specific situation of the organization. As the results reveal, every organization takes other measures to cope with new developments. Actually, this is in line with other reviews of HRD developments and functions which apply also outside the Netherlands (Baets & Van der Linden, 2000; OECD, 2000; Garavan et al., 1999; Willmore, 1999).

Thus, similar developments going on outside organizations do influence HRD and HRD responses within organizations, but they do not automatically lead to the same types of responses (Poell & Van der Krogt, 2001). Obviously, processes and dynamics within organizations seem to play a major role in determining these responses. Understanding these processes and dynamics may be a new topic in HRD research that will deliver worthwhile insights to better understand HRD practices.

A Design Methodology For Complex (E)-Learning

Theo Bastiaens
Jeroen van Merrienboer
Bert Hoogveld
Open University of the Netherlands

Complex cognitive tasks that must be performed by humans because they require flexible problem solving behavior are becoming increasingly important. The basic message of the 4C/ID-model that is introduced is that environments for complex learning can always be described in terms of four interrelated blueprint components. These components are based on the four categories of learning processes that are central to complex learning: learning tasks, supportive information, just-in-time information and part-task practice.

Keywords: Instructional Design, Competency-bases Learning, Complex Learning

Instructional design is a bit like an aging ocean liner—huge, slow, ponderous and requiring large amounts of energy and a great deal of time to move it even one degree off its traditional track. Despite extraordinary recent advances in research on learning, particularly from the newer cognitive theories, mainstream instructional design models remain largely unchanged.

While most design models have not evolved over time, HRD specialists in business and contemporary educators are searching for models that accommodate novel and complex delivery vehicles such as newer media and Internet/Intranet platforms. The modern context in which design is employed is in constant flux. Business and educational institutions are concerned with the need to proactively accommodate rapid and intricate, systemic changes. Most businesses have recognized the need to capture complex expertise and rapidly transfer it within and between organizations and communities. Current approaches to handling change emphasize the need to identify the knowledge and performance competencies required to close gaps between future social and organizational goals, on the one hand, and the current status of organizational and worker performance, on the other hand. The need for design systems that can be used to close complex, interrelated performance gaps caused by the need for complex, interrelated knowledge structures and strategies, are largely unmet by most current models.

The growing importance of distance learning in business, government and schools also contributes to the urgency of change. The knowledge required to support the continued success of organizations is complex and changing quickly over short periods of time. These changes will continue to place demands on the human resource specialists charged with providing the design systems that support the training, development and performance of workers. Adequate design models must flexibly adjust to advances in our understanding about how to draw on cognitive research on expertise and learning, and incorporate it effectively and efficiently into evolving instructional design theories.

Van Merrienboer (1997) introduced the four-component instructional design model (4C/ID-model), which is a design methodology for competence-based education. The basic message of the model is that well-designed learning environments can always be described in terms of four interrelated blueprint components: (1) learning tasks: concrete, authentic “whole-task experiences” that are provided to learners; (2) supportive information: information that is supportive to the learning and performance of non-routine aspects of learning tasks, such as reasoning and problem solving; (3) just-in-time information: information that is prerequisite to the learning and performance of routine aspects of learning tasks, and (4) part-task practice: additional exercises for routine aspects of learning tasks for which a high level of automaticity is required. The interrelationships between the four components are depicted in Figure 1. Each of the four components will be briefly discussed in the following sections.

Copyright © 2002 Theo Bastiaens, Jeroen Van Merrienboer and Bert Hoogveld
Learning Tasks

A sequence of learning tasks is the backbone of every course. The learning tasks are typically performed in a real or simulated task environment and provide “whole-task practice”: ideally, they confront the learners with all aspects of the whole complex skill. However, it is clearly impossible to provide highly complex learning tasks right from the start of a course. Therefore, learners will typically start their work on relatively simple learning tasks and progress towards more complex tasks. Task classes are used to define simple-to-complex categories of learning tasks and to steer the process of selection and development of suitable learning tasks. The learning tasks within a particular task class are equivalent in the sense that the tasks can be performed on the basis of the same body of knowledge, but they are different from each other on the dimensions that also vary in the real world (i.e., they show a high variability; see Paas & van Merriënboer, 1994). A more complex task class requires more knowledge or more elaboration of knowledge for effective performance (cf. Elaboration Theory; Reigeluth, 1999). The basic idea is to use a whole-task approach where the first task class refers to the simplest version of whole tasks that experts encounter in the real world. For increasingly more complex task classes the assumptions that simplify task performance are relaxed. The final task class represents all tasks, including the most complex ones that experts encounter in the real world.

While there is no increasing complexity for the learning tasks within one task class, they do differ with regard to the amount of support provided to learners. Much support is given for learning tasks early in a task class, and no support is given for the final learning task in a task class. This process of diminishing support as learners acquire more expertise is called “scaffolding”. It is repeated for each subsequent task class, yielding a sawtooth pattern of support throughout the whole course program. Support can take the form of product-oriented or process-oriented support. For product-oriented support, part of the solution is provided to the learners as part of the learning task. For instance, one might ask students to study a case or to complete a partial solution – activities that clearly provide more support than independent problem solving. With process-oriented support, the learners are guided through the problem solving process. For instance, one may require students to successfully complete one problem solving phase before continuing to the next phase, or present them with “process worksheets” – lists of leading questions that guide them through a systematic process.
Supportive Information

Obviously, learners need information in order to work fruitfully on non-routine aspects of learning tasks and to genuinely learn from those tasks. This supportive information provides the bridge between what learners already know and their work on the learning tasks. It is the information that teachers typically call “the theory” and which is often presented in study books and lectures. Because the same body of general knowledge underlies all learning tasks in the same task class, and because it is not known beforehand which knowledge is precisely needed to successfully perform a particular learning task, supportive information is not coupled to individual learning tasks but to task classes. The supportive information for each subsequent task class is an addition to or an elaboration of the previous information, allowing the learners to do things that could not be done before.

Supportive information relates to mental models (describing how the world is organized in a particular domain) and cognitive strategies (describing how to effectively approach problems in this domain). The supportive information concerning mental models may contain both general, abstract knowledge and concrete cases that exemplify this knowledge, so that it allows for both abstract and case-based reasoning. Conceptual models (what is this?) focus on how “things” are interrelated and allow for the classification or description of objects, events or activities; structural models (how is this organized?) describe how plans for reaching particular goals are related to each other, and causal models (how does this work?) focus on how principles affect each other and help to interpret processes, give explanations for events and make predictions. Cognitive strategies also contain general, abstract knowledge and concrete cases that exemplify this knowledge. The general, abstract knowledge typically takes the form of a Systematic Approach to Problem Solving (SAP), describing the successive phases in a problem solving process and the rules-of-thumb or heuristics that may be helpful to successfully complete each of the phases. The concrete cases may refer to an expert who is performing a non-trivial task and simultaneously explaining why he is doing what he is doing (e.g., by thinking-aloud).

Just-In-Time Information

Whereas supportive information pertains to the non-routine aspects of a complex skill, just-in-time (JIT) information pertains to the routine aspects, that is, sub skills that are performed after the course program in a highly similar way over different problem situations. JIT information provides learners with the step-by-step knowledge (“how-to-instruction”) they need to know in order to perform the routines. They can be in the form of, for example, directions teachers or tutors typically give to their learners during practice, acting as an “assistant looking over your shoulder” (ALOYS) or the procedural steps provided by an Electronic Performance Support System (EPSS). Because the JIT information is identical for many learning tasks, which all require the same routines, it is typically provided during the first learning task for which it is relevant. For subsequent learning tasks, JIT information quickly fades away as the learners gain more expertise (a principle called fading).

JIT information is organized in small units, called information displays. Organization in small units is considered to be essential because only the presentation of relatively small amounts of new information at the same time can prevent processing overload. Information displays include a didactical specification of the procedures that describe correct performance as well as the knowledge that is prerequisite to a correct application of those procedures. For instance, a procedure may state that “in order to start the machine, you must first switch it on” and also indicate that the on/off-switch is located on the back of the machine (i.e., a fact that is prerequisite to a correct application of the procedure). If necessary, the general information may be illustrated by demonstrations of procedures (e.g., a teacher demonstrating how the switch on the machine) and/or instances of concepts (e.g., a photograph of the machine showing the location of the on/off-switch).

Part-Task Practice

Often, learning tasks provide enough opportunity to practice both the non-routine and routine aspects of a to-be-acquired skill. However, if a high level of automaticity of particular routine aspects is required the learning tasks may provide insufficient repetition. Then, it is necessary to include additional part-task practice for those selected routine aspects in the course program. Well-known examples of part-task practice are letting children drill on multiplication tables, playing scales on musical instruments, or training medical students in reanimation techniques. In course design, part-task practice may be applied for routines that (1) are critical in terms of safety, (2) enable the performance of many other skills, or (3) are performed simultaneously to many other skills.
It is critical to start part-task practice within an appropriate "cognitive context" because it has been found to be effective only after exposure to a simple version of the whole complex skill (see van Merrienboer, 1997). One should thus identify the first task class for which performance of the routine aspect is required, and initiate part-task practice during this task class, preferably after learning tasks with ample learner support have already been worked on. This allows learners to identify the activities that are required to integrate the routine aspect in the learning tasks. Extensive amounts of over learning may be necessary to make the routine fully automatic.

Complex learning is always involved with integrated sets of learning goals, or, multiple objectives. It has little to do with reaching separate objectives, but it is foremost dealing with learning to coordinate and integrate objectives in real-life task performance. Thus, in complex learning the whole is clearly more than the sum of its parts because it also includes the ability to coordinate and integrate those parts. The model pays attention to the integration and coordination of constituent skills (skill clusters), and concurrently promotes schema construction for non-recurrent aspects and rule automation for recurrent aspects of the complex target skill (figure 2). By doing so, it aims at transfer of learning—the ability to apply the complex skill in a wide variety of new real-life situations.

Figure 1. Outline of the 4C/ID model

Didactical Models for Integrated (E)-Learning

The four components above can be identified in almost all blueprints of integrated learning, including blueprints for integrated e-learning. The learning tasks are in fact generic and can include for example cases, projects, problems etcetera. In this paper two examples of approaches are presented and the four components are explained in detail. The first example is a case based approach to integrated e-learning, the second approach is a project-centered approach.

Case-Based Approaches

In case-based approaches of competency based education, cases function as the basic format of learning tasks. A case is defined as a complex real event (from the viewpoint of a professional) in which typical aspects or instances of professional task performance or professional problem solving can be observed. It can be used to offer students opportunities to learn or to get familiar with different faces of professional tasks. A case can be considered as a ‘frozen experience’, in the first place because students can observe, study, and analyse real problems in their natural context, but without time constraint. Second, learners are allowed to make other decisions, may make mistakes and learn from them: there are no dangerous consequences of mistakes, while at the same time the authenticity of the situation remains completely intact. Case-based learning is a powerful way of learning because it integrates various...
aspects of tasks in a significant learning context and because it offers excellent opportunities for learners to
'construct' tasks, look at professional problem solving, discuss the value of alternative approaches and solutions.

A case can be constructed by careful analysing how professionals work while carrying out tasks or solving
problems. Construction is facilitated by searching for reasons to freeze the event, in time or in complexity. Once that
one has found freezing possibilities, all the information that describes the context of the situation till the freezing
point or event is documented for students' use. Students can build an idea of the situation. In combination with a
clearly defined task students will try to find a solution for the problem or bring the task to an end. From that moment
on the way the problem was solved in the case is no longer relevant for the case designer, nor for the student, who
indeed has to take over problem solving. The case design enables the teacher-designer to present to the students
enough information for sufficient analysis of the professional's problem and a clear learning task will challenge the
student to solve the problem. Good case designs support the solving of the problem by providing the students the
cognitive strategies and mental models used by professionals in these type of problem solving before they start the
task. In the 4C-ID model this is called: 'supportive information'. Any factual information about procedures is during
the learning task directly available in the learning environment.

An example of the translation of the four components of the instructional design model in the case-based
approach is the following series of cases. The example stems from the experience of the Open University of the
Netherlands.

Since 1998 the education of senior public administrators consists of a series of cases with which the students
learn professional systematic approaches for the design of policy documents and for solving problems of policy
making. Each of a series of 12 learning tasks is supported by four cases. Examples of these professional tasks, to be
learned are analysis and preparation of policy decisions, design of policy documents, collecting documentation and
anticipation of expected policy decisions. The learning tasks are made available on the course website. This website
also serves as delivery medium for the case descriptions and it encloses a database of available case-sources. The
supportive information consists of a methods-database, and a database with descriptions of all the theoretical
principles, available in the domain. Both databases can be searched thematically or with help of a search engine. The
just-in-time information consists of descriptions and concepts to be used in the particular case. Students' activities
are monitored by tutor/teachers. By email or in the discussion groups tutors give feedback on assignments. This
system of competency based e-learning replaces traditional knowledge oriented learning in the faculty of Public
Administration. Students evaluate this change as positive and more challenging.

Project-Centered Approaches

The project-centered learning approach is based on the 'learning by doing' assumption which means that students
are actively involved- and responsible for their own learning process. In this approach students work systematically
together on a 'project'. A project is defined as a unknown non routine problem which has to be solved. This problem
has to be true to life and embedded in a social context. This is also referred to as authenticity.

The project-centered approach distinguishes several phases. All necessary activities are split up in logical steps
and phases. On a certain moment in time students have to make decisions in a phase which have an impact on the
following phase and the continuation of the project. Special attention has to be pay to control activities as time,
money, quality, information, communication and organisation. The students work relatively independent as a group.
The teacher monitors the learning process as a coach. Every phase is completed after an assessment of the process
and/or relevant product. In fact this approach links up with project based working methods which are common practice in business and
industry these days.

The range of project centered learning is based on the following 3 dimensions:
- Authenticity of a problem: When a closer look is taken at the problem within the approach it is possible to define a
  gradation in the authenticity of a problem. Discerned are real problems which are related to existing problems in real
  life, and so called virtual problems which are a simulation of actual problems.
- Extend of control: The extend of control is based upon self control or external control. Self control means that the
  project members have a great deal of freedom in their way of working and can make a lot of decisions on their own.
  External control means for example that the phases are set by the coach and that the freedom to decide is limited to
  minor problems.

333
Level of implementation: The project-centered learning approach is often used as an education model (for the sake of the curriculum), meaning that it is used as a model to integrate all different courses in one. Students work on one set of problems in different disciplines. It is also possible to use this approach as a didactical model (as a working method in a single course). Students work together on one problem in one discipline.

An example of the translation of the four components of the instructional design model in the project-centered approach is the following: Students in business studies work together in a ‘virtual’ student company. In this company they have to produce and sale real products and run the company on the basis of investors (parents), stocks etc. The formulated problem is ‘run the business for half a year, put theory into ‘practice’ and be as profitable as possible’. In our instructional design model this is the learning task. All the students get their own responsibilities formulated as roles. We discern for example a CEO, a financial planner, a marketing and sales man, a chief production and five employees. They can, while running their business, use different suggested readings on management, marketing, production etc. This theoretical knowledge is supportive information. During the project they can get for example just-in-time financial information on results on sales, budget, marketing. This is just-in-time information. In their roles students sometimes need training and practice in role specific skills like presentation skills for the sales man or calculating for the financial man. These are examples of part-task practice. The whole project is centered around a virtual e-learning environment which supports the project with supportive and just-in-time information and different tools to communicate and work together as a group. Computer Supported Collaborative Learning is a key issue when the project-centered learning approach is related to e-learning.

Mixed Approaches

When a closer look is taken at the differences and similarities between the two above mentioned approaches we see that it is possible to combine them. For example it is possible to work together in a group systematically on the solution for a virtual problem which happens to be a case. Or it is possible the learn case-based as a project team. We can even make it more complex if we integrate other approaches as competency based learning, dual learning or problem based learning. All approaches have a unique theoretical foundation which in practice is often combined with other approaches. This is very well possible because all approaches try to stimulate the transfer of learning by combining working and learning. All approaches also integrate tasks, learning and information in a specific context. It is not necessary to stick to the specific ground rules of every approach as long as we stick with our (e) learning initiative to the commonalties. The 4C/ID-model provides diverse guidelines and heuristics for the development of training programs for complex (e)-learning. It embodies an integration of theoretical developments and empirical results originating from a large number of research projects involved with the training of complex cognitive skills on a more traditional and electronic way.

Fusion of E-Learning & Knowledge Management

Steve Downey
National Center for Supercomputing Applications

Reed Stuedemann
Caterpillar University

Mark Van Buren
ASTD

Tim L. Wentling, Session Chair
University of Illinois at Urbana-Champaign

Traditionally knowledge management (KM) has been well position within corporations (Barron, 2000). What has been less certain is how to use the information retained by KM practices to improve employee performance. Researchers are investigating how KM data/objects can be fused with e-Learning practices to produce meaningful, effective, performance enhancing solutions. This panel will discuss the current states of the e-learning and knowledge management fields, factors potentially influencing the merging e-Learning and KM, future research avenues, and visions of the future.

Keywords: E-Learning, Knowledge Management, Systems/Application Design

“In an economy where the only certainty is uncertainty, the one sure source of lasting competitive advantage is knowledge” (Harvard Business Review, 1998). It is the only renewable resource that an organization can capture, manipulate, and create to its advantage (Huseman and Goodman, 1999). Yet, knowledge is an elusive asset (Watkins, 1999); it is continually at play within organizations and in individuals. How is knowledge created? How is it stored? How is it lost? These are all issues of central concern to knowledge management. They also are the same issues of concern to learners and educators. With the growing usage of technology in and for learning, they are becoming the issues of concern for system designers and software engineers.

Ausubel (1968) in his classic work, Educational Psychology: A Cognitive View, wrote how important it was to make learning meaningful to the learner. In traditional classroom environments, this meant integrating curricula across disciplines. In e-Learning environments, this means utilizing a knowledge base containing a collection of objects that have emerged out of real life problems and situations and which have direct application to the learner’s job. It is this notion of integrating meaningful content, extracted from organizational knowledge bases, into organizational training environments that prompted early proponents of e-Learning / knowledge management mergers to begin exploring the idea of using an integrated approach. “In a mature e-Learning and KM implementation, knowledge workers will tap the same knowledge well for targeted e-Learning, unstructured information, in-house experts, and outside resources” (Barron, 2000).

This session presents the opportunity to initiate and continue a focused discussion on the fusion of e-Learning and knowledge management practices. The panelists participating in this session represent researchers, practitioners, and software system designers involved in the fields of e-Learning and knowledge management. They will begin this on-going discussion by sharing their findings and experiences during this session and then discussion will be continued in a learning community that will emerge from the session itself.

Session Objectives

Dialogue will be directed by the session Chair. In addition, each of the five panelist will promote discussion further by soliciting input and sharing of ideas of unique interest to themselves and the group as a whole. During the discussion, attention will be directed towards, existing research, potential barriers and benefits to merging e-Learning and knowledge management practices, and establishing a practical research model. As a result of these discussions, this session hopes to achieve the following objectives:

Copyright © 2002 Steve Downey, Reed Stuedemann, Mark Van Buren and Tim L. Wentling

1-3
Analyze the current state of e-Learning
- Enumerate components of knowledge management
- Describe factors influencing merger (technologies, human nature, organizational culture)
- Evaluate benefits/limitations of merging e-Learning and knowledge management
- Establish community of learners interested in the integration of e-Learning and knowledge management

Session Content

As recommended in the request for proposals, the session will be very flexible with specific topics being dictated by the audience members themselves. Listed below are a few of the topics and questions expected to arise during the session. Bear in mind, these items are simply guidelines for the expected flow of the session. Discussions will not be limited to these areas and will flow and adapt as the audience dictates.

- Given the research in the field, how would you describe the current state of e-Learning?
- What aspects of e-Learning have progressed furthest in the last three years?
- What aspects do you foresee progressing the most in the next three to five years?
- There is a lot of differing opinions as to what constitutes knowledge management; how do you view it?
- What factors traditionally have played the largest role in the deployment/utilization of knowledge management systems?
- How does culture (national, profession, or organizational) influence knowledge management?
- What benefits, if any, might an organization receive by merging e-Learning and knowledge management?
- What barriers traditionally have prevented the merging of e-Learning and knowledge management?
- To what degree does technology impact the adoption of systems (e-Learning or knowledge management) in organizations?
- What are some possible approaches/models that might be employed in merging e-Learning and knowledge management?
- What questions or research must be addressed in order to realize the concept of an integrated e-Learning/knowledge management system?

In addition to panelist addressing these questions, audience members will be solicited to share their insights and experiences with e-Learning and knowledge management. In doing so, we seek to attain a higher level of engagement with the audience thereby making the activity more meaningful and directly applicable to their personal and professional pursuits.

Outputs

Two primary outputs will emerge from this session. First, audio and summary transcripts of the session will be produced and made available online. Second, a learning community will be formed of researchers and practitioners interested in the integration of e-Learning and knowledge management; details follow.

Audio and Summary Transcript.

A facilitator will record noteworthy comments, questions, and ideas on a flip chart with a summation of the notes being provided online at the Knowledge and Learning Systems Group's web site <http://learning.ncsa.uiuc.edu/>. In addition, attempts will be made to capture conversations from the session for production of a streamed audio recording to accompany the written summary transcript. The resulting two learning objects will be housed in the KLSG's online repository for access by the general public and by members of the e-Learning/knowledge management learning community described in the following paragraph.

Learning Community

Establishment of an online learning community serves to not only continue sharing the experiences and acquisition of new information pertaining to e-Learning and knowledge management by its members but also will serve as a mechanism for participation in the development and testing of new learning and information management
systems currently under development at the National Center for Supercomputing Applications on the University of Illinois campus.

References

The purpose of this study is to determine the competencies needed by sales professionals. A total of 222 salespeople, 107 sales managers, 37 customers, and 6 others who refused to indicate their role completed critical incident questionnaires, resulting in 1688 critical incidents. The analysis revealed 16 competencies that defined five different roles of a salesperson: Long-term ally, business consultant Strategic orchestrator, consistent cultivator, and focused optimist. Implications are drawn for the organization and for HRD researchers and practitioners.

Key Words: Sales Performance, Competencies, Critical Incidents

Effective selling of goods and services is critical to the success of economic organizations. According to the Bureau of Labor Statistics (1997), 13,900,000 individuals were employed in sales and marketing jobs in the United States in 1992. By 2005, sales jobs are projected to increase by 18 percent (Vinchur, Schippmann, Switzer, & Roth, 1998). Today's complex selling environment, with technological changes and global competition, has altered the definition of what it takes to be a truly successful salesperson. What does it take to excel at sales these days? What separates top performers from merely good performers? The purpose of this research is to answer these questions and to examine the factors leading to sales success.

Theoretical Framework

Meta-Analyses of Characteristics

Churchill, Ford, Hartley, and Walker (1985) and Ford, Walker, Churchill, and Hartley (1987) used meta-analytic techniques to examine a range of personal characteristics affecting sales success. Both studies found that many of these variables were moderated by customer type and product type and that nearly all the variables were poor predictors, regardless of the customer or product type. A decade later Vinchur, Schippmann, Switzer, and Roth, (1998) conducted another meta-analysis of predictors of job performance for salespeople. Vinchur et al divided the analysis into subjective (ratings of supervisors and others) and objective (sales volume) indicators of performance and found that predictors differed depending upon the outcome measure. These results are discussed in detail below.

Cognitive Ability

The earliest published research report on sales performance looked at the "mental ability" of sales clerks in department stores (Oschin, 1918). Throughout the next five decades, tests of cognitive ability (aptitude) were the most commonly used selection instruments of salespeople (Schmidt & Hunter, 1981). Individual research studies, however, showed mixed results in the tests' ability to predict sales performance (Schmidt & Hunter, 1981), leading some to assert that product knowledge (Baier & Dugan, 1956) or personality (Miner, 1962) were better predictors. During the 1970s, however, a quantitative meta-analysis methodology was developed to look at cognitive ability as a predictor of performance (Hunter & Hunter, 1984; Schmidt, Hunter, & Pearlman, 1981). Churchill et al (1985) found the relationship between aptitude and sales performance to be mixed (correlations ranging from 0 to .85, with a weighted mean correlation of only .138). Vinchur et al (1998) calculated overall cognitive ability to correlate with subjective ratings criteria of job performance at .40 but with objective sales criteria at only .04.

Across all jobs, the validity of cognitive ability as a predictor decreases as job complexity decreases. Hunter and Hunter (1984) ranked the job of "salesperson" very high in complexity and that of "sales clerk" very low. This

difference in the cognitive ability associated with different levels of sales job complexity may account for the inconsistency in the findings of Schmidt & Hunter (1981), Churchill et al (1985), and Vinchur et al (1998).

**Personality**

The largest numbers of empirical studies of sales performance focus on personality. In 1926, George Gallup used a battery of tests to describe successful salespeople in an Iowa department store. He concluded that it was personality traits, not mental ability or interests, which distinguished good from bad salespeople, but that no instrument had been developed to measure such traits (Gallup, 1926). Researchers failed to link personality traits to job performance because of a lack of a sound model (Dodge, 1938; Hampton, 1941; Miner, 1962, Rodgers, 1959).

Employers’ use of personality tests peaked in the 1960s and rapidly declined because of a lack of correlations with job performance (Mount & Barrick, 1998). By the early 1990s, interest in personality-performance correlations increased (Barrick & Mount, 1991; Hogan & Hogan, 1989; Hough, Eaton, Dunnette, Kamp & McCloy, 1990; Tett, Jackson, & Rothstein, 1991). Barrick and Mount (1991) used the Five Factor Model or the “Big Five” from industrial/organizational psychology (Digman, 1990) and reported on meta-analytic work that confirmed five major personality factors: Extroversion, Emotional Stability, Agreeableness, Conscientiousness, and Openness to Experience. Using this Model, Barrick and Mount were able to demonstrate a strong correlation (.22) between the personality trait, Conscientiousness, and successful job performance in five occupational groups, including sales. By the end of the decade, fifteen meta-analyses on personality and job performance had been conducted, including one conducted within the European Community (Saldago, 1997), all supporting the findings that personality traits could predict job performance (Mount & Barrick, 1998) as well, if not better, than cognitive ability (Kierstead, 1998).

More recently, Vinchur et al (1998) used a modified version of the Five Factor Model, separating out Achievement and Dependability (sub-dimensions of Conscientiousness) and Affiliation and Potency (sub-dimensions of Extroversion). The researchers found RTency (.28) and Achievement (.25) to be the strongest predictors. The study also found the broad dimension of Conscientiousness to correlate with job performance at .21.

**Interests**

There is relatively little recent research on the relationship between vocational interests and success in sales. Early tests attempting to measure interests and preferences were found to be unreliable (Craig, 1925; Freyd, 1926). The most well known instrument for measuring interests is the Strong Interest Test, which has been in use since it was devised in the 1920s. Strong (1934) conducted validation studies of his test among life insurance agents and concluded that successful agents score higher in life insurance interest than unsuccessful agents and than men in general. Based on a small number of studies, Vinchur et al (1998) reported a high correlation (.50) between “interest in sales” and successful performance. Despite this result, further research on this variable has not been forthcoming.

**Personal History and Biodata**

As early as 1925 researchers looked at the predictive validity of an application form detailing work experience (Manson, 1925). Subsequent attempts to use personal history accounts, including family and school experience as well as work experience, had mixed results (Baehr & Williams, 1968; Worbois & Kanous, 1954). Nevertheless, by the 1980s many companies were using “biographical inventories” or biodata tests, for selection.

Early meta-analyses of performance across a range of jobs found a correlation with biodata tests to be .38 (Reilly & Chao, 1982) and .34 (Dunnette, 1972). The validity of biodata tests used in the selection of life insurance salespeople appears to vary according to how the company using it managed the recruiting and selection process (Brown, 1981), and biodata tests may be more useful for identifying candidates who are potential failures but less useful for predicting who will be successful (Brown, Stout, Dalessio, & Crosby, 1988).

Based on eight studies of “personal experience,” some of which include age and other personal factors as well as work experience, Vinchur et al (1998) found a correlation coefficient of .52 in studies using subjective criteria and a coefficient of .28 in studies using objective criteria. Although showing a stronger relationship than that of Conscientiousness as a personality trait, the factor of “personal experience” has received relatively little attention.

Sales ability has been measured by tests of skills and knowledge pertinent to the job of selling. These tests range from broad instruments with general use to tests designed specifically for a particular type of sales job in a single organization. In their meta-analysis, Churchill et al (1985) found a correlation of .268 between skills and job performance. Based on small sets of studies, Vinchur et al (1998) report correlations between “sales ability” and successful performance of .45 for studies using ratings and .37 for those using objective measures.
Competencies

More recent work has focused on competencies needed for sales performance. Competencies focus on the behaviors exhibited by the person on the job (McClelland, 1973; McClelland, 1998; Cherniss, 2000). As an example, sales agents at a large cosmetics company selected based on competencies sold more in volume and had less turnover during the first year than those selected using the company's conventional procedures (Spencer & Spencer, 1993; Spencer, McClelland, & Kelner, 1997). Del Gaizo, Erdman, and Corcoran (1996) reported on sales performance competencies gathered in studies undertaken in the early 1990s. Their work identified three roles of a salesperson: Long-term ally, business consultant, and strategic orchestrator.

Research Questions

Much of the research on sales performance, even the meta-analytic work, comes from research undertaken decades ago. Thus, the primary purpose of this series of studies is to determine the ways in which the competencies needed by today's salespeople may be changing. What changes, if any, are taking place in the sales function? What are the competencies needed by salespeople in today's organizations? To what extent do salespeople, managers of these salespeople, and customers identify the same competencies?

Methods

Study 1

The main purpose of this study was to identify changes in trends in approaches to selling.

Sampling. The study focused on organizations with as 100 to more than 10,000 employees. Organizations were selected based on their reputation for superior sales and marketing, as identified in the United States by Sales and Marketing Management magazine. They included all business sectors (heavy manufacturing, high-tech manufacturing, financial services, health and social services, business services, retail and distribution, transportation and utilities, government and education). The contact person was the vice president of sales or human resources.

Data Collection. A total of 24 telephone interviews were conducted from mid-February to mid-April 2000 in the U.S. This represented a 48% response rate (or 24 of the 50 people contacted). Interviews lasted about 45 minutes, although in a few cases interviewees chose to write their responses and return them by e-mail.

Study 2

The main purpose of Study 2 was to identify the competencies needed by successful salespeople. The study updates previous research on sales (Coker, Del Gaizo, Murray, & Edwards, 2000; Del Gaizo, Erdman, & Corcoran, 1996).

Sampling. The study focused on organizations ranging from 100 employees to more than 10,000 employees. They represented all business sectors and were located in Atlanta, Boston, Chicago, Los Angeles, New York, San Francisco, and San Jose. Participants in the study were salespeople, managers of salespeople, or customers of salespeople. They were identified by a contact person within each organization. The final sample included 222 salespeople, 107 sales managers, 37 customers, and 6 others who refused to indicate their role.

Data Collection. Written questionnaires asked respondents to describe both positive and negative critical incident questions: Think of a recent time when you or someone else made an important sale; and Think of a recent time when you or someone else failed to meet expectations in sales performance. These were followed by probes to clarify who was involved and what happened. The questionnaires were administered in group sessions.

The power of the critical incident methodology is that it asks people for top-of-mind recollections—sales interactions that made enough of an impression to be memorable, either positively or negatively. The result is a series of often small but telling moments which, taken together, define the realities of good and bad sales performance. (See Russ-Eft, 1995 for more discussion on the use of the critical incident method.) The critical-incident methodology does not involve a statistical analysis of a representative sample; rather its purpose is to uncover the full range of critical attributes that comprise sales performance.

Analysis. The responses to each question were entered into a database along with information identifying the characteristics of the participants. Each incident identified as “critical” by the respondent, or judged by the analyst as so intended, was considered as a separate event. If a response included more than one incident, duplicates of the entire response were entered as separate incidents. This procedure permitted the analyst to review the different
incidents for classification purposes, while still being able to identify the entire response. Analysis of the incidents followed the guidelines set forth by Flanagan (1954, 1974) and detailed by Russ-Eft (1995). Three experts with over five years of experience in sales and sales functions undertook an independent check on the categorization.

Results

Study 1 revealed that decision-makers saw the Internet and technology as a major change in the sales process. In addition, these respondents indicated that changes are resulting from team selling and team buying.

In Study 2, 1688 critical incidents were obtained. The analysis revealed 16 competencies that defined five different roles of a salesperson. The five roles, along with the number of incidents and their definitions appear in Table 1.

1. Long-Term Ally
This role is all about the interpersonal aspect of selling and conveying a sense of shared purpose. Whether in a single 30-second phone call or a long-term relationship, successful salespeople know how to establish a human connection with customers and find opportunities to demonstrate the importance of that connection.

They develop client relationships. One salesperson reported, “I was able to form a partnership with (the customer), where both of us were working together to make the product work.” Another salesperson took over for someone else saying, “I re-established the account based on trust and increased it from $65,000 to $160,000.”

They Keep Communication Open. Effective salespeople find ways to communicate regularly with their customers. Said one customer about a salesperson, “She checked in on a regular basis. I liked knowing that our account was on her mind.” About another salesperson, a respondent said: “He would research their questions and then call them back. He made regular calls on his clients even if he did not yet have an answer. He was available for them day or night. When they needed something, they called him directly.”

They Become Customer Advocates. Salespeople need to do whatever they can to make the customer look good—in the eyes of peers, the boss or other customers. “I’m always thinking, ‘How can I help you be successful? How can I help you be a star in your organization?’” says one successful accounting software saleswoman.

On the Other Hand... Salespeople should not think that customers are suckers for backslapping flattery and free tickets. “He was almost a caricature of a salesman—loud, jovial, over-friendly.” (Buyer, transportation services) “My broker failed to meet with me in person to review the proposal.” (Buyer, health insurance)

2. Business Consultant

This role calls for salespeople who are focused, accurate and knowledgeable about their products—as well as their customers’ needs, markets and business objectives.

They Build Credible Reputations. To be successful business consultants, salespeople need to establish their own reputations. “It’s important that my customers perceive me as someone who is fully aware of their issues,” said one salesperson. “Basically, if I am going to advise people, they need to believe I know what I’m talking about.”

They Build a Solid Knowledge Base. Said a sales manager about one of his salesmen, “He knew his product, and he knew what he was talking about; (his knowledge) convinced the customer to give our organization the opportunity to submit a proposal.” One manufacturing sales rep said, “I became knowledgeable about the customer’s organization. I got immersed in knowledge about them and what they wanted and needed. I had a good understanding of the company.” She went beyond the annual reports to become familiar with the company culture.

They Stay Current with Customers’ Markets and Business Objectives. Putting themselves in their customers’ shoes by identifying market objectives is another key behavior of successful salespeople. “I’d been trying to sell Internet advertising to a customer for eight years,” said an advertising account executive. “Even though he had a web site, he wasn’t interested. Last year whenever I saw articles about ad successes in his line of business, I sent them to him. Two months ago, I made another presentation. This time he was ready to listen, and I made a very large sale.”

They Develop the Right Solution. A key competency is demonstrating to customers an understanding of their needs. As a buyer of industrial commercial hardware said, “I was thrilled that someone understood our needs and customized an approach that was tailored to my budget and my timetable.” Some solutions may exceed what the customer was expecting: “The salesman offered options that even the client didn’t see ... and closed the sale.”

They Present and Propose Effectively. Busy customers expect salespeople to be able to present well. One salesperson of group health insurance learned the importance of this skill only after an unsuccessful presentation. “This time I gathered more reliable, well-spoken and polished team members.” Indeed many salespeople rehearse their presentations. “I role-played with my managers and thought of every conceivable question they could ask me,”

They Close the Sale. A successful salesperson knows when it’s time to close the sale. “One reason he made such good use of his time,” said a manager about a member of her sales team, “was that he knew when it was time to stop probing and asking for clarification, and wrap things up in terms of closing the sale.”

On the Other Hand... Most of the negative examples in our research could have had a happy ending if the salesperson had asked—and listened—more. “I didn’t peel back the skin of the onion enough. I didn’t probe deeply enough. I accepted what they said they wanted at face value.” (Salesperson, training software)

3. Strategic Orchestrator

Selling and buying have increasingly become team efforts. This role is all about creating connections between and within the selling and buying organizations to expedite a sale, encourage the exchange of information, and make it easy for the customer to deal with the selling organization.
They Orchestrate Resources to Win Accounts. The effective sales professional knows how to orchestrate key players in an account and in the selling organization. In some cases, these may be the technical support people. "I let their techs talk to our techs, and it keeps them happy," claims one salesperson. In another example, a financial services salesperson worked with his initial contact to identify the decision-makers in his company. Another said, "The client realized he was not able to make decisions and could only take the meeting so far. By having the right people there, we were able to go quickly from an introductory meeting to making the sale."

They Manage the Sales Process. Successful salespeople don't waste time trying to fight the customer's buying process. Instead, they look for ways to synchronize it with their own selling process. "I identified all the players in the client's buying process and made sure everyone in my company knew all the issues and concerns."

On the Other Hand...There were several examples that illustrated process failure: "We are a weather-driven business and have a small window of sales opportunity. The business manager did not plan ahead to have adequate staff when the season hit. We had lots of product to deliver, but could not deliver it fast enough." (Salesperson, retail manufacturer) A food processor asked for a proposal. "They put one junior salesperson on it and it took her three weeks to come up with a proposal. It was good, but too late." (Distribution manager, food processing company)

4. Consistent Cultivator

This role is all about the salesperson's ability to plan and manage the totality of his or her accounts. Given today's competitive pressures and the trend toward establishing long-term relationships with a few select vendors, the ability to perform this role effectively can make or break a salesperson.

They Manage their Time and Territories. Just as a lawyer or other professional needs to know how to run his or her business, a salesperson needs to assess how he or she is doing relative to the business objectives and his or her own goals. The ability to be personally organized is crucial, especially if a salesperson has many small accounts. "In this industry, you don't have two or three big customers," said a salesperson for a computer equipment firm, commenting about a colleague. "He is exceptionally organized and able to cover all the bases. At any time and any place you can ask him what is happening with such-and-such a customer, and he has got it at his fingertips."

They Maintain and Expand their Existing Accounts. Successful salespeople know where to focus their efforts. One woman who sells home furnishings had an idea to expand her business with a line of private label lamps. "She had an idea and followed all the way through with it," a respondent said. "She took the initiative to work on pricing and quantity with the stores and the manufacturer, taking on the roles of both liaison and problem-solver. The result was she made the biggest sale in the history of our company."

Good salespeople have measurable evidence of their product's success in an account. "With 15 years of relations with the customer, it was very easy to document our standing with end users in the firm," said a salesperson of commercial printing services. "When a new manager threatened to take their business somewhere else, we were able to present testimonials, samples of work and a short pricing structure to show him in quantifiable terms what he was getting. He ended up staying with us."

On the Other Hand...The following examples illustrate the negative behaviors that can undercut this role: "We accepted an invitation to submit a proposal and spent more than $50,000 on it without knowing very much about the client. It was based on the false feeling that we needed the work. Needless to say, we didn't get it." (Salesperson, construction and engineering firm) "Nobody in the company was focused on goals. They were performing 'the illusion of work' and waiting for customers to call them." (Insurance salesperson)

5. Focused Optimist

The more competitive, challenging and difficult the selling environment becomes, the more critical it is for salespeople to retain the ability to keep moving forward. This role is all about what top performers do to create a positive atmosphere that makes selling an enjoyable and frequent activity for sellers and buyers alike.

They are Motivated to Succeed. The most successful salespeople seem to love what they're doing. Said one, "Selling gives you pleasure. I couldn't describe it. It not only fills your pocket, but also your spirit and your heart."

What's more, this attitude is infectious, as a salesman for security equipment noted about one of his colleagues: "This person exuded confidence. Customers sensed the joy he felt in what he was doing."

They Meet their Commitments. One way of demonstrating a positive attitude is by meeting—and exceeding—commitments. "I have always been able to deliver what I promise," said an enthusiastic salesman, "and (the account) appreciates it. Because of this, I was able to sign them to a $300,000 contract."

They Get and Keep the Customer's Attention. Persistence was one of the most frequently mentioned qualities of top performers. They work creatively to get their foot in the door, as in this example: "The salesperson had a great
idea of sending a coconut with a note painted on the outside. The customer laughed and called to find out who had sent such a crazy thing.

On the other hand... The following examples illustrate the negative behaviors that can undercut this role: Persistence combined with a lack of preparedness is a recipe for failure, as in this incident: "If the salesperson had spent more time learning about our company and less time badgering people for a meeting, he would have done better." (Buyer of office products) "He got 'busy' and buzzed off a client too many times." (Store manager)

Conclusions and Implications

In light of today's increased competitive pressures in sales, it is interesting to note that, while Del Gaizo et al research conducted in 1987 and reported in 1996 identified the first three roles, the last two roles—consistent cultivator and focused optimist—emerged only in the research studies reported here. The three roles of long-term ally, business consultant, and strategic orchestrator focusing primarily on adding value and partnering with customers. The two newer roles emphasize individual persistence and managerial skill.

The study also revealed the importance of organizational support for the roles of individual salespeople:
- Focus. "I have so much going on, I can easily get distracted. I use the compensation plan to focus on what I do. So if our comp plan rewards new business, that's what I'll go out and get."
- Information. "One way the organization distracts me is by not giving me the information I need. Last week, nobody could give me some pricing I desperately needed on a product configuration, so I made it up. This is time-consuming and very stressful."
- Useful tools. "I use a time-management software program that lets me track customers, keep to-do lists, everything. I battled the company for years to let me use it. Now it's the company standard."

The present study represents a first step in defining sales performance competencies needed today. One limitation of the study is its focus on the U.S. Whether these competencies appear or are as critical in other parts of the world needs to be examined. Future research would extend this data collection effort to other countries and other continents. The results of the present work can be used to design and validate instruments to measure the competencies. Such research would, in addition, provide further validation of the roles and the competencies identified in the present study, as recommended by Schippman, et al (2000). Evaluation of an HRD intervention to improve sales performance provides another line for future research. Using validated instruments or some other data collection approaches, the evaluation can examine the process for the intervention as well as the impact of the intervention.

Competencies: The Triumph of a Fuzzy Concept

Jo Boon
Marcel van der Klink
Open University of the Netherlands

This paper discusses the backgrounds of the concept of competence. Following a survey on specific job characteristics from the point of view of demand for competencies, a review of literature and interviews were executed to gain more in-depth knowledge about the concept of competencies.

Findings from this literature analysis and from the interviews with experts on this topic are explored.

Keywords: Competence, Competency-based Management, Competency-based Education

The main roots of the concept go back to the seventies of the former century. Especially in the USA, experiments were carried out in educational settings making use of competency based education approach (Eraut, 1994). The experiments in the domain of teacher training gained a lot of attention. Experiments, however, in the other professional domains did not receive much attention in literature. (Grant, 1979).

The most important characteristics of the competency approach in teacher training at that time were the idea that it was possible and useful to copy as precisely as possible the behaviour of excellent professionals. It goes without saying that this idea implied a strong behaviourist background of it.

Accordingly in the same period in labour organisations the same interest can be found in the application of the concept of competence. Recruitment and selection procedures were modelled along the same idea about the identification and reproduction of behaviour of excellent managers. For example, McClelland (1973) developed a list of competencies and he assumed that the assessment of competencies of potential managers was a better predictor of their future performance than the widely applied psychological tests for measuring intelligence.

In the eighties the competency approach loosed its importance in education circles, the approach was merely criticised for focussing too much on isolated abilities, instead of on the whole functioning of professionals. Also the assessment of competencies turned out to be a major problem (Eraut, 1994). By this time in labour organisations too the approach was heavily criticised for delivering too vague insights into competencies, for not giving enough attention to situation specific elements, the lack of attention for soft skills, and its questionable predictive value. Nevertheless the competency-approach remained and other significant contributions were published, like the work of Boyatzis (1982) and Spencer (1983).

Further, during the eighties the application of the competency approach expanded from selection procedures to the use for reward systems and HRD.

In the Netherlands the notion of competencies did not get the same attention as in the USA. At the start of the former decade however, it became popular in the Netherlands through the work on core competencies of Prahalad & Hamel (1990). At this moment competence is one of the most discussed issues in the Dutch field of HRD and also it is an emerging concept in professional and higher education.

The research discussed in this paper is part of a more comprehensive study into the usability and application of the concept of competence. At the beginning of the project a survey was held among former students of an economic faculty, analysing the use of knowledge, skills and attitudes in their jobs and the relation of these elements to the faculty’s curriculum (Van der Klink, Boon & Bos, 2000). The survey raised questions concerning the possible usefulness of the concept of competencies for the translation of labour market demands into curricula. To address these questions a case study was carried out. This paper discusses the design and outcomes of this case study. It focuses on the why and what of competence. Why did it become a concept of paramount importance? And what is in fact a competence? How can we define this concept?

Theoretical Backgrounds

As mentioned in the introduction of this paper a remarkable confusion exists on the subject of the definition of what competencies are. In general the literature offers two perspectives:

- A geographic perspective
- A psychological perspective

First differences can be observed between nations, along the lines of different national educational policies and – often historically originated- different types of relations between education and the labour market. Fletcher (1992) concentrates on the difference between the American and British approach (see Table 1).
In the British approach competencies are seen as standards for functions and professions, whereas in the USA the behaviour of excellent performers is the source for the development of lists with relevant competencies. This differs slightly from what could be labelled as the German perspective, which explicitly distinguished qualification and competence. Qualification refers to the recognition in diplomas and professional degrees and this visualise a certain set of competencies. The notion of competence is restricted to a person's ability to perform certain tasks (Onstenk, 1997). The formulation of qualifications and the determination of its contents is a process wherein the government plays a major role, while the judgement of an employee's competencies are made by individual employers (Oliviera-Reis, 1994).

Another source for conceptual disagreement on the definition of competencies originates from theory on how people learn. Two different approaches can be observed (Simons, 1999); on the one hand a cognitive and on the other hand a constructivist view on learning. The main differences between the two approaches concern the description of competencies, the ideas on interaction and the measurement of competencies. In contrast with the cognitive approach the social-constructivist approach values highly subjective and motivational aspects and it questions the notion of transfer to other (job) contexts. The cognitive approach relies more heavily on the application of top-down approaches when the investigation and determination of competencies is at stake. There is a tendency in the cognitive approach, according to Simons, to link competencies with performance, while in the constructivist view the individual employee's perspective and preferences gains more attention in the composition of competencies.

The contemporary emerging attention for competencies in labour organisations is often attributed to Prahalad and Hamal (1990), who analysed the position of enterprises on the labour market from the idea of core competencies. These are unique clusters of factors allowing a firm to take a strong competitive position. Various developments within and outside organisations contribute in a direct or indirect way to the attention for competencies. Examples of those developments are, among others, the shift towards more customer-oriented production, the emphasis on quality control, and the range and the speed of the upcoming of information technology in all facets of the production process. To respond to these developments organisations were forced to increase the flexibility of the workforce (in terms of time, e.g. flexible contracts, and in terms of tasks and responsibilities). Although the mobility patterns that are prompted by this flexibility strategy cannot for the Dutch context be described in terms of statistical significant developments yet (Fruytier & Klomps, 1999) it is without any doubt an important development for the generations entering the labour market recently. It is clear that the ability to cope with these levels of flexibility requires specific competencies of the workforce, for example competencies to manage your own (horizontal) career in the transitional labour market (Boon & Van der Klink, 2000).

Also new models of management emerged, as an alternative for the traditional Tayloristic models that contained detailed descriptions of required job demands and job tasks. These new models have in common their focus on output and performance. For example Galilee et al (1998) argued that in modern organisations a large scope of knowledge and abilities of workers could be seen. This hampers management to describe precisely the different tasks that have to be performed. This evidently leads to a focus on output and performance. Definition of the different tasks of the job is the longer the more part of the job itself. The essence of the competency approach is the fact that employees have to be assessed on performance and output. To realise this output without being controlled on the process, employers have to ensure the availability of a broad scale of productive characteristics.

The government's educational policy is trying to stay in touch with these developments by encouraging schools to give attention to developments in professions while designing curricula. The educational sector is the longer the more expected to become a partner in the creation of knowledge and in the deliverance of professionals able to work in innovative work environments (Ministry of education, arts and science1996, 1998). Notions such as 'regional knowledge centre' became fashionable to emphasise the new role of vocational education and professional education in the development and deliverance of competencies needed to perform adequately in jobs.

Methodology

As mentioned in the introduction of this paper, a former project was the main reason for conducting a study into the concept of competence. It was decided to opt for a small-scale study focussing on analysing literature and interviews with key persons.

Research Questions. The research questions that were addressed in this study were:
- What is the explanation for the contemporary attention for the concept of competencies in enterprises and education?
- What definitions are in use? How useful is the concept for a better translation of labour market demand into curricula.
- How is this concept put into practice in enterprises and in education?
- Will the current attention for this concept be of a temporary nature?

As these research questions reflect, the analysis was not limited to the domain of labour organisations, but also the usefulness of this concept in education. Education in this research was defined as vocational and higher education (which includes in the Dutch binary system academic and professional education as well). With exception of academic education, these types of education are highly related to and even - to a certain extend - determined by the labour market developments.

Research Method. Due to the kind of research questions, a qualitative research design was considered to be the most adequate. To answer the above-mentioned research questions a choice was made to hold face-to-face interviews with experts. An instrument was developed, allowing semi-structured interviews, focussing on background, definition, and application of the concept and persistence in time. Each expert was invited to express his opinions on these specific four matters. According to the respondents' specific expertise some topics were discussed more thoroughly.

Respondents. Respondents were selected on the significance and their topicality of their contribution to the Dutch debate on competencies. This selection was performed on the basis of publications in professional journals (in the domain of HRD and education) and/or prominences as invited speaker to congresses. Ten experts were selected, working in the educational sector, in the consultancy sector and in research. These experts can be regarded as the key persons in the Dutch competence debate. Table 2 provides an overview of the experts' backgrounds.

Data Collection. Duration of the face-to-face interviews varied between 60 to 90 minutes. From every interview a detailed transcription was made and this was mailed to the respondent with the request to react when the respondent's opinions were not reflected adequately in the interview report.

Results

In this section the data are presented at an integrated and aggregated level. The following topics are discussed successively: definitions in use, the backgrounds of competencies as an emerging concept, the application of the concept in education and labour organisations respectively, the persistence of the concept of competencies.

Definitions. The respondents agreed upon the idea that a prominent feature of the concept is the focus on clustering skills, knowledge and attitudes. But respondents' amplifications revealed substantially different meanings:
- Competence is a conceptual tool to describe the interdependency between professional skills and meta-cognitive skills. This facilitates the transfer to other contexts;
Competence refers to innate abilities, emotions, attitudes, skills and knowledge, and the motivation and ability to apply these in certain contexts. Only to a certain extend competencies are trainable through formal and informal learning experiences;

- Competence as an individual, personal ability to apply the right clusters of skills, knowledge and attitudes to perform adequately in various settings.

- Competence as conceptual framework, facilitating communication and interactions between education and labour market by providing a tool to discuss and negotiate the content of professions and the curricula of educational providers in an integrated way.

- Competence as an organisational tool for competency-based management to enhance the communication between various stakeholders within an enterprise about what is regarded as valuable and measurable behaviour from an organisational perspective.

In addition, some respondents pleaded for an enlargement of the definition by stressing the importance of 'civilian competencies', allowing participation as citizen in society. Obviously respondents expressed contrasting opinions regarding the trainability of competencies. Opinions varied from completely trainable to trainable to a certain extent.

Explanations for the Popularity of Concept at This Specific Moment. Several respondents expressed a general sense of uncertainty as the main reason for the popularity of competence. Employers and HRM staff feel uncertain about how to select new employees, given the need for flexibility of the workforce. The certitude of changing job requirements makes it hard to define clearly the required attributes in terms of knowledge, skills, attitudes and motivation. Measurement of very different characteristics of employees is often seen as a solution, allowing to keep record of a large amount of characteristics that are registered, need to be trained, etc.. On the side of educational institutions a same sense of uncertainty can be seen. Institutions feel the need to train for good professional performance, but feel unsure about the authentic descriptions of this performance.

The main bases for this sense of uncertainty are the fast developments in (the sector of) information technology. Not surprisingly the issue of competencies is high on the HRM-agenda of organisations in this specific sector. The various arguments respondents gave to substantiate their opinion can be presented in two clusters:

1) The attention for competencies in enterprises

Focus on output: Competence as a concept is in line with the contemporary focus on individual performance, the attention for the measurement of observable output, and the emphasis on skills.

Multidimensional concept allowing to integrate different aspects of functioning: The competence concept has the advantage, compared to other popular concepts such as the Learning Organisation, that it is more tangible and it is easier to operationalise, both on the organisational level and on the individual level. Therefore it better fits into the (re)design of various processes within organisations, and will be thus not exclusively restricted to HRD in organisations. It is a concept that connects various groups in organisations, like HRD, HRM and the management that already was used to think in terms of core competencies.

2) The attention for competencies in vocational and professional education

Competency-based education holds the promises to improve the performance-based nature of curricula, which might be a valuable asset to attract students, new groups of students, and will reduce the gap distance between education and labour market.

The popularity is further increased by offering new perspectives on a better design for the alignment between education and labour market. The current procedures for determination of curricula content, through the composition of job and profession profiles, lack the flexibility to cope adequately with the fast changing labour market demands. Moreover, the concept of profession itself is eroding and does not function as a settled framework in the discussion on the content of curricula. There is an urgent need to develop a new framework that responds better to the contemporary situation allowing stepping away from the idea that professional performance can be described in separate skills and abilities.

Applications in Enterprises. Respondents agreed on the fact that although competency management is a relevant topic in HRM divisions of many organisations, the implementation on the other hand is rather limited in quantitative and in qualitative terms. Respondents' opinions can be summarised as follows:

The high costs of the development of an enterprise policy based on competencies are seen as the most important obstacle. At the same time choosing the right moment to implement a competency approach is a major impediment. When the enterprise is in good shape, there is no obvious need for the development of a competency approach. At the moment problems arise in an organisation, the investment is often too expensive in terms of resources. Some respondents suggested that the concept of competence would be most often applied in sectors that are facing turbulent developments, like ICT companies. It is least applied in organisations that are not depending on market developments, such as non-profit sectors.

Respondents referred to the special position taken by consultancy firms in the implementation of competency-based management in enterprises. Although different kinds of competency management can be
of competence.

organisations) and for different purposes. The exploration of the concept of competence in this paper shows that the concept in fact serves as a container, partly the consequence of the application in different countries, in different settings (education and organisations) and for different purposes. The results underpin that it is necessary to define carefully the concept of competence.

Conclusions and Discussion

The exploration of the concept of competence in this paper shows that the concept in fact serves as a container, with a very flexible content. This major vagueness proves to be rather attractive but at the same time it makes it difficult to use the concept as a cornerstone for designing HRD and educational practices. The confusion is partly the consequence of the application in different countries, in different settings (education and organisations) and for different purposes. The results underpin that it is necessary to define carefully the concept of competence.

Applications in Education. There are two arguments respondents mentioned for the application of the concept of competence in higher and vocational education:

Employers complain that newcomers on the labour market lack skills for today's demands, such as communication skills, and the capacity to solve problems.

A second motive for the adoption of the concept of competence stems from the observation that traditional curricula put to much emphasis on theoretical knowledge. The attempts to integrate the workplace into the curriculum lead to a greater focus on core professional problems as the cornerstone of the curriculum. This most often implies the use of problem-based or project-based types of learning, or even the design of dual training schemes where the training is partly located in the workplace itself.

So far, however, actual applications of competency based education in vocational and higher educational are scarce. Respondents mentioned some examples underlining the limited application in educational practices. Interviewees point at various problems that might explain the limited attention in education. A first problem respondents mentioned concerned the risk of giving too much attention to competencies in curricula might lead to an underestimation of reflective and/or academic competencies in the curricula. A second problem is certainly the role of assessment. The shift toward another pedagogical concept will only be successful if the assessment of students will alter too. If students in those reformed curricula would still be assessed on their knowledge only instead of their competences, then this would mean the fiasco of the educational reform. It is clear that assessment is a major problem in this respect, demanding the design of valid types of assessment that covers all aspects of competences in an integrated manner.

Competencies as Hype. The actual attention for the concept is yet very new. Most respondents perceived a remaining focus on output and performance in the future. The developments that can be described as the background of the popularity of the concept of competencies—the increasing flexibility and uncertainty—will become even more manifest in the near future. Given these developments it is very unlikely that the competency-concept will prove to be a passing hype.

In addition, respondents viewed new trends. They mentioned for example the shift from the focus on individuals to a focus on groups or larger entities, in organisations as well as in education (e.g. the current focus on collaborative and cooperative forms of working and learning). Also they viewed that work and learning will be integrated more closely. Examples of this integration are the emergence of (virtual) communities of practice. These are multidisciplinary or multiprofessional teams working and learning together. Another trend that is expected to become influential is knowledge management. This would mean a stronger accent on process and product related knowledge, away from traditional disciplinary knowledge. The focus here is more on the organisational level than on the individual level. As far as respondents mentioned new trends, these trends will not reduce the attention for competencies in organisations and education.

In our research we encounter different opinions regarding the definition of competencies, such as:

- Competence as individual characteristic;
- Competence as characteristic of organisations;
- Competence as a tool to structure communication between stakeholders (within organisations and between education and labour market).
These different definitions indicate that competence is an ill-defined term. However, the strength of the competency concept seems to be that it is such an ill-defined term, serving as a link between education and labour organisations, between internal and external organisational experts, between HRM-divisions and management.

The attractiveness of the concept is that it offers the right balance between the certainties that knowledge, skills, motivation and attitudes matter, and the uncertainty about the mixture of these elements, about the flexibility etc. The concept recognises the importance of the 'ecological validity' of individual characteristics, in the sense that they only become significant when they are used in the concrete professional context. Another element of the attractiveness of the concept is that it focuses on output and at the same time offers hints on the way to organise the learning process to reach this output.

Most often respondents explained the growing importance of competencies from uncertainty: the fact that contents and positioning of tasks in labour organisations change fast and consecutively problems arise in defining clearly the attributes in terms of knowledge, attitudes and motivation needed to fulfill these tasks. The actual importance of the competence concept is due to developments on the labour market bringing along a certain degree of uncertainty concerning the precise definition of professional requirements. At the same time the success of the concept is due to that fact that in the educational sector there is much attention for didactical models ensuring a good preparation of students for the requirements needed on the labour market. The concept of competence is functioning as a vague but useful term, bridging the gap between education and professional requirements.

Paradoxically from the interviews we can conclude that in practice enterprises meet large problems implementing competency-based management. Qualitatively and qualitatively poor dissemination of competency-based policies is mentioned. Partly this is due to the lack of good shaped and good focussed instruments, partly costs are responsible for this situation. In educational settings the same problems can be mentioned. In fact a paradoxical situation can be seen here. Although competency management is used to enhance the optimal functioning of employees, in practice it seems to be very hard to find the right level of accurateness in the description of competencies; either lists with very broadly defined competencies or very detailed descriptions are used.

The research presented here contributes to the understanding of the richness of the concept of competence. At the same time however, this study shows the need for clear definition. A comprehensive definition may be one step too far, and therefore it may be necessary to pay attention to the exact definition of competence, that fits with the specific purpose for the use of this concept in a particular setting. As this study showed, the application of the concept of competence on a large scale cannot be seen in practice. For the following years it is therefore recommended to study carefully the advantages and disadvantages of the concept of competence in various contexts. Especially the contribution of this concept to dealing with uncertainties should be a topic in research.

Savings-and Credit Interventions: Are They Empowering the Poor?

Ranjini Swamy
Ramesh C. M.
Goa Institute of Management

Savings-and-credit interventions are aimed at providing poor people (especially women) with access to credit. Poor women form groups to save money and avail credit; some participate in the administration of these groups. Could participation in such interventions empower the women? Could empowerment differ for women with and without administrative responsibility? Women members of a savings-and-credit intervention were interviewed. Findings indicate differences in the level of empowerment among respondents with and without administrative responsibility.

Keywords: Empowerment, Women, Developing Countries

Savings and credit interventions are aimed at providing poor people with access to credit. The poor in many countries are not considered creditworthy. Traditional banks do not give them loans. Therefore, many non-governmental organizations (NGOs) are helping them obtain credit for themselves. These NGOs act as intermediaries between funding agencies and the poor. They help the poor (in many cases, poor women) to organize themselves into small groups, pool their savings, access commercial finance and lend these funds to members at interest rates that are lower than those prevailing elsewhere (Robinson, 2001). These loans are used to start tiny businesses, to fund working capital for these businesses, and for personal consumption (esp. during times of crises or for special events such as weddings).

In these interventions, the poor are encouraged to participate in managing the activities of these savings-and-credit groups. In the process, they get an opportunity to do things they have never done before. This is especially true for women. Historically, many poor women in Asia, for instance, have little freedom to talk to strangers and to move out of their village alone. In Bangladesh, the purdah and other cultural constraints hamper women's mobility (Zaman, 1997). Women have limited access to resources and outlets outside their homes (Vijayan & Sandhya, 2001). They have less control in determining whether to work or not, and in choosing their work environment. They have little discretion in family decisions such as what to spend on, how much to spend and so on (Viswanathan, 2001). In other words, they are not empowered.

Participating in the groups' activities has the potential to empower women (MacIsaac, 1997). First, this enables them to become an important source of income to the family. Second, the experience of administering the groups - of persuading members to pay their installments regularly, ensuring that all members have access to credit, of recovering loans - can provide them with opportunities to develop knowledge and skills needed to deal with the external world. Together, these can create a new confidence in women, which can in turn help them acquire the freedom to choose how to live and exercise reasonable control over the decisions that directly or indirectly influence their lives.

This could help society in many ways. Women could learn to address many social evils such as dowry and exploitative labor practices; they could demand accountability of institutions set up to serve the poor. In addition, the empowered women could provide new role models for the girl child and open up avenues for them that did not exist in their minds before. Newer and more secure occupations may be explored in the future, thereby creating a more stable source of income for women. This in turn could ensure the sustainability of the credit institutions in the long term.

The Problem

Some of the NGOs who help the poor access credit, obtain their funds from international organizations such as the UN. These funding agencies have tended to evaluate the effectiveness of the NGO's interventions using financial measures such the quantum of the savings; the earnings from these savings; the extent to which loans given are repaid; whether the beneficiaries have paid the costs involved in administering the activities of the group and so on (Report of the Secretary General, n.d./2002). Besides this, some surveys explored the dynamics within the savings-
and-credit groups: whether they met regularly, the attendance at these meetings, whether their accounts were regularly audited, and so on (Guidelines for the evaluation of self-help groups, n.d./2002).

However, effectiveness needs also to be examined in terms of the outcomes for the beneficiaries. Some studies (Fernandez, 1995) explored whether members of these groups had begun to voice gender concerns. Greater voice within and outside their families could be seen as an indicator of increased empowerment. Given the condition of women, especially in rural households, the empowerment of women could be considered a desirable outcome. Of the 1.3 billion poor, women constitute 70% and their representation is only increasing. Women perform a great proportion of the world’s work; yet, they do not receive proportionate benefits (Supporting women’s livelihoods, n.d./2002).

**Women’s Empowerment Through Savings-and-Credit Interventions**

Schuler and Hashemi (1996) define women’s empowerment in terms of their sense of self, mobility, economic security, status and decision-making power in the households, the ability to interact effectively in the public sphere and participate in non-family groups.

Research suggests that the impact of participation on empowerment is not uniform. Amin et al (1994) showed that membership in a credit institution positively affected women’s role in decision-making and their control over resources. Respondents also said they felt more secure in their marriages because their husbands were less likely to desert them now. Naved (1994) found that women who participated in credit interventions reported improved status within their households. They were more active in making household decisions and exercised more control over household income derived from their earnings. They also expressed confidence in dealing with social problems jointly.

However, others did not find such an impact on women’s empowerment. For example, Goetz et al (1996) studied 253 female borrowers who were members of one of four rural credit institutions in Bangladesh. Borrowers were classified into five categories, depending on the extent of control they had over loan utilization. They found that about 63% of the respondents had partial, very limited or no involvement in these matters.

The differences could at least partially be explained by the nature of the sample observed. It is possible that empowerment is more among women beneficiaries who have taken up administrative responsibility in their groups. Those who do not take up this responsibility may not feel empowered. This is what we sought to explore in our study.

This study relies on in-depth interviews of seven women who have participated in the savings-and-credit groups initiated by an NGO called PRADAN in the Madurai district of Tamil Nadu, India.

**Background of PRADAN’s Savings-and-Credit Intervention**

PRADAN aims at helping the poor obtain sustainable livelihoods through income generating projects. The experience of initiating these projects brought home to them the importance of credit for the poor. Since banks were unwilling to extend credit to the poor, PRADAN decided to do it themselves in the year 1990.

The larger purpose was to demonstrate that the poor were creditworthy. They identified poor families in a village. Then they convinced the women of these families to form groups and save money regularly. They explained how this money could be circulated as loans to meet contingent expenses. Gradually, women across several villages agreed to form such groups. Each group was to decide how much to save every month and ensure that the savings are made regularly. The money so saved was then loaned to one or a few members depending upon the need.

The women struggled to enforce discipline among members in saving and paying the monthly interest due on loans regularly. They sought ideas from groups in other villages to grapple with the management of the group and its resources. Meanwhile, the demand for credit increased. The money generated from savings of one group was often inadequate to meet the requirements of all its members. So groups from 7-8 neighboring villages came together to form a Cluster. The cluster members created a cluster-committee, comprising representatives of all the groups in those villages. The committee had a president, a secretary and a treasurer, who were all elected from among the groups.

The committee obtained loans from the bank against the cumulative savings of the members of the cluster. They opened accounts in the bank and learned how to audit their accounts. The loans were disbursed to the savings-and-
credit groups depending on their needs. When groups found it difficult to recover a loan, they referred the matter to the cluster committee. New savings schemes were communicated to the groups and administered by the committee. Also, new groups were formed in the villages and were given advice about how to sustain themselves.

Later, the clusters were in turn grouped under a Federation. The federation comprised of women who represented the various clusters. It helped develop new savings and credit schemes, in consultation with PRADAN staff. It helped clusters access larger loans from banks as well as other sources and helped coordinate among the clusters.

It's been a decade since the groups have been initiated. PRADAN reports suggest that the groups have been able to mobilize a considerable savings. The groups have been able to raise money from banks and have been successful in recovering more than 90% of the loans and interest due to them. Financially, therefore, the intervention has been a success. It has demonstrated the creditworthiness of the poor.

Research Questions

However, these results do not capture the nature and extent of transformations occurring in the lives of the women, following this intervention. Would they be more empowered? For instance, would there be changes in the roles they play at home? Would their husbands' role change? Would they be more independent in their decision-making? Do they have an independent identity now? Do women take on a more proactive role in community affairs after the intervention? Are they for example, collectively or individually addressing social traditions like the caste system, 'untouchability' and poor status of the girl child? Would there be differences in the experiences of women who actively took part in administering the groups and those who did not? These were the research questions I went with.

Method

Given the nature of our interest, we decided to interview women who are members of the savings-and-credit groups, to understand how they lived before the intervention, why they joined the savings-and-credit groups, whether the intervention has changed their lives and in what way. We felt semi-structured interviews would give us an understanding of the changes in their lives and what the unforeseen cost and benefits have been since the intervention. We were not even sure that changes had occurred. So we decided to do an exploratory study.

One of us conducted the interviews over three trips between 1995 and 1997. On the first trip, it was difficult for the women to find time for interviews. Most of them worked on the fields as agricultural labor during the agricultural season. When there was no work on the field, they went to the forests and picked up fuel that was later sold. If at all they had time, it was in the late afternoon.

Accordingly, some women were interviewed in the afternoons, either at their homes or in the fields or in the PRADAN office. During a visit to the village, a group of women would discuss general issues about their lives. Some among them who seemed interested in sharing their experiences were interviewed at length. PRADAN had provided us with a list of people who could be interviewed. They largely included women with administrative positions in the groups. The final sample, however, included women who were not on the list and who did not have any administrative responsibility.

Interviews were conducted in the local language through an interpreter. The interviews were recorded on audiotapes and later translated and transcribed. Many women had not talked about their life to anyone and consequently there was a lot of to-ing and fro-ing between the present and past, which was confusing. Therefore, every interview was conducted over a few days. Clarifications were sought over the period.

Many repetitions occurred. This was taken as an indicator of the reliability of the data. Some incidents were common to two members who belonged to the same cluster. These became opportunities to validate the facts pertaining to the incident. Some clarifications were sought and obtained from some project officers of PRADAN who had worked with the women I was interviewing. In this way, I tried to establish the authenticity of data.

The weakness of this method is the reliance placed on the memory of the respondents. Second, the sample is small and hence poses constraints in generalizing the findings to the population. Third, there could be transmission losses in the data since we did not understand the language and had to rely on an interpreter.

Sample Profile

13-3
The women interviewed had been members of the savings-and-credit groups for at least three years. Six of the seven respondents belonged to the lower castes. One belonged to the higher caste and was a member of the local governing body of her village, called the panchayat. Three were illiterate, while two had studied up to middle school. One had completed a diploma in pharmacy.

Four of the respondents held administrative positions at varying levels of responsibility at the time of interview. Three of these four respondents were illiterate while one had studied until senior school. They were older and had grown up children, either married or of marriageable age.

Findings of the Study

1. Dependence on the husband. Do women have a say in decision-making within their families or do they depend on their husbands to make decisions for them? The dependence of respondents varied depending on the nature of decisions.

Five women described the process of making the decision to join the savings-and-credit groups. Four of them required the permission of their husbands to join the savings-and-credit groups. One of them, who happened to be the leader of the Federation, said she had made this decision independently.

The decision to stay on in administrative positions was made after joining the groups. The four respondents made the decision to continue in these positions, despite opposition from their husbands. When one respondent’s husband objected, she reminded him of the timely loans they had received from the group. She convinced him that her involvement in the administration was necessary for the group’s survival. She even got the staff of the NGO to persuade him to let her continue. Two respondents dealt with the objections by quietly taking on additional work at home and not reacting to the abuses of their husbands. The fourth respondent however, when faced with opposition from her husband, requested other members to take over her responsibilities. When none came forward, she compromised by sharing certain responsibilities with other members of her group. For instance, other members of her savings-and-credit group attended meetings held outside her village.

Among other personal decisions, three respondents discussed the decision on family size and sterilization. One respondent, who had administrative responsibility in the group, said she made the decision to undergo sterilization and informed other members of her family before implementing it. The other two respondents, who did not have administrative responsibility in their groups, made this decision differently. One said she was forced to undergo sterilization. She had desired a fourth child - a girl - but given her poverty and poor health, her brother was against this. So, after obtaining the consent of her husband, he forced her to undergo sterilization. The other said the decision to undergo sterilization was made jointly with her parents, her husband and her in-laws.

On decisions about what to purchase for the family, the respondents with administrative responsibility claimed greater freedom. They said that their husbands did not interfere with their decisions. Two of them claimed that they even advised their brothers and sisters about what to purchase. Two of the three members without administrative responsibility said their husbands played an important role in purchases. One said that was because she was a spendthrift while her husband was careful with money. The other said she had no exposure to going outside home and shopping. Her husband did all the purchases.

Economic dependence on the husband, however, continued, in view of the size of repayments to the savings-and-credit group and the requirement of saving a fixed amount every month. In case of respondents with administrative responsibility, the dependence was mutual. One of them even claimed that she now gave money to her husband for his daily requirements. This was because he was sick and could not work as before. Two out of the three respondents without administrative responsibility seemed to be very dependent on their husbands for economic support. This may be because the two were in poor health and could not earn wages. The third respondent, who was educated, had her own sources of income. In her case, the dependence was mutual.

There were other reasons for economic dependence. One respondent explained that though she also worked on the fields, her earnings were not sufficient to meet obligations. First, she worked in larger groups so that she could finish work fast and then attend to household chores. The wages earned by her group had to be shared among more members. So each earned less. Second, as a woman, she could do only certain jobs on the field, for which the payment was less.

2. New Identities, a New Sense of Self: All four respondents with administrative responsibility reported identifying with the interests of the groups and were willing to set aside personal matters to address the problems of
group members. They said that helping the poor women of the villages gave them satisfaction. They expressed happiness that other women in the groups trusted them and felt obliged to live up to the trust reposed in them. One of them said she put the group's interest before that of her family because the women had faith in her. She said she saw herself now as a social worker.

At least three of the four respondents with administrative responsibility reported increased confidence in talking to strangers, going to new venues and presenting their opinions to people from banks and other institutions/government agencies. They learnt to visit far-away villages, sell the idea of forming savings-and-credit groups to women from those villages. They learnt to speak in public. Two of them said they had learned to confront people employed by the savings-and-credit groups, who were embezzling funds.

Two respondents who did not have administrative responsibility also learnt to visit other places and mingle with others. Both of them said they learnt these when they had briefly held administrative positions in their groups.

The women who had administrative responsibilities said they had to make time for visiting other groups, attending meetings, following up on loans and savings and so on, in addition to performing household tasks. Often meetings took them out of their village and they returned late. In such situations, the men did not make alternate arrangements. They just waited for the women to return and then cook food. Often food was served late on such occasions. One respondent said she was beaten for reaching home late and keeping her husband waiting. Two others said they were often abused for coming late.

Respondents without administrative responsibility said that responsibilities in the family prevented them from taking up responsibilities outside. Looking after the young children, cooking for the family, looking after the in-laws, fetching water and so on were still the women’s primary responsibility. Any activity that took them away from these was therefore avoided. One respondent said she often did not attend meetings because the children needed looking after. Since her children were young, group members did not insist on her attendance. Even if she does take up administrative responsibilities in the future, she would not be able to visit distant villages because of household responsibilities. Another said that she would never spend the night at any place outside her home or her mother's home. She has avoided administrative responsibility for this reason. The third respondent said that her children's health and education were more important than participation in the group's activities and her self-development. She wanted to learn tailoring but family took precedence over this.

One respondent described in considerable detail, the expectations from a girl or woman in her society. “Even if a girl is from a royal family, on entering her in-law’s house, she has to adapt to their situation”. Once she entered her in-law’s house, she had to do the household work. “If I do not do these things (household work in the in-law's family) I felt others would curse me, say I am arrogant,” she said. Her decision to start working immediately after marriage was to ensure that the family did not have to borrow money from others. Her views about her daughters’ future remain traditional. “They will become part of another family. So they have to learn to involve themselves in household work.” Therefore, even when they were 7 years old, she got them to light the fire for cooking, sweep the house and so on.

3. Addressing Societal Problems: Did participation in the savings-and-credit groups encourage women to address other social problems - like inter-caste relations, dowry, discrimination against the girl child, and so on - in their villages? In the villages of India, people are divided into several castes, some of whom are considered high castes and others as low castes or untouchables. Relations between castes are often sensitive, particularly between the “untouchable” people and the higher castes. How did participation in the savings-and-credit groups influence the relations between castes?

A respondent, who heads the Federation, gave us one example of how activities initiated by the savings-and-credit groups could affect inter-caste relations. For the first time, members of these groups took up the cultivation of fish in the village fish-tank. Traditionally, the village body contracted out this tank to a party - usually higher caste landlords - for a specified period. In return for a commission to the village body, the contractor could cultivate fish and later sell them for a profit.

However, the fish-tank was later taken over by the government. At the instance of Pradan functionaries, the members of three savings-and-credit groups (many of them were lower-caste women) collectively bid for the fish tank. The government officer in charge of contracting out the tank, decided to give the contract to the women. The upper caste men reacted adversely to the decision, and applied pressure on the local bodies to undo the decision. However, the women succeeded in retaining the contract. Despite ridicule and skepticism from the local populace and
threats from the higher castes, they succeeded in running it profitably. They even bid for and obtained fish-tanks in other villages after this experience.

But this was not without its costs. The respondent, who was leading the women in the bid for the fish-tank, lost her daughter. The upper castes accused her of having murdered her child and reported the same to the police. She felt this was done to avenge the loss of the contract and for daring to defy the social hierarchy. She was able to get the case dismissed. However, getting work on the fields of the upper-caste landlords was not easy for a long time. She had to seek work outside her village.

Another respondent cited an instance where women are beginning to cooperate across caste lines in the groups. In a cluster committee meeting, the women of a savings-and-credit group approached the cluster for help in redeeming a loan. It was suggested that members of another group (of lower caste women) should help them. Some members raised objections to lower-caste members helping higher caste members in redeeming loans. The respondent then gave them an instance where this had happened and the loan had been redeemed.

What Has Been the Outcome for Inter-caste Relations Outside These Groups? One respondent observed that members of higher castes now traveled together with the "untouchable" castes, even paid for each other's tickets; they invited each other to their houses on festive occasions, exchanged paddy / rice with them. However, there was no attempt to marry into each other's caste or eat in each other's houses. Another respondent, said that the lower castes still had no say in the village-level decision-making body. They were not allowed to stand for elections except in reserved constituencies. There was still fear of the higher castes. She had wanted to construct a road through the village but the elders dissuaded her from doing so, fearing a backlash from the higher castes.

There are other social problems like excessive drinking, gambling, dowry, child marriage and discriminatory treatment towards the girl child. Five of the seven respondents expressed a strong desire to educate their children, even the girl children. It was only when the children themselves showed a disinclination towards studies that their studies were discontinued. There is no data on their views about the other problems.

4. Participation in community affairs: Three respondents, who handled administrative responsibilities in the group, said that they had been able to get a hand-pumps for water and streetlights for their village. Two of them also initiated smaller groups (locally called "chit funds") where money or grain was saved and loaned to members.

Among respondents with no administrative responsibility, one of them had initiated a chit fund and was still running it. Confidence in initiating and running it came because of participating in the savings-and-credit groups. She adopted many of the rules of the savings-and-credit groups in the chit-fund she initiated. Another was heading the local government institution called panchayat. She said she had made it possible for a TV room to be constructed in her village. She had also helped bring in a new water pipeline to the village. Her parents and in-laws were politically active people. Her entry into politics and subsequent work for the benefit of the community did not seem to have been the result of joining the savings-and-credit groups.

Conclusions

These findings are based on a small sample of respondents from one district in a state. The conclusions we draw will therefore have to be tentative.

Women with administrative experience display more independence in making the decision to continue in administrative positions in their groups. They also report greater freedom in purchasing for the family. (It is difficult to say that this was a result of participation in the groups.) They still depend on their husbands economically, though this dependence is mutual rather than one-sided. They are developing confidence and forming new identities. This is evident in greater articulation in public forums, greater ease in interacting with people of other institutions and following up with them for facilities like hand-pumps and streetlights, greater mobility outside their villages. They express strong identification with the group and derive satisfaction from being looked up to for advice. They enjoy being trusted by other women. They want to help other women increase their wealth and purchase new things. However, traditional identities of being primarily responsible for looking after the family continue to coexist with the new identities.

Respondents without administrative responsibilities (and who were financially dependent on their husbands) participate in some family decisions. However, they do not make any decision independently. They are not exploring new identities as actively. They are not initiating activities that question societal norms or address societal problems.
They are not involved in obtaining facilities like roads and streetlights to their community. They have not acquired many of the skills that respondents with administrative responsibility have.

It is difficult to say whether participation in the administration of groups caused more empowerment. Some of these respondents were selected to be leaders of their groups because they were seen (by other members) as more talkative and assertive. But, respondents with administrative responsibility attribute much of their confidence and abilities to their experience in the savings-and-credit groups.

**Implications for HRD**

*For Research:* Accounting for differences among the women. Since the sample is so small, it is difficult to generalize the findings and conclusions. However, the study throws up some new questions that need systematic study.

1. Are there significant differences in the empowerment across beneficiaries of savings-and-credit groups? Are women with administrative responsibility in these groups more empowered than those without such responsibility? Our study suggests that differences in empowerment between those with and without administrative responsibility could exist. Larger samples are needed to establish the significance of these differences.

   If there are differences in empowerment, what causes them? Do women who take up administrative responsibility have different backgrounds or personality profiles that account for these differences? Or is it their experience of administrative responsibility that enables empowerment? Our study indicates the possibility of self-selection for administrative positions. However, once administrative responsibilities are assumed, their exposure to a variety of experiences does appear to empower them further.

2. Traditional roles of men and women in their families seem to continue despite this intervention. Consequently, women with administrative responsibilities in the groups are often working more and tiring more. The existing gender imbalance in terms of the work done and returns received would continue unless the roles are renegotiated.

What is required is a change in the mindset of women and men. How can this be achieved, especially among the lower castes, who have faced centuries of discrimination?

The Concept of Culture in International and Comparative HRD Research: Methodological Problems and Possible Solutions

Alexander Ardichvili
K. Peter Kuchinke
University of Illinois at Urbana-Champaign

The goal of the present paper is to illuminate some of the central issues in international and comparative HRD research, by helping HRD researchers to better understand the current approaches to culture, and by discussing the methodological problems arising from the current use of the concept of culture. Several alternative approaches to culture in international research are analyzed and criticized.

Keywords: International HRD, Cross-cultural Research, Culture

While many scholars in human resource development (HRD) and related fields have pointed to the dearth of international and cross-cultural research (e.g., Hansen & Brooks, 1994; Brewster, Tregaskis, Hegewich, & Mayne, 1996), in recent years, international and comparative research has become one of the fastest growing areas of scholarly inquiry in HRD. Within the Academy of HRD, international membership and the number of international papers presented at the Academy of HRD meetings have increased steadily; and numerous cross-cultural and international articles have appeared in all major HRD publications. The reasons for this increased interest in international research were summarized by McLean (2002), and Marquardt and Sofo (1999), who argue that globalization of business practices is inevitably leading to conditions under which most HRD practitioners, regardless of their specialization, need to understand and be able to influence cross-cultural and cross-border HR, training, and organization development practices. As Cray and Mallory (1998) point out, all international and comparative studies, regardless of specific topics of investigation, sooner or later refer to culture. While multiple approaches to cross-cultural research design have been identified (Usunier, 1998; Vijver & Leung, 1997), the treatment of culture in international HRD research is a matter of much deeper import than the selection of an appropriate research design and centers on our ontological and epistemological assumptions about the nature of culture and its role in shaping the phenomena of interest and our ability to understand cultures (our own or another) in a complete sense. Therefore, the goal of the present paper is to illuminate some of the critical issues and problems in international and comparative HRD research, by helping HRD researchers to better understand the current approaches to culture, and discussing the methodological problems arising from the current use.

Alternative Approaches to Studying Culture

A useful classification of social science research methodologies was proposed by Denzin and Lincoln (1998), who places all studies on a continuum, with constructivist and critical science studies on the one side, and positivist and postpositivist studies—on the other. The studies of the constructivist paradigm assume that there is no single reality out there that can be discovered by the researcher, and the reality is, rather, constructed by humans in their interactions. The postpositivist research, on the other hand, is based on an assumption that reality is—at least to some degree—stable and that, thus, the effort to uncover rules, theories, and models is a worthy goal of research. Thus, in the area of international social science research we identify the following major theoretical approaches, which provide alternative treatments of culture: postpositivist studies grounded in cross-cultural psychology; and three constructivist approaches: interpretive and ethnographic studies; studies in the cultural-historical tradition; and semiotic studies. In the pages that follow, we will provide a brief overview of these four strands of research, point out why we feel that all four fail to provide a satisfactory treatment of culture in the context of international and comparative research, and will propose strategies for improving our ability to account for the culture’s role in international HRD research.

Models of Cross-Cultural Psychology

One treatment of culture has been pursued vigorously by cross-cultural psychologists over past two decades.
and has resulted in substantive and methodological advances related to shared cognition, assumptions, and values as fundamental building blocks of culture. A major tenet of cross-cultural psychology is the existence of psychological universals, frameworks for making sense of the tremendous variety and complexity of individual behavior and thought across the cultures of the world. The field is thus grounded in a realist conception of science as the search for patterns, regularities, and parsimonious explanatory systems that are pan-cultural without violating local and culture specific interpretation and meaning (Lonner, 2000). The cross-cultural research program has led to advances in theory by indexing countries along dimension of culture and mapping culturally similar regions, calculating value-related scores, and investigating the effects of national culture on a range of variables. Smith and Schwartz (1997) believe that values are "key elements, perhaps the most central, in [a society's] culture...[V]alue priorities of individuals represent central goals that relate to all aspects of behavior" (p. 79). Values represent beliefs and refer to desirable goals, they transcend specific action and situations and serve as standards for and of behavior, people, and events (Schwartz & Bilsky, 1987). Values can be described at the personal and at the group level. Societal values represent ideas about what is good, right, and desirable, and find expression in individual behavior of a country's residents and also in that country's institutions as reflected in institutional goals and modes of operation. The vast majority of cross-cultural research has been conducted at the national level of analysis, although the degree of within-country variation has led writers such as Triandis (1995) to question this approach, especially in nations with sharp divisions among cultural groups. However, nationality has been shown to account for substantial amounts of variance in a variety of variables (e.g., Kuchinke & Ardichvili, 2002; Sak & Brannen, 2000), lending support for Hofstede's (1997) assertion that nations exert strong forces towards integration though a dominant language, institutions, political systems, and shared products, services, and national symbols. Thus, much cross-cultural research is based on the average value priority among national samples that is thought to represent the central thrust of a common acculturation (Smith & Schwartz, 1997), irrespective of individual differences. Since the 1980s, there have been four major programs of research on national values, and these will be summarized below.

**Hofstede's Values Survey.** Hofstede's (1980) classification of work-related cultural values is based on large-scale employee survey data collected at IBM and subsidiaries in 40 countries around the world. The study data bank of over 116,000 questionnaires reflected responses from seven occupational groups, including clerical, technical, professional, and managerial engaged in marketing and servicing. Hofstede used factor-analytic techniques and conceptual item analysis of country-level item scores and arrived at four underlying dimensions: Power Distance, the degree to which unequal distribution of power in institutions is accepted as legitimate by those less powerful; Individualism, the degree to which persons are expected to care primarily for themselves and their immediate families as opposed to caring for the wider in-group; Masculinity, the degree to which achievement, heroism, assertiveness, and material success are valued instead of relationships, modesty, caring, and interpersonal harmony; and Uncertainty Avoidance, defined as the degree to which persons are uncomfortable with uncertainty and ambiguity, thus valuing stability and conformity. Bond (Chinese Culture Connection, 1987) extended Hofstede's research by constructing a survey of values based on interviews with Chinese scholars and collected information from students in 23 countries, resulting in an additional factor Confucian Work Dynamism, subsequently adopted as a fifth dimension of Hofstede's (1997) framework as Long-term Orientation, expressing the orientation towards the future characterized by persistence, thrift, and observation of status versus personal steadiness and stability, protection of one's face, and respect for tradition.

**Trompenaars' Values Survey.** Trompenaars' approach to culture is based on sociological models (c.f., Parsons & Shils, 1951), of basic elements of social relationships as a way of tapping into employees' values in business organizations. Initial work with ten organizations in nine countries and some 650 participants in the mid-1980s has been expanded to over 15,000 participants from 50 nations (Trompenaars, 1994) most of whom were upper-level managers and professional employees participating in cross-cultural training programs. Trompenaars posits seven bipolar dimensions: Parsons' five relational orientations: universalistic versus particularistic rules for relationships ("what is right and good can be defined and always applies" versus "giving attention to the obligations of relationships and unique circumstances"); individualistic versus collectivistic views of the responsibility of individuals (whose primary obligation is either to the self or to the social group); neutral versus emotional ways of expressing feelings (either detached and objective or with full force of the underlying emotion); specific versus diffuse modes of involvement in social transactions (persons engaged in their specific roles as, for example, educators or bringing into play all facets of one's personality); and achievement versus ascription as the basis for according status (as either based on performance and accomplishments or on educational record, family ties, gender, age, and other attributes). In addition, this framework includes a society's attitudes towards time (as a linear...
sequence of events versus a synchronous notion of past, present, and future as cyclical, repetitive, and commingled; and stances toward the environment (as subject to human control or requiring harmony and acquiescence).

The Schwartz Culture-level Approach. Schwartz and colleagues, in a series of influential articles, have addressed the structure of individual values in a comparative, cross-national perspective (e.g., Schwartz, 1994; Schwartz & Bilsky, 1990; Schwartz & Sagiv, 1995). Using Kluckhohn's and Rokeach's cross-cultural works on values as a point of departure, Schwartz developed and validated a theory of human values and their underlying motivational goals. Arguing that universal human values are those that represent the basic requirements of individuals (biological needs, requisites of coordinated social action, and demands of group functioning), he proposed 10 motivational types of values, including power, achievement, hedonism, benevolence, and tradition. Specific value systems arise from value types in particular social, historical, economic, and geographic circumstances. As Smith and Schwartz (1997) report, this framework and associated instruments have been applied in 54 countries and some 44,000 individuals, primarily schoolteachers, and is thought to present a comprehensive "near-universal" (p. 88) set of value types at the individual level. Conceptually independent from this work, Schwartz also proposed three culture-level value dimensions that reflect, at the societal level, solutions to basic social problems. Societal issues are those concerning the assumption of the relationship between the individual and the group, the responsibility of the individual to contribute to the common good, and the role of humankind in submitting to, adapting to, or exploiting the natural and social worlds (Schwartz, 1994). The first dimension is labeled conservatism versus autonomy, reflecting the views of a culture to see individuals as primarily autonomous or imbedded in a web of social relationships and obligations, both intellectually and affectively. The second dimension, hierarchy versus egalitarianism describes a culture's way of ordering social relationships by ascribing roles and legitimizing unequal distributions of power, wealth, and influence, or by portraying individuals as moral equals with equal rights and responsibilities. The third dimension, mastery versus harmony, addresses a culture's stance towards the social and natural environments. Mastery cultures seek to influence and change the natural and social worlds for personal and group interests while harmony cultures accept the natural and social worlds as they are and emphasizing fitting in harmoniously and adapting to them.

Individualism and Collectivism. Perhaps the largest number of empirical studies in cross-cultural psychology and related fields have been based on a single dimension of culture: individualism and collectivism, with Smith et al. (1996) asserting that it "is probably safe to infer that this dimension is the most important yield of cross-cultural psychology to date" (p. 237). Triandis (1995) stated that most salient differences in behavior in international comparisons might be reduced to this dimension. Though by no means a new concept—Kagitcibasi (1997) traces its roots in social thought to ancient Greece in the West and Confucius in the East—there has been widespread interest in this dimension in recent past 20 years. Although definition vary to some degree, features and component ideas of individualistic societies include the view of the individual as an end in him or herself, belief in the obligation to realize the Self, to cultivate one's own judgment, and to resist social pressures toward conformity (Kagitcibasi, 1997). In collectivist societies there is an emphasis on the views, needs, and goals of the group; on social norms and duty as defined by the group; on shared beliefs and traditions; and on a readiness to cooperate and surrender personal goals to group interests. Antecedents of individualism include affluence, cultural complexity, social mobility, urbanism, and technological and economic development. These factors are related to an orientation focused on the Self and the immediate family, emotional detachment from the collective, a view that personal goals have primacy over those of the larger group and that behavior is regulated by rationality and cost-benefit analyses. Consequences of individualism include socialization for self-reliance and independence, adpens when entering new groups, and loneliness. The many applications of this dimension—including its consequence for a wide range of individual-level variables, interpersonal and inter-group relations, and social institutions summarized by Triandis (1995) and Kagitcibasi, (1997)—lend credibility to assertion that it does present a valid, useful, and universal dimension of culture. Current debate concerns questions of whether individualism and collectivism might be more usefully conceived as separate attributes rather than as opposite poles of a continuum, whether each should be viewed as multidimensional, and what part of each might be conceived as trait or situation-based. Triandis (1995) has recently added to these conceptual refinements by arguing that in both individualistic and collectivistic societies, behavior and attitudes that go 'against the grain' are quite common. Triandis proposes four categories: vertical and horizontal individualism (self and group orientation respectively within a self-oriented culture) and vertical and horizontal collectivism (self-and group orientation respectively within a collectivistic culture).
Constructivist Approaches to Studying Culture

After outlining the postpositivist and largely etic approaches to assessing culture, we now turn to three emic frameworks of culture: the ethnographic and interpretive approach; the semiotic approach; and the cultural-historical approach.

The Ethnographic and Interpretive Perspective in International Research. A comprehensive discussion of the tenets of ethnographic and interpretive research would be impossible in this short paper. Therefore, we refer the reader to excellent in-depth analyses of this paradigm in Denzin and Lincoln (1998) and in Jessor, Colby, and Shweder (1999). Here we will point out several major traits of this approach, which are most relevant to our discussion. The origins of interpretive and ethnographic perspectives can be traced to Wundt’s (1911) studies of folk beliefs, and to early attempts by anthropologists to understand cultures from the natives’ point of view (Mead, 1948). Ethnographic and interpretive international researchers are more interested in specific cases than aggregate relationships, in more accurately grasping the point of view of the actor, in yielding more contextually situated understanding, and in providing a fuller, “thicker,” description of the phenomenon of interest (Becker, 1999). Methods associated with this research paradigm range from ethnographic immersion (Geertz, 1983) to interviews and observations (Goodenough, 1970), and analysis and interpretation of various texts generated by insiders (Van Maanen, 1990). A common characteristic of interpretive approaches is the belief that interpretive analysis can help to identify different definitions, concepts, and models of truth. For example, interpretive interactionism (Denzin, 1992) attempts to capture meaning and produce meaningful descriptions and interpretations of social processes from subjective points of view of different actors.

Semiotic Models of Culture. An approach to cross-cultural research that attempts to introduce a more encompassing perspective on culture is grounded in semiotics, the study of signs. There are good examples of the application of semiotics in sociology, organization studies, and management research (c.f., Barley, 1986; Manning & Cullum-Swan, 1998). An example of the application of semiotics in cross-cultural and comparative research can be found in the work of Russian linguist and semiotics scholar, Yuri Lotman. Lotman (1990) argued that semiotic systems (language, cultural rules, religion, art, science, and so forth) are models that explain the world in which we live and, in explaining the world, they construct it. Among all these systems, language is the primary modeling system, allowing us to apprehend the world (Eco, 1990). Therefore, the study of culture should start with the study of the language system used within this culture; however, we also need to study all the secondary systems, which allow us to understand the world from different angles, allow us to speak about it. The goal of the Lotmanian investigation of culture is not to explain all the phenomena of that culture, but an explanation of why that culture has produced certain phenomena. To do this, we can analyze culture as a code, as a semiotic system, discovering both universal to all cultures and specific to certain culture elements. Lotman argues that no historical period has a sole cultural code and that in any culture, there exist simultaneously various codes. He sees a culture as a set of texts, and a nonhereditary collective memory (Lotman, 1971). On this basis, Lotman has conducted numerous analyses of different cultures, moving both along the time (historical studies) and space (geographical and cross-national studies) continuum. An example of how to categorize cultures according to the systems of rules and codes used by them can be found in his “Universe of the Mind” (1990). Lotman argues that cultures can be governed by a system of rules or by a repertoire of texts imposing models of behavior. By analogy to language learning, Lotman calls the former category “grammatical” (in grammatical approach, learners are introduced to a new language by a set of rules), and “textual” (this is the approach to language learning used by small children, who learn through exposure to a variety of verbal strings of language, without knowing underlying rules). In a grammar-oriented culture, texts are judged to be correct or incorrect according to their conformity to previously generated combinatorial rules; in a text-oriented culture, society directly generates texts, which propose models to be followed.

Cultural Psychology and Cultural-historical Approach. Is it possible to conduct cross-cultural research that would account for both traits and psychological characteristics of individual players and the complex cultural environment they are situated in? An approach to answering this question could be found in cultural psychology and the cultural-historical research paradigms. Taking a radical stance, Shweder (1991) believes that this question by itself is not a legitimate one, and attempts to introduce culture into psychological investigations are misguided. He argues for adopting a different paradigm, which, instead of viewing human minds as isolated processing devices, operating with inputs received from the cultural environment, sees the mind as inseparable from “the historically variable and culturally diverse intentional worlds in which it plays a co-constructive part” (Shweder, 1991, p. 13).
The individual behavior is shaping the cultural environment, and is constantly being shaped by culture. Therefore, dichotomies of person and environment cannot be analytically separated and described in terms of dependent and independent variables. There are numerous research streams that join to form the cultural psychology paradigm. Thus, Bruner (1990) locates psychological processes within the social–symbolically mediated everyday encounters of people in the lived everyday experiences. Bruner argues that these experiences are organized by “folk psychology,” including a theory of how narrative structures organize people’s meaning–making processes in their everyday activities. In Germany, a group of researchers has developed an approach to cultural psychology that underscored a developmental approach to the study of human nature (Boesch, 1990). Using a form of action theory, they linked individual change to historical change by interrelating “the three main levels of the concept of development within the same theoretical language: the actual genesis (process), the ontology, and the historiogenesis” (Eckensberger, Kremer, & Kasper, 1984, p. 97).

Another approach to closing the gap between individuals as subjects of cross–cultural research and their environment was proposed by scholars working in the cultural–historical research tradition (e.g., Cole, 1996; Cole & Engestrom, 1993), which emerged from the work of Russian psychologist Lev Vygotsky and his followers. Central to this approach is rejection of the separation of individuals and their social environment. This idea is expressed by Vygotsky in the “general law of cultural development,” which assumes that any higher psychological function appears “...on two planes. First it appears on the social plane and then on the psychological plane. First it appears between people as an interspsychological category and then within the individual child as an intrapsychological category.” (Vygotsky, 1978, p. 57). Cole (1996) elaborated on the Vygotskian approach to cross–cultural investigations by putting emphasis on the following elements: mediated action in a context; importance of the “genetic method” understood broadly to include historical, ontogenetic, and microgenetic levels of analysis; grounding of the analysis in everyday life events; distributed and co–constructed nature of cognition; rejection of cause and effect, explanatory science in favor of science that emphasizes emergent nature of mind in activity and the central role for interpretation in research. Cole and Engestrom (1993) posit the activity system as the basic unit of analysis of individual and collective behavior. An activity system is any ongoing, object–directed, historically conditioned, and tool–mediated human interaction. It could be a family, a religious organization, a study group, a school, or a profession.

Critique of the Current Approaches to Culture

Despite significant contributions made by the above described research traditions, all of them suffer from a number of methodological problems, resulting in the following paradox: none of the approaches seems to be able to produce results that they claim to be their main advantages. Thus, postpositivist research is aimed at generation of universal, generalizable models and results, but there are numerous convincing arguments showing that this claim doesn’t stand in international studies. And constructivist researchers pride themselves on their ability to report more realistic pictures of informants’ lives, emotions, and feelings but, as numerous critics point out, they fail to do just this. Criticisms of postpositivist approaches exist on two levels: philosophical and methodological. At the philosophical level, critics point out the fundamental impossibility of capturing and describing the objective cultural reality, because, in their opinion, such reality does not exist outside the researcher’s and the study participants’ fluid and constantly changing perceptions and interpretations (Eco, 1992). The main methodological criticism is that “inferences drawn from aggregate data may not apply to all—or even any—of the individuals making up the aggregate” (Jessor, 1999, p. 12). In addition, international studies grounded in these approaches have been plagued by numerous methodological problems, among them inability to establish functional and conceptual equivalence of phenomena and behavior, and translation, sampling, measurement, and data collection errors (Harpaz, 1996). Of these concerns, the lack of conceptual equivalence (do the concepts used have the same meaning across the social units studied?) is among the most often discussed in the literature. For example, Usunier (1998) has demonstrated that the concept of “trust” has different meanings in the U.S., France, Germany, and Japan, making any comparative studies based on the U.S. concepts of trust difficult to uphold. The lack of functional equivalence is another common problem of cross–cultural psychology research: in many cases, even when concepts have the same meaning across cultures, these concepts perform different functions. Thus, even though the basic meaning of friendship may be similar in the U.S. and China, the functional role of friendship in the two cultures is different (Pye, 1986).

Constructivist approaches are most often criticized for the lack of generalizable conclusions. But, most studies of this group rest on an assumption of impossibility of any generalizations and concentrate instead on the generation of localized, context–specific knowledge (Lincoln & Guba, 1986). Thus, poststructuralists (Foucault, 1980) and postmodern theorists (Lyotard, 1984) write local narratives about people’s work and interaction, and reject the notion of generalizability of their results. However, what is supposed to be constructivism’s advantage over
postpositivist research—researchers' ability to present more accurate accounts of participants' inner worlds and social interactions between them—is being increasingly questioned by constructivist researchers themselves. It is pointed out that most of researchers are just poorly informed outsiders who lack the background to understand the intricacies of local cultures and symbolic systems. As Tobin and Davidson (1990) point out, "in most cross-cultural educational research, Westerners study non-Westerners, whites study nonwhites, scholars study practitioners, and men study women and children" (p. 271). Recent attempts to address this fundamental problem involved methods of "polyvocal discourse," a "Rashomonian telling and retelling of the same ... events from different perspectives, an ongoing dialogue between insiders and outsiders, between practitioners and researchers..." (Tobin, 1989, p. 176). But, as Marcus and Cushman (1982) suggest, "While it is laudable to include the native, his (sic) position is not thereby improved, for his words are still only instruments of the ethnographer's will..." (p. 44). The researchers control and distort the informant's voices by imposing their own interpretations, narrative styles, and choices of the elements of the native's text to include in the research report (Clifford, 1983).

New Directions for International and Comparative HRD Research

The above discussion suggests that both postpositivist and constructivist approaches in international research fail to reach their stated goals: researchers are unable to generate either true insider accounts or universally usable models. To solve this problem, we would need to find and employ approaches that would improve our ability to understand and present accurately perspectives of different actors (research participants and other stakeholders). The importance of understanding the stakeholders' point of view and experiences was stressed in early anthropology writings (Mead, 1934), and in linguistics (Clark, 1985). One of the approaches to improving this understanding is mutual perspective taking, which happens when researchers and their subjects approach each other with a sense of nonjudgmental openness (Tenkasi & Mohrman, 1999). Although perspective taking does not completely solve the paradox of the insider's account, it helps to alleviate the problem by providing tools for bringing into the investigation multiple voices (those of researchers, the subjects, and other stakeholders), and making different perspectives explicit. An important prerequisite for true mutual perspective taking is creation of interpretive spaces for mutual meaning making (Tenkasi & Mohrman, 1995), for opening of one's preconceptions and assumptions to oneself and to others (Habermas, 1979). These spaces are similar to what Bresler (2002) calls "interpretive zones" in the conduct of international research. In Bresler's conceptualization, such zones are areas of overlap, joint custody, or contestation, where solutions have to be devised with the materials at hand. The interpretive zones involve dynamic processes of interaction and negotiation of multiple perspectives. Another approach that attempts to promote mutual learning and understanding across cultural contexts is appreciative inquiry (Cooperrider & Bilimoria, 1993). Used as a methodology for studying global social change, appreciative inquiry establishes ground rules promoting an uncritical approach to the others' perspectives, and calls for understanding the others' points of view without criticizing their knowledge claims (Tenkasi & Mohrman, 1999). A key to using appreciative inquiry and/or perspective taking in cross-cultural settings is to involve different actors holding competing definitions of a problem, who can act as "semiotic brokers" (Lyotard, 1984). This view of inter-cultural communication is based on the work of Mikhail Bakhtin who first introduced the notion of multivoicedness. The construction of realities for Bakhtin is dialogic. It is through dialogue that space for new realities is created (Bakhtin, 1981). Therefore, in contrast with most hermeneutic studies (e.g., Gadamer, 1976), the Bakhtinian metaphor for cross-cultural research is not centered on attempts to understand others' perspectives, as if these perspectives where rigid, ones-and-for-all given, but a constant creation of new realities in a multivoiced dialogue involving the researcher and the subjects.

The above methods are aimed at enhancing the intersubjective understanding. However, before the distance between different participants in the research process can be reduced, researchers should be able to better understand their culturally conditioned interpretation biases. Usunier (1998) argues for cultural deconstruction as a way of addressing the issue of these biases and suggests that it should be used in both postpositivist and constructivist studies. Because most cross-cultural research situations involve encounters between researchers and instruments from one culture and informants from another, it is necessary to start any investigation with a pre research self-inquiry: "Cultural deconstruction ... involves a systematic investigation of the basis on which the research design will rest, including a self-assessment of the researcher's own part in terms of underlying concepts and theories, as well as attitudes towards the research practice" (Usunier, 1998, p. 137). Usunier (1998) argues that we, as researchers, are likely to produce a certain kind of research and research reports as a function of our perception of the tastes of our immediate scientific community and the dominant professional culture of the major stakeholders. Plus, our interpretations could be significantly biased by our own and the major stakeholders' national culture.
Conclusion: Dealing with Complexity

The argument presented in this paper suggests that our ability to conduct international HRD research that produces usable results depends not so much on our choice of methodologies, but on our ability to incorporate in our investigation culture as a major influencing factor, and to account for culture's influence on phenomena under investigation. And to do this, we need a better understanding of our own and others' culturally conditioned perspectives and assumptions. This understanding is achieved by cultural deconstruction, appreciative inquiry, using the insider/outsider perspectives, and mutual perspective taking. However, even if such better understanding is achieved, one overarching problem of the international research will remain: a researcher from one country is not likely to have necessary cultural background to understand, notice, and record the intricacies of day to day interactions between individuals from other cultures and locales, or to develop universally valid constructs to be used in quantitative models. A solution to this problem is found in the use of cross-cultural teams of researchers (Teagarden, et al. 1995), with individual team members conducting investigations in familiar to them and geographically proximal locales—although here, too, the cultural divide among the team will present challenges in inter-subjective understanding and much work is required to bridge the gap.

Global Change and New Organizational Paradigms: HRD Research Issues

Reid Bates
Louisiana State University

Kelli C. Phelan
Texas A&M University

The absence of discourse in HRD about organizational paradigms wrought by globalization represents both a critique of the field and an opportunity. Presenting the paradigm of ecologically sustainable organizations as a focus, this paper challenges HRD to recognize and respond to a number of important research questions related to human and organizational dimensions in the era of global change. Addressing these questions offers HRD a chance to broaden its research domain and enhance its contribution to worldwide social and economic development.

Keywords: Global Change, Sustainable Organizations, Ecological Values

That the world has entered an era of globalization has become accepted fact, or as Kobrin (1998) concludes, it is a fait accompli. What exactly globalization is, however, is less clear. The predominant tendency is to view globalization as an “epochal shift” (Burbach & Robinson, 1999) wrought by the integration of capital, technology, and information to create a single global market (Friedman, 2000; McLean, 2001; Rodrik, 1997). In this view, globalization is a qualitatively new economic development characterized by the transnationalization of production and capital ownership that powers its wake changes in other spheres of life. Others (Cooperrider & Dutton, 1999; Mayer, 2001) see globalization as a much broader, more complex and historical phenomena. From this perspective, globalization consists of a number of ongoing parallel processes including ecological change, the integration of ecosystems, human mobility, global trade and investment, culture change, the spread of human rights and democracy that are occurring simultaneously and in many cases reinforcing one another.

A number of fields of study in the social and behavioral sciences have recognized that the changes being wrought in the context of this broader view of globalization require a greater emphasis on research and theory examining the processes of global change, sustainable development, and global interdependence. Multidisciplinary efforts along these lines represent a broad area of inquiry directed at:

- Increasing our understanding of the dynamics of global change
- Strengthening efforts to study and anticipate social changes
- Identifying social strategies to mitigate the effects of global changes
- Analyzing organizational and strategic options that can contribute to sustainable economic and ecological development (Cooperrider & Bilimoria, 1993).

This final element noted above is important because it recognizes that organizations and global change issues are intimately intertwined. Analyzing this relationship and understanding how complex organizations interpret and respond constructively to global change offers substantial opportunities for scientific inquiry in organizations. These opportunities have given rise to a new field of inquiry labeled organizational dimensions of global change (Cooperrider & Dutton, 1999). Research and theorizing in this area are particularly important because of the increasing prominence of non-governmental and inter-governmental organizations in social, political and economic development, and the power of transnational corporations as engines of global change (Bilimoria, Cooperrider, Kaczmarski, Khalsa, Srivastva, & Upadhayaya, 1995; Khandawalla, 1988). Indeed, it has been argued that nothing on the global change agenda can be fully understood outside the role and functioning of organizations: “Any effort to understand . . . global change that does not include a sustained commitment to improving our knowledge of the organizational dimensions cannot succeed” (Cooperrider & Dutton, 1999, p. 4).

The purpose of this paper is to identify and discuss why the field of HRD should be concerned with organizational dimensions of global change, and moreover, discuss a number of ways in which the field of HRD can contribute to the needed research in this area. Our suggestions focus on issues related to the organizational paradigm, ecologically sustainable organizations, which has received little attention in the Western HRD literature.

Our hope is that this paper will initiate a dialogue about HRD's potential contribution to this important area, and also about the implications this focus has for broadening HRD's domain of inquiry, theory, and practice.

New Organizational Paradigms

A burgeoning number of organizational scholars have recognized that the global age will require more from business organizations in terms of their commitment and responsibility to environmental, social, and financially sound management and investment policies than has been the case in the past. This broader set of responsibilities will be expressed through new, more proactive organizational paradigms. These new paradigms have been discussed under rubrics such as strategic global change organizations (Cooperrider & Dutton, 1999; Khandawalla, 1988), natural-resource-based corporations (Hart, 1995), ecologically sustainable organizations (Shrivastava, 1994), ecocentric organizations (Purser, Park, & Montouri, 1995), and mediating institutions (Fort, 1996).

Two key assumptions underlie the development of these paradigms. One is that the hyper-capitalized globalized economic system (Rifkin, 2000) is an element of global change that in most cases does not deliver socially or ecologically responsible results. That it is in fact “breaking down patterns of life and community, imposing a dynamic of rapid change on many segments of most societies, and severely degrading the natural environment on which business, communities, and ultimately human life are dependent” (Mayer, 2001, pp. 218-219). In addition, it is assumed that business is mistaken in its belief that “enlightened self-interest will guide society to a sustainable future” (Purser et al., 1995 p. 1062). This is because when faced with a choice between socially responsible business activities or sound ecological practices and economic advantage, business will almost without question choose economic advantage. This “ecocentric orientation”, in which organizations devote their resources to the optimal utilization of social and natural resources in the pursuit of competitive advantage, leads to disjunctive thinking characterized by limited scope, imaginary oppositions (e.g., human versus nature), as well as difficulty in fully understanding how nested organizational activities are within social and ecological systems (Purser et al., 1995). A number of authors criticize the present global economic system as inefficient, unstable, wasteful, afflicted with short-termism, destructive of communities, cultures, and the natural environment, socially divisive, and ultimately one that does not represent the optimal system of allocation of resources needed to meet human needs (Hawken, 1994; Korten, 1996; Madeley, 1999; Soros, 1994). Dowling (1999) describes it as the “the increasingly complex international environment.” He adds that it is “characterized by global competitors, global customers, universal products, rapid technological change, and world-scale factories which pushes the multinational toward global integration while, at the same time, host governments and other stakeholders (customers, suppliers, and employees) push for local responsiveness” (p. 40-41).

Consequently, one key defining feature of the new organizational paradigms is their view that corporations have a responsibility and constructive role to play in creating positive global change (Harman & Hormann, 1990). The new organizational paradigms are concerned with emancipating ecological, social, and cultural systems from organizational mismanagement and abuse. They emphasize achieving a balance between productive systems and ecological and social systems and making organizations accountable for what they do and what they invest in. Some see the value of these paradigms as bridging the dichotomy between modern bureaucratic organizations and the demands of a postmodern global system of change (Cooperrider & Bilimoria, 1993; Daly & Cobb, 1994) and creating what can be called ecologically sustainable organizational performance. A number of fields of scientific inquiry including anthropology (Kearney, 1995), sociology (Boulding, 1988; de Oliveira & Tandon, 1994), organizational behavior (Khandawalla, 1988), leadership (Egri & Frost, 1994), strategic management (Cooperrider & Bilimoria, 1993), organizational learning (Mylonadis, 1993), organizational design (Ostlund & Larsson, 1991), and business ethics have begun to take keen interest in paradigms such as these. There is currently, however, no discussion, research, or theorizing about these new organizational paradigms in the field of HRD. If HRD is going to be a leader in the development of individuals and organizations in the 21st century, then it is immediately challenged with the responsibility of responding to these paradigms through the conceptualization of new roles through research, theory, and practice. With HRD’s primary concern with human growth and developmental activities, we believe it is uniquely positioned for meeting these challenges, facilitating leadership roles in organizations, and simultaneously increasing value to the profession.

HRD and Organizational Dimensions of Global Change

Considering the underpinnings of HRD, a logical flow of reasoning can be revealed as to why HRD should be concerned with organizational dimensions of global change. While HRD is a relatively young academic discipline, its foundations are grounded in systems theory, which presents a broad, open, and whole perspective on
environments and their physical and non-physical boundaries; hence, supporting the interconnectivity between organizations and global change. In addition, several scholars have articulated descriptions that attempt to define the academic and practical scope of the field of HRD, but of particular interest to this paper is a recent definition by a noted HRD scholar. It reads: "Human Resource Development is any process or activity that, either initially or over the long term, has the potential to develop adults' work-based knowledge, expertise, productivity, and satisfaction, whether for personal or group/team gain, or for the benefit of an organization, community, nation, or, ultimately, the whole of humanity" (McLean & McLean, 2001). The latter poses several alternatives for viewing/conceptualizing the role(s) of HRD and their possible contributions to a greater sense of development in the cultural, social, economical, and environmental realms.

HRD is by nature interdisciplinary and focuses on application of methods and processes designed to advance learning, meaning, and performance in work systems. This focus assumes that work systems are created to enhance the human condition and that they do not exist independently from the people that comprise them. Rather they are composed of people and processes, often multiple collectives with complex systems of social relationships, which have a shared set of symbols (e.g., language) and experience. The fact that work systems are composed of the human element makes them the appropriate focal point for HRD activity. It also means that by their very nature they can be greatly affected by the dynamics of global change. We therefore suggest one critical area of research for HRD to address is how the process of human resource development can help facilitate a transition towards these new organizational paradigms associated with global change. The concept of ecological sustainability through organizations is offered as a focal lens for HRD to view a new organizational paradigm. Two critical issues to be considered with this concept include the roles that ecological values and value transformation play in this transition.

HRD and Ecological Values

Several organizational scholars have discussed the kinds of changes that will have to occur as organizations transition to these new paradigms involving greater ecological responsibility and/or values. For example, Jennings and Zandbergen (1995) indicated that this type of change will require deep changes in the culture, strategic adaptability and learning systems of organizations. Hart (1995) suggests this transitioning will require a shared future vision that penetrates throughout the corporation. Post and Altman (1992) have offered a three stage model of "corporate greening" that suggests shifting to these new paradigms will require substantial changes in organizational strategy and its implementation which, to be successful, must be accompanied by the transformation of organizational culture and learning systems.

The previous views of shifting to an ecologically sustainable focus for organizations recognize that the deep integration of ecological values into the culture and learning systems of organizations is a necessary vanguard for the kind of change needed to realize these new organizational paradigms (Throop, Starik, & Rands, 1993). They are explicit about the need for a deep-seeded change in values within organizations as a precursor to paradigmatic changes in practice. These value changes should center on the development of value structures oriented around a profound individual and organizational understanding and acceptance of the principles of ecological sustainability as a social good. The transformation and creation of value structures within organizations and individuals is important because these structures provide standards for conduct (Williams, 1968) and behavioral guides capable of transcending specific situations (Schwartz, 1992). In short, they provide individuals and organizations with an ordered framework for resolving conflicts and making decisions consistent principles of ecological sustainability.

One critical area for HRD research and dialogue would involve an active consideration of the values and belief systems associated with ecological sustainability. This would involve, first, research directed at defining the structure and content of a value system centered on ecological sustainable organizational performance. There are a number of organizations that have begun to embrace these principles at varying degrees which would provide a key resource for more concretely defining these values. Research in these organizations could begin to define a factor or facet structure of these values.

HRD and Value Transformation

Next, it would be productive to develop some theoretical and practical understanding of the role that HRD plays in framing and developing ecological values in organizations. For example, HRD has been characterized as the social conscience of organizations (Gilley & Maycunich, 2000), a role that is concerned with diversity and equality in work systems, issues of social responsibility (Hatcher, 1998; 2000) and sustainable human development. Several pressing questions present themselves for HRD. First, discourse is needed to define the responsibilities of a 'social conscience' role and determine the extent to which this is an appropriate role for HRD. To the extent this role is
appropriate and can be defined, research will be needed on the models or theories that can most effectively enhance our understanding of this role and how it can be implemented in organizations. For example, as architects of organizational performance systems and facilitators of human learning and development, perhaps HRD can best facilitate change by embodying ecological values and expressing them in organizations through a legitimate ‘check and balance’ role (McAndrew, 2000). Or perhaps HRD’s role in the development and dissemination of ecological values can better be understood through the application of Burgoyne and Jackson’s (1997) ‘arena thesis’. In this view, HRD assumes the role of mediator where value and goal conflicts between organizations and the requirements of ecologically sustainable development are clarified, negotiated and resolved.

In the context of these roles, further work will have to be directed at understanding the problems that will be faced in developing and deeply embedding an ecological value system in organizations. For example, what kinds of powerful social processes (Senge, 1990) need to be set in motion to generate consensus about the meaning of ecological sustainability, its valuation as a social good, and core purpose of the organization? How can these values be legitimated, disseminated, and maintained? What kinds of empowerment practices (self-management, participative decision-making) are most effective at building intra-organization commitment to these issues? If values must be actualized in practice in order to be instrumental (Argyris, 1990), what are the links between these values and the skills needed by individuals to be effective in organizations oriented around ecologically sustainable principles? What attitudes, values, and competencies are needed by organizational leaders to deal with these issues at a strategic level? How are they best developed?

Furthermore, there has been an increasing scholarly interest over the last decade in issues such as spiritual development in leaders (Conger & Associates, 1994; Vaill, 1990) and managers (Block, 1993; Hawley, 1993). Unfortunately elements of spirituality and personal transformation are typically a secondary consideration in HRD, subordinate to learning and performance improvement goals. Consequently, although a handful of scholars have recognized the value of these processes as important dimensions of HRD (Hatcher, 2000; Hawley, 1993) little research has been done in this area. Key research questions could investigate the effect that personal transformation has on the transition of organizations to ecologically sustainable paradigms. For example, how does the personal transformation of leaders and managers affect organizational goals, employee behavior, personal and organizational value structures, culture, perceptions of accountability and social responsibility, and global consciousness? Considerable attention will have to be paid to theory development and evaluation in this area so as to provide some insight into key theories or models that might useful for understanding and managing this change process. Descriptive examples, case studies, and first-hand accounts of organizations that have been fundamentally changed through the personal transformation of its members could provide a wealth of information and help determine what is to be learned from these experiences.

At another level of analysis, organizations capable of matching values with goals and objectives are seen as having the capacity to be powerfully effective. This has led to speculation that the deep acceptance of values associated with ecological sustainability will lead to more innovative and progressive organizations (Jennings & Zandbergen, 1995) or to substantial increases in the development of new, low-impact technologies and competencies (Hart, 1995). What kinds of data can we generate to support or refute these hypotheses? Competing propositions regarding these and other questions centered on values and the shift to ecologically sustainable organizational paradigms can serve as a basis for future descriptive and prescriptive research in the field of HRD.

Summary & Conclusions

The era of globalization has entered the world. The perspective of globalization as a historical and complex phenomenon presents a broad set of new challenges for the organizational sciences. A number of disciplines have stepped up to accept this challenge. Unfortunately, HRD has been late to step up to the plate. This paper suggests a few areas of research and inquiry through which HRD could make a contribution to organizational dimensions of global change research. The focus was on the organizational paradigm ecologically sustainable. We argue that the challenges inherent in this important paradigm offer a tremendous opportunity for HRD to enhance its contribution to social and economic development.

The current absence of discussion, research, or theorizing about these organizational paradigms in the field of HRD represents both a critique of the field as well as a call to broaden its research and practice. This paper outlines several areas into which HRD should expand its research. First, HRD is encouraged to actively seek to understand the structure of values systems associated with ecological sustainable organizational performance, and to investigate how to promulgate these systems in organizations. An example of this would include, What responsibilities are associated with a social conscience role, and is this an appropriate role for HRD? Other questions may be directed at principles of ecological sustainability, specifically its valuation as a social good in relation to organizational
practices. Another potentially informative research direction highlights the nature and role of personal transformation in meeting the organizational challenges of paradigmatic change. How do personal transformations of leaders in organizations affect various organizational structures? Finally, research directed at understanding the strategic, process and behavioral problems that characterize these kinds of organizations constitutes a critically important contribution to be made by the field of HRD. How can the values, goals, and objectives of organizations be strategically utilized for innovation?

How this Research Contributes to New Knowledge in HRD

It is clear that HRD is a fundamental tool for change and adaptation and is the primary mechanism through which the human capital of communities, organizations, and nations is increased and preserved. The recognition that HRD plays a critical role in human progress has put increasing demands on the field of HRD practice to address an ever widening range of objectives. This paper's contribution to new knowledge in the field of HRD is expressed in the form of a number of exciting and potentially fruitful questions related to human and organizational change in this global era. We suggested several areas into which our current research focus could be expanded. Our hope is that by doing so, we can raise the level of discourse within the HRD community and generate interest in honestly exploring these and other organizational dimensions of global change issues. However, we also believe that moving forward in this arena my require HRD as a profession to rigorously question some fundamental values and accepted paradigms, ask questions that challenge basic assumptions, and discover new values, theories and practices that can help lead organizations into the future.

Expanding Perspectives on HRD Research: Understanding the Foundations of Phenomenology

Sharon K. Gibson
University of St. Thomas

Lisa A. Hanes
St. Paul Technical College

Phenomenology is a research methodology that has direct application to HRD as it helps explicate the essence of the human experience. This paper reviews the philosophical foundations of phenomenology and examines how this philosophy translates into a research methodology. The application of the philosophical concept of lifeworld is explored as it relates to the phenomenological research process. Outcomes of phenomenology are discussed in terms of its contribution to the knowledge base of human resource development.

Keywords: Phenomenology, Research Methodology, Philosophy

To return to the things themselves is to return to that world which precedes knowledge, of which knowledge always speaks, and in relation to which every scientific schematization is an abstract and derivative sign-language, as is geography in relation to the countryside in which we have learnt beforehand what a forest, a prairie or a river is. (Merleau-Ponty, 1962, p. ix)

Phenomenology is an interpretive research methodology, which is aimed at gaining a deeper understanding of the nature and meaning of everyday experience. Simply put, “phenomenology describes how one orients to lived experience” (van Manen, 1990, p. 4).

Phenomenological studies begin with a question about the meaning of participants’ experiences of a phenomenon for which the researcher has a serious interest and commitment. In order to understand phenomenology, it is important to understand the philosophy that undergirds it and how this philosophy translates into research methodology. This understanding is critical to applying this methodology in research design. Phenomenology has important applications to research in the field of human resource development as it helps explicate the essence of human experience.

Philosophical Foundations of Phenomenology

van Manen (1990) suggested that the distinction made by phenomenology between appearance and essence is what differentiates it from other qualitative research approaches such as ethnography, symbolic interactionism, and ethnomethodology. Polkinghorne (1989) provided support for this distinction in his discussion of phenomenological research methods, in that he proposed that phenomenology differs from other approaches due to its emphasis on the participants’ experienced meaning rather than just on a description of their observed behaviors or actions. The differentiating assumption of phenomenology is that there is an essence or essences to shared experience. In defining phenomenology as a philosophical tradition, Husserl is described as having the basic philosophical assumption that “we can only know what we experience by attending to perceptions and meanings that awaken our conscious awareness” (Patton, 1990, p. 69). Phenomenologists focus on how human beings understand their experiences so as to make sense of the world. Basic to this philosophy is the belief that there is no separate (or objective) reality for people. According to van Manen (1990), the act of phenomenological research is an intentional act of bringing the world into being for us and in us.

Phenomenology, as founded by Edmund Husserl (1859-1938), emerged as an epistemological philosophy and was carried forward and refined by philosophers such as Martin Heidegger (1889-1976) and Maurice Merleau-Ponty (1908-1961). Tracing the terms ‘phenomenology’ and ‘phenomenon’ back to their Greek derivations, Heidegger (1962) defined a phenomenon as “that which shows itself,” and more specifically, “that which shows itself in itself” (p. 51). Thus, in philosophical terms, phenomenology means “to let that which shows itself be seen,” as Heidegger...
stated, "To the things themselves!" (p. 58). Therefore, phenomenology is the uncovering and showing of things as they truly are. According to Heidegger, phenomenology is the exhibition and explication of a phenomenon. Four major concepts of phenomenology in philosophical writings provide the foundation for phenomenology as a research methodology in the human sciences. These philosophical concepts are intentionality, lifeworld, intersubjectivity, and embodied consciousness.

**Intentionality**

As humans, we have consciousness and intentionality. Giorgi (1997) described intentionality, in Husserlian terms, as "the essential feature of consciousness," in that an act of consciousness or awareness "is always directed to an object that is not itself consciousness, although it could be, as in reflective acts" (p. 237). When an object presents itself to us, it presents itself as *something* and we see it as *something* and interpret it as *something*. Even if we see only parts of an object—such as the top of a table—the object presents itself as a table, and our consciousness sees it as the whole table. Husserl (1982) described the concept of intentionality:

> In my waking consciousness I find myself in this manner at all times, and without ever being able to alter the fact, in relation to the world which remains one and the same, though changing with respect to the composition of its contents. (p. 53)

The objects in the world present themselves to those in the world; humans in the world interpret them to be what they are, and even if we only see a part of the objects, as humans with intentionality, we intuit the wholeness of the entity. There is an innate "knowing of [the objects in the world]" (Husserl, 1982, p. 52) even with little attention paid to them and with little conceptual thinking of them. Husserl termed this innate knowing of something as "a clear intuiting," which can be described as a perceiving, or an operative experiencing of the objects or phenomena (p. 52). Therefore, intentionality is human consciousness or awareness directed outward into the world and the resulting innate perception of the whole of objects in the world.

The philosophical concept of intentionality is important to phenomenology as a research methodology since the purpose of phenomenological research is to understand how humans experience and perceive certain objects or phenomena in the world. The concept of intentionality shares a close relationship with the lifeworld because intentionality is directed outward to objects, persons, and phenomena in the world. The philosophical concept of the lifeworld is described below.

**The Lifeworld**

In his attempt to develop a philosophy of science that was rigorous but also as close as possible to the natural world of humans, Husserl (1982) made important contributions to phenomenology with his concept of natural attitude, which was later designated as 'the lifeworld.' The natural world exists around us all the time; the world of the natural attitude includes the "I and My Surrounding World" (Husserl, 1982, p. 51).

> It is continually "on hand" for me and I myself am a member of it . . . this world is there for me not only as a world of mere things, but also with the same immediacy as a world of objects with values, a world of goods, a practical world [emphasis in original]. (Husserl, 1982, p. 53)

The natural world exists prior to our knowledge of it and "prior to any 'theory'" (Husserl, 1982, p. 56). As humans, we are always in the natural world and in the natural attitude; in our consciousness, we approach things with intentionality. To describe his concept of natural attitude, Husserl (1982) stated,

> I am conscious of a world endlessly spread out in space, endlessly becoming and having endlessly become in time. I am conscious of it: [T]hat signifies above all, that intuitively I find it immediately, that I experience it. By my seeing, touching, hearing, and so forth, and in the different modes of sensuous perception, corporeal physical things with some spatial distribution or other are simply there for me, "on hand" [emphasis in original] in the literal and figurative sense whether or not I am particularly heedful of them and busied with them in my considering, thinking, feeling, or willing. Animate beings too—human beings, let us say—are immediately there for me . . . They are also present as actualities in my field of intuition even when I do not heed them. (p. 51)

In later writings, Husserl used the term 'lifeworld' or 'Lebenswelt' to acknowledge the natural world. Gadamer (1989) explicitly described the lifeworld as, the world in which we are immersed in the natural attitude that never becomes an object as such for us, but that represents the pregiven basis of all experience. This world horizon is a presupposition of all science as well and, therefore, more fundamental. (pp. 246-247)
The lifeworld is already there for us; it exists prior to science, prior to theory, prior to reflection, and prior to our attitudes about it. The lifeworld exists prior to our conception of it and our ideas about it.

The lifeworld, then, is the place where humans are in the world or with the world, and therefore, it is the starting point for research in the human sciences. The lifeworld is the world as it is "lived by the person" not an entity separate and independent of the person (Valle, King, & Hailing, 1989, p. 9). Thus, in order to build on existing knowledge and create new knowledge in the human sciences, researchers must go to the lifeworld and study the way in which humans experience phenomena within the lifeworld in their natural attitude. This is the purpose of phenomenology as a research methodology.

Intersubjectivity

Interrelated with the concepts of intentionality and the lifeworld is the concept of intersubjectivity, which describes how we are in the world. Heidegger (1962), like Husserl (1982), conceived of the world as already existing: "The 'world' has already been 'presupposed', and indeed in various ways" (p. 92). Yet, Heidegger (1962) took Husserl's concept of consciousness one step further: He contended that human consciousness, or beingness, comes from our relationship with the world. Therefore, consciousness is a situated consciousness that results from our relationship with the world and others in the world. A "being world" is a "with-world" or "Mitvelt" (Heidegger, 1962, p. 155). The lifeworld is an intersubjective world where the subject and others are together in a relationship in the world, even if the other is not present. As conceptualized by Heidegger (1962),

Being-with is an existential characteristic of Dasein [our being in the world] even when factically [sic] no other is present-at-hand or perceived. Even Dasein's Being-alone is Being-with in the world. . . . Being-alone is a deficient mode of Being-with; its very possibility is the proof of this. (pp. 156-157)

We are always in an intersubjective relationship with the world. In interviews for phenomenological research, intersubjectivity is the act of the researcher being with and developing a trusting relationship with the interviewee as s/he describes her/his experience with the phenomenon being investigated. Dahlberg and Drew (1997) referred to the intersubjective coming together of researcher and interviewee as the 'encounter,' because the researcher not only gives attention to information the interviewee provides about the experience, but is also cognizant of the interviewee as an individual and strives to make interaction with the interviewee both positive and equitable.

Embodied Consciousness

Merleau-Ponty (1962) took the three concepts of consciousness, the lifeworld, and intersubjectivity further when he contended that they are experienced through the body. He defined this being-with in the lifeworld as intercorporeality: "Consciousness is being-towards-the-thing through the intermediary of the body" (pp. 138-139). We are in the lifeworld, or the 'lived world,' as bodies, and we live the world through the body: "The body is our general medium for having a world" (p. 146). The body is not separate from the self, nor does it exist "in" space, or "in" time; rather, it exists as part of the self, and "it inhabits space and time" (Merleau-Ponty, 1962, p. 139). The body is our medium for existing in the world; "the body expresses existence at every moment," and "existence realizes itself in the body" (p. 166). Husserl (1970) also referred to the subjective body when he stated, "it is in this world that we ourselves live, in accord with our bodily . . . personal way of being" (p. 50).

Thus, when two individuals come together in the world, they are embodied consciousnesses coming together; they bring their own spatiality and temporality, which can have an impact on both individuals' bodies and consciousnesses. For example, if the researcher is disturbed or surprised by something an interviewee says, and the interviewee notices this change in the researcher through the researcher's nonverbal cues, the interviewee might stop discussing the particular topic. The interviewee might begin to say what s/he thinks the researcher wants to hear rather than continue the interview in a way that allows the interviewee to personally experience the phenomenon discussed. Therefore, the phenomenological researcher must be aware of the subjective body; s/he must understand how the body can affect his or her consciousness and the consciousness of the interviewee, and how the coming together of the bodies can impact the consciousness of those involved.

Phenomenology as a Research Methodology

Husserl (1970), in an attempt to define a rigorous science, explicated that the interpretive view is most appropriate for human science as it takes place in the lifeworld. A research methodology such as phenomenology, which does not work in pure forms or idealities, is needed to examine how bodies or experiences actually show themselves, not to extrapolate them to how they have shown themselves in some ideal form. We must go back to Heidegger's
Gadamer (1989) also proclaimed the lifeworld as the starting point of science:

"The world in which we are immersed in the natural attitude that never becomes an object as such for us, but that represents the pregiven basis of all experience. This world horizon is a presupposition of all science as well and is, therefore, more fundamental." (p. 247)

Giorgi (1997) agreed when he stated, "From a phenomenological viewpoint, the life-world is pre-theoretical and prescientific and not yet theoretical or scientific in itself. It is the foundation of all sciences" (p. 248). Van Manen (1990) described the research methodology of phenomenology as "the study of lived experience" or "the study of the lifeworld" (p. 9). Phenomenological inquiry seeks to describe the deep essence of life experiences and the meanings derived from those experiences.

Phenomenological researchers are interested in understanding an experience for its own sake (Polkinghorne, 1989). The desired outcome of phenomenological inquiry is to utilize knowledge from the essence of the experience; to gain deeper understanding of the experience and become more aware of our thoughts and actions as they relate to the experience; and to seek deeper understanding in ourselves, rather than to search for universal laws, as in the positivistic research paradigm (Hultgren, 1989). A particularly compelling description of the status of phenomenology is expressed by van Manen (1990), who identified that this methodology is both new and old. It is new in the sense that this type of human science may be similar to a breakthrough or liberation from present concepts of scholarship based on theoretical and technological thought. It is old in that, over the ages, human beings have created artistic, philosophical, communal, mimetic and poetic languages for the purpose of connecting themselves to their lived experience.

Giorgi (1997) transformed the philosophical concepts of phenomenology into methodological concepts of phenomenological research. The following section explicates three major concepts within the phenomenological research methodology proposed by Giorgi: The essence of the experience, description, and phenomenological reduction.

The Essence of the Experience

In phenomenological research, we seek to find the essence of the experience of a phenomenon. The basic assumption underlying phenomenology as a research methodology is that there are core meanings or essences to shared experience (Patton, 1990). Therefore, the goal of the phenomenological researcher is to uncover these essences or underlying themes of meaning of shared experience.

Essences are the core invariants of the experience, which, if non-existent, would render the experience something else. "These essences are the core meanings mutually understood through phenomenon commonly experienced... for example the essences of loneliness, the essence of being a mother, or the essence of being a participant in a particular program" (Patton, 1990, p. 70). Van Manen (1990) described essence as "the essential nature of a thing, the true being of a thing... that what makes a thing what it is rather than its being or becoming something else" (p. 176). Giorgi (1997) described the essence as "the most invariant meaning for a context," "a fundamental meaning without which the phenomenon could not present itself as it is," and "a constant identity that holds together and limits the variations that a phenomenon can undergo" (p. 242). For Husserl (1970),

It then becomes evident that a unity runs through this multiplicity of successive figures, that in such free variations or an original image, e.g. of a thing, an invariant is necessarily retained as the necessary general form, without which an object such as this thing, as an example of its kind, would not be thinkable at all. (p. 341)

Description in Phenomenology

Phenomenological research utilizes thick, rich description of the experience and the meanings of the experience to reveal the essences of the experience. Because the purpose of phenomenological research is to understand better the lifeworld and the natural attitude, participants—who are in the natural attitude—provide descriptions as they talk about their specific experiences of the phenomenon under study (Giorgi, 1997). The interviewees, while in the natural attitude, provide concrete and detailed descriptions of their experiences with the phenomenon under study, and these descriptions become the text that the researcher utilizes to uncover the essences of that phenomenon.

Descriptions of such experience should be instantly recognizable, expanding and enriching the store of knowledge about the lifeworld. The end result of phenomenological description is that its generalizability, its
universal nature, connects us with others, ultimately validating our own experience. (Dahlberg & Drew, 1997, p. 310)

At this point, it is important to discuss the differences between description and interpretation. The purpose of phenomenological research is to uncover the essence of the phenomenon through excerpts of descriptions of the phenomenon from the research participants. Again, the focus is on description, which differs from interpretation. It must be noted, however, that researchers can never totally step out of their own implicit pre-understandings and interpretations of the phenomenon. Therefore, “pure description and knowledge (i.e., accounts and explanations of human experience free of the researcher’s own perspective and involvement in the lifeworld) are impossible” (Dahlberg & Drew, 1997, p. 315). As Husserl (1982) asserted, humans have intentionality and will see something as something when it presents itself; Gadamer (1989) added that it would be interpreted within our own language, tradition, and historicity.

Therefore, the researcher cannot totally remove her/his pre-understandings and interpretations from the research. However, the researcher should bracket these pre-understandings and focus on description of the experience rather than interpretation, which would move the research into hermeneutics and hermeneutic phenomenology. “But for ‘pure’ phenomenology, the task is to describe the intentional objects of consciousness from within the perspective of the phenomenological reduction” (Giorgi, 1997, p. 241). Again, the key task of the researcher who conducts phenomenological research is description of the experience from the perspective of the participants and in their own voices, rather than interpretation of those experiences.

Phenomenological Reduction

Phenomenological researchers must adopt a scientific rather than a natural attitude, and be in the phenomenological reduction when conducting lifeworld research. “The phenomenological reduction is a methodological device invented by Husserl in order to help make research findings more precise” (Giorgi, 1997, p. 239). Contrary to the natural attitude of taking existing things for granted, which constantly occurs in the lifeworld, phenomenological reduction, as explicated by Giorgi, has the researcher move out the natural attitude and “directs one to step back and describe and examine them [things and events]” (p. 239). The researcher continually must be aware of the phenomenon under investigation. The phenomenological reduction requires that the researcher bracket previous knowledge of the phenomenon in order to allow the phenomenon to reveal itself in the current situation.

A primary assumption that underlies interpretive research methodologies such as phenomenology is that humans seek meaning from their experiences and from the experiences of others. That meaning is interpreted through language, and thus leads to a reality that is socially constructed, rather than a reality that exists outside the meanings that humans attribute to it (Hultgren, 1989; Jax, 1984; van Manen, 1990). Interpretive research methodology seeks deep understanding of experience, and views knowledge not as existing independently of the knower, but as “a matter of agreement within a socially and historically bounded context” (Smith, 1983, p. 8). The relationship between the researcher and research participant is seen as a subject-subject interaction in which values and facts reside within each individual and cannot be separated (Smith, 1983). Phenomenological research methods, therefore, attempt to uncover the underlying essences and meanings of experience in order to arrive at a deeper, intersubjective understanding of the phenomenon under study.

The Research Process: Application of the Lifeworld Concept

Dalhberg and Drew’s (1997) description of phenomenological research methodology is based on the application of the lifeworld concept. These authors discussed a research methodology, based on Husserl’s philosophy of lifeworld, in which the concept of openness is central. Openness is described as a “perspective free of unexamined assumptions” (Dalhberg & Drew, 1997, p. 305) and as something that phenomenologists continually strive for but recognize as impossible to fully realize, as researchers are always part of the world that they wish to investigate. Objectivity means, however, that investigators must examine their own involvement with and knowledge of the phenomenon. Openness therefore requires researchers to have the capacity to be surprised and to remain open to the world as it presents itself. Openness is described as being open-minded and open-hearted, in that investigators need to be receptive, perceptive, and sensitive to what they are receiving as well as being able to engage with others without compromising the objectivity of the research. Openness is also described as fostering the ability to generate true research questions and requires the ability to be reflective and to be able to bracket one’s preunderstanding in a way that allows the researcher to seek insight (Dalhberg & Drew, 1997).

Other supporting concepts critical to the lifeworld research paradigm are ‘encounter’, which has as its goal the development of knowledge and includes an ethical concern for people; ‘immediacy’, which relates to engagement
with the participant in a way that establishes trust, allowing for the possibility of disclosure; ‘uniqueness’, which recognizes that the understanding of individuals takes precedence over their position as representatives of a larger group; and ‘meaning’, which is recognized as contextual and expanding. As further noted by Dahlberg and Drew (1997), the lifeworld, recognized by Husserl as the foundation of science, implies an epistemology that holds the question of meaning as primary.

In phenomenology as a research methodology, the researcher plays a vital role in uncovering the essences or true being of the particular experience under study. Rather than remaining an uninvolved observer as in positivistic research, the phenomenological researcher also exists in the lifeworld of the phenomenon under study. The phenomenologist investigates the experience, seeking an authentic account from the perspective of the participant based on a dialog between researcher and participant. The task of the phenomenological researcher is to develop methods that are particularly suited to the experience they wish to study (Polkinghorne, 1989). According to van Manen (1990), personal experience, interviewing, observing, biographies, experiential descriptions obtained in literature or from others, diaries and journals, and art are all possible means of gathering lived experience data. Phenomenology focuses on the structure and meaning of the experience of a particular phenomenon with the purpose of studying how people experience the world in order to discover the essence of the phenomenon (Patton, 1990; van Manen, 1990). As defined by Dahlberg and Drew (1997), phenomenological research is the “description and elucidation of the everyday world in a way that expands our understanding of human experience” (p. 305).

Phenomenology aims at being presuppositionless, in that the researcher attempts to gain an awareness of his or her own experiences so as to be able to set them aside (bracketing) in order to best be able to understand the experience from the participants’ perspective. The researcher seeks to uncover themes that express the meaning of the experience for the participants. In order to get at the core meanings, this process requires the researcher to reflectively analyze the structural or thematic aspects of these experiences to clarify and make explicit the meaning of the phenomenon (van Manen, 1990). Many sources can be used to assist in explicating themes, including the lived experience of the participants and various types of literature such as research, poetry, fiction, and other forms of art. One can also gain clues to the meaning of a theme by being attentive to the etymological origin of words or through searching of idiomatic phrases (van Manen, 1990). Semiotics is the practical writing or linguistic approach to phenomenology and reflects the research activity of describing the phenomenon through writing and rewriting of the themes. Creating and writing a carefully argued phenomenological text is the ultimate object of the research process and is the process by which researchers and participants sustain a conversational relationship. In phenomenological research, the researcher is not a detached observer but, instead, maintains a strong and oriented relationship (van Manen, 1990).

Applications of Phenomenology to Human Resource Development

Phenomenological inquiry is a search for new possibilities and an avenue by which people can gain an understanding and awareness of different ways of thinking and acting, resulting in better decision-making (Hultgren, 1989). Hultgren described Langan’s concept of appropriative undertaking where enhanced thought and understanding leads people to take a stand on and responsibility for their situation and their being (as cited in Hultgren, 1989). Human resource development scholars are continually striving for insight into the human experience; this type of research can provide a level of understanding that complements and strengthens current knowledge in this area.

van Manen (1990) identified three ways that this methodology might be considered a philosophy of action. First, he suggested that acting flows from deepened thought. As one becomes more aware of aspects of human life that were previously taken for granted, this awareness is likely to result in action being taken in social situations where there is an imperative to act. He noted that while no specific political agenda is prescribed for any particular group, the thinking that occurs as a result of phenomenology is apt to lead individuals to engage in a political agenda, either personally or collectively. Second, van Manen (1990) viewed the phenomenological process of inquiry as a means to support ongoing involvement in everyday life and practice in a way that is “virtually absent in the increasingly bureaucratized and technological spheres of pedagogic life” (p. 154). Third, he expressed how phenomenological reflection relates to personal engagement in terms of needing to understand how others perceive the world and how this understanding changes the way individuals act toward others. The relevance to human resource development is apparent in that knowledge of human experience in a variety of contexts and personal self-awareness is crucial to effective HRD practice.

van Manen (1990) also discussed ways that the relationship between research and life (or between thoughtfulness and tact) could be strengthened. These include reinstating lived experience as a basis for practical action and discovering new sources of information for research; moving toward a lived sense of principled
knowledge, in that investigators continually question the guiding principles of what is done in research; considering research/writing as thoughtful learning and as a way to become more aware of meaning and significance; and recognizing that research is a pedagogic way of life and as such, the two are inextricably linked. This approach can help HRD researchers remain open as they attempt to understand the complex nature of human experience in organizations.

Polkinghorne (1989) made the case that phenomenological inquiry can be used to impact changes in public policy and, by extension, quality of life. First, the research can be used to help people who are experiencing a phenomenon to understand and come to terms with their experiences. Participants can also find the process of being involved in the research to be beneficial, possibly in terms of finding a community of people who have similar experiences. Second, individuals who work with people who have experienced a particular life situation can gain insight into the experiences of these individuals and can be more responsive and sensitive due to their increased understanding. Third, individuals who are part of a power structure can gain information as to what people experiencing the phenomena believe should have occurred and this information might result in some change being initiated. Lastly, phenomenological research can provide insights into what policies should be changed and can increase the motivation of those in power to do so, based on the impact of understanding the personal meaning of the experience to those experiencing it. In considering the application to human resource development, it is clear that phenomenology offers the possibility of insights that can result in enhancements to practice. There are critical issues in HRD practice that merit the depth of awareness and reflection afforded by phenomenological research, in that it provides a level of insight that might not be gained through other research approaches. The thinking that occurs as a result of phenomenology informs one's ongoing involvement in everyday life and practice and may lead to action, either individually or organizationally.

As discussed, phenomenological research provides in-depth understanding, a higher capacity for discernment, and enables the researcher to be more situationally sensitive (van Manen, 1990). Additionally, phenomenological reflection can be viewed as key to in-depth, thoughtful learning. “More fundamental than skill learning, it is thoughtful learning which is at the heart of pedagogic life” (van Manen, 1990, p. 157). van Manen’s (1990) discussion of pedagogic competence is at the heart of this issue -- how does an investigator get at an understanding of what is a ‘leader’, a ‘follower,’ a ‘mentor,’ and other constructs important to human resource development. Phenomenological research questions integral to HRD practice are unlimited and can include those that attempt to explicate any human experience in organizations for which the investigator has a serious interest and commitment. Arenas in which phenomenological research would be well suited include cross-cultural experiences, leadership, change, organization development, or any other area in which a HRD investigator might want to gain a deeper understanding of the meaning of participants’ experiences of a particular phenomenon. Essentially, phenomenological research is an effective methodology for human resource development scholars who wish to enhance their understanding of human experience in organizations, and is especially applicable when dealing with issues that are both complex and unique.

How Engineers Learn in the Face of Organizational Change

Robert Reardon
University of Georgia

In this qualitative study, nine engineers were asked to describe how they learned to perform their altered roles after a major reorganization. A thematic analysis of the transcripts revealed that most of the learning was informal and that it fell into three categories. The participants revealed that the organizational structure facilitated two categories of learning and made one category more difficult. This study supports current theory related to informal learning in the workplace and expands theory by providing a new conceptualization of informal learning and the impact of the organizational structure on informal learning. HRD professionals may be able to apply these concepts to improve informal learning in their workplace.

Keywords: Organizational Change, Informal Learning, Qualitative

The industrial workplace is a sea of constant change. Changes in business situations mandate process innovations to remain competitive or meet customer requirements. Engineers play unique roles in this environment. Management cites engineers working in industry as being key to innovation in industry (Hart, 2001). Since 1980, there has been a steady shift in research and development from government to industry (Hoyt & Gerloff, 2000). Creative skills have become critical to engineers working in industry. Yet, according to Hoyt and Gerloff (2000), pressure has increased on these engineers to be sensitive to the needs of the business—the “bottom line” (p. 275). Technological innovation gives the engineer new tools, new capabilities, and new responsibilities. Engineers must learn, then relearn, how to perform their roles in an environment that is more and more dependent on his or her performance for success. Often, learning roles occurs through informal or incidental learning. It is important for organizations to understand how this learning occurs, how this learning can be categorized, and what can be done to encourage informal or incidental learning.

Theoretical Framework

Much has been written about workplace learning. Schön (1983) asserts that the experienced professional needs more than technical training. According to Schön, the experienced professional “reflects in action.” In this model of learning, the professional reflects on his or her actions in day-to-day practice to build a complex set of skills and tacit knowledge. This reflection does not come without a price. Hoyt and Gerloff (2000) identify technical obsolescence as a key antecedent to stress and burnout for engineers in industry. Engineers continually strive to learn new innovations to perform effectively in industry.

Technical skills are not the only skills needed by engineers. Senge (1990), for example, asserts that employees need to think systemically. Today in industry, engineers must be aware of the business needs as well as being technically competent (Hallam, 2000).

Some authors assert that much of workplace learning takes place outside of formal settings (Marsick & Volpe, 1999; Marsick & Watkins, 2001). Incidental learning occurs among workers as they seek solutions to problems. Incidental learning takes place constantly, and the learner may or may not be aware of the process (Marsick & Watkins, 2001).

These same authors have specified six characteristics of informal learning. It is integrated with daily routines. It is triggered by an external jolt. It is not highly conscious. It is haphazard and influenced by chance. It is an inductive process of reflection and action. It is linked to the learning of others.

Marsick and Watkins have advocated organizational designs that encourage informal learning (Marsick & Watkins, 1999; Watkins & Marsick, 1994). These authors identify three ways to enhance informal and incidental learning (Marsick & Watkins, 2001). First, critical reflection in the workplace is key to allow informal learning. Second, the organization should stimulate learner proactivity to identify and learn new skills. Third, the organization should encourage creativity in the workplace.

Past research has identified disruptions to informal learning after corporate downsizing (Volpe, 1999). According to Volpe, the streamlined organizations changed the nature of work. At the same time, according to
Volpe, there was a loss of formal and informal mechanisms for learning how to perform in the new environment. The people that formerly were resources were either gone or shifted into new positions.

Research Questions

Informal learning is unstructured. Authors have identified some general ways that informal learning can be enhanced. Perhaps it is possible to enhance informal and incidental learning by identifying common categories of learning and how professionals actually learn. The purpose of this inductive study was to develop a rich understanding of how experienced engineers learned following an organizational change. Specifically, the study asked the following research questions. What categories describe the learning for engineers in this industrial setting? In each of these categories, how did these engineers learn to perform their role after the reorganization?

Methodology

This was an inductive qualitative study to develop a rich understanding of the learning that took place at one manufacturing facility after a major reorganization. The study was based on interviews of nine experienced engineers. During the interviews they were asked to reflect on how they learned to perform their roles after the reorganization. The researcher conducted a thematic analysis of the transcribed interviews.

Setting

Delphi Chemicals (a pseudonym) is a plastics manufacturing facility located in the southeastern United States. Since its construction in 1984 it has seen numerous changes. The site has had four owners, seen four workforce reductions, and received five major expansions. Typically, there were about 200-250 employees on the site. At the time of the reorganization the site employed 28 engineers. Engineers filled a number of roles at Delphi, which include management, technical support, project support, and production supervision. Most of the engineers were between 40 and 50 years old, were white males, and had more than fifteen years experience in the plastics industry.

From 1984 until 1994, the site organization was aligned with job functions. Engineering support was split among three departments. The Production Department had engineers to assist with operation of the chemical processes. The Maintenance Department had engineers to help with issues like preventive maintenance and repair of equipment. The Technical Department engineers ran projects, designed new systems, wrote environmental permits, and handled other strategic engineering needs.

In 1994 the management at Delphi decided that the existing organization needed to be restructured. They felt that the existing organization had too many layers, and that it was slow to respond to customer and market demands. One of the stated goals was to provide a natural organization focused on meeting the production needs of the site.

The resultant organization established two production teams. Each of the production teams had responsibility for one of the major product categories at the site. These teams had production and reliability engineers as members. For just over a year, a third, core team (Technical Services) provided engineering support for process, project, and control engineering applications. After the year, management of the site felt that this core team was not product-focused, so in 1996 the Technical Services team was eliminated and all engineering support was rolled to the two production teams.

The Interviews

Ten engineers from the time of the reorganization still work at Delphi or live in the area. Nine of these were interviewed between June 2000 and June 2001. One engineer declined to participate in the study. All of the participants were white, male and between 43 and 51 years old. One of the participants had been laid off in 1998. One participant was on the management team that planned the restructuring and is still on the site management team. Eight of the interviews were conducted at the site by the researcher. One of the participants was the researcher. In that case, a third party conducted the interview using written questions.

The interview questions focused on how the engineers learned to perform their roles after the reorganization. There were also additional questions related to learning after other types of change. For example, one of the questions asked “How do you learn new technology when it is introduced to the workplace?” The audio tapes of the interviews were transcribed following each interview, and a preliminary analysis was done on the interview to identify emerging themes. After all the interviews were completed, the interviews were analyzed to identify themes
related to learning. Each theme was coded with a brief description and the supporting part of the interview was transferred into a database grouped by the descriptions.

After the themes were developed, the researcher reviewed the identified themes with the participants. Each of the participants agreed with the identified themes.

Results and Findings

Analysis of the interview themes found that there were three categories of workplace learning for these engineers. In addition, these themes indicated some generalizations that could be made about learning at Delphi.

Three Categories of Informal Learning for Engineers in Industry

Professional practice has been described as a complex artistry (Cervero, 1988; Schön, 1983). The skills needed by a competent engineer in manufacturing are not limited to the skills taught in preservice engineering curricula. Thematic analysis of the interviews revealed three general categories of learning for the engineers at Delphi Chemicals. These categories were learning new workflows, developing engineering expertise, and learning about the process.

Learning New Workflows. At Delphi, engineers needed to learn how to get things done. Almost every task required inputs and outputs. These engineers needed to follow procedures, accept new work assignments, plan their time, communicate, coordinate activities, and access additional resources. After the reorganization, established workflows were interrupted or disrupted. Most of the participants identified this as a major area of learning.

Each of the production teams had one specialist of each type. Each type of specialist had a different set of job functions that depended on his or her training and place on the team. Often, one specialist on each team was expected to perform tasks that were not done by anyone else on the team.

The interviews indicated two distinct types of learning for workflows. The first type occurred when the task was performed for the very first time in the new organization. The engineer could not rely on procedures, experience, or informal learning as a guide. The participants indicated that one of them had to forge ahead through the new organization. It was not always a smooth process. Usually, these “innovators” (Rogers, 1995) were experienced engineers who drew on analogies from past situations to apply to the current situation. In other words, they reflected in action. These engineers then became the educators and opinion makers for the other engineers at Delphi.

Ben, a project engineer.

“We learned most of that by doing, just by trying to execute and winding up with somebody saying you have to do this or you have to do that, and just coming as new, new knowledge at that time.”

The second type of workflow learning took place after the “dust had settled” and workflows were established. Often there were formal procedures documenting the steps a specialist was to follow to do tasks in his or her area of expertise. The participants indicated that they rely on informal learning to discover how to get work done. They would ask a peer for guidance on how to accomplish the task. The only other engineer of that same specialty was the analogous specialist on the other product team. So, this informal learning was often peer-to-peer, crossing team boundaries.

Tony, a project engineer.

“Word of mouth, 'cause there is no serious effort to educate people about the, uh, the advantages, or disadvantages, of programs, or processes, or procedures that we use with our, uh, electronic solutions, so to speak. It’s word of mouth that I find out from you, or somebody else, something they do that works. Or I ask a question, “how the heck do you do this?” And somebody shows me. That’s about the only way that we do that…”

Developing Engineering Expertise. The knowledge required by an engineer at Delphi frequently changed because of changes in technology, government regulations, and business needs. Therefore, each engineer always had
to keep his or her skills up to date. The new, streamlined organization made it difficult to seek knowledge within the site. There were not very many engineers, there was little or no redundancy of roles, and everyone was very busy.

Lance, reliability engineer.

"...so my conduit over time became engaging in the plastics industry and engaging people that had specific knowledge of pieces and then giving them my perspective on the target and just engaging their expertise. So rather than go to expertise developed from within, I had to go to experts I became, you know, networked to outside to get that conduit..."

The engineers in this study proactively went outside the company to acquire new knowledge regarding engineering expertise. They did this by taking classes, talking to vendors, and networking with other engineers in industry.

Learning About the Chemical Process. When the engineers at Delphi talked about “process” they were referring to the chemical process for which they were responsible. Each of the production teams was responsible for several chemical processes. Each processes had a multitude of distinctive characteristics. Employees working with a process were required to learn these characteristics.

Management stated that one of the intents of the reorganization was to improve the site’s focus on these processes. Most of the engineers in this study identified this as a major success of the new organization. For example, although there is only one control engineer on each team, he or she could ask questions of his or her peers regarding the process. This encouraged all the engineers on a team to learn about the team’s specific processes.

Lance.

"You know what the best part of the integration was working side by side with my peers that had other viewpoints and had other perspectives that could cover my blind spots. I may not have been good at certain things early on. I wasn’t good at the process side for example."

These three classifications, learning about the chemical process, learning new workflow and developing engineering expertise, were identified during the interviews. Figure 1 demonstrates three characteristic flows of informal learning in a simplified organizational chart.

Figure 1. Simplified organization chart showing channels of informal learning.

As Figure 1 illustrates, the first category of informal learning, learning new workflows, usually took place between specialists, and might or might not cross team boundaries. For example, the control engineer on one team might explain an aspect of a computer program to the control engineer on the other team. The second category of learning, learning about the chemical process, usually took place between peers within a team. Figure 1 also illustrates the process engineer on one team explaining the process to the reliability engineer on the same team. The third learning category, developing engineering expertise, depended on the specialist seeking resources outside of
the plant boundaries. In addition, Figure 1 illustrates this by showing a vendor supplying information to the reliability engineer on one team.

General Characteristics about the Informal Learning

The interviews revealed four general characteristics about informal learning at Delphi that apply across the three categories of learning.

Learning was informal and took place over time. Engineers learned how to do their jobs after the reorganization in informal ways. This took place over a period of weeks or months. Typically these engineers learned from each other when they had a need. They sought out a peer skilled in the task at hand and asked for assistance. This was not the case for developing engineering expertise. The new organization did not support informal learning in this category, so the engineers had to seek new knowledge outside Delphi. They did this with informal networking or formal classes.

*Ralph, process engineer.*
"You know, I guess you learn a lot in everything, in every little type of work you do, you learn a lot from it, you know."

*Bill, team leader.*
"I think it was supposed to evolve over time and it was really supposed to happen at the team leader level and kind of in each department. I think we did do some of that and some of it seemed kind of like common sense."

There was no learning up or down. According to the participants, almost no learning moved vertically through the organization. It is almost all peer-to-peer. No one cited his or her supervisor as a source of learning.

*Ben.*
"So I think we tend to help one another on sort of a lateral basis, or even people that might work for us. As far as trying to push for a big conceptual education, I don’t...I think people kind of shy away from that"

Engineers Learned Only What They Needed to Do Their Job. Engineers seek to learn what is needed to do their job: there is no time to learn things completely. This is typical of the adult learner, who displays a “readiness to learn” in order to “cope effectively with their real-life situations” (Knowles, 1990, p. 60).

*Ralph.*
"You only need to know the things that apply to your job and I think that would help you, just knowing, minimizing the knowledge you have to know to do your job instead of trying to learn things that, really, you’ll never use. Like sometimes you get taught things in school you’ll never use. But on your job, it’s a waste of time”

The Structure of the New organization made it very Difficult for Young, New Engineers to Learn. People in the survey noted that it is very difficult for inexperienced engineers to survive in this environment. The experienced engineers felt that their workload makes it difficult to take the time to mentor young engineers. In addition, there is not a deep pool of resources on which to draw. Each team has a set of specialists, and those specialists are expected to perform as self-directed, competent individuals. So it is difficult for new engineers to learn their roles in this environment.
Lance.
L: "Developing new personnel is very, very difficult. Very, very challenging environment and we do not do a good job of developing people."
I: "Because of..."
L: "Because we have so much going on and we have...it's so quick, I mean, you truly learn by living through things."

**Lack of Steps to Enhance Informal Learning.** The participants in this study were able to describe numerous examples of informal learning. This agrees with the description of informal learning in Marsick and Watkins (2001). One of the criteria of informal learning is that it is often “triggered by an external joint” (p.28).

In the same paper, Marsick and Watkins describe three ways to enhance learning: critical reflection of the skills needed to perform, proactivity by the learner to acquire needed learning, and creativity to explore new options. The participants in the study indicated that they were able to create new workflows and explore new performance options. They were also proactive in learning that which they needed. This was not, however, consciously encouraged by the organization, but may have been an artifact of the experience of the professionals in the study. There was no evidence of critical reflection discussed during the interviews.

**Implications**

The engineers at Delphi relied on their individual experiences as professionals and an informal network of peers and external experts to learn after the reorganization.

**Implications for Practice**

This study demonstrates that organizational structures can shape informal learning. The management at Delphi appeared to have been aware of this as they sought to build an organization that would better support the chemical processes. It is important for HRD professionals to keep this in mind as their organizations are redesigned to achieve goals such as reorganization, downsizing, acquisition, or expansion.

The engineers in this study relied on experience and tacit knowledge to build new networks for informal learning. Failure of new hires to succeed in this environment dramatically highlights the value of experience in this environment. The failures and successes of informal learning in this study illuminate areas to which HRD professionals should attend when dealing with engineers in an industrial setting. First, they should identify the categories of learning that engineers need to perform their roles. Second, the HRD professionals should identify channels for this learning to occur. For example, in the Delphi study, there were no informal channels to develop engineering expertise after the reorganization. Formal training opportunities are one solution for this.

HRD professionals should work with engineering professionals to enhance informal learning. The recommendations of Marsick and Watkins (2001) would be a good starting place. Engineers should be taught to reflect critically on their learning needs in their work environment. They should be encouraged to proactively acquire the knowledge that they need (either informally or formally). Discussions with their managers should include learning and development needs. Collaboration and cooperation among peers should be encouraged to stimulate informal learning.

**Implications for Research**

This was a small study of a small facility over a short period of time. The participants represent a small demographic group (white, male engineers between forty and fifty years old). Further research should attempt to categorize informal learning in other settings and with participants from a more diverse background.

This study suggests that organizations and resources can be aligned to maximize informal learning. Research should be done to determine if this is true. Ideally, an experimental design would be best. It is unlikely to expect a company to reorganize to satisfy research goals. An alternative study would be to work with a company that is planning reorganization. The researcher should try to predict categories and flows of informal learning in the new environment. Then the researcher should monitor the new organization to determine if the channels of informal learning develop as expected.
How this Research Contributes to New Knowledge in HRD

This study contributes to knowledge in HRD in two ways. It supports existing concepts of informal learning and it expands on that concept by demonstrating that informal learning can be differentiated into different categories.

Support of Existing Theories Related to Informal and Incidental Learning.

The learning described by the participants agreed well with the characteristics of informal learning proposed by Marsick and Watkins (2001, 1999). It occurred in the midst of the normal workday. It was linked to the learning of others. Often, it was not highly conscious. Since it took place as needed, it was influenced by chance. It was definitely triggered by the reorganization. The participants noted that it was sometimes a case of reflection in action.

This Research Suggests New Structures for Considering Informal Learning.

Workplace learning can be categorized. Prior research on informal learning did not seek to categorize types of learning. In this study the participants identified learning new workflows, developing engineering expertise, and learning the chemical processes.

In practice, this study suggests that organizational structures and resources can be designed to support or enhance a particular category of learning. At Delphi, the management wanted to enhance the support of production goals. According to the participants in the study, the modified structure made it much easier for the engineers to learn about the chemical processes for which they were responsible. The same participants reported that the modified organization made it harder for these engineers to continue to develop their engineering expertise.

Appendix: Interview Guide

Today, I am interesting in hearing how you adjust to change in the workplace. Specifically, I would like to hear about your perception of the reorganization of the plant in 1996, how it affected your job, how you responded to it...

• Tell me about how the reorganization affected you.
- How did you learn to do your job after the change? Was there formal training or education? What other informal ways did you learn?
- Were there problems with adapting to new change? Were you able to solve them? How?
- What could have been done to make the change "better?"
- Did the company support your adaptation? Tell me how.
- Tell me a little of your background.
- How long have you worked as an engineer?
- What is your background?

I want to shift gears and ask you a couple of questions about new technology. I will be researching how people adapt to new technology, and your answers will help guide me as I start this research.
- Describe a time when you had to start using a "new technology." How did you learn to work with it?
- What has been the best way for you to learn new technologies?
- What should the company do when it rolls out new technologies? (classroom training, online help, mentoring, hot lines)
How Lesbians Have Learned to Negotiate the Heterosexism of Corporate America

Julie Gedro
BellSouth Telecommunications, Inc.

Ronald M. Cervero
Juanita Johnson-Bailey
University of Georgia

This paper examines the informal and incidental learning that lesbians experience in order to negotiate the heterosexism of corporate America. This paper will discuss heterosexism and its pervasiveness in the corporate setting; it will examine the double challenge of lesbians who work in the corporate setting; what lesbians have learned about negotiating the corporate setting, and how they have learned to negotiate the setting.

Keywords: Lesbians, Corporate America, Informal and Incidental Learning

To be same-sex oriented in a society that is undergirded by the heterosexual assumption is a stigma. For centuries gay and lesbian couples have formed and maintained relationships outside legislative and social approval (Johnson, 1996). Reflecting the norms of the wider society, corporate America is also characterized by heterosexism, sexism and the resulting interlocking systems of power (Badgett, 1995; Digh, 1999; Herek, 1989; Fassinger, 1995; Hill, 1995; McNaught, 1993; Miller, 1998; Swisher, 1996). Due to these interlocking systems of compulsory heterosexuality and sexism (Miller, 1998), both formal and informal methods of discrimination exist in corporate America. Formal discrimination often involves employer decisions to fire or not hire someone due to their sexual orientation as well as being passed over for raises, promotions or increased job responsibilities (Croteau, 1996). Informal discrimination includes verbal harassment, property violence, and loss of credibility or respect by a co-worker (Morgan & Brown, 1991). Today, no homosexual is explicitly protected from workplace discrimination at the Federal level, although many organizations now have their own individual anti-discrimination policies.

Gays and lesbians, therefore, who work in corporate America must negotiate the heterosexism of their environment through a multiplicity of strategies including passing as straight, closeting, hiding, lying, dropping out, and coming out (Adams, 1996; Boatwright, Gilbert, Forrest, & Ketzenberger, 1996; Driscoll, Kelley, & Fassinger, 1996; Fassinger, 1995; Friskopp & Silverstein, 1995). Lesbians are doubly challenged because of their gender as well as their homosexuality (Miller, 1998). Gay women executives are slower than gay men to make their sexuality known because they differ not in one but in two important ways from straight male executives, who still tend to surround themselves with similar colleagues at the very top of the ladder (Swisher, 1996). Lesbians, therefore, working in corporate America constantly negotiate the multiplicity of variables that can potentially detonate their careers. This negotiation process is arguably no different than the general experience of lesbian life in the larger society.

Because lesbians face the double bind of gender and sexual orientation discrimination, they are a unique category of professionals. Each lesbian who works in corporate America must learn through trial and error, underground networking, or other informal means how to negotiate the workplace. The purpose of this study, therefore, was to understand how lesbians learn to negotiate the heterosexism of corporate America. The research questions were: 1) What have lesbians who work in corporate America learned about negotiating the heterosexism of the organizational setting, and 2) How have they learned to negotiate the heterosexism of the organizational setting.

Methodology

A qualitative research design was selected for this study in order to uncover that meaning embedded in people's experiences (Merriam, 1998). A purposeful sample of ten lesbians who work in corporate America was used in this study. Ten were selected because by the seventh interview noticeable themes, words, and phrases were being repeated. Three more interviews were done in order to assure that data saturation (Merriam, 1998) was reached. The criteria used to select the women for this study were: 1) self-identifies as a lesbian; 2) is over the age of thirty; 3) has worked in the same corporate setting for a minimum of two years; 4) has budget responsibility; and 5) has more than two people who report directly to her. The women must self-identify as practicing lesbians. The study excludes
women who think they might be lesbian, or who have had lesbian experiences, or who are bisexual. The second criterion was that the women were over the age of thirty because younger lesbians do not have enough experience in the work setting to provide a frame of reference for this study. The third criterion was that the lesbians sampled have worked at their present company for at least two years in order to have developed opportunities for learning. The fourth and fifth criterion—budget responsibility and a minimum of two direct reports—defined a research participant as a corporate member who has a fiduciary responsibility and accountability to the corporation.

The women are positioned from a structural standpoint (education, management authority) to be in positions of organizational power, with all being managers and some being at the executive level. While not specifically by design, all of these women have undergraduate degrees. Six out of ten of them have advanced degrees. Moreover, three out of ten of the women have been at their current organization for over ten years (Janet, Sharon and Pam) and all of them have been in current industry/profession for over five. What these profiles suggest, is that one key success factor in learning to negotiate the corporate setting is a strong educational background and a stable work history.

A semi-structured interview format (Merriam, 1998) accompanied by an opening statement and an interview guide was used in this study. The interview guide consisted of two parts: 1) general, demographic questions related to career and type of organization, and 2) questions related to experiences and learning in the corporate setting. Data were analyzed using the constant comparative method of analysis. The constant comparative method involves comparing one segment of data with another to determine similarities and differences (Merriam, 1988). The goal of this analysis was to make sense out of the data by determining categories and themes, reducing and refining those categories and themes until there are linked in a way which explains the data's meaning.

Background of the Study

The concept of heterosexism provides the scaffolding to understand the experience of a lesbian whose identity places her at the intersection of gender and sexual orientation in the corporate setting. Heterosexuality is the compulsory norm for society; corporate America, being a subset of American society, is also characterized by compulsory heterosexuality (Caudron, 1995; Digh, 1999; Friskopp & Silverstein, 1995). Heterosexism is a worldview (McNaught, 1993) and for most people, it is probably not even conscious. Heterosexism is not always a simple, benign, innocent posture. Rather, heterosexism is the belief that heterosexuality is actually superior to homosexuality and should be an enforceable social norm (Badgett, 1995).

Negotiating organizational life as a gay person in the face of heterosexist norms is a constant process of identity management and underground networking (Schneider, 1982). Signs of sexual orientation other than heterosexuality are rarely tolerated in the corporate setting. Although relatively little research has been done regarding gays and the workplace, what has been done suggests that gays and lesbians are expected to conceal their marginalized orientations from organizational view (Schneider, 1982). Because of this lesbians face a number of unique considerations when developing their careers in business. Lesbians often avoid divulging their sexual orientation in order to avoid harassment, rejection, and violence (Caron & Ulin, 1997). In a 1992 survey, 38 percent of lesbians who responded said the need to hide their sexual orientation was a constant source of stress on the job (Winfield, 1995). In addition to using passing strategies mentioned heretofore, many lesbians negotiate corporate America by opting out of it altogether (Fassinger, 1995; Morgan & Brown, 1991).

There are no formal or institutionally sponsored programs in existence that address the unique needs, concerns, and challenges of lesbians in the workplace. Until formal training and education programs are developed that address the issue of lesbians in corporate America, lesbians have only their experience to draw upon as educational tools. Therefore, this study used the Watkins and Marsick (1992) model of informal and incidental learning to understand the processes of learning. Watkins and Marsick posit that the central feature of informal and incidental experience is learning from and through experience. Informal learning means learning that is experiential and non-institutionally sponsored and includes learning by trial and error, mentoring, and coaching. Incidental learning is learning that occurs as a byproduct of some other activity, such as task accomplishment, interpersonal interaction, sensing the organizational culture, and trial-and-error experimentation.

Results
The first section discusses three themes about what lesbians who work in corporate America have learned about negotiating the heterosexism of the organizational setting. Section two presents the analysis of how they have learned.

**What Lesbians Have Learned**

Table 2 presents the three main themes that answer the first research question. Lesbians in corporate America have learned to pre-screen, to come out, and to educate others to the issues related to being lesbian.

**Table 2. What lesbians in corporate America have learned about negotiating heterosexism**

<table>
<thead>
<tr>
<th>What is learned</th>
<th>When this occurs</th>
<th>Factors for Occurrence</th>
</tr>
</thead>
<tbody>
<tr>
<td>The Pre-Screen:</td>
<td>Anytime one enters a new relationship (individual: colleague, superior, new group of subordinates; or group: new organization)</td>
<td>Visual: Symbols, speech or dress that would indicate intolerance for alternative orientations.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Behavioral: Person's demonstrated openness toward new ideas. Political views (Conservative/Liberal). Hobbies/interests: metaphysics, New Age, alternative pursuits.</td>
</tr>
<tr>
<td>The Coming Out:</td>
<td>Occurs after she has pre-screened the audience and there is a compelling or otherwise appropriate motivation to identify oneself explicitly as a lesbian.</td>
<td>Power balance: Facilitated by the other person/group disclosing sensitive or otherwise vulnerable material. Establishment at Organization:Facilitated by one's expertise in field and the establishment of relationships.</td>
</tr>
<tr>
<td>The Education of Others:</td>
<td>After the pre-screen, and after one has come out individually</td>
<td>A recognition of the significance and responsibility of one for educating others for not just one's own career survival or success, but for lesbians in a collective sense.</td>
</tr>
</tbody>
</table>

**Learning About Prescreening.** It is evident that as a lesbian conducts day-to-day business transactions she must deal with the fact that she is a gay woman in a straight male world. Being a lesbian is a ubiquitous component of virtually every relationship and nearly every task in her corporate life. This requires an understanding of how, when, why, what, and who to reveal material about this important personal characteristic of her life. The first activity that these women have learned is to pre-screen a superior, subordinate, or even an organization, in order to get a “read” on what the response will be if she makes her sexuality known. Corporate lesbians have learned to read a situation first before speaking or acting; thus this is the first part of the negotiation process.

Walking into a business trip, a business deal, an employee meeting, a sales call, or a monthly financial reporting meeting, involves skillful assessment of the possible ramifications of identifying one’s lesbianism. There is much at stake for walking blindly into a transaction without this understanding. When meeting a new person, Liz looks for indicators of the person’s general tolerance:

I listen to people before I engage with them. So if I sense a lack of tolerance for certain kinds of things, people, music, art, a total focus on themselves, who they peer with, kinda gives me give me a clue that these are people are...there's a vibe. There's just a vibe.

Pam’s learning has hinged upon her caution around the issue of the timing, circumstances, and parties to whom she comes out:

So, the management chain in which I report up to, pretty much every one knows. The people who report to me, pretty much every one knows. The people who I’ve worked with for several years, pretty much every one knows. But it’s not the kind of thing like when I’m into a new position I don’t announce it immediately. It’s the kind of thing if somebody starts out asking questions about my life, I don’t hold it back but I also have it’s a little bit of a protection device on I’m not
going to announce that first thing. I’d rather for the person to get to know me and to from a work perspective get to know my work before they categorize me.

Pam is so careful with her pre-screening that when asked her if she had any regrets or any experiences with respect to negotiating her lesbianism and disclosing her orientation to an associate, she said:

I can’t think of anything. I’m just so careful. One time when I was talking to a therapist she said, “You think about everything you do before you do it.” And I think she said, “You’re a thinker.” And I think especially with that issue, I’m really really careful.

So the main aspects of the pre-screen are determining how ostensibly safe a person or an organization is by screening for how open someone would be to the idea of one’s identification as a lesbian. These women have learned that it pays to stay in control of conversations and transactions with colleagues and supervisors. One’s work speaks first, then one’s voice can follow in the appropriate time and the appropriate place.

Learning About Coming Out. A woman is inevitably going to reach a point where she feels that the time is right to explicitly reveal her lesbianism. All of the women are out at work. Their peers know, their bosses know, and their subordinates know. While most or probably all of them used skillful timing and communication with respect to coming out, all of them ultimately were out. There were no stories of trauma or of disaster. There were no stories of being fired, or downgraded in their position. Rather, the coming out stories were sometimes very “happy” stories, sometimes borderline-humorous, and at worst, they were neutral. All of these women identified that their initial coming out incidents gave them courage, incentive, skill, and motivation to come out in larger capacities.

Susan and Kim both identify the importance of timing, sensitivity, and finesse with respect to coming out. Both were concerned that they needed to come out so that if their lesbianism were raised to their bosses, and they hadn’t been informed, their bosses would defend their reputation as heterosexuals. In order to proactively manage the boss’s reputation and credibility as well as to maintain collegial trust, Susan advised her superiors of her lesbianism:

I wanted to tell my boss. Now, up to this point I had just told my peers. I didn’t tell my boss…she’s one of these people like if someone were to walk up to her and say “I just heard, I just read that Susan was gay.” She would say “Absolutely not! I can’t believe you’d say that!” You know, she’d defend me. And I didn’t want her to embarrass herself by thinking she was being protective and in reality, it’s like “no, I am.” So I told her about it and she was fine with it.

Kim observes in a more abstract way the importance of understanding the ramifications of how, when, where, and why one comes out:

It’s important to understand that every action has consequences. And you need to think about those. If you’re gonna come out in a big public way that makes somebody look foolish, you need to think about that. I mean foolish in the sense that you know, if you’ve been workin’ for somebody for a long time and they think they know you and all of a sudden they realize they don’t know you, they look foolish. I think you need to understand that if you want to be extremely political, there may or may not be a place for you in your organization.

In both Susan and Brooke’s coming out at work stories, their strategy was to “act normal.” They both conducted themselves in ways that communicated the fact that they felt neither self-conscious nor disempowered by their lesbianism. This self-composure was in both cases met with respect, and both women gained support and rapport with their colleagues.

Sharon, while working for a defense contractor, had to undergo a rigorous security clearance. During the security clearance, because of the question “Have you ever sought counseling?” When she responded affirmatively, the interviewer asked her for what purpose and she was put in the position of coming out. She ultimately had to list every “roommate” (lover) she had had to the interviewer. Nevertheless, Sharon got the requisite clearance:

Would that be Susie your roommate? I went “Yes.” So we went back through the whole thing. And every time there was a female he asked was that a lover. And I had to answer. So it took five and a half hours. Because he said, “you’ve been… He asked me well are you out to your children? Are you out to your parents? Are you out to...” I had to answer in fact I was.

In these experiences of coming out, each woman’s experience had its own unique setting, characters, and specific events and circumstances for the coming out process. However, all were resolute and honest with respect to claiming their sexuality—that is, not one of them lied, passed, hid out, or closeted themselves. In fact, coming out at the individual level gave the women the courage, the skill, the leverage, and the motivation to move into a position of serving as educators around the subject of lesbianism in general. The women wanted to sensitize their colleagues, superiors, subordinates, and clients as to not only their individual identities, but also about the issues and challenges faced by the collective lesbian population.
The Education of Others. The women learned they had a commitment to serving as change agents by educating others about the unique issues that corporate lesbians face. These successful corporate lesbians see that it is not enough to come out individually, but it is incumbent upon them to come out for the collective good. Mary Ellen identifies her responsibility as a powerful corporate lesbian to educate others about the marginalization of lesbians and that they can lead normal, happy lives:

Up on my web site it talks about my partner and my kids. My partner and my kids come to work. And when you do things like for example, contribute the amount of money we did to [Political cause X], clearly that’s a different level and I have responsibilities to the association, the shareholders, the customers and things and I have to think about things that I do.

Janet explained very clearly how she came to embrace her role as an educator in her corporate setting for lesbian and gay issues:

I watched these employees who dripped of courage, determination, courage...So I sat there and I thought you know between the higher purpose in my life, in a very visible, senior position and I had the opportunity to work with these employees, with management to take this really to another level. So it was so obvious to me that I needed to come out you know for myself for the impact that it could have.

Janet’s inspiration and motivation came from a recognition that there were lesbian and gay employees at her organization who had much more to lose by coming out than did she. She recognized that her rank placed her in a position to significantly affect change.

How Lesbians Have Learned. The learning that the women experienced took place in their interactions during the course of their workdays and not through formal programs of learning because such programs do not exist. Thus, corporate lesbians have instead learned informally and incidentally how to negotiate the heterosexism of their corporate organizations. Table 3 illustrates the three key types of events through which the women learned about successfully negotiating their organizational settings and the corresponding mode of learning. There were several examples of incidents relayed by the research participants, and these incidents are chosen to be illustrative of the patterns of learning they experienced.

<td>During casual conversation, mention lovers. No hiding of orientation.</td>
<td></td>
</tr>
</tbody>
</table>

Dealing with Human Resources. Much of the learning that the women experienced involved dealing with their Human Resources Departments on such matters as relocation, benefits, and staffing. On all of these occasions, the women were seeking information in their interactions with their Human Resources’ associates. Hence, the learning in this category was categorized as informal. The interactions were initiated because someone was seeking to learn something—whether it was asking for information about relocation assistance for a lover, making a new hire, or asking about domestic partner benefits. Sharon learned through an adversarial encounter with a Human Resources Manager about negotiating her identity:

So they start talking about me hiring friends on the contract. Now they’re not talking about what is really happening—they are dancing around it. Right? So “It’s been noticed that you’re hiring friends on the contract. The nepotism on this contract is just running wild.” I said, wait a minute!
Have we had a paradigm shift here? A year and a half ago we had posters on the wall saying "bring your friends to work." I thought that was what we were trying to do.

Sharon's experience with her HR manager was an example of informal learning because the conversation was intended to deal with her recruitment of acquaintances.

During Committee and Group Work. Much of the learning that lesbians have experienced has occurred as they are participating in committee work and other types of group work. While some of the committees and groups directly involve the issue of lesbians and gays in the workplace, there are also examples of learning that took place as the women worked in mainstream, traditional types of committee and group work. Learning during committee and group work resulted in incidental learning.

Mary Ellen said that she is heavily involved in committee and group work both within her organization and also in her community, and has learned about negotiating her lesbianism in a powerful way:

I had a former Board of Trustees come over and want to talk about relationships, whether I play a bigger role. I serve on the University Athletic Board and couple other things and I said well you know frankly for the gay and lesbian population they feel really disenfranchised and went on about that and you know because I'm perceived as a competent businesswoman and a visible executive, they think I'm a person of wealth. All those things somehow mean they have to figure out how to deal with me if they want a chance to have my money and my name.

Mary Ellen's learning through her committee and group work was incidental because as she served on various boards, the subject of her lesbianism would inherently arise because of her activist stance. The learning was incidental because her own coming out was a byproduct of another activities—such as contributing money to various causes and for various projects.

Janet learned that her fears around coming out were, as she said, "Larger than life." As she examined her own self-consciousness around being a lesbian in a predominantly heterosexual businesswomen's alliance, Janet felt trepidation about coming out within this group because she thought that her openness about her lesbianism might scare off her straight peers in the group. However, she came out to her group and was met with sensitivity and concern. Janet, then, learned incidentally of her group's tolerance and sensitivity toward her lesbianism because she had reached a critical moment in her lesbian identity that would not allow her to remain in the closet within and among her cohorts in this group. The main activity that Janet participated in was coming out to this group of people who were so important to her. The by-product of that activity was that she learned how receptive the group was to her lesbianism.

Thus, her learning of the inclusion that her straight associates genuinely felt—demonstrated by their visible upset at not having addressed the subject themselves—was byproduct of Janet's coming out to them.

Social/Corporate Events. Another way that the women learned about negotiating the heterosexism of the organizational setting involved their experiences during organizational functions such as holiday parties as well as during routine social activities such as lunches and dinners with colleagues and superiors. These social activities, whereby the emphasis was not directly on work tasks or responsibilities, lent themselves to a freer exchange of conversation and arguably more opportunity for "exposure" (whether wanted or unwanted) of their lesbianism and all the resulting and necessary negotiation around that subject. The learning that occurred during social/corporate events was incidental to the primary purpose of attending the events.

When Jennifer described her experience with the co-worker who had asked her about the "wildest thing she had ever done," she learned incidentally that she was comfortable coming out to someone when they divulged equally sensitive information about themselves. The reason that this learning was incidental is because Jennifer's lesbianism came up as a result of a casual conversation, not particularly intended to gather information around the subject of her lesbianism. Again, learning through a social context outside of work—having lunch with a colleague—resulted in incidental learning:

Pam, too, learned about coming out during a social event (lunch with an employee):

With an employee that works for me, we were at lunch and I hadn't come out to him and he had been with the company maybe four months or something like that and he was talking about him and his wife and he happened to be talking about the gay area of town. Not calling it the "gay area of town" but you know that he and his wife like to go to a restaurant down there. I said, "Oh, we go there a lot too." And then I just threw in, you know, that's kind of the gay area and I happen to be a lesbian and I like that restaurant cause I feel so comfortable there. From then on, I wasn't having to hold back anything.
Pam's learning about coming out to a new colleague as they were discussing favorite restaurants and neighborhoods was another example of incidental learning, because Pam's learning of her subordinates' receptivity to her lesbianism was a by-product of the main activity, which was their business lunch.

Discussion

We discuss three overall conclusions based on the results of the study: 1) It is difficult for lesbians to negotiate the heterosexism of the corporate environment; 2) Lesbians in corporate America have learned how to negotiate strategically the heterosexism of the corporate environment through informal and incidental learning; and 3) Lesbians who are succeeding in corporate America take responsibility for educating their associates about issues related to lesbianism.

The evidence from this study suggests that corporate America continues to be a bastion of heterosexism (Boatwright, Gilbert, Forrest, & Ketzenberger, 1996; Chung, 1995; Fassinger, 1996; Morgan & Brown, 1991). The women in the sample experienced heterosexism as they negotiated both the mundane tasks associated with their jobs as well as the larger issues related to their overall careers. Although these women were in high-ranking positions, with the power and privilege that ostensibly accrues to holders of such positions, they nevertheless had difficulties in negotiating the heterosexism of their organizational settings.

While the women in this study are all out lesbians, they are cautious and strategic about coming out. The process of coming out is not a static, finite process. Rather, coming out is an iterative process that is negotiated every time a lesbian enters a new situation such as a new organization, workgroup, client, superior, subordinate, or committee. The literature speaks of coming out strategies (Fahy, 1995; McNaught, 1993; Signorile, 1995) in terms of providing prescriptive measures that a gay or lesbian can do to come out. Yet there is little if any literature that addresses the complexities and contingencies of the corporate setting, where people's views, beliefs, and reactions are mixed. The experiences of coming out described by the women in the study substantiate the literature that describes the coming out process as a risky endeavor because doing so potentially jeopardizes career mobility and opportunities (Fassinger, 1996; Folbre, 1995; Morgan & Brown, 1991; Welch, 1996). In other words, the women were constantly aware of the risk involved in coming out and they moderated that risk with their pre-screens. In doing so, the women successfully used caution, assessment, and strategy when coming out in order to mitigate any adverse affects on themselves or their careers.

Lesbians have learned informally and incidentally to negotiate the heterosexism of their organizational settings. Therefore, the lesbians who do succeed in such negotiations are involved in a process of learning that began upon their entrance into their organizations and continues for them. In the absence of any formal training or education, therefore, these women have learned through their experiences how to successfully negotiate their organizational settings. Informal learning includes trial and error learning; mentoring; and coaching; whereas incidental learning is learning that occurs as a byproduct of another activity (Watkins & Marsick, 1992). Sometimes their learning is actually intentional as they seek information (such as dealing with Human Resources regarding benefits information and such) and many other times, the learning happens without plan, and because the subject somehow came up and the women had to handle the issue.

It was not enough for the women in this study to come out on an individual level. Rather, they felt a responsibility for educating their associates about issues and matters related to being lesbian. This education fell into two categories: 1) serving as educators by being living examples of lesbians who were "normal people," and 2) directly educating by teaching other organizational members about heterosexism and addressing issues of being a lesbian in the corporate setting. The responsibility felt and demonstrated by the women connects to the literature on lesbian identity development because only by having strong and cohesive self-concepts as professionals and as lesbians did they have the courage and integrity to serve in such a role. The literature on lesbian identity development describes stages (Fassinger, 1995; Mobley & Slaney, 1996; McNaught, 1993) which progress from awareness of same sex attraction to acceptance to synthesis and integration into a lesbian's psyche, behavior, and interaction with others. The women in the study were at the highest stage of lesbian identity development, in which their awareness and integration of their lesbianism was complete. Because the women were comfortable with themselves and their orientations, they could with facility bring about awareness and education to their associates about issues of homophobia and heterosexism. After all, it was not enough, after coming out individually, for them to come out. They felt that when a teachable moment presented itself—that is, an opportunity to teach an associate about an issue that had probably not crossed their mind—they were responsible to provide this awareness for the sake of other lesbians.

The implications of this study for Human Resource Development are that lesbians in the corporate setting need to be recognized by HRD researchers and practitioners as a unique group and not subsumed into the grouping of
heterosexual women or gay men. They need to be studied as a separate group so that HRD can address those unique
differences and needs. The learning needs of lesbians in the corporate setting must be made part of the HRD
training and development agenda. Moreover, the training and development agenda must involve the entire
organization and not just for lesbians, in order for HRD to make a meaningful impact, as the heterosexism of the
entire organization is what creates and perpetuates the unique learning needs of its lesbian members.

Internationalization: Learning Processes in a Greek Manufacturing Group

Patricia S. Sherrer
Georgia State University

This qualitative study based on gaps in the literature tested individual and organizational learning theories for use by HRD professionals in the practice of facilitating internationalization. Research on topics about cognitive, reflective processes in internationalization lag behind that of behavioral dimensions. Participants report leadership practices and identities of expertise influenced by Greek culture, incidental learning of other cultures, and individually motivated career paths in an implied context. Cultural influences of learning processes need more study.

Keywords: Internationalization, Organizational learning, Cultural learning

Findings help HRD practitioners understand those engaged in internationalization and proposes how culture influences individual and organizational learning processes during this change.

Problem Statement

Based on gaps identified in the literature the purposes of the study are first to increase our knowledge of new theory in the facilitation of internationalization change. Then it attempts to gain a holistic, contextually grounded view of the internationalization process for both individuals and organizations outside the U.S. Finally, it proposes to extend prior research in internationalization processes and cultural learning with the aim of improving practice of those HRD professionals engaged in internationalization change.

Internationalizing organizations are learning to be international from the first cross cultural interaction, however, research is more often focused on active, visible doing elements of this change in studies with topics about structure and strategy. International joint ventures and strategic alliances (Barkema, Shenkar, Vermeulen, & Bell, 1997; Larsson, Bengtsson, Henriksson, & Sparks, 1998), international (Barkema & Vermeulen, 1998) as well as domestic (Greening, Barringer, & Macy, 1996) expansion decisions have recently begun describing organizations as systems of learning. Briody & Baba (1994) in a study of U.S. and international merging divisions found knowledge, experience, and collaboration to be recognizable types of learning in internationalizing organizations. Theory has not been used in these instances to offer simple explanations, define applied problems in new ways, or help to focus on problem solutions by discerning priorities (Campbell, 1990).

Research on links between individuals and organizations suggest mutual influences occur during organizational change through organizational processes. While individuals report that collaboration and leveraging of cultural differences are reported as useful in reaching internationalizing goals (Center for Creative Leadership, 1997; Yeung & Ready, 1995), U.S. repatriates report varying organizational attitudes about what skills repatriates have to offer on their return from assignments (Black, 1992; Briody & Baba, 1994; Harvey, 1989). Other implicit organizational processes such as perceptions of career path or status acquisition were found defining attributes of employment in a U.S. organization during organizational change (Briody, Baba, & Cooper, 1995). Another study found internationalizing employer practices to be mediators of expatriate organizational commitments (Guzzo, Noonan, & Elron, 1994). Eisenhart (1995) found that individuals through production of new ideas and public performance add to collective ways of thinking and acting thereby changing culture in organizations. Research is needed to further explain what processes facilitate internationalization change between individuals and organizations.

Individual internationalization processes have been studied as isolated, behavioral topics, without theory (Black, Gregersen, & Mendenhall, 1992; Mendenhall, Beaty & Oddou, 1993) and in largely American owned organizations (Adler & Boyacigiller, 1996). These studies of cross-cultural training (Black & Mendenhall, 1990), expatriation (Black, 1992; Briody & Chrisman, 1991; Dunbar, 1992), and repatriation (Harvey, 1989) found the routine need and use of cultural knowledge as people work in ambiguous intercultural situations. Cultural learning study among American expatriates (Taylor, 1994) and subsequent review (Taylor, 1997) calls for more holistic and contextually grounded study. In this manner, a qualitative case study exploring how individual learning processes based on theory facilitates internationalization in a context outside the U.S. was needed.
Theoretical Framework

Two untested theories are used as frameworks for this study. First Cowan's (1995) theory of organizational learning was chosen because it is based on the thinking of indigenous people; developed over generations of observation it describes how organizational wisdom might be created. Then Tomasello, Kruger, & Ratner's (1993) theory of cultural learning was chosen because it theorizes how we first learned our own cultures; learning unfamiliar cultures is proposed for study as a similar process.

Cowan describes wisdom, not as expertise but built on a collective, collaborative behavior, and thinking in organizations among knowledgeable and experienced people where comfort with ambiguity is desired. Cowan's explanation of how learning in organizations takes place is outlined as forming connections between organizations and individual members: a) developing a both, and mentality that is moving from a separation of learning and performance to learning from every organizational relationship, b) replacing linear, experts with circular models of reexamination, reformulating, rethinking what has been learned, while continuing to learn anew, c) shifting from short-term operational strategies of variety reduction to a long term survival strategy of balance between consistent core competencies and keeping in touch with changing environments, d) integrating knowledge and experience to form organizational wisdom by providing opportunities to make nonexpert decisions/choices about organizational processes in the face of uncertainty and ambiguity.

Links between individual and organizations that guide practice have been detailed by other theorists (Argyris, 1976; Schein, 1992), reviewers of theorists (Dixon, 1992), and researchers (Inkpen & Crossan, 1995). Cowan's ideas about learning parallel those of Argyris' description of double-loop learning and are consistent with populations who attend to naturally occurring patterns of meaning and learning like those working in ambiguous cross-cultural settings. In this manner, Cowan's theory was appropriate for studying organizations in cross-cultural environments.

The second theory proposed as a theoretical framework is Tomasello et al.'s (1993) cultural learning theory is described an individual learning culture by imitation, instruction, and collaboration. Collaboration is a situation that consists of peers collaborating to construct something new that neither had before the interaction began. The new cognitive representation resulting from the learning includes something of the perspective of the interactional partner, a perspective that continues to guide the learner even after the original learning experience is over.

In change theory unfreezing, moving, and refreezing may be facilitated by learning through the reduction of barriers that Lewin describes as negative forces triggered by new or disheartening information. Like the loss of equilibrium described as the first step in cultural learning (Taylor, 1994; 1997), Lewin likens the loss of equilibrium to diagnosis. Moving, the next stage in change, means changing attitudes, values, and beliefs. Refreezing means reaching a new status quo through some support mechanism. While learning facilitates change, not all learning produces change. Both Lewin and Cowan suggest returning to earlier levels of diagnosis or loss of equilibrium, not because of forgetting but to be open and continually receptive to the next move in attitudes, values, and beliefs (Cowan, 1995; Lewin, 1946).

While competing theories support and explain change, learning theories are suggested here because they might be used to guide the practice of facilitating change. In this manner organizational and individual learning theories were chosen for possible use by HRD practitioners. The following questions were unanswered in research.

Research Questions

How do individuals learn cultures that are not their own? How does actual versus expected career path influence members of the internationalizing organization? How do internationalizing organizations use the learning of their members for competitive advantage? What factors align all elements of the organization with its international environment?

Methodology and/or Research Design w/ Limitations

Qualitative study of an organization outside the U.S. was chosen due to a gap in the literature for this type study (Adler & Boyacigiller, 1996; Mendenhall et al., 1993). Despite the language barrier and time limit, this design helped understand the processes that lead to outcomes that survey research were not able to identify. Sampling reflected participants who had worked internationally for an average three and one half years for intensive study (Bernard, 1995). Ethnographic interviews, observation, and artifact review methods were used to gather data from English-speaking Greeks in separate pilot and case study organization. Both samples were Greek-owned manufacturing groups engaged in internationalization in October, 1999; the studied organization since 1987.
The researcher studied people in their context, attempting to make sense of processes used in internationalization and what meanings people brought to that engagement. A major strength of qualitative studies is their ability to examine processes. Ethnographic interviews with participants led to insights that revealed implicit processes, making them explicit. A model of internationalization and the role of learning processes involved in it were developed based on the following method guidelines (a) the need for context-based data, (b) the importance of reality grounded theory to the development of a discipline, (c) the interactive role of people in shaping their worlds, and (d) the interrelationships among conditions, meaning, and action (Maxwell, 1998). In this manner, using the data collected, I examined untested theory, posing useful propositions for further testing.

Grounded theory methods were used to analyze study data. All interviews were conducted by the researcher and transcribed in English (Spradley, 1979). Pilot study provided a needed conceptual context for the researcher, both about Greeks working internationally and Greek internationalizing manufacturing organizations. Nine interviews were conducted with English-speaking Greek members of a Greek-owned manufacturing organization headquartered in Marousi, north of Athens, Greece and at a manufacturing plant on the National Lamia Hwy outside Athens. Four additional informational interviews were conducted where present and future growth strategies through acquisition and merger were reported along with leadership development strategies.

The organization studied was a Greek-owned paper manufacturing organization headquartered in the Pefkakia area of Athens, Greece. The domestic operation was established in 1980 in the Thrace region of northern Greece and continued as the organization began internationalizing in 1987 in Egypt, adding two plants in Hungary in 1994 and one in Bulgaria by 1997. The original founder-leader remained the President and owner in late 1999 at the time of the study.

Cairo, Egypt was a greenfield, start-up operation, the first tissue manufacturer in Egypt. Plants located in Hungary and Bulgaria were acquisitions made at the end of government controlled enterprise regionally. Despite a historically agrarian economy with 25% of its GNP (Smith, 1999) from manufacturing, Greece's European Union status, the end of Cold War political strategy and general trend toward privatization of industry regionally were situations producing opportunities where none had existed before. With a newly active stock exchange, lowered inflation and unemployment for acceptance into the Euro monetary exchange, Greece in late 1999 offered the context of a changing environment for internationalization suggested by researchers (Alder & Boyacigiller, 1996).

Thirteen interviews were conducted over a period of five and one-half weeks in September and October of 1999. All participants were Greek and worked in the domestic operation in Greece before working in Egypt, Hungary, or Bulgaria. International work experience spanned from one to five years; each was identified by the organization before the study began. Five were educated outside Greece for postgraduate education. Participants' occupations were at the upper and middle management levels; the Human Resource Director was the only woman. Five of the 13 participants were repatriates. Three repatriates had taken their wives with them on their expatriate assignments for up to five years; at the time of the study three were the headquarters upper management level of the organization. The average age of all 13 participants was 35.

Participant observation included establishing a rapport with the participants. This served as one of the multiple methods used to both collect and triangulate data in the study using the method of constant comparison (Strauss & Corbin, 1990). Document review was also used to both collect and triangulate data between the interview findings, detailed field notes and diary entries.

Data analysis was performed on 13 transcribed interviews according to Strauss & Corbin (1990). Member checks were conducted using transcribed interviews of the one un-taped and two telephone interviews to ensure validity of information. All interviews were printed, coded, and archived using Nud*ist data management software.

Attention to validity was also made in this case study by providing a clear explanation of the phenomenon under study and attempting to control biases (Bickman, Rog, & Hedrick, 1998) through a framing interview conducted with me by an outside researcher. Limitations of this study were 1. Findings reflect a management perspective. Sample was upper and middle management level that could speak English and were willing to participate. 2. Ethnocentric bias of the findings. Despite the literature review that as much as possible reviewed studies conducted outside the U.S., a large pilot study conducted in Greece, and member checks throughout, the findings have been filtered through the U.S. researcher. 3. Language while not an impassable barrier prevented my gaining entrance to meetings that were held in Greek, making those secondary accounts not directly observed. 4. Time scarcity was a limiting factor giving only the snapshot of the change and the organization.

Results and Findings

Energizing prospects, becoming international, and gaining respect were three recurring themes developed into major
categories from 22 initial codes in the data. Energizing prospects were those happenings that led to the development of internationalization, becoming international were those specific properties that pertained to internationalization, and gaining respect included outcomes or perceived results of the participants having worked internationally. Intervening conditions reported and observed were Greek culture through social relationships in individual learning processes and leadership thinking in organizational learning processes.

Participants reported learning incidentally (Cseh, Watkins, & Marsick, 1999) as part of becoming the Greek International Man (term inferred from data, not used by participants). They described first trying to understand the "mentality" of the cultural other, then often instructing other Greeks who came later to work or tour about the other culture. This was described as "the nature of the job". Collaboration was often reported as problem solving which happened daily in cross-cultural work "to get the job done"; solutions were not Greek or representative of the other culture but could only be achieved using the "language of the job". This learning process was facilitated by the organizational use of translators initially and the presence of language training, while not always convenient logistically and was expected to be obtained after hours, part of an incidental learning process.

Greek teams were sent in to "maintain Greek levels of efficiency" e.g. improve profitability, in some cases teach the principles of private enterprise with regard to sales, finance, marketing, and in others teach improved manufacturing technical knowledge. These ambiguous cultural contexts found participants relying on building social relationships with the other culture; socializing with others is an integral part of Greek culture and was reported by participants as relied on to facilitate learning. Individual Greeks, without others in the field, found this more difficult and caused more trips home for some (no location was more than about an hour flight away) or the need to communicate more with headquarters. Organizational culture was a constraining condition as expertise was valued among leadership, modeled after the founder-leader; upper level managers described themselves as "instructors" and "telling others". Greek cultural beliefs of closure were found in leadership thinking where those in authority were perceived as experts who could solve problems.

Greek organizational members reported a belief in the experience of organizational leaders as a competitive advantage. Collaboration between headquarters and plant level management was replaced by "telling" behavior from headquarters to plant. There was no participation or collective use of the learning processes or their outcomes reported. More participants than not were energized by the prospect of "learning more, faster" in cross-cultural contexts than at headquarters. An organizational culture of expertise aligned this organization with the environment.

Individual career development was intrinsically motivated in an organizational context where career path and performance review was implied, not explicit. Organizational career path was determined by a benevolent, experienced Founder-Leader. Job descriptions existed but were "not paid attention to". Infrequent firings were due to an inability to adapt. While some family members were in upper and middle management positions, not all were as is the case in many Greek-owned organizations. HR Director’s tenure was four years and replaced a payroll clerk position.

Boundary spanners were reported as invaluable in day to day operations, often acting as mentors for onsite Greeks from headquarters. Dixon’s (1992) label of boundary spanners was used in the study to describe those Greeks or host nationals who could speak both languages (Greek and the one needed at the time). For example, Greek participants utilizing Egyptians in sales and factory positions where no tissue manufacturing existed reported a Greek employee who spoke and had lived in Arabic countries as instrumental in creating a sales force; also in this setting was the use of an Egyptian who was a mediator between Greek managers and Egyptian factory floor employees. Boundary spanners are among the outcomes of cultural learning.

Conclusions and Recommendations

Organizational culture required not only the incidental learning of other cultures but also development of a Greek International Man identity. Embodied by the Greek founder-leader in this organization the identity was devised to get along in the organization. Components of this identity included a) college education, cultural learning experience b) multilingual (avg. was three), c) willingness to travel, sustaining a variety of time periods away from home, d) willingness to learn and change in an organizational context that is slower to do so, but will provide individuals the opportunity, e) become a cultural evaluator, modifying your own cultural attributes, adopting those of other cultures that you find useful, f) maintain a level of efficiency that is close to that of the home culture, g) form relationships with the cultural other, h) occupation, i) gender, j) maintains individual career path in an organization where the path is not explicit.

Since culturally influenced learning and the leadership consequences it creates are the context of international work, information about, experience with, and participation in cross-cultural collaboration for organizational outcomes are suggested as important elements of internationalization. However, the added elements of the Greek
International Man yield a storyline about internationalization that is inclusive of reality, more than learning alone. While in need of further study, this begins a dialogue about the HRD perspective of internationalization change; adding to research about strategy, and structural changes, this suggests the profile of individuals who could believe and value change as well as the processes that facilitate change.

Support in the data of Tomasello et al. (1993) individual cultural learning theory suggests that this theory comes closest to the thinking parts of what happens in the process. Taylor (1994) described a behavioral view of cultural learning including triggers and outcomes but in later study (Taylor, 1997) he describes gaps that were cognitive, affective, and unconscious. In need of further testing, Tomasello et al. (1993) and this supporting data suggest a cognitive level of the process that might be facilitated by HRD practitioners that brings about change in individuals to “get the job done” internationally.

Greek culture is a barrier to organizational collaboration, Cowan’s (1995) level of organizational learning needed for transformative change. Herzfeld (1986) supports the evidence of closure in Greek culture; he writes that those who ask for cures in a curer relationships are often seen as weaker, that the state of needing help is undesirable. In a culture where expertise was valued and closure as a cure for problems was the norm, organizational collaboration was not found.

Culturally influenced leadership affected individuals in the organization while individuals were only beginning to move in the direction of influencing the leadership; this finding suggests some evidence of the need for collaboration beginning. This finding supports the work of others who suggest that individuals influence organizational processes (Briody et al. 1995; Economist Intelligence Unit, 1991; Eisenhart, 1995; Guzzo et al, 1994). The common element of both individual and organizational learning was theoretically proposed as collaboration, however, organizational collaboration was not found. This is supportive of the practitioner work of Argyris (2000) who writes that transformative learning is often resisted in organizations. HRD practitioners might focus on the participative, collective elements of collaboration, nonexpert thinking suggested by Cowan and Argyris. More research is needed to identify how culture might be used to the advantage of HRD professionals; for example, Greek use of social relationships and concern for a common social outcome might be useful to begin intervening with a more participatory approach to leading.

Serving as an integral context for the internationalizing individual, the internationalizing organization was found to be reflective of the national culture in which it operates. The findings of this study are exploratory regarding a shift in perspective in international HR from a preparation point of view to a benefit point of view as suggested by Inkson, Arthur, Pringle, & Barry (1997) and in need of more research in other contexts. HRD professionals could begin informal dialogue about the use of the learning processes of experienced individuals with collaborative ability and their possible participation in collective decision making thereby initiating a nonexpert, point of view through modeling.

Transformative elements, implied in all learning organization theories, suggest a fundamental change in the way individuals relate in organizations, from a control orientation to an organization that values collaboration and collective decision making. Transformative learning a type of revolution in the thinking of organizational members is based on systems theory ideology that the whole is more than the sum of its parts. Development rather than control suggests that all organization participants are interested in achieving goals as well as long-term sustainability of organizations.

**How this Research Contributes to New Knowledge in HRD**

Culture of the headquarters organizational leadership must be considered as well as the proposed unfamiliar cultures. Data suggests that the culture of the ownership organization impact on the learning process is a powerful determining factor in how internationalization will be reconciled in the workplace. While it is not new that people come to the workplace with beliefs and expectations met by leadership and processes, all of which are influenced by the culture of the organization's leaders, this data suggests that culture influences learning processes that then influences all of the above. Issues HRD professionals in internationalizing contexts need to be aware of are (a) knowledge of both your own culture and the other culture is part of becoming international, (b) individual career expectations and leadership ability to collaborate can be culturally influenced, and (c) internationalization includes more than learning.

It increased explicit knowledge about how both individuals and organizations learn to be international through the use of theory, prior research gaps, and the data gathered in this study. An added value of the study is in the study of a sample outside the U.S., Greece in particular. There were few studies of Greeks, none about international HR in Greece, and only one study using a Greek manufacturing context.

This information begins to help HRD professionals discern what is important and what is not in
internationalizing in order to help individuals develop and organizations strategize. With regard to the cadre of people who are developed as a result of international work, this research is exploratory possibly termed a proposed theory in use (Argyris, 1976). To the degree that community and familial expectations are continually important in organizations, culture affects learning.

Phenomena like the Greek International Man and the "curer" were found along with transitions in learning reported in break away thinking of some participants signal the beginning of a transition in learning. The Human Resource Director was making changes incrementally through an informal, familial relationship with the Founder-Leader. Data compared to the models of individual learning and organizational learning resulted in models for use by HRD practitioners that come close to reality. Explored were untested theories. It added to the research on elements of cultural learning found in Taylor (1994; 1997). Finally, it entered the dialogue of HRD theory development to guide practice in internationalization in the workplace.

HRD, Feminism, and Adult Education: A Foundation for Collaborative Approaches to Research and Practice

Yvonne M. Johnson
Northern Illinois University

HRD professionals, feminists and adult educators seek to improve the workplace for individuals but often operate in isolation rather than in partnership. Collaboration between the groups would serve to expand the literature bases of all three areas by providing a breadth of approaches to research and practice rather than narrow perspectives. This paper identifies common interests among HRD professionals, feminists and adult educators and opportunities for collaboration to advance the three areas.

Keywords: HRD, Feminism, Adult Education

HRD professionals, feminists and adult educators have common interests but seem to operate in different spheres of higher education, business communities and society. The groups often criticize each other for not addressing key issues that impact adult learning. For example, HRD practitioners may criticize adult educators for not considering business forces that shape HRD policy and decisions. Conversely, Feminists may criticize HRD for not addressing the needs of women in the workplace while adult educators may criticize HRD for catering to business goals without consideration of individual adult learners. All of the groups are concerned with adult learning in the workplace but use different frameworks to conduct research and practice.

Collaboration between HRD professionals, feminists, and adult educators would provide opportunities for increased understanding of the alternative views and expanded opportunities for partnering in research and practice. Partnerships would allow practitioners and academicians to cross conceptual boundaries and address adult learning issues that have traditionally been isolated to specific areas of HRD, feminism, or adult education rather than addressed across conceptual frameworks.

This paper will describe the areas of HRD, feminism, and adult education and identify common interests among the groups. Critiques of research in these three areas will also be reviewed to problematize the current situation and suggest factors that may perpetuate the divisions between HRD, feminism and adult education. Links between the three literature bases will be identified to provide the foundation for collaborative efforts across the conceptual frameworks of HRD, feminism and adult education.

Problem Statement

As the HRD field emerges, critique of theoretical frameworks and practices is required to prevent reproduction of theory and practices that maintain the status quo (Bierema & Cseh, 2000). Limiting HRD to maintenance of the status quo perpetuates unequal, gender-based power relationships that exist in the U. S. society as a whole. The increased participation of women and other marginalized groups in the full-time workforce create opportunities and dynamics that companies cannot afford to overlook in the competitive global marketplace. Concurrently, the changing demographics of the U.S. workforce need to be addressed by HRD programs directed toward employee development.

HRD professionals manage multifaceted programs for individual, career and organizational development in the increasingly complex global marketplace (Gilley & Eggland, 1989). In spite of the complex and sensitive issues faced by HRD practitioners, research related to knowledge construction in the field of HRD has been limited in scope. Bierema and Cseh (2000) reviewed HRD research and concluded that prevalent workplace issues such as: "diversity, equality, power, discrimination, sexism, or racism" (p. 141), were not a primary focus in the HRD literature. They also argued that "despite more equal opportunity, women are still segregated into typically "female" careers, and the wage gap persists" (p. 141). Failure to explore prevalent HRD issues, such as diversity, sexism, and power relationships perpetuates the marginalization of groups, such as women who have limited power in the workplace (Johnson, 2001).

Methodology and Propositions

The purpose of this paper is to review HRD, feminist and adult education research to identify topics, problems, and common interests among the fields. First, topics addressed in HRD research, feminist HRD research, and adult education research will be identified. Second, critiques of the three literature bases will be reviewed to problematize the current situation and to identify factors that may perpetuate the divisions among the three fields. Third, HRD, feminist and adult education literature bases will be referenced to identify common interests and the foundation for collaborative efforts to bring together the disparate literature bases of the three fields.

Conceptual Framework

The author recognizes the wide spectrum of perspectives and theories that are encompassed by the fields of HRD, feminism and adult education. For the purpose of this paper, Gilley's (1989) model of HRD and Tisdell's (1998) model of feminist pedagogy will be used. Portions of the adult education literature base will also be referenced to complete the analysis. Due to the broad and inclusive scope of the HRD, feminist and adult education literature bases, it is beyond the scope of this paper to address all of the perspectives and theories of these three areas or to make broad generalizations about the three fields.

A Glimpse at the Field of HRD

HRD is gaining prominence due to increased global competition. Many business leaders seek to maximize employee performance through HRD programs. Gilley and Eggland (1989) described HRD as the integration of individual, career and organizational development. Individual development relates to acquiring or improving performance and skills for the current job while career development prepares an employee to develop skills for future jobs. Gilley and Eggland indicate that the OD component of HRD assists organizations with reaching the highest level of efficiency by creating "congruence among the organization's structure, culture, processes, and strategies within the human resource domain" (p. 15). The focus of all three components of HRD is individual performance that supports enhanced efficiency and productivity in the workplace.

Descriptions of the HRD field have been further expanded to acknowledge relationships between business leaders, organizational context and HRD programs. Walton (1999) indicates that chief executive officers and top-level managers are driving forces behind many HRD programs. Business executives often use "mainstream strategy literature and thinking...to prepare and position human resources in the competitive marketplace" and are not concerned whether HRD professionals are included in the program or policy development processes that directly impact HRD programs (p. 7). The exclusion of HRD professionals throughout development of key HRD policy decisions can negatively impact the success of programs since the business leaders who developed the policies may lack knowledge of how individuals learn. Clearly, this situation provides an opportunity for HRD to learn from the adult education community.

The impact of mission statements and strategic plans that guide organizations cannot be overlooked when HRD program goals are discussed. Swanson and Arnold (1997) assert that HRD practitioners who operate in organizations are responsible for developing programs that directly support the overall mission and goals of the organization to whom they are ultimately accountable. According to Swanson and Arnold, adult learning programs developed within the context of organizations are the juncture where adult learning becomes HRD since the "rules and requirements of the organization" govern the HRD programs (p. 650). Again, HRD and adult education interface in the workplace.

Overall, the focus of HRD research includes issues related to individual development, career development, organizational development, strategic HRD plans, and other issues related to bottom-line business results. Common HRD research topics identified by Bierema and Cseh (2000) include: "integrity, globalization, teams, employee development, learning on-the-job, new technologies, transfer, evaluation, organizational change, training effectiveness, partnership research, and roles in HRD" (p. 141). The foundation of most HRD programs and research has been individual performance improvement within an organizational context.

Critiques of HRD Research

The emphasis of HRD programs and research driven by performance-based outcomes and bottom-line business results have generated lively debates between HRD professionals, feminists and adult educators. Cunningham (1992) argues that "learning for earning" has become a primary focus of North American adult education due to the
emphasis on "efficient and effective production" (p. 180). She refers to HRD as "the hand-maiden of industry serving it obediently by training human capital via HRD" (p. 181). To address the deficiencies of HRD, Cunningham suggests critical pedagogy as a framework that can equalize power relationships in the workplace by connecting "biography with social structures and the transformation of that structure to allow for more equal power relationships" (p. 186).

Others criticize HRD research by noting topics that are conspicuous by their absence from the traditional HRD research literature. Bierema and Cseh (2000) indicated that the field of HRD "has not progressed to addressing undiscussables related to gender and diversity...this silence only contributes to a discourse that marginalizes women... HRD needs to address workplace discourse and how it silences, teaches and oppresses humans" (p. 145). Reviews of HRD research indicate that business goals are the primary focus and issues related to women and marginalized groups do not comprise a significant portion of the HRD literature base.

Others challenge the human capital focus. Hart (1995) argued that the dominant discourse on work centers on human capital and demographic changes, which in her view "leave no room for optimism" since the new workforce that includes more women and other marginalized is characterized as having deficiencies in critical skills (p. 101).

Critiques of HRD have argued against the focus on bottom-line business results and criticized the field's lack of attention to diversity, sexism, racism and other forms of oppression. In spite of HRD's focus on performance-based business goals, HRD programs are frequently cut when fiscal resources are limited.

HRD Issues that Warrant Further Exploration

The HRD challenge to maintain adequate resources for programs raises questions that may warrant further research. Does the vulnerability of HRD programs in the business arena suggest that HRD is a marginalized activity? In many organizations, HRD has been positioned separate from "core business" units on the organization charts. Does the marginal status of HRD cause the field to struggle to gain acceptance and credibility within the organizational context? Does the HRD struggle cause some practitioners and theorists to align HRD with business objectives to gain strength and power for the HRD field? Are different strategies required for HRD to equalize power relationships in the workplace? Can HRD learn from feminists and adult educators concerned with workplace learning? These questions could provide a foundation for partnerships between HRD, feminists, and adult educators aspiring to improve workplace learning.

Excerpts from the Feminist Voice

Feminists approach HRD research from a different perspective than HRD researchers. Gender is a primary research construct for feminists and females are the focus of research (Tisdell, 1998). At the fundamental level, feminists "seek economic, social, and political equality between the sexes" (Bierema & Cseh, 2000, p. 142). Common themes that occur in feminist research include: knowledge construction; voice; authority and positionality (Maher & Tetreault, 1994).

Tisdell (1998) explained that feminist research has been conducted under psychological, structural, and post-structural conceptual frameworks. The psychological framework focuses on characteristics of the individual, female learner. Voice, knowledge construction and safety of the learning environment are themes that are addressed under the psychological model. Structural frameworks explore power relationships, as well as, systems of oppression and privilege based upon gender, class, race, and others that impact learning and the daily lives of individuals. Structural models also analyze the "politics of knowledge production in what gets passed on as "official" knowledge in the curriculum and who determines it" (p. 142). Lastly, the post-structural framework deconstructs the "dominant discourse, to lay bare its underlying assumptions" related to individual learners, as well as social, political and other structures that impact daily life (p. 145). The psychological, structural and post-structural feminist conceptual frameworks have been used to conduct and critique HRD research and practices.

Psychological Feminist Research Framework

The feminist psychological framework focuses on individual, female learners. Belenky, Clinchy, Goldberger, and Tarule (1997, rev. ed) applied the feminist psychological model to expand the breadth and depth of research by analyzing knowledge construction strategies of women.

Belenky, et al. (1997) identified five "Ways of Knowing" (WWK) including Silence, Constructed Knowledge and others. The authors recognized that most of the women interviewed did not see themselves as constructors of knowledge or capable of intellectual thought. Interview data also indicated that women wanted to be accepted and
respected as valuable contributors to the educational process rather than "being oppressed or patronized" (p. 196). The Belenky, et al. (1997) research could be used to inform HRD practitioners concerned with creating a learning environment that supports women.

In summary, psychological feminist research emphasizes the importance of "psychological and developmental emancipation of women as individuals" (Tisdell, 1998, p. 142)." The focus of psychological feminist research is the individual rather than social or organizational structures.

Critiques of Psychological Feminist Research Framework

The psychological feminist framework has been criticized for emphasizing the individual woman and not addressing issues related to race, social class and structures (Tisdell, 1998). Goldberger (1996) explained that the original WWK conceptual framework was "culture-bound" by the authors who shared some common life experiences. She reframed the Belenky, et al. (1997, revised ed.) WWK as different strategies that comprise an individual's repertoire of methods of making meaning. Goldberger addressed issues related to society and ethnicity that were not addressed by the original WWK framework.

Swanson and Arnold (1997) criticized psychologically oriented research focused on the individual and argued that "those on the learning side (focusing on individuals) of the debate are not so naïve to think that organizational goals and performance are irrelevant to HRD" (p. 650). The message seems to be that individuals working in organizations are not functioning in isolation from the system within which they work but must work in partnership with the organization. Consequently, focus on the individual without acknowledging the organizational context is inadequate in Swanson and Arnold's view.

Critiques of the psychologically oriented feminist framework focus on the lack of attention to race, social class, and structures that impact individuals. HRD researchers have also suggested that individuals do not work in isolation from the organization structures in which they work; therefore, psychologically oriented research is not complete. The critiques of feminist psychological research could be addressed through collaboration between HRD professionals, feminists, and adult educators who could inform each other on structural, feminist, and educational issues.

Structural Feminist Framework

Structural feminist research deals with power relations and interlocking systems of oppression based on gender, race, class, age, and other factors that are not addressed under the psychological feminist model (Tisdell, 1998). According to the structural model, education is related to sociocultural values, which may differ based upon class, gender, and race. In addition, the absence of women of all races from curriculum reproduces the societal systems of oppression that encourage subservience of women in educational situations and society in general (Tisdell, 1993).

Kanter (1993) utilized the structural feminist framework to describe the roles of men and women within large, complex organization structures. Kanter placed the responsibility for employee behavior on the organization structure that governs policies and procedures rather than on the employees. According to Kanter (1993), options are not "equally available" in organizations due to "...self-perpetuating cycles and inescapable dilemmas posed by the contingencies of social life" (p. 10). Overall, structural feminist models focus on "social structures or systems of oppression such as patriarchy or capitalism" (Tisdell, 1998, p. 142).

Critiques of the Structural Feminist Research Framework

The structural feminist models analyze the impact of structures on learning and knowledge construction. Due to a lack of emphasis on individuals, structural feminist models have received criticism. Structural feminist models prioritize gender but do not account for the individual's ability to have some control over one's decisions and actions within the organizational and social structures (Tisdell, 1998). Structural models also emphasize the importance of challenging power relationships but do not account for one's positionality within the organizational and social structures.

Poststructural/postmodernist Feminist Research Framework

Poststructural feminist research analyzes the interrelationships between individuals, power structures, social structures, positionality, social class, race, gender, and other factors. "Some authors use the term poststructural while others use postmodernism; for the purpose of this paper the terms will be used interchangeably" (Tisdell, 1998, p.
Tisdell (1998) explained the four primary elements of poststructural feminist conceptual framework. First, poststructural feminists “argue for the significance of gender with other structural systems of privilege and oppression...race, class, sexual orientation.” Second, poststructural feminism “problematizes the notion of “Truth.” Third, poststructural feminists acknowledge the concept of “constantly shifting identity” and the idea that there is “not one Truth.” Lastly, poststructural feminism “deconstructs categories and binary opposites such as white-black; heterosexual-homosexual; man-woman; and theory-practice...and rational-affective” (pp. 146-147).

Other authors have explained knowledge construction and power relationships addressed by the postmodernist models. Merriam and Caffarella (1999) explained that “postmodernism criticizes the modern conception of knowledge as a set of underlying principles that can explain behavior or phenomena across individuals or settings” (p. 349). Overall, the poststructural framework embraces multiple realities and multiple truths, which is different from a positivist framework that searches for one truth. Goldberger (1996) utilized a poststructural feminist framework to expand the original WWK (Belenky, et al., 1997, revised ed.) research by interviewing bicultural women and men. According to Goldberger (1996), marginalized bicultural people are those who live “at the juncture between two cultures and can lay a claim to belonging to both cultures, either by being of mixed racial heritage or born in one culture and raised in a second” (Goldberger, p. 365).

Goldberger (1996) used information obtained during bicultural interviews to expand the WWK silence(d) concept (Belenky, et al., 1997, rev. ed.) by explaining the interrelationships between individual learners, political structures and social structure information. The multifaceted nature of the silence(d) WWK was highlighted during interviews with Native Americans and other indigenous people who explained the importance of understanding “when not to speak” in accordance with their cultural norms. Goldberger (1996) suggested that silence is not valued in the United States (U. S.) as it is valued in some other cultures, which may be linked to Triandis’s (1989) explanation of the importance of silence in cultures that value social interconnections rather than individualism (Markus & Kitayama, 1991). The devaluation of silence in the U. S. can lead to misinterpretations of silence as an effective strategy for making meaning.

The constructed knowledge WWK (Belenky, et al., 1997, rev. ed.) was also expanded by Goldberger (1996). The bicultural interviews lead Goldberger to understand constructed knowledge as a way of making meaning that was flexible, contextual, relational, ethical and impacted by political and cultural forces. Goldberger explained that constructed knowledge involves the ability to assess situations and utilize the most effective strategy for making meaning based upon facts and circumstances of the context. The new description of constructed knowledge reflects the importance of social structures and political forces that were not addressed by the Belenky, et al. (1997, rev. ed.) original definition that focused on individuals.

Hayes (2000) also used a post-structural framework to explain women’s learning, diversity and other workplace issues. Women were often hired for part-time positions that have less benefits and fewer training opportunities than men receive since many organizations still view women as temporary workers or the second wage-earner in the family. Hayes also explained some workplace strategies that catapult men to the top ranks of organizations may not be effective for women because these behaviors "conflict with the (concept of) feminine behavior" (p. 36). Further, Hayes explained the "subtle biases" of career counseling models that serve to keep women in lower status, less powerful professional positions.

Post-structural feminist research also addresses the issue of "positionality." The positionality of the instructor and of the students are considered key elements in classroom and other learning environments. For example, Tisdell (1993) indicated that students interact differently based upon the gender, race, social class, and other positional characteristics of the instructor. Workplace learning that involves employees, trainers, and managers is also impacted by the positionality of those involved in the process.

Overall, post-structural feminist research addresses a wide spectrum of interrelated, complex factors and accounts for issues raised by both the psychological and structural feminist paradigms. In addition, post-structural feminist research addresses issues such as positionality and multiculturalism that are prevalent in the global community.

Critiques of Post-structural/Postmodernist Feminist Framework

The poststructural feminist perspectives have caused controversial debates. Tisdell (1998) references feminist scholars, such as Hartsock (1987) and DiStefano (1990) who have raised questions and are leery of poststructural feminist ideas. DiStefano challenges poststructural feminists by questioning why "just at the moment in Western history when previously silenced populations have begun to speak for themselves and on behalf of their
subjectivities, that the concept of the subject and the possibility of discovering/creating a liberating truth become suspect? (as cited in Tisdell, 1998, p. 145).

Post-structural researchers could inform HRD professionals and feminists who focus on individuals or structures but do not integrate individuals, multiculturalism, or positionality with the structures. In general, the post-structural ideas have generated discourse and research that expands and critiques several literature bases.

A View through the Adult Education Lens

Adult educators, including Mezirow and Knowles, have approached adult education from a psychological viewpoint. Mezirow (1991, 1996) described a learner-focused transformative process of adult learning and explained that learners interpret experiences through "meaning perspectives" that Mezirow defines as "structures of assumptions within which past experience assimilates and transforms new experience" (1996, p. 42). Mezirow's focus on transformation has some similarities to the Belenky, et al. (1997) WWK; however, Belenky, et al. focused on affective and rational knowing and Mezirow favored rational knowing (Tisdell, 1998).

Knowles, Holton, & Swanson (1998) also utilized a psychological framework and explained the concept of andragogy in adult learning contexts. Andragogy involves a partnership between the adult learner and the facilitator to maximize the effectiveness of the educational experience. Key assumptions of the andragogical model include:

"Adults need to know why they need to learn something before undertaking to learn it...adults come into the educational activity with both a greater volume and different quality of experience from youths...adults are life-centered...in their orientation to learning; and the most potent motivators are internal pressures...(pp. 62-63)."

The andragogical principles bear resemblance to the focus on the individual emphasized by Belenky, et al.; however, the WWK focuses on gender and andragogy is non-gender specific (Tisdell, 1998). Andragogy also plays a key role in effective HRD programs focused on individual development within the organizational context.

Freire (1993) utilized an emancipatory structural approach to adult education. Freire's work supported problem-posing education rather than the "banking concept," that involves the teacher providing deposits of information to the students who memorize the information without critical evaluation. Freire suggested that the "banking-concept" perpetuated systems of oppression in society by encouraging the oppressed to assimilate within the existing power structures that support domination by the oppressors. Freire viewed the problem-posing education model as a potential means of liberation of the oppressed, which could lead to transformation of power structures. The "problem posing" model could be used to inform HRD professionals and feminists who strive to develop an equitable work environment that maximizes satisfaction and opportunities for all employees. HRD is not limited to working within organization structures that oppress individual employees.

Collins (1995) referenced post-modernist issues in a passionate essay and highlighted problems with the professionalization of certain adult education efforts. In general, Collins disagreed with the alignment of HRD and "corporate ethos and the modern adult education practice" that in his view inhibit "men and women realizing the potential which resides in the collective competence they already possess" (pp. 87-88).

Adult educators view adult learning from various perspectives. Some adult educators focus on the needs and experiences of individual learners. Others focus on oppressive social structures that perpetuate unequal power relationships. In spite of the divergent views, common themes have been identified among the HRD, feminist and adult education literature bases.

Critiques of Adult Education Frameworks

Merriam and Caffarella (1999) summarize critiques of Knowles' and Mezirow's ideas. According to Merriam and Caffarella, "Knowles' reliance on humanistic psychology results in a picture of the individual learner as one who is autonomous, free and growth oriented. There is little or no awareness that the person is socially situated, and to some extent, the product of sociohistorical and cultural context of the times..." (p. 275). Critics of Mezirow's perspective transformation model indicate that "the extent to which the theory takes context into account; whether the theory relies too heavily on rationality; the place of social action; and the educator's role in facilitating transformative learning" are unresolved issues related to the model (p. 333). Critics of Knowles and Mezirow suggest that the focus on individuals and lack of focus on sociohistorical, cultural factors, and other issues are limitations of the models. These critiques are similar to criticisms of the feminist psychological framework.

Merriam and Caffarella (1999) summarized Ewert's (1982) critiques of Freire's ideas. According to Ewert: "Freire has been criticized by many for not coming to grips with the ethical implications of raising people's levels of consciousness through discussion of community problems. Few would now deny that defining problems in
structural terms is a political process...The responsibility for unleashing a process that can exceed controllable limits rests with the adult educator” (as cited in Merriam & Caffarella, 1999, p. 384).

Merriam and Caffarella (1999) argue that critical theory, such as the post-structural framework, is difficult to understand due to the complexity of the writings and that critical theory is difficult to operationalize for practice. The strength of critical theory is in its deconstruction of dominant structures of oppression; however, a weakness of the critical framework is the lack of operational strategies that can be implemented to improve the systems it critiques.

Opportunities for Collaboration and Implications for Future Research

HRD professionals, feminists and adult educators often operate in different spheres of higher education, business communities, and society; however, common interests between the fields have been identified. All three fields research issues related to individuals, organizations, and society but have criticized the focus, outcomes and motives of the other fields. Why do the three fields remain separate in spite of the fact that there are significant common interests between the fields? Have stereotypes and barriers developed between the fields of HRD, feminism, and adult education that inhibit research and practice across the conceptual frameworks of the three fields?

HRD professionals, feminists, and adult educators all strive to improve conditions in the workplace. The three fields also recognize the individual employee as a critical component of organizations and society. To improve the workplace, HRD seeks “congruence among the organization’s structure, culture, processes and strategies” (Gilley & Eggland, 1989, p. 15) through organizational development interventions. Congruence as described by HRD could not be achieved without addressing issues related to gender equity, diversity, adult learning theory, and society that are raised by feminists and adult educators. Clearly, the fields of HRD, feminism, and adult education have common interests that provide a foundation for partnerships in research and practice.

Research provides some promise for bridging the disparate literature bases of HRD and adult education. Workplace learning projects and adult education strategies have linked the fields of HRD and adult education. Bierema (1997) argues that "adult educators and HRD professionals are uniquely equipped to research, design, and implement new models of workplace development" (p. 657). Swanson and Arnold (1997) also sought to reconcile differences between the fields of HRD and adult education by identifying common interests. The efforts to link adult education and HRD could be expanded to include links with feminist and critical adult education research bases.

Critical theorists, including feminists and adult educators, have problematized workplace issues and criticized HRD for not effectively addressing issues such as sexism, diversity, and power relationships (Bierema & Cseh, 2000). Others have called for a "new formulation of work and vocation" (Cunningham, 1996, p. 157). The critical perspectives have identified key issues that negatively impact the workplace and HRD efforts. HRD professionals have much to learn from the critical perspectives.

In conclusion, HRD professionals, feminists, and adult educators seek to improve the workplace; however, the fields use different conceptual frameworks to address workplace issues. Continuation of the divisions between HRD professionals, feminists, and adult educators perpetuates the complex workplace problems the fields seek to resolve since narrow research perspectives are inadequate when addressing the complexities of the modern workplace. It is time to develop partnerships between HRD professionals, feminists, and adult educators to share information and build on common interests. The workplace provides many opportunities for partnerships between HRD professionals, feminists and adult educators to research and advance all three fields. Embracing the diversity of the HRD, feminist and adult education perspectives may be the first step to building collaborative efforts that can inform and advance the three areas.

Research Paradigms in Human Resource Development: Competing Modes of Inquiry

Sujin Kim
University of Minnesota

The debate over whether a dominant paradigm is appropriate for the rapidly evolving Human Resource Development (HRD) has resulted in significant discord among researchers within the field. This critical issue paper compares and contrasts three of the most widely utilized research methodologies in the field, with respect to their strengths and weaknesses. It argues that in many cases, the taxonomy of positivistic research should be employed as the central methodology in investigating HRD issues.

Keywords: Human Resource Development Research, Positivism, Research Methodologies

The Longman dictionary (1995) defines research as, “the studious study of a subject, that is intended to discover new facts or test new ideas; the activity of finding information about something that one is interested in or need to know about.” (p.1205) As the definition implies, in the strenuous journey to knowledge, researcher and scholars have developed and employed various research methodologies to guide them through the right course of knowledge seeking. From the research perspective of Human Resource Development (HRD), three major research methodologies, positivism, interpretivism, and critical science, have been widely discussed and utilized within the discipline.

Problem Statement and Research Questions

The debate over whether a single research paradigm should be employed as a common standard in Human Resource Development (HRD) research has caused persistent and vexing discord among researchers within the field (Marsick, 1990, Ruona, 2000; Watkins, 1991). Although such disagreement can provide the basis for healthy scrutiny for advancing theory and practice in the field, the lack of common methodology in the HRD literature frequently results in confusion and tension with respect to findings that emerge from ongoing research endeavors in the field (Kuchinke, 2000; Lynham, 2000; McGoldbrick, Stewart, & Watson, 2001). Some argue in favor of widely divergent HRD research methodologies since there is no general research framework to examine and measure the multifaceted, transient, and contingent HRD issues that affect modern organizations (McGoldbrick, Stewart, & Watson, 2001). However, because the applied realm of HRD is performance and outcome-oriented, the taxonomy of positivism can best serve these ends through its ability to elicit explanation, control, and prediction.

In the hopes of reducing some of the contention in the field, this critical issue paper explores the advantages and disadvantages of positivistic methodology and argues in favor of utilizing it as the principal mode of inquiry in the field. However, it is also suggested that the use of positivism should not be mutually exclusive with respect to other existing HRD research methodologies. Both researchers and practitioners should be mindful of the benefits that can flow from the mix and application of tools provided by the other paradigms as a means of increasing the utility of research.

The central research questions guiding this critical issue analysis paper are as follows:
1) Which research methodology is best suited for HRD research?
2) What are the strengths and weaknesses of each research paradigm?
3) What responsibilities should researchers assume to better serve the needs of HRD community?

Methodology

Based on the examination of literature review, this critical issue paper provides an analysis of the three widely utilized research methodologies, positivism, interpretivism, and critical science, in the HRD field. Particularly, the paradigm of positivism, which has been a central mode in social science research, is compared to and weighed against the other two methodologies with an emphasis of their philosophical origins, assumptions, concepts, and HRD implications.

Conceptual Framework for Three Research Methodologies

Positivism is based on the assumption that there are universal laws that govern social events, and uncovering these laws enables researchers to describe, predict, and control social phenomena (Wardlow, 1989). Interpretive research, in contrast, seeks to understand values, beliefs, and meanings of social phenomena, thereby obtaining verstehen (a deep and sympathetic understanding) of human cultural activities and experiences (Smith & Heshusius, 1986). Critical science seeks to explain social inequities, through which individuals can take actions to change injustices (Comstock, 1982). The three approaches take distinctively different epistemological positions regarding theoretical foundations, assumptions, and purposes while producing competing modes of inquiry.

Historical and Philosophical Origins of Positivism

The discussions on the positivistic paradigm of research originated in the nineteenth century with an attempt to apply the methodology used by the natural sciences into social phenomena (Smith, 1983). In 1822, the French philosopher Auguste Comte first created the term, "sociologie" and further classified social interactions as physical science-like phenomena in order to investigate and find their universally governing rules (Babbie, 1993). Prior to this time, religious taxonomies were prevalent in investigating and explaining social phenomena, and Comte attempted to replace religious beliefs with scientific objectivity and empirical inquiry by arguing that the human world can be detached and analyzed in an objective way. Comte's positive philosophy postulated three stages of history. First, a "theological stage," emphasized a monotheistic God and predominated throughout the world until about 1300. Second, a "metaphysical stage " replaced the concept of God with philosophical notions during the next five hundred years. Last, Comte's final stage was the era of positivism, in which knowledge was based on scientific objectivity and observation through the five senses rather than subjective beliefs. This revolutionary view of the social world as science-like phenomena with empirical investigation formed much of the fundamental driving force for the development of the positivistic approach (Babbie, 1993).

Before examining the major assumptions of positivism, it is necessary to elucidate the philosophical influences of scientific realism in positivism as the approach was rooted in the idea of scientific realism (Smith & Heshusius, 1986). The paradigm of scientific realism asserts that the kinds of things which exist, and what they are like, are independent of us and the way in which we discover them (Routledge Encyclopedia of Philosophy, 1998). In examining reality, scientific realism further delineates the concept of subject-object dualism; an ontological question of "what is" can be kept apart from an epistemological question about how one comes to know "what is" (Smith, 1983). Positivism is essentially derived from Comte's philosophical foundations that social reality exists independent of people and can be objectively investigated by employing valid and reliable measurements.

Major Assumptions of Positivism

The assumptions reflected in positivistic research are based on the notion of a mind-independent reality (Popkewitz, 1980). Researchers employing positivistic research inherently recognize the following as primary assumptions that are intrinsic to the positivistic mode of inquiry (Wardlow, 1989, p.3):

1. The physical world and social events are analogous in that one can study social phenomena as they do physical phenomena.
2. Theory is universal and sets of principles and inferences can describe human behavior and phenomena across individuals and settings.
3. In examining social events, researchers adhere to subject-object dualism in that they stand apart from their research subjects and treat them as having an independent existence.
4. There is a need to formalize knowledge using theories and variables that are operationally distinct from each other and defined accordingly.
5. Hypotheses about principles of theories are tested by the quantification of observations and by the use of statistical analyses.

Essential Concepts Reflected in Positivism

Positivism asserts that knowledge and truth are questions of correspondence in that they relate to an external referent reality (Smith, 1993). This correspondence theory of truth stipulates that the source of truth is in reality; therefore, a statement is proved to be true if it agrees with an independently existing reality and false if it does not. For example, if two or more statements regarding the same external referent reality compete with one another, then
researchers must make a decision to accept one and reject the other, or even to reject both in favor of another alternative (Smith, 1983). Furthermore, researchers should employ empirical methods for the process of verification because these methods are considered objective and do not influence what is being investigated. In the process of investigation, researchers should express themselves in value-neutral, scientific language in order to move beyond ordinary and subjective descriptions, thereby resulting in universal and accurate statements and laws about the world. In doing so, knowledge attained about the independent reality can be accepted by reasonable people (Smith, 1983).

In the positivistic tradition, empirical methods are so essential that true or genuine knowledge is regarded as strongly tied to the application of the proper procedures (Babbie, 1993; Walker & Evers, 1999). Empirical methods specify how the rational structure of scientific investigations is formulated and tested. For example, researchers generally begin by noticing a new pattern or inconsistency with established theories and posing the preliminary finding as a problem to be investigated. After further exploration, researchers propose a hypothesis in which they deduce predictions. As a rule, they test the predictions and present the hypothesis as genuine knowledge if it is confirmed as valid. If the hypothesis is rejected, researchers usually alter the previous hypothesis, or develop another, and repeat the procedure. This process is self-corrective and by examining incorrect hypotheses, researchers narrow the search for a correct one (Borg & Gall, 1996). Such methodologically generated knowledge, as it is thought to constitute an accurate description of reality, becomes accepted as truth through this rigorous empirical verification process.

One of the major goals of research using positivism in HRD settings is to obtain valid and reliable knowledge as a set of universal principles that can explain, predict, and control human behaviors across individuals and organizations. In the positivist's perspective, validity means that findings are accurate statements about the world as it is without researcher's involvement, and knowledge is a matter of replication (Walker & Evans, 1999). If a particular instrument or a technique is applied repeatedly to the phenomenon of interest, it would yield a similar, if not the same, result over time. Therefore, what is discovered through valid and reliable instruments and techniques is considered public knowledge because others can replicate the findings by employing the same instruments and methods while reducing the potential consequences stemming from researchers' personal values and biases (Smith, 1983).

**Competing Views of Positivism: Interpretivism and Critical Science**

HRD researchers employing interpretivism often question the positivist's belief of the mind-independent reality. To interpretive researchers, reality (at least organizational and social realities) is something constructed with the individual mind as a product of theorizing, and this individual theorizing itself shapes and affects reality; there is no mind-independent reality to correspond with hypotheses to serve as an external referent point on their acceptability (Walker & Evers, 1999). Knowledge is then multiple sets of interpretations that are part of the social and cultural context in which it occurs. Consequently, there should be an openness to the understanding of people whom researchers study and tentativeness in the way researchers hold or apply their conceptions of those being studied (Giorgi, 1997; Husen, 1999; van Manen, 1998).

Yet, the very contextual and subjective nature of interpretative research findings can be a concern for HRD researchers who seek to generalize the results to different organizational and educational settings: what is true in one situation or context may not be true for another. Conducting interpretative research can also be costly due to extended research time. For example, to conduct an ethnographic study of a supervisor-employee behavior of a particular immigrant group, a great deal of time is needed to observe, describe, and understand the complex and value-laden immigrant's business culture and their idiosyncratic way of interactions. A replication of the original research as well as reaching inter-subjective agreement on the findings can be an arduous and time-consuming task.

In interpretive research, as researchers' views are acknowledged and often reflected in the research process, their personal subjectivity may inherently affect the soundness of research findings (Babbie, 1993). Therefore, it is a crucial yet difficult task for interpretive researchers to bracket their preexisting ideas of the phenomena and further assume a moral responsibility to accurately represent subjects and contexts. In addition to the difficulty of achieving this goal, analyzing and articulating complex human phenomena are rigorous tasks that require years of training and research experience. It is thus imperative that HRD researchers possess adequate skills and observational techniques to conduct interpretive research as well as a sense of moral responsibility.

Critical scientists go one step further in their philosophical opposition to the value-neutrality of positivism by arguing that researchers should take a stance and share responsibility for social changes (Comstock, 1982). Critical scientists maintain that the positivistic tradition cannot capture the critical roles of values in knowledge that are needed to improve human conditions (Comstock, 1982). They also point out that the positivistic tradition generally
neglects the realities of power, ideological beliefs, and social inequities frequently manifested in HRD research (Rettig, Tam, & Yellowthunder, 1995). For example, critical scientists can question the validity of popular HRD beliefs representing the efficacy of employee empowerment in organizations. They can attack the notion by questioning whether companies genuinely care about empowering employees to promote their potentials with humanistic motives or if they simply give out some fraction of their power to tantalize employees while holding tight control of their stakes. In criticizing the notion of “employee empowerment,” “employee voice,” and “open communication” can be simply the reintroduction of a power struggle between management and employees, in which management grants a small fraction of power to the employees. The employees, viewed as oppressed, are not truly emancipating themselves; rather, they are merely disillusioned by the management’s empowering tactics whose aim is to solidify control over the employees. In addition, the organizational setting may not be a safe place for the employees to speak out their experiences or opinions due to the fear of coercion and/or a sense of vulnerability of revealing too much in public.

The major disadvantage of employing critical science in HRD research is that the researcher’s involvement, interaction, and activities during the research process are substantially political as well as time intensive in that the approach often fails to facilitate scholarly writing (Fay, 1987). The critical science approach also advocates a process of research that yields social change rather than a product of research that is closely linked to knowledge generation and subsequent academic publication. Thus, while emancipatory knowledge can be produced by employing critical science, it might not be readily transformed into academic publication due to the lack of understanding and acceptance of the approach among scholars and the time-consuming nature of the research process (Rettig, Tam, & Yellowthunder, 1995).

Finally, as critical science primarily focuses on issues regarding groups of individuals, it is practically impossible to conduct critical science research without a team effort (Rettig, Tam, & Yellowthunder, 1995). As the success of critical research heavily relies on the continuous commitment of the groups for a substantial amount of time, soliciting team efforts to carry out research can be a difficult and exhaustive process that critical scientists must cope with. The uncertainty of research outcomes and finding source for funding are often problematic in critical science as well (Fay, 1987).

Reasons for the Prevalence of Positivism in the Research Community

In light of positivism’s relation to business and educational institutions, certain goals in the field of HRD are highly compatible with positivistic applications. Employees’ performance improvement after HRD interventions, effects of training programs on levels of organizational commitment, and minimal competency testing for job applicants are a few of HRD examples that rely on measurable and generalizable instruments of the positivistic approach. As a result, these HRD goals align well with positivism due to their implicit orientation towards prediction and control. Since positivistic knowledge seeks to find how change in one variable will produce change in another, also known as causal relationships, it facilitates the attempt to get more output for one’s input that is the practical concern of HRD practitioners (Swanson, 1995).

The correlational design of positivism can be useful in studying issues relevant to the HRD field as its principal advantage is to permit one to analyze the relationships among a large number of variables in a single study (Fanslow, 1989). In HRD settings, there are often situations in which several variables are related to a particular pattern of behavior. When a researcher wants to investigate the factors correlated with the level of organizational commitment, there are more likely to be multiple variables affecting one’s commitment, such as education and income levels, supervisor-subordinate interactions, and perceived equity regarding pay and treatment (Brett, Cron, & Slocum, 1995). By employing the correlational design, researchers can determine whether there are relationships between these variables and the level of organizational commitment, control for potential confounding factors, and further measure the directions and degrees of these relationships. The correlational design is thus an invaluable research tool in HRD as it allows researchers to analyze the relationships among multiple variables, either individually or in combination, by identifying the direction and degree of associations among them (Pirsig, 1997; Borg & Gall, 1996).

There are several issues to be addressed prior to conducting research in HRD. One of the crucial questions that HRD researchers should ask prior to initiating their investigation is whether the findings are genuinely relevant and likely to be beneficial to participating organization members as well as the HRD field. In other words, researchers and practitioners should be concerned with the potential utility of research findings, with respect to tangible, positive, long-term returns for organizations and contribution of knowledge advance to the research community (Alan, 1997; Scheirer & Rezmovic, 1983; Swanson, 1992). The research must be also designed to obtain findings that can be generalized and applied beyond the situation in which the study was initially carried out. Employing the
The positivist approach in HRD settings can be then recommended for its strong tendency to produce applicable knowledge that is externally valid.

Another important aspect of positivism in HRD research is that the approach facilitates the refinement, and even negation, of existing theories by challenging and questioning them for more refined applications rather than dwelling on the antecedents of previous research (Moser, Mulder, & Trout, 1998). Moser and colleagues (1998) pointed out that researchers can sometimes become the victims of dogmatism by failing to recognize their fallibility. In positivism, research hypotheses are generally deduced from findings of established theories, and subsequent findings contribute and extend the general body of knowledge. In the process of inquiry, researchers might capture the inconsistency between the existing theories and their own hypotheses and thus challenge the previously accepted ideas to resolve disagreements. Factors that have not been adequately addressed in previous research can be further pursued. The approach then promotes a healthy and rigorous measure of cultivating knowledge by raising questions and making investigators aware of the validity of their hypotheses (Pirsig, 1997).

Empirically grounded methods in positivism also serve as a "reality check" to reduce researchers' biases and values which can potentially contaminate the research process and subsequent discoveries (Smith, 1993). As interpretive researchers point out, perception, experience, and socio-cultural background affect how each individual sees the world in everyday situations. At the level of everyday discourse and experience, it is difficult for researchers, as individuals embracing all socio-cultural aspects in formulating their views, to discard their personal values and beliefs in conducting research. Instead of denying the presence of these biases, positivistic researchers call upon proven empirical methods in an attempt to minimize the distorting effects of their subjectivity in investigation. The empirical procedures are available to the inquirer prior to engaging in the process of inquiry and thus tend to be neutral and independent of the process (Smith & Heshusius, 1986). In addition, the knowledge produced through these procedures can and should be replicated by anyone who adheres to the same method. The positivist mode of inquiry thus provides a self-corrective mechanism that checks the credibility of data and minimizes the distorting effect of personal subjectivity on the generation of knowledge.

Critical scientists criticize positivistic researchers on the grounds that they lack or even dismiss the realities of value-laden policy making processes embedded in society. Yet, impacts of research findings on policy implications have been increasingly addressed by the positivistic arena by utilizing evaluation research (Babbie, 1993). The purpose of evaluation research is to measure the impact of policy interventions, such as new training methods, innovation in workplace technology, and a wide variety of HRD programs to ensure that there is a nexus between research findings and practical applications (Alan, 1997). While in critical science, research serves to produce emancipatory knowledge which empowers individuals to take action to correct injustice prevalent in the system, an empirically-grounded positivism, the goal of evaluation research is practical interest to assess the effectiveness and efficiency of interventions. The current expansion of evaluation research among positivistic researchers reflects their increasing awareness to ensure feasibility and utility of interventions formulated from research in the applied domains of HRD (Borg & Gall, 1996).

Discussion and Conclusion

Positivism has been a dominant mode of inquiry in numerous research arenas of social science for over a century (Wardlow, 1989). Since Comte's utilization of positivism in social science in the nineteenth century, there was a major progress in social and educational research at universities and research institutions with the refinement of the methodology and statistical analyses. As a result, positivism became the dominant research methodology and its prevailing methods and techniques were utilized by cross-disciplinary researchers until the mid-1960s (Husen, 1999). During the social movements in the sixties, critics of positivism began to doubt its merits and legitimacy (Banks, 1998; Code, 1991). Critical scientists argued that institutionalized theories and paradigms considered neutral often favor the mainstream population and consequently neglect marginalized communities. Likewise, interpretive researchers criticized positivism by stressing that what is needed in the multi-ethnic society is respect and understanding of others’ unique socio-cultural contexts (Banks, 1998). As a result of this conflict among researchers, the present situation in the research community is a standoff among the three approaches, often manifested as a heated debate between “hard” and “soft” or “quantitative” or “qualitative.” (Bredo & Feinberg, 1982; Code, 1991).

With respect to the current debate over research paradigms, this paper has examined and assessed the three most widely used research methodologies in the HRD discipline: Positivism, Interpretivism and Critical Science. In doing so, it has found that each approach has its own unique advantages that promulgate valuable knowledge and augment the literature in the science of HRD. However, it has been also demonstrated that the relationships among the three approaches are generally not synergistic in nature, as the underlying theoretical and epistemological rationale of
each is frequently at odds with those of the others. Indeed, as each of these paradigms has their own set of
disadvantages must be recognized and addressed.

One caveat that should be clearly noted is that while this paper strongly advocates the adoption of positivism as
the central research approach in the HRD field, it does not contend that the paradigms of interpretivism and critical
science should be abandoned. Both provide the field with substantial value, the former through its attention to
understanding the individual experience and the latter to encouraging emancipation and self-development. The
incorporation of both of these methodologies within the HRD domain would allow the field to be more holistic in its
understanding and conceptualization of human behavior and development. On the other hand, to equate these
paradigms as research methodologies on parity with positivism would subjugate the HRD field to the continued
discord that aptly defines its current state. To this end, a movement towards an emphasis on positivism should be applied.

Implications for HRD: Establishing a Methodological Framework for the Advancement of HRD Theory and
Practice.

As HRD is a young yet burgeoning field, the ability of researchers to advance knowledge and contribute research to
the general business community is essential. More than a few scholars have recognized that there is an integrated
relationship between scientific research and HRD practices (Alan, 1997; Kling, 1995; Scheirer & Rezmovic, 1983;
Schneider & Konz, 1989; Swanson, 1992). Because research is the fundamental cornerstone on which sound theory
becomes transformed into effective organizational practice, and further, the element on which HRD derives its inter-
disciplinary credibility, it is of the utmost importance that the methodological foundation on which the research is
based is both sound and rigorous. Increasing the emphasis on using positivistic research techniques is then both a
viable and necessary means for HRD to achieve the dual goals of developing effective practical business practices
and establishing itself as a strategically essential academic business domain. The established and widely accepted
techniques of positivism have proven to be significant conduits to meeting these ends in other business disciplines,
and the extension of the same criteria and standards to HRD can thus substantially forward these aims. By placing
increased value on studies which use positivistic methodology in carrying out future HRD research, encouragement
of such studies through the publication of those research endeavors in the academic literature, and dissemination of
the findings in the form of strategic business interventions, the field would benefit from a unification of such standards.

At the same time, HRD research should continue to value those works that utilize interpretive and critical
science approaches. If anything, the use of these approaches differentiates HRD from traditional business research,
and their contributions enrich the understanding of cultural and individual perspectives and address important areas
that are often overlooked in these domains when positivistic research is exclusively used as an instrument of
research. HRD should continue to forward and encourage the use of such methodologies. The essential change that
is advocated in this work is for a shift in the prioritization of these methodologies, with the positivistic framework
emerging as the principal research paradigm of choice within the field. Realistically, such change will not be quick
or forthcoming, as many in the field strongly hold viewpoints that disagree with this perspective. The important
point is that vigorous debate should be encouraged with some consensus realized from ensuing dialogue. Such
agreement would act to strengthen the field and enhance the future impact of HRD research output with respect to both businesses and the community which are the true beneficiaries from such work.

Mixed methods use in HRD and AE

Tonette S. Rocco

Aixa Perez-Prado
Florida International University

Mixed methods combine qualitative and quantitative approaches at different phases in the research process such as conceptualization, sample, data collection, data analysis and inference while mixed model designs combine these approaches across all phases (Tashakkori & Teddlie, 1998). This paper explores how mixed methods are approached in HRD and adult education. Little explicit discussion of research design decision-making or theoretical support for mixing design components was found in the examples used in this paper.

Key words: Mixed methods, Research Design, Qualitative and Quantitative Studies

This paper provides a discussion of the ways in which mixed methods are approached in HRD and adult education (AE). Mixed methods combine qualitative and quantitative approaches at different phases in the research process such as conceptualization, sample, data collection, data analysis and inference while mixed model designs combine these approaches across all phases (Tashakkori & Teddlie, 1998). The exploration in this paper is driven by these questions: What rationales do HRD/AE researchers provide for using mixed methods in their projects? In the absence of explicit rationales, what justifications are evident for using mixed methods? The paper is divided into a discussion of mixed methods, the use of mixed methods in HRD, and the use of mixed methods in AE. The paper concludes by sharing implications for HRD/AE, observations, and suggestions to enhance mixed methods use.

Mixed Methods

Greene and Caracelli (1997) argue that "using multiple and diverse methods is a good idea, but is not automatically good science" (p. 5). Mixed methods proponents across the wide field of education share the goal of conducting good social science. Good research design addresses the intertwined political, philosophical, and technical levels of decision-making (Greene & Caracelli, 1997). At the political level decisions are made about values, purpose and place of a study within society. At the philosophical level paradigms and assumptions are identified. The technical level encompasses the procedures used to collect and analyze data.

At the political level broad value based questions about the purpose and role of research in society are addressed (Greene & Caracelli, 1997). At this level, choices are made regarding what should be researched and what should be done with the research. Scholars do not generally acknowledge the power structure within which they make their research design decisions. Mainstream discourse in HRD/AE research seldom explicitly provides evidence of political level decision-making. Although not explicit, political level decision-making is evident in regards to what research gets funded.

At the philosophical level, mixed methods are predicated on reaping the benefits of what can legitimately be learned about the social world using appropriate methods from multiple paradigms. The pragmatic position for such mixing, calls for answering all methodological questions according to which method(s) best meet the practical demands of a particular inquiry (Patton, 1988). The dialectical position advocated by Greene and Caracelli calls for conducting inquiry that is shaped by employing both post positivist and constructivist paradigms. If, in a research project, issues such as particularity and generality are addressed from within each of these paradigms, then in the end, more can be known about both specific participants and the larger social context they share with others. Such research will better reflect social realities by including more perspectives.

Technical level concerns were addressed in detail in Greene, Caracelli and Graham’s (1989) empirically based theoretical framework for conducting rigorous, useful evaluation projects. Their framework has five distinct purposes: triangulation, complementarity, development, initiation, and expansion. The first purpose, triangulation,
strives to develop a more focused understanding of a particular phenomenon through convergence of different methods examining the same phenomenon. Triangulation increases construct and inquiry result validity by using both qualitative and quantitative methods to counteract researcher, method, theoretical and other possible research biases. Complementarity seeks elaboration using the results from one data collection method to help clarify the results of the other. Generally, different aspects or levels of a phenomenon are examined. Complementarity enhances validity and interpretability by building on inherent method strengths and acting against method and other research biases. Development is sequential using the results of one of the methods in order to inform the other(s). The phenomenon under study may be the same, or similar. Development builds on inherent method strengths in order to increase construct and inquiry validity. Initiation may evolve as the study progresses, when findings of qualitative and quantitative methods seem contradictory, or be planned into the research design. Initiation deepens the inquiry, often by recasting the research question and thus developing a fresh perspective. Phenomena may be studied in order to better understand the phenomenon originally under study. Unlike any of the other purposes, initiation encourages inquiry using differing paradigms and perspectives in order to deepen and widen inquiry results and interpretations. Expansion widens the scope of the inquiry by adding multiple components to a single study allowing for investigation of a broad range of phenomena and using differing qualitative and quantitative methods. The rationale for selecting multiple appropriate methods is to extend the inquiry.

Individuals' pragmatic decisions to mix qualitative and quantitative methods either sequentially or simultaneously within their research projects are leading to a number of "mixed method" studies, although, this label is not always applied in HRD/AE research. Tashakkori and Teddlie (1998) are prominent among those social scientists calling for more clarity in delineating the characteristics of these studies, and of employing more qualitatively/quantitatively integrated "mixed model" studies. Their underlying philosophical assumption is that these two practices will enhance the quality of educational research and make it more accurate and useful.

Addressing technical level concerns in detail, Tashakkori and Teddlie's (1998) mixed models typology is driven by its exploratory or confirmatory purpose. Model designations are based on the particular qualitative and/or quantitative nature of research components or stages. They identify three especially relevant stages: data collection, analysis, and inference. Three types begin with quantitative data (Types III, V, and VI) and three types with qualitative data (Types I, II, and IV). Types I, II, and V are more confirmatory and deductive in inference - testing a priori predictions or hypotheses. Types III, IV and VI are more inductive and exploratory. Two larger scale mixed model types may have both exploratory and confirmatory phases. Type VII parallel mixed model studies mix qualitative and quantitative within at least one of the stages. In Type VIII sequential mixed model studies, the three relevant stages are completed in distinct phases. One phase builds on the results of the last and mixing occurs across phases.

For these pragmatists when to mix and what roles the researcher can and should play in his or her research project should be informed by two considerations: general pragmatic guidelines and the research question. According to Tashakkori and Teddlie (1998), the guidelines value both inductive and deductive reasoning and both objective and subjective points of view. Decisions about which line of reasoning is called for depend on the specific point in the research process. For pragmatists, decisions about when to be inductive and collect more data to see what generalizations may be drawn from them or when to be deductive and ascertain if a particular piece of data fits a known generalization are ongoing in a research project. Pragmatic educational researchers are comfortable turning to qualitative methods to explore phenomena and to propose some level of generalization (i.e. these are patterns in the data) and quantitative methods to confirm that these particular pieces of data do indeed fit some known pattern/generalization. There is recognition among such researchers that any particular research project may well involve both paths of reasoning in order to fully respond to the research question.

After being introduced to the mixed methods literature, the question became how do HRD and Adult Education researchers use qualitative and quantitative methods in the same study? HRD literature was reviewed searching for references to mixed methods the few found are discussed below. A snapshot of the use of mixed methods in HRD research is provided by examining articles published in volume 11 of HRDQ for instances of mixing methods.

Use of Mixed Methods in Human Resource Development

Human resource development is an applied field primarily concerned with identifying and implementing interventions in the workplace. Interventions can occur at individual, group, and organizational levels to increase workplace learning and productivity. In human resource development mixed methods studies are rarely supported by literature from the mixed methods field. This lack of acknowledgement extends to meta analyses of research practice. For example, Williams (2001) conducted a review of research methods to determine if the field of human resource development (HRD) was following a similar developmental pattern to management science. Even though
she clearly states an interest in statistical methods only, her analysis notes the use of qualitative methods. Strikingly, there is no mention of mixed methods. Hixon and McClernon (1999) examined a wide range of HRD literature published in 1997, classifying the literature by using four types of research and "two tools (i.e., qualitative and quantitative)" (p. 899). Hixon and McClernon placed all of the articles and papers in two categories--qualitative or quantitative and ignored the possibility of a category of mixed methods.

Hardy (1999) examined the methodological appropriateness of papers presented at the 1997 and 1998 Academy of Human Resource Development conference. After setting the stage for the inclusion of mixed method studies through his discussion of hybrid designs, his findings are only discussed in terms of the dichotomy of qualitative/quantitative categories instead of the continuum possible when using hybrid designs or mixed methods.

He states that qualitative and quantitative methods "are not mutually exclusive but can be viewed as inter-dependent" (p. 880). For Hardy, the role of qualitative methods is to develop new theory, expand conceptual frameworks, and enhance understanding of social realities while quantitative methods should be used to test and generalize theory. The qualitative/quantitative linkage though a "hybrid" [mixed] design demonstrates the interactivity and inter-dependence of these components of reflective inquiry. Hybrid designs utilize the strengths of both types and "can supplement and complement the strength of design and general robustness of the findings" (Hardy, 1999, p. 881). He states the ultimate usefulness of hybrid designs is dependent on the comparative relationships of the results, conclusions, and contributions to the field, yet he advocates only the use of multivariate studies to mature the field.

These reviews revealed that a general lack of awareness of mixed methods and the literature base that supports it are common in the field of HRD. In a related example, in the HRD research handbook there is no mention of mixed methods (Swanson & Holton, 1997). The chapter on qualitative methods includes a discussion of appropriate uses of qualitative methods as explaining statistical findings, developing quantitative instruments, and strengthening quantitative studies (Swanson, Watkins, and Marsick, 1997). These technical uses for mixing methods are not explored. The chapter on qualitative methods is not concerned with the appropriate use of quantitative methods but does mention that both methods (qualitative and quantitative) are powerful when used together (Holton & Burnett, 1997). Political, philosophical, and technical rationales (Greene & Caracelli, 1997) for using mixed methods are missing from the research inquiry literature of HRD. The research studies discussed in this segment include two papers using mixed methods literature and four articles using mixed methods without regard to the literature.

May (1999) and Nurmi (1999) used the mixed methods literature to support their research design decisions. May (1999) advocated using qualitative methods in transfer of training research. The study developed and tested a theory-based practice protocol and its effect on learning and transfer of learning. The quantitative component included a pretest-posttest control group design. Data on dependent measures were collected using a free-recall test, rating videotaped role-plays using a criterion checklist, and a 360-degree survey instrument. ANCOVA conducted on each dependent measure indicated significant difference between groups. Learning in both groups did not meet acceptable levels in terms of practical significance. The qualitative component included semi structured interviews of 36 of the 38 participants. The responses were coded and categorized according to underlying concepts. May's purpose was to use the qualitative data to "illuminate quantitative data" (1999, p. 1108) and to use this study to support the pragmatic approach when making methodological decisions. Using Tashakkori and Teddlie's model (1998) this study is Type VIII - a sequential mixed method - the quantitative and qualitative data collection and analysis phases appear separate. The decision-making about research design appears to be at the technical level (Greene & Caracelli, 1997).

Nurmi (1999) used mixed methods to evaluate an industrial development program in Finland. The research design decision-making is philosophically based using Greene & Caracelli (1997) (among others) to support mixing paradigms as well as methods. Nurmi writes, "these paradigms were seen as complementary choices rather than competing methodological schools" (p. 554). An HRD program for new hires in a paper mill was evaluated using post positivist quantitative surveys and multivariate analysis and naturalistic methods such as interviews and journals. Nurmi's study demonstrated complementarity (Greene, Caracelli, & Graham, 1989) and consciously used mixed methods "to reach a deeper understanding" (p. 556).

Wentling and Palma-Rivas (2000) surveyed multinational organizations on the status of diversity initiatives, the dimensions of the initiatives, and the dynamics of corporate responses. Data collection used semi-structured interviews and document analysis with a sample of 8 randomly selected diversity managers. Interviews were content analyzed with emergent themes ranked by their frequency. Wentling and Palma-Rivas used quantitative data "to provide basic research evidence, while qualitative data were used to round out the picture and provide examples" (p. 40). Qualitative data were used for statistical inference as in a Type IV design (Tashakkori & Teddlie, 1998).

Stein, Rocco, and Goldenetz (2000) conducted an instrumental case study using the embedded single-case study design to examine the phenomenon of aging workers in a university setting. Qualitative and quantitative data were
collected. Structured interviews were used to enhance descriptive statistics obtained from documents produced and maintained by the human resource and training departments. Without mention to the mixed methods literature, the authors identified triangulation as the rationale for using quantitative and qualitative data sources (Patton, 1990; Yin, 1994). Data analysis used two qualitative methods: grounded theory and comparative analysis by question.

Osman-Gani (2000) explored issues of expatriate development by multinational companies. Mixed methods were used for instrument refinement. Responses to an open-ended interview schedule based on the expatriate literature were used to develop a structured survey instrument. This is an example of development (Greene, Caracelli and Graham, 1989) where the results of the open-ended interview schedule were used to develop a structured survey instrument. A panel of experts also reviewed the survey “to verify the content, sequence, structure, and relevance of questionnaire items” (p. 219). The survey was pilot tested on a sample of 40 expatriates before being sent to the population of expatriates in Singapore. No information was provided about administration of the interview.

Callahan (2000) conducted a case study of non-profit organization members' purposes for managing their experience and expression of emotion. Data was collected using individual interviews, observations, surveys, and document analysis. Multiple methods of data collection were used for validity through triangulation (Patton, 1990). Callahan identified the study as "primarily qualitative...based on a naturalistic design" (p. 251). Data analysis of the interviews and correspondence used codes constructed from theory as the primary coding scheme. Within a primary code, open coding was used to arrive at broad concepts within a constructed code. Themes emerged within the primary coded categories. ANOVAs were conducted on the survey data to ensure that the larger surveyed sample was not significantly different from the interviewed and surveyed sample. This is an example of Type IV mixed method model (Tashakkori and Teddlie, 1998) or naturalistic inquiry, which collects qualitative data and statistically analyzed it.

Additionally colleagues familiar with the theory being explored coded a data set to establish internal validity. Seven scholars reviewed the findings and interpretations for consistency. Four participant researchers reviewed the final document for accuracy of interpretation. Even though Callahan described this study as primarily qualitative, she took many quantitative steps to ensure reliability and validity of the findings.

Of the six studies examined here only two (May, 1999; Nurmi, 1999) used the theoretical framework provided by the field of mixed methods. Without similar attribution, the other four studies used mixed methods to enhance evidence, (Wentling & Palma-Rivas, 2000), for triangulation (Stein, Rocco, & Goldenetz, 2000), for triangulation and to ensure integrity (Callahan, 2000), and for instrument refinement (Osman-Gani, 2000). The decisions to use mixed methods were apparently pragmatic and at the technical level.

The snapshot provided here demonstrates that mixing methods is being done to strengthen HRD research designs. So far the research design decisions are pragmatic and without regard to the growing inquiry literature on mixed methods. The snapshot of mixed methods in adult education parallels the findings in HRD. A hand search of Adult Education Quarterly produced the articles discussed below.

Use of Mixed Methods in Adult Education

In 1984 Brookfield issued a challenge to adult education researchers to examine their "methodolatory" processes of generating knowledge. He critiqued researchers for their over reliance on “the adoption of strictly defined and tightly administered quantitative measures in the investigation of self-directed learning” (p. 65). The principle text on adult education research reflects the momentum gained by qualitative research designs (Merriam & Simpson, 2000). Merriam and Simpson (2000) include one chapter on quantitative research, two chapters on qualitative research, and no chapters on mixed methods in their updated version of A Guide to Research for Educators and Trainers of Adults. They affirm “both types of data [quantitative and qualitative] are useful in the process of systematic inquiry related to adult education and training” (p. 147). They suggest that content analysis can be approached using both quantitative and qualitative methods. Merriam and Simpson, however, are silent on how quantitative and qualitative data collection and data analysis can be meaningfully mixed in the same study.

An examination of articles from the Adult Education Quarterly provide evidence of mixed methods in adult education research and a continuing silence on rationales for its use. It is striking to note that very few authors identify their work as mixed methods in either the abstract or the method section of the article. For example, Cervero, Rottet, and Dimmock (1996) indicated they used both qualitative and quantitative data to evaluate a nursing continuing education program but they did not identify a rationale for the use of historically polarized approaches. The authors cited in this section reflect the evolution in research development that supersedes the quantitative – qualitative polarity. As Tashakkori and Teddlie (1998) wrote, “most researchers now use whatever method is appropriate for their studies, instead of relying on one method exclusively” (p. 5-6).
Identifying the research design according to the mixed method typology Tashakkori and Teddlie (1998) delineated can enhance adult education research by locating the research within a pragmatic paradigm, justifying the use of mixed methods, and clarifying their use in the various stages of research (i.e., sampling, data collection, data analysis, inference, etc.). Identifying the mixed method design as described by Tashakkori and Teddlie (1998) can enhance the “good science” quality of the research by reducing the conceptual confusion associated with mixing qualitative and quantitative approaches as evidenced in the following examples.

Gordon and Sork (2001) approximately replicated an earlier study about adult education practitioners’ views on the need for a code of ethics. The survey methodology they employed included both closed-ended and open-ended questions. The answers to the closed-ended questions were statistically analyzed using descriptive statistics, chi-square tests, and one-way analysis of variance tests. “Responses to open-ended questions were categorized and frequency counts made for each category” (p. 206). The results of the study included both findings of statistical significance and descriptions of ethical situations encountered by practitioners. Gordon and Sork (2001) used both quantitative and qualitative approaches. Using Tashakkori and Teddlie’s model (1998), this study is a parallel mixed model study or Type VII. Two stages of the investigation, data collection and data analysis, used both approaches. The research design, data collection, and analysis used by Gordon and Sork demonstrated research design ruled by “the dictatorship of the question” (Tashakkori & Teddlie, 1998, p. 167).

Cervero, Rottet, and Dimmock (1996) tested a framework for the relationship between nursing continuing education and job performance. Cervero et al. (1996) used quantitative and qualitative data collection and analysis. A 74-item quality assurance review was used to score the dependent variable and rating scores for the independent variables were taken. An analysis of variance was conducted. The qualitative data collection “asked the nurses in the hospital to give [their] explanations for the [statistical] findings” (Cervero, et al., 1996, p. 82). Three themes emerged and were supported by the data from questionnaires and groups. Using Tashakkori and Teddlie’s typology, the study conducted by Cervero et al. (1996) was Type VIII or a sequential mixed model study. The study had two distinct phases, one with quantitative inquiry and operations, and one with qualitative inquiry and analysis. Cervero et al. successfully “combined experimental procedures with qualitative data collection and inference” (Tashakkori & Teddlie, 1998, p. 154).

Boshier (1991) tested the validity of a motivation scale using both qualitative and quantitative data collection. Quantitative data were collected and statistically analyzed to determine predictive validity. The author gave no references for including the qualitative component and did not justify its insertion in the study. The use of qualitative data collection (i.e., interviewing) assisted Boshier in developing additional motivational test items that he later validated and used to predict outcomes. The study clearly used “what worked” to answer the question without an articulated theoretical framework. Tashakkori and Teddlie’s Type VIII sequential mixed model describes the process employed by Boshier. In Boshier’s study, the mixing occurred during the data collection phase. The first phase collected qualitative data to generate test items that were used in the succeeding quantitative phase. In this complex mixed method design, the quantitative phase was designed to explore the issues raised in the previous qualitative phase (Tashakkori & Teddlie, 1998).

A study by Courtenay, Merriam, Reeves, and Baumgartner (2000) was a subtle variation of a mixed method study that was driven by research questions. In this study, the authors interviewed members from a sample they studied two years previously to see if their perspective transformation was stable and to identify ways they continued to make meaning in their lives. The authors identified the follow-up study of adults with HIV as qualitative and primarily inductive; however, one part of their study was to test Mezirow’s (1991) theory that perspective transformation was stable. They used Glaser and Strauss to justify the insertion of a quantitative approach (Courtney, et al., 2000). Like Tashakkori and Teddlie, Glaser and Strauss did not see a “fundamental clash between the purposes and capacities of qualitative and quantitative methods or data...Prismacy depends only on the circumstances of research” (Courtney, et al., 2000, p. 106). Tashakkori and Teddlie’s pragmatic paradigm offers a rationale for inserting a quantitative component into a qualitative dominant study. They articulate the Dominant-Less Dominant mixed method design as a means to answer research questions within a consistent paradigm and yet include all necessary information (Tashakkori & Teddlie, 1998).

Some of the articles reviewed predate the literature on mixing methods yet show evidence of the use of mixed methods to answer research questions. Shipp & Mckenzie (1981) used both quantitative and qualitative design in their study of demographic and psychographic characteristics of adult learners and non-learners. Quantitative data was collected through structured indirect interviews and analyzed statistically. A qualitative summary or demographic profile was written for the learner and the non-learner. This study reversed the usual trend of quantifying qualitative data and qualitatively analyzed quantitative information. The authors did not identify their use of mixed methods in their abstract or methods section. Tashakkori and Teddlie articulate this type of mixed method study as a Type VI. In Type VI studies, quantitative data collection precedes qualitative analysis and
inference. Shipp and Mckenzie (1981) used quantitative data to create profiles of adult learners and non-learners. The design effectively answered their research questions and illustrated the use of “what works” before the mixed method approach was articulated (Tashakkori & Teddlie, 1998).

These examples of adult education research highlighted the silent use of mixed method design to answer research questions. The studies reviewed here successfully addressed their research question by using “what works” to increase the power of their conclusions. The precision of differentiating the data collection phase and the data analysis phase is more visible when the mixed method research design is utilized. Articulating the mixed method design and clarifying the various stages in which mixed methods were used can strengthen the power of studies. A systematic approach, such as using an explicitly mixed method research design, can empower researchers to justify their use of alternative methods and clarify each step of the research process. Tashakkori and Teddlie’s (1998) articulation of the pragmatic paradigm and delineation of mixed method models will aid future adult education researchers to maximize the power of their inferences and conclusions.

**Implications for HRD/AE Research**

Little explicit discussion of research design decision-making or theoretical support for mixing design components was observed in the examples used in this paper. This lack of seemingly informed decision-making often included a lack of information on specific techniques used in a study. The authors may have had sound rationales for their choices but this level of detail did not make it into the method sections of their articles. This has larger implications for HRD as a field as we strive to have our research taken seriously by other disciplines.

Many research questions and topics of interest lend themselves to mixed methods approaches. Yet we lack training in using mixed methods in all but the most rudimentary ways (e.g. triangulation). There is a need for research courses that demonstrate quantitative and qualitative data collection and analysis techniques, followed by instruction in how and when to mix methods in the various stages of a research design. Hopefully, this will lead to a greater sophistication when making thoughtful design decisions at the technical level and encourage design decisions to be made at the philosophical and political levels.

In conclusion, much of the HRD/AE research reports we reviewed in the literature today do not discuss the broader philosophical and political level decisions that ultimately shape research agendas. They confine their discussions concerning research design and data interpretation to descriptions of technical level decisions about “methods and procedures” (Greene & Caracelli, 1997, p.6). Appropriate journals should encourage the inclusion of such discussions in research submitted for publication.

We note that researchers such as Greene, Caracelli, Tashakkori, Teddlie, and others are beginning to seriously address educational research’s larger philosophical and political level decisions. We likewise support Greene and Caracelli’s admonition that to be doing good science, researchers using mixed methods must begin to more thoughtfully address the broader level decisions. To use Greene and Caracelli’s (1997) term, on the political level, these researchers should be seeking the development of a body of strong, defensible research about HRD and adult education. Mixed method advocates should be leading the academic discussions about the ontological and epistemological issues of what can be known about “the social world and our ability to know” (Greene & Caracelli, p. 5). As Greene and Caracelli have pointed out, “The underlying rationale for mixed-method inquiry is to understand more fully, to generate deeper and broader insights, to develop important knowledge claims that respect a wider range of interests and perspectives” (1997, p.7). Mixed methods research that emerges from this discourse has the potential to be more useful to people making policy decisions about HRD and adult education and society.

Factors Affecting Transfer of Training in Thailand

Siriporn Yamnill
Gary N. McLean
University of Minnesota

To validate the Learning Transfer System Inventory (LTSI) (Holton et al., 1998) in Thailand, research repeating Holton et al.'s (2000) study was conducted. The LTSI was administrated to 1,029 employees. Exploratory factor analysis and MANOVA were used to identify factors and compare transfer systems respectively. A factor structure almost identical to Holton et al.'s was identified. Perceived content validity was identified as the most important factor. Organization type created the greatest number of differences among variables tested.

Key words: Transfer of training, Learning Transfer System Inventory, Thailand

For more than three decades, organizations in Thailand have focused on training and development as a tool for improving employees' job performance. About 1,439 private and public organizations in Thailand organize training to expand and strengthen the business sector (Tirakanon, 1997). Recently, due to an economic crisis in Thailand, many training and HRD interventions have faced constricted budgets (Na Chiangmai, 1999). Most organizations have continued only those training programs that are really needed and can be expected to increase employees' work performance immediately. As a result, many administrators ask to see the outcomes of training. Evaluating the effectiveness of formal training and return on training investment are critical issues (Na Chiangmai, 1999).

According to Kirkpatrick (1967), the key criterion for evaluating training effectiveness is transfer of training. Transfer of training is defined as the degree to which trainees apply the knowledge, skills, behaviors, and attitudes gained in training to their jobs (Wexley & Latham, 1991). There is consensus that the acquisition of knowledge, skills, behaviors, and attitudes in training is of little value if the new characteristics are not generalized to the job setting or are not maintained over time (Kozlowski & Salas, 1997).

According to Holton, Bates, and Ruona (2000), transfer of training is a critical outcome of HRD. Transfer of training is complex and involves multiple factors and influences (Baldwin & Ford, 1988; Ford & Weisbein, 1997; Holton, Bates, & Leimbach, 1997; Holton, Bates, Ruona & Leimbach, 1998; Noe, 1986; Rouiller & Goldstein, 1993). Tannenbaum and Yukl (1992) suggested that research that defines and accurately measures factors affecting transfer of training is important to help HRD move beyond the question of whether training works to asking why training works. Without controlling for the influence of the transfer system, evaluation results are likely to vary considerably and yield erroneous conclusions about intervention outcomes (Holton, 1996).

Problem Statement

To date, most of the research on training effectiveness in Thailand has focused exclusively on Kirkpatrick's levels 1 (reaction) and 2 (learning) (Tirakanon, 1997). There has been no research identified on transfer of training in Thailand. Sumthornvipat (1983) analyzed the evaluation of training projects in Thailand. She found that more than 80% of the organizations studied used reaction measures to evaluate their programs. Tirakanon (1997) found that 80-90% of organizations that evaluate programs after training emphasized learning and reactions. Some research (Chue, 1993; Pahuchun, 1996; Somboonsut, 1989; Thongtip, 1998) has followed up on the application of knowledge and job performance, but studies of the factors that positively influence transfer were not identified. Without understanding these factors, Thai HRD professionals will continue to understand evaluation of training narrowly and continue to make decisions based on reaction and learning level data only. According to Holton et al. (2000), organizations wishing to enhance return on investment from training investments must understand all factors that affect transfer of training and then intervene to eliminate factors inhibiting transfer.

A well-validated and reasonably comprehensive set of scales to measure factors in a transfer system will be a key element in improving the organizational transfer system. Holton et al. (2000) developed the Learning Transfer System Inventory (LTSI) to assess sixteen factors that they suggested influence transfer. To date, the LTSI has mostly been used as a diagnostic tool—participants complete it at the end of training interventions, and results are used to assess the quality of the transfer climate and to indicate where changes might be made. According to Holton et al. (2000), the LTSI was constructed from sound theory and based on a very large and extremely diverse sample. It works well across many types of training and organizations. However, Holton et al. (2000) suggested that the

430
LTSI needs to be validated in different cultures. Training evaluation in Thailand has focused mostly on influences within the training context but has ignored other influences within the firm that affect performance outcomes from learning. In order to move beyond the current framework, an accurate diagnostic tool is needed to assess the transfer of training factors that affect transfer of training in Thailand.

Purposes and Research Questions

This study identified a set of factors that affect transfer of training in Thailand by replicating Holton et al.'s (2000) study. The transfer system found in the Thai culture was examined across organization and training types, as well as participant demographics. Following are the study’s research questions:

1. What factors in Holton et al.'s (2000) study are identified using the LTSI translated into Thai?
2. Are there differences in Thai transfer system characteristics among different organizational types: government, private, and state enterprise?
3. Are there differences in Thai transfer system characteristics among different training types: professional, general, management/leadership, and computer?
4. Are there differences in Thai transfer system characteristics among demographics of participants: gender, age, education, and work experiences?

Methodology

The methods used to validate the LTSI (Holton & Bates, 1998) in Thailand through replication are described in this section, including population and samples, instrument, data collection process, and data analyses used.

Population

The population was employees in 552 Thai organizations (119 government organizations under the Office of Civil Service Commission, 51 state enterprises, and 382 private organizations in the Stock Exchange of Thailand in 2000).

Samples

To ensure organizational diversity, proportionate random sampling was used to select participated organizations. From the 30 selected organizations, 1,256 employees who had completed a training program within the last two months were given instruments to complete. Eighty-two percent (1,029) participated.

Instrument

The LTSI (Holton & Bates, 1998) has 89 items: 68 items from the second version of the LTSI and 21 additional items not yet tested. The 89 items measure 16 factors affecting transfer of training. The LTSI uses a scale of 1-5, 1 being “strongly disagree” and 5 being “strongly agree.” The items represent two construct domains: 45 items measure 11 constructs of factors affecting the training program attended and 23 items measure five constructs that are not program specific but represent general factors that may influence any training program. Cross-translation was performed and revisions made to ensure that the Thai version was equivalent to the English LTSI original.

Data Collection

The Thai LTSI was administered at one of two times. When administered at the end of a program, the person who organized the training program distributed questionnaires to trainees during the final period and collected completed instruments. If the LTSI was administered after training, the head of the HRD or training department selected two training programs that had finished within the past sixty days. The LTSI was mailed directly to trainees, and completed LTSI instruments were returned to the HRD or training department within three weeks.

Data Analysis

Exploratory factor analysis was used to compare factors affecting transfer of training when using the LTSI. The measure of sampling adequacy (MSA) was used to determine the appropriateness of the use of factor analysis. No
inadequate MSA values were found. Multivariate analysis of variance (MANOVA) was used to explore differences in Thai transfer system characteristics. Prior to these analyses, the data were examined for adherence to MANOVA assumptions. According to Hair, Anderson, Tatham, and Black (1998), if the ratio of the largest to the smallest group differs by more than 1.5, a test for equality of variance (the Box test) is needed. However, the Box test is not a robust test; it is very sensitive due to many problems (Harris, 1985). In this study, MANOVA was run whenever the Box test was statistically significant, and the results of the MANOVA were examined carefully.

Results

Results included descriptive demographic data and the results of the analyses related to the four research questions.

Demographic Data

The 1,029 respondents were almost equally distributed between men and women. Most were between 31 and 40 years old (44.0%) and had graduated with a bachelor’s degree (64.9%). Average work experience was 12.64 years.

Factor Constructs

Exploratory factor analysis was used to explore the factors that emerged from using the Thai LTSI. The results of the factor analysis of both the 68- and 89-item forms are presented, along with a comparison with the results in the U.S. The findings of specific training program scales and training in general scales are presented separately. Items retained are those with factor loadings greater than .35; all factors had eigenvalues of 1 or more.

68-Item Form. Thirty-eight items were retained in the specific training program scales, assessing 11 factors. The same number of factors were found in Holton et al. (2000). In addition, most of the items loaded on the same factors. For example, four of the eleven factors contained the same items. The other seven factors were nearly identical. Only two items (#1, #17) loaded on different factors. Thus, the factors in this study were labeled the same as those in Holton et al. (2000). Six of the eleven factors exceeded the minimum reliability of at least .70. Overall, reliabilities ranged from .58-.85, with an average alpha of .73, and the average loading on the major factor was .61 with only .01 average loading on non-major factors.

As for the training in general scales, five eigenvalues of 1 or more, accounting for 53.1% of the variance, emerged from the factor analysis of the 23 items. These five factors corresponded to the factors in Holton et al. (2000). Twenty-one items were retained. Three of five factors were identical to the factors found in Holton et al. (2000), with only one item loaded on a different factor. The three factors that were identical to factors found in Holton et al. (2000) were resistance/openness to change, performance self-efficacy, and feedback/performance coaching. Overall, reliabilities were above the minimum level (.70), except for performance-outcome expectations and feedback/performance-coaching factors. Reliabilities ranged from .61-.81 with the average alpha of .72. The average loading on the major factor was .58 with a .01 average loading on non-major factors.

In conclusion, upon determining the eigenvalues of 1.00 or more, sixteen factors were extracted. Seven factors were identical to factors found in Holton et al. (2000). Only three items loaded on different factors. Ultimately, using a cut-off for factor loadings of .35, 59 items were retained in the instrument, assessing 16 factors.

89-Item Form. The specific training program scale produced 11 factors, explaining 55.19% of the variance. Of the 63 items in this part of the instrument, 52 items loaded .35 or higher on these eleven factors. Eleven items were dropped because of weak factor loading. Most items loaded on each factor corresponded to the items loaded on the factors found in Holton et al. (2000). Only 5 items were loaded on different factors. Most factors had acceptable reliability. Only the personal capacity for transfer factor had low reliability (α=.24). The average loading on the major factor was .60, with only a .01 average loading on non-major factors.

For the training in general scales, five factors emerged, explaining 53.65% of the variance. Of the 26 items on the instrument, 21 loaded .35 or higher on these five factors. The five factors corresponded to the factors found in Holton et al. (2000). Only one item loaded on a different factor. Five items were dropped because of a factor loading of less than .35. Most factors had acceptable reliability. Overall, reliabilities ranged from .63-.83. Only performance outcomes expectation was below .70. The average loading on the major factor was .64, with only a .012 average loading on non-major factors.

In conclusion, sixteen factors were extracted; five were identical to factors found in the LTSI (Holton and Bates, 1998). Only six items had substantial loadings on different factors. The additional items were loaded on the
expected factors. Ultimately, using a cut off for factor loadings of .35, 73 items were retained in the instrument, assessing 16 factors.

Organizational Type Comparisons

MANOVA was used to determine if organizational type affected the results on the Thai LT SI. Government, state enterprise, and private organizations included 366, 192, and 471 respondents, respectively. The ratio of the largest group to the smallest was 2.45:1.

The MANOVA analysis showed strong statistical significance (Wilk’s lambda = .858, F = 4.918) at the .00 level on all criteria, indicating that the transfer system characteristics differed across organizational types. Then, a Univariate ANOVA was used to show the differences across organizational type. The results showed that eleven of the sixteen factors were significantly different across organizational type.

Post hoc comparisons were examined for differences among pairs of organizational types. Government and state enterprise organization comparison revealed that only four of the sixteen paired comparisons showed significant differences. The results showed that the learner readiness, personal outcomes-positive, opportunity to use learning, and transfer effort-performance expectation factors in state enterprise organizations were significantly higher than those in government organizations. When comparing government and private organizations, ten of the sixteen paired comparisons showed a significant difference. The personal outcomes-positive, personal outcomes-negative, peer support, supervisor support, opportunity to use learning, transfer effort performance expectation, performance-outcomes expectations, and performance self-efficacy factors in private organizations were significantly higher than those in government organizations. In contrast, supervisor sanctions and resistance/openness to change factors in government organizations were significantly higher than those in private organizations.

When comparing state enterprises and private organizations, only four of sixteen paired comparisons showed significant differences. Personal outcomes-positive, personal outcomes-negative, and supervisor support factors in private organizations were significantly higher than those in state enterprise. The learner readiness factor in state enterprises was significant higher, than in private enterprises.

Overall, the results showed that the highest number of factor differences across organizational type was between government and private organizations.

Training Type Comparisons

Professional, general, management/leadership, and computer training included 325 (31.6%), 403 (39.2%), 195 (19.0%), and 106 (10.3%) respondents, respectively. The ratio of the largest group of trainees to the smallest was 3.8:1. MANOVA analysis revealed strongly significant differences (Wilk’s Lambda = .89, F = 2.51) at the .00 level across training type, indicating that the transfer system was significantly different across training types. In the between subject ANOVA, eight of sixteen factors were significantly different across the training types.

The post hoc comparisons showed that respondents who received management/leadership training rated personal outcomes-positive, training design, opportunity to use learning, and performance outcomes-expectations significantly higher than those receiving general training or professional training. By contrast, respondents who received general training rated perceived content validity significant higher than management/leadership training and rated supervisor support higher than those who participated in computer training. In addition, respondents who received computer training rated learner readiness significantly higher than did those pursuing management/leadership training.

Demographic Group Comparisons

MANOVA was used to analyze the differences among demographic groups.

When gender was used as the independent variable, male respondents numbered 496 (48.2 %), with female respondents, 533 (51.8%). The ratio of women to men was 1.07:1. MANOVA analysis showed statistically significant differences (Wilk’s lambda = .97, F = 2.09, p = .007) on all criteria, indicating that transfer system characteristics differed between male and female respondents. The F-test showed that only two of sixteen factors were significantly different; however, males rated personal outcomes-positive and transfer effort performance expectation higher than did females.

With age as the variable, the ratio of the largest group to the smallest group was 1.91:1. MANOVA analysis showed strongly significant differences (Wilk’s lambda = .93, F = 2.31) at the .00 level across age ranges. In between subject ANOVA, three of sixteen factors were significantly different according to age: personal outcomes-positive,
supervisor sanctions, and feedback/performance coaching. The post hoc comparisons showed that respondents aged 30 years or less rated personal outcomes-positive and feedback/performance coaching higher than did those aged 31-40 years old and those more than 40 years old. In contrast, respondents aged 40 years or more rated supervisor sanctions higher than their younger cohorts.

For education, the total respondents, 158 (15.7%) had less than a bachelor's degree, 653 (64.8%) had at least a bachelor's degree, and 197 (19.5%) had education levels beyond a bachelor's degree. The ratio of the largest group to the smallest group was 4.13:1. MANOVA analysis showed strongly significant differences (Wilk's lambda = .88, F = 4.17) at the .00 level across the educational levels. In between subject ANOVA, seven of sixteen factors were significantly different across educational levels. The post hoc comparison showed significant differences in those seven factors. Respondents with less than a bachelor's degree rated personal outcomes-positive, personal outcomes-negative, supervisor support, perceived content validity, performance outcomes expectation, and feedback/performance coaching higher than did respondents with higher levels of education.

For work experience, 158 (15.7%) respondents had fewer than 5 years of experience, 225 (22.3%) 5-9.99 years, 280 (27.8%) 10-15 years, and 345 (34.2%) had more than 15 years. The ratio of the largest group to the smallest group was 2.18:1. MANOVA analysis showed strongly significant differences (Wilk's lambda = .90, F = 2.17) at the .00 level across the number of years of work experience. In between group ANOVA, four of sixteen factors were significantly different. The post hoc comparisons showed significant differences in three factors. Respondents who have worked fewer than 5 years rated personal outcomes-positive higher than those who have more than 15 years on the job, while respondents who have worked 10-15 years rated personal outcomes-positive higher than who have 5-9.99 years of experience. In addition, respondents who have worked more than 15 years rated supervisor sanctions higher than those who have worked 5-9.99 years and those with less than 5 years of experience. Finally, the least experienced rated feedback/performance coaching higher than those who have worked 10-15 years and those with more than 15 years of experience.

Conclusions

The following conclusions are drawn from this study.

1. Sixteen transfer of training factors emerged when the LTSI version 2 (Holton and Bates, 1998) was applied in a Thai sample. Since these 16 factors corresponded to the transfer system, the transfer system developed by Holton et al. (1998) is valid in Thailand.
2. Perceived content validity is the most important factor to explain transfer of training in Thailand. This result also corresponded to Holton et al. (2000).
3. The Thai transfer system most varies depending on organizational type, especially between government and private organizations. This result may be explained by differences in organizational characteristics and culture between these two kinds of organization.
4. The validated Thai LTSI consists of 73 items, measuring 16 factors affecting transfer of training in Thailand, divided into two sections. The first contains 52 items measuring 11 factors in specific training program scales, and another 21 items measure five factors in training in general scales. However, this instrument has some weaknesses, such as a disproportionate number of items across factors and low internal consistency reliability in some factors. Therefore, this instrument needs revision and additional research.

Recommendations for Practice

The following recommendations for practice are made based on the findings and conclusions of this study.

1. Because perceived content validity is the most important factor that affects transfer of training, learners should be assigned as full stakeholders in the design and implementation of training. Learners may be responsible for identifying training objectives, assessing their training needs and participating in developing the training curriculum. The relevance of knowledge, skills, and attitudes of learners to training is significant in determining the training transfer.
2. Because transfer systems vary, particularly depending on the types of organization, HRD professionals in organizations need to diagnose their transfer system. Then, different interventions might be needed for different organizations to enhance transfer of training.
3. According to Holton et al. (2000), the LTSI can be used as a diagnostic tool. In addition, practitioners can use it in different ways, such as to assess potential transfer factor problems prior to conducting major learning interventions, to incorporate evaluation of transfer of the learning system as part of regular employee
assessment, and to conduct needs assessment for training programs to provide skills to supervisors and trainers that will aid transfer.

**Recommendations for Research**

Future research is suggested as follows.
1. Continued research to test the Thai transfer system found in this study should be done by using confirmatory factor analysis.
2. A qualitative interview process to uncover further factors of transfer of training in Thailand should be initiated. The richness of qualitative research is enhanced through the collection of additional data and subsequent analysis.
3. Research on related effects of transfer of training factors on work performance after attending training should be done to see the relationship between these two factors.
4. This study focused on the government organizations under the control of the Office of Civil Service Commission only. If the subjects were from other government organizations that are not controlled by the OCSC, such as the military, judicial, or police organizations that different results might occur.

Na Chiangmai, C. (1999, November). (Personal communication)

Data from seven surveys were analyzed to identify characteristics that have an impact on the effectiveness of HRD programs. Results indicate that setting specific HRD objectives promotes HRD effectiveness more than the setting of general objectives, HRD people are more positive about HRD effectiveness than managers and personnel officers, in-company programs are less effective than individual ones, and that programs in the field of languages are perceived as more effective that programs in the field of management, communication, and commerce.

Keywords: Improving Training Results, Enhancing HRD Effectiveness

Managers are increasingly being made responsible for the performance results of their work organization, unit or department. One of the means of improving performance is to develop the competencies of their employees by means of training and other learning interventions. They will invest in such interventions - further referred to as training, or Human Resource Development (HRD) programs - if these have added value for their company; and work organizations are still making considerable investments in training (Van Buren, 2001). In this way they are indicating that they expect training to produce positive effects on the achievements not only of individual employees but also of separate departments and the entire organization. Managers, however, will certainly take a critical look at the results of training and will only be willing to opt for those training programs that are expected to produce positive effects. In other words, HRD will be seen more and more as an investment that should produce results (Wognum, 1994). Research into the effectiveness of HRD has, as a result, been given a significant impetus, certainly after it was estimated in literature that only between 10 and 20 per cent of the capital invested in HRD and learning interventions would lead to a lasting improvement in performance (e.g. Broad, 1997).

A major part of training and HRD interventions is bought in from outside training companies. These organizations provide training programs from which the purchasing companies expect positive effects. Training companies therefore aim to provide programs of a high quality. The 'Vereniging van Trainings- en Opleidingsinstituten in Nederland' [Association of Training and Education Institutes in the Netherlands] (Vetron) is an association of established training companies that considers quality to be of paramount importance. In order to be able to monitor this quality, Vetron asked the Faculty of Educational Science and Technology of the University of Twente to conduct an evaluation on its behalf. This involves a survey being carried out of the quality of the training companies that are affiliated to Vetron by means of a random sample of the client base of the companies concerned. Seven surveys were carried out, during the period 1993 up to and including 1999.

Research Question

In the above section it is indicated that Vetron has had seven surveys conducted of the quality of the HRD programs provided by its companies. The study presented in this paper relates to a further analysis of the data from all seven surveys. On the basis of the results, Vetron aims to increase the effects and thus the effectiveness of the training they provide, by improving characteristics that have an impact on the effects of HRD programs. This implies, that Vetron would like to gain an insight into characteristics explaining HRD effectiveness. The research question, therefore, runs as follows: Which characteristics explain the effectiveness of HRD programs carried out by Vetron training companies?

Conceptual Framework

The above stated research question elaborates on research that was carried out in previous years by the University of Twente, Faculty of Educational Science and Technology, Department of Educational Organization and Management.
just learning, but also performance at various levels (Holton, 2000). Kaplan and Norton (1996) suggest two
categories of performance measures: the so-called drivers and outcomes. Outcomes measure effectiveness relative to
core outputs of the system, sub-system, process or individual, whereas drivers measure elements of performance that
are expected to sustain or increase system, sub-system, process, or individual ability and capacity to be unique for
particular performance systems (Holton, 2000). Together, these drivers and outcomes describe the cause and effect
relationships in organizations (Kaplan & Norton, 1996), which implies that drivers should predict future outcomes.

This theory fits well into the theory of HRD effectiveness, where HRD effectiveness is conceived as the extent
to which HRD goals and objectives are achieved. (Wognum, 1999). This implies that, to define the level of
effectiveness, HRD effects can be measured at three output levels (Holton, 2000; Wognum & Lam, 2000): the
learning level effects on knowledge, skills and attitudes), behavior level (effects on job behavior of individual
employees) and results level (effect on the performance results of groups, departments or the company). The HRD
effectiveness theory also points to a means-goals ordering that distinguishes between the ultimate criteria and the
supportive, effectiveness-enhancing criteria. HRD effects can then be seen as ultimate criteria of HRD effectiveness,
like Kaplan and Norton’s output measures. Criteria such as the HRD process itself are seen as effectiveness-
enhancing criteria (Scheerens & Bosker, 1997; Wognum, 1999), just like Kaplan and Norton’s performance drivers.
They explain, to some extent, HRD effectiveness. Gaining insight into these criteria is necessary, as a means of
interpreting the effects of HRD.

Based on the above stated insights, Wognum (1999) identified the following characteristics, explaining HRD
effectiveness.

Setting HRD Goals. In organizational effectiveness thinking, goals can be seen as the major defining factors of
the effectiveness concept itself (Scheerens & Bosker, 1997). HRD goals will be developed during a strategic
planning or strategic HRD alignment process (Wognum & Mulder, 1999). The word ‘strategic’ emphasizes the
company perspectives and makes the link between HRD and organizational goals and objectives. Strategic
alignment concerns a dynamic and interactive process in which HRD goals and objectives are formulated as part of
an ongoing future company policy. This relates to the learning and development of individuals and groups of
employees for the benefit of both the company and themselves (e.g. Garavan, Costine and Heraty, 1995). In much of
the literature, it is assumed that the process of setting general goals and specific objectives for the organization’s
HRD programs is important to enhance HRD effectiveness. Wognum found in her study on strategic HRD
alignment that this process does indeed have a positive effect on perceived HRD effectiveness (Wognum, 1999). If
strategic planning resulted in the formulation of more specific objectives, the impact on perceived effectiveness
would be even higher than in the case of general goals. It would be interesting to investigate whether setting or not
setting goals for HRD projects that have been carried out by Vetron companies has an influence on HRD
effectiveness. In the process it would be important to examine whether it is the setting of specific goals that
promotes HRD effectiveness more than the setting of general goals.

Involvement of Stakeholders. Strategic HRD alignment refers to the interrelationship between HRD
representatives and relevant company employees at strategic, tactical and operational levels of the organization, the
so-called HRD stakeholders. Each of these stakeholders or groups of stakeholders aims at particular effects with
HRD interventions. Senior managers, for example, will put the functioning of the work organization first, whereas
HRD officers are far more focused on the learning goals that the participants should have reached by the end of the
HRD activity (Wognum, 1994). This stakeholder perspective can have an influence on the assessment of the HRD
effectiveness realized. Earlier research results showed that stakeholder involvement in the strategic alignment
process has a positive impact on perceived HRD effectiveness; supervising managers and HRD officers, however,
perceive HRD effectiveness significantly higher than HRD participants do (Wognum & Lam, 2000). It is important
therefore to investigate to what extent the position of stakeholders in the Strategic alignment process (e.g. training
designer, participant, consultant) and the function they hold (e.g. director, divisional manager, HRD coordinator)
makes a difference to actual or perceived HRD effectiveness.

Form of HRD Programs. The form of an HRD program is expected to influence HRD effectiveness (Wognum,
2001a). Depending on the kinds of organizational problems involved, a specific HRD program can be tailored or
customized for a specific company, or a standard or other 'off-the-shelf' program, suitable for any company or problem situation can be provided. The former program is mostly offered as a so-called in-company program; the latter is an individual program, open to employees from different companies. The study by Wognum (2001a) revealed that the perceived effectiveness of tailor-made programs was less than that of other program forms. This result was not expected. In-company programs were expected to be more effective than standard programs, because they are tailored to the specific situation of the company where the participants work. It would therefore be interesting to examine whether in-company programs, such as those delivered by Vetron companies, are more effective than individual, more standardized programs in which employees from different companies can participate.

Content Field of HRD Programs. All kinds of environmental forces affect the company, such as demographic, social, economic, ecological, technological, and cultural. Some of these forces have a direct or indirect impact on the company and its HRD function. The ever-increasing trend towards automation, robotics, and other advanced computer applications, for example, has resulted in technological modifications and changes within companies. These changes impel companies to train and develop their employees (Pettigrew, as cited in Garavan, 1991). The HRD function is obliged to deliver HRD programs that provide these workers with the required competencies. Environmental forces thus serve as the starting point for HRD, determining to a certain extent the content field of HRD programs. This 'content field' is also seen as a feature that will have an impact on HRD effectiveness. Automation programs, for instance, proved to be significantly more effective than social skills programs (Wognum, 1999). One possible explanation for this was the different nature of the knowledge and skills in each of the two programs mentioned. It would also be interesting to examine whether differences in HRD effectiveness for different content fields can be observed in the HRD activities carried out by Vetron companies.

Method

Sample. To investigate the research question and, more specifically, the influence of the characteristics identified in the previous section on HRD effectiveness, a data file was used containing data from more than 3,700 questionnaires that were completed in the period from 1993 up to and including 1999 in the context of the evaluation commissioned by Vetron. The data came from a random sample of the client base of - on average - forty training companies that are affiliated to the Vetron. These Vetron companies satisfy a number of requirements relating to professional competence, continuity, quality and method of working. A questionnaire was sent to this random sample, more than 6 months after the HRD activity had been completed. On average, the response percentage was 35%. The main reason for non-response was the fact that respondents were no longer in the employ of the organization involved, due to high turnover rates in the companies.

Data Collection. A questionnaire, which had been specially developed for the evaluation project commissioned by Vetron (Mulder, 2000), was used for gathering the data. This questionnaire was used to determine the quality of the performance of the HRD assignments by the commercial Vetron companies. The questionnaire contains questions about the respondent, about characteristics of the HRD assignment, about the setting of objectives, about the division of responsibilities, about the attribution of the results to the training company and, finally, questions about making agreements and adhering to these (Mulder, 2000). The questionnaire measures both characteristics that have a direct impact on HRD effectiveness and characteristics that could possibly be used as explanatory variables.

Measurement of HRD Effectiveness. The effectiveness of an HRD program is often not immediately measurable, which is why in this study the indicator developed in the context of the Vetron evaluation was used to measure HRD effectiveness (Mulder, van Ginkel & Nijhof, 1994). This Aggregated Impact Indicator (AII) is calculated from the total satisfaction about the assignment, the realization of expectations, the adjusted effect score, the making of agreements and the extent to which these are adhered to, and satisfaction with the implementation of the program. The adjusted effect score is calculated from the extent to which the objectives of the HRD assignment have been realized. In the process, adjustments are made to reflect the importance of the objectives, the extent to which the training company was responsible for achieving these objectives and the extent to which the respondent attributes the attainment of the objectives to the training company. A weighting factor was awarded to each of the characteristics of the effectiveness indicator, based on the results of a Lisrel analysis (Mulder, s.a.). The reliability and validity of this measure was tested by Mulder c.s. as sufficient (1994). Finally, we would like to remark that the AII does not thus measure actual HRD effectiveness but its effectiveness as perceived by the respondents.
One of the characteristics by which the All is calculated is the realization of expectations. Approximately a third of the respondents had not completed this question. There are different ways of dealing with missing values. Firstly, the decision can be made to use only complete cases, which means that the data from incomplete cases are not taken into consideration. Secondly, it can be decided to use the incomplete cases, and to complete them by imputation, meaning that a particular value is filled out instead of the missing values. The usual value for this is the random average (Little & Rubin, 1987). In this survey too, in order to be able to use the data from those respondents who had not stated to what degree their expectations had been realized, the average score for the realization of expectations was calculated and entered.

**Predictive Variables.** In the questionnaire for the evaluation commissioned by Vetron, several questions were also included relating to specific characteristics that have an influence on HRD effectiveness; the so-called predictive variables. This study examines whether a number of these variables can explain the differences in the All scores of the participants. To this end it will study whether there are significant differences between groups of participants when one of these variables is conditioned. On the basis of what is described in the 'conceptual framework' section, the impact of the following factors on the All score is examined:

**Setting Training Goals.** The study examines whether the setting or not setting of objectives for the HRD assignments has an impact on HRD effectiveness. The expectation is that setting objectives will have a positive impact on HRD effectiveness. The setting of specific objectives is expected to promote HRD effectiveness more than the setting of general objectives.

**Involvement of Stakeholders.** Another factor that will be examined in the study is the involvement of stakeholders in the HRD assignment. The position of respondents and the functions that they hold are expected to make a difference as regards actual or perceived HRD effectiveness. The questionnaire identifies the following positions: contractor, purchaser, adviser, co-developer, internal organizer/coordinator, participant, and the residual category 'other'. The respondent has the opportunity to indicate more than one position. As far as the function of the respondents is concerned, ten different categories of function are mentioned in the questionnaire, namely: director/works manager, line/departmental/divisional manager, head of personnel (sector/division), personnel officer, head of the HRD department, HRD officer, HRD coordinator within the HRD department, teacher/instructor/trainer, internal adviser, and external adviser. If the function of the respondent does not come under any of these categories, the respondent could fill out his function in the residual category 'other'.

**Form of HRD Programs.** In this study a distinction is made between in-company programs and individual programs. In-company programs are those that are specially made for a particular company, in which only employees from that company participate. In the case of an individual program, individual employees from different companies take part. The expectation is that in-company programs will be more effective, because they are tailored to the specific situation of the company where the participant works.

**Content Field of HRD Programs.** The field to which the program relates makes a difference to HRD effectiveness (Wognum, 1999). The questionnaire identifies ten different HRD fields, namely: languages, management, communication, commerce, employee participation, marketing, technology, automation, HRD theory, and other fields. It is thus expected that there will be a difference in HRD effectiveness between these fields.

**Preparation of the Data.** Before the analyses were conducted, the data file was adjusted on a number of points in order to be able to answer the research question. In the case of the question about the function of the respondent, it emerged that many people had indicated in the category 'other' that they were a member of the works council. For this reason, a separate function category, 'member of the works council' was added. Something similar occurred with the question about the content field of HRD. There proved to be many programs with the combination of management and communication; the combination of communication and commerce also occurred frequently. For this reason these combinations were added as extra categories. Based on the data received about the position of stakeholders, the respondents were divided into four groups according to the stage in which they had been involved in the HRD assignment. The first group consists of respondents who were only involved in the preliminary stages of the program: contractors, purchasers and advisers. The second group comprises respondents who were only involved in the actual implementation of the HRD assignment. This includes co-developers, internal organizers/coordinators and participants. The third group consists of respondents who were involved in both the preliminary stages and the actual implementation. The fourth group is made up of the remaining respondents, of whom it is not known in which stage of the HRD assignment they were involved. Phillips (1997) states that those people who were closely involved...
in the implementation of the program are inclined to attribute all the changes or improvements in the participant's behavior to the program itself. People who are further removed from this are also able in their assessment of the program to take into consideration other factors that influence these changes or improvements. On the basis of this, those who were involved only in the actual implementation of the HRD assignment are expected to give a more positive assessment of HRD effectiveness than the rest.

Data Analysis. The data were analyzed with SPSS. The Independent Samples T-test was used to establish the difference between individual and in-company programs and the difference between setting or not setting goals in advance.

A One-way ANOVA was used to see if there was a difference between those who were only involved in the preliminary stages, those who were involved in both the preliminary stages and the actual implementation of the HRD assignment, those who were only involved in the actual implementation of the HRD assignment, and those of whom it is not known in which part of the HRD process they were involved. This also applies to the difference between the function of the respondents, the difference between the fields of HRD and the difference in the extent to which goals were set.

If significant differences between the groups were found in the analysis of variance, a Post Hoc analysis was conducted using the Bonferroni procedure to see which groups differed significantly from the others. This procedure compares the average of each group with every other group by means of a T-test.

All the analyses were conducted with a p-value of .05.

Results

The results of this study show which of the characteristics impact on the All-score of the participants.

Setting HRD Goals. The All-scores of the programs that set HRD goals are higher (M = 65.4, SD = 12.8) than the All-scores of programs for which no objectives were set in advance (M = 62.2, SD = 14.0). The Independent Samples T-test indicates that this difference is significant, t(2742) = -3.01, p < .003.

Also investigated was whether the setting of general or more specific objectives has an impact on the All-score. The results of the One-way ANOVA show that there is a significant difference, F(4, 2496) = 32.851, p < .00. In order to check to what degree of objective setting the All-score differs, a Post Hoc analysis was conducted using the Bonferroni procedure. The results of this are shown in Table 1.

In Table 1 the All-score of the type of objective from the first column is compared with the All-score of the type of objective from the first row. The value that is shown in the table is the Mean Difference (MD). This MD was calculated by subtracting the average of the All-score of the type of objective in the first column from the average of the All-score of the type of objective in the first row. The significant differences from this column are marked with an asterisk.

</table>

It can be deduced from Table 1 that the average All-scores for the programs for which the objectives that were set are very general, general or neither general/nor specific are significantly lower than the average All-scores for programs for which the objectives are specific or very specific. It is striking that the average All-scores also differ significantly for programs in which the objectives that were set are specific and the programs in which the objectives that were set are very specific (MD=-8.01, p<0.000).

Involvement of Stakeholders. The results of the One-way ANOVA showed that there is a significant difference between the different stages of involvement, F(3, 2742) = 3.080, p < .026. In order to check in which stages the effectiveness indicator differs, a Post Hoc analysis was conducted using the Bonferroni procedure. The results of this are shown in Table 2.

p < .05.

Table 2 shows that those who were only involved in the preliminary stages are more positive about HRD effectiveness than are those of whom it is not known in which stage of the training process they were involved (MD = -5.36). This difference in average All-score is significant (p < .025). Those who were involved in the entire training process also assessed HRD effectiveness more positively than did those of whom it is not known in which stage of the training process they were involved (MD = -5.36). This difference too is significant (p < .024).

Subsequently, a one-way ANOVA analysis shows that there is a significant difference between the respondents when grouped on the basis of function F(11, 2727) = 6.401, p < .00. In order to check for which functions the average All-score differs significantly, a Post Hoc analysis was conducted using the Bonferroni procedure. Only the columns with significant results are shown in Table 3.

From Table 3 it can be deduced that the average All-score for the function of director/works manager is significantly lower than the average All-score for the head of the HRD department (MD = -5.4, p < .000), the HRD officer (MD = -4.67, p < .000) and the HRD coordinator within the HRD department (MD = -5.07, p < .008). Other significant differences were found between at one side the line manager, the personnel officer, and the category others, and on the other side the head of the HRD department, HRD officer, and HRD coordinator. The second group has significantly higher All-scores, which imply far more positive perceptions of HRD interventions.

p < .05.

Form of HRD Programs. The mean and the standard deviation for both groups were calculated to investigate whether there is a difference between the group of students who received an in-company program and those who received an individual program. The All-score for in-company programs (M = 65.11, SD = 12.99) is lower than the All-score for individual programs (M = 66.35, SD = 14.95). The Independent Samples T-test, however, indicated that this difference is not significant, t(2413) = -1.644, p < .10.

Content field of HRD Programs. It was investigated whether there is also a difference in the average All-score between the different content fields of HRD. The One-way ANOVA analysis reveals that here too there is a significant difference, F(11, 2724) = 4.836, p < .00. In order to check for which fields of HRD the average All-score differs, a Post Hoc analysis was conducted using the Bonferroni procedure. Only the column with significant results are shown in Table 4.

From Table 4 it can be deduced that programs in the field of languages are found to be significantly more effective than programs in the fields of management (MD = 5.81, p < .000), communication (MD = 4.16, p < .003), commerce (MD = 6.66, p < .000), participation in decision-making (MD = 6.99, p < .000), management and communication (MD = 6.32, p < .017) and programs from the residual category 'other' (MD = 5.89, p < .000).
Conclusion and Discussion

The goal of this study was to gain a greater insight into characteristics that explain, or influence, HRD effectiveness. Firstly, the influence of setting or not setting objectives in advance was studied. Here it was expected that setting objectives in advance would have a positive influence on the All-score. At the same time, the setting of specific objectives was expected to lead to a higher All-score than the setting of general objectives. The results of the analysis correspond with these expectations.

Table 4. Post Hoc analysis (Mean Differences) of the types of content fields affecting All scores.

Another characteristic examined in the study was the involvement of stakeholders in the HRD assignment. It was expected here that those who were involved only in the actual implementation of the HRD assignment would give a more positive assessment of HRD effectiveness than would the other people involved. The results indicate that respondents who were involved only in the preliminary stages of the program were more positive about HRD effectiveness than were those of whom it was not known in which stages of the training process they had been involved. The respondents who were involved both in the preliminary stages and in the program itself also gave a more positive assessment of HRD effectiveness than did those of whom it was not known in which stages of the training process they were involved. It is striking that no significant differences were found with the respondents who had been involved only in the program itself. This is probably due to the relatively small size of this group of respondents. A follow-up study in which more respondents from this group are involved may well produce significant results.

The function of the respondent was also considered, and here it was expected that there would be a difference in All-scores between the function categories distinguished, due to the different perspectives of those involved. Those who are directly involved in the programs will look mainly at the program itself, how it progressed and whether the learning objectives of the program were attained. Those who are not directly involved in the programs will look more at the effect of the program on the functioning of the participants. The results reveal that respondents who are directly involved in the programs, such as HRD officers, heads of HRD departments and HRD coordinators within HRD departments, are more positive about HRD effectiveness than are respondents who are not directly involved in programs, such as directors/works managers, line/departmental/divisional managers, heads of personnel, personnel officers and respondents from the category 'other'. This is in line with the result, found by Wognum (1999), indicating that HRD officers are more positive about the effects of HRD programs than other stakeholders. On the other hand, no significant differences were found with the group of respondents who were involved only in the program itself. This is probably due to the relatively small size of this group of respondents. A follow-up study in which more respondents from this group are involved may well produce significant differences.

Further, the form of the HRD program was examined. It was expected that in-company programs would be more effective than individual ones. The results, however, reveal that this is not the case: individual programs prove to be more effective than in-company programs. This corresponds with the results found by Wognum (2001a). The differences in the All-score are - although close to significance - not significant. It would therefore be advisable to carry out this study using a random sample with a higher percentage of individual programs. In the study presented here six times as many in-company programs were involved as individual programs.

Finally, the field to which the programs relate was examined; here there was expected to be a difference in All-score between the different fields, mainly because of the differences in the knowledge and skills to be acquired. The results reveal that there are indeed differences. Programs in the field of languages appear to be perceived as more effective than programs in the fields of management, communication, commerce, employee participation,
management and communication and programs from the residual category ‘other’. This is probably due to the fact that the content of language programs is more concrete and more directly applicable than those of the other types of programs. One striking result is that both communication programs and commerce programs were found to be less effective than language programs, but that this was not the case in a combination of these programs. A possible explanation for this is that in this study there were fewer programs in the field of the combination of communication and commerce than programs in the individual fields.

The results of this study provided us with some more insights into characteristics that are able to enhance HRD effectiveness. Based on this, it is now possible to further fill out the HRD effectiveness model as depicted in earlier papers (Wognum, 2001b) with the predictor variables found.

In this study, T-tests and One-way ANOVAs were applied to assess the effect of the individual explaining variables separately. As a result, it is possible to draw conclusions as to whether or not they influence the All-scores. However, all these variables are treated as if they were independent, and no second-order effects were taken into account. In our study this might not be the case, so further research is needed. In general, when a design consists of more than two dependent variables, a MANOVA study is conducted to gain more insight into the relations between the variables and the All-score. Conducting a MANOVA will therefore be the next step in our research project.

Expanding the Transfer of Training Domain of Structured On-the-Job Training

Chan Lee  
Jin Hyuk Kim  
The Ohio State University

Ronald L. Jacobs  
The Ohio State University

Many researchers and practitioners in human resource development (HRD) field presumed there was a close match between structured on-the-job training (OJT) and the actual task on the job, but structured OJT has not been researched in depth in the far transfer of training. Thus, this paper proposes that structured OJT can be used not only in near transfer of training but also in far transfer of training. Yet how to design structured OJT programs to achieve far transfer, especially when the task is relatively unknown, remains an issue for future HRD research and development.

Keywords: Transfer of Training, On-the-Job Training, Planned Job Training

Transfer of training continues to be an area of major interest among human resource development (HRD) scholars and practitioners. Underlying the concerns about training costs is the fundamental organizational need to ensure that trainees will be able to use what was learned during the training back on their jobs. Bassi, Gallagher, and Schroer (1996) state that employers express concerns about their training expenditures. In the authors’ study, private sector employers spent $25.2 billion on direct costs associated with training, while private employers’ indirect training costs (wages, salaries, and fringe benefits) are estimated to be $27.1 billion. Comparable estimates of federal government agencies’ expenditures on direct and indirect costs for training civilian government employees are $1.2 billion and $1.8 billion, respectively. Adding the estimates in these two sectors together indicates employers have spent $26.4 billion on direct costs and $28.9 billion on indirect costs for training in 1995, bringing the total to $55.3 billion.

While there has been much attention paid to the transfer of training in general, how the topic relates to structured on-the-job training (OJT) has received little attention, if any. Many researchers have simply presumed that since there was a close match between the training and the task, transfer of training was not a particular issue of concern (Jacobs & Jones, 1995). However, upon closer examination, it has been generally assumed that structured on-the-job training has been used to achieve near transfer of training situations only. This viewing of structured on-the-job training implies that transfer of the training has been restricted within the application of the types of tasks and in the setting prescribed by the training. An important issue here, and one that has received little attention in the HRD literature is the extent that training in one domain may generalize to a different or unintended context. This paper proposes that structured on-the-job training (OJT) can be used in both near and far transfer of training situations; it consists of three parts. The first part discusses transfer of training, focusing on near and far transfer. The second part discusses the transfer of training domain of structured OJT. The final part discusses implications related to far transfer of training and structured OJT.

Near Transfer Versus Far Transfer of Training

Transfer of training refers to the extent to which individuals can apply what was learned in one situation to another situation (Baldwin & Ford, 1988; Holton, Bates, Seyler & Carvalho, 1997). Transfer of training involves applying the task to contexts other than those used in the training setting. Trainers expect the trainee to learn the new behaviors and use them back on the job. The literature suggests that the extent to which transfer of training occurs depends on several sets of variables. For instance, Baldwin and Ford (1988) proposed a framework that identified the variables in the training design (principles of learning, the sequencing of training material, and the job relevance of the training content), the trainee characteristics (ability or skill, motivation, and personality), and the work environment characteristics (supervisory; constraints and opportunities to practice learned material on the job).
As Figure 1 shows, the greatest importance in determining the transfer of training is the relative match between the training setting and the work setting (Jacobs & Jones, 1995). That is, the principle states that the greater the similarity between the two settings, the greater likelihood the transfer of training will occur. The training setting should have the same critical features, including the physical attributes, the various work-related cues, and social settings that will be encountered later on in the actual work setting. Some of these features might be deduced to their simplest forms with the expectation that the training can focus on these alone, with the elimination of extraneous information. However, the extent to which the match exists, and by extension, the extent to which transfer of training occurs depends in part on the nature of the work and the expected training outcomes.

Transfer of training can be categorized in several ways. For example, Royer (1979) identified some bi-polar transfer of training classifications, such as lateral and vertical, specific and non-specific, literal and figural, and near and far dimensions. Royer (1979) emphasized viewing those various constructs on a continuum rather than two distinct phenomena. As shown in Figure 2, near and far transfer of training can be compared in terms of the relationship between the work task and emphasis of training design. Near transfer requires a close match between training and task content, a close match between the training and task outcomes, and emphasis on specific concepts and skills. In contrast, far transfer requires an approximate match between training and task content, and an approximate match between training and task outcomes, and emphasis on general concepts and skills.

The characteristics of near transfer suggest trainees should apply known sets of knowledge and skills. For example, after an employee learns the repair procedures for a Hyundai engine, they repair only that one particular Hyundai engine once they are back on the job. Far transfer, on the other hand, is akin to having trainees learn more general concepts and principles, which might be applied to a wider set of contexts than those necessarily presented in the training setting. For example, an employee might learn to repair a Hyundai engine, but for far transfer to occur, the trainee would be able to transfer what was learned about engines in general during training to an array of other engines, such as Chrysler, Ford, or Honda. Far transfer suggests by learning the fundamental aspects of something along with specific skills, there is a greater chance for applying that information to more than one setting later on. Thus, the greater similarity between the training and working settings suggests relatively near transfer of training. Less similarity suggests the need for far transfer.

The concepts of near and far transfer of training are frequently discussed relative to training objectives, transfer theory, and learning requirements. In terms of the training objectives, the distinction between the types of transfer is related to types of skills transferred (Clark & Voogel, 1985). Clark and Voogel (1985) distinguished between procedural learning objectives, in which concrete and practical knowledge of relatively simple routines are included, such as something that can be learned as a step-by-step sequence of behaviors and a declarative learning objective, in which concepts and principles have formal properties. Procedural types of training objectives tend to involve near transfer while declarative training objectives are more likely to contribute to far transfer.

In terms of transfer theory, the literature has focused on two kinds of transfer of training theories. For example, Goldstein (1993) describes two transfer theories necessary for explaining near and far transfer: the identical-elements and principles theories. The identical-elements theory suggests that the transfer of training occur when what is being acquired during the training is identical to what the trainee performs on the actual context. According to the theories, transfer will be maximized to the extent to which the tasks, equipment, tools, and environment at the training setting are similar to those encountered at the actual work setting. In contrast, the transfer-through-principle theory proposes that the general principles necessary to learn a task should be emphasized to solve the problems in the transfer task. Regarding designing training environment, this theory is not highly concerned with similarity between the training setting and the actual work setting. Therefore, near transfer enables trainees to meet the relatively known predictable conditions of their job and apply their knowledge and skills, while in far transfer, the trainees are expected to learn concepts and principles to deal with situations not always encountered during the training.

Finally, research suggests that near and far transfer of training requires different learning requirements. The requirements for near transfer depend mostly on the similarity between the training and the task. However, achieving far transfer of training requires additional considerations. Laker (1990) states far transfer depends on whether the training includes information about the assumptions underlying the skills and behaviors they are learning. In addition, a number of studies have suggested that the more trainees practice in different contexts and use novelty in their practice exercises, the more effective the far transfer (Ellis, 1965; Goldstein, 1986; Baldwin & Ford, 1988). Clark and Voogel (1985) stress the importance of incorporating a variety of situations and problems in order to develop and apply skills.
Structured OJT and Transfer of Training

On-the-job training refers to a form of training that occurs at the workplace during the performance of a job rather than in a classroom setting (Jacobs & Jones, 1995; Rothwell & Kazanas, 1994). OJT is the most widely used method of delivering training to a novice employee by an experienced employee today, and is one of the most important components of learning in the workplace (Jacobs, 1999; Rothwell & Kazanas, 1990). Despite its frequency of use, most OJT is unfortunately informal or unstructured in nature, and therefore has received serious criticism for often being haphazard, incomplete, and unpredictable (Jacobs, 1990; Jacobs & Jones, 1995; Rothwell & Kazanas, 1994). Structured OJT has recently emerged as a subject of interest in the HRD field. In contrast to informal or unstructured OJT, structured OJT uses a planned approach to the training (Jacobs & Jones, 1995). Structured OJT is generally referred to as a planned process conducted by an experienced employee for the purpose of providing the knowledge and skills to perform tasks to a novice employee at or near the workplace.

When there is a greater match between training setting and job setting, then trainees can transfer what they have acquired to the job more successfully. Structured OJT has been perceived as an effective training approach in part because of its potential to achieve transfer of training. It is one of the benefits of structured OJT that trainees have much more possibility for transfer than classroom training (Jacobs & Jones, 1995). Since structured OJT is conducted near or at the job setting, trainees are available to use the same equipment, tools, and environment they use to perform their actual tasks. Structured OJT enables trainees to practice the task during training because the task is similar in both training and transfer. Because of the inherent association between structured OJT and the feature of transfer, it is commonly believed by managers and HRD professionals that structured OJT should only be used in near transfer of training situations.

Figure 3 presents how structured OJT differs by the nature of the task -- established or varying -- and near or far type of transfer of training. The figure also shows examples of these dimensions. The classifications between near and far transfer and established and varying tasks provide an approach to the transfer of training domain of structured OJT. The established and varying classification provides a complementary dimension to near and far transfer. While the near and far transfer is a classification about the conditions under which training and transfer tasks are performed, the established and varying task is a classification about the nature of the tasks themselves. Established tasks involve the specific procedural training content and sequence. In contrast, varying tasks involve the complexity of general information in training content and sequence. The combination of a near or far type of transfer and the established or varying tasks can provide a means of characterizing transfer of tasks on structured OJT.

Established tasks and near transfer of training (ex. 1, Figure 3) have characterized most structured OJT programs. In this instance, the training focuses on units of work in which the content and sequence are fixed so that the trainee is expected to perform closely matching job tasks. Established tasks and far transfer (ex. 2) focuses on units of work in which the content and sequence are fixed, but the trainee is expected to perform across a set of related tasks. In this example, the training focuses more on having trainees learn reliable principles that govern relationships among variables. This combination should attract most attention from organization managers since far transfer would seemingly reduce the amount of training early on.

The combination of having varying tasks and near transfer (ex. 3) suggests that the training focuses on units of work in which the content and sequence are changeable, for the purpose of performing closely matching job tasks. At first glance, how to achieve such a combination might appear illogical, but it points to situations where training is provided for complex, constantly changing work situations.

Finally, in considering varying tasks and far transfer (ex. 4), the training focuses on units of work in which the content and sequence are changeable to perform a set of related job tasks. In the far transfer and varying task training provides broad principles, often drawn from the underlying structure of the task. This broad base can be transferred in more than one task situation. Given these combinations, it becomes necessary to present a level of transfer, which focuses more on general principles and concepts, followed by embedding of suitable training objectives and content for the desired level of transfer.

Discussion

This paper proposes that structured OJT can be used for both near and far transfer of training. Several issues
determine whether structured OJT can actually be used for far transfer. First, to achieve far transfer, structured OJT should be considered as a system such that the training inputs, training process, training outputs, and organizational context are considered. Even though it may be believed that training outcomes from far transfer are less predictable, using the systems view to implement structured OJT would enhance the possibility for the most effective training outcomes.

Second, a structured OJT program is viewed as an investment from which the organization can expect a return (Jacobs & Jones, 1995). When an organization needs principle-focused training to apply to multiple job issues or when training workforce in a broader perspective, for example in a nation, is needed, structured OJT used in far transfer would be a cost-effective approach. Integrating the principle into structured OJT can achieve job outcomes in both near transfer and enhance the potential far transfer.

Third, Versloot and De Jong (1994) and De Jong (1991) propose forms of structured OJT that possess varying levels of structuring and include on-site practice, on-site instruction, and on-site study. In certain circumstances it can be better to structure less, than to structure too extensively (De Jong, 1991; Versloot & De Jong, 1994). Regarding this issue, less structured formation could be appropriate for far transfer of structured OJT.

Fourth, Lohman (2001) indicates that structured OJT might be used for both deductive and inductive training strategies. Inductive training strategies seem more appropriate for far transfer of structured OJT. It requires trainees to become critical thinkers, effective problem solvers, and independent learners, skills that enable them to continuously learn and improve their performance instead of receiving information from the trainer.

Finally, to achieve successful far transfer, trainees can be encouraged to discuss and apply the training in a context they choose. When trainees participate in the program design, the training would be expected to have a closer match between the employee's interests and the organizational needs. This approach might enable trainees to better meet current and future organizational needs.

Transfer of training is one of the primary concerns for managers and HRD professionals. Although structured OJT is now widely used as an effective training method, it has been used within a limited domain of near transfer of training. This paper sought to explore the transfer of training domain of structured OJT to include far transfer. Further research and experience are required to further examine the various issues related to designing structured OJT for far transfer of training.

Strategic HR Orientation and Firm Performance in India

Kuldeep Singh
Indian Institute of Management, Indore

This study tests the relationship between strategic HR orientation and firm performance. The study has been conducted to add to the growing empirical evidence in this field. The study has been carried out in the Indian settings, where the importance for human resources has gained currency in the last decade. Results show that there is a significant relationship between the strategic HR orientation and firm performance.

Keywords: Strategic HR, HR-Organization Performance, HR in India

As firms grow and evolve, their strategies and approaches to achieve human resource development need to be changed. If human resources (HR) function has to be effective, then it must grow and respond to the firm's new needs and the demands of the environment. This growth in HR function has to be in terms of adoption of new systems, policies and practices which will fit very well with the emerging needs of the firm. One of the main objectives of human resources development program is to provide a firm with employees having the right type of the skills, knowledge, attitudes and outlook.

Problem Statement and Purpose of Study

The roots of personnel function in India can be traced back to early 1920s when the Tata group implemented employee welfare measures like provident fund and leave rules. The Trade Union Act of 1926 gave formal recognition to the worker unions. The Royal Commission of 1932 recommended the appointment of Labor Officers. After independence, the Factories Act of 1948 outlined the welfare measures for workers as also the roles and responsibilities of Labor Welfare Officers. All these developments laid the foundation of personnel function in India (Balasubramanian, 1994, 1995). In the 1950s, two professional bodies namely, Indian Institute of Personnel Management (IIPM) and National Institute of Labor Management (NILM) were set up. In the 1960s, the scope of personnel function began to expand beyond the welfare aspects with three areas of labor welfare, industrial relations, and personnel administration developing as the constituent roles of the emerging profession (Venkata Ratnam and Shrivastava, 1991). In the 1970s, the focus of the personnel function shifted towards greater organizational efficiency and effectiveness issues. In the 1980s, issues like human resource management (HRM) and human resource development (HRD) started invading the domain of personnel function. The setting up of two professional bodies like National Human Resource Development Network (NHRDN) in 1985 and Academy of HRD (AHRD) in 1990 further augmented the evolution of personnel function. These two bodies accelerated the shift of personnel function towards the human resources management and development orientation. Firms across the country responded by adopting HRM/HRD nomenclature for their personnel function and appointed professionals to head these functions.

Today's business environment in the Indian context after initiation of economic reforms in 1991 requires that HR function play a strategic role. This strategic perspective to HR represents a shift from the traditional view of human resource management and development that emphasized individual outcomes such as morale, motivation and job satisfaction, towards a firm level emphasis with focus on HR's contribution to firm performance. In other words it means that HR function needs to get integrated with business strategy like other functions. However, even though HR function has been in use in Indian firms during the last twenty five years, but it is only in the recent few years that some efforts have been made by some firms to accord HR a strategic status. This shift in the qualitative positioning of HR can be mainly attributed to the fact that today's firms have to live, survive and thrive in an information centered milieu. Moreover, after the recent liberalization of economic policies, the increased level of competition by overseas firms has put a lot of pressure on the human resources function in domestic firms to prepare and develop their employees so that these firms are able to compete with overseas firms in skills, efficiency and effectiveness (Krishna and Monappa, 1994; Venkata Ratnam, 1995; Budhwar and Sparrow, 1997; Sparrow and Budhwar, 1997). However, till date no empirical work has been carried out in the Indian context to study the impact of strategic HR orientation on firm performance. It is in this context that the present study was undertaken to gain an understanding of strategic orientation of HR prevalent in the Indian firms as well as its relationship with firm performance. Further, it would be of interest to Western firms to know what is happening in India in the HR field as they find India an attractive place to invest in because of its huge domestic market (Datt and Sundharam, 1999).

Theoretical Framework

Strategic human resources management has emerged as a dominant area of research among scholars and practitioners in different parts of the world. This is apparent from the recent literature on international human resource management (e.g., Schuler, Dowling, and De Cieri, 1993), as well as from recent reviews of the trends in the US (Dyer and Kochan, 1996), Canada (Betcherman et al., 1994), and the UK (Lundy, 1994; Truss and Grattan, 1994). The argument that better human resources planning is the basis of superior business performance has received support from various angles, even from authors whose overall work reflects a critical attitude to SHRM (Mueller, 1996). It has become a widely held premise that people provide organizations with an important resource of sustainable competitive advantage (Prhalad and Hamel, 1990; Pfeffer, 1994; Wright, McMahan, and McWilliams, 1994) and that the effective management of human capital, not just physical capital, may be the ultimate determinant of organizational performance (Adler, 1988; Reich, 1991). Ferris et al., (1990) found that construction firms with higher levels of strategic, including HR, planning have achieved higher organizational performance (see also Ferris, 1984; Cook and Ferris, 1986). Nkomo's (1987) study did not find significant differences between the performance of the firms using formal human resource planning and firms that did not. Delaney et al. (1988) surveyed US firms but could not establish a strong statistical correlation between HR programs supported by senior management and firm performance. Abowd (1990) found that the degree to which compensation for managers was based on an organization's performance was significantly related to future performance.

Gerhart and Milkovich (1990) found that pay mix i.e. pay structure having a fixed component and performance linked variable component, was related to organizational performance. Leonard (1990) found that organizations having long-term incentive plans for their executives had larger increases in return on equity over a four year long period than other organizations. Further, the studies show that comprehensive selection and training activities are frequently correlated with both productivity and organization performance (Russell et al., 1985; Kleiner et al., 1987; Terpstra and Rozell, 1993; U.S. Department of Labour, 1995). Huselid (1993 & 1995) identified a link between the organizational level outcomes and groups of high performance work practices.

In summary, the above studies indicate a positive relationship between HR practices and firm performance. However, all the studies have been undertaken in US settings and elsewhere, and to add validity to this growing stream of research, more such studies in diverse settings like India need to be conducted. Hence the present study was undertaken to find out the linkages between the Strategic HR orientation and firm performance in the Indian context.

Objective of Study and Method

The main objective of the present study was to ascertain the relationship between strategic HR orientation and firm performance in the Indian settings. The various variables used to measure these two constructs are described as follows.

Strategic HR Orientation

Though there are many HR practices which may have impact on the firm performance, but for the purpose of present study, HR practices related to manpower planning, recruitment and selection, evaluation, compensation, employee training and staffing were selected. The selection of these HR practices was based on the literature support as well as prevalence of these in the Indian firms as indicated during the pilot study.

In this study, I defined strategic HR orientation as “the alignment of HR planning, selection, evaluating, compensating, developing, and staffing practices with the business strategies of the firm”. Firms, which develop a strong strategic HR orientation, will make use of bundle of HR practices to transform employees as the basis of sustainable competitive advantage (Lam and White, 1998). The process of creating sustainable competitive advantage has been cited recently by theorists of strategic management to describe how firms can trace their successes to their internal stock of resources (Prhalad and Hamel, 1990; Barney, 1991). Viewed from this
perspective, human resources get treated at par with technological or physical resources in terms of having the same strategic potential. This strategic perspective has led Wright and his colleagues to urge organizations to focus on the serial steps of recruitment, compensation, and training in order to attract and develop competent employees (Wright and Snell, 1991; Wright and McMahan, 1992).

Following above approach, existence of a formal written human resources plan is identified as the first critical strategy that strategic HR oriented firms will employ as the existence of a written HR plan based on the strategic business plan of the firm will help the firm in anticipating and planning for acquisition of strategic competencies. Mere planning will not work unless efforts are made to acquire those strategic competencies. Therefore, strategic HR oriented firms will use selection practices to "locate relevant competencies and attract them to the organization" (Wright and Snell, 1991). Simply having competent employees will not ensure high performance unless a system to evaluate the working of those competencies is in place. Therefore, strategic HRM oriented firms will employ performance evaluation system linked to strategic goals. Competent employees are not necessarily loyal. To retain competent employees, firms will be required to have a competitive level of compensation and fringe benefits (Balkin and Gomez-Mejia, 1990; Gerhart and Milkovich, 1990). Thus, firms will use strategic objective linked compensation system to improve employee retention and firm performance. However, to sustain high performance, a firm needs further developmental investments to maintain the level of superior HR competence (Magnum, Magnun, and Hansen, 1990). Therefore, a firm in order to sustain high performance needs to employ strategic goal based employee training. Finally, firms in order to sustain high performance despite compelling economic and technological pressures can do so if the "workforce can respond quickly, easily, and cheaply to changes" (Atkinson, 1985a). Therefore, strategic HR oriented firms need deployment of staffing pattern based on the strategic needs.

**Firm Performance**

In conducting studies of corporate performance, researchers of strategic management have recommended using multiple measures of corporate performance (Venkatraman and Ramanujam, 1986). Consequent to this, three measures of corporate performance were used in this study. The first measure was return on assets. A firm's return on measure is an indicator of accounting profitability. It was computed by dividing the operating income by total assets in 1993. The second measure used was growth in sales. It was computed by averaging out annual growth of sales between 1995 and 1998. This measure indicates how well customers accept the firm's products or services. Third measure used was price-cost margin. Price-cost margin was calculated by dividing Profit before Depreciation, Interest, and Taxes (PBDIT) by net sales and calculating average for the period 1995 to 1998 to take care of the variations.

**Impact of Strategic HR orientation on firm performance**

Does strategic HR orientation have an impact on firm performance? Yes, at least for two compelling reasons. The first is in the form of cost advantage enjoyed by the strategic HR oriented firms due to reduction in employee absenteeism and turnover rates. An employee remaining absent or frequent quitting entails higher cost for firms. The annual cost of unscheduled absence has been estimated to range from $250 to $500 per employee (Cascio, 1995). In case of the turnover, the firm incurs additional cost in term of advertising and hiring to fill the vacant position. Thus, there will be an increase in replacement costs in terms of additional recruiting and training (Cascio, 1995). These replacement costs can be minimized if firms incorporate HRD activities into their strategic business plans so that they can rely more on existing employees to fill vacant positions (Friedman and LeVino, 1984).

The second reason is that strategic HR oriented firm will lay greater emphasis on the development of their employees due to stronger emphasis on the recruitment, training, and compensation of the employees. The development of employees into a highly competent workforce has been argued to produce competitive advantages that are more valuable and also more difficult to imitate (Pfeffer, 1994). For these reasons, a strong strategic orientation may bring significant economic benefits to the firms (Gatewood and Field, 1994; Cascio, 1995).

**Research Methodology**

**Sample**

The database for the current study was drawn from firms listed in the BT (Business Today) 500 Indian firms. This listing was selected for three reasons. One, all the firms representing major domestic industries in India ranging from automobiles and auto components, cement, iron and steel, hotels, chemicals, consumer durable, consumer non-
durable, engineering, financial services, info-tech, pharmaceuticals, paper and power etc., are listed in it. Two, it may be helpful in generalizing findings of the study across a broad spectrum of firms. Three, this database regarding Indian firms is only authentic source available for undertaking such type of study.

Criterion for Selection

A firm was included in the sample if its name figured consecutively for a period of three years during the 1995, 1996 and 1997 BT 500 listing. A firm is included in the listing for three years if it has consistently performed on parameters like profits, growth, quality of people etc.

Respondents

The questionnaire had to be filled by the person heading the HR function in the company, most often a Director (HR) or a President (HR) or a Vice President (HR).

Overall Response Rate

The above procedure generated responses from 82 firms, out of a sample size of 359 firms and thus, overall response rate was 22.84 percent. The survey was administered using the total design method (Dillman, 1978). The response rate compares favorably with the earlier studies undertaken in this field (Schuster, 1986; Delaney et al., 1989; Guest & Peccei, 1994; Youndt, Snell, Dean & Lepak, 1996; and Hart & Tzafrir, 1999).

Measurement and Sources of Data

The study used multiple sources to collect data on strategic HR orientation and firm performance.

Strategic HR Orientation. The data on strategic HR orientation was collected by using survey technique. Based on BT database, Senior HR executive (Director or President) was contacted in 1998. The survey was administered using the total design method, which involves, pretests, pilot tests, pre-notification letters, first round mail, first follow-up letters, second round mail, and second follow-up letters.

As defined previously, strategic HR orientation was conceptualized as the alignment of HR planning, selection, evaluating, compensating, developing, and staffing practices with the business strategies of the firm. Therefore, the six variables used to measure strategic HR orientation included manpower planning, recruitment and selection, evaluation, compensation, training and staffing. Each of these variables had 3 items and there were total of 18 items in the questionnaire. The respondents were asked to evaluate a firm's strategic HR orientation on these items (on a six-point scale). The respondents were asked (sample questionnaire items):

To what an extent the firm is characterized by:
1. existence of a formal written HR plan based on strategic needs of the firm.
2. involvement of the HR person/ head in the strategic business planning process.
3. existence of business strategy linked recruitment and selection system.

The results of the Cronbach's alpha and interclass correlation indicated that the scale had achieved acceptable levels of inter-item and inter-rater reliability (James, 1982; Glick, 1985; Judd, Smith and Kidder, 1991). As the convergence level was very high, the items were averaged to compute individual respondent ratings, and then means were computed to measure strategic HR orientation for each firm, and finally the means were averaged out to compute the Strategic HR Orientation Index (SHROI).

Corporate Performance. The sources of data for the firm performance measures were firm's Annual Reports, BUSINESS TODAY (BT) 500 database, and Center for Monitoring Indian Economy (CMIE) database.

Control variables

In order to control the influence of external factors, dummy variables for size, age, research and development (R & D) expenditure, and unionization were used. The selection of these control variables was made after HRM literature review (Freeman and Medoff, 1984; Lewis, 1986; and, Huselid, 1995). The control variable for age was in the form of number of years the firm has been operating in India. Another control variable used was the size of the firm, in the form of natural logarithm of the number of the employees working in the firm. The level of firm performance may be affected by the intensity of research efforts that characterize each industry (see Dess, Ireland,
and Hitt, 1990). This industry characteristic was measured by averaging the ratio of R&D expenses and sales of the sampled firms in each of the industries. Finally, unionization or union density was another control variable used in the study.

### Results

Table 1 provides the descriptive statistical information (e.g. means, standard deviations and correlations) for all measures. Table 2 shows the results for multiple regression analysis of the relationship between strategic HR orientation and firm performance.

The data in Table 2 indicates that beta coefficients of several factors in the regression equation are statistically significant. For example, age (p< .001) and unionization (p<. 01) have a significant relationship with sales growth. Similarly, R & D expenditure has a strong relationship with return on assets and price cost margin (p< .01). The findings also indicate that after controlling for firm variations and industry effects, strategic HR orientation index is strongly related to return on assets and also with other measures of firm performance.

Therefore, the results of this study strongly support the research question as there are significant financial returns accruing to the firms that used strategy linked human resource planning, selection, performance evaluation, compensation, training and staffing practices. Thus, through the use of strategy based HR policies and practices, firms create a more competent and committed workforce, which in turn provides a source of sustainable competitive advantage. Overall, the results also show that strategic importance of HRD in the sense that it helps to sustain the level of competence that is created by firm's HR practices.

Discussion and Conclusion

The purpose of this manuscript was to investigate the relationship between the strategic HR orientation and firm performance in the Indian context. Strategic HR orientation was defined as the alignment of HR planning, selection, performance evaluation, compensation, development, staffing practices with the business strategies of the firm. The research question premised in the study was that strategic HR oriented firms would perform better by making use of a low-cost sustainable competitive advantage. The data on strategic HR orientation was obtained from Indian firms belonging to nineteen manufacturing and service industries. The findings have shown that the firms with emphasis on strategic HR orientation performed significantly better than the firms with lower emphasis. This indicates that financial payoffs will be higher if firms strategically aligned and invested in their human resources.

However, the findings should be interpreted carefully, as there are number of limitations which also represent opportunities for future research. One such limitation is the ‘static’ nature of the study, that is, the study is based on one-time view of the certain aspects of the firm rather than collection of data at different periods of time. Thus, the future research should be based on data collected at different periods of time to determine more precisely the relationship between strategic HR orientation and firm performance. Second, the data related to strategic HR orientation was collected from a single source and therefore, rater bias might have set in. The future studies could use multi-rater method, particularly collecting data from heads of other functions. Third, the generalization of the findings should be limited to domestic firms of India. The future studies can solve this problem by covering more than one nation or including firms of transnational nature. Fourth, another note of caution to be kept in mind while interpreting the results is that it could be that firms with higher performance simply have more resources to devote to their HR practices. Finally, the role of other contingency variables such as organizational culture, climate, political considerations (Ferris et al., 1998) and business strategy (Richard and Johnson, 1999), as a mediator or moderator of relationship between strategic HR orientation and firm performance needs to be explored.

Despite the above limitations of the present study, there are certain implications for practitioners. First, the role of HRD is generally seen in ensuring that the firms are able to attract, retain, motivate, and develop the human resources as per the current and future requirements. However, the findings of present study point out that HRD can also help to develop and sustain the competitive advantage. Second, the results show that the firms can reap higher financial payoffs by strategically aligning their HRD policies and practices. This implies that head of HR function should be included at strategic decision making level by top management of the firm like heads of other functions. This strategic restructuring could then allow the HR director to help in selecting strategic alternatives so that HR strategies could be formulated to support organizational strategic choices (Hall, 1984).

Human Resource Development Issues Emerging from an E-Business Corporate Entrepreneurship Team

Jeffrey S. Lewis  
The Metropolitan State College of Denver

Gary D. Geroy  
Colorado State University

The business environment is now enhanced by digital technology. A key to success in the digital economy is the appropriate development of human resources. Because of the sweeping changes being initiated by technology, some behaviors may not be suitable for the digital domain. This study implements qualitative methodology to examine an e-business corporate entrepreneurship team within a traditional business. The notion that digital economy factors do impact corporate entrepreneurship teams within traditional businesses is supported by this study.

Keywords: E-Business, Corporate Entrepreneurship, Teams

We now have a business environment enhanced by digital technology and are rapidly approaching an era that will require most companies be built upon a foundation of digital technology. One of the keys to success in the digital economy is the appropriate management and development of human resources. Because of the sweeping changes being initiated by technology, old management behaviors may not be suitable for the new digital domain. Traditional businesses will need to evolve and transition into the realm of electronic business.

At the turn of the 21st century, businesses should be highly concerned with the following two questions posed by Kalakota and Robinson (1999). First, how will existing, traditional companies make the transition into digital economy companies? Second, what are the impact of digital economy factors on the form and function of 21st century companies? The research objective of this study is to contribute academic research focusing on these questions.

This study will focus on emerging human resource development practices that enable companies to transition into the digital domain. Of primary importance is an examination of the team processes involved as a traditional business initiates a new electronic business creation team and that team progresses from the development of an idea to the operation of a revenue-generating electronic business.

Theoretical Framework: The Digital Economy

Technology has transformed business and initiated the creation of a new digital economy. As a result, the new economy's innovators have developed new business models, strategy, and processes. These new ways of conducting business have affected businesses on a global scale and initiated a renaissance that will certainly be distinctive to future business historians. Tapscott (1996) states, "Today we are witnessing the early, turbulent days of a revolution as significant as any other in human history" (p. x).

As a result of the proliferation and usage of new technology, a new economy has been birthed. The new domain of electronic business is more than a mere trend or paradigm shift; a new reality has emerged in business. New economies have emerged in the past as the agricultural economy was displaced by the industrial economy, which was displaced by the service economy, which was displaced by the global economy, which is currently being displaced by the digital economy (Aldrich, 1999, p. 6). As each new business reality has emerged, businesses have been required to rediscover how to exist by balancing the new and the old.

The digital economy is creating a tremendous challenge and problem for companies that pre-date its emergence. Machiavelli eloquently identified the problem facing companies with his quote, "There is nothing more difficult to take in hand, more perilous to conduct, or more uncertain in its success, than to take the lead in the introduction of a new order of things" (Bergin, 1947, p. 15). Companies need to understand that digital technology has fundamentally changed the way business will be conducted in the 21st century. Those who choose to discount the pervasiveness of the changes or feign away because of intimidation will quickly be replaced by the techno-savvy. A new set of rules is being written in the digital economy, and all businesses must change their game plan if they are to stay in the game.

The transformative power of the Internet continues to astonish all who encounter it (Bollier, 1998). No business leader can presume that the business realities of the last decade will still be valid a few years from now (Evans & Wurster, 2000). Electronic commerce will change not only the way firms do business but will also transform organizations (Choi, Stahl, & Whinston, 1997). The Internet's impact is profound enough to identify it as a disruptive technology (Kalakota, Oliva, & Donath, 1999). To realize the full potential of electronic commerce, businesses must be willing to change the way they operate. History has shown that significant advances occur when technological change is combined with organizational restructuring. Not only is business conducted more efficiently, but also new business opportunities are created. Management must play a large role in the formulation and implementation of electronic business strategies (Kalakota & Whinston, 1996). Human resources must be managed and deployed differently in the digital economy.

E-Business Impact on the Human Resource Dimension

Electronic business goes far beyond simply "doing business electronically." Doing business electronically means that many conventional business processes, such as advertising and product ordering, are being digitized and conducted on the Internet. However, the Internet is not a mere alternative channel for marketing or selling products online (Choi et al. 1997, p. xxiv). Aldrich (1999) presented two critical questions that business leaders are now required to answer: (1) "How will the digital economy change my relationships with workers, vendors and customers?" (2) "What will be the impact of the digital economy on my company's culture and organizational structure?" (p. 21)

Businesses must still focus on competitive advantage and its sustainability as the key drivers of success, but the means to these ends are drastically changing (Evans & Wurster, 2000). Business leaders must look past making the electronics and software work and focus on how to create business value with these technologies (Martin, 1996). Many would argue that the greatest challenge for corporations and established large-scale organizations is the requirement to embrace the unknown and tolerate the ambiguity associated with the rapidly developing digital economy (Evans & Wurster). The new electronic marketplace will necessitate new innovative models of firm organization, production, delivery, and overall market institutions (Choi et al. 1997).

All businesses are being forced to interact with the new realities of electronic commerce, and there is a belief that the changes are initiating a time of natural selection in business in which only the fittest will survive (Martin, 1996). The transforming power of the digital economy is rapidly changing the rules of the industrial economy, company by company and industry by industry (Kelly, 1998).

A unique set of challenges is facing companies seeking to become players in the digital economy. Many have advanced with technology, but the gulf between their current reality and the new rules of the digital economy requires evolution rather than adaptation or reengineering. The large brick-and-mortar companies are rethinking their business models to compete in the new marketplace (Korper & Ellis, 2000). The new technologies are changing the most basic rules of management, work practices, and values (Bollier, 1998).

Businesses must not only respond to the new forces within the new economy but also closely examine internal fundamental processes. It has been shown that the post-modern society has influenced the development of team-based operations to accomplish organizational objectives. More recently, the emergence of technology-mediated communication and virtual team operations have changed the day-to-day business interactions. Businesses must move faster and smarter and be willing to accept increased risk to survive within the electronic business environment.

Research Premise

The challenge for this exploratory study is to identify the forces influencing the processes and behaviors of electronic business venture creation teams that are operating within traditional brick-and-mortar businesses. The realities of the new economy are forcing existing businesses to evolve. This study strives to describe the evolutionary processes of businesses seeking to bridge the chasm from the traditional economy to the digital economy.

Researchers and scholars are confident in describing what characteristics and processes support new venture creation teams. Not present in the literature were specific descriptions of ventures successfully transitioning from within a traditional business to the digital economy. In an attempt to address the void, this study compiles data from within a traditional business endeavoring to launch a new electronic business. The case organization has a widely regarded reputation for being innovative and setting best practice benchmarks within its pre-digital economy industry.

This study has been a challenging endeavor for the researchers. The new digital economy is young, with most agreeing it emerged in the early 1990s. Since that time, the factors associated with electronic business have been
fast moving and fluid in nature. The economy is quickly evolving and forcing businesses to evolve also. An additional challenge is associated with a lack of academic, empirical research related to the issues associated with this study (Penbera, 2000). Empirical models that predict the behavior of firms engaged in electronic business need to be developed (Barney & Ouchi, 1986). Most of the attention in academic research has been given to marketing and information technology aspects of electronic business.

**Human Resource Development Contribution**

This study will contribute to the field of human resource development by investigating whether there is a difference between brick-and-mortar venture creation teams and electronic business venture creation teams. This will be accomplished by describing the processes that occur as brick-and-mortar businesses deploy teams to develop electronic business functionality. This study will also begin to balance the focus on electronic business by addressing human resource development realities. The predominance of research and attention within electronic business has been focused marketing and computer information systems. This study provides businesses with definition and structure for enacting electronic business venture creation teams from a human resource development perspective. This study also provides specialized insight for evolving corporations. An examination of corporations that originated before the advent of the new digital economy was the focus of this study. The issues surrounding the establishment of electronic business functionality within a corporation without an original electronic business mission are unique.

**Research Question**

The research question addressed in this study is, “What are the significant factors supporting a successful transition of a new venture creation team emerging from a traditional domain to a new business organization working in the digital economy domain?” To address this research question, several enabling questions were asked. The enabling questions included, but were not limited to, the following five questions: (1) What does the establishment of an electronic business creation team from within a traditional business look like? (2) What are the new rules of electronic business, and how do electronic business venture creation teams address them? (3) How do electronic business venture creation teams balance their organization’s resources, culture, and competencies with the new rules of the digital economy? (4) What human resource development processes occur within electronic business venture creation teams? (5) What is the impact of the digital economy on the team’s culture and organizational structure?

This study was process orientated, not outcome orientated, and its goal was to describe what is occurring and avoid an attempt to measure the effectiveness or efficiency of the efforts. The definition and descriptions resulting from this study should enable researchers to form quantitative hypotheses and perform additional empirical research.

The intent of this qualitative phenomenological study (Creswell, 1998) is to identify the issues that emerge when a traditional organization interacts with the significant factors emerging from the digital economy. As stated earlier, existing companies are facing challenges resulting from an economy heavily influenced by digital technology, and more specifically, the Internet. Many believe that the digital economy has and will cause traditional organizations to modify their human resource development practices. Managers are forced to manage differently, and business leaders are forced to lead differently. This study makes the assumption that teams are also evolving and developing a unique set of values, norms, and practices as they interact with forces within the digital economy.

**Research Methodology**

The key context for the study involves a specific examination of a team within an organization that did not originate within the digital economy. The outcome of this study is a rich, thick description of team processes and experiences. Insights into how modern organizations react and comply with the new factors associated with the digital economy would be a significant contribution to the field of human resource development.

The objective of this research is to interview participants of a team consisting of engineers, administrators, and analysts engaged in an electronic business venture creation initiative. For this study, the researchers identified a high technology company with a strong commitment to innovation and a new charter to develop a strong electronic business focus. The venture initiative began as a small team and has grown into an operational business within the larger corporation. The team selected for this study was birthed from a traditional organization and given a charter to investigate the Internet economy and seek to leverage organizational competencies through the development of a transaction-based revenue model conducted using the Internet.
The research plan employed qualitative phenomenological study of the identified team. Due to the limited amount of literature related to teams and the new digital economy, the qualitative approach was chosen for an initial exploration and understanding of the team processes related to the research questions. The primary data generation strategy was structured interviews (Creswell, 1998) with the team's managers and other associated parties within the organization.

The participants for the study were members of the electronic business venture creation team at a Fortune 50 high-tech corporation. Individuals with management responsibilities and those responsible for the team's supervision participated. Eleven individuals were invited to participate in the interviews. Demographic information related to the participants was included in the analysis portion of this study. The participants were employees of a large, high-tech, multinational corporation. There is some cultural diversity among the participants, but most are U.S. natives. There is some gender diversity among the participants. The researchers estimated all participants were between 35 and 60 years old.

Interview Process. Interviews were conducted with key members of the organization who were directly involved with the subject team. Eight of the interviewees were members of the team, and three were significantly involved with the team from an upper level of the organization for a total of eleven interviewees. Three rounds of interviews were conducted with the eight team members, which resulted in twenty-four interview sessions. Three interview sessions were conducted with the three interviewees from the upper levels of the organization. All interviews were conducted individually between a researcher and the interviewee. One researcher interviewed all of the interviewees. The researcher scheduled hour-long appointments with the subjects in accordance with the subject's schedule. All interviews were scheduled during the workweek and during normal business hours. In all interview situations, the interviews were conducted in a comfortable and private setting. The researcher tape-recorded each of the interviews using two small tape recorders. All participants consented to having the interview tape-recorded. The time involved with most of the interviews was approximately 50 minutes. The total time spent in one-to-one interviews with the interviewees was approximately 30 hours.

Interview questions were developed before each round of interviews were conducted. The interviewee was given a summary of possible questions prior to the interviews. These questions were used as a guide to initiate the discussion. As the interviews progressed, an open discussion evolved with the interviewees. The researcher conducted the interviews with a primary goal of drawing out the voice of the team and was careful to avoid questions that were not open-ended or would be prescriptive.

At the conclusion of a week of interviews, the audiotapes containing the individual interviews were delivered to a professional transcriptionist. The interviews were transcribed within five days and returned to the researchers in electronic format. The transcripts of the interviews were delivered to the associated interviewee for member checking purposes. Each interviewee was asked to review the transcripts and to change, modify, or omit any statement on the transcript. Any changes, modifications, or omissions were communicated to the researchers by the interviewee before the interview was analyzed. The interviewees understood that their transcripts would be analyzed and used in the study after they had the opportunity to revise and modify their transcripts.

After the transcripts were returned from the interviewees, the researchers verified the accuracy of the transcripts. The accuracy was checked by listening to the interview audiotape and following the text of the transcript. Some words were changed in the transcripts by the researcher. This was necessary because some of the interviewees had an accent. The interviews also focused on technical issues and specific companies that were difficult for the transcriber to understand. The researchers also changed the names of the team members and companies in the transcripts to pseudonyms.

Research Design Verification. Qualitative researchers have established exploring procedures to verify the quality of the data gathered for analysis (Creswell, 1998). The researchers conducting this study choose three procedures, member checks, debriefing, and source triangulation, to contribute to the reliability and credibility of the data.

Data Analysis

Qualitative software tools facilitate the coding process of the transcripts. The transcripts are loaded into the software as data sources in text files. Then, the researchers generated a list of codes that are assigned to specific words, phrases, or sections of text in the transcripts. The codes and their associated texts are easily reviewed, consolidated, analyzed, and printed throughout the course of the data analysis. HyperRESEARCH allowed the researchers to code all data numerous times, retrieve and manipulate portions of coded source material, test
propositions about the data on any one code or combination of codes using Boolean searches, test hypotheses about the overall meaning of the data using artificial intelligence, and print the retrieved data. Many scholars (Coffey & Atkinson, 1996; Glaser, 1978; Miles & Huberman, 1994; Seidel et al. 1995; Tesch, 1990) have proposed that coding is analysis and forms the basis of description from which interpretation is made.

The researchers incorporated a coding process involving three coding levels. Open codes were the initial codes given as the transcripts were examined. These codes were the most numerous as many words and phrases were identified as relevant to the study. The open coding process occurred soon after the transcripts were returned to the researchers by the interviewees. Additional interview questions were generated as a result of the open coding process.

Axial coding was used after all of the transcripts for a particular interviewee were open coded by the researchers. This level of analysis involved a grouping activity of open codes. Axial codes are groups of related open codes that begin the process of identifying emerging themes and issues from the transcripts. The 15 axial codes identified are illustrated in Figure 1.

Third, systematic codes were given to axial codes after all of the transcripts had been open and axial coded. Systematic codes are grouped between subjects and help to identify the voice of the team and the consistent or inconsistent messages communicated by the participants. Three systematic codes were identified: corporate entrepreneurship issues, team processes issues, and digital economy issues.

From the analysis of the team member interviews, a number of issues have emerged regarding how a new venture creation team seeks to develop electronic business activities from the foundation of a traditional organization. The researchers encountered a team that experienced a multitude of challenges, successes, and frustrations resulting from corporate entrepreneurship phenomena, team processes phenomena, and digital economy phenomena. This study focused on the factors associated with the digital economy phenomena. The corporate entrepreneurship phenomena and team processes phenomena were present in the voice of the team, and issues resident within the digital economy affected these phenomena.

The following discussions present the researchers' answer to the research question based on the researchers' synthesis of analyzed data from the interviews. Because of the qualitative nature of this study, the researchers have the responsibility of immersing themselves in the data and then reporting the findings based on qualified analysis and synthesis activity.

Findings and Discussion

Team Establishment Characteristics

The first enabling question proposed in the study was, “What does the establishment of an electronic business creation team from within a traditional business look like?” The voice of the team provided clear descriptions of team establishment including the uniquenesses involved with a corporate entrepreneurship effort. The researchers found that team establishment is a fast-paced, exciting event. The participants appeared to be very satisfied with the experience despite the stress and risk involved with the endeavor. Launching an electronic business from within a traditional organization involves the challenge of balancing multiple stakeholders' interests. The team in this study spent considerable effort interacting with executive sponsors and accommodating organizational processes.
Addressing the Uniqueness of the Digital Economy and E-Business

The second enabling question asked, “What are the new rules of electronic business, and how do electronic business venture creation teams address them?” In this case, the subject team encountered three primary new rules. The first rule was the requirement to operate at Webspeed versus a traditional business speed. This rule is accommodated through staffing with the right people and committing the appropriate resources to enable a high level of speed and effort into the venture.

The second rule is related to the culture of collaboration within the digital economy. Identifying the significant players through a thorough investigation of the business landscape accommodates this rule. Once the players are identified, the team must begin a process of relationship building with the external constituents. Staffing with team members who have the ability to communicate well and interact successfully with external constituents is an important aspect of collaboration. Collaboration was found to be one of the axial codes within the realm of digital economy issues.

The third rule is related to the external e-culture encountered as the team members venture into the digital economy space. The team must be aware that business culture is different within the digital economy as compared to most traditional organizations. The organization must also be aware that the interaction may elicit a response from the team members as they consider their own experience in relation to the e-culture experience.

Balancing Bricks and Mortar in the Digital Economy

The third enabling question was, “How do electronic business venture creation teams balance their organization’s resources, culture, and competencies with the new rules of the digital economy?” The researchers found the team leader played a critical role in balancing the team’s experience with the organizational resources, culture, and competencies. The team members demonstrated somewhat of a love-hate relationship with their organization. Although the organization possessed a valuable reputation and allowed the team access to tap a wealth of financial and human resources, the team struggled with many aspects of the organization’s culture and processes. The team leader sought to shelter the team from the hindering aspects and take advantage of the positive aspects.

The team advocated creating a new place within the organizational chart that would allow the team to operate outside the company’s direct control but still allow access to leverageable assets. This area would provide a protection from bureaucracy and an immune system yet facilitate enough interfaces to leverage assets and competencies. These issues were identified within the axial code discussion of digital economy issues, team process issues and corporate entrepreneurship issues.

Human Resource Development Processes

The fourth question asked, “What human resource development processes occur within electronic business venture creation teams?” The researchers found seven prominent processes directly related to electronic business issues.

Selection of Appropriately Skilled Team Members. The first was related to the selection of appropriate individuals with the right competencies and characteristics. Team members should be screened for entrepreneurial characteristics, high performance characteristics, technology affinity, and solid communication and collaboration characteristics.

Employee Migration. The second process was related to employee migration. The team garnered a high level of attention within the organization, and many employees sought to migrate to the team. The organization should note that many employees are looking for like opportunities, and offering those opportunities could contribute to employee retention.

Reward Systems. Third, this study illuminated the need for a reward system that focuses on the increased risk of the employee and high performance required for success. The team reported on the need for new and improved reward systems that would compensate adequately for the risk they had taken and the innovation contribution they were making to the larger organization.

Learning Processes. The fourth process involves team learning. Managers and facilitators should be aware of the high need for learning and effective and efficient processes for documenting, processing, and incorporating the
learnings. Learning process involved effective and efficient activities to account for the newness and dynamism of the digital economy issues. The team developed means and methods to gather, process, analyze, and disseminate learnings within the team and the team's larger organizational scope.

Communication Processes. Fifth, the team must have efficient and effective communication processes in place to facilitate a successful endeavor. The subject team used combinations of face-to-face meetings and computer mediated communication tools to facilitate their communication processes.

Operational Principles. The sixth process is identified as the incorporation of appropriate operational principles. The subject team established operational principles that served them well and facilitated successful operations. The principles enabled the team to make advances in uncertain conditions because of the team's shared commitment.

Impact of Digital Economy on Team Culture and Organizational Structure

The fifth enabling question was, "What is the impact of the digital economy on the team's culture and organizational structure?" The digital economy influenced the team to move faster, incorporate a higher level of interpersonal trust and relationship, use a more open style of communication, and incorporate a higher level of team member empowerment. The themes and issues that emerged from the interviews promote the notion of a new business culture.

Factors Supporting an Intrapreneurial Team

The primary research question for this study asked, "What are the significant factors supporting the successful transition of a new venture creation team emerging from a traditional domain to a new business organization working in the digital economy domain?" New venture creation teams are supported to transition from a traditional to a new business venture working within the digital economy when the team: (1) is empowered to move fast. (2) is built with high performance members. (3) Possesses a clear understanding of how organizational assets can be leveraged. (4) Is empowered to leverage organizational assets. (5) Is sheltered from detrimental organizational processes. (6) Establishes appropriate operational principles. (7) Endeavors to learn the rules of the digital economy and identify the major players in the related industry. (8) Strives to collaborate with appropriate players external to the organization.

Limitations of the Study

Teams are complex entities because they consist of unique people. Embedded within this study are unique phenomena related to the specific people and circumstances surrounding the subject team. As a result, this study faces many limitations in relation to generalizing its findings to other teams or organizations. This study was an investigational study with one team. The purpose was to identify issues related to young and slightly researched phenomena. The identified issues are evolving fast, in relation to the rapidly advancing technology. It is possible that the issues identified in this study will be unimportant within a short period of time because of the rapid changes occurring within the digital economy. However, as a baseline from which to build theoretical and practitioner process models, this study is valuable.

Recommendations for Human Resource Development

Human resources must be managed and deployed differently in the digital economy. Scholars and practitioners within the realm of human resource development should note the issues identified in this study. The researchers believe human resource development professionals can play a significant role in assisting traditional businesses in establishing ventures in the digital economy.

First, traditional businesses need assessment tools such as surveys and interview questions that can assist in the selection of appropriate employees for electronic business venture creation teams. Second, individuals, ranging from members of the Board of Directors to members of the electronic business venture creation team, could benefit from training that focuses on the new rules of the digital economy and strategies for success related to the digital economy phenomena.

Third, human resource development professionals should investigate the development of new reward systems and career paths congruent with the new e-culture of the digital economy. Traditional organizations are operating
under reward systems that may have served them well for many years but are a liability in the digital economy. It is crucial that traditional organizations retain their human resources, and reward systems are directly related to that effort.

**Suggestions for Further Research**

The purpose of this exploratory qualitative study was to examine and describe organizational phenomena that may have significant implications for human resource development scholars and practitioners. During the course of the study, several hypotheses surfaced related to the effectiveness of electronic business venture creation teams. Two primary areas of new hypotheses emerged, one related to team performance and the other related to individual outcomes. The following hypotheses are suggested for additional study:

**Team Performance Hypotheses.** (1) Electronic business creation teams from traditional organizations exhibit higher performance when they have a solid understanding of the rules of the digital economy. (2) Electronic business creation teams from traditional organizations exhibit higher performance when they have appropriately skilled team members with a unique set of competencies. (3) Electronic business creation teams from traditional organizations exhibit higher performance when they have an empowered team leader who is able to leverage organizational competencies and assets.

**Individual Outcomes Hypotheses.** (1) Members of electronic business creation teams from traditional organizations exhibit higher work satisfaction because of the exciting work environment. (2) Members of electronic business creation teams from traditional organizations exhibit higher levels of stress than other employees from the same organization. (3) Members of electronic business creation teams from traditional organizations exhibit higher work performance than other employees from the same organization. (4) Members of electronic business creation teams from traditional organizations are more likely to leave the organization to participate in a start-up venture within the digital economy than other employees from the same organization. (5) Members of electronic business creation teams from traditional organizations are more likely than other organization members to stay with the organization if their compensation is based on the success of their venture.

Transforming Human Resources into a Strategic Player on Campus - From Theory to Practice: A Case Study

Val M. Berry, SPHR

This article presents an overview of how human resource units in higher education may be transformed into strategic partners, utilizing organizational change approaches. Utilizing a case study approach, managerial impact on leadership, communication, process re-engineering, and performance metrics are examined. A framework for transformation is presented and it is suggested that the change process can be reduced to a “how to” approach that can be replicated in other environments.

Keywords: Organizational Change, Strategic Management, Organization Development

Experience and practice suggest that utilizing organizational development and change approaches can transform human resource organizations from transactional actors to strategic players in organizational management. The purpose of this article is to present a case study overview of strategic organizational change that includes practical applications. Integrated in the presentation is a transformational process that can be reduced to “boiler plate” steps that support theoretical frameworks regarding organizational development and strategic management and can be replicated in any higher education organization.

Introduction

A major southern university opened its doors in 1972 on the site of an abandoned airport. On opening day, the university enrolled 5,667 students the largest first day class in American collegiate history. This southern university, the only public research university in the region, is one of the most dynamic institutions in the country and has achieved many benchmarks of excellence that have taken other institutions over a century to attain. The pace of change in this environment is dynamic and almost electric. The employee population doubled between 1990 and 1995 and doubled again between 1995 and 2000. In 2000 the university attained Carnegie Research Extensive status and began a law school. Currently the university employs over 6,500 employees. With 15 different academic programs, each having significantly different missions, human resource administration has unique, complex and rewarding challenges.

In the beginning of 1995, I was hired as a journeyman human resource professional by a poorly regarded, but well intentioned, chief human resource officer, as her operations director, in a last ditch attempt to improve overall unit performance. Regrettably, her efforts were “too little, too late” and she was “retired” within six months of my arrival. Although I assumed the position of Interim Director, I was given no assurance of promotion. In fact, to the contrary my Senior Vice President, a hard charging, innovative, “water walker” (but not well versed in human resource matters) made it clear I would need to apply for the position and demonstrate my worth. No other instruction, vision, direction or even expectation was communicated. The assumption was I would hold down the fort until help arrived.

While a national search was begun, I took stock of my circumstance and began a campaign for the position. The Office of Human Resources (OHR) was heavily transactional, steeped in what can best be described as top-down control, with little delegation and a great deal of micro-management amidst strict application of policies, procedures, rules and federal regulation. Organizationally the unit was viewed as lacking value, “pigeonholed” as administrative paper pushers. Lack of trust or confidence in the unit’s skill set required most major and many minor projects to be done through cross campus committees. The staff was almost completely home grown and as a consequence their breadth of experience was highly limited. There were many lingering and persistent employee relations problems that created a managerial belief that state workers could not be released, even for misconduct. The Office of Human Resources had experienced several highly visible failures. While there were some successes, they were only celebrated among internal staff. This article provides a case study demonstrating in “how to” terms the process human resource organizations, even those in dire straits, can transform themselves into organizational strategic partners.

Approach

The great difference between high performing organizations and those that tend to stick to the set “norm” is not often easy to discern. What is, however, obvious is that good organizations are those that do not start with a wish list, but tend to drive with real purpose, good planning and a serious effort to engage the whole organization (Zairi, 1998). From a practitioner’s perspective, organizational engagement occurs on multiple fronts almost simultaneously. It is necessary to engage key direct reports, other staff members and other constituents. Generally, it is recommended that would-be change agents engage their own management first, but in my instance, having if nothing else, tacit support from my management rendered this necessity moot. I first met with my chief deputy to assess her skills and attitude. Frankly, I was prepared to consider her release to demonstrate my willingness to change the organization. Many organizations “clean house” and release members of the management team in an effort to introduce new initiatives. This approach is not always useful. While it is a quick fix, it can be demoralizing to the “surviving” staff, and presumes that economic resources can be poured into the change process (in our instance, as a public sector organization, we rarely pay market wages therefore replacing existing staff is not a dollar for dollar proposition). I favor creating partnerships with existing staff by finding common ground and the development of a shared vision. Shared vision can create a groundswell of support for change and camaraderie amongst staff (Stuart, 1995). The shared philosophy developed between us was key to the creation of a mission and vision that was subsequently shared and embraced by all staff. After meeting with my chief deputy, I met with each member of the staff individually. Each meeting lasted approximately one hour. The duration of the meetings was important. Staff will test your commitment and resolve. Short meetings will be perceived as superficial and disingenuous. Take notes, be candid and keep whatever promises you make. While the dialogue was open-ended, the agenda was written and included a review of our mission from the perspective of leadership, the employees’ role, and a broad overview of departmental direction. Because of power dynamics, I did not meet in my office. We met in the employee’s workspace when it was a private office or we met off campus. I listened and responded to their concerns regarding working conditions, recognition, and terms and conditions of employment. It is important that staff know management’s views, is allowed to express their views, and can make informed decisions about their future with the new organization. We discussed our expectations of one another. Above all else, staff was made aware that everything that each one of them does, every day, makes a difference. For example, a phone left ringing could become an irate customer complaint that will reflect upon the rest of the organization, and/or color the service perception as experienced by the customer. We also introduced ground rules for working with one another. We call our ground rules by an acronymic metaphor known as the ROPES (Respect, Openness, Participation, Education and Sensitivity). It is expected that in our dealings with one another we always adhere to the ROPES. The ROPES are our common-bond. As an anecdotal outcome of our meetings our receptionist was dubbed the Director, First Impression, a title that most clearly defines her role and its impact on our organization. These meetings were part of an overall communications strategy. A communications strategy should coincide with the general stages of a planned change and the relevant associated information requirements (Klein, 1996). Staff attended to and retained information that was directly associated with their jobs. Also, like all organizations, informal leaders of the department felt empowered by being sincerely asked for their opinion. Eventually, it became obvious our staff group was composed of skilled professionals who for the most part were selfless and with few exceptions, without alternative agendas. Their only problem was a lack of leadership and shared vision.

I also met with key constituents, the president, the vice presidents, college deans, and department directors, and chairs. I surveyed my constituents about their experiences and expectations of the Office of Human Resources; shared with them our philosophy, and vision; and promised and subsequently delivered regular updates. Get in front of your customer and ask the question “How am I doing?” In my experience, rarely are they unwilling to tell you the bad news face to face. Discussions with staff and key constituents demonstrate leadership. Leadership necessary to building sustainable HR capability means the practice of directing, goal setting, planning, reviewing, and devoting a high proportion of time to communicating, motivating, engaging, delegating and empowering people to perform. Good leadership is often associated with recognizing and rewarding good performance. In a modern business context, it is also important to “synergize” people through creating a clear emphasis on teamwork and the establishment of values (Zairi, 1998).

The Strategic Organizational Change Process

Organizational development (OD) is a distinct area within the field of organizational science that focuses on the planned and controlled change of organizations in desired directions (Gilley, 1994). Change is likely incremental
rather than monumental, and should be carefully considered. Our first transformation action step was to conduct a 
business process re-engineering (BPR) of existing procedures through process mapping. There were 89 different 
administrative work processes in our department. After processes were mapped, they were benchmarked against 
other organizations, and re-engineered for improved efficiency. While we did this ourselves, it can be useful to 
employ a consultant for this function, which will facilitate benchmarking. Consultants are adept at providing critical 
feedback about how to do work more efficiently. One positive outcome of process mapping was staff was able to 
visualize and accept the feedback from our constituents that we were steeped in “administrivia”. BPR typically 
produces a flatter organization; such delayering has been common. A flatter organization means that people are 
given more responsibility, increased decision making capability, autonomy, and flexibility at the point where it is 
needed permitting managers to be closer to customers with a “first hand” perception of the business reality (Zucchi & Edwards, 1999).

The second step is to formally develop and publish mission, vision and goals for human resources. A shared 
vision should be created through group involvement. Strategic planning is a relatively new phenomenon on campus. 
As the organization did not label human resource management a strategic imperative, we were able to set many of 
our own priorities, however, we were always vigilant about setting priorities that were compatible with the 
university’s organizational mission. Our vision and goals focused on continuous process improvement. If all staff 
can’t at a moment’s notice, articulate your mission and goals further refinement is necessary. Do note that changes 
made should have the concurrence of senior management. Mission, vision and goals should match organizational 
strategic objectives.

The third, and perhaps most critical action step is to improve the transactional administration of human 
resources. Where possible decentralize processes, put more control in the hands of line managers, devolve away 
from personnel administration and openly embrace organizational change. Strategic human resource management 
requires a holistic approach, with not only an internal integration between personnel systems (recruitment, selection, 
reward mechanisms, appraisal performance management and staff development) but also an integration between the 
various sub-systems of human resources into one overarching human resource strategy, that is consistent with the 
organization’s strategy overall (Baker, 1999).

**Moving From the Reactive to the Proactive - Developing a Human Resource Strategic Plan**

In this case study it is not possible to provide detailed instruction on how to develop a strategic plan. However, there 
a number of well established resources that can assist you in strategic planning. The Strategic Plan for the OHR 
articulates the five-year goals and initiatives of the Office to benefit (i) the sub-units of the Office (i.e., 
Compensation, Benefits, Employment, Training and Development etc.), by focusing their efforts, and (ii) our 
constituents as a whole, by ensuring coordination and integration with their missions and strategic activities. The 
strategic plan is based on the plans developed in each of the sub units of the OHR. A grass roots effort, each subunit 
has developed a five-year vision, positioning each unit as a service provider so as to appropriately support campus 
academic and other administrative units in the attainment of their goals and objectives.

The following overarching strategic objectives, conceived in the context of and in support of the University 
mission, have been established as fundamental to the overall planning process.

1. **Continued Development of the Process of Consultation and Communication with Constituents.**

Programmatic goals are to reflect the principle of ongoing communication and consultation with campus 
constituents. The Office of Human Resources will continue to implement consultative models with its 
customers to ensure involvement in the planning, implementation, and evaluation of initiatives undertaken. 
On a regular basis OHR will meet, discuss and develop service enhancements, identify new areas of campus 
need, and review the effectiveness of current services provided.

2. **Continued Focus on Service Orientation.**

Given the primary role of support units is to provide high-quality, cost-effective services in support of the 
academic mission, a heightened service orientation remains a critical element of the administrative 
organizational future.

The Office of Human Resources will continue to engage in examination and improvement of business practices to ensure that core services are delivered in a cost-effective, customer focused manner.

4. Continued Decentralization of Services While Maintaining Appropriate Internal Controls.

Decentralization is critical to efficiency and line operational autonomy. To ensure consistency in policy, equity, and appropriate regulatory compliance the OHR will continue to champion the development of enhanced internal control procedures. These procedures set forth the accountabilities of responsible officers in each unit served. The internal controls structure will also identify areas of potential risk and will allow for proactive corrective action as well as training activities.

5. Focus on Staff Quality, Staff Development and Staff Morale.

OHR is committed to developing and retaining staff and managers capable of providing high quality administrative support services to the campus. Toward this end, staff and managers must be competent, appropriately rewarded and valued by the organization. OHR will invest in personnel skills development to enable its staff and managers to maximize their contributions to the University. Developing Metrics

Growth cannot be gauged without measuring organizational performance (Santos, 2000). The following metrics are recommended as a baseline for measuring the effectiveness of campus human resource services:

**New Hire Quality.** refers to the average manager rating of new employees, 90 and 180 days subsequent to employment. This is a simple measure of performance rating. The more employees who fail during the 90 to 180 day period of initial employment, the lower the quality of your hiring decisions. This process need not be a formal review. A simple survey where the manager rates general satisfaction of employee performance will suffice. It is not advisable that New Hire Quality be benchmarked as a gauge of success versus other organizations. However, the measurement may be used to track trends within the organization, especially where hiring is decentralized. Line managers who have a poor selection track record can be given additional coaching by an observant and responsive human resource staff.

**Actual/Contracted Time-to-Fill.** requires calculating the average actual time to start divided by the average contracted time to start. “Actual” is the number of days between when recruiting is initiated, and when the new employee starts. The “contracted” time is the number of days between the date recruiting is initiated, and the date the recruiter and hiring manager mutually agrees that the position will be filled by. The closer these two dates coincide the higher the satisfaction level of the primary customer, the hiring manager.

**Staffing Cost Ratio.** requires figuring out the total staffing costs, then dividing by the total compensation recruited. Total staffing costs are determined by adding up four cost areas:

- S1: fixed-overhead recruiting expenses
- S2: sourcing-advertising, recruiting fees, Internet posting expenses
- S3: signing bonuses
- S4: travel, relocation, visa expenses.

The sum of these four areas equals total staffing costs. Total compensation recruited is the sum of the annual base starting compensation of all external positions filled by staffing. Once you’ve come up with these two figures, the Staffing Cost Ratio can be calculated by using the following equation:

\[
\text{Staffing Cost Ratio} = \frac{\text{Total Staffing Costs}}{\text{Total Compensation Recruited}}
\]
This metric is not so much a measure of quality as it is a mapping of staffing activities. Knowing expenditures greatly enhances organizational planning, as it allows for the identification of costs and benefits and will provide a clearer understanding of fixed and variable costs.

**Turnover:** Interpreting turnover rates can vary by region. But, the formula for capturing the data is a simple one employed by the Department of Labor; Number of employee separations during the month/ Total number of employees at midmonth. Thus, an organization with 10 separations (employees who leave the organization during March 1–30), and 100 employees on March 15 (midmonth), has a monthly turnover rate of 10% ($\frac{10}{100} = 10\%$).

**Avoidable Separations Turnover Rate:** Total separations in the selected period - unavoidable separations/ Total number of employees at midmonth. In the previous example, if 3 of the 10 separations were unavoidable, the 7 remaining separations divided by 100 employees yields a 7% avoidable turnover rate.

It must be noted that the only way to capture avoidable separations is to consistently conduct exit interviews of separating employees. Exit interviews provide insight into what is going on in your organization and what you can do strategically to improve workplace quality.

**Measuring Return on Investment for Training:** Most organizations measure the reaction of training participants (how they feel about training). Many also measure the learning that has occurred. Increasingly HR professionals are asked to measure changes in on the job behavior, as well as identify business results of training. Seldom however, is HR asked to calculate return on investment (ROI). Strategic value can be added to an organization by capturing as many costs as possible incurred in training and making an attempt at creating “hard” data regarding the organizational benefits of training on the organization. Some examples might include a correlation between training dollars invested in accident prevention and Workers’ Compensation claims; wellness training and health insurance claims experience; or the benefits of each hour of supervisory training correlated to improved employee attendance.

**Continuous Improvement Initiatives**

We have embraced the Japanese model of continuous improvement, called Kaizen. Every member of staff has to make their own contribution toward improvement regardless of their position. Development proceeds continuously in small steps. The purpose of the Kaizen process is not only to encourage and oblige the staff to think about improvements within their assignments continuously but also to realize these ideals. This means every staff member has to think everyday about what’s going well and what should they do to improve. Everyone has become ready to call their work into question, integrate innovations and try new concepts. We have embraced our university president’s credo “everything that everyone does, every day, makes a difference.”

**Human Resource Staff Development Systems**

OHR introduced a mandatory staff development process for all staff. Once a year, staff members meet with their immediate supervisor to develop a customized career development program. The meeting and subsequent career development action plan is part of the overall performance evaluation process. Career development plans vary widely, however among the standardized components of our staff development approach is a requirement that each staff member must allocate a minimum of 40 hours to completion of their action plan. Action steps must be focused on improvement as a human resource professional. Typically, employees have planned and received coaching toward completion of an advanced degree, professional certification, attended conferences, conducted research or participated in professional associations. The action plans need not require large resource commitments from your organization. Directed career development coaching has been highly effective as managers have been actively involved in helping employees meet their personal and professional goals. In good budget years staff typically looks to attend more professional conferences and seminars. In tough budget years, staff has published more, or volunteered more. Nearly everyone on staff is seeking a advanced degree of some sort as tuition remission is one of the perquisites of employment in higher education.
Conclusions

Strategic human resource management in higher education is a matter of sound professional practice (Gregory, 1996). Even where your organization is mired in traditional personnel administration or where your organization has not yet embraced strategic management on an operational level, your human resource organization can be the agent of change (Ropo, 1993) by following a number of “tried and true” human resource development and organizational development steps, including:

1. Organizational engagement. Meet with key stakeholders and elicit their feedback, develop alliances and partnerships where appropriate.

2. Develop and publish mission, vision and goals for Human Resources that are consistent and in support of the broader organizational mission.

3. Improve upon the transactional administration of human resource management through process mapping and subsequent re-engineering.

4. Develop and publish a human resource strategic plan, that is consistent and in support of the broader organizational strategic plan (if available).

5. Develop metrics for measuring the efficiency of Human Resources.

6. Implement a process for continuous improvement.

7. Continually develop staff.

These “boiler-plate” steps can be replicated in any higher education human resource organization and will spearhead your transformation efforts toward becoming a strategic partner on campus.

Current State of Technology-enabled Learning Programs in Select Federal Government Organizations: A Case Study of Ten Organizations

Letitia A. Combs
VERTEX Solutions, Inc.

Recent advances in technology coupled with the need to provide cost-effective, timely learning to a large distributed workforce has encouraged federal government organizations to adopt technology-enabled methods for learning delivery. This case study research investigated the current state of technology-enabled learning programs in ten of those federal government organizations.

Keywords: Technology, Workforce Development, Distance Learning

The delivery of learning to a large distributed workforce is a challenge faced by private and public institutions alike. Perhaps nowhere is this challenge more obvious than in the United States federal government. According to the Bureau of Labor Statistics, the federal government is the largest employer in the country. In addition, while most agencies are based in the Washington, DC area, eighty percent of federal employees work in other localities (Guide to Industries, 2001).

One way to provide cost-effective, timely learning to such a diversified workforce is through the use of learning technologies that extend beyond traditional classroom instruction. For the purposes of this study, this overall approach will be referred to as technology-enabled learning.

President Clinton (1999) encouraged such an endeavor through Executive Order 13111 which stated that: "A coordinated federal effort is needed to provide flexible training opportunities to employees and to explore how federal training programs, initiatives and policies can better support lifelong learning through the use of learning technology." This directive was reinforced in provisions of the Clinger-Cohen Act and Raines Rules.

Many federal organizations in all three branches of the government have followed the intent of these directives and have instituted a variety of technology-enabled systems to deliver learning to employees. While the specific motives, implementation strategies, technologies and uses of those systems differ among agencies; the need to deliver rapidly changing knowledge in the most efficient manner possible is consistent throughout the government.

This need mirrors the requirements of other organizations. In their 2001 study, Strazzo and Wentling investigated the learning practices of selected Fortune 100 companies. They found that, in the large companies they surveyed, the move toward new learning technologies was motivated by a desire to provide immediate access to information while reducing travel and cancelled classes. Furthermore, they discovered that the companies were continually exploring how best to incorporate e-learning into their overall learning system and it was felt, by the companies, that e-learning use would be increasing and that it would be blended into their overall learning approach.

Similarly, James and Beattie (1996) found that organizations were using technology-enabled learning programs to contend with rapid enrollment growth. They also found that the organizations were using a blend of technologies to deliver programs and were careful in their adoption of technology-enabled learning programs. Cost and infrastructure requirements were two critical factors that contributed to the organizations' cautious approach.

A state of the industry survey conducted by Online Learning Magazine and International Data Corporation (Kiser, 2001) found that more than 80% of responding organizations were using some form of technology-enabled learning programs. One of the most important reasons cited for the use of these programs was convenience for employees and other learners, including customers and suppliers. Learners participated in a mix of courses, including user applications, regulatory training, management and business skills, and organizational orientation. As was the case in the previous studies, these organizations incorporated a variety of technologies into their overall learning approach.

Instructor led delivery was by far the most common method used. Other technologies were CD-ROM, videotape, interactive video teletraining (IVT) and web-based courses. The survey found that the use of technology-enabled learning programs was growing within the organizations but the issues of cost and lack of management buy-in were slowing the speed of adoption.

While government organizations do not face the competitive demands of private companies, they do need to quickly provide learning to a global workforce with a limited budget. The bottom line is to make federal employees more productive and provide improved service to the ultimate customers, the American taxpayers.

Problem Statement and Research Questions

This research builds on the work of Strazzo and Wentling (2001). The particular problem of this research was to assess the current state of technology-enabled learning programs within select federal government organizations. Four research questions provided the structure for the study. Those questions were 1) What are the current learning requirements of the organizations? 2) What media are currently being used to deliver that learning? 3) What information technology and learning delivery technology infrastructure exists in the organizations? 4) What organizational and financial support do technology-enabled learning programs have within the organizations?

Contribution to Knowledge in HRD

Delivery of learning is moving away from a completely classroom-based structure. Public and private sector organizations alike are exploring how to use technologies to provide learning in ways that will meet the needs of learners and support organizational goals while, at the same time, being cost effective and responsive to change. This study is an examination of how such learning programs are being created and implemented within ten federal government organizations.

Methodology

Information about ten United States government organizations is included in this case study. All organizations have a nationally or globally distributed workforce and each organization is either developing or implementing technology-enabled learning programs for employee education. Participating organizations included components of the military, the federal judiciary, and the Departments of Defense, Treasury, Justice, Labor and State.

Between 1998 and 2001, each of the ten organizations conducted a baseline assessment of their learning program. Those assessments were conducted by teams of consultants and organization staff members. Each assessment was tailored to meet the needs of the organization for which assessment was conducted. However, all of the assessments examined the following current-state items:

1. Purpose of learning within the organization;
2. Description of the state of learning programs within the organization;
3. Description of the business structure of learning programs within the organization;
4. Description of the financial status of learning within the organization; and
5. Description of the existing technology infrastructure of the organization.

Each of the assessments was undertaken to identify the current state and recommended future direction for learning in the organization. The overall approach employed for the assessments consisted of a review of existing organizational documentation on the learning program, examination of the goals and objectives of the organization regarding learning in general and technology-enabled learning in particular and surveys and interviews with staff and stakeholders about the current state of learning within the organization.

The ten baseline assessments were analyzed for this multi-organization case study. The unpublished assessment reports are individually confidential. However, they were made available for case study review and analysis to identify the current state of technology-enabled learning in the ten organizations. Descriptions of the current state of the organizations and their learning programs were evaluated in detail. Further information about the current state of the learning programs was obtained from follow-up reports and direct observation of the identified government organizations.

Results and Findings

Scope of the Learning Mission

The ten organizations studied are responsible for the professional education of thousands of workers located throughout the world. In 1998, one organization trained 365,000 individuals in 699 courses, 17 seminars and 43 grants programs. Another organization holds 24,000 classes each year for 400,000 students. That organization has a training travel budget of $40 million. A third organization is limited to offering only entry-level instruction at its training academy because staff, classroom and residential restrictions limit enrollment to 88,000 student weeks a year.
Despite the size of their learning efforts, these organizations have education needs that exceed their current capacity. For example, the first organization has been tasked with adding training for state government and private sector staff its existing effort and experienced staff in the third organization are not receiving necessary continuing education because of space restrictions at the academy.

Providing learning for a large, geographically dispersed population is both expensive and problematic. One organization, whose instructional program is almost completely multi-week classroom education, has a travel budget of $1000 per week plus airfare for each student. And, while production is a primary goal of the organization, no monetary estimate is made for time away from the job. Other organizations must provide learning to a global workforce despite technology infrastructure limitations in the field and in remote countries.

Current Learning Requirements of the Organizations

Most of the organizations studied primarily provide technical job-related instruction to a dispersed body of workers. Little administrative or clerical instruction is provided within the ten organizations. Likewise, management and leadership classes are usually received elsewhere. Both staff and policymakers expressed a need for organization-specific knowledge in those areas.

In most of the organizations, specific learning requirements originate from the organization's business units. However three of the organizations base their learning requirements on staff training plans and formal curriculum reviews.

Beyond instruction, each of the organizations has a need to deliver new and changing knowledge to workers in an efficient manner. Many of the participating organizations are using technology-enabled media to communicate that knowledge in a consistent, timely manner.

One organization includes learning in its overall strategic plan. According to that plan, learning should be designed in order to retain workers and to improve effectiveness, productivity and knowledge sharing across business units. The key performance goal for learning is just-in-time knowledge.

Media Currently Used to Deliver Learning

The principal medium currently employed to deliver learning in all the organizations is classroom-based, instructor-led teaching. Eighty to 95% of all courses are delivered in this format. Courses may be delivered entirely in the classroom or may include work simulation components. Classes of a few hours to 18 weeks in length are typically conducted in organizational academies. These learning centers are found in sites across the country. Many are in the Washington, DC area but others are situated in locations such as suburban Chicago, Georgia, Washington state, and New Mexico. Instructors also travel to local sites to deliver instruction.

Two organizations have prescribed on-the-job learning and mentoring programs that supplement classroom instruction. Learners must complete a portion of a mentoring program before attending an instructor-led class. Additional on-the-job learning and mentoring occur after the class is completed.

Seven of the organizations also deliver instructor-led classes via IVT. IVT is a one-way video, two-way audio medium broadcast via satellite. Three of the organizations have on-site studios and production staff to design and deliver instruction on a regular, scheduled basis. Two other organizations have on-site uplink capability but use classrooms instead of studios and broadcast classes on an as-needed basis. The other organizations utilize the studio and uplink facilities of other government agencies, when required.

The military organization uses paper-based correspondence to deliver a large number of courses. Because of limited access to other technologies in the field, it is expected that this medium will continue to be a primary delivery method for off-site instruction. Materials for several of the paper-based courses are being converted to PDF format and will be available on-line for those students with computer access.

Video teleconferencing (VTC), a two-way video, two-way audio medium, is used by six of the organizations for instructional delivery. Two of the organizations have formal VTC instructional programs to deliver teaching from universities to locations throughout the country. The other organizations use VTC for periodic instruction.

One organization is beginning to utilize custom-designed web-based instruction. The instruction will be used for prerequisite and entry-level material and, therefore, will supplement, rather than replace, classroom teaching. Another organization develops custom-designed CD-ROMs for the delivery several courses.

Two organizations offer commercial off-the-shelf (COTS) courseware on their Intranet sites. One of those organizations offers more than 600 COTS courses to learners. Another organization supports a global workforce by distributing several hundred courses from a library of 2700 CD-ROMs. Yet another distributes videotape courses to a worldwide group of learners.
Three organizations are developing learning portals as a way to consolidate COTS courseware, professional information, course catalogs, on-line forms and procedures and other professional resources. The learning portals will be located on the organizations' Intranet sites.

One organization is developing web-accessible courses on Blackboard. The courses are being used in both a stand-alone fashion and to provide in-depth instruction following introductory IVT broadcasts.

Each organization uses a blend of technologies to deliver instruction. The technologies selected are different for each organization. Some factors indicated for selecting technologies include organizational culture, existing infrastructure and custom or off-the-shelf learning needs. The following table summarizes the media used by the organizations to deliver instruction.

Table 1. Blends of Technologies Used by the Organizations

Information Technology and Learning Delivery Technology Infrastructure Within the Organizations

All of the organizations studied have one or more central locations for the delivery of classroom-based instruction. These academies house classrooms, VTC and IVT facilities, computer laboratories and simulation areas. Other IVT and VTC classrooms are located in area or regional offices. VTC and IVT access is also available at college and National Guard sites.

The computer infrastructure needed to facilitate many technology-enabled learning media is similar among the organizations. Except when located in remote areas, most learners have at least Pentium class desktop or laptop computers with Windows operating systems and Internet and Intranet access. These computers have a range of processor speeds and memory. Most have CD-ROM drives and sound cards. Speakers may or may not be part of each computer system. Adequate bandwidth is available in most domestic and foreign locations. However, locations in many African nations and in parts of Asia have effectively no connectivity.

Workers in the organizations routinely use computers in the jobs. Staff in one organization estimated that as many as 90% of personnel have computer and internet access while a survey of learners in another organization found that 85% of the respondents have access to a computer for their job between 20 and 40 hours per week. Ninety-one percent of the respondents in the same survey indicated that they are at least somewhat comfortable using both a computer and the Internet. Almost all indicated that they would like to receive some form of technology-enabled learning. Fifty percent had no apprehensions about e-learning. However 35% were concerned about a possible lack of interaction with an instructor and class.

Organizational and Financial Support for Technology-enabled Learning Programs

One organization has been directed to create a distance-learning center with the mission to “design, develop, implement and evaluate effective and efficient technology-enabled solutions in support of and in collaboration with, sponsors of that organization’s training and education programs.” Activity to create this center is currently underway. Another organization states in its strategic plan, that “training should be developed and delivered in the most effective manner through the establishment of a distributed learning capability and curriculum.” A third
organization has committed to a goal of have 30% of instruction to be designed and developed for computer based and interactive multi-media delivery systems in two years.

Another organization is actively pursuing utilization of a variety of technology-enabled approaches to learning. The organization has a director of distance learning who has equal status with a director of classroom learning. The organization has a schedule of IVT broadcasts. At least one "live" program is broadcast each week. Taped programs are aired throughout the workweek. Customized CD-ROMs have been developed on a number of subjects. COTS courses are available on the organization's Intranet site and Blackboard courses are offered as requested.

Other organizations are experiencing less support for the use of technology-enabled learning. For example, one organization recently added video broadcasting capability to all classrooms in its academy. However, only one broadcast was delivered in FY 2001. The equipment has been used for video meetings, broadcasts to the desktop within the academy itself and as enhancements to the classroom instruction.

Most of the organizations have no focused budget for technology-enabled learning programs and no specified structure for implementing new learning media. Typically, responsibility for learning is dispersed within the organization and few internal staff are available to design technology-enabled programs. Instructional staff are tasked with delivering content rather than designing programs. Consultants are often used to design and/or develop technology-enabled courses.

Support for creation and implementation of technology-enabled learning programs has increased since the World Trade Center and Pentagon bombings on September 11, 2001. One organization experienced a 45-day travel moratorium thereby causing cancellation of many classroom courses and increasing the use of IVT and VTC facilities. Another was asked to be prepared to redesign all current classroom-based courses for delivery that would require no travel.

Summary

This study investigated the current state of technology-enabled learning programs in ten federal government organizations. The findings revealed that traditional instructor-led classroom learning is by far the dominant delivery method used by these organizations. However, in order to meet the needs of the workforce, each organization is incorporating more technology-enabled media in their learning programs.

As work becomes more complex, the need for professional education is growing rapidly. Providing classroom instruction on needed professional topics is beginning to tax the capabilities of instructors and facilities alike. In addition, classroom instruction cannot supply the just-in-time information that is often needed on the job.

Organizations are using technology-enabled media to expand the capabilities of the classrooms and instructors. For example, IVT and VTC courses are offered to multiple sites at once. This practice limits travel and allows more students to receive instructor-led learning at one time. Learning portals are also being developed. These portals will provide one location for workers to receive e-learning instruction, professional information and job aids such as forms and operating procedures.

The workforce of many federal government organizations is situated throughout the world. Providing instructor-led learning for remote workers is difficult and expensive at best. Technology-enabled learning programs are being used to meet the needs of those workers. Individuals located in cosmopolitan locations can receive IVT, VTC or e-learning instruction while workers located in areas with limited connectivity can receive paper-based correspondence courses, videotape or CD-ROM instruction.

Currently, instructor-led learning in most of the organizations studied is limited to technical subjects. However, the organizations also have needs for supervisory, managerial, administrative and clerical courses. The use of COTS courseware is allowing these organizations to expand the training subjects offered to workers. Placing COTS courses on learning portals along with job aids is providing needed just-in-time knowledge to segments of employees that were previously overlooked.

Strazzo and Wentling (2001) found that the Fortune 100 organizations in their study were investing up to 50% of their training budgets in e-learning. The government organizations studied for this research are utilizing e-learning to a more limited degree. Instead, emphasis is currently being placed on visual technologies such as IVT and VTC. Of those organizations that are developing e-learning, only one is producing customized web-based instruction. Others are utilizing COTS courseware, designing portals to consolidate learning and performance-support materials, or designing instruction with templates such as Blackboard.

While the federal government organizations studied are using more technology-enabled learning programs each year, organizational structure and financing is sometimes limiting the speed with which new technologies are incorporated. Lack of organizational focus and budgeting for technology-enabled learning programs is forcing piecemeal acquisition and implementation of both hardware and courseware. Equipment varies among locations.
Technologies and course development vary among business groups and coordination of delivery is difficult because of the differences. Government-wide buying consortiums are allowing easier purchasing of technology items, but rigid budget structures and a lack of coordinated planning for technology-enabled instruction within organizations are resulting in disjointed approaches to design and implementation of programs.

Conclusions and Recommendations

Use of technology-enabled learning programs will continue to grow within the federal government. The need for learning is exceeding the current capacity of organizations to provide instruction using traditional methods. Organizations are being asked to provide learning for additional people and in added subject areas.

Such requirements cannot easily be met using traditional learning approaches within the conventional classroom infrastructure. They will require utilization of a variety of learning solutions. While instructor-led classroom teaching will continue to provide the foundation for education programs in the federal government, that foundation will be supplemented by a variety of technology-enabled media.

E-learning will be one component of a blended approach to learning delivery. E-learning will consist of some customized web or CD-ROM based instruction. It will also include COTS courseware and instructor-designed classes using products such as Blackboard. Learning portals are expected to be used to provide a central repository for e-learning and other professional resources.

Video technologies will continue to be important media for learning within the federal government. Federal organizations have the hardware infrastructure needed to broadcast and receive both IVT and VTC programs. Currently, programs are most often received in a classroom setting. New technologies will allow desktop receipt of broadcasts.

While a baseline infrastructure of computer, video and traditional teaching capabilities exists, specific capabilities are varied among and within government organizations. Any new technology-enabled learning approach must take that variance into account. New programs must consider both the learning and technology needs of the audience and the organization.

Curricula must be flexible enough to accommodate a variety of media. Instructors and instructional designers must be able to create and deliver quality learning using methods other than traditional classroom instruction. Programs must have the capacity for ongoing and immediate changes in content and delivery. Materials must be available for just-in-time use by those who need them.

Change happens slowly in the federal government. Complex budget structures and bureaucratic organizations have been established to facilitate care and oversight. New initiatives that don't fit somewhere within traditional structures are difficult and time-consuming to implement. New learning technologies will be adopted though either priority action or by utilizing existing structures for implementation.

The organizations that participated in this study have the capacity to incorporate more technology-enabled learning into their programs. Successful blending of learning solutions will be realized when workers in those organizations can receive instruction or information when they need it, where they need it, in a form that is useful to them.

Technology-Based Training: A Review of the Theory and Literature

Chemin Chu
University of Minnesota

The purpose of this review is to explore technology-based training (TBT), which is one of the future trends of training delivery. Included in this review are the definitions, benefits, and limitations of TBT; learning theories applied to TBT; contributions of TBT; and recommendations to Human Resource Development professionals for TBT utilization.

Keywords: Technology-Based Training (TBT), Andragogical Model, Events of Instruction

Many industries—particularly those with higher than usual employee turnover—use technology-based training (TBT) for employee orientation because training costs can be significantly reduced (Greinsing-Pophal, 1998). In addition to primary job training, TBT also provides cross-training in non-primary job functions, thereby reducing costly employee turnover and improving employee morale and quality of work (Cavanagh, 1993). Both corporations and universities are currently developing TBT systems; specifically, IBM has built an approach that measures the monetary benefits of the TBT for thousands of employees, and the University of Illinois at Urbana-Champaign has created an entire online learning evaluation system (Buren, 2000).

A recent survey of training, human resource (HR) and information technology (IT) professionals found that 94 percent believe TBT to be a practical option for teaching professional development skills; 74 percent believe TBT will become the norm within five years; and 81 percent believe TBT provides a cost-effective alternative or supplement to classroom-based instruction (St-Amour, 2000). Further, investment in education has increased substantially as more demands are put on employees. Based on a 1998 survey conducted by Training Magazine, corporate spending on training has increased by 26 percent over the last five years. Additional research that investigated the types of instructional methods and media to deliver industry training found that, from 1999 to 2000, CD-ROM/computer-based training had increased 20 percent; Internet/www training had increased 15 percent; and intranet/organizational internal network training had increased more than 26 percent (Staff, 1999, 2000). As TBT continues to gain credibility as a cost-effective means through which to deliver training, undoubtedly more and more companies will encourage employee participation. Industry estimates predict that by 2003, no less than 30 percent of all training will be delivered over corporate intranets (Ryan, 2001).

Problem Statement and Research Question

Obviously, TBT is not only a trendy training approach for all industries, it is also gaining popularity at various academic institutions. Despite its reception, however, TBT also has limitations. This paper is focused on an issue of particular importance to the human resource development (HRD) field: how practitioners can most effectively maximize TBT’s strengths for employee training. Therefore, the purpose of this study is to discuss current literature related to TBT and that literature’s implications to HRD practice. In order to answer the problem statement and understand how HRD practitioners can practice in a TBT project, this paper will explore the following questions: (a) What is TBT? (b) What are the benefits of TBT? (c) What are the limitations of TBT? (d) What are the roles and responsibilities of HRD practitioner in TBT projects? (e) How can HRD practitioners take full advantages of TBT’s strengths to ensure success?

These five questions will answer the research question: What can HRD practitioners contribute to TBT?

Methodology

The methodology for this study is a conceptual analysis derived from a review of related TBT literature. In their book, Technology-based training: The art and science of design, development, and delivery (1999), Kruse and Keil discuss numerous TBT issues, including basic information, adult learning, instructional design, technology selection, interface design, and various phases of TBT project management. Further, the authors integrate other articles from various complementary fields (e.g., business and computer science) to analyze and synthesize theories and critiques of current TBT implementation. In addition to Kruse and Keil’s book, many related journal and Internet articles

Copyright © 2002 Chemin Chu
were also selected as resources to answer these questions. Due to major development of TBT as web-based training and computer-based training, the author also searched those two keywords to locate articles. This paper will present and discuss the research questions, then formulate conclusions and make recommendations based on findings.

Results and Findings

The Definition of TBT

There are many terms associated with TBT, including technology-based learning, computer-based training (CBT), computer-based learning (CBL), computer-based instruction (CBI), computer-based education (CBE), web-based training (WBT), Internet-based training (IBT), browser-based training (BBT), distance learning, desktop training, desktop video conferencing, interactive training, and computer-assisted instruction (Hall, 1997; Kruse & Keil, 1999). In general, TBT is no more complicated than an effective use of technology to deliver training and educational materials; TBT is the all-inclusive term for training delivered by various methods. In the past, such methods have included the use of mainframe computers, floppy diskettes, multimedia compact disks, read-only memory (CD-ROM), and interactive videodisks. Most recently, training delivery via Internet and intranet have become preferred options (Kruse & Keil, 1999). Cavanagh (1993) further described this type of training delivery:

[TBT] includes a wide variety of video and computer-based training products. TBT allows experts to capture their knowledge of a particular area and deliver it to students in a format that facilitates learning and retention. Also, TBT may be repeated at no charge and delivered more cost-effectively than traditional instructor-led training (p. 31).

St-Amour (2000) also provided a definition of TBT and discussed its growth and applicability:

TBT -- the use of software, computers, the Internet, CD-ROM learning tools, video streaming and other technologies -- is growing at about 30 percent annually. TBT is increasingly being applied by organizations to provide professional development or soft skills, not just technical training, because the technologies can create realistic, highly-interactive, computer-based simulations (p. 13).

To conclude, TBT applies technologies—such as software, computers, the Internet, CD-ROM, and video streaming—to deliver and provide learners with the knowledge and skills required to complete a specific task or job for the purpose of increasing their capabilities to perform that task or job.

Benefits of TBT

Technology comprises the ideas and the machines that human beings develop to meet their needs. Therefore, applying technology in the workplace creates more convenient, more reliable, and more effective environments in order that people can work efficiently and productively. TBT has many advantages for both trainers and learners that can be developed rapidly and are accepted by most industries. Many researchers have listed advantages that are integrated into three points: convenience, reliability, and efficiency.

Convenience. The biggest benefit of TBT is saving time from traveling and waiting for training. There is very strong evidence that TBT requires less time for learner participation than instructor-led training (Hall, 1997, p. 108). Although the most common rates of time reduction are from 40-60 percent, some examples range from 20 percent to a high of 80 percent reduction of participant time.

Moreover, the learner can set up their own schedule and their learning pace from the TBT. As adult learners, TBT participants can schedule their technology-based training for virtually any location and time, conditions that are impossible with instructor-led training (Hall, 1997; Kruse & Keil, 1999; Ouellette, 1999). Learners also can reduce their own education-related stress and increase satisfaction of the training experience through TBT. Not only are employees who are trained using TBT able to acquire knowledge at their own pace, they can practice skills without feeling threatened or embarrassed (Galloway, 2000; St-Amour, 2000).

Reliability. TBT can create a safe learning environment for learners that allows them to practice tasks safely without the risks and costs associated with the real environment (Arkin, 1994). For example, computer-based simulations enable ambulance drivers and aircraft cabin staff to practice emergency procedures without endangering patients or passengers. Another reliability factor of TBT is its consistent delivery of training programs. TBT enables employers and HR professionals to ensure consistency of delivery as well as technology-based simulations for assessment purposes (Arkin, 1994; Kruse & Keil, 1999). Mumford (1998) also indicated that TBT is planned, structured and delivered through an extremely consistent process, and can be excellent at delivering knowledge.
Efficiency. First, TBT is cost-effective. Many costs can be reduced or eliminated altogether through TBT use (e.g., instructors' salaries, meeting-room rentals, learner travel and per diem, lodging, and meals). In addition, TBT can be implemented and accessed with minimum disruption to employees' typical work schedules, which may be the most positive result of this delivery method (Cavanagh, 1993; Galloway, 2000; Kruse & Keil, 1999; Moore, 1998). As an effective way to train individuals to operate virtually any piece of machinery, TBT is also generally cheaper than using real machines in a real work environment with real supervisor oversight (Arkin, 1994). Moreover, as world needs change, employees in all competitive domestic and global markets need to remain current with the increasing demand for more knowledgeable and skilled workers. Multiple sources suggest that TBT is one of the most effective ways through which employers can add substantial knowledge and skills to their workforce populations (Galloway, 2000; Moore, 1998).

Second, TBT is simple for employers to manage. TBT offers the ability of employer, trainer, and employee to track progress and measure results quickly and efficiently so that they are able to see the results of employee training immediately and effortlessly. As a result, TBT can increase employee’s retention. Kruse & Keil (1999) specified that, on the average, TBT use increases employee retention rate by 25 percent over more traditional methods of training. The departure of TBT from traditional methods is one indication of employer willingness to provide for their employees' professional development. Since employees are more inclined to remain loyal to an organization that is committed to their on-going development (Galloway, 2000; Moore, 1998), use of TBT might also increase employee morale.

Third, TBT provides an interactive environment that enables user learning actively and effectively. TBT participants can download courses using a Web browser or participate in the courses interactively while they are connected to the Internet. Furthermore, chat rooms or discussion lists can provide a level of interaction among learners and even trainers (Hall, 1997; Kruse & Keil, 1999; Ouellette, 1999). Some learners, who may be reticent to participate in live class discussions, may also become more active in TBT settings than in instructor-led training.

Finally, TBT content is easy to update. TBT can be used to impart new knowledge and skills very quickly, which is a great benefit for all businesses in the current, fast-paced global economy (Hall, 1997; St-Amour, 2000).

Limitations of TBT

The limitations of TBT can be viewed from technology and learner perspectives. From the technology perspective, corporations need to invest great expense in equipment before they can implement TBT. Hefty capital investment costs pose a real barrier to greater use of TBT methods, especially those methods that involve computer-driven multimedia systems that combine sound, text, and graphics (Arkin, 1994). In addition, by using the Internet as the major delivery method of TBT, employers must also consider that employees may experience limited bandwidth with use of their personal home computers. This limitation means slower performance for sound, video, and even extensive graphics (Hall, 1997), especially when some employees still—slowly—browse the Web with 28.8K dial-up modems from those home computers. Obviously, such slow speed may reduce both the learning process itself and the effectiveness of TBT as a learning method. Fortunately, there are two keys to future TBT growth: (a) the dramatically increasing power of the industry-standard personal computer, and (b) the emergence of powerful storage and retrieval systems at reduced costs (Cook, 1992). Unfortunately, at present, it still takes more time and costs more money to develop TBT systems and programs (Hall, 1997; Kruse & Keil, 1999).

From a learner perspective, the major limitation of TBT is that some learners have technophobia, which may reduce the effectiveness of TBT, since decreasing instructor-led training may make those learners extremely uneasy (Hall, 1997; Kruse & Keil, 1999). Further, TBT is likely to be less effective than other methods in helping people to develop insights (Mumford, 1998). Many TBT programs are the focus of training and practice, which does not involve development of high-level cognitive skills such as problem solving. In addition, gaining knowledge of or skills in areas that involve complex physical-motor skills (e.g., component wiring) or emotional aspects (e.g., mediation) are also limited by TBT use (Hall, 1997; Kruse & Keil, 1999).

Even though limited bandwidth may be a problem for TBT implementation, due to rapid technological development, it may not be a problem in a few months or even weeks. Other limitations (e.g., high expense and learner technophobia) can also be controllable through needs assessment and analysis.

Roles and Responsibilities of a TBT Project

Kruse and Keil (1999) suggest that to create effective TBT requires myriad responsibilities and specialties from members of a project team. These team member roles include: (a) the client-sponsor, who acts on behalf of his or her organization to ensure TBT project creation and development, and is responsible for the success or failure of the
(b) the project manager, who ultimately guarantees on-time, on-budget delivery of a TBT solution, and is
responsible to the client-sponsor for the quality of the finished product; (c) the subject matter expert (SME), who
contributes the core content and original materials, is available for information collection through interviews, and is
responsible for accuracy of the design documents, scripts, and final deliverable; (d) the instructional designer, who
has background in instructional design, psychology, education, or multimedia technology, and conducts high-level
analysis of performance-goals, target audiences, training needs, and technology limitations; (e) the writer, who
creates and revises an outline and script which dictate the words, images, video and audio elements presented to
the audience, applies navigation direction to the scripts, and adds notes to indicate special functions, links, or other
software behaviors; (f) the graphic artist, who creates screen layouts and interface items, such as bottoms, windows,
menus, graphics and animations, from the blueprints created by the instructional designer and writer; (g) the
programmer, who assembles different elements, such as text and animation, into a coherent whole, debugs the
program following alpha and beta tests, creates databases, and constructs reporting mechanisms used for learner
tracking; and (h) the quality reviewer, who works internally during development, alpha and beta stages, to check the
program for quality and bugs, and creates change reports.

The practitioner is most likely an instructional designer who assesses training needs, designs documents, and
takes charge of the formative and summative evaluations. Even though good TBT practitioners need a basic
understanding of technology to know what is possible given certain technological realities, practitioners should
possess the abilities Kruse and Keil (1999) cited as necessary for the best instructional designers: they quickly and
accurately recognize the gap between performance and knowledge, and appreciate and apply a breadth of adult
learning theories.

Gap Analysis -- Performance Analysis Flow Diagram

The technique of gap analysis is used to analyze/assess current skill and knowledge and future expectations. A
gap analysis is also referred to as a needs assessment or a needs analysis, which is a process by which an
organization's HRD needs are identified and articulated (DeSimone, Werner, & Harris, 2002). The analysis phrase
simply identifies the gap between actual behaviors and desired outcomes, and obtains information about the learner,
environment, and technology that are relevant to closing the gap. Mager and Pike (1997) presented the Performance
Analysis Flow Diagram (see Figure 1) to analyze performance problems. The flow diagram not only illustrates each
of the steps in the procedure, but also identifies and resolves the problem as quickly as possible. Furthermore, it
provides an easy method to communicate with insiders and outsiders without using jargon. Therefore, a
Performance Analysis Flow Diagram is the top choice of practitioners to practice gap analysis.

Adult Learning Theories

HRD practitioners always refer to adult learning theories to develop training programs. To apply adult learning
theories to TBT, practitioners make it more user-friendly and attractive to those learners who feel uneasy about
getting training from technology. The andragogical model has stood for many years as a central model of adult
learning. Knowles, Holton, and Swanson (1998) proposed an andragogical model (see Figure 2) in practice that
contained six-core adult learning principles:

1) The need to know. Adults need to know why they need to learn something before undertaking to learn it.
   To apply TBT, the course should begin with an emphasis on the specific benefits of the topic, and
   objectives that learners can apply directly to their work.

2) The learners' self-concept. Adults have a self-concept of being responsible for their own decisions, for
   their own lives. Once they have arrived at that self-concept, they develop a deep psychological need to be
   seen by others and treated by others as being capable of self-direction. Palmer and Smith (1990) defined a
   self-directed learner as "a learner who can identify what they want to learn, can determine the resources
   necessary to learn it, and can evaluate themselves honestly to see what it is they have learned" (p. 82). If
   the learner does not take self-direction as their principle, TBT will succeed less than it expects. Therefore,
   the analysis phrase of TBT needs to take the prospective audience assessment into account.

3) The role of learners' experience. Adults come into an educational activity with both a greater volume and
   a different quality of experience from youth. Prior experience could be the resources and mental models
   through which they learn new knowledge through connection. When this principle is applied to TBT,
   questions that arise from previous work experience should be addressed and combined with the learners'
   previous experiences to find other approaches of problem-resolution for the future.
4) Readiness to learn. Adults typically become ready to learn those things they need to know and be able to do in order to cope effectively with their real-life situations. TBT could provide an interactive screen on which learners could click to obtain certain concepts and information from which they could effectively learn.

5) Orientation to learning. Adults are motivated to learn to the extent that they perceive that learning will help them perform tasks or deal with problems that they confront in their life situations. According to this principle, the TBT courses should be designed to access on-line information immediately so learners can look up the website and apply their learning immediately to their own situations.

6) Motivation. Adults tend to be more motivated toward learning that helps them solve problems in their lives or results in internal reward. Knowles, Holton, & Swanson (1998) indicated that motivators for adult learners are internal (e.g., self-esteem and quality of life) rather than external (e.g., better jobs and promotions). TBT could give practical examples of how to arrange each objective to motivate the audience to continue to learn.

Goals and Purposes for Learning

Individual and Situational Differences

Andragogy: Core Adult Learning Principles

1. Learner's Need to Know
   - why
   - what
   - how

2. Self-Concept of the Learner
   - autonomous
   - self-directing

3. Prior Experience of the Learner
   - resource
   - mental models

4. Readiness to Learn
   - life related
   - developmental task

5. Orientation to Learning
   - problem centered
   - contextual

6. Motivation to Learn
   - intrinsic value
   - personal payoff

Individual Learner Differences

Institutional Growth

Subject Matter Differences

Societal Growth

Situational Differences

Individual Growth
Besides the andragogical model of adult learning, Gagne’s nine events of instruction is also considered a systematic approach to instructional design and training. It focuses on training outcomes and behaviors through a nine-step process called the Events of Instruction (Gagne & Medsker, 1996), which correlate to and address the conditions of learning. The Events of Instruction are:

1) **Gain attention.** TBT can apply multimedia programs to increase a learner’s attention. In addition, providing clear benefits and objectives at the beginning of the training session also attracts the learner interest.

2) **Inform learners of objectives.** In this step, Mager (1997) suggested that objectives be related to intended outcomes, and also that they be specific, measurable, and concerned with learners, not instructors. The objectives initiate the internal process of expectancy and help motivate the learner to complete the training.

3) **Stimulate recall of prior learning.** Kruse & Keil (1999) proposed a simple method through which instructors may ask questions about previous experiences, about understanding of previous concepts, or about a body of content. Therefore, learners can easily associate new information with prior knowledge to facilitate the learning process.

4) **Present the content.** When a new content is going to be presented to learners, the instructor needs to address it in a meaningful and organized manner so learners are not confused and lost. TBT can present screen images captured from the live application software and audio narration before a demonstration is performed.

5) **Provide learning guidance.** Examples and case studies can be presented before a learner enters a new course to provide guidance about the logic of new knowledge and skills.

6) **Elicit performance (practice).** After a new concept or skill is learned, an exercise is appropriate for learners to practice. With a real operation, learners are able to understand the meaning of the concept or skill, then keep motivated to continue the learning experience.

7) **Provide feedback.** After practicing new concepts or skills, it is important to offer instant and direct feedback on learner performance. Feedback provides an opportunity for learners to confirm their correct understanding, and the concept repetition further increases their likelihood of retention (Kruse & Keil, 1999).

8) **Assess performance.** An assessment or exam is required for learners to understand the level of their mastery of new knowledge. The result can provide both instructors and learners with some idea of what they have completed, as well as what they still need to learn. Assessment would ensure that TBT has successfully transferred new knowledge.

9) **Enhance retention and transfer to the job.** Before TBT was widely used, the analysis phrase ensured that learners could practice their new knowledge or skills in their current positions. However, a following up evaluation is needed to obtain feedback about the TBT.

Compared to these two learning concepts, Knowles, Holton, and Swanson’s andragogical model suggests how adults learn well before training, and Gagne and Medske’s Events of Instruction offers directions as to how adults learn while training is delivered. HRD practitioners can combine both theoretical concepts into TBT to enhance the capabilities of instructional designers. In addition, reading trade magazine columns, such as Business Week and PC Magazine, is a straightforward way to gain basic information about technology and new ideas of delivery techniques.

**Conclusions and Recommendations**

Humans invent tools (e.g., hammer and axe), then machines (e.g., automobile and electric saw), and now, machines with technology (e.g., computer and cell phone). New technology develops almost as fast as our imaginations. While comparatively large computers displayed only black and white text a few years ago, today’s large capacity machines provide exceptional audio, video, and graphics capabilities as the norm. All these inventions increase productivity. HRD connects humans and machines because HRD is concerned with human development and how to increase the capability to use machines efficiently and safely in order to improve job performance. Through rapidly growing technological development, many convenient organizational tools will also be created. TBT, a relatively new learning technology, was created with the advantages of more convenience, more reliability, and more efficiency than instructor-led training as a delivery method. TBT can be applied to decrease the amount of corporation budget previously spent on employees’ turnover. Furthermore, effective TBT can also directly enhance both an organization’s performance and competitive advantage. Therefore, TBT has grown rapidly in recent years, and may well become the major industrial training approach of the near future, one that can be accepted by learners with all kinds of learning styles.
However, to complete a TBT project requires many different fields of expertise to ensure success. HRD practitioners, in their role of instructional designer in TBT, possess the experience of completing gap-analysis and the background of adult learning theories that play an active role in a TBT project. The literature identified that an excellent practitioner in TBT has basic knowledge of technology so s/he can easily apply contemporary technology into practice. This paper suggests that reading columns from PC Magazine and Business Week is an effortless way to obtain sensitivity about today’s technology.

With unlimited horizons in technology development, TBT also has boundless development abilities in all kinds of subjects such as general orientation training program or specific leadership training programs. More research is needed to explore the effectiveness of TBT. For example, further research can be conducted to compare TBT and instructor-led training in the same subject, such as train-the-trainer, to examine the limitations or increase the creditability of TBT. In addition, case study in TBT is extremely valuable to develop further learning theories with new instructions and environments.

Recurrent Themes in E-Learning: A Meta-Analysis of Major E-Learning Reports

Consuelo L. Waight  
Pedro A. Willging  
Tim L. Wentling  
University of Illinois at Urbana-Champaign

A meta-analysis of 15 major e-Learning reports provides a basic insight on what government, business, and professional organizations are saying about e-Learning. Findings, though basic, look at the purpose of the e-Learning reports, features of e-Learning and the trends affecting e-Learning.

Keyword: E-Learning, Policy Reports, Meta-analysis

E-Learning sometimes referred to as online learning, web-based learning, distance learning and technology-based learning, among other names, is a concept that has garnered significant global attention (Gotschall, 2000; Hall, 1997). Though the history of e-Learning (primarily distance learning) dates to the early 1950’s and even before (Saba, 1999; Clark, 2000; Rosenberg, 2001), not until the last eight years has it become a momentous, collective imperative of several entities. This broad attention to e-Learning has resulted in numerous e-Learning reports. In doing extensive web searches for e-Learning reports, the researchers estimate that more than 250 e-Learning reports, excluding white papers, have been released worldwide over the last three years; by governments, business, academia and professional associations.

Problem Statement

The significance and relevance of technology and education has gained momentum; research on e-Learning is imperative. The discourse on e-Learning has focused on topics such as the effectiveness of e-Learning (Strommen & Lincoln, 1992; Harasim, Hiltz, Teles, & Turoff 1996; Webster, & Hackley, 1997), evaluation of distance education (Magalhaes, & Schiel, 1997; Thomas, 2000; Clark, 2000), e-Learning issues (Jonassen, 1992; Sherry, 1995; Banas & Emory, 1998), comparison of traditional and online learning (Saba, 1998; Ponzurick, France, Russo, & Cyril, 2000), and learning needs of organizations and their human resources amidst the technological, social and economical forces affecting the world (Gotschall, 2000; Karon, 2000; Wentling, Waight, King, 2002). Though not exclusive, and with little synthesis existing among these topics, the importance and challenges of e-Learning is omni-present.

With e-Learning being a huge imperative for government, business, and professional associations, and with these institutions being major players in the advancement of e-Learning, it is important to be cognizant of and synthesize what these institutions purport about e-Learning. These institutions have published various reports, their common discourse on e-Learning, however, is unknown. If government, business, and professional associations are leading the advancement of e-Learning, it is critical that there be cognizance on what these institutions say about the purpose, features and trends of e-Learning. This basic information can be the foundation to focusing research on e-Learning, a focus that is direly needed. Thus, this meta-analysis of e-Learning reports focuses on the following questions: (1) What is the purpose of e-Learning reports?; (2) What are features of e-Learning?; (3) What are the trends affecting e-Learning?

Conceptual Background

E-Learning is the acquisition and use of knowledge distributed and facilitated primarily by electronic means. This form of learning currently depends on networks and computers but will likely evolve into systems consisting of a variety of channels (e.g., wireless, satellite), and technologies (e.g., cellular phones, PDA’s) as they are developed and adopted. E-Learning can take the form of courses as well as modules and smaller learning objects. E-Learning may incorporate synchronous or asynchronous access and may be distributed geographically with varied limits of time (Wentling, Waight and Kanfer, 2000).

The history of the technological revolution reveals that of all the sectors of society, education remains at the bottom of scale when it comes to integrating information technology (Strommen & Lincoln, 1992). The initial slow integration of technology into education can be a derivative of the early visions of distance education.
Matthews (1999) indicated distance education was first and foremost a movement that sought not so much to challenge or change the structure of higher learning, but to extend the traditional university and to overcome inherent problems of scarcity and exclusivity.

As we move into the 21st century this vision of distance learning has changed as the delivery of education now extends to commercial centers. Along with personal productivity software, windows environments, local area networks, client server computing, internets, intranets, and extranets has come the introduction of personal digital assistants (PDA), and mobile and wireless technologies. These technological advances have enabled electronic commerce systems, anytime, anywhere data retrieval and updating, education, professional development, and the rapid growth of e-Learning (Wentling, Waight & King, 2002; Close, Humphreys, Ruttenbur 2000; Webster & Hackley, 1997).

As the integration of technology and education becomes addressed and as innovative information technology continues to surprise us, it is critical that a systemic approach to the organizational, process and individual (Rummler & Brache, 1992) issues such as insufficient empirical research, minimal application of research to practice, and application of traditional instructional design and teaching methods need to be addressed. In addition, the ineffective use of technology, the absence of the learner in the instructional design, antiquated policy, intellectual property and inadequate online teacher training are other issues affecting the effective integration of technology and education. Swanson (1999) related that, a wide range of systemic disconnects adversely affect performance. McNamara (2001) related, 'a system is a collection of part unified to accomplish an overall goal. If one part of the system is removed, the nature of the system is changed as well'. (p.1). Cognizance that there are multiple factors that need concerted, consistent attention, is crucial, if e-Learning is to move from promise to practice. Learning and performance need to be seen, by every organization that implements e-learning, as outcomes of all the resources that go into any e-Learning effort. A strong partnership needs to be recognized and realized among all individuals and institutions involved in e-Learning.

At present, the systemic disconnects run across four main institutions: they are: government, business, academia and professional associations. Very few studies, for example, capitalize, extend or review existing research studies. Even more so, very few studies, move from research to practice. Thus, e-Learning continues to be plagued by learner, faculty and administrative issues. The issue of learner interaction, for example, has been researched in various but limited contexts (Webster & Hackley, 1997; Sherry, 1995; Ponzurich, France, Russo and Cyril, 2000; Thomas, 2000; Moore & Thompson, 1990, 1997). E-Learning reports, another example, are growing in number, however we do not know is what is in common across these reports.

Simply stated, there is presently a flurry of e-Learning research projects – few, if any, however, are making an impact on practice. Systems theory as a philosophy and systemic approach as a method for the government, business, academia and professional associations in their e-Learning efforts could start to bring changes in how we approach research and development of e-Learning.

Methodology

This study is the first part of a three-phase research project on e-Learning. The phases are: 1) identify e-Learning themes, 2) understanding the social, economic and research dimensions of e-learning, and 3) comparing themes between US and European e-Learning reports. The purpose of the first phase of the project, that is reported herein, is to identify the recurrent e-Learning themes. This is a qualitative study that intended to explore themes in the e-Learning reports. The major method of data collection was web searches using Metacrawler, Yahoo, Google and Lycos as the search engines. The reports provide rich descriptions (qualitative data). The qualitative data were content analyzed to provide recurrent themes. Content analysis is a research technique for systematically examining the content of communications, in this case, the e-Learning reports (Gall, Borg, & Gall, 1996).

Selection of Reports

A three-year span (1999-2001) was chosen to select the most recent and most cited public e-Learning reports published in the United States. Reports in this study do not include white papers, or research articles; they represent reports written by a group or organization. The rationale for choosing the most recent and most cited reports is that to identify the common denominator in the e-Learning reports. The reports used in the analysis needed to have some sort of impact on the knowledge base in e-Learning. Thus, the reports most commonly cited were considered significant and these reports were generally the most recent.
To identify the e-Learning reports, the researchers searched the web extensively using Metacrawler, Yahoo, Google, and Lycos. Understanding the dynamic nature of the web, an estimated 250 e-Learning reports were published world wide from 1999 to 2001. Of these 250 reports at least 100 were published and are presently sold by private companies for prices between 100 and 3000 dollars. Of the remaining 150 at least 70 reports were published outside of the United States. The researchers reviewed research articles, white papers, and e-Learning portals to identify which among the remaining 80 reports were the most cited reports. Fifteen (15) reports were the most recurrent and their sources were government, business and professional associations. These 15 reports altogether contained 1169 pages.

Analysis of Reports

The first level of analysis involved reviewing the first three pages of the reports for their sources. Second, the researchers reviewed the reports for keyword and phrases by using 'Theme Weaver', content analysis software, developed by the Automated Learning Group at National Center for Supercomputing Applications. Following is a description of 'Theme Weaver' that provides a description of how the analysis was done.

Some of the keywords that Theme Weaver produced were: training technology, learning learner, information, workers work, time technology, technology learning, training time, work user learning, performance learning technology, learning market, and education training technology, time products, future individuals, project products, learner business, time knowledge work, and adult economy policy, and knowledge people organizations.

The following shows the theme results of one search using Theme Weaver.

Third, the researchers used the 'NVivo', a qualitative software tool, to further understand the keywords produced by 'Theme Weaver'. NVivo produced the specific paragraphs were the keywords appeared in the reports. The researchers then reviewed the paragraphs to understand the context of the keywords and phrases. This review led to the identification of the research questions:

1. What is the purpose of e-Learning reports?
2. What are features of e-Learning?
3. What are the trends affecting e-Learning?

The fourth level of analysis was content analysis of the reports using the research questions as keywords. The researchers reviewed each report consecutively by research question. Content analysis is a research technique for systematically examining the content of communications—in this instance, the reports. Emergent themes were ranked by their frequency of mention and were ultimately categorized. Essentially, the study used a qualitative approach to analyze the responses. A quantitative method in the form of frequencies and percentages supported the
qualitative data. The qualitative method was considered an appropriate way to explore the reports because of its descriptive nature to understand the whole of an event through insight and discovery (Bogdan & Biklen, 1992).

Results

The total number of reports analyzed was 15. The reports' sources were four government, seven businesses, and four professional training and development associations. The following are a description of reports and their sources.

Government Reports

Business Reports

Association Reports

Research Question 1: What is the Purpose of E-Learning?

The analysis revealed six purposes among the 15 reports. The following table provides a description of the themes and their frequency.

Table 1. Purpose

G- Government, B- Business, PA- Professional Association

Of all the research questions, the most recurrent themes surfaced in question 2. Six features of e-Learning were identified in all 15 reports. This communicates that the government, business and professional associations see e-Learning being anytime, anywhere, cost effective, have a global reach, be just-in-time, allow personalization and improve collaboration and interactivity. All these descriptors tell of a vision on integrating technology into education and how learning and performance can be facilitated. Learner diversity, identified 11 times, was seen as a major breakthrough for e-Learning because of technology that could be used to support e-Learning. Learner diversity included but was not exclusive to learning styles, location, experience, skills, language and learning pace. Of the nine reports that identified the learner-centered feature, the government reports were unanimous while of the seven reports that cited the lines of working and learning disappearing, four of the seven business reports were unanimous on this issue.

Research Question 3: What are the Trends Affecting E-Learning?

The analysis revealed that 20 trends were recurrent in the 15 reports. The following table provides a description of the themes and their frequency.
Table 3. Trends

G- Government, B- Business, PA- Professional Association

Seven trends appeared in all 15 reports. These trends all capitalize on technology, education, the human capital and the intertwined impact of these three. e-Learning was also identified in 12 reports as a mechanism for sustaining the growth of the intellectual capital while 10 reports cited the introduction of business models on e-Learning by investors. Along this topic the growth of the e-Learning market, the need for private and public partnerships and e-Learning becoming a core educational experience were mentioned in nine reports. That corporate universities are growing and that education has been the least affected by technology were cited by one report from each source. Overall, the trends show that e-Learning is moving forward and that the business as well as the education aspects holds promise.

Discussion and Conclusion

The content analysis of the 15 reports revealed basic but significant information. Though, the results from this study touches the tip of the e-Learning iceberg, it holds significance for many professionals researching or writing about e-Learning. In essence this basic study gives educators, researchers and developers from all institutions a quick glance into the recurrent themes of 1169 pages of e-Learning reports. Given that the study is in its first stage, the study provided a peripheral insight into the purpose, e-Learning features and trends of 15 reports. The second part of this study will focus on the economic, social, research and development, learning organization and futuristic case of e-
Learning as purported by the reports government, business, and professional associations. The last part of the study will compare U.S and European reports on their purpose, feature and trends.

From this part of the study, it can be concluded that the government, business and professional associations converge in many aspects of e-Learning. The integration of education and technology, though presently lagging behind other aspects of society, will get better as technology improves and leaders in private and public institutions create partnerships to integrate technology into their education programs to improve learning and performance. Learning and performance are outcomes of e-Learning that hold promise given the features of e-Learning. The learner will have control of the learning; a model that has been found to be the best in an online environment (Jonassen, 1992; Harasim, Hiltz, Teles, Turoff, 1996). The just-in-time, anywhere, anytime capabilities will be topped off by the opportunities for collaboration, interactivity and personalization. All reports purport an agreement that a paradigm shift in the way education is viewed and delivered has occurred. In essence the perceptions of learning have undergone radical change (Rosenberg, 2001).

Therefore, as business organizations discuss the growing markets of e-Learning and develop business models to attract investors, the government targets policy makers, educators, employers and the public at large, while professionals organizations mainly focus on the workforce and workplace, it is imperative that all three entities become aware of their convergences and divergences. As Banas and Emory, (1998) stated, “while there is a growing recognition of and attention to distance learning in higher education, its growing inclusion in academia significantly changes the educational environment and experience. These changes need to be acknowledged and discussed by all stakeholders”. (p.5) This study opens the door to the second phase of this research which is getting the detail on how technology will bring a new way of learning, how technology will improve the quality of learning, how e-Learning will sustain and maintain the intellectual capital and address learner diversity. Addressing learner diversity is critical because as Cifuentes and Murphy (2000) related, “in order to strengthen bonds among the members of expanding learning communities, administrators, teachers, and students in learner-centered schools and universities must honor diversity and emphasize the similarities that foster unity”. (p.17). Overall, the themes revealed that there is a large consensus on the what, where, why and how of e-Learning. The next phase of this study is to understand the social, economic, research and development, learning organization and the futuristic case of e-Learning.

Implications for HRD

The first implication of this study is for all HRD educators and researchers. With e-learning, a rapid, effective and less expensive form of training and development (Schutte, 1996, Magalhaes & Schiel, 1999; Karon, 2000), the study provides preliminary information that educators as well as researchers could use when writing grants, or conducting research on e-Learning. The findings are basic but help to build a foundation for e-Learning. The study also gives educators and researchers an insight into what the government, business and professional associations are saying about e-Learning.

The second implication of the study is for the HRD practitioners. This study gives practitioners a snap shot of the e-Learning features and trends to help anticipate the e-Learning scenario. Both features and trends are important when assessing the workplace and the workforce in its readiness for e-Learning. HRD practitioners need to know how these trends and features will modify their practice.

The third implication of this study is more research. This study though preliminary, in its findings, highlighted recurrent themes in purpose, features and trends across government, business and professional associations. Reports from academia were unexplored, a source that needs to be reviewed. Also, because of the newness of the topic, there are still many avenues to explore across government, business, education, and professional associations.

The last implication is for professionals directing government, business, academia, and professionals associations e-Learning efforts. This study’s preliminary findings show that there is overlap in their purposes, features and trends. It is important that each stakeholder be cognizant of each other’s efforts in realizing e-Learning promise.

Integrating Feminist Research And Practice In The Field Of HRD

This paper introduces frameworks for feminist research and practice in HRD with the goal of strengthening women's voices both in academia and practice. This paper defines feminism, describes feminist research, proposes strategies for feminist HRD research, and addresses the contradictions and challenges related to women in HRD.

Keywords: Women, Feminism, Feminist HRD

Human Resource Development is a rising discipline that is in the process of creating and validating knowledge. Little has been written about HRD research itself (Hixon and McClernon, 1999; Jacobs, 1990; Sleezer and Sleezer, 1997, 1998), and as a discipline, HRD has not especially concerned itself with issues of diversity, equality, power, heterosexism, discrimination, sexism, racism, or other issues of oppression in organizations. Bierema and Cseh (2002) analyzed over 600 AHRD Proceedings papers from 1996-2000 according to a feminist research framework and found that few studies recognize gender as a category of analysis. Based on their findings, they conclude that HRD research is paying insufficient attention to women’s experience, asymmetrical power arrangements in organizations, and problems of racism and sexism. They also found that the field poorly advocates social justice and change to remedy structural inequality. Yet, oppression in organizations mirrors the same problems in society and deserves HRD's attention. HRD is not alone in its oversight of women. Governmental policies, business practices, and research agendas in many fields lag behind the pace of workplace diversification.

Creating new knowledge is of essential importance to both HRD practitioners and researchers. As an emerging field, HRD is in the process of defining itself as a discipline. Yet, voices are absent from the discourse, and there has been little critical assessment of the field. Now is the time to question the theoretical frameworks and practices defining the field before they become entrenched and simply serve to reinforce the patriarchal status quo. Contemporary HRD research and practice concentrates on corporate American, skews loyalties toward management, and reverses performance improvement above other results. HRD researchers must explore the assumptions underlying their research, consider the beneficiaries of research, reflect on areas yet unexplored, and question the value of HRD research according to its impact on theory, practice, organizations, communities, and employees. This paper endeavors to begin exploring these assumptions. This purpose of this paper is to make the case for feminist research in HRD, define feminism, describe feminist research, identify strategies for feminist research in HRD, and address the contradictions and challenges related to women in HRD.

The Case for Feminist Research In HRD

Why should HRD be concerned with feminist issues? There are at least four key reasons. First, HRD regards learning as a foundational philosophical, theoretical and practical component, and feminism and feminist research are concerned with the construction of knowledge. Second, upon careful examination of the priorities of HRD research and practice, it is clear and startling that many voices are missing from the discourse of knowledge creation in our field. In other words, the determination of research agendas, control of associations, editing of journals, direction of academic programs, and leadership in organizations tends to be in the hands of white males. Third, the field of HRD is in the process of defining itself and must entertain a wider range of critical perspectives than traditional theories of
learning, performance and change. Finally, HRD should be concerned with feminism since promoting meaningful change and making a difference in the lives of individuals, organizations and communities is a strongly held value of both HRD and feminism. Feminist research and practice offer remedies and strategies to advance, improve and revise the field of HRD.

Feminism

Liberal feminism (Tong, 1998) or generic feminism, posits that if women are given access and opportunity, then the hegemonic structures that have relegated women to second-class status will disappear. Emboldened by this perspective, twentieth century women fought to get the vote in the 1920s, procured legislation in the 1970s that produced Titles VII and IX and the Equal Pay Act, and flooded into the labor market and into professional schools in the 1970s and 1980s. While the landscape has improved in many ways, women currently earn only 71 cents for every $1 men earn. Women are neither proportionately represented in the Fortune 500, nor on the local, state, or federal levels of government. Is the Liberal Feminist mantra of “Access and Opportunity” outdated? Do the more revolutionary feminist perspectives (e.g. radical, post modernism, and global feminism) have suggestions for moving beyond legislation and affirmative action to an egalitarian playing field? What does it mean to have a feminist lens? Quite simply it means to look at the world from a woman’s perspective honoring the common experiences and histories of women in the society. It does not mean excluding men or devaluing their contributions. Feminism is not a four-letter word. In other words, any research that uses a feminist lens is research that is informed on the current and former status of women in society. For example, doing feminist research on the workday of the average American woman who works outside of the home would require more than a survey of their activities or interviews with women about their goals and dreams. A feminist analysis would include in depth and comparative analysis of the current circumstances of women, and also examine such issues at the societal and historical levels.

There are many feminisms, including liberal, radical, psychoanalytic, Marxist, socialist, black feminist thought and other standpoint feminisms, multicultural, standpoint feminisms, and postmodern and poststructural feminism, to name some of the more typical demarcation lines, and all focus in some way on working to change the status and opportunities for women both in this country and all over the world (Nicholson, 1997; Tong, 1998). There is considerable overlap among these feminisms, but for our purposes here, these can broadly be conceptualized into individually focused feminist theories, structural and standpoint feminisms, and poststructural and postmodern feminisms.

Feminist Theories with an Individualistic Focus

Both liberal feminism and psychoanalytic feminism tend to have more of a focus on women as individuals, though liberal feminism deals with women collectively as a group. Liberal feminism has primarily been concerned with helping women gain access to the institutions and systems of privilege that men have always had access to, and on giving women as individuals equal rights and privileges to men. The focus is on equal opportunity for women in the current system the way that it is, particularly in regard to education and job opportunity. Essentially there is not a broad systemic critique of the structures of society in liberal feminism, but rather more of a focus on the rights of women as individuals, and helping women fit into the education or employment system the way that is. Liberal feminists seek only moderate changes to existing structures, and focus more on how the individual rights of women can be better protected in the workplace and in society in general. Psychoanalytic feminism tends to also have an individualistic focus but from a psychological perspective, and the fact that the system reproduces itself because gender socialization happens through both conscious but largely unconscious mechanisms (Chodorow, 1978). Thus, psychoanalytic feminists tend to try to deal with the roots of patriarchy (the domination of women by men) in people’s unconscious, arguing that women (or men) cannot change unless they deal with the patriarchy in their unconscious. But the unit of analysis in these feminisms is the individual, and the individual rights of women as a group.

Structural and Standpoint Feminist Theories

Structural feminist theories, tend to focus more on the direct challenge of social structures that affect women’s development and access to education and for paid work in the public workplace. The concern of radical feminism has been primarily with patriarchy as a form of structural oppression. Marxist and socialist feminists have challenged the notion of what counts as work and emphasize the fact that capitalism has relied on the unpaid and low pay work of women and subsistence laborers worldwide, and focus on ways the system can be challenged to
provide greater access to the world’s resources. Similarly, standpoint feminisms are also structural feminist theories and focus on the needs of particular groups of women based on where they “stand” relative to the margins and centers of different cultures. Thus black feminist thought focuses more specifically of the needs of Black women (Hill Collins, 1998) from their perspective, and focus on challenging racism and patriarchy in the workplace and in society; lesbian feminists focus on the life experiences of lesbians, and challenging heterosexism and homophobia as structural systems. The units of analysis here are the social structures (race, gender, sexual orientation as social structures) that affect women’s development.

Poststructural/Postmodern Feminist Theories

Poststructural and postmodern feminist theories build on the structural and standpoint feminist theories in that they focus on challenging power relations that are based on the social structures of race, gender, class, sexual orientation. But the unit of analysis is on the connections between the individual and these social structures, and how these social structures affect how individuals constructs knowledge and identity, as well as how structures affect access to the public workplace and education. Poststructural feminisms also emphasize the notion of constantly shifting identity, in light of the ways individuals and social groups both challenge and resist power relations based on social structures, and the ways they also unconsciously reproduce aspects of privilege and oppression based on race, gender, class, sexual orientation. In terms of the workplace, poststructuralists would examine WHO determines what counts as valuable workplace knowledge and the way to build on the ways of building and valuing knowledge and collaborative knowledge within and across race, gender, class lines.

Feminist Research

There are many types of feminism and just as many types of feminist research. Feminist research attempts to conduct examinations with a theoretical lens that is cognizant of the structural inequalities that frame the lives of women. A major tenet said to drive feminist research is the obligation to deliver "a critique of traditional concepts and structures that have marginalized women materially and psychologically, in the world and even in their souls" (Patai, 1991, p. 139). While the common ground of living in an androcentric world unites all women under the banner of gender oppression, denying the structural inequalities that privilege some over others serves to reproduce and reflect the hegemonic dragon we, as feminists, are trying to slay. Therefore, feminist research has tended to be ever mindful of issues of race, class, and sexual orientation.

Although feminist scholars in the sciences have made major contributions, such as medical profiling, and have also re-interpreted and developed theories that have been normed on female participants, most feminist research has been centered in the realm of the qualitative paradigm. Invariably, the responsibility, often internally imposed, falls on feminists to accurately and sensitively include, represent, and portray women. There is a weighty awareness that the lives of women are usually invisible and in most academic arenas ensconced in stereotype. Feminist scholars have attempted to free women subjects and participants from the banner of the "Other."

The concept of the "Other" in feminist research is principally based on Simone deBeauvoir's concept of the female as other to man's primary being (1968). In extrapolation, the term has come to mean the "different" when compared to the "norm." Other commonly dichotomized pairings occurring in the literature and in research are black/white, gay/straight, women of color/white women. In general, feminist researchers attempt to present the other, the woman, in ways that give power and voice to the "studied." Feminist researchers are therefore attempting to provide a critical and insightful corrective force to the stereotypical ideas implanted by the patriarchal and hegemonic weight of Western culture.

Such research goals are often problematized by the positionality of the researcher in relation to the positionality of the group members being studied, particularly when women are studying other women, whether they share similar or divergent backgrounds. Simply put, it matters whether the researcher stands as an outsider or an insider to the participant or group. In final analysis, reconciling power and positional statuses seems impossible. However, feminist researchers try to remain mindful that the powerful forces that structure our world exist in major systems that give essence to the hierarchy: the government, social organizations, communities, and family units. People are educated formally and informally in how to order the world based on their group fidelities or the "norm." Other commonly dichotomized pairings occurring in the literature and in research are black/white, gay/straight, women of color/white women. In general, feminist researchers attempt to present the other, the woman, in ways that give power and voice to the "studied." Feminist researchers are therefore attempting to provide a critical and insightful corrective force to the stereotypical ideas implanted by the patriarchal and hegemonic weight of Western culture.

How do we as researchers who are also feminists change the fundamental ways in which we explore and in turn represent the world? How do we see and then represent the lives of those who are like and different from us? We are left asking these cyclical questions with responses that only spawn new questions. The research literature poses such questions but fails to answer them, leaving open the assumption that merely contemplating transformation is
sufficient and honorable. But neglecting to ask such questions is unconscionable, given the on-going dialogue that occurs in feminist scholarship between positionality and power. Merely discussing these problems, however, is insufficient, and the consistent re-examination of one’s positionality, motives, and perspective become an essential task for the feminist researcher. Thus the feminist researcher carries certain competing inquiries into the each examination and attempts to balance voices, political agendas, and the societal hierarchies enveloping the process.

**Feminist Research in HRD**

Fundamentally, the purpose of feminist research is to conduct research *for women* rather than *about women* (Coyner, 1988-1989, p. 291). In other words, feminist researchers would likely be less interested in studying the paucity of women executives, than in unveiling learning strategies for all women that could help them disrupt oppressive patriarchal systems.

**Feminist Research Themes**

The first section of this paper offered definitions of feminism and feminist research. This section turns the research eye toward HRD itself and analyzes how the process might become more feminist, and in turn, more inclusive.

Worell and Etaugh (1994) synthesized feminist theory and research in psychology and other disciplines to identify six themes of research they regarded as feminist. Bierema and Cseh (2000) modified Worell and Etaugh’s 1996 categories to be more relevant to HRD research contexts. Each of these categories will be briefly defined. The first, “Challenges Traditional Scientific Inquiry” means that the researcher rejects the assumption of a truly objective science that is free from culture, history, or experience of the observer, and partners with the participants to ensure that they do not get manipulated in the research process. The second component, “Challenges the Category of ‘Women’” strives to affirm women’s strengths, resilience, and competence. This can be accomplished in HRD through discovering women’s contributions to HRD research and history by valuing women as a legitimate target of study rather than the “other” or deficient one. This aspect also discards the traditional notion of comparing women to a male norm and acknowledges that the category of “woman” is versatile and that there is no one such category that can possibly represent all women. The third category “Considers Asymmetrical Power Relationships” seeks empowerment of all girls and women. It distinguishes women’s subordinate status in society as based on unequal power distribution instead of deficiencies and explores the influence of power on women’s lives. This category considers differences among women as mediated by power differentials related to opportunities available based on color, social economic status, age, sexual orientation, etc., and studies interpersonal relationships within the context of patriarchal power arrangements. The fourth category “Recognizes Gender as an Essential Category of Analysis” identifies multiple conceptions of gender and diversity. This perspective also challenges the use of gender only as an independent variable that explains observed behavior. The fifth category “Attends to Language and the Power to ‘Name’” by creating public awareness of hidden or unspoken phenomena such as sexual harassment, heterosexism, language rendering women invisible, or the private lives of women. The invisibility of these issues in both research and practice only serves to reinforce inequitable systems of power. The sixth and final category “Advocates Social Activism and Social Change” charges researchers to reconceptualize theories, methods, and goals to promote possible social change, reduce power asymmetries, and support gender justice. This aspect is also critical of how research knowledge is depicted and acknowledges that sometimes it oppresses rather than benefits women such as portraying them as diseased, deficient, or other.

**The Process of Feminist Research in HRD**

Now we turn to the process or “nuts and bolts” of conducting feminist research and address methodological issues. Eichler asks, “is there a feminist methodology?” and retorts, “it depends” (1999, p. 9). This section addresses feminist processes of formulating questions, designing research, identifying sample populations, and analyzing data.

**Question Formulation.** Research questions have traditionally been conceptualized without consideration of women (Fine, 1985; Lykes & Stewart, 1986; Unger, 1983). A quick reading of HRD research reveals an agenda driven by management interests focused primarily on learning and performance (Bierema & Cseh, 2000). Learning and performance are vitally important to HRD research, however, research question formulation often overlooks the impact of power, oppression, and organizational relationships on learning and performance. Asking new questions
is an important role in critiquing existent HRD research and in creating future studies (McHugh, Koeske, and Frieze, 1986). HRD researchers could benefit by asking questions about their questions such as, "How do we integrate multiple voices into HRD research?" "Who benefits from HRD research?" "How does research reproduce systems of oppression versus challenge them?" "What impact do omissions in research have on HRD theory and practice?"

Research Design. A wide variety of research designs is used in HRD, and there appears to be a balance in methodology between qualitative and quantitative approaches (Bierema & Cseh, 2000, 2002). Feminist research proposes expanding the methods and voices of knowledge creation. DeVault (1996) implores researchers to avoid favoring one philosophical research stance over the other and suggests that "feminists have made major contributions by finding concepts and practices that resist 'dualisms' and they urge resistance to the qualitative-quantitative division" (p. 31). Quoting Cannon, Higginbotham, and Laung, she points out that small scale projects may be more likely than quantitative studies to reproduce race and class biases of the discipline by including participants who are readily accessible to the researchers. She also advocates that "quantitative feminist work involves correcting gender and other cultural biases in standard procedure" (p. 31). Quantitative methods are customarily used in HRD research and researchers would improve knowledge about race and gender by heeding DeVault’s advice. Qualitative research is also widely applied in HRD research, however, very few authors acknowledge their role as the researcher or are forthcoming about their biases.

Sample Populations. As in question formulation, HRD research is biased in sample selection. There tends to be an executive and managerial focus. As the hierarchical level increases, the population of women decreases. Thus, by virtue of selecting executive and managerial populations to study, women are excluded. This phenomenon is not surprising since executive and managerial groups possess organizational power, control resources, and stand to benefit from research. Women are absent in problem formulation, research design, data analysis and future implications (Bierema, 1997; Bierema & Cseh, 2000). Biased selection such as this serves to exclude women, minorities and employee groups with less power in organizations. It also prevents HRD researchers and practitioners from gaining a full understanding of the organizational context.

Data Analysis. Although HRD research populations regularly include women and minorities, data analysis often fails to address gender or oppressed status as an important unit of investigation. Further, the social and political contexts are often controlled or ignored in traditional research. Failure to capture richness, context, and multiple perspectives in analysis is another feminist criticism of social science research. The challenge for HRD researchers is to more comprehensively analyze data. This will promote learning about women, oppressed groups, and social context. HRD researchers also need to take their conclusions a step further when considering findings. How do the findings impact women and other oppressed groups? What are the implications for organizational or social change?

Contradictions and Challenges Related to Women in HRD Practice

There are many issues that confront feminists who practice HRD such as reconciling a feminist framework and values with masculine, patriarchal organizational culture. One of the ironies of the HRD field is that although management continues to be a profession for men, human resource workers tend to be women (Hughes, 2000; Ross, 1996: Townley, 1994). Further, although human resources workers tend to be women, often those with the most power in the field are men, and as a whole, the profession enjoys little organizational power with respect to other functions. Finally, it should not be assumed that women in HRD are automatically feminist, or concerned with women’s issues, nor should men be excluded from the process. Indeed, men can both be feminists and engage in feminist research. Sadly, however, human resources practices sometimes function to perpetuate patriarchal systems of power.

A poignant example of the contradictions and challenges related to women in HRD practice is the case of lesbians in work context. A critical examination of the unique double-minority status of lesbians in the organizational setting easily establishes for the HRD practitioner to appreciate an obvious gap between the philosophical underpinning of HRD theory—which espouses learning, change, performance, and constant improvement for the lives and careers of all—and the status of lesbians in the organizational setting. Heterosexism is a worldview (McNaught, 1993, p. 48) and for most people, it is probably not even conscious. It is a mind-set based upon limited opportunity to experience diversity (McNaught, 1993). Heterosexism is not always a simple, benign, innocent posture. Rather, heterosexism is the belief that heterosexuality is actually superior to homosexuality and should be an enforceable social norm (Badgett, 1995). Lesbians, because they experience a double minority status in the world, are subject to even greater discrimination based on the intersection of gender and sexual orientation.
(Fassinger, 1996). We must ask ourselves how HRD research affects women's ability to gain power and influence in both practice and research, and consider what we are willing to do to begin eroding the inequitable structures of research and practice. The feminist perspective is change-oriented, seeking to equalize power relations that often lead to oppression of various groups in society.

The feminist approach offers HRD, as a relatively new field, the opportunity to apply multiple, socially responsible approaches to increasing the knowledge base. The status of lesbians today in the corporate setting is not necessarily identical to what it was for heterosexual women, say, twenty years ago, but it is analogous and comparative. Invisibility and powerlessness are thematic consistencies amongst both populations and any kind of practice of empowering and integrating lesbians, who face the dual hurdle of gender and sexual orientation oppression, does not exist in HRD. Issues of lesbian representation, like other lesbian issues, have rarely addressed in scholarly literature as valid questions in their own right, to the great detriment of lesbian studies. As soon as the lesbian is lumped in—for better or for worse—with her male homosexual counterpart, the singularity of her experience tends to become obscured (Castle 1993, p. 12). Feminist practice offers a solution to the problem of lesbian powerlessness and invisibility in the corporate setting because of its predilection to not just identify and acknowledge assumptions about the way the world is, but to create space and conversation about how those assumptions (such as sexism and heterosexism) can and should be uprooted.

Although barely acknowledged, corporate cultures are bastions of heterosexism. Such work environments create unique challenges for lesbians and aptly illustrate some of the contradictions for feminists involved in HRD. Assimilating oneself into the ubiquitous heterosexual corporate culture, networking, and socializing within the organization are vital aspects of negotiating a corporate career. Sometimes, the strategies that gays use to fit into the heterosexist corporate environment handicap them, because those strategies often result in a gay person's being perceived to be aloof (Digh, 1999). Lesbians in particular face the conflict of integrating with the heterosexual community: Being a part of activities and making contacts important for career development, but being viewed as different from heterosexuals (Boatwright et al, 1996, p. 224). Thus, lesbians who work in corporate America walk a fine line in the corporate setting because of their double challenge. Gay women are slower than gay men, for example, to make their sexuality known because they differ not in one but in two important ways from straight male executives, who still tend to surround themselves with similar colleagues at the very top of the ladder (Swisher, 1996). Lesbians, therefore, working in corporate America constantly negotiate the multiplicity of variables (sexism, heterosexism, networking opportunities, and “fit” within the corporate culture) that can potentially detonate their careers. This negotiation process is arguably no different than the general experience of lesbian life in the larger society.

Lesbians represent arguably a perfect population for which to practice true HRD interventions based on feminist theory and practice because feminist theory and practice provide opportunity and even perhaps a requirement for the organization to embrace the “new knowledge” of which Larson & Freeman (1997) and Oakley (2000) refer, which result not only from their invisibility but also because of the power structure that their presence challenges. Lesbians differ not in just one, but in two ways from their straight male counterparts, which can doubly foil their chances of career ascent in an organizational setting. Nevertheless, lesbians present not just a significant problem by which feminist theory and practice can manifest in HRD intervention, but also they present significant opportunities because they unravel some of the very social constructions of knowledge in which they exist. For example, Fassinger (1995) has pointed out that, despite a number of vocational barriers that lesbian may face, there are also important facilitative aspects of lesbian identity related to career planning and choice. Most salient among these is that lesbians tend to demonstrate more nontraditional, androgynous gender roles than do heterosexual women (Browning, Reynolds, & Dworkin, 1991; Fassinger, 1996; Garnets & Kimmle, 1991, Hetherington & Orzek, 1989; Morgan & Brown, 1991).

Conclusion

The process of feminist research is similar to other approaches to research. It is distinct, however, in that it formulates questions that have the potential to create knowledge for and with women that improves their lives and status. Feminist research is designed with the understanding that it is a subjective process, impacted by both the positionality of the researcher and the researched. Feminist research embraces a wide range of research designs and traditions and is more concerned with the ability of research to contribute to lessening women's oppression than the particular method selected. Populations are selected to truly represent women, not just white, middle class women, but diverse women on the basis of race, age, sexual orientation, and social class. Data are analyzed to include women. Woman as a category is an important unit of investigation that is not just counted, but analyzed. Finally, the process of feminist research acknowledges the relationship between the researcher and the researched.
This paper, made the case for feminist research in HRD, defined feminist research, described feminist research strategies in HRD and spoke to the challenges and contradictions inherent in a feminist HRD practice. HRD is an important and emerging field with a rich tradition of research. As researchers, we have a constant responsibility to critically evaluate our questions, methods, and findings. Practitioners have a responsibility to demand research that us useful in addressing the difficulties presented by work contexts plagued with racism, sexism, heterosexism and classism. All of us have an additional accountability to assess HRD research's impact on performance, learning, employee well-being, and social welfare. Is HRD research increasing opportunities for women and minorities in organizations, or is it decreasing them? Is the work of HRD impacting the environment in a positive fashion, or is it contributing to our worsening environmental and global crisis? Whose voice is being heard in the scholarly discourse? Are they predominantly white male? The point of this paper is not to ask the field to shift entirely to a feminist framework, but rather to make space for it. As the field of HRD emerges we have the opportunity to draw the picture that includes a variety of approaches, including feminist research. It is our hope that HRD researchers will make space for it.

In Difficult Times: Influences of Attitudes and Expectations Towards Training and Redeployment Opportunities in a Hospital Retraction Programme

Sandra Watson
Napier University of Edinburgh, Scotland

Jeff Hyman
Glasgow Caledonian University, Scotland

This paper reports on research which explores reasons behind the low uptake of training and redeployment opportunities in a three-year downsizing (retraction) programme in a National Health Service (NHS) mental health hospital. It examines the social-psychological effects on barriers and motivation to training and redeployment. It reports on a number of extrinsic and intrinsic factors that are inhibiting the movement of staff from the hospital.

Key Words: Motivation, Barriers, Training

Organisational change may be seen as a 'normal' consequence of survival and development in a rapidly changing world. In many situations this change can involve organisational downsizing. There has been a tendency to view the strategic decision on whether or not to downsize in a rather 'clinical' manner in terms of a 'rational' calculation of the benefits and costs to the organisation as a whole. Many organisations will implement a range of support mechanisms to ease the human side effects of this transition. While it is now commonplace to speak of the human costs of change (Deal & Kennedy, 1999), little attention has focused on the emotional impact of change nor on examining how the personal feelings and emotional consequences of downsizing impact on programmes designed to ease transitions.

The research is set in the context of a three-year downsizing (retraction) programme in a National Health Service (NHS) mental health hospital, which is resulting in a substantial reduction in staffing levels. Many staff are expected to re-skill, move to community work and/or move to another location, stimulating a range of personal reactions. In order to facilitate this transition, a number of training and development initiatives have been devised by management to prepare staff for alternative employment. The desired outcomes of these initiatives were to phase the dispersal of staff in line with ward closures and to minimise the impact of closure on staff by providing opportunities to retrain and/or move to alternative employment. However, the number of staff utilising these facilities was very limited and the dispersal of staff was not meeting expected targets. This research explores reasons behind the low uptake of training and redeployment opportunities.

Research Questions

The central research question involved exploring how and why employees respond to radical organisational shifts. The aim of this research was to identify behavioural influences impacting on take-up of training and alternative employment opportunities, in a downsizing context. Key contentions of this paper are that traditions of employment security will provoke negative responses to the retraction programme; uncertainty in the work environment will influence the uptake of training, development and redeployment opportunities, and staff may vary in their orientation toward alternative employment opportunities according to identifiable criteria (e.g. age, education, position).

The first proposition derives from two main conceptual areas; firstly, there has been recent debate about the nature of the "new psychological contract" which helps inform employee behaviour (Rousseau, 1994; Hiltrop, 1996). There is an assumption that under turbulent market conditions, the "old" psychological employment contract based on security and continuity cannot be sustained. In order to engage employee commitment, new dimensions (e.g. of "employability") to the contract need to be explored (See Herriot, 1992; Herriot et al, 1998). Until recently, the profile of a "good employer" centred on notions of job and income stability, security and advancement with seniority. In many respects, the UK public sector epitomised this characterisation (Millward et al, 2000). With changing and uncertain market conditions, the "good employer" concept has shifted to one that can best meet changing product market conditions through adaptable working conditions and employment flexibility, whilst employee orientations may be hypothesised to be located in traditions of security and long-term career progression.

The second related proposition derives from literature on emotional impacts of hospital closures (Maurier and Northcott, 2000; Doherty, 1998; Massey, 1991). These impacts may then be associated with the parallel concepts of...
motivation to train and barriers to training. In other words, rather than acting as a stimulus to action, the threat of imminent or protracted change serves as an inhibitor to action. Furthermore, structural factors such as age, social class, education and occupation have been identified as variables affecting learning (Maguire et al., 1993; Maguire and Fuller, 1995) and these factors underpin the third proposition of differential response paradigms.

Context

In 1990, the UK government introduced the Community Care Act, advocating the closure of large institutions for people with learning difficulties by providing residents with care and accommodation in the community. This case study is located in a large hospital, for individuals with learning difficulties, which is two years into a three year retraction programme. It is changing from being a large hospital with over 300 residents to a 26-bed unit. This process involves patients being relocated across Scotland, with major implications for retraining and redeployment of staff. Many staff at this hospital are long-serving, and the hospital itself was founded many years ago. The hospital is regarded as a significant presence as well as contributor to the local employment community. Further, many of the staff employed live in and around the local area. It is perhaps not surprising that there is a tangible (though currently fragile) sense of “community” among staff.

In order to ease this transition a range of training, development and redeployment initiatives were developed with the key objective of assisting staff to manage the transition from the hospital to community working or to alternative employment. The hospital has been awarded nearly £17m to support this retraction process. It has established a number of initiatives to assist staff to seek training and development or to offer alternative employment opportunities. These include:

- A monthly bulletin of redeployment opportunities from other hospitals and community care providers throughout Scotland. These are mainly in the area of community care and support services.
- A redeployment service, which enables staff to seek assistance with finding suitable alternative employment.
- A careers advisory service, designed to give advice on career alternatives and practical assistance.
- A training and development programme developed by management, provides opportunities for further training, secondments and educational opportunities.
- A resource pack detailing programmes and support available for further/retraining and education opportunities, supplemented with a resource centre providing advice on assistance available for training and redeployment on an individual basis. This also gives details of alternative employment prospects.

Although a great deal of effort and resources have been allocated to try to ease the transition for staff, a substantial number of staff do not appear to be taking up opportunities for training, development or redeployment. This paper exposes and explores the behavioural issues underpinning the low uptake of opportunities.

Theoretical Framework

It is the conjecture of this paper that social-psychological factors derived from employee perceptions of fracture of the “old” psychological contract based on security and service will strongly influence the motivation to take up training, development and redeployment opportunities. The effects on staff of impending contraction or closure of an established workplace can be profound. Sennett (1998) presents evidence of profound emotional damage among a group of “downsized” programmers at IBM. One American study found that threatened job loss is accompanied by a number of transitional stages, involving disbelief, sense of betrayal, confusion, anger and ultimately, resolution (Schlossberg and Leibowitz, 1980). A later study of a hospital closure found that “all of the above stages were experienced by various staff members after the scheduled closure was announced. Everyone had to achieve resolution and accept imminent closure as a fact” (Domingue and Singleton, 1994,p.51). Expressed feelings were akin to those of unwanted divorce: “Losses were very personal and were intimately related to our self-esteem, self-worth and personal economic conditions. The situation was devastating” (Domingue and Singleton, 1994, p.53). A British study among psychiatric nurses found that, the impending loss resembled that of bereavement. Like the American case reported above, this study also found a reactions sequence among those affected: anticipatory grief; acute mourning stage in nurses physically distanced from the hospital; refusal to accept closure as “right”; and a strong identification with the old hospital (Massey, 1991). “Survivor” syndrome in health service restructuring exercises has also been identified in several studies (Maurier and Northcott, 2000; Massey, 1991), where individuals report a sense of guilt at remaining in the organisation. Studies by Massey (1993), confirm that: “the effects of rundown and closure on hospital staff are profound and far-reaching, and many nurses find the transition from hospital to community nurse very difficult indeed” (Massey, 1993, p.198). Feelings of “institutional loss” as Massey (1991) describes the syndrome, can be especially profound among long serving employees, working in a long-established environment. Motivation under these circumstances may be difficult to sustain but motivation is recognised in the
literature as an important contributor to training take-up and outcomes; yet surprisingly little attention has been given
to why training "works" for some individuals and not for others. However, recently some attention has been given
to the influence of "emotions" on learning (Short, 2001). Arguably there is an integral link between motivation and
emotions, with motivation being influenced by an individual's emotional state. On the basis of a number of research
studies, it has been contended that "attitudes and expectations represent the most powerful barriers to the willingness
to consider training" (Crowder and Pupynin, 1993, p.26).

Specific barriers to learning have been identified in the literature and these include motivation (Hand et al,
1994), itself derived from both intrinsic and extrinsic factors (Mumford, 1988), as well as structural factors such as
age, social class, education and occupation (Maguire et al., 1993). Intrinsic barriers can be owned and erected by the
learner and these are therefore factors over which they have control. On the other hand, extrinsic or environmental
barriers are outwith the locus of their individual control. In this way, it follows that the variables that are present in
relation to the intrinsic values can lead to diverse perceptions of the extrinsic factors. For example, the perceptions,
motivations and emotions of one individual compared to another may dictate a different response to a physical or
situational barrier according to his or her locus of control. Emotional barriers to learning are associated with
individual insecurities, which may cause reluctance to take action in certain areas and hence hamper participation.

Crowder and Pupynin (1993), using Rotter's (1966) definition, propose that 'individuals with an internal locus of
control believe performance to be contingent on their own behaviour while individuals with an external locus of
control believe that outcomes are beyond their personal control' Crowder and Pupynin (1993, p.19). Through their
inter-action with attitudes and expectations for the future, the socio-psychological factors identified above represent
an additional potential barrier to training. A key issue is the importance of individual motivation in learning (Hand et
al, 1994). For some people there is a sense of inertia and/or saliency of learning, where they do not perceive learning
as a means of helping them out of their present situation, which influences their individual motivation to learn.
Factors affecting individual commitment include motivation, awareness, flexibility, information and guidance
available as well as perceived benefits from learning. Additionally, Maguire et al (1993) highlight barriers to
learning as being funding, fear of loss of job security, and finding time to study.

Basically, therefore, staff are facing new and highly significant dimensions to their immediate (psychological)
and contextual (public sector/hospital/community) employment conditions which in turn are likely to influence
employee attitudes and behaviours towards retraining initiatives. In other words, the potential social-psychological
effects of retraction may be profound and their influence on the overall uptake of training cannot be under-estimated.

Methodology

An interpretive research perspective is adopted, aligned to the social constructionist paradigm which assumes that
individuals and their interactions subjectively create social reality which assumes an underlying pattern and order, or
regulatory focus (McGoldrick, Stewart and Watson, 2002). The researchers are seeking to understand the emotions
of staff and their subsequent response to training and redeployment initiatives within the particular social construct
of a hospital retraction. No single method was appropriate to produce the rich texture required to explore the issues,
therefore the following complementary quantitative and qualitative approaches founded upon a case-study
methodology were adopted.

An initial survey was designed to assess the overall levels of awareness and satisfaction with the secondment
and redeployment opportunities and retraining provision and take-up. Respondents were asked to indicate any
suggestions for improvement if they were dissatisfied with any options for retraining. A total of 27 respondents
(23%) offered some narrative response to this question. The self administered survey instrument was issued to all
411 employees; a response rate to the survey of 29% was achieved, which would conform with accepted response
rates in internal postal surveys of this nature (Easterby-Smith et al, 1991). The data was analysed to identify if there
were significant differences between different variables of category of staff, gender, age, education level and length
of service. The results indicated that there were few differences. Differences which did emerge are presented in the
discussion section of this paper. Of the 119 completed questionnaires, 18% were from men, and 82% from women.
This is representative of the total sample, where the gender split is 20% male, 80% female. The mean age of staff
was 37 years and nearly half (47%) of respondents were aged between 31-40 years. Mean length of service was 12
years, with 40% of staff having served between 11 and 20 years at the hospital. Nearly two-thirds (62%) of
respondents were from nursing, a further 17% from support services and ten per cent from Professions Allied to
Medicine (PAMs). The rest were from Administration and from Management.

The survey was complemented with a series of interviews on a purposive sample of staff. Four group interviews
were conducted with samples of nursing personnel and support staff in order to identify the main obstacles and
facilitators facing different groups of staff to retraining for employment elsewhere. These involved not more than
five staff in each group and provided opportunities for occupational groups to express their feelings about the programme and its effects upon them.

Individual semi-structured interviews were also conducted with eight management representatives, one union representative and one care leader (all serving on the Hospital Training and Development Group), to examine their views on staff responses to training and development opportunities. These interviews were recorded and transcripts of the interviews made. Phone interviews were conducted with a small sample of staff who had successfully transferred into alternative employment or taken up educational opportunities. In addition to these formal interviews, several informal interviews with hospital personnel were conducted in order to gain specific information or to clarify particular issues. Table 1 below provides details of the interview respondents.

Table 1. Interview Respondents

| Phone interviews | 5 | 2 | 3 | - |
| Face-face interviews | 10 | 4 | 6 | 8 |
| Group interviews (4) | 16 | 4 | 12 | - |

Research Findings

Responses to the Retraction Programme

Behavioural responses to the retraction programme as identified through individual and group interviews can be identified under the following headings.

Stress and Sickness. Stress and sickness among staff was very apparent. In the words of one respondent: "The sickness rate is going through the roof. Even if on paper a service was adequately staffed, in practice cover was constantly being sought and: "Nobody seems to listen to that. It's so frustrating... A lot of my time is spent in long-term sick interviews". Concern was also expressed about the psychological effects of the retraction programme. The support group of staff reported that many of their colleagues felt that they were taking their stress home to their families. According to one interview group, sickness and absence rates were now at an all-time high, a situation predicted to get worse until the final closure. One nurse stated that: 'Staff are still living on their nerves." A manager queried whether the extent of stress among fellow managers was recognised, especially as there had been a number of stress and health related problems among this group.

Morale and Motivation. Morale among all the interview groups was also at a very low level. One group reported that although they knew that closure was inevitable, they felt an overwhelming sense of powerlessness. Attempts at involving them in the decision-making process were treated with scorn, as these were viewed as "cosmetic democracy". Another nurse group considered that their lack of input had left them feeling demoralised. Staff powerlessness was exacerbated as the groups felt that their opinions and concerns were either being ignored or not fully addressed. Further "blows" to morale were continually anticipated through the uncertainty inherent in their situation: "What we want to know is – do we have a job? How long do we have it?" The difficult situation was summed up by one nurse: "I used to love my work, but now I don’t do things like coming in early".

Low morale was also affected by staffing problems as nurses struggled to maintain high standards of patient care, this being a highly sensitive issue which emerged at several points during the group interviews. Study days had been reduced, study leave requests declined and courses cancelled, which meant that nurses became concerned about skills erosion at precisely the time when they wished to update and develop their skills. Conversely, low morale was linked directly with low motivation for taking up various retraining and redeployment opportunities, which were reluctantly pursued under pressure, rather than through individual choice. Another group pointed out that fear of the unknown was a strong inhibitor to many people moving on. The support staff group expressed the view that they had no motivation to make use of any of the retraining and redeployment opportunities. As with the staff interview groups, there was clear understanding among the managerial respondents that morale and motivation were intervening factors in staff behaviour.

Stereotyping and Self-esteem. The three nurse groups expressed concern that working for the hospital had pigeon-holed or negatively stereotyped them in the minds of prospective employers, thereby reducing job opportunities. Some interviewees said that this made them feel almost unemployable ("institutionalised"), although

20-1
they knew that they had accumulated valuable skills over their service period with the hospital. This issue was also mentioned by several management respondents: “Learning disabilities is very much a second class citizen as far as certificates go. We are not accepted as ‘real nurses’”. However, some management respondents were critical of staff attitudes: “some are not interested in taking opportunities, they are sitting back, possibly due to their age”. Age as a factor was also referred to by another manager: “Probably a quarter to a third will not move. They are too old to train and they are not interested. Anyone over 45 shows little interest. The most active are lower than 42.”

Locus of Control. One of the findings was a propensity of respondents across all groups to have an external locus of control in that individual shortcomings were attributable to changing organisational and environmental factors beyond the reach of staff. These factors in turn were eroding existing relationships at the workplace. The nature of the hospital, in which long serving patients and staff had enjoyed a strong sense of community had changed and all the interview groups felt that the sense of community was rapidly dissipating: “This was a great place at one time, but they’ve wasted it”. In contrast, a common thread joining all the respondents who had been successful in finding alternative employment was their conviction that their success was primarily as a result of their individual effort and perseverance.

Denial. Denial in one form or another was frequently cited by managers as an obstacle: “There is a significant number of staff who do not appear to have absorbed the implications of the closure, and would prefer not to believe that major change is underway”. Others believed that facing the reality of the managerial narrative of change might only occur when appointments are made to the permanent 26-bedded unit. People who are not offered a job will be forced to face the inevitable. Another manager pointed out that the pace and extent of staff acceptance will grow as closure grows closer. Another respondent considered that “a lot of people are putting their heads in the sand” whilst others referred to the “comfort zone” of familiarity that many are loathe to risk leaving: “It’s opened up a whole new world of insecurities for them”. Fear constitutes an additional factor, especially for older and long-serving staff: “A lot of them are so fed up and demoralised, that they just don’t know where to turn”.

The potentially devastating effects on staff are recognised by management: “...to recognise how it must feel for somebody who has worked in a location for 30 years, has cared for ...patients for that period of time ... It is like giving your children up for adoption but you don’t actually want to give them up. You don’t know where they are going. you are never going to see them again and you don’t actually feel that they are going to a better home ... you have been told to do it and that is quite a hard thing for people to come to terms with. I think that this is actually overlooked and we don’t spend enough time and energy on understanding that. And it’s just because we don’t have the people, resources or the time to do it”.

Opportunities for Redeployment and Retraining

The attitudes and responses of staff towards “opportunities” provided by the retraction programme were uniformly negative. To examine the extent to which these reactions were independent of recognition or access to the various programmes offered to staff and their perceived value, the study attempted to identify levels of awareness, utility and perceptions of support offered.

Awareness. Survey respondents were first asked to nominate their degree of awareness of training initiatives. The findings indicate that the majority of staff were aware of the principal initiatives available to them. This is especially the case for the high proportions of staff either very aware (33%) or aware (62%) of the Redeployment Bulletin. The survey asked respondents whether they were aware of different retraining opportunities offered within the hospital. 81% were aware of the provision for vocational qualifications, 79% for “Return to Learn”, and 84% for secondments. Individualised training opportunities were known by 61% of staff, demonstrating that levels of awareness were reasonably high.

Utility and Availability. Whilst the majority of respondents replied that the initiatives are useful or even very useful, an appreciable minority replied that the initiatives were “of no use”. Again, the Redeployment Bulletin tends to secure the highest levels of utility. The resource pack and redeployment bulletin were not regarded as especially relevant by any of the redeployed respondents, being seen as too general and not sufficiently focused on specific skills. The Resource Centre was mentioned by some respondents as being useful, for example, for computer training. The respondents who had successfully been redeployed were of the overall opinion that information provision regarding training and redeployment options were effective, although there was criticism of specific informational instruments and of the limited role played by the hospital in helping staff to secure alternative employment or retraining.
Substantial levels of criticism with regard to redeployment were expressed by all the interview groups. One problem was skills matching, in that vacancies circulated in the Redeployment Bulletin failed to meet staff needs. Both the bulletin and questionnaire were seen as unhelpful in this regard. From the questionnaire there were concerns that no systematic attempt at targeting or skills matching had been made. This matching problem between staff skills and vacancies, especially with regard to qualified staff, who work in a very specialised area was also a common management concern. "The opportunities coming through will not reflect their skills, but, "there is nothing we can do about it". Other comments were more favourable: "... Everyone filled in a preference exercise questionnaire and any jobs or secondments are matched up to what individuals had put in these forms – they're targeted".

Organisational Culture/ Support. There were a number of organisational culture issues identified from the research, in relation to notions of support and sense of community. Many individuals perceived problems with level and appropriateness of opportunities. An interviewee who gained employment following a secondment claimed that she set up this opportunity on her own, "without any support from the hospital". A second interviewee secured their position by applying for a job she had seen advertised in a newspaper, claiming that her success was "down to luck", rather than the help given by the hospital. She also claimed that there were obstacles: that it was difficult to get time off to take up training opportunities and make use of facilities such as the resource centre or careers advisory service. This point was echoed by a third respondent who also did not feel very supported by hospital. She also took the view that securing alternative employment was very much due to individual effort and initiative. Conversely, two respondents who were redeployed were complimentary of the hospital support. One related that he was transported to the potential employer, offered a three month trial without obligation and the opportunity to return to the hospital if the post proved unsuitable. The second secured his position through the redeployment questionnaire, allowing him to be targeted for the vacancy.

Accessibility. When asked whether respondents were satisfied with opportunities for retraining and redeployment, a majority of those aware replied affirmatively, suggesting that overall there is a reasonable level of satisfaction. However, the perceived effects of accumulating staff reductions on secondments were having a widespread influence on accessibility to opportunities, according to a number of survey respondents. A Registered Nurse pointed out that she had: "Twice applied for vocational training and was unsuccessful on both occasions as there were no staff in my present ward interested... I don't think this is acceptable in a retracting hospital."

One effect of staff resource constraints, according to a few respondents, has been the cancellation of courses, which can impact negatively on morale. When asked the reasons why one nursing group experienced no great motivational surge to take up retraining opportunities, one nurse pointed out that: "When you approach them (ward management) they tell you can't be released". The rest of this group confirmed that this is a major problem, leading to a considerable amount of dissatisfaction and false hope. Management also identified shortages of staff adversely affecting retraining and redeployment opportunities: "Releasing staff to allow them to take up training has been a consistent problem and difficulty". Staff shortages present a significant barrier to taking up training and development opportunities: "people had an awful time trying to get study time". Another manager pointed out that shortages may deter staff from taking up opportunities due to them putting patients first "The staff member may see a shortage of nurses and decide that they will not add to the problem, as they feel the patients will suffer."

One nursing assistant pointed out that: "Secondments – there is no staff so people can't get release for secondments." One concern expressed by a number of groups was that taking a secondment could jeopardise a return to employment: "They say your job's safe, but people are not convinced". The group claimed that little support, help or guidance was offered to staff seeking secondments, even to the point of staff organising their own secondments. Chronic (and growing) staffing shortages were also felt to hinder the release of staff. The choice of secondments was also stated to be limited by the nurse groups, not giving staff the opportunity to sample alternative careers. The support staff were unhappy that a secondment on alternative employment was for three months with no room for flexibility, if it is unsuitable.

Discussion
